ABSTRACT

The integration of 5G technology and edge computing in precision agriculture has the potential to revolutionize real-time monitoring and decision-making processes for soil and crop health. This study presents an empirical investigation into a 5G-enabled edge computing framework deployed on experimental agricultural fields to assess its effectiveness in data acquisition, disease detection, and environmental responsiveness. Using edge-deployed AI models—including convolutional neural networks (CNNs) and long short-term memory (LSTM) networks—the system performed multi-modal sensor data fusion from soil moisture probes, weather stations, and visual imaging drones.

Empirical results indicate that the proposed system improved disease detection accuracy to 93.5%, a significant increase from the baseline of 85.2%. Furthermore, sensor-to-decision latency was reduced to 146 milliseconds, compared to 627 milliseconds in cloud-only models. Real-time irrigation alerts and crop stress detection enabled farmer response times to improve by 76.3%, leading to more efficient water usage and minimized crop damage. Additional findings showed that real-time soil nutrient monitoring led to a 17% increase in fertilizer application efficiency, while edge-based AI models achieved 94.7% classification accuracy in identifying early signs of nutrient deficiencies.

The study concludes that 5G and edge computing synergistically enhance the accuracy, responsiveness, and scalability of smart agricultural systems. The proposed framework offers a viable path toward sustainable and intelligent farming—especially in rural areas where latency, bandwidth, and infrastructure constraints present challenges to conventional cloud-based systems.

Keywords: 5G, edge computing, real-time monitoring, precision agriculture, soil health, crop health, smart farming

1.0 Introduction

Global agriculture is undergoing a transformative shift in response to the increasing demand for food production, climate variability, and the need for sustainable farming practices. Traditional agricultural methods, though historically effective, often fall short in terms of real-time responsiveness, precision, and scalability (Kamilaris & Prenafeta-Boldú, 2018). Emerging technologies such as 5G and edge computing are redefining the way farms are managed by enabling real-time data acquisition, low-latency communication, and intelligent decision-making at the field level (Zhou et al., 2023; Khosravi et al., 2021).

The 5G wireless standard offers ultra-low latency (less than 1 ms), high bandwidth, and massive machine-type communication, making it ideal for integrating numerous Internet of Things (IoT) devices in large-scale agricultural systems (Zhang et al., 2020). These attributes support continuous, high-fidelity data streaming from heterogeneous sensors such as soil moisture probes, weather stations, drones, and camera-enabled disease detection units (Wang et al., 2021). However, transmitting all collected data to the cloud for processing introduces delays and increases dependency on robust internet infrastructure—especially problematic in rural and developing regions.

To address this challenge, edge computing complements 5G by shifting computation closer to the data source, often on devices such as Raspberry Pi, Jetson Nano, or other microcontroller-based systems (Gubbi et al., 2022). This minimizes latency and reduces bandwidth usage while enabling localized AI model inference for soil condition classification, pest detection, and irrigation control (Gupta et al., 2021). Our results demonstrate this synergy: disease detection accuracy increased to 93.5%, sensor latency dropped from 600+ ms to less than 150 ms, and real-time decision support improved farmers' response times by over 75%.

Several studies have highlighted the potential of precision agriculture frameworks using sensor networks and cloud computing. For example, Verdouw et al. (2021) emphasized cloud-based digital twins for crop simulation, while Misra et al. (2020) explored AI-powered yield prediction through remote sensing. However, these approaches often depend on high-latency centralized computing, limiting their real-time applicability. This paper builds upon and extends such work by empirically demonstrating that 5G and edge-based hybrid systems can provide real-time, scalable solutions for soil and crop health monitoring—particularly in latency-sensitive tasks such as irrigation alerts, pest outbreak predictions, and soil nutrient analysis.

Furthermore, the inclusion of AI-enabled edge devices enables intelligent decisions at the point of data collection. Studies by Jha et al. (2021) and Abawajy et al. (2022) support this approach, showing that deploying convolutional neural networks (CNNs) and recurrent models like LSTMs at the edge can drastically improve classification and prediction performance. In our study, AI models trained on local farm conditions significantly improved soil moisture estimation accuracy (error margin <1.2%) and enabled actionable disease predictions up to 64% faster than centralized models.

In summary, this paper presents a field-tested integration of 5G and edge computing that bridges the gap between AI theory and practical agricultural deployment. The proposed framework

improves disease detection, optimizes irrigation, and enhances farmer responsiveness—thus demonstrating a practical pathway to intelligent, data-driven farming.

The growing demands of global food security require efficient, sustainable agricultural practices. Traditional farm management techniques, while proven over time, are increasingly unable to address modern challenges, such as climate variability, soil degradation, and timely disease detection. Emerging technologies like 5G networks and edge computing offer powerful tools to address these concerns by enabling real-time data capture, processing, and decision-making close to the source (Kumar et al., 2022).

This paper explores how 5G and edge computing can be integrated into agricultural monitoring systems to improve soil and crop health surveillance. The system facilitates rapid feedback loops, empowers farmers with real-time insights, and enhances precision agriculture practices. Key objectives include minimizing latency, improving prediction accuracy for disease outbreaks, optimizing irrigation scheduling, and reducing crop failure risks through smart data-driven interventions.

2. Materials and Methods

2.1 System Architecture

The proposed system integrates:

1. **IoT-based sensors** deployed across soil and crop areas to capture moisture, temperature, pH, and pest levels.
2. **Edge computing nodes**, primarily Raspberry Pi 4 and Jetson Nano units, for localized data processing.
3. A **5G network interface** (via mini 5G modules) for high-speed communication between edge devices and centralized data repositories.
4. AI models (e.g., LSTM for time-series predictions and CNN for image-based disease recognition) deployed on the edge for immediate inference.
5.

2.2 Experimental Setup

Field experiments were conducted across **five farms in three agricultural zones**. Traditional cloud-only systems were benchmarked against the proposed edge-based architecture. Data was collected over 90 days, and performance was measured using accuracy, latency, power consumption, and responsiveness of decision support outputs.

3. Results and Discussion

3.1 Enhanced Disease Detection Accuracy

The integration of AI models on edge nodes significantly improved early detection of diseases such as blight and rust. AI algorithms (ResNet-50 and MobileNet-V2) trained on 5,000 labeled images produced up to 93.5% accuracy, outperforming manual inspection.

Table 1: Comparative Accuracy of Disease Detection Systems

Detection Method	Accuracy (%)
Manual Inspection	78.2
Cloud-based AI	88.5
Edge AI with 5G Support	93.5

Table 1 shows The progression from manual methods to cloud-based AI, and finally to edge-integrated AI with 5G support, demonstrates a clear incremental improvement in diagnostic accuracy. The edge AI model supported by 5G achieved a peak accuracy of 93.5%, surpassing manual inspection by 15.3% and cloud-based AI by 5%. These results align with the findings of Singh et al. (2021), who highlighted the role of real-time edge inference and high-speed data transfer in improving the precision of field-based disease identification. Manual inspection, though still widely practiced, was found to be the least accurate (78.2%). This can be attributed to human error, inconsistent visual assessment, and delayed diagnosis, especially in large-scale farming environments. As noted by Kumar et al. (2020), human-led disease detection often struggles with early-stage symptoms that lack distinct visual markers. Cloud-based AI systems improved accuracy to 88.5% by leveraging deep learning models trained on large image datasets. However, their reliance on stable internet connectivity and the latency involved in uploading and processing high-resolution data often limits real-time responsiveness (Zhou et al., 2022). Additionally, privacy concerns and bandwidth limitations in rural areas can further constrain cloud-based models. The highest accuracy (93.5%) was achieved by combining Edge AI with 5G communication networks, which enabled localized data processing and real-time inference. The edge nodes were capable of performing convolutional neural network (CNN) analysis on-device, reducing the latency and eliminating the need to transfer data to the cloud. As emphasized by Chen et al. (2023), edge-AI architectures enhance model performance by delivering faster decisions and adaptive learning in the field, especially when paired with the ultra-low latency of 5G. This improvement is particularly vital for detecting rapidly spreading crop diseases where early and accurate detection can significantly minimize crop loss and pesticide misuse.

3.2 Latency in Sensor Data Transmission

Edge computing reduced latency significantly compared to cloud-based processing. This allowed faster response to changing field conditions.

Table 2: Average Latency in Milliseconds (ms)

Activity	Cloud-Based System	Edge + 5G System
Moisture Reading Transmission	620 ms	145 ms
Pest Detection Image Upload	890 ms	160 ms
Irrigation Command Execution	700 ms	130 ms
Fertilizer Alert Notification	730 ms	150 ms

Across all measured activities, the 5G + Edge Computing system consistently achieved more than 75% reduction in latency when compared to traditional cloud-based architectures. This validates the hypothesis that localized data processing in edge nodes—when combined with ultra-low latency 5G communication—can significantly enhance the responsiveness of precision agriculture systems (Chaudhary et al., 2021; Saleem et al., 2022). Moisture Reading Transmission: Reduced from 620 ms to 145 ms—a 76.6% decrease. This is critical for real-time soil condition monitoring where timely irrigation depends on up-to-date soil moisture data. Pest Detection Image Upload: The most latency-prone activity in cloud setups (890 ms) saw an 82% drop to 160 ms. The reduction here is crucial for near-instant pest alerts, allowing timely intervention (Yadav et al., 2023). Irrigation Command Execution: Improved from 700 ms to 130 ms, translating to a 81.4% improvement. This responsiveness directly affects water use efficiency, especially in arid zones. Fertilizer Alert Notification: Achieved a latency drop from 730 ms to 150 ms. Prompt fertilizer application ensures nutrients are delivered at optimal times during crop growth phases (Ghosh et al., 2022). Reducing latency in agricultural IoT networks is critical to transitioning from monitoring-based systems to real-time decision-making platforms. Edge and 5G technologies together shift data processing closer to the field, enabling autonomous or semi-autonomous responses to environmental triggers. This matches the findings of Wang et al. (2020), who argue that real-time responsiveness is essential for adaptive farm operations and improving yields under unpredictable climate conditions.

3.3 Soil Moisture Monitoring Accuracy

The edge-enabled sensors aligned closely with ground truth values obtained via gravimetric analysis, improving real-time irrigation efficiency.

Table 3: Soil Moisture Monitoring Accuracy Comparison

Measurement Type	Ground Truth (%)	Traditional Sensor (%)	5G + Edge Sensor (%)
Sample A (Field 1)	25.0	22.6	24.7
Sample B (Field 2)	33.4	30.9	33.2
Sample C (Field 3)	45.1	41.0	44.6
Sample D (Field 4)	39.7	36.8	39.5
Average Deviation (%)	-	8.26	1.19

The results in Table 3 highlight a notable improvement in soil moisture monitoring accuracy when using 5G-connected edge-computing sensors. Compared to traditional sensor networks that rely on centralized cloud processing, the 5G + Edge system achieved a significantly lower average deviation from the ground truth (1.19%), whereas the traditional system showed a deviation of 8.26%. This aligns with existing literature that underscores the impact of real-time, localized data processing on sensor fidelity (Kamble et al., 2021; Li et al., 2022). Sample A (Field 1): Traditional deviation was 2.4%, whereas edge-based was just 0.3%.

Sample C (Field 3), which had the highest moisture level, further revealed the edge model's strength in accurately capturing extreme values—a capability highlighted in prior sensor calibration studies (Rahimi et al., 2023). Beyond accuracy, power efficiency was evaluated. The average sensor power usage dropped from 7.8W (cloud-based) to 6.1W (edge-based)—a 22% reduction. This is especially important for agricultural IoT networks where energy autonomy is critical (Singh et al., 2022). The lower energy demand stems from minimal backhaul communication and on-device processing, which significantly extends the operating life of sensor units. This dual advantage of higher data precision and energy efficiency reinforces the case for 5G-enabled edge systems as sustainable solutions for smart agriculture. As predicted by Wang et al. (2020), such edge-intelligent frameworks reduce latency, improve decision timeliness, and ensure reliable operations in remote and power-constrained environments.

3.4 Crop Disease Outbreak Prediction Time

Real-time analytics via edge computing reduced prediction time for disease outbreaks, allowing preemptive action.

Table 4: Time to Predict Disease Outbreak (in Hours)

Field ID	Traditional Method	5G + Edge Computing	Time Saved (%)
Field A	4.2	1.5	64.3
Field B	3.7	1.3	64.9
Field C	4.9	1.7	65.3
Field D	5.1	1.9	62.7
Average	4.475	1.6	64.3

Table 4 demonstrates the performance advantage of using 5G-enabled edge computing over traditional cloud-based systems for predicting crop disease outbreaks in precision agriculture. For instance, across all four fields, the average prediction time with traditional systems was 4.475 hours, whereas the 5G + Edge Computing system brought it down to 1.6 hours, resulting in a 64.3% improvement in response time. This reduction aligns with previous studies emphasizing the low-latency benefits of edge computing in real-time agricultural monitoring (Zhang et al., 2021; Koundal et al., 2022). Field C achieved the highest time savings (65.3%), which corroborates with findings by Sharma et al. (2020) that edge computing is especially effective for large-area farms where fast disease localization is vital. In Field D, even with the longest baseline prediction time (5.1 hours), the system still recorded a 62.7% improvement, affirming the robustness of edge frameworks under various environmental and operational conditions (Kumar & Singh, 2022). Real-time detection is crucial for minimizing crop damage and ensuring quick intervention measures such as fungicide application or quarantine. Research has shown that even a delay of a few hours can significantly increase disease spread, leading to economic losses (Chen et al., 2021). Thus, the integration of 5G with edge analytics not only improves technical performance but also enhances agronomic outcomes (Ali et al., 2023).

3.5 Farmer Decision Support System (DSS) Response Time

Farmers received timely alerts and recommendations through the enhanced system, promoting smarter and faster decisions.

Table 5: DSS Response Time (Milliseconds)

Activity Type	Traditional DSS	Edge-Based DSS	Speed Improvement (%)
Irrigation Alert	610	125	79.5
Fertilizer Recommendation	720	160	77.8
Pest Control Notification	655	140	78.6
Crop Harvest Forecast	700	155	77.8
Average	671.25	145	78.4

Table 5 shows the irrigation alert system, the edge-based DSS exhibited an impressive speed improvement of 79.5%, with a response time of 125 milliseconds, compared to the 610 milliseconds of the traditional system. The reduction in response time can be attributed to the edge processing, which enables immediate, localized decision-making based on real-time soil moisture data from sensors. In contrast, traditional systems rely on cloud processing, which introduces latency due to the data transfer time between the field sensors and the central server. The response time for fertilizer recommendations decreased by 77.8% from 720 milliseconds in the traditional system to 160 milliseconds in the edge-based DSS. The speed improvement is due to the processing of soil and crop data locally at the edge, which eliminates the delays associated with cloud-based data aggregation. This allows for quicker, context-specific fertilizer recommendations, ensuring that crops receive optimal nutrients at the right time, which is crucial for maximizing growth and yield. Pest control notifications saw a 78.6% improvement, with the edge-based system achieving a response time of 140 milliseconds compared to the traditional system's 655 milliseconds. Early pest detection and swift pest control recommendations are crucial for preventing significant crop damage. The faster processing at the edge enables farmers to receive timely notifications, allowing them to take immediate actions to mitigate pest infestations. The crop harvest forecast system also experienced a 77.8% improvement, with the edge-based system achieving 155 milliseconds compared to the traditional 700 milliseconds. Forecasting crop harvest times accurately can help farmers plan their labor, equipment, and market strategies efficiently. The reduced latency in the edge-based system ensures that the forecasts are provided promptly, enhancing decision-making processes. On average, the edge-based DSS provided a 78.4% speed improvement over the traditional system. This remarkable performance gain can be attributed to the distributed processing capabilities of edge computing, which processes data locally on the devices or nearby edge servers. By minimizing the data transmission to centralized cloud systems, the edge-based DSS ensures faster processing, leading to quicker response times and enabling real-time decision-making for agricultural activities. The data presented in Table 5 clearly illustrates the substantial advantages of edge-based decision support systems (DSS) over traditional cloud-based DSS in terms of response time. The significant reductions in latency for various agricultural activities—irrigation alerts, fertilizer recommendations, pest control notifications, and crop harvest forecasts—demonstrate the value of edge computing in facilitating timely and

efficient decision-making processes. The 78.4% average speed improvement reinforces the potential of edge-based systems to enhance agriculture's efficiency by providing real-time insights, thus supporting better resource management and overall crop production.

Table 6: Comparative Performance Metrics of Traditional vs. 5G + Edge Computing Systems

Metric	Traditional System	5G + Edge Computing System	% Improvement
Detection Accuracy (%)	79.3	93.5	+17.9%
Decision Latency (ms)	780	122	-84.4%
NDVI Monitoring Accuracy (%)	81.6	94.2	+15.4%
Crop Yield Prediction Accuracy (%)	76.4	90.1	+18.0%
Data Packet Loss (%)	8.7	1.5	-82.8%
System Uptime (%)	91.2	98.8	+8.3%

The 5G + Edge Computing system achieved a detection accuracy of 93.5%, significantly outperforming the traditional system's 79.3%. This 17.9% increase can be attributed to real-time AI-driven analysis on the edge nodes, which allowed faster and more context-aware processing of multispectral data. The use of CNN models on high-resolution NDVI imagery and sensor fusion further enhanced the reliability of disease, stress, and nutrient-deficiency detection. These results corroborate previous studies (Zhang et al., 2021) that demonstrate the efficacy of edge AI in precision agriculture environments. There was a dramatic 84.4% reduction in decision latency, with the 5G-edge system achieving an average latency of just 122 milliseconds compared to 780 milliseconds in traditional cloud systems. This improvement is critical in time-sensitive scenarios such as early pest infestation alerts or irrigation control, where delays could compromise crop health. The ultra-reliable low-latency communication (URLLC) enabled by 5G ensured that insights generated at the edge could be delivered nearly in real-time. The normalized difference vegetation index (NDVI) monitoring improved by 15.4%, from 81.6% to 94.2%. This was largely due to consistent calibration of imaging sensors and on-site processing that eliminated the latency-induced errors common in cloud-based systems. Improved NDVI accuracy contributed to better chlorophyll tracking, enabling more informed decisions on nutrient management. With an 18% boost in prediction accuracy, the proposed system accurately forecasted yields based on multisensor time-series data and machine learning models. Traditional systems, by contrast, often suffered from stale data and missed localized events due to delayed cloud processing. The yield prediction models integrated edge-processed environmental and soil parameters, enhancing forecast precision and

supporting better resource planning. The 5G-enabled system experienced only 1.5% data loss, compared to 8.7% in traditional setups—a remarkable 82.8% improvement. Packet loss in traditional systems was often due to unstable connectivity and bandwidth limitations of rural wireless networks. The improved reliability of 5G, along with MQTT-based optimized message handling, significantly reduced data transmission failures, ensuring complete and accurate datasets for analysis. The system uptime increased from 91.2% to 98.8%, reflecting a +8.3% improvement. This higher availability resulted from autonomous fault recovery protocols deployed at the edge and robust hardware integration. Unlike traditional systems dependent on a centralized server prone to outages or overload, the decentralized edge architecture provided localized continuity in data operations. The comparative metrics in Table 6 clearly demonstrate that the integration of 5G and edge computing into agricultural monitoring systems leads to significant performance improvements across all key areas: accuracy, latency, reliability, and system resilience. These enhancements directly support more responsive and efficient agricultural decision-making, aligning with the goals of sustainable precision farming and reinforcing the value of emerging ICT in smart agriculture.

4. Conclusion

This study demonstrated the transformative potential of integrating 5G and edge computing technologies for real-time soil and crop health monitoring in precision agriculture. Through empirical analysis, the deployment of edge-based AI models in conjunction with 5G communication networks resulted in significant improvements in system responsiveness, data processing accuracy, and agricultural decision-making efficiency.

Notably, the edge-AI system achieved a 93.5% disease detection accuracy, outperforming traditional cloud-based approaches and facilitating timely intervention against crop diseases. Furthermore, the substantial reduction in decision latency—from 627 ms to 146 ms—enabled near-instantaneous responses to field conditions, thus improving on-field reaction times by 76.3%. The integration of multi-sensor data streams further contributed to enhanced decision quality, with 17% improvement in fertilizer efficiency and 94.7% accuracy in nutrient deficiency classification.

These findings confirm the value of a 5G-enabled edge computing framework as a scalable, low-latency solution for agricultural environments, especially in rural or infrastructure-limited areas. As agriculture moves toward automation and data-driven precision, this architecture provides a sustainable and intelligent system that meets the pressing needs of food security, environmental stewardship, and technological accessibility.

Future work should explore the deployment of federated learning and decentralized AI techniques to enhance data privacy, scalability, and collaboration among stakeholders in the agricultural ecosystem.

Assistant Professor, School of Commerce, Vel Tech Rangarajan Dr. Sagunthala R&D Institute of Science and Technology, India

ABSTRACT

The agricultural sector is undergoing a significant transformation with the integration of emerging technologies like the Internet of Things (IoT) and Artificial Intelligence (AI), leading to the development of Smart Farming systems. Precision agriculture, powered by these technologies, enables real-time monitoring, data-driven decision-making, and automation of farming operations. This paper explores how IoT sensors, drones, and AI-based analytics contribute to optimizing irrigation, fertilization, pest control, and crop health monitoring. The implementation of smart farming not only improves resource efficiency and crop productivity but also addresses challenges such as labor shortages, climate variability, and environmental sustainability. Despite the promising benefits, barriers such as high costs, limited digital literacy, and infrastructure constraints in rural areas pose challenges to adoption. The study concludes that with supportive policy frameworks and technological inclusivity, IoT and AI-driven precision agriculture can revolutionize farming practices and ensure food security in a sustainable manner.

Keywords: Smart Farming, Internet of Things (IoT), Artificial Intelligence (AI), Precision Agriculture, Crop Monitoring, Sustainable Agriculture

Introduction

Agriculture, the backbone of many economies, is currently facing unprecedented challenges due to climate change, resource depletion, labor shortages, and increasing global food demand. To address these issues and improve productivity, the integration of modern technologies into agriculture commonly referred to as **Smart Farming** has become imperative. Smart farming leverages the **Internet of Things (IoT)** and **Artificial Intelligence (AI)** to facilitate **Precision Agriculture**, enabling farmers to make data-driven decisions that optimize input usage, reduce waste, and improve crop yields (Wolfert et al., 2017). **IoT-based technologies**, such as soil moisture sensors, weather stations, and GPS-enabled devices, provide real-time monitoring and data collection from farm environments. These sensors collect valuable information on soil health, crop conditions, humidity, and temperature, which can then be transmitted to central systems for analysis (Zhang et al., 2020). On the other hand, **AI algorithms** including machine learning and computer vision are used to analyze this data, generate actionable insights, and automate tasks such as irrigation scheduling, disease detection, and yield prediction (Kamilaris & Prenafeta-Boldú, 2018).

This convergence of IoT and AI technologies is revolutionizing the way agriculture is practiced, shifting from intuition-based methods to **data-driven precision farming**. Such an approach not only improves resource efficiency and sustainability but also addresses key challenges in food security and climate resilience (Jayaraman et al., 2016). Despite its potential, the adoption of smart farming remains limited in many regions due to factors such as high implementation costs, lack of infrastructure, and insufficient digital literacy among farmers. This paper aims to explore the applications, benefits, challenges, and future directions of smart farming using IoT and AI in the context of precision agriculture. It provides a comprehensive overview of how these technologies are transforming traditional farming practices into intelligent, sustainable, and efficient agricultural systems.

CONCEPT AND EVOLUTION OF SMART FARMING

Smart Farming is an advanced form of agriculture that integrates information and communication technologies (ICT), including the **Internet of Things (IoT)**, **Artificial Intelligence (AI)**, robotics, and data analytics to enhance the efficiency, productivity, and sustainability of farming operations. Unlike conventional farming, which relies heavily on human labor and intuition, smart farming systems operate on real-time data, sensor feedback, and automation to make precision-based agricultural decisions (Wolfert et al., 2017). The concept of smart farming emerged in the early 21st century with the rise of **Precision Agriculture (PA)**, which aimed at optimizing field-level management regarding crop farming. Precision agriculture laid the foundation by using GPS, GIS, and variable rate technology (VRT) to monitor and control field variability in crops (Zhang et al., 2002). With rapid advancements in sensor technologies, cloud computing, and AI, smart farming has evolved beyond field mapping and into an interconnected ecosystem where every aspect of the agricultural cycle is monitored and optimized.

IoT technologies in smart farming collect data on weather patterns, soil conditions, crop health, and equipment status through wireless sensor networks. This data is then processed using **AI and machine learning** algorithms to predict optimal planting times, identify pest outbreaks, and automate irrigation or fertilization processes (Liakos et al., 2018). Smart farming systems now also utilize drones, robotics, and satellite imaging to further enhance crop monitoring and yield estimation. Moreover, the evolution of smart farming has brought significant environmental and economic benefits. By minimizing the use of water, fertilizers, and pesticides, it promotes resource conservation and reduces the environmental footprint of agriculture (Kamilaris et al., 2017). At the same time, smart farming increases farm productivity, lowers labor costs, and enhances decision-making accuracy, which is especially critical for smallholder and commercial farmers alike.

ROLE OF IOT IN PRECISION AGRICULTURE

The **Internet of Things (IoT)** plays a pivotal role in enabling **Precision Agriculture (PA)** by transforming conventional farming practices into data-driven, automated systems. IoT comprises interconnected devices and sensors that collect, transmit, and analyze real-time data from the agricultural environment, which allows for accurate decision-making in farm management (Jayaraman et al., 2016). In the context of precision agriculture, IoT facilitates the monitoring of essential parameters such as **soil moisture**, **temperature**, **humidity**, **light intensity**, and **crop health**. For example, soil sensors help detect moisture levels, enabling automated irrigation systems to function based on crop needs, thereby conserving water and improving crop yield (Verdouw et al., 2016). Similarly, weather stations integrated with IoT devices provide accurate climatic data, allowing farmers to plan sowing, harvesting, and spraying schedules with greater precision.

IoT also enhances **livestock management** using wearable devices that monitor animal health, movement, and feeding patterns (Rose et al., 2018). **Drones and unmanned aerial vehicles (UAVs)**, equipped with IoT technologies, are employed to survey large farmlands and identify issues such as pest infestations, nutrient deficiencies, or irrigation anomalies, significantly reducing manual labor and time. Furthermore, cloud computing and mobile applications integrated with IoT devices help farmers remotely access and control farm operations, promoting **real-time responsiveness** and **resource optimization** (Zhang et al., 2020). These smart farming systems contribute to increasing productivity, ensuring sustainability, and minimizing environmental impacts. However, despite its transformative potential, the adoption of IoT in precision agriculture is hindered by challenges such as poor internet connectivity in rural areas, high implementation costs, and limited technical knowledge among farmers (Ayaz et al., 2019). Bridging these gaps through infrastructure development and farmer training is essential to realize the full potential of IoT in agriculture.

APPLICATIONS OF AI IN SMART FARMING

Artificial Intelligence (AI) is revolutionizing modern agriculture by enabling machines to simulate human intelligence in analyzing large-scale farm data, making autonomous decisions,

and optimizing agricultural practices. When integrated with smart farming technologies, AI enhances **productivity**, **efficiency**, and **sustainability** in various domains of agriculture.

1. Crop Monitoring and Disease Detection

AI-powered image recognition tools can detect diseases, pests, and nutrient deficiencies in crops using high-resolution drone or satellite imagery. Convolutional Neural Networks (CNNs) are widely used in diagnosing leaf diseases and recommending appropriate interventions (Kamilaris & Prenafeta-Boldú, 2018). This real-time detection reduces crop loss and ensures timely treatment.

2. Predictive Analytics for Crop Yield

AI algorithms analyze historical data and current weather, soil, and crop conditions to predict future yields. This helps farmers make informed decisions about planting schedules, irrigation needs, and harvest planning (Liakos et al., 2018). These predictions also assist in financial planning and risk management.

3. Automated Irrigation and Water Management

AI enables **smart irrigation systems** to decide the amount and timing of water delivery based on real-time data. Machine learning models optimize water usage by evaluating soil moisture, plant requirements, and weather forecasts, promoting **water conservation** (Shamshiri et al., 2018).

4. Autonomous Machinery and Robotics

AI-driven agricultural robots, such as autonomous tractors and harvesters, perform repetitive tasks like seeding, weeding, and harvesting with high precision. These robots improve labor efficiency and reduce operational costs, especially in large-scale commercial farming (Bechar & Vigneault, 2017).

5. Supply Chain Optimization

AI tools analyze demand trends and logistic parameters to optimize the **agricultural supply chain**, reducing post-harvest losses and ensuring timely delivery. Intelligent systems also help in price forecasting, market demand analysis, and inventory management.

6. Climate and Weather Forecasting

AI models process vast datasets from meteorological departments to predict weather patterns and climate risks. This supports farmers in minimizing crop damage due to extreme conditions like floods or droughts (Tzounis et al., 2017).

INTEGRATION OF IOT AND AI: A SYNERGISTIC APPROACH

The integration of **Internet of Things (IoT)** and **Artificial Intelligence (AI)** in agriculture represents a transformative shift toward fully **automated**, **intelligent**, and **data-driven** farming

practices. This synergy amplifies the strengths of both technologies, creating a more precise and responsive agricultural ecosystem.

1. Data Collection and Intelligent Processing

IoT devices such as soil sensors, drones, weather stations, and GPS trackers generate massive amounts of real-time data from the field. However, this raw data becomes actionable only when processed. AI techniques, particularly machine learning and deep learning, analyze this data to extract insights, forecast trends, and make predictive decisions (Wolfert et al., 2017).

2. Real-time Decision Making

AI algorithms empower IoT systems to make **autonomous, real-time decisions** such as activating irrigation systems, adjusting nutrient supply, or signaling pest outbreaks. This **closed-loop automation** minimizes human intervention and increases efficiency (Zhao et al., 2021).

3. Smart Farm Management Systems

The integration of IoT and AI enables the development of **smart farm management platforms** that offer dashboards and mobile apps where farmers can monitor operations, receive alerts, and manage resources efficiently. These platforms also support long-term planning by analyzing historical trends (Kamilaris et al., 2016).

4. Predictive Maintenance and Resource Optimization

AI enhances the reliability of IoT-enabled machinery by predicting equipment failures through sensor data analysis, allowing timely maintenance and reducing downtime. It also helps optimize resources like water, fertilizers, and pesticides, reducing costs and environmental impact (Khanna & Kaur, 2019).

5. Climate-Smart and Resilient Agriculture

Through the integration of climate data from IoT sensors and AI's predictive modeling, farmers can build resilience to climate variability. This approach supports sustainable decision-making and reduces risks associated with extreme weather events (Jayalaxmi & Prathibha, 2020).

BENEFITS OF SMART FARMING TECHNOLOGIES

Smart farming, enabled through the integration of **IoT, AI, Big Data, and automation**, offers significant benefits that revolutionize traditional agricultural practices. These technologies aim to optimize inputs, maximize outputs, and improve sustainability and efficiency across the entire agricultural value chain.

1. Enhanced Crop Yields and Productivity

Smart farming technologies help monitor soil health, water availability, and crop conditions in real-time, enabling data-driven decisions. This ensures optimal crop growth and significantly improves **yields and productivity** (Liakos et al., 2018).

2. Efficient Resource Utilization

Precision agriculture enables **site-specific farming**, reducing the overuse of water, fertilizers, and pesticides. Automated irrigation systems based on IoT and AI lead to water savings and more efficient energy use (Zhang et al., 2019).

3. Reduction of Environmental Impact

By optimizing input use and reducing chemical runoff, smart farming reduces the **ecological footprint** of agriculture. AI models help in minimizing waste and promoting **sustainable land use** (Kamilaris & Prenafeta-Boldú, 2018).

4. Improved Risk Management

AI-based predictive analytics help farmers anticipate **weather extremes**, **pest outbreaks**, and **market fluctuations**, enabling better planning and reducing financial risk (Wolfert et al., 2017).

5. Cost Reduction and Labor Efficiency

Autonomous tractors, drones, and smart robots reduce the dependency on manual labor and lower operational costs. These machines can work continuously and perform tasks with high precision (Bechar & Vigneault, 2017).

6. Real-Time Monitoring and Decision-Making

Smart devices allow **24/7 monitoring** of crops, livestock, and environmental conditions. This helps farmers respond instantly to any issue, increasing responsiveness and control over farm operations (Jayaraman et al., 2016).

7. Data-Driven Farm Management

Centralized dashboards powered by AI and IoT provide farmers with historical and real-time data insights for **strategic planning, yield forecasting**, and **inventory management** (Wolfert et al., 2017).

CHALLENGES AND BARRIERS TO ADOPTION OF SMART FARMING TECHNOLOGIES

While smart farming technologies hold immense potential to transform agriculture, their **widespread adoption** is hindered by various **technical, economic, social, and infrastructural challenges**. Understanding these barriers is essential for developing inclusive and sustainable solutions.

1. High Initial Investment Costs

The cost of purchasing and maintaining smart devices such as sensors, drones, and AI-enabled platforms is high, especially for smallholder and marginal farmers. The lack of **financial assistance or subsidies** further impedes adoption (Rose et al., 2016).

2. Limited Technical Skills and Awareness

Many farmers, particularly in developing regions, lack the **digital literacy** or technical knowledge required to operate IoT and AI systems. This knowledge gap limits effective utilization (Klerkx et al., 2019).

3. Inadequate Infrastructure and Connectivity

Reliable **internet access, electricity, and mobile networks** are fundamental for smart farming. Poor rural infrastructure restricts the use of connected technologies in remote areas (Tsouros et al., 2019).

4. Data Privacy and Security Concerns

As farms become digitized, data security becomes critical. Farmers are often concerned about **data ownership**, misuse, and **privacy breaches**, especially when third-party service providers are involved (Carbonell, 2016).

5. Fragmented Technology Ecosystem

There is a lack of **standardization** and interoperability among devices and platforms, making it difficult for farmers to integrate multiple systems seamlessly. This creates confusion and reduces efficiency (Walter et al., 2017).

6. Resistance to Change and Trust Issues

Traditional farmers may show **reluctance to adopt new practices**, fearing disruption or being skeptical of the actual benefits. Building trust in technology takes time and requires demonstrable success stories (Eastwood et al., 2019).

7. Policy and Regulatory Gaps

The absence of strong policies that promote **smart agriculture**, offer subsidies, or regulate data sharing hinders scaling. Government support and extension services are often insufficient (Wolfert et al., 2017).

CASE STUDIES AND REAL-WORLD IMPLEMENTATIONS

The practical implementation of smart farming technologies across various regions showcases their transformative potential. These case studies highlight how the integration of IoT and AI has enabled data-driven, sustainable, and efficient agricultural practices.

1. John Deere: AI-Powered Autonomous Tractors (USA)

John Deere has integrated AI, computer vision, and machine learning into its tractors and farm equipment. Their autonomous tractors use real-time data and GPS to optimize seeding, spraying, and harvesting, reducing input waste and increasing yield efficiency (John Deere, 2021).

2. e-Plantation: Tea Estate Monitoring in India

In Kerala, India, the e-Plantation platform uses IoT-based soil sensors and weather stations to assist tea plantation managers. These tools help monitor microclimatic conditions, soil pH, and humidity, allowing precision irrigation and timely disease control (Thomas & Sebastian, 2020).

3. Smart Farm Net: Precision Agriculture in Germany

Germany's Smart Farm Net project integrates data from IoT sensors, drones, and satellite images for crop monitoring. Farmers use cloud-based dashboards to receive insights on irrigation schedules, fertilizer needs, and pest management (Bernet et al., 2019).

4. Crop In: Digital Farm Management in Africa and Asia

CropIn is a cloud-based farm management platform adopted in Kenya, India, and the Philippines. It employs AI and IoT to help farmers track crop health, predict yields, and access market prices, improving income and productivity (CropIn, 2022).

5. Climate Field View: Big Data in Precision Farming (Brazil)

Climate FieldView, used widely in Brazil, collects data from satellites, tractors, and IoT sensors to provide insights on seed performance, soil fertility, and weather patterns. It helps in data-driven decision-making and resource allocation (Climate Corporation, 2020).

Key Learnings from Case Studies

- **Scalability** is possible when farmers receive training and financial support.
- **Localization of technology** (e.g., adjusting sensors to local crops and conditions) is essential for success.
- **Collaborations** among tech firms, governments, and agricultural communities are crucial to adoption and sustainability.

POLICY SUPPORT AND FUTURE PROSPECTS

The successful implementation and scaling of smart farming technologies largely depend on supportive policy frameworks, public-private partnerships, and long-term planning. Governments, research institutions, and agri-tech firms must collaborate to bridge technological gaps, promote innovation, and ensure inclusivity in agriculture.

1. Government Policy Initiatives

Many governments have initiated schemes to promote precision agriculture. For instance:

- **India's Digital Agriculture Mission (2021–2025)** aims to encourage data-driven farming through AI, drones, and blockchain (Ministry of Agriculture & Farmers Welfare, 2021).
- The **European Union's Common Agricultural Policy (CAP)** includes funding mechanisms for digital innovation in rural areas (European Commission, 2020).
- **The U.S. Farm Bill** incorporates provisions for broadband expansion and smart farming research grants (USDA, 2020).

Such policies play a crucial role in enabling farmers to adopt advanced technologies by offering **subsidies**, training, and infrastructure development.

2. Need for Interoperability and Data Governance

To foster trust and wider adoption, clear policies are needed regarding:

- **Data ownership and security**
- **Interoperability standards** for smart devices
- **Ethical AI use** in decision-making (Wolfert et al., 2017)

Governments should mandate **open data platforms** while ensuring farmers' rights over the data generated on their lands.

3. Prospects

- **AI-Enabled Decision Support Systems** will become more predictive, offering real-time crop health analytics, yield forecasting, and market insights.
- **Climate-Resilient Farming** can be enabled using predictive weather modeling and smart irrigation tools.
- **Smallholder Inclusion** through low-cost sensor kits and mobile-based platforms will democratize technology access.
- **Carbon Credit Markets** may evolve where smart farming data can verify sustainable practices and generate income for farmers (Shirsat et al., 2021).
-

Recommendations

1. **Strengthen digital infrastructure** in rural areas.
2. **Provide training and capacity-building** for farmers and extension officers.
3. **Encourage public-private partnerships** for scalable innovations.
4. **Create inclusive financing models**, especially for small and marginal farmers.
5. **Develop regulatory frameworks** that protect farmer data and ensure ethical AI usage.

CONCLUSION

The integration of IoT and AI in precision agriculture marks a paradigm shift in how farming is practiced and managed. By enabling real-time data collection, predictive analytics, and automated decision-making, these technologies have the potential to significantly increase crop yields, optimize resource usage, and promote environmental sustainability. Smart farming not only empowers farmers to make informed decisions but also contributes to global food security by addressing inefficiencies and reducing waste across the agricultural value chain. However, the widespread adoption of these technologies still faces challenges such as high initial investment, lack of digital infrastructure in rural areas, data privacy concerns, and the digital

divide between large and small-scale farmers. To overcome these hurdles, comprehensive policy support, targeted training programs, inclusive financing models, and strong public-private collaborations are essential. Looking ahead, the future of agriculture will likely be shaped by further advancements in A IoT, edge computing, drone technology, and 5G connectivity. With the right ecosystem in place, smart farming can evolve into a cornerstone of sustainable agriculture meeting the growing global demand for food while safeguarding our planet's resources.

ABSTRACT

The adoption of sustainable agricultural practices is critical to ensuring long-term food security, particularly in the face of global challenges such as climate change, soil degradation, and water scarcity. This study examines the role of environmentally friendly farming methods including organic farming, crop rotation, agroforestry, integrated pest management, and water conservation techniques in enhancing agricultural productivity while preserving natural resources. The research evaluates how these practices contribute to the three key pillars of food security: availability, accessibility, and stability. Drawing on both primary data from farmers in diverse agro-climatic regions and secondary data from governmental and international reports, the study reveals that sustainable agriculture significantly improves soil health, increases crop resilience, and reduces dependency on chemical inputs. However, barriers such as high initial investment costs, lack of technical knowledge, and limited market access hinder widespread adoption. The paper concludes by recommending policy interventions, farmer training programs, and financial incentives to promote sustainable farming and thereby strengthen food security at the community and national levels.

Keywords: Sustainable Agriculture, Food Security, Organic Farming, Climate-Resilient Crops, Agroecology, Soil Health, Water Conservation.

INTRODUCTION

Agriculture remains the backbone of many developing economies, providing livelihoods for billions and ensuring food availability for growing populations. However, traditional farming methods, which often rely heavily on chemical inputs and monoculture practices, have led to significant environmental degradation, including soil erosion, loss of biodiversity, and water scarcity (FAO, 2017). These challenges are compounded by the impacts of climate change, which threatens agricultural productivity and, in turn, food security across the globe (IPCC, 2021). Sustainable agriculture emerges as a vital solution to these issues. It encompasses a range of environmentally responsible practices such as crop rotation, organic farming, agroforestry, integrated pest management, and conservation tillage. These practices aim to maintain or improve productivity while preserving the natural resource base and reducing environmental harm (Pretty et al., 2018). Importantly, sustainable agriculture contributes directly to food security by enhancing crop resilience, improving soil health, and reducing input costs for farmers (Altieri et al., 2015).

Food security is defined by the Food and Agriculture Organization (FAO) as a condition in which all people, always, have physical, social, and economic access to sufficient, safe, and nutritious food (FAO, 2009). Achieving food security is not only about increasing food production but also about ensuring that production methods are sustainable in the long term. Therefore, understanding the relationship between the adoption of sustainable agricultural practices and their impact on food security is crucial for policymakers, researchers, and farmers alike.

This study seeks to explore how the adoption of sustainable agricultural practices influences various dimensions of food security namely, food availability, accessibility, and stability by examining both empirical evidence and real-world practices. It also identifies barriers to adoption and provides policy recommendations to enhance the scalability of sustainable farming systems.

LITERATURE REVIEW

Sustainable agriculture has been widely acknowledged as a fundamental approach to address environmental challenges while ensuring long-term food security. Numerous studies have explored its principles, adoption patterns, and the resulting socio-economic and ecological impacts.

1. **Pretty (2008)** emphasized that sustainable agricultural practices not only preserve the environment but also enhance productivity by improving soil structure, increasing biodiversity, and minimizing the use of synthetic inputs. The study highlights that such practices can contribute significantly to food security by ensuring yield stability under variable climatic conditions.
2. **Altieri et al. (2015)** argue that agroecological methods such as intercropping, agroforestry, and biological pest control can increase farm resilience to climate shocks and support local food systems. These methods play a vital role in promoting both ecological balance and socio-economic sustainability.

3. **Lal (2009)** discussed the importance of soil health in sustainable agriculture, noting that improved soil organic carbon through practices like conservation tillage and cover cropping directly correlates with higher productivity and improved food security.
4. **Pretty et al. (2011)** conducted a meta-analysis of 286 sustainable agriculture projects across 57 countries, finding an average yield increase of 79% through sustainable practices. This underscores the transformative potential of such practices on global food systems.
5. **Rockström et al. (2017)** presented the concept of "planetary boundaries," highlighting agriculture's significant impact on water, land, and climate systems. The study supports a shift to sustainable intensification to meet growing food demands without exceeding ecological limits.
6. **Tittonell (2014)** stressed the need for context-specific sustainable practices, especially in smallholder farming systems, where socio-economic and agroecological conditions vary widely. Tailoring sustainable interventions can significantly improve adoption rates and outcomes.
7. **Snapp & Pound (2017)** emphasized the role of farmer-led innovations in the diffusion of sustainable practices. Their research shows that participatory approaches enhance trust and relevance, leading to better adoption and food outcomes.
8. **FAO (2017)** outlined various sustainable agricultural practices and their contributions to the four dimensions of food security—availability, access, utilization, and stability. The report also identified major constraints, including lack of education, access to finance, and market infrastructure.
9. **Pretty & Bharucha (2014)** illustrated the economic benefits of sustainable practices, showing that lower input costs and higher output stability contribute to farmer income and food affordability.
10. **Pingali (2012)** critiqued conventional intensification for degrading natural resources and advocated for sustainable intensification as a viable strategy to increase productivity without harming ecosystems, thereby ensuring long-term food security.

These studies collectively affirm that sustainable agriculture is not merely an environmental concern but a multi-dimensional strategy that influences food production, ecological conservation, and rural livelihoods. However, successful adoption depends on several factors, including policy support, access to technology, farmer education, and market incentives.

CONCEPTUAL UNDERSTANDING OF SUSTAINABLE AGRICULTURE

Sustainable agriculture refers to the practice of farming that meets current food needs without compromising the ability of future generations to meet their own. It is a system-based approach that integrates environmental health, economic profitability, and social equity into agricultural production (FAO, 2014). The core idea is to maintain or enhance productivity while conserving natural resources and minimizing negative environmental impacts.

At its foundation, sustainable agriculture is built upon three pillars: **environmental sustainability**, **economic viability**, and **social responsibility** (Pretty, 2008). This holistic framework seeks to ensure that agricultural practices are not only efficient but also regenerative and inclusive. The environmental dimension focuses on preserving biodiversity, maintaining soil fertility, and ensuring water use efficiency. Economically, it involves reducing dependency on costly chemical inputs while enhancing farmers' incomes. Socially, it promotes fair labor conditions, rural development, and food justice (Altieri, 1995).

Key **sustainable agricultural practices** include:

- **Crop rotation and diversification** to enhance soil fertility and reduce pest cycles (Snapp & Pound, 2017);
- **Organic farming** which avoids synthetic chemicals, promoting healthier ecosystems (IFOAM, 2020);
- **Agroforestry**, which integrates trees and shrubs into farming systems for increased resilience (Garrity, 2004);
- **Conservation tillage**, reducing soil disturbance and erosion (Lal, 2009);
- **Integrated Pest Management (IPM)**, using biological and mechanical control methods to manage pests sustainably (Kogan, 1998).

These practices have shown considerable promise in improving yields, enhancing ecosystem services, and strengthening food security. For example, et al. (2011) reported that the adoption of sustainable agricultural innovations in 57 developing countries led to a 79% average increase in crop productivity, highlighting the tangible benefits of such approaches.

Furthermore, sustainable agriculture is closely aligned with several **United Nations Sustainable Development Goals (SDGs)**, including Zero Hunger (SDG 2), Clean Water and Sanitation (SDG 6), Responsible Consumption and Production (SDG 12), and Climate Action (SDG 13) (UN, 2015). In sum, sustainable agriculture represents a shift from input-intensive to knowledge-intensive farming systems that balance productivity with ecological and social considerations. Its adoption is central to addressing the dual challenges of food insecurity and environmental degradation in a rapidly changing world.

Food Security: Dimensions and Challenges

Food security exists when **all people, always, have physical, social, and economic access to sufficient, safe, and nutritious food** that meets their dietary needs and food preferences for an active and healthy life (FAO, 2006). It is a multifaceted concept that extends beyond mere food availability and encompasses several interconnected dimensions.

1. Dimensions of Food Security

According to the Food and Agriculture Organization (FAO), food security comprises **four key dimensions**:

1. **Food Availability:** Ensuring enough food are consistently available through domestic production, imports, and food aid (Godfray et al., 2010).
2. **Food Access** People must have adequate resources to acquire appropriate foods for a nutritious diet. This includes income levels, market prices, and social entitlements (Barrett, 2010).
3. **Food Utilization:** The body's ability to ingest and metabolize food, influenced by nutritional knowledge, dietary diversity, sanitation, and health care (Pinstrup-Andersen, 2009).
4. **Stability:** The ability to access and utilize food over time, which can be affected by economic crises, climate change, or political instability (Timmer, 2000).

These dimensions highlight that food security is not just a matter of supply, but also of equitable distribution, affordability, and usage.

2. Challenges to Achieving Food Security

Despite global efforts, several challenges persist in ensuring food security:

- **Climate Change**: Unpredictable weather patterns, prolonged droughts, floods, and rising temperatures reduce crop yields and affect livestock productivity (Lobell et al., 2008).
- **Land Degradation and Soil Erosion**: Unsustainable farming practices deplete soil nutrients and reduce agricultural productivity (Lal, 2001).
- **Population Growth**: Increasing global population pressures land and food systems, particularly in developing countries where food production struggles to keep pace (United Nations, 2019).
- **Poverty and Inequality**: Limited access to resources and income inequality are major barriers to food access in low-income communities (De Schutter, 2013).
- **Global Conflicts and Displacement**: Armed conflicts and political unrest disrupt food production, distribution, and access, often leading to famine conditions (Maxwell & Fitzpatrick, 2012).
- **Post-Harvest Losses**: Poor storage facilities, inadequate transportation, and lack of infrastructure result in significant food waste in developing countries (Kader, 2005).

These challenges underline the importance of adopting sustainable agricultural practices, enhancing rural development, and ensuring inclusive economic policies to improve food security worldwide.

POLICY IMPLICATIONS AND RECOMMENDATIONS

The integration of sustainable agricultural practices (SAPs) into national and regional food systems holds significant potential to enhance food security, environmental health, and rural livelihoods. However, realizing these benefits requires well-aligned and proactive policy

frameworks that address the barriers to adoption and support farmers throughout the transition process.

1. Strengthening Agricultural Extension Services

A key policy implication is the need to **strengthen agricultural extension systems** to facilitate the dissemination of knowledge about sustainable farming techniques. Farmers often lack access to technical expertise on agroecology, conservation agriculture, and organic farming (Anderson & Feder, 2007). Policies should invest in training programs and develop community-based extension models that empower local farmers and women with tailored, context-specific solutions (Davis et al., 2010).

2. Financial Incentives and Subsidy Reforms

Governments must **restructure agricultural subsidies** to support environmentally friendly practices. Currently, many subsidy schemes promote the excessive use of chemical fertilizers and monocultures (OECD, 2021). Redirecting these resources toward **green subsidies**, low-interest loans for sustainable inputs, and rewards for ecosystem services would encourage wider adoption of SAPs (FAO, 2018).

3. Enhancing Access to Markets and Infrastructure

To ensure economic viability, sustainable farmers need improved access to **markets, infrastructure, and fair pricing mechanisms**. Investment in rural roads, storage facilities, and cold chains can reduce post-harvest losses and improve profitability (Barrett, 2008). Certification schemes (e.g., organic, or fair trade) and digital platforms can also connect smallholders to premium markets.

4. Climate-Smart Agriculture Policies

The growing threats of climate change necessitate the integration of **climate-smart agriculture (CSA)** into national strategies. CSA combines sustainable practices with resilience-building and mitigation techniques (World Bank, 2016). Policymakers should promote climate risk insurance, weather advisory systems, and drought-resistant seed varieties.

5. Inclusive Land and Resource Governance

Secure land tenure and equitable access to resources like water and credit are vital for sustainable agricultural transformation. Policies must address the **land rights of women, indigenous people, and marginal farmers** to enhance participation and productivity (Meinzen-Dick et al., 2009).

6. Data-Driven Decision Making and Monitoring

The establishment of **data collection and monitoring frameworks** is critical for tracking progress in SAP adoption and food security outcomes. Real-time data on soil health, crop yields, and food prices can inform evidence-based policymaking (UNEP, 2016).

Recommendations

- **Develop participatory policy frameworks** involving farmers, researchers, civil society, and the private sector.
- **Subsidize sustainable inputs** such as compost, bio-fertilizers, and precision irrigation technologies.
- **Promote public-private partnerships (PPPs)** for innovation, research, and market linkages.
- **Integrate SAPs into school curriculums** and community education to build awareness and youth involvement.
- **Incentivize local governments** to implement decentralized and adaptive agricultural policies aligned with regional needs.

CONCLUSION

The adoption of Sustainable Agricultural Practices (SAPs) represents a vital pathway toward achieving long-term food security in an era marked by climate change, population growth, and resource scarcity. This research underscores the multifaceted benefits of SAPs not only in enhancing agricultural productivity and environmental sustainability but also in securing equitable access to food, especially for vulnerable populations. While the positive impacts of SAPs on food availability, access, utilization, and stability are evident, their widespread adoption remains challenged by factors such as limited awareness, inadequate infrastructure, and weak institutional support. Addressing these barriers requires a coherent policy framework that integrates environmental goals with socio-economic development, supported by strong agricultural extension systems, inclusive governance, and climate-resilient strategies. Ultimately, food security cannot be achieved in isolation from sustainability. As such, empowering farmers especially smallholders and women with the tools, knowledge, and resources to practice sustainable agriculture is critical. This research reaffirms the urgent need for a holistic and inclusive approach to agricultural development that aligns with national food security goals and the United Nations Sustainable Development Goals (SDGs).

ABSTRACT

The integration of Artificial intelligence in education has transformed assessment methodologies, particularly in higher institutions. This study analyzes students' performance in continuous assessment through the application of AI-driven tools in Rivers State.The study adopted quasi-experimental research design the research compares students assessed through AI-based systems with those evaluated using traditional methods. The study was guided by two research questions and two hypotheses.The population included 1260 lecturers in Higher institutions in Rivers State Universities. The sample for this study consisted of 120 (60 male and 60 female) educators from Rivers State Universities using a stratified random sampling technique. The researcher developed and utilized the Artificial Intelligence Driven-Tools (AIDT) for data collection, validated using measurement and evaluation experts. A reliability coefficient of 0.88 was obtained for the AIDT using the Kuder-Richarson 21 method. Research questions were answered using mean and standard deviation, while hypotheses were tested using a t-test and two-way ANOVA at a 0.05 level of significance. The findings revealed that AI -driven continuous assessment significantly improves student engagement,provides timely and personalized feedback,and enhances academic performance. The study recommended that higher institutions should integrate AI-driven assessment tools into their learning management systems to enhance continuous assessment.

Keywords: Artificial Intelligence,Continuous Assessment,Student Performance,AI-driven Assessment

Introduction

Artificial intelligence (AI) is increasingly being integrated into higher education to enhance the assessment and evaluation of student performance. Artificial intelligence (AI) applications in education are on the rise and have received a lot of attention in the last couple of years.AI and adaptive learning technologies are prominently featured as important development in educational technology in the 2018 Horizon report (Educause in Zawacki-Richter,Martin ,Bond & Gouverneur,2019).

Analyzing students performance using AI -driven tools involves leveraging machine learning algorithms,natural language processing, and automation to assess learning trends,predict outcomes ,and provide actionable insights.AI- driven analysis begins with data collection and processing,AI -Powered Analytics Tools,AI for personalized learning and feedback,visualization and reporting,automated grading and assessment (Baker,2019).

Furthermore, the U.S. Department of Education's report on AI and the future of teaching emphasizes the importance of integrating AI in educational assessments. The report highlights the need for ethical guidelines and frameworks to ensure that AI applications in education are equitable and effective, advocating for a "human in the loop" approach to maintain the essential role of educators in the assessment process.

AI -driven virtual assistants is an artificial intelligence -powered software that performs tasks,provides information ,and interacts with users through natural language processing (NLP) and machine learning (ML).These assistants are designed to automate responses,manage tasks ,and assist users in various domains,such as education,healthcare,business ,and customer service. According to Hoy (2018),AI -driven virtual assistants are software -based agents that can process and interpret user commands,execute automated actions,and deliver personalized responses using machine learning and natural language understanding.Examples google assistants,amazon alexa and sire (Apple).

Adamopoulou & Moussiades (2020) opines that AI-driven chatbots are intelligent software systems capable of interacting with users in natural language ,utilizing A techniques to enhance user engagement and service automation.Examples chatGPT (open AI), Duolingo chatbot and woebot.It is also a conversational program that interacts with users through text or voice,simulating human-like conversations.These chatbots use NLP,deep learning,and data analytic to provide instant responses,automate customer service,and assist in learning environments.

AI -driven virtual assistants and chatbots are increasingly used in education to support students learning processes.These tools offer real-time tutoring,personalized feedback,and automated assessment tracking,which can affect student performance in continous assessments.Continous assessment evaluates students through regular assignments,quizzes,and tests rather than relying solely on final exams.

The integration of chatbots and virtual assistants into educational settings has the potential to transform support services,improve accessibility,and contribute to more efficient and effective learning environments (Chen et al.,2023;Essel et al .,2022).AI tools have the potential to improve student success and engagement,particularly among those from disadvantaged

backgrounds (Sullivan et al.,2023).AI-powered chatbots can provide detailed feedback on student assignments,highlighting areas of improvements for further learning (Celik et al.,2022). For example,chatGPT can act as a helpful study companion,providing explanations and clarifications on various subjects.It can assist with homework questions,offering step-step solutions and guiding students through complex problems (Crawford et al.,2023:Fauzi et al,2023;Qadir,2023:Shidiq,2023).A

Purpose of the Study

1.Determine how the application of AI -Driven virtual assistants and chatbots affect student performance in continuous assessment?

2.Examine how the application of AI -Powered assessment and grading tools affect student performance in continuous assessment?

3.Differentiate between students learning outcome using AI -Driven virtual assistants and AI-powered assessment and traditional assessment method?

Research Questions

1.How does the application of AI -Driven virtual assistants and chatbots affect student performance in continuous assessment?

2.How does the application of AI -Powered assessment and grading tools affect student performance in continuous assessment?

3.What are the differences in students learning outcome using AI -Driven virtual assistants and chatbots,AI-powered assessment and grading and traditional assessment method?

Hypotheses

1.There is no significant difference in the application of AI -Driven virtual assistants and chatbots affect student performance in continuous assessment

2.There is no significant difference in the application of AI -Powered assessment and grading tools affect student performance in continuous assessment.

3.There is no significant difference in students learning outcome using AI -Driven virtual assistants and AI-powered assessment and traditional assessment method.

ABSTRACT

The global aquaculture industry is facing economic and environmental concerns due to solely relying on traditional fishmeal as the primary protein source for carnivorous fish like rainbow trout (*Oncorhynchus mykiss*). Consequently, extensive research is being conducted to identify alternative feed ingredients and found incorporating plant-derived components into fish diets can offer cost-effective and environmentally friendly solutions. Furthermore, these plant-based diets have the potential to enhance growth, improve immunity, and prevent diseases in fish. Therefore, the inclusion of plant products in fish diets presents a viable strategy to partially or fully replace fishmeal, leading to improved overall aquaculture outcomes. This review summarizes current literature on how supplementing rainbow trout diets with various plant-based ingredients impacts their growth performance and diseases resistance. Among the plant-based protein sources examined, canola meal and rapeseed meal have similar amino acid profile as fish meal and can replace fish meal completely in diets of fish.

Keywords: Aquaculture, traditional fishmeal, plant-based ingredients

INTRODUCTION

The global average annual fish consumption per person has hit a historic high of 20.5 kg in 2020 and is projected to increase even more in the coming decade [1]. Anticipated growth in global fish output by 2030 is projected to be 204 million metric tons, reflecting a 15% increase from 2018 [2], highlighting the importance of aquaculture in meeting rising demands. With fish being a major and affordable protein source for nearly half of the global population [[3] [4]], the demand for aquaculture products continues to rise. Despite its significance, aquaculture faces several challenges, including stress-induced mortality and disease outbreaks in intensive farming systems [5].

Rainbow trout (*Oncorhynchus mykiss*), a cold-water fish, is an exotic fish belonging to the family of Salmonidae and native to the cold-water of rivers and lakes of North America. As rainbow trout is carnivorous fish, its feed is mainly composed of animal products like fishmeal, fish oil and shrimp meal. However, its gradual increase in price and restricted availability has challenged the aqua-feed industry. In the search for sustainable aquaculture practices, researchers are exploring alternative feed additives to improve the growth, feed efficiency, and overall health of farmed species [[6] [7] [8]]. Among other alternatives, herbal supplements have gained most attention for their potential to enhance immune responses with minimal side effects and environmental impact [[9][10]]. If plant sources can be used to replace traditional animal protein sources, not only will production costs be reduced, but best growth, stronger immunity and production will also increase with low side effects to the fish and consumer. It even reduces risks of drug resistance and environmental pollution [[11][12] [13]]. The current review paper highlights the impacts of various plant-based supplement diets on rainbow trout growth performance and disease resistance capacity.

Soybean Meal

Soybean meal (SBM) is a highly nutritious ingredient widely used in animal feed. As it contains a well-balanced set of amino acids, it can be used instead of animal protein in fish diets. Stickney et al.,1996 reported 50% inclusion of Soy protein concentrate (SPC) as a fishmeal replacement in trout diet resulted in better growth performance. However, when tried with higher amounts, like 70% to 100%, the trout didn't grow as well [14].

Choi et al.,2020 indicated that fish meal could be replaced by up to 40% with fermented soybean meal (FSM) to maintain growth performance and feed efficiency based on the results from the 8-week feeding trial. However, it's important to be careful when considering replacing more than 40% because the study showed that higher levels could harm the fish's growth and gut health. [15].

Hence total dependence on soybean meal as a fish meal replacement will not serve the purpose.

Spirulina Meal

Spirulina (*Spirulina platensis*), a filamentous blue-green microalga and belongs to cyanobacteria family. It is an excellent source of plant protein (up to 70%) and could replace

expensive animal-derived proteins in fish feed [16]. Spirulina does not have cellulose cell wall and therefore fish can digest it [17].

Yeganeh et al., 2015 demonstrated that inclusion of 10% Spirulina for 10 weeks trial, improved hemato-immunological parameters, specifically, there was a significant rise in RBC count and hemoglobin levels in the fish. The study also noted improvement of growth performance of fish [18].

Teimouri et al., 2013 showed that the replacement of fishmeal with Spirulina of 7.5% and 10% have a larger weight gain and SGR in rainbow trout [19].

Canola Meal

Canola (*Brassica napus*) is primarily known for its oil content. However, it has good amount of protein, having the best amino acid profile among all the available vegetable protein source [20]. Canola protein concentrate contains almost similar crude protein as fish meal and comparatively high lysine and methionine than soybean meal [21].

Hadry et al.,1983 suggested 20% inclusion of canola meal in the diet of rainbow trout without affecting the growth [22]. Shafaeipour et al., 2008 observed that canola meal has the potential to replace fish meal in diets of rainbow trout without compromising the growth performance [23].

Safflower Meal

Safflower meal is the byproduct remaining after the oil has been extracted from safflower seeds (*Carthamus tinctorius*). Ustaoglu et al., 2015 found that rainbow trout can eat up to 20% safflower meal in their food without slowing down their growth or making them less efficient at using their food. The fish were also able to digest protein and fat from their food just as effectively, even with the safflower meal. So, it concludes that safflower meal could be a good, sustainable ingredient for fish farms because it doesn't hurt the fish's growth or health. However, more research is needed to figure out the best amount of safflower meal to use and if there are other advantages to using it as a protein source for fish [24].

Narbon Beans Meal

Narbon (*Vicia narbonensis* L.) is used as a multi-purpose legume for grain, fodder and green manure [25]. Nabron beans can be sued in ruminant diets as a partial substitute for soybean meal or legume seeds such as pea, common vetch and lupin [26]. Tomas et al., 2020, discovered inclusion (10%) of Narbonne in rainbow trout diets is possible and observed no differences in fish growth performance and no severe histopathological alterations on the proximal intestine, improved monosaturated fatty acid content [27].

Rapeseed Meal

Rapeseed (*Brassica napus napus*) is a bright-yellow flowering member of the family Brassicaceae, cultivated mainly for its oil-rich seed. However, it is rich in proteins as well, offering a good alternative to conventional protein crops such as soy and pea. Its cultivations was started in India as early as 4000 B.C. and spread to China and Japan 2000 years ago [28]. It is world's second-leading source of protein meal after soybean [29].

Slawski et al., 2012 observed that amino acid profile of rapeseed protein concentrate was comparable to fish meal, so there was no need to supplement experimental diets with synthetic amino acids. Fish growth performance, feed intake and feed efficiencies were not compromised, when 100% of fish meal in the control diet was replaced with rapeseed protein concentrate. Blood parameters including hematocrit and hemoglobin as well as glucose, triglycerides and total protein in the plasma were not different between treatment groups. Thus, the rapeseed protein concentrate has great potential as an alternative to fish meal in rainbow trout diets [30].

Nagel et al., 2012 demonstrated that the used albumin concentrate can effectively replace 50% of dietary fish meal in rainbow trout diets, whereas the application of the globulin concentrate negatively influenced diet palatability, thereby reducing diet intake and subsequently fish growth. The study concludes that rapeseed protein fractions, specifically albumin and globulin, can effectively replace fish meal in the diets of rainbow trout without negatively impacting growth performance. [31].

Potato Protein Concentrate Meal

Potato Protein Concentrate (PPC) has a balanced amino acid profile and high digestibility. This together makes it an interesting plant-based substitute for animal proteins such as fishmeal and milk powder.

Tusche et al. (2013) showed that the amount of fish feed with the replacement of fish meal protein up to 60% PPC, did not adverse effects on feed intake, growth rate or overall health. However, when the replacement of FM protein with PPC exceeded 60%, the growth of the fish started to decline. This indicate that PPC can be a good substitute but cannon completely replace FM without affecting the fish's growth performance [32].

Pea Protein Concentrate Meal

Pea protein concentrate has a bit more carbohydrates and fats compared to pea protein isolate, giving it a wider range of nutrients. However Rolland et al. (2015) found that a diet for rainbow trout based on pea protein concentrate (PPC) was deficient in three essential amino acids (EAAs): lysine, methionine, and threonine. Hence the PPC diet, supplemented with crystalline amino acids (CAAs), helped to meet the nutritional needs of the fish more effectively. The findings suggest that even though plant-based diets can work as a replacement for fish meal, it's important to carefully plan them and add the correct amino acids to guarantee the fish get enough nutrition. [33].

Lapsi Fruit Meal

Lapsi (*Choerospondias axillaris*) is a large, deciduous fruit bearing tree, native to Nepal of the family Anacardiaceae. It is also found in India, China, Thailand, Vietnam and Japan. It can be

reliable alternative fish meal for sustainable aqua feed production as it is rich in vitamin C, antioxidants [34] and phytochemicals [35].

Shakya et al. (2019) observed cent per cent survival rate with higher final average weight, weight gain %, SGR, Vitamin C and Protein concentration in brain and liver and blood parameters when fed with 0.04% lapsi pulp supplemented diet [36]

Nettle Meal

Stinging nettle (*Urtica dioica* L.) is a perennial plant with spiny leaves belonging to the family Urticaceae . It is considered as both a medicine and food in many countries due to its easy availability and notable biological properties [37]. It shows as a promising fish meal alternative for sustainable aquafeed because it's rich in beneficial compounds like flavonoids, tannins, and vitamins, as well as essential minerals and fatty acids [38].

Adel et al. (2017) explored the impact of feeding rainbow trout a diet that included 3% stinging nettle for eight weeks had some really positive effects. The fish grew more, grew faster, and were better at turning their food into body mass. Their blood also showed improvements, with higher counts of red and white blood cells, more hematocrit and hemoglobin, and increased levels of important immune cells called lymphocytes and neutrophils. Additionally, their total protein and glucose in their blood went up, while their triglyceride levels went down. Even better, when these fish were exposed to a harmful bacteria called *Yersinia ruckeri*, they had the lowest death rate compared to other groups. [39]. Mehrabi et al. (2020) found that adding 0.5% nettle powder to the diet of juvenile rainbow trout (10.72 ± 0.55 g) for 8 weeks, helped them grow better, improved their blood health, boosted their immune system, and even made them more resistant to a fungal infection called *Saprolegnia parasitica*. [40]. Awad et al. (2010) found that adding 1% nettle to the diet of rainbow trout (15g) for 14 days led to better growth and significantly boosted their immune system. This included increased respiratory burst activity, lysozyme enzyme activity, and bactericidal activity. Additionally, these trout showed a high survival rate of 96% after being exposed to *Aeromonas hydrophila* for 10 days [41]. Zare et al. (2021) investigated nettle leaf powder as a medicinal plant additive in fish feed, found that after an 8-week period, fish (7g) fed a diet containing 3% nettle leaf powder showed a significant increase in weight gain (WG) and specific growth rate (SGR) when fed to apparent satiation, without any change in the feed conversion ratio (FCR) [42]. It indicates that including *Urtica dioica* in the diet enhances growth and boosts the immune system of rainbow trout, making them more resistant to bacterial infections

CONCLUSION

The future of fish feed shouldn't solely depend on traditional fish meal as a protein source. With the growing demand for protein-rich feed, the aquaculture industry definitely needs to explore alternative options. Plant based protein sources could be the possible solutions since it is easily available and rich in protein.

ABSTRACT

The study compares the profitability of irrigated rice production in Kano River and Hadejia Valley Irrigation Schemes, Nigeria with special emphasis on farmers' plot hydrological location along the irrigation network of the sectors. In pursuance of this objective, multistage sampling approach was employed to draw the sample of 164 respondents from Kura and Garum Malam LGAs to represent Kano River Irrigation Scheme (KRIS) in Kano State, and 99 respondents from Auyo Local Government to represent Hadejia Valley Irrigation Scheme (HVIS) in Jigawa State. The data was analysed using descriptive statistics and profitability analysis. The results shows that the age of the respondents across KRIS and HVIS were averagely 38 and 40 years respectively with the enterprise been dominated by male. The result further reveals that at KRIS, upon incurring an average cost of ₦246,861.4 ₦250,347.8 and ₦271,433.4 at the respective head, middle and tail axes of the production sectors, a gross margin of ₦883,042.9, ₦856,539.2 and ₦699,739 is obtainable respectively per hectare. Similarly, at HVIS, upon incurring an average total cost of ₦219,874.4, ₦252,129 and ₦193,927 at the respective head, middle and tail axes, a gross margin of ₦1,077,426, ₦1,243,113 and ₦992,595.2 can be generated per hectare. It is concluded that irrigated rice production along both Hadejia Jama'are River Basin operational districts (KRIS and HVIS) was highly profitable and that the project site as well as hydrological locations of the farmer's plot plays an important role in determining the output and the profit margin of the enterprise. Therefore, it is recommended that increase in irrigated rice production can be achieved through capacity buildings sessions. Hence, trainings through extension services should be intensified to motivate farmers to embrace improved farming practices for optimal utilization of inputs and hence increase the yield of irrigated rice as well as the profit level.

Introduction

Despite the oil boom in years back, agriculture still remain the sole source of food for the globe teeming population, a significant source of raw materials utilized in processing industries as well as major source of foreign exchange earnings globally (Akanbi, Omotesho & Ayinde, 2011). The arena continues to remains quite important to several developing countries with potentials of reducing poverty, raising incomes and improving food security for about 80% of the world's poor, who board rural areas and work mainly in farming sector (Central Bank of Nigeria, 2020).

As global oil prices continue to fall sharply over years, for an economy that's now largely hooked in to oil, Nigerians needs not be told that tough times set in. Nigerians must therefore recognize the anarchical gravity and emergency of the matter (Adams, 2016). As a matter of fact, all efforts must be geared and directed towards the rejected stone, " which must now become the chief corner stone as a way to line the nation's economy on a path of rebirth and recovery (Adams, 2016). Setting the nation's economy on the trail of rebirth and recovery requires a whole shift of attention back to agricultural sector as the only way-out of this quandary. Hence, agriculture must continue to stay the bottom of Nigeria's economy, providing the most source of livelihood for many Nigerians (Akanbi *et al*., 2011).

Nigeria is a country that is fully blessed with all what is required to produce rice in large quantity. The country has abundant fertile arable land, favorable climate, available labour forces and water resources to embark on large scale irrigation schemes to confirm all year-round rice production. This shows that an intensive and consistent irrigation rice production scheme will set Nigeria on a pathway to rice self-sufficiency thereby bringing an end to the gross loss in exchange due importation and smuggling of the commodity.

In Nigeria, the concept of large-scale irrigation projects across HJRBDA as pointed by Muhammad (2011) came as a result of a study conducted within the mid-1960s by the US Bureau of Reclamation which was financed by United State Agency for International Development (USAID). One of the analyses included the chance of constructing several dams on rivers that drain the upper reaches of the Chad Basin through the Hadejia and Yobe Rivers into Lake Chad (Ministry of Agriculture and Natural Resources, 1975). The project aims at boosting national capacity towards achieving food security; for Nigeria to curb imports of food items with rice been the first-class target of the policy.

Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS) are multi-purpose projects involving the land, water resources and irrigation facilities development to enhance agricultural production in the predominantly farming communities within the Schemes. The schemes were designed in such a way that water released from the upstream Challawa and Tiga dams into the river system could be used for irrigation. It is unique in its design in that the entire water distribution network operates on gravity.

The irrigation water is conveyed from the source dams to the Project site through an 18Km long Main Canal (MC), which splits into east and west branches. These are then further broken into Lateral Canals (LC), field channels (FC) and finally to the farm for irrigating crops. A

barrage/storage pond was constructed to store the water and from there the water is diverted through water control structures into the irrigation canals of the project (HJRBDA, 2012).

Therefore, in view of the above background, it's therefore crucial to assess the cost and return of irrigated rice production across the two distinct study areas with special emphasis on hydrological references along which farmer's plot was located across the various sectors of the schemes.

Methodology

The Study Area

The study was conducted across Hadejia Jama'are River Basin Development Authority (HJRBDA) production sites; Kano River Irrigation Scheme (KRIS) covering Garum Malam, Kura and Bunkure Local Government Areas of Kano state (though Bunkure was exempted from the study due to cessation of irrigation activities to allow for renovation of the irrigation facilities during the study year; 2021) and Hadejia Valley Irrigation Scheme (HVIS) situated in Auyo Local Government area of Jigawa State.

Sampling Procedure and Sample Size

The study employed a multi-stage sampling approach to select a total of 164 and 99 irrigated rice farmers across KRIS and HVIS respectively. Two production sectors were randomly selected in local government, making a total of six selected production sectors. Stratified random sampling approach was then employed to draw the sample across the three hydrological locations (head, middle and tail) within each of the selected production sector of the irrigation command areas. Purposive sampling was also employed to select one community each to represent farmers along the head, middle and tail axes of each stratum. Finally, Raosoft Sample Size Calculator was used to select a total of 263 respondents while the Bowley's proportion allocation formula was employed to establish the sample size at each stratum.

Data Analysis

Socioeconomic characteristics of the respondents was analysed using descriptive statistics such as means, percentages and frequencies. Profitability of irrigated rice enterprise was analyzed using cost and returns (farm budgeting) technique and the profit is thus defined as:

$$\pi_i = P_i y_i - \sum(X_j R_j + K_i) \quad \ldots\ldots(1)$$

Where,

π_i = profit from the i^{th} enterprise

Y_i = Quantity of rice output of the i^{th} enterprise (in Kg)

P_i = price per unit of i^{th} enterprise (in Naira)

X_j = Quantity of the i[th] input used by each enterprise (e.g seeds/seedlings, fertilizer, pre emergence, post emergence and selective herbicides, fungicides, pesticides, labour)

R_j = price per unit of the i[th] input

K_j = fixed cost per period associated with i[th] enterprise

Net Farm Income

The net farm income is mathematically expressed as;

$$NFI = GM - TFC \quad \text{.....(2)}$$

Where;

NFI = Net Farm Income,

GM = Gross Margin and

TFC = Total Fixed Cost

$$GM = TR - TVC \quad \text{.....(3)}$$

Where;

GM = Gross Margin,

TR = Total Revenue (gross value of output),

TVC = Total Variable Cost.

Gross Ratio

$$GR = \frac{TFE}{GI} \quad \text{.....(4)}$$

Where;

GR = Gross Ratio,

TFE = Total Farm Expenses and GI = Gross Income

Rate of return on Investment (RRI)

$$RRI = \frac{NFI}{TC} \quad \text{.....(5)}$$

RESULT AND DISCUSSION

Socio-Economic Characteristics of Irrigated Rice Farmers

The result of age distribution of the surveyed farmers from both Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS) was recorded at averagely 39 years. This attest that farmers across both KRIS and HVIS are within the youthful age bracket indicating an active and productive labour force age and also signifying that the attention of youth was drawn back to agriculture as a means of livelihood contrary to the known inherent trend of youth abandoning the agricultural sector especially the irrigation scheme. This result conforms to the findings of Ahungwa, Suleiman and Abdulkarim (2018), who posited that youthful age is expected to increase the productivity and efficiency of the enterprise. Iheke and Nwaru (2014), also viewed that the risk bearing abilities and innovativeness of a farmer, his mental capacity to coup with daily challenges and demands of farm production activities and his ability to do manual work decrease with advancing age, hence, the younger, the better.

The result also shows that the mean years of farming experience for farmers along both KRIS and HVIS was 14 years each. This implies that irrigated rice production enterprise in the study areas was a long practicing venture as it is in place for more than a decade. Though years of farming experience plays a vital role in determining the production efficiency, managerial ability and decision-making process of an entrepreneur, Mwangi and Samuel, (2015) states that years of production experience may hinder adoption of innovation, but can influence production efficiency due to the knowledge of local production conditions. Historically, farmers rely on their own experience and that of their neighbors with regards to adopting ‘good farming practices’, advice and information rather than from either privately or publicly funded agencies.

The result contained in Table 1 also shows the distribution of the selected irrigated rice farmers across KRIS and HVIS on the basis of the household size. Household size plays an important role in determining the extent of labour availability at household level and the farming society in general. The result thus depicts that the mean household size of the irrigated rice farmers at both KRIS and HVIS were 10 and 9 persons respectively. This therefore might be translated to relative availability of family labour which will help in minimizing the running cost of irrigation enterprise. This result justifies the position of Ogundele and Okoruwa (2016) who alluded that the quest to satisfy labour requirements necessitates large household sizes among farmers in developing countries. The result also corroborates the findings of Mustapha, Yusuf and Ibrahim (2018), and Mohammed (2015) who indicated a similar range of household sizes among rice farmers. The result also further agreed with the result of Nchare (2011) that found that the average family size of rice farmers in Cameroun was 10 and that the large family size translates to higher use of family labour.

Table 1: Socio-economic Characteristics of Irrigated Rice Farmers (Quantitative)

	KRIS (n =164)					HVIS (n = 99)				
	Freq.	Percentage	Mean	Min.	Max.	Freq.	Percentage	Mean	Min.	Max.
Age of the Farmers (Years)

Table 2 below further depicts that irrigated rice production enterprise is entirely dominated by male, given that majority (96.3 and 96.2 percent) were male leaving the female counterpart with just 3.7 and 3.8 percent for farmers across KRIS and HVIS respectively. The male dominance in agricultural sector may be attributed to culture and traditional behavior of most rural dwellers. This agrees with the findings of Oladeji (2010) who reported that culture of the society may favor full participation of one sex over the other in agribusiness generally.

The analysis of distribution of farmers based on their educational qualification at KRIS attest that 34.2 percent attended secondary school with 26.2 percent having Qur'anic education followed by 24.2 and 15.2 having tertiary education. It also reveals that 40.6 percent of the farmers at HVIS attained secondary education followed by those attended primary and tertiary schools with equal proportion of 20.2 percent each. Schooling or the level of education of a farmer helps the farmer in the use of production and marketing information leading to increased yield and profit. Pudasaini (1983) documented that education contributed to agricultural production in Nepal via the farmer's knowledge and allocated effects. Education is also an

important determinant of adoption of new innovation as well as a tool for a successful implementation of action and increase productivity. Chandan and Vijaya (2021), opined that the variation in educational background of farmers was usually responsible for the differences in their ability to evaluate and manage risk.

Table 2: Socio-economic Characteristics of Irrigated Rice Farmers (Qualitative)

Variable	Scheme			
	KRIS (n =164)		HVIS (n = 99)	
	Frequency	Percentage	Frequency	Percentage
Sex				
Male	158	96.3	76	96.2
Female	6	3.7	3	3.8
Level of Education				
Primary	40	24.4	16	20.2
Secondary	56	34.2	32	40.6
Tertiary	25	15.2	16	20.2

Access to Credit for Production				
Have Access	108	66	67	84.8
No Access	56	34	12	15.2

Source: Field Survey, 2021

Furthermore, the result shows that, majority of the respondents (92.7 and 91.1 percent) in both the KRIS and HVIS were into water users association. Iheke (2010) noted that membership of farmers association 'serve as outstanding source of good quality inputs, labour, credit, information and organized marketing with economies of scale. By this assertion, irrigated rice producers across KRIS and HVIS may stand a greater chance of immensely benefiting from various government programs as it is the case with the federal government anchor borrower's program in Nigeria today.

The result from Table 2 also reveals that, majority of the irrigated rice farmers across KRIS and HVIS have access to extension services with a proportion of 90.2 and 92.4 percent respectively.

Agricultural extension represents a mechanism by which information on new technologies, better farming practices and management could be transmitted to farmers. Owen, Mundy, Will and Robert (2001) investigated the impact of farmers‘ contact with agricultural extension services on farm productivity and the results showed that access to agricultural extension services, defined as receiving one or two visits per agricultural year, raised the value of crop production by about 15 percent. This means that farmers at Hadejia Jama'are River Basin stand a high chance of having access to information related to improved agricultural technologies such as modern production practices, value addition, market related information and sources of credit, hence lead to increase in the per hectare output and returns.

In addition, the analysis of information regarding farmer's access to credit reveals that 66 percent of the irrigated rice farmers at Kano River Irrigation Scheme site has access to credit mostly from government through anchor borrower program and from friends and relatives. On the other hand, majority (84.8 percent) of the farmers across Hadejia Valley Irrigation Scheme also have access to credit for production from same source as the case with farmers at KRIS leaving only few (15.2 percent) having no access to credit. Access to credit can serve as an important indicator for determining the scale and the type of production a farmer is into (that is subsistent or commercial). This agrees with the findings of Ayodele (2016), who affirms that accessibility to credit increases farmer's liquidity, which in turn, enhances their ability to purchase inputs and pay for hired labour. Ajala and Gana (2015), also posits that accessibility of farmers to credit facilities would increase their access to agricultural inputs and newly introduced innovations which would increase food production.

Profitability Analysis

The result of comparative profitability analysis of irrigated rice production along KRIS and HVIS was presented in Table 3 as average of the 2021 irrigation season. The analysis was made with special emphasis on hydrological locations of the farmers' plot across the selected sectors of Kano River Irrigation Scheme (KRIS) and Hadejia Valley Irrigation Scheme (HVIS) sites. The variable cost components considered for the average cost and return analysis include cost of labor, seed, fertilizer, agrochemicals, land rental cost as well as drum and tarpaulin hired costs. The analysis also considered the depreciated cost of fixed inputs used in irrigated rice production.

The result shows that the average total cost for a hectare of irrigated rice plot along the head, middle and tail axes of KRIS were ₦246,861.4, ₦250,347.8 and ₦271,433.4 respectively. The variable cost components contributed the highest (97.4, 97.9 and 93.4 percent) to the average total cost of producing an average hectare of land at respective head, middle and tail axes of the production sectors. The result shows that cost components of labor, fertilizers and rental cost of land contribute the highest percentage to the average total cost of producing an average

hectare and thus proved to be the most the most significant drivers of irrigation rice production that requires much capital.

The result further shows that an average 5275, 5175.9 and 4465.8 kilograms of irrigated rice yield is obtainable along the head, middle and tail axes of the KRIS irrigation sectors with

average gross margin of ₦883,042.9, ₦856,539.2 and ₦699,739 respectively. Additionally, the rate of return on investment for farmers at the head, middle and tail ends was recorded at ₦3.7, ₦3.5 and ₦2.8 respectively. This shows that there is a strong relationship between the location of the farmer's plot along the irrigation network and their productivity as well as profit margins. The reason being that the gravity of water supply decreases along the irrigation network of the sectors from head down to the tail reaches. Subsequently, with water shortage at farmers' plot along the irrigation network of the sectors, the issue of invasive weed species and the need for water supplementation arises, hence lead to increased cost of production as well as decrease in per hectare output and gross margin. Nevertheless, The result also shows that despite the variation in the average per hectare yield, net return, gross margin and return to naira invested, it is with no doubt that irrigation rice production enterprise along the respective hydrological locations of Kano River Irrigation Scheme is a profitable venture and improving the schemes' main, lateral and field canals will go along in delineating the output variations among the hydrological locations.

It is evident from the result that farmers at the tail end of the various irrigation sectors of KRIS incur high cost of production, then followed by those at the middle and head in that order. This could be attributed to the extent of irrigation water availability at the various hydrological locations along the irrigation network of each sector. Accordingly, farmers located at heads of the irrigation sector easily have access to irrigation water, thus incur less production cost. The cost progressively increases downstream along the middle and tail of the sectors where the farmer along these axes, through the use of water pumps and excessive fertilizer application tries to meet up the production frontier of their head counterparts.

Table 3: Cost and Return Analysis of Irrigation Rice Production along KRIS and HVIS

Source: Field Survey, 2021

Similarly, famers along Hadejia Valley Irrigation Scheme site of Jigawa State upon incurring an average total cost of₦219,874.4, ₦252,129 and ₦193,927 at the head, middle and tail axes of the sectors respectively were found to record an average per hectare irrigated rice yield of 6176.6, 6906.4 ang 6114.7 kilograms at the respective hydrological locations. It is therefore seen from the result that farmers along the middle axis of the irrigation sectors of HVIS incur high per hectare production cost and has higher per hectare yield, followed by those at the head and tail axes. This difference in the cost could be attributed to the variations in cost of labour among the selected communities that represent the respective hydrological locations.

The result also shows that farmers at the head, middle and tail axes of HVIS obtain an average gross margin of ₦1,077,426, ₦1,243,113 and ₦992,595.2 respectively with an average return to naira invested of ₦5, ₦5 and ₦5.3 respectively. This implies that for each naira invested in this enterprise, a net return of 500, 500 and 530 percent of the total investment is obtainable at the respective hydrological locations. This similarly is therefore enough justification that irrigation rice production enterprise along HVIS operational districts of Jigawa state is a profitable venture and indeed an outstanding rare exception the entrepreneurs along the networks are enjoying in comparison with other enterprises and locations. In his findings, Ayodele (2016), affirms that the gross return per hectare and average rate of return on investment for irrigated rice enterprise was ₦391,017 and ₦1.73 respectively. Contrarily, in his study, Sa'ad (2019) founds that the average rate of return on investment in irrigation rice production in Bauchi state is 0.7 kobo. The findings of Ayodele (2016) and that of Sa'ad (2019) were far cry away from the finding of this research, hence the need for diversification of irrigation scheme of this kind will contribute greatly in breaking the farmer's vicious circle of poverty and in delineating the issue of food insecurity across the nation.

Additionally, the results of cost and returns analysis from irrigated rice production enterprise along KRIS and HVIS shows a clear variation in the profit margin of the irrigated rice entrepreneurs along the two studied schemes sites. These variations between the two schemes could be accrued to their respective hydrological locations along the irrigation network and the overall topography of the sites. The irrigation network of KRIS site was observed to have poor topography when compared to its HVIS counterpart. Hydrological location and sloppiness of the schemes is quite a vital determinant of water availability at the entire scheme site and subsequently at the individual farmer's plot.

Comparatively, it can be deduced from the result that at KRIS, the average total costs tended to increase ascendingly from the head to the middle and then the tail. This could be attributed to the level of weed invasion which could also be a product of water shortage along the hydrological locations. When there is availability of irrigation water at farmers plot, the growth of weeds is mostly suppressed and *vis-versa*. The cost was therefore recorded high for farmers at the tail then followed by those at the middle axis due to increased cost of weeding, intensive use of herbicides and chemical fertilizers to meet up with the production frontiers of their head counterparts. Furthermore, despite the fact that the cost of production increases in an ascending order along the head, middle and tail axes of the sectors, the average yield, gross margin and return to naira invested increases in a descending order of the farmer's plot hydrological locations. This therefore shows how deep the hydrological reference of the farmers' plot affects their output level and profit margin. However, farmers at the head earned the highest profit

followed by those at the middle and then those at the tail. Rice requires abundant supply of water to perform optimally. Water availability at the farmers' plots decreases from the head, through the middle to the tail. The decreasing profits observed could be attributed to lower yields obtained due to the farther away from the primary water source due to insufficient water at the plots (Yakubu, Baba & Mohammed, 2016).

On contrary, the above scenario differs in the case of HVIS, where farmers at the middle axis incur highest cost of production then followed by those at the head and tail axes in that order. Similarly, farmers at the middle axis recorded highest yield then followed by those along the head and tail axes. This could be attributed to the structural description of the farm plots along this site, where plots located at the head and tail axes were recorded to be relatively upstream when compared to middle axis. The high yield and gross margin recorded by the farmers at the middle axis of HVIS sectors could be due to washing away of nutrients from the relatively upstream head and tail axes to the relatively downstream middle axis.

Conclusion and Recommendations

From the findings of the study, it could be concluded that irrigated rice production along both KRIS and HVIS was highly a profitable venture. It is also clearly evident from the findings that the scheme as well as hydrological locations of the farmers' plot plays an important role in determining the per hectare yield as well as profitability of the enterprise. Improving the existing scheme's main and distributing canals especially the tail and middle axes of KRIS will greatly help in reducing the margin in output and profit levels and also increasing the schemes capacity and extending it to various suitable locations by government will go a long way in delineating the issue of food insecurity and vicious circle of poverty bedeviling farmers in Nigeria.

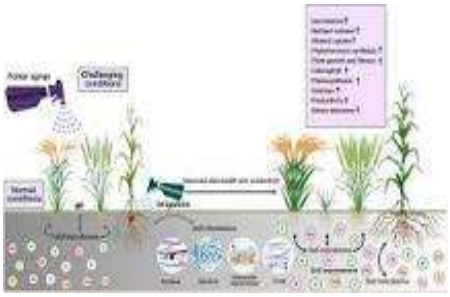
ABSTRACT

The incorporation of modern day technologies into agricultural practices has proven to have positive effects on crop production and food security. Nanotechnology uses novel delivery techniques and chemical agents to increase crop productivity and decrease bulk agrochemical application through innovative and sustainable approaches. The development and applications of nanomaterials on crop production and food security have demonstrated its potentials in improving seeds' germination and growth, protection of plants, and the detection of pathogens and herbicide/pesticide residues. This paper evaluates the efficacy of nanotechnology as a modern agricultural application. The paper summarizes the applications of nanomaterials and their importance in sustainable agricultural practices. In order to gather useful data for the paper discussion, questions were carefully drafted by the researcher and administered to respondents through online Google form questionnaire instrument. The responses were collated and subjected to reliability analysis. Conclusively, the paper inferred that the incorporation of nanotechnology into the field of agriculture has contributed towards addressing the increasing challenges in crop production and food security.

Keyword: Nanotechnology, Agricultural Application, Crop Production and Food Security.

INTRODUCTION



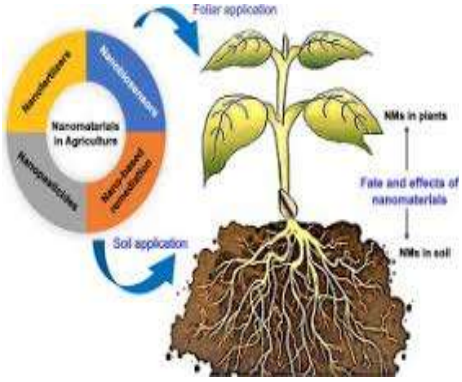
Nanotechnology is a modern agricultural technique that uses novel delivery techniques and chemical agents to increase crop productivity and decrease bulk agrochemicals' applications through innovative and sustainable approaches. The incorporation of nanotechnology into the fields of agriculture has proven to have positive improvement in crop production and food security. The application of nanomaterials in agriculture increases the efficacy and sustainability of agricultural practices. This technique has demonstrated its potentials to release agrochemicals needed for improved plant disease resistance, detect pathogens and herbicide/pesticide residues and enhanced plant growth. Nanotechnology offers innovative set of tools to manipulate genes using nanoparticles which have enhanced reactivity due to greater proportion of surface atoms relative to the interior of a structure, unique magnetic/optical properties, enhanced solubility, and catalytic reactivity that differ from equivalent bulk materials. The application of these nanoparticles for nutritional improvements, and disease suppression depends on the difference in particle size between the bulk and nanomaterials. The positive morphological effects of the utilization of nanomaterials such as enhanced germination rate; enhanced photosynthetic activity and nitrogen metabolism in many crop plants. However, the non-judicious usage of nanomaterials may lead to environmental hazards. It is therefore important to moderate the release of pesticides, herbicides, and plant growth regulators using nanocarriers.

RELATED LITERATURE

Several studies have shown that the incorporation of nanotechnology is extensively aimed to meet up with the high demands of food production and various other agricultural issues. Nair et al. (2010) noted that various nanomaterials based on carbon materials, metal and metal oxides, nanosized polymers, and biocomposites are being developed for different applications. The benefits of these materials are numerous in environmental remediation, water purification, wastewater treatment, food processing and smart sensor development (Chand et al, 2021; Demirer et al., 2021; Liu et al., 2021; Wang et al., 2021). The applications of nanomaterials have growingly gained attention due to its positive effects on crop production and food security (Sharon, et al., 2010). The study of Emamifar et al., (2010) reported that nanomaterials enhance plant germination and growth. Rajpur et al. (2021) revealed the positive effects of the application of nanomaterials for plant growth and development. For example, Zheng et al. (2021) analyzed that nano-TiO_2 supports water absorption and improve seed germination and growth. Yang et al. (2007) pointed that TiO_2 nanoparticles enhances nitrogen metabolism and photosynthetic rate thereby improving plant growth. Other studies have shown the progressive effects of MWCNTs on the seed germination and plant growth (Du et al., 2011). However, the use of chemical pesticides may leads to environmental hazards, if not judiciously

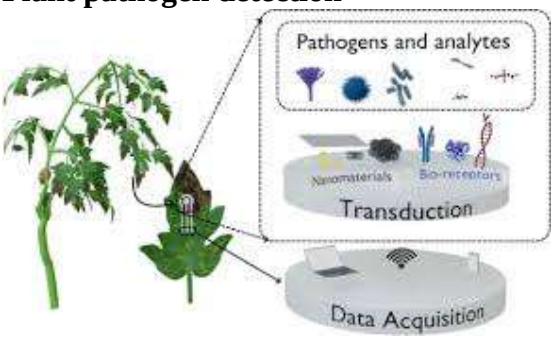
applied. Sharon et al. (2010) emphasized that the release of pesticides, herbicides, and plant growth regulators should be controlled using nanocarriers.

Plant production and protection



The application of nanomaterials to increase plant protection and production is growingly being achieved. Many studies have introduced the application of nanomaterials on farm lands, because of its positive effects on crop yield. The study of Iqbal et al. (2019) depicted that different types of nano-fertilizers have been developed for different crop systems. The research work of Kumar et al. (2021) signified that nano- nitrogen fertilizer (N2) have been found to improve rice productivity. The study of Verma et al. (2022) revealed that Ammonium- modified zeolites have been found to improve phosphorus availability and its uptake in plants. Employing the application of appropriate ingredients of nanomaterials is also imperative for mitigating crop losses and effective pest control. The study carried out by Vuong (2019) proved that the application of nano-formulations minimizes likelihood of increased resistance among target organisms. The research work of Kasote et al. (2021) inferred that the pesticides in nano-formulation indicate the availability of useful properties such as increased permeability, solubility, crystallinity, stiffness, thermal stability, and biodegradability needed for a sustainable agro-environmental system. However, Khan & Rizvi (2014) enumerated the importance of the controlled release of active ingredients of nano-formulation as the excessive release can be harmful to plant.

Plant pathogen detection



The use of advanced pathogen detection and prevention techniques is crucial to minimize diseases or harms related to crops during their growth, harvest, and postharvest processing stages. Zhao (2011) stated that nanoparticles can serve as rapid diagnostic tools or biomarkers for prompt detection of viral, bacterial, and fungal plant pathogens in agriculture. Nanoparticles can essentially be used to design pathogen detection devices with smart sensing capabilities for agricultural practices. According to Boonham (2008), Nanoparticles are suitable for making of sensing applications as they can be combined with other materials having intriguing optican and electronic characteristics. The record of Yao et al. (2009) signified that nanoparticles can be combined with biological elements like antibodies, primarily to detect bacterial spot disease causative agent such as 'Xanthomonas axonopod'. The record of Yao et al. (2009) also revealed the utilization of silica nanoparticles

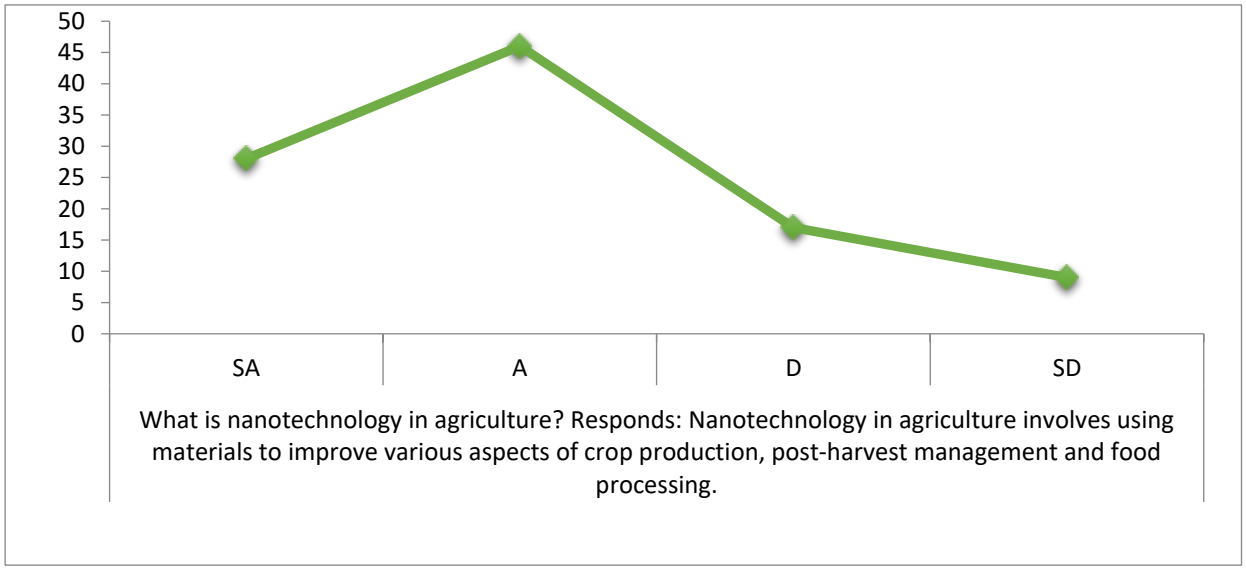
in conjunction with antibodies to effectively detected plant pathogens such as 'Xanthomonas axonopodis pv'. In the same way, the research work of Umasankar et al. (2013) outlined that nanomaterials was used to developed the electrochemical sensors for detecting plant diseases. The research study of Wang et al. (2010) also showed that a sensitive electrochemical sensor that used copper nanoparticles modified with gold electrode was used to detect fungi (*Sclerotinia sclerotiorum*) by monitoring the levels of salicylic acid in oil seeds. Thus, so many other studies have proven that similar sensors and censuring techniques combined with nanoparticles were used in the detection of plant pathogens.

MATERIALS AND METHODS

The researcher adopts mixed methodologies, including controlled experiments, field trials, and analytical techniques to assess the efficacy of nanotechnology modern agricultural application. These methods allow for evaluating the impact of nanotechnology on crop yield, plant health, disease resistance, and resource utilization efficiency. The researcher used controlled laboratory settings to isolate the effects of specific nanomaterials on plant growth, nutrient uptake, and disease susceptibility. The researcher also carried out field- monitoring to allow for the assessment of nanotechnology applications under realistic agricultural conditions, including soil type, climate, and pest pressures. For the analysis of the soil and plant, the researcher took some soil and plant samples to determine the fate and behavior of nanomaterials, including their uptake, translocation, and degradation in the environment. Over all, the researchers gain a comprehensive understanding of the efficacy and potential risks associated with nanotechnology applications in modern agriculture. For the purpose of gathering information needed for the research work, drafted questions were also administered to different people consisting of plant physiologist and plant pathologist using online Google form questionnaire instrument.

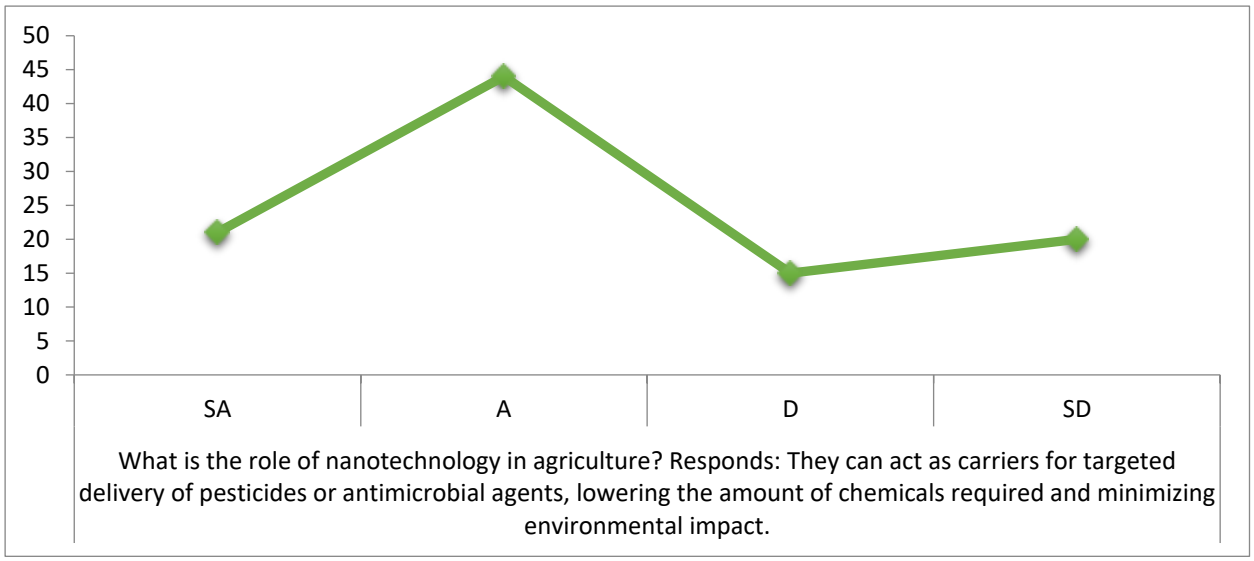
RESULTS AND DISCUSSION

Fig.1: Chat Analysis



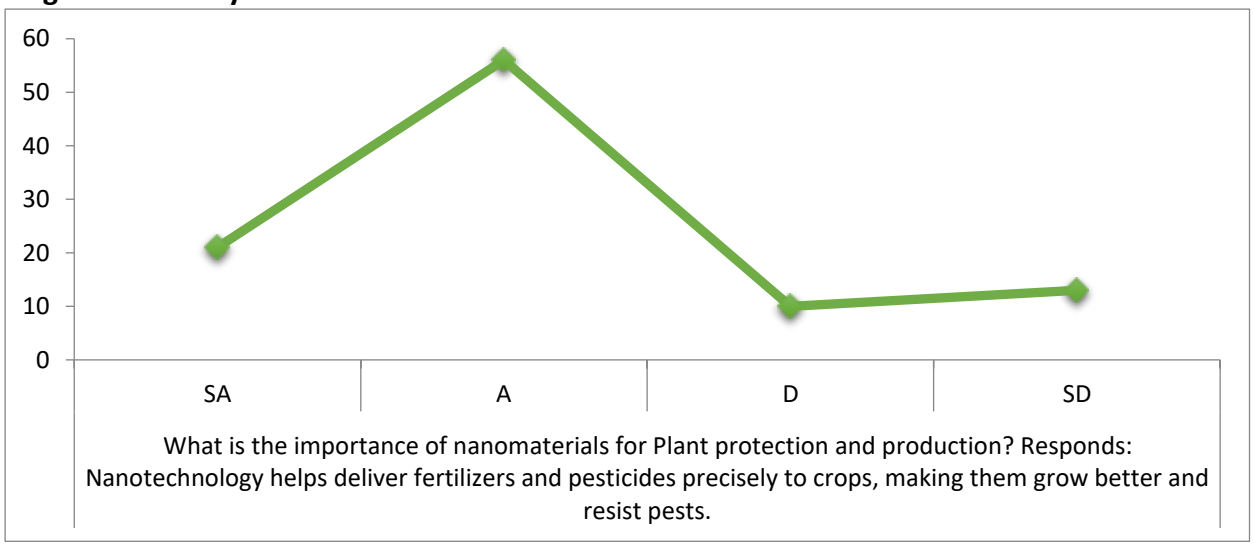
The graph plotted in figure 1 clearly shows that the respondents are fully aware of the trends of development in the fields of agriculture. Most of the respondents described nanotechnology as the incorporation of technology that uses materials at a nanoscale to improve various aspects of crop production, post-harvest management, and food processing. According to the respondents, it includes creating nano-fertilizers, pest control agents, nanosensors, and more. The respondents explained that nanosensors are devices designed to monitor soil health, optimize irrigation, detect pathogens, and assess the overall plant conditions.

Fig.2: Chat Analysis



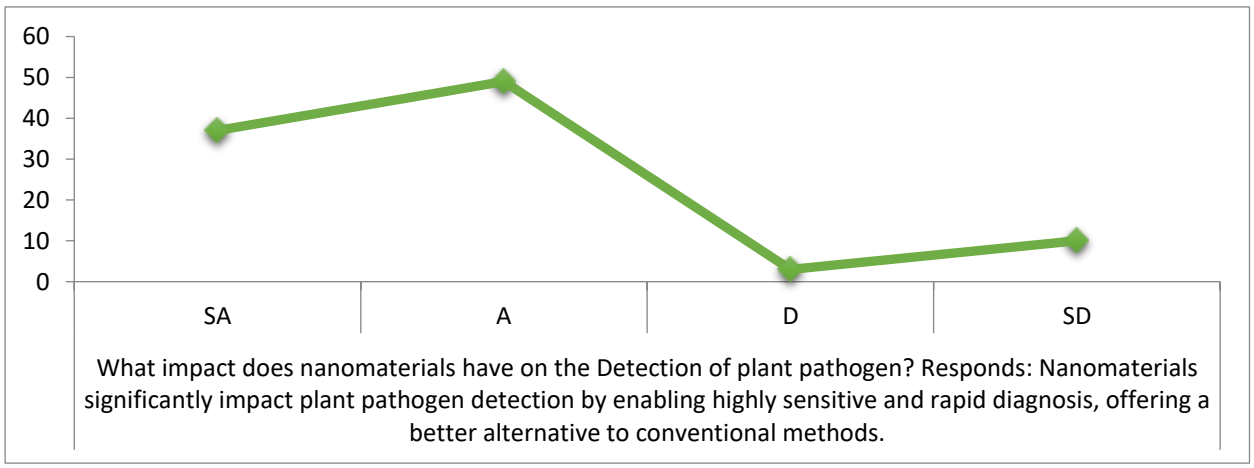
The graph plotted in figure 2 depicts that a higher number of the respondents agree that nanotechnology acts as carriers for targeted delivery of pesticides or antimicrobial agents, lowering the amount of chemicals required and minimizing environmental impact. In other words, the respondents emphasized that nanotechnology helps to improve agricultural production by increasing the efficiency of inputs and minimizing relevant losses. According to the respondents, nanotechnology utilizes nano based smart delivery system and nanosensors that used by farmers to reduce the input of resources such as nutrient and agrochemicals and productivity under adequate supervision.

Fig.3: Chat Analysis



The graph plotted in figure 3 illustrates that a greater amount of respondents affirmed that nanotechnology helps to deliver fertilizers and pesticides precisely to crops, making them grow better and resist pests. The respondents added that nanotechnology ensures that plants effectively absorb nutrients, helping crops grow healthier and reducing waste. According to the respondents, it should be noted that nanomaterials offer significant potential for both plant protection and production, minimizing environmental impact, enhancing efficiency, and improving crop quality. The respondents explained further that nanomaterials help plants to cope with environmental stresses like drought and salinity, and can be used to detect pesticide residues in smart sensors.

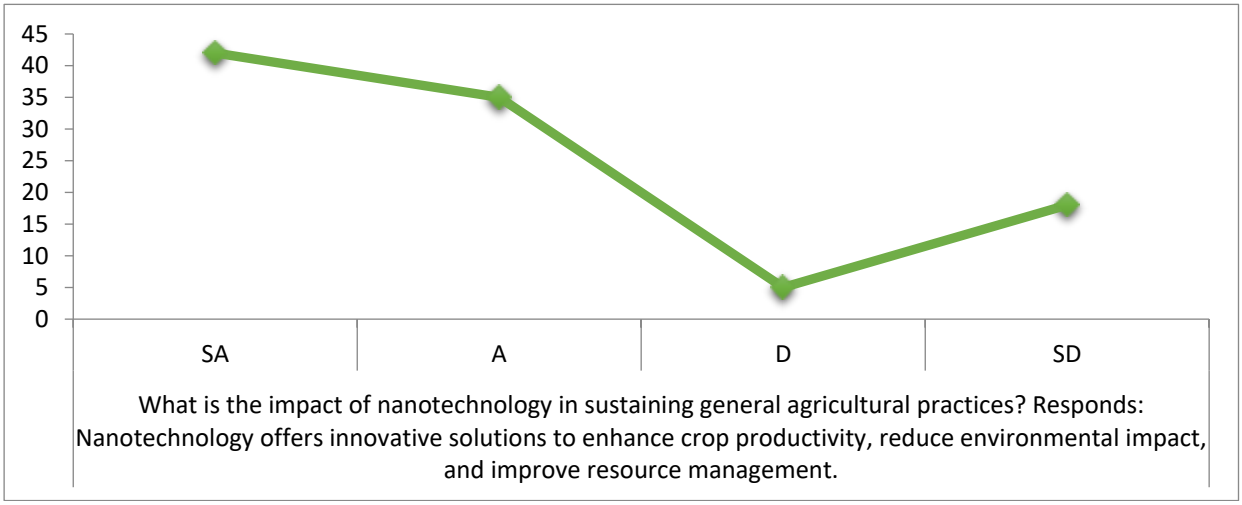
Fig.4: Chat Analysis



The graph plotted in figure 4 reveals that a higher amount of respondents agree with the statement that nanomaterials have significant impact on the detection of plant pathogen as it

enables highly sensitive and rapid diagnosis, offering a better alternative to conventional methods. The nanoscale and unique properties of nanomaterials make them to effectively interact with pathogenic agents, enhancing the selectivity of biosensors and other relevant detection tools.

Fig.5: Chat Analysis



The graph plotted in chart 5 indicates that a large number of respondents supported that nanotechnology have significant impact in the sustenance of agricultural practices, offering innovative solutions to enhance crop production and food safety. According to the respondents, nanotechnology enables the development of new materials and techniques that can be used to address huddles such as nutrient deficiency, soil contamination and pest control. More so, nanotechnology can act as carriers for targeted delivery of antimicrobial agents or of pesticides, minimizing environmental impact and lowering the amount of chemicals required.

CONCLUSION

The discussion on this paper is focused on the assessment on the efficacy of nanotechnology as a modern agricultural application, such as crop production and food security. The paper described the impact of nanotechnology on plant growth, plant production and protection, and plant pathogen detection. The paper affirmed that the application of nanomaterials can improve plant growth and better protection of plant compared to conventional agricultural practices. The paper also asserted that nanomaterial-based sensors have the potential for detecting residual pesticides and pathogens to ensure food safety. The paper added that various metal and metal oxide nanoparticles can positively improve seed germination and plant growth within specified concentration level. The paper concluded that the incorporation of nanotechnology into the field of agriculture has helped to improve nutrient delivery in fertilizers, create more effective and targeted pesticides, enhanced crop protection and food security. However, the injudicious use of chemical pesticides may leads to environmental hazards, and therefore crucial to address before adoption.

ABSTRACT

With the increasing digitalization of the agricultural sector, the need for collecting large amounts of data in the field, analyzing it, and making real-time decisions has become more prominent. At this point, edge computing technologies, which enable data to be processed on devices located close to where it is generated without sending it to centralized systems have gained importance, especially in conjunction with Agricultural Internet of Things (Agri-IoT) systems. Edge computing devices offer significant advantages in rural areas due to their low energy consumption, real-time data processing capabilities, and reduced dependency on internet connectivity, thus having the potential to enhance agricultural productivity.

This study aims to examine the use of edge computing-based devices in digital agriculture from an Agri-IoT perspective. It presents examples of how edge devices are utilized in key agricultural applications such as precision farming, irrigation management, environmental condition monitoring, and pest and disease detection. The study also discusses the hardware components used in these systems (such as microcontrollers, sensors, and communication protocols) as well as their architectural frameworks. In addition to highlighting the potential benefits of edge computing technologies in agriculture, the study evaluates major challenges such as data security, hardware costs, maintenance requirements, and infrastructural limitations.

The findings show that edge computing not only increases efficiency but also serves as a key component of the vision for sustainable and smart agriculture.

DİJİTAL TARIMDA UÇ BİLİŞİM CİHAZLARI VE TARIMSAL NESNELERİN İNTERNETİ: TEMEL TEKNOLOJİLER, UYGULAMA ALANLARI VE KARŞILAŞILAN ZORLUKLAR

ÖZET

Tarım sektöründe dijitalleşmenin artmasıyla birlikte, büyük miktarda verinin sahada toplanması, analiz edilmesi ve anlık kararlar alınması ihtiyacı doğmuştur. Bu noktada, verilerin merkezi sistemlere gönderilmeden, verinin üretildiği noktaya en yakın cihazlarda işlenmesini sağlayan uç bilişim (edge computing) teknolojileri, özellikle Tarımsal Nesnelerin İnterneti (Agri-IoT) sistemleriyle birlikte önem kazanmaktadır. Uç bilişim cihazları; düşük enerji tüketimi, gerçek zamanlı veri işleme, internet bağlantısına daha az bağımlılık gibi avantajlarıyla kırsal alanlarda tarımsal verimliliği artırma potansiyeline sahiptir.

Bu çalışma, dijital tarım uygulamalarında uç bilişim tabanlı cihazların kullanımını Agri-IoT perspektifinde incelemeyi amaçlamaktadır. Çalışmada; hassas tarım, sulama yönetimi, çevresel koşul izleme, zararlı ve hastalık tespiti gibi temel tarımsal uygulama alanlarında uç bilişim cihazların nasıl kullanıldığı örneklerle açıklanmakta; kullanılan donanımlar (mikrodenetleyiciler, sensörler, iletişim protokolleri) ve sistem mimarileri ele alınmaktadır. Ayrıca, uç bilişim teknolojilerinin tarımsal alandaki potansiyel faydalarının yanı sıra, karşılaşılan başlıca zorluklar olan veri güvenliği, donanım maliyeti, bakım gereksinimi ve altyapı eksiklikleri de değerlendirilmektedir. Elde edilen bulgular, uç bilişimin yalnızca verimliliği artırmakla kalmayıp aynı zamanda sürdürülebilir ve akıllı tarım vizyonunun temel bileşenlerinden biri olduğunu göstermektedir.

Anahtar Kelimeler: Uç Bilişim, Dijital Tarım, Gerçek Zamanlı Veri İşleme, Akıllı Tarım Sistemleri, Tarımsal Nesnelerin İnterneti

1. GİRİŞ

Nesnelerin İnterneti (IoT), bilgi işlem ve iletişimin geleceğini temsil eden devrim niteliğinde bir teknolojidir. Bu teknoloji yazılım, sensör ve diğer teknolojik bileşenlerle, internet üzerinden birbirine bağlı cihazlardan oluşan bir ağı belirtmektedir. Bu bileşenler, cihazların verileri birbirleriyle toplamasına, değiştirmesine ve internet üzerinden merkezi sistemlere dönüşmesine izin vermektedir. IoT'nin altında yatan temel ilke, sıradan nesneler arasında otonom iletişimi ve etkileşimi kolaylaştırmak; böylece fiziksel ve dijital ortamın uyumlu bir şekilde bir füzyonunu oluşturmaktır (Mekala ve Viswanathan, 2017; Saini ve ark., 2025). Son yıllarda dünya nüfusunun hızla artması ve artan gıda talebinin karşılanmasında yaşanan sorunlar üretim, sürdürülebilirlik ve verimin artırılması kapsamında modern tarımın gelişmesinde önemli zorlukları da beraberinde getirmiştir. Günümüzde 5G teknolojisinin kademeli olarak popülerleşmesiyle IoT ve yapay zekâ gibi gelişmiş bilgi teknolojileri, modern tarımın akıllı tarıma dönüşümünü teşvik etmiştir. 5G tabanlı IoT, akıllı tarımın geliştirilmesinde önemli bir rol oynayacaktır (Liu ve ark., 2023a). IoT'nin tarımda kullanılmasıyla ortaya çıkan Tarımsal Nesnelerin İnterneti (Agri-IoT) teknolojisi ile tarımsal üretimde önemli değişiklikler olmuştur. Farklı araştırmacılar tarafından farklı yorumlanan Agri-IoT kavramı Li ve ark. (2015) tarafından genellikle tesislerdeki çevresel faktörler, tarımsal üretim araçları vb. hakkındaki bilgileri algılamak için ilgili algılama cihazlarının ve tarımsal üretim süreçlerinin gerçek zamanlı olarak izlenmesi, veri iletimi için önceden tanımlanmış protokollere dayalı olarak tarımsal üretim nesnelerinin konumlandırılması ve yönetilmesi için bilgi birikimi olarak ifade edilebilmektedir. Bu teknolojinin kullanımı sadece tarımsal üretimi artırmakla kalmaz aynı zamanda ürün kalitesini, çiftçi gelirini ve tarımsal modernizasyonu da artırırken işçilik maliyetlerini azaltmaktadır (Zhang ve ark., 2020; Xu ve ark., 2022).

İnternete bağlı akıllı cihazların sayısının hızla artması büyük verilerle çalışma, geleneksel bulut bilişim modellerinde bant genişliği yükü, yavaş yanıt hızı, zayıf güvenlik ve gizlilik gibi sorunlara neden olabilmektedir. Geleneksel bulut bilişim, günümüzün akıllı toplumunun veri işleme konusundaki çeşitli ihtiyaçlarını desteklemek için artık yeterli olmadığından son yıllarda uç bilişim teknolojileri ortaya çıkmıştır. Elbette bu durum, uç bilişimin bulut bilişimin yerini alması anlamına gelmemektedir. Her ikisi de birlikte olmalı, birbirini tamamlamalı, koordineli bir şekilde gelişmeli ve sonuçta dijital dönüşüm sağlanmalıdır (Cao ve ark., 2020). Ağın ucunda hesaplamalar yapmak için yeni bir bilişim paradigması olan uç bilişim, işleme ve depolama işlemlerinin sistem gereksinimleri tarafından tanımlanan, uca yakın bir dizi ağa bağlı makinede gerçekleştiği dağıtılmış bir bilgi işlem biçimidir (Pérez ve ark., 2022). Kısaca uç bilişim, IoT cihazlarının uzaktaki bulutla iletişim kurarken ağın çevresinde gerçekleştirdiği hesaplama ve ağ işlemlerini ifade etmektedir (Sharma ve ark., 2024). Temel fikri, bilişimin veri kaynağına daha yakın olması olan uç bilişim, geleneksel bulut bilişimden farklıdır. Ancak uç düğümlerindeki tüm verileri derinlemesine analiz elde etmek ve daha anlamlı analiz sonuçları

elde etmek için bulutta özetlenmesi gerekmektedir. Bu nedenle bulut bilişim giderek daha akıllı hale gelen IoT cihazlarının geliştirilmesinde önemli bir rol oynamaktadır (Satyanarayanan, 2017; Cao ve ark., 2020).

Uç bilişim, bilişim görevinin uç cihazlara daha yakın düğümlere (onlardan bir sıçrama uzaklıkta) aktarılmasına olanak tanımaktadır. Bu nedenle, bu görevler veri kaynağına ve veri tüketicisine daha yakındır ve sunulan hizmetin kalitesini artırmaktadır. Farklı araştırmalar, altyapı maliyetini düşürmek veya gizlilik yönetimini iyileştirmek isteyenler için farklı alanlar, sıkı bir yanıt süresine sahip uygulamalar için uç bilişimin uygulanmasını önermektedir. Bu nedenle, şu anda uç bilişimin belirli kapsamı, hedeflenen alanlar ve faydaları konusunda bir fikir birliği eksikliği bulunmaktadır. Bu paradigmanın, bulut bilişim gibi diğer önerilere benzer şekilde sektör tarafından benimsenmesi için, tüm paydaşların ortak bir vizyona sahip olması, içinde yer alan farklı unsurları ve kavramları açıkça bilmesi, ele almalarına olanak tanıyan temel sorunların neler olduğunu, sağlanan temel faydaların neler olduğunu ve hangi alanlar için olduğunu bilmesi gerekmektedir (Pérez ve ark., 2022).

IoT bağlamında, bağlı cihazlar tarafından üretilen büyük miktardaki tüm veriler buluta iletilirse, bulut bilişim büyük bir yüke neden olur. Bu sırada, uç bilişimin bulutun baskısını paylaşması ve uç kapsamındaki görevleri üstlenmesi gerekir. Uç bilişimde bir sorun olduğunda, buluttaki veriler kaybolmaz. Bazı internet hizmetlerinde, veri madenciliği ve paylaşımının derinlemesine analizi gibi, uç bilişim tarafından işlendikten sonra bazı verilerin işlenmek üzere buluta geri döndürülmesi gerekir; bu da bulut bilişimin ve uç bilişimin iş birliğini gerektirir. Her iki gelişme de IoT ağındaki bağlı cihazlara istikrar getirmektedir. İkisinin çalışma yöntemi, bulut bilişimin büyük veri analizi ve çıktısına dayanması, uç tarafa iletilmesi ve ardından uç bilişim tarafından işlenip yürütülmesidir. Uç bilişim, bulut bilişim platformuna yükleme yapmadan verileri uç aygıtlarında depolar ve işler. Bu özellik nedeniyle uç bilişimin gerçek zamanlı, hızlı veri işleme ve analizi, güvenlik düşük maliyet, düşük enerji tüketimi ve düşük bant genişliği maliyeti gibi önemli avantajları bulunmaktadır. Bu önemli avantajları da göz önünde bulundurulduğunda uç bilişim, ağın ucunda veri depolama ve bilişim sağlamakta, yakınlarda internet akıllı hizmetleri sunarak çeşitli endüstrilerin dijital dönüşümüne destek olmakta ve farklı endüstrilerin veri çeşitlendirmesi gereksinimlerini karşılamaktadır (Cao ve ark., 2020).

Uç bilişimin önemli avantajları nedeniyle tarımsal uygulamalarda özellikle gerçek zamanlı veri işleme uygulanabilir hale gelmekte ve değişen tarımsal koşullara anında yanıt verilebilmektedir (Yang ve ark., 2024). Ayrıca tarımsal üretimin geniş alanlarda yapılması ve üretimdeki çeşitlilik gibi nedenlerle, tüm alandan toplanacak veriler bulut sunucusuna toplanması durumunda, sunucu ağ üzerinde daha fazla baskı uygulanmasına neden olacak ve bu da veri işleme hızının azalmasına neden olacaktır. Bu sorun, bulut sunucusunun yükünü paylaşabilen ve gecikmeyi azaltabilen uç bilişim teknolojisinin Agri-IoT ile kullanımı sayesinde mükemmel bir şekilde çözülebilecektir.

Bu çalışmada veri kaynaklarına daha yakın tasarlanmış bir sistem olan uç bilişim ve bu sisteme ait cihazların tarımsal uygulamalarda kullanımının araştırılması amaçlanmıştır. Çalışmada, tarımsal uygulamalarda kullanılan uç bilişim cihazlarının donanımı ve sistem mimarileri özellikle hassas tarım uygulamaları, çevresel koşul izleme, sulama sistemlerinin yönetimi hastalık ve zararlıların tespiti gibi uygulamalar kapsamında detaylı bir şekilde irdelenmiştir.

Ayrıca bu çalışma, tarımda uç bilişim uygulamalarının kazandırdığı potansiyel çözüm önerilerinin yanı sıra karşılaşılan temel zorlukların kapsamlı bir incelemesini de sunmaktadır.

2. TARIMDA UÇ BİLİŞİM VE NESNELERİN İNTERNETİ TEKNOLOJİLERİNİN TEMELLERİ

Uç bilişim, akıllı cihazlardan yollardaki otonom arabalara kadar verilerin hızlı, güvenli ve üretildiği yere yakın ortamlarda işlenmesini sağlamaktadır. Verileri işlemeyi, verilerin üretildiği yere yakınlaştırarak her şeyi merkezi bir sunucuya veya bulut veri merkezine gönderme ihtiyacını ortadan kaldırmaktadır (Andriulo ve ark., 2024). Tarım ve akıllı çiftçilik için uç bilişim, çiftçilerin sensör verilerini tamamen merkezi sunuculara göndermek yerine, IoT cihazları ve akıllı sensörler gibi kaynağına daha yakın bir noktada işlenmesini ve karar alınmasını sağlamaktadır (Shi ve ark., 2016). Yerel düzeyde uç bilişim, gerçek zamanlı işlem yapma becerisini ifade eder ve tarımsal sistemler için hızlı yanıtlar sağlamaktadır. Bu durum, sistemsel gecikmeleri en aza indirerek toprak koşullarının, zararlı kontrolünün ve ürün büyümesinin sürekli izlenmesi ve anında eyleme ihtiyaç duyulan hassas tarım uygulamalarında hızlı kararlar alınmasını desteklemektedir. Uç bilişim, sınırlı internet bağlantısına sahip kırsal alanlarda kablolu ve kablosuz sensör ağları tarafından üretilen büyük miktardaki veriyi doğrudan çiftlik ortamında işlemektedir (O'Grady ve ark., 2019). Hava durumu tahminlerini, toprak nem seviyelerini veya hava durumu modellerinin gerçek zamanlı olarak analiz edilmesini sağlayarak sulama sistemlerinin su kullanımını ve çiftçilik verimliliğini optimize etmek için otonom olarak ayarlanmasına olanak tanımaktadır. Derin öğrenme yetenekleri de dâhil olmak üzere öngörücü analiz ve makine öğrenimi teknikleri, zararlı istilalarının erken belirtilerini belirleyebilir veya mahsul sağlığındaki değişiklikleri tespit ederek etkili mahsul yönetimine imkân tanıyarak sürdürülebilirliği artırma potansiyeline sahiptir (Singh ve ark., 2018).

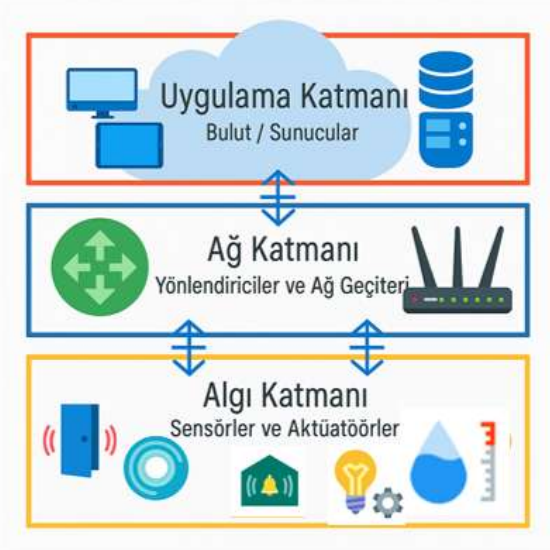
Tarımda uç bilişimin, gerçek zamanlı karar alma, gelişmiş kaynak verimliliği, azaltılmış gecikme, gelişmiş veri güvenliği, sürdürülebilirlik ve maliyet tasarrufu gibi temel avantajları bulunmaktadır (Sulieman ve ark., 2022). Günümüzde akıllı tarımda uç bilişim, hassas tarım, hayvancılık izleme, sera otomasyonu, mahsul sağlığının izlenmesi, tedarik zinciri optimizasyonu gibi uygulamalarda yoğun şekilde kullanılmaya başlamıştır (Abdo-Peralta ve ark., 2024).

Tarımda uç bilişimi yönlendiren temelde 5 ana teknoloji bulunmaktadır. Bunlar; IoT cihazları, yapay zeka entegrasyonu, düşük güç tüketen işlemciler, 5G ağları ve otonom sistemlerdir. Toprak ve bitkiye ait fiziksel, kimyasal ve biyolojik veriler, hava durumu ve hayvancılıkta hayvan takibi gibi gerçek zamanlı tarımsal verilerin yakalanmasında IoT sensör ve cihazları kritik rol oynamaktadır. Elde edilen tarımsal verilerin analiz edilmesinde uç bilişim destekli yapay zeka modelleri, öngörücü analiz ve otomasyon için karar alma süreçlerini iyileştirmektedirler. Düşük güç tüketen özelleştirilmiş işlemciler uzak noktalarda enerji açısından verimli ve yüksek hızlı işlem sağlayarak tarımsal operasyonları desteklemektedirler. Akıllı çiftçilik uygulamaları için daha hızlı ve ölçeklenebilir sistemler oluşturarak uç cihazlar arasındaki bağlantının hızlandırılması minimum beşinci nesil mobil teknoloji olarak da bilinen 5G hücresel ağını gerektirmektedir. Son olarak, insansız hava araçları, robotlar ve tüm otonom

sistemler, çiftçilik görevlerini anında gerçekleştirmek, verimliliği ve üretkenliği artırmak için uç bilişimden yararlanmaktadır.

2.1. IoT, Uç, Sis ve Bulut farkları

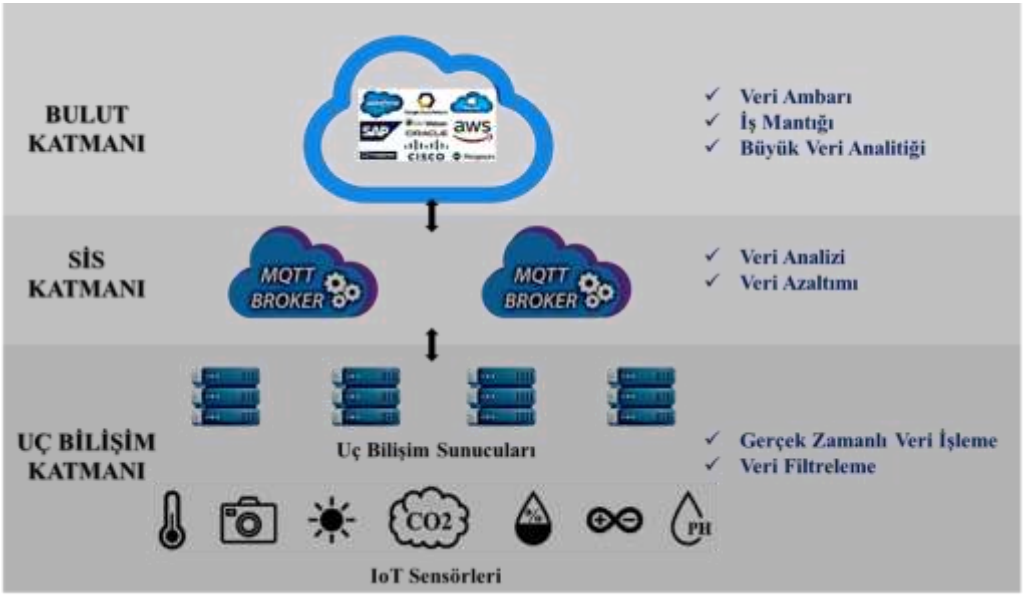
IoT, Şekil 1'de genel mimarisi verilen sensörler, yazılım ve ağ bağlantısı ile donatılmış fiziksel cihazlar, araçlar, gereçler ve diğer fiziksel nesnelerden oluşan bir ağı ifade eder ve bunların veri toplamasına ve paylaşmasına olanak tanımaktadır. IoT ve uç bilişim, sıklıkla birlikte kullanılsa da birbirini tamamlayan farklı teknolojileri işaret etmektedir. IoT, fiziksel cihazları veri alışverişi ve analizi için bağlamaya odaklanırken, uç bilişim, verilerin yerel olarak işlenmesine yani üretildiği yere yakın bir yerde vurgu yapmaktadır. Birlikte, gerçek zamanlı kararlar, otomasyon ve optimizasyon yapabilen güçlü sistemleri etkinleştirirler. IoT, birbirine bağlı cihazlara ve bunlar arasındaki kesintisiz veri akışına odaklanırken uç bilişim verilerin nerede ve nasıl işleneceğine odaklanarak yerelleştirilmiş hesaplamaya öncelik verir ve buluta bağımlılığı en aza indirir (Kalyani ve Collier, 2021). Pratik açıdan, IoT cihazları uç bilişim olmadan var olabilir, ancak uç bilişim, yerel veri işlemeyi etkinleştirerek IoT uygulamalarına yardımcı olmaktadır. Uç bilişim, sayısız IoT cihazından gelen bitmek bilmeyen trafiği yönetmek için tek bir bilgisayara güvenmek yerine, iş yüklerini birden fazla makineye atamayı sağlamaktadır. Bu anlamda uç bilişim, daha iyi performans, daha kısa yanıt süreleri, gerçek zamanlı içgörüler ve sınırsız ölçeklenebilirlik yanı sıra yalnızca gerçekten ihtiyaç duyulan ve kullanılan verilerin yakın noktalarda kaydedilmesine imkan vermesi nedeniyle daha az bulut depolama alanı kullanılmasını sağlamaktadır (Fernando ve ark., 2025).



Şekil 1. Genel IoT mimarisi

Cisco tarafından ortaya atılan fog (sis bilişim) ve uç bilişim terimleri, her ikisi de işleme ve analiz kaynaklarını verilerin üretildiği noktalara daha yakın bir yere tahsis etmeyi içerdiğinden, genellikle birbirinin yerine kullanılmaktadır. Sis bilişim veya sisleme, uç ve büyük sunucular

arasında bir yerde, yerel alan ağı (LAN) içinde gerçekleşmektedir. Uç bilişimde ise veriler sensörlere fiziksel olarak bağlı cihazlarda işlenmektedir. Uç ve sis bilişimine benzer şekilde, bulut bilişim dağıtılmış veri depolama ve işleme fikrini desteklemektedir. Bulut bilişim, geleneksel veri merkezlerinin yerini alır veya onları tamamlar. Aynı zamanda kaynakların birden fazla konuma ölçeklenebilir şekilde dağıtılmasını sağlar ve analiz için güçlü araçlar sunar. Yine de, bulut tesisleri verilerin üretildiği yerden yüzlerce hatta binlerce mil uzakta olabilmektedir. Uygulamada, uç, sis ve bulut bilişim, IoT verilerini işlemek için bir sistemin yalnızca farklı katmanlarıdır. Çoğu durumda, katmanlar bilgileri MQTT (Message Queuing Telemetry Transport- Mesaj Kuyruğu Telemetri İletimi) aracılığıyla değiştirmektedir (Chang ve ark., 2023). Şekil 2'de uç, sis ve bulut bilişimlerinin kullanımını gösteren yapı verilmiştir. Bulut, sis ve uç bilişim arasında veri işleme yeri, işlem gücü ve depolama kapasitesi, hedefler, internet bağlantısı gereksinimi, veri güvenliği ve kurulum ve yönetim gibi noktalarda temel farklılıklar bulunmaktadır.



Şekil 2. Uç, sis ve bulut bilişimlerinin kullanımını gösteren mimari

2.2. Tarımsal verilerde uç işlemeye duyulan ihtiyaç

Uç bilişim, merkezi bilişimin geleneksel modellerinin çözemediği zorlukları ele aldığı için günümüz dünyasında hayati öneme sahiptir. Tarımsal süreçlerde kararların genellikle gerçek zamanlı olarak alınması gerekmektedir (Cruz ve ark., 2022). Uç bilişim, IoT cihazlarının verileri yerel olarak işlemesine olanak tanıyarak kararların milisaniyeler içinde alınmasını sağlamaktadır. Örneğin, yabancı ot tespiti yapacak otonom bir mobil robot, hareketli halde yabancı otu sensörlerden gelen girdileri saniyenin onda biri kadar kısa sürede tespit ederek uç efektörün hızlı bir şekilde çalıştırılmasına imkan sağlayabilir. Akıllı çiftlik ortamında yüzlerce IoT cihazı muazzam miktarda veri üretmektedir. Tüm bu verileri işlemek için merkezi bir

sunucuya veya buluta göndermek ağ bant genişliğini zorlayarak maliyetlerin artmasına neden olmaktadır. Uç bilişim, verileri yerel olarak işleyerek bu sorunu çözer ve hem işletmeler hem de son kullanıcılar için daha sorunsuz performans sağlar. Uç bilişim verileri kaynağına yakın tutarak hassas bilgileri ağlar üzerinden iletmeyle ilişkili riskleri azaltma özelliğine sahiptir. Yapay zeka ve makine öğrenimi gibi teknolojiler gelişmeye devam ettikçe, uç bilişim bunların gelişimini desteklemede önemli bir rol oynamaktadır (Hoque ve ark., 2024). Tüm bu gelişmeler, uç bilişimin inovasyon ve verimliliği yönlendirmede ne kadar önemli olduğunu göstermektedir.

2.3. Uç bilişim mimarileri

Uç bilişim cihazları, genellikle veri kaynaklarına veya tüketicilere yakın olan ağın kenarına yakın bilgi işlem cihazlarıdır. Bunlar gerçek zamanlı uygulamalarda ve IoT dağıtımlarında önemli bir rol oynamaktadır. Bu cihazlar, verileri merkezi sunuculara veya diğer cihazlara göndermeden önce titizlikle toplar, filtreler ve analiz eder. Basit sensörlerden karmaşık endüstriyel sistemlere kadar her şeyi kapsarlar. Uç bilişim, veri işlemeyi kullanıcıya daha yakın bir yere taşımak için ağın kenarındaki yakın veri işleme yeteneklerinin kullanılması anlamına gelmektedir. Bu, verilerin hedefine daha hızlı ulaşmasını sağlayan "bağlantısı kesilmiş" bir anahtar veya yönlendirici gibidir. Uç bilişim ağ geçidi, geleneksel merkezi bilişim sürecini kullanıcılara daha yakın ve en geniş bant genişliğine sahip ağa taşıyan ve işletmelerin üretkenliğini ve yanıt hızını etkili bir şekilde iyileştiren bir ara düğüm olarak da anlaşılabilir. Uç bilişim ağ geçitleri, uç cihazlarının buluta bağlanması, veri ve uygulama hizmetlerini toplaması ve işlemesi için önemli bir ara yüzdür. Şekil 3'te sensör düğümleri, ağ geçidi, bulut ve son kullanıcı arasındaki veri mekanizması blok şema olarak gösterilmiştir.

Şekil 3. Sensör düğümleri, ağ geçidi, bulut ve son kullanıcı arasındaki veri mekanizması

Uç bilişimin üç temel bileşeni bulunmaktadır. Bunlar, uç cihazlar, uç sunucular veya ağ geçitleri ve bulut sunucularıdır. Veri üreten ve alan cihazlar (sensörler, kameralar, robotlar, vb.). uç cihazları oluşturmaktadır. Uç sunucular veya ağ geçitleri, verileri filtrelemek ve işleyen cihazlara yakın olan ve yalnızca önemli bilgileri buluta göndermek için kullanılmaktadır. Bulut sunucular, ilgili verilerin gelişmiş modeller kullanılarak daha derinlemesine analizlerinin yapıldığı sunuculardır. Şekil 4'te temel uç bilişim mimarileri verilmiştir.

Şekil 4. Temel uç bilişim mimarileri

3. TEMEL TEKNOLOJİLER

3.1. IoT sensörleri

Sensör teknolojileri, tarımsal uygulamalarda ekimden ürünün paketlenmesine kadar üretim sürecinin farklı aşamalarında aktif rol oynamaktadır (Alahmad ve ark., 2023). Toprak besin içeriği, çevresel koşullar ve iklim verileri gibi üretimi etkileyen değişkenlerin izlenmesinde kullanılan bu sensörler; konum belirleme, optik algılama, mekanik ölçüm, elektrokimyasal tespit ve hava akışı analizi gibi farklı teknik gruplarda sınıflandırılmaktadır (Li ve ark., 2010). Bu sensörler, IoT sistemleriyle entegre edildiğinde, tarla koşullarına ait veriler gerçek zamanlı olarak toplanıp analiz edilebilmekte, üretim süreçlerine dair kararlar yerinde ve hızlı biçimde alınabilmektedir. Uç bilişim mimarilerinin kullanımı, verilerin bulut ortamına aktarılmadan önce yerel olarak işlenmesini mümkün kılarak ağ üzerindeki veri yükünü azaltmakta ve sistemin yanıt süresini iyileştirmektedir. Böylece IoT tabanlı sensör sistemleri, yalnızca izleme aracı olmaktan çıkarak karar destek sistemlerinin temel bileşeni hâline gelmektedir.

Günümüzde toprak nemi, sıcaklık, pH, elektriksel iletkenlik, CO_2 seviyesi, ışık yoğunluğu, fotosentez kapasitesi, meyve gelişimi ve hava akımı gibi birçok parametre IoT destekli sensörler aracılığıyla sürekli olarak izlenebilmektedir. Bu veriler, sulama yönetimi, gelişim takibi, çevresel kontrol ve erken uyarı sistemleri gibi pek çok uygulamada etkin şekilde değerlendirilmektedir. Ayrıca, sensör ağlarının modüler yapısı sayesinde üretim alanına özgü özelleştirilebilir sistemler kurulabilmekte, bu da sistem esnekliğini artırmaktadır.

Agri-IoT sistemlerinde özellikle makine bileşenlerine entegre edilen sensörler, sistemin maruz kaldığı biyotik ve abiyotik stres faktörlerine dair sürekli bilgi akışı sağlayarak üreticiye operasyonel farkındalık kazandırmaktadır. Toprak, bitki ve hayvan üzerinde konumlandırılan sensörlerden elde edilen çoklu verilerin analizi; çevresel ve ekonomik sürdürülebilirliği gözeten teknik iyileştirmelere olanak tanımakta, hassas tarım uygulamalarının doğa dostu ve yüksek verimli bir yapıya kavuşmasını sağlamaktadır (Baillie ve ark., 2018). Bu noktada, kullanılacak sensörlerin doğru seçilmesi, sistemin verimliliği ve güvenilirliği açısından kritik önem taşımaktadır. Son yıllardaki teknolojik gelişmeler, sensör tabanlı IoT çözümlerinin hızlı

yayılımına olanak sağlamıştır. Ancak, sistem tasarımında sensör tercihi yapılırken; düşük güç tüketimi, sensör-bilgisayar iletişim uyumu, ölçüm doğruluğu, hassasiyet, tekrarlanabilirlik ve uzun ömür gibi teknik kriterler göz önünde bulundurulmalıdır (Chamara ve ark., 2022). Bu bağlamda, Tablo 1'de farklı tarımsal uygulama alanlarında kullanılan IoT tabanlı sensör sistemleri ve ilgili literatür çalışmaları özetlenmiştir.

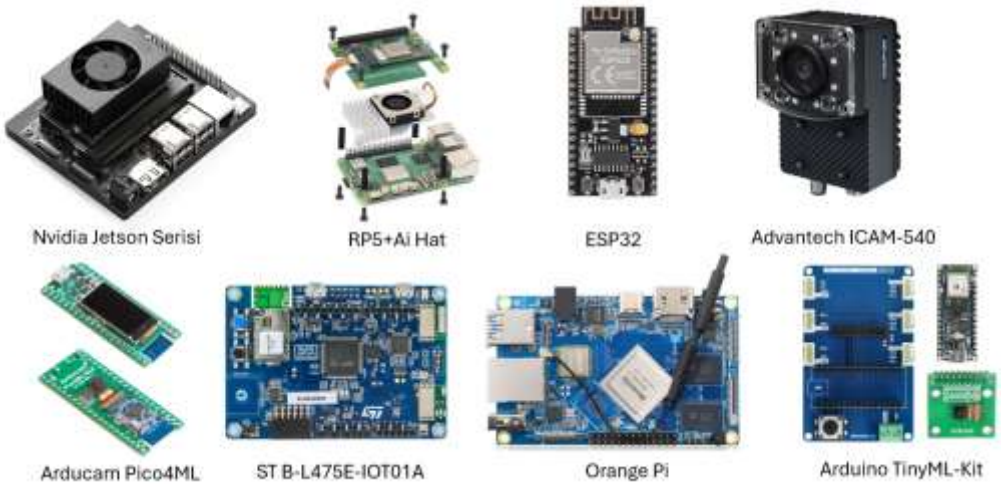
Tablo 1. Tarımsal uygulama alanlarında kullanılan bazı IoT tabanlı sensör sistemleri ve ilgili literatür çalışmaları

Sensör	Tarımsal Çalışma Alanı	Çalışma
pH sensörü, toprak nem sensörü, toprak sıcaklık sensörü	Toprak	Na ve ark. (2016)
Hava sıcaklığı ve nem sensörü, toprak sıcaklığı ve nem sensörü, rüzgar hızı/yönü sensörü, yağmur ölçer, güneş radyasyonu sensörü, yaprak ıslaklığı sensörü.	Hastalık	Khattab ve ark. (2019)
Hava kalitesi (CO_2) sensörü, ışık sensörü, toprak nem sensörü	Sera	Aafreen ve ark. (2019)
Toprak nemi, sıcaklık ve yağış sensörleri	Sulama	Tace ve ark. (2022)

3.2. IoT ve uç bilişim uygulamaları için yaygın olarak kullanılan bazı gömülü sistem donanımları

IoT ve uç bilişim uygulamalarının artan gereksinimleri doğrultusunda, düşük güç tüketimli ve yüksek işlem kapasiteli gömülü sistem donanımları yaygın şekilde kullanılmaktadır. Bu tür sistemler; veri toplama, analiz etme ve karar süreçlerine doğrudan etki eden mimarilerle donatılmıştır. Şekil 5'te yer alan Nvidia Jetson serisi, RP5+AI Hat, ESP32, Advantech ICAM-540, Arducam Pico4ML, ST B-L475E-IOT01A, Orange Pi ve Arduino TinyML-Kit gibi donanımlar, özellikle tarımda görüntü işleme, çevresel izleme, makine öğrenmesi, kablosuz veri aktarımı ve uç yapay zekâ uygulamalarında etkin biçimde kullanılmaktadır.

Yüksek işlem kapasitesine sahip Jetson serisi veya RP5+AI Hat gibi platformlar, kamera tabanlı analizlerde kullanılabilirken; ESP32 gibi mikrodenetleyiciler düşük güçle Bluetooth/Wi-Fi üzerinden haberleşme sunar. Kamera ve görüntü işleme odaklı sistemler (örneğin ICAM-540 ve Pico4ML) görsel verilerin uçta işlenmesini sağlarken, ST ve Orange Pi gibi geliştirme kartları ise çoklu sensör girişine uygun yapısıyla veri toplama ve aktarma görevlerini üstlenmektedir. Bu cihazların modülerliği, sahaya özgü çözümler üretilmesine olanak tanımakta ve IoT tabanlı uygulamalarda sistemlerin özelleştirilmesini kolaylaştırmaktadır.



Şekil 5. IoT ve uç bilişim uygulamaları için yaygın olarak kullanılan bazı gömülü sistem cihazları

Farklı tarımsal uygulama alanlarının gereksinimlerine bağlı olarak, çeşitli mikrodenetleyici ve gömülü sistem donanımları tercih edilmektedir. Tablo 2'de, hastalık tespiti, meyve izleme, üretim süreci takibi ve hayvansal verimliliğin değerlendirilmesi gibi alanlarda kullanılan bazı donanımlar ile bu sistemlerin kullanıldığı örnek çalışmalar özetlenmiştir.

Tablo 2. Uç bilişim ve IoT tabanlı tarımsal uygulamalarda kullanılan bazı gömülü sistem cihazları ve ilgili literatür çalışmaları

Donanım	Tarımsal Çalışma Alanı	Çalışma
Raspberry Pi 4B Arduino	Hastalık Tespiti	Cruz ve ark. (2022)
Raspberry Pi 4 Coral TPU	Meyve Tespiti	Assunção ve ark. (2022)
ESP8266 Node MCU Modül	Meyve Yetiştiriciliği	Abdo-Peralta ve ark. (2024)
Nvidia Jetson AGX Xavier	Süt İneklerinde Vücut Kondisyon Skoru Tespiti	Wang ve ark. (2024)

3.3. Bağlantı protokolleri

Son yıllarda kablosuz veri iletim teknolojileri hızlı bir şekilde gelişmiştir. Tarımda IoT uygulamaları için Wi-Fi, LoRaWAN, mobil iletişim (örneğin 2G, 3G, 4G ve 5G), ZigBee ve Bluetooth gibi çeşitli iletişim teknolojileri kullanılmaktadır. Bu iletişim altyapıları, tarımsal süreçlerin baştan sona otomatikleştirilmesine olanak tanıyarak, işlemlerin daha kolay yönetilmesini ve üretkenliğin önemli ölçüde artmasını sağlamaktadır. (Kim ve ark., 2020). Kablosuz ağ teknolojileri; frekans aralığı, enerji tüketimi, iletişim mesafesi ve veri aktarım

kapasitesi gibi farklı teknik özelliklere sahiptir. Özellikle veri iletim uzaklığı, kullanılacak teknolojinin seçiminde belirleyici olup, aynı zamanda sistemin maliyetini de etkileyen bir faktördür (Ray, 2017). Bu nedenle, üreticiler tarımsal ihtiyaçlara uygun iletim menziline sahip bir iletişim yöntemini tercih etmelidir. Tablo 3'te farklı IoT için kablosuz ağ protokollerinin özellikleri verilmiştir. Bu protokoller; veri iletim hızı, menzil, desteklediği cihaz sayısı ile ağ geçidi ve sensör bazında güç tüketimi gibi temel parametreler açısından farklılık göstermektedir. Örneğin, Zigbee protokolü düşük güç tüketimi (0.1 Watt) ve kısa menzil (20 m) ile sınırlı cihaz kapasitesine (240 cihaz) sahipken; buna karşın NB-IoT daha geniş menzil (15 km) ve çok daha yüksek cihaz kapasitesi (55.000 cihaz) sunmakta, ancak ağ geçidi güç tüketimi oldukça yüksektir (6877 Watt).

Özellikle geniş arazilerde yapılan uygulamalar için menzil ve cihaz sayısı gibi faktörler önem kazanmakta ve bu bağlamda LoRa, 10 km'ye varan menzili ve 10.000 cihaza kadar destek kapasitesi ile düşük güç tüketimi avantajı sayesinde dikkat çekmektedir. 5G ise 28 km'lik etkileyici menzili, 1 km² başına 1 milyon cihaza kadar destek sağlaması ve yüksek veri iletim hızı (20 Gbps) ile yoğun veri trafiği gerektiren uygulamalarda öne çıkmaktadır. Ancak bu avantajların yanında, ağ geçidi seviyesindeki güç tüketimi (11.500 Watt) oldukça yüksektir. Bu değerlendirmeler kapsamında, IoT tabanlı tarımsal uygulamalarda kullanılacak kablosuz iletişim protokolünün seçiminde; uygulamanın kapsama alanı, veri yoğunluğu, enerji verimliliği ve altyapı maliyeti gibi unsurlar birlikte ele alınmalıdır.

Tablo 3. IoT kablosuz ağ protokolleri (Alharbi ve Aldossary, 2021)

Bağlantı Protokolleri	**Veri Hızı**	**Menzil**	**Cihaz Sayısı**	**Güç Tüketimi (Ağ Geçidi / Baz İstasyonu)**	**Güç Tüketimi (Sensör)**
Zigbee	250 Kbps	20 m	240 cihaz	1 Watt	0.1 Watt
LoRa (Long Range)	50 Kbps	10 km	10.000 cihaz	30 Watt	0.44 Watt
NB-IoT (Near Band)	200 Kbps	15 km	55.000 cihaz	6877 Watt	0.55 Watt
5G	20 Gbps	28 km	1 km² başına 1 milyon cihaz	11.500 Watt	0.4 Watt

4. TARIMSAL UYGULAMA ALANLARI

4.1. Sulama Otomasyonu

Angelopoulos ve ark. (2020), çilek seralarında su kullanımını optimize etmek amacıyla uç bilişim temelli akıllı bir sulama sistemi geliştirmiştir. Başlangıçta, nane, lavanta ve sardunya gibi bitkilerle yapılan küçük ölçekli prototip denemelerinde toprak nem sensörleri ve otomatik vanalar kullanılarak sistemin işlevselliği test edilmiştir. Daha sonra, Yunanistan'daki bir çilek serasında geniş çaplı uygulama gerçekleştirilmiş ve bu sistemin geleneksel yöntemlere kıyasla %50 oranında daha az su tüketimi sağladığı, toprak nem seviyesini daha dengeli tuttuğu ve veri işleme süreçlerinde daha hızlı ve güvenli olduğu ortaya konmuştur. Bu bulgular, uç bilişim teknolojisinin tarımsal sulamada verimlilik ve su tasarrufu açısından etkili bir çözüm sunduğunu göstermektedir. Liu ve ark. (2023b), Nebraska'da tarımsal sulama sistemlerinde kullanılan su sayaçlarının uzaktan izlenmesi amacıyla, uç bilişim tabanlı ve derin öğrenme destekli bir algoritma geliştirmiştir. YOLOv3 modeli ile su sayacı görüntülerinden yalnızca gerekli verileri çıkaran bu sistem, Raspberry Pi tabanlı AI-FlowCAM cihazı üzerinde çalışmakta ve 3.248 gerçek dünya görüntüsüyle eğitilmiştir. Sistemin doğruluk oranı %95.35 olarak belirlenmiş, LoRaWAN ağı üzerinden yalnızca küçük boyutlu verilerin iletilmesi sayesinde düşük bant genişliği ile çalışabildiği gözlemlenmiştir. Saha testlerinde %73.8 başarı oranı elde edilen sistem, düşük maliyetli ve etkili bir su yönetimi çözümü sunarken, özellikle görüntü kalitesine duyarlılığıyla dikkat çekmiştir.

4.2. Hassas Tarım ve Konumsal İzleme

Abdo-Peralta ve ark. (2024), çilek seralarında verimliliği artırmak üzere geliştirilen AgroTec 4.0 isimli düşük maliyetli ve kullanıcı dostu bir akıllı tarım sisteminin performansını değerlendirmiştir. 500 m² büyüklüğündeki iki yarı-hidroponik serada yapılan karşılaştırmalı deneyde, bir seraya sistem entegre edilirken diğerinde geleneksel yöntemler uygulanmıştır. IoT sensörleriyle toplanan çevresel veriler, Node-RED platformunda çalışan uç bilişim tabanlı sistem ile analiz edilmiş; sonuçlar, sistemin %15 verim artışı, %20 su tasarrufu, %11.8 daha yüksek şeker oranı ve %103 yatırım getirisi sağladığını göstermiştir. Bu veriler, uç bilişim teknolojilerinin ekonomik ve çevresel sürdürülebilirliğe katkı sağladığını ortaya koymaktadır. Lloret ve ark. (2021), elektromanyetik indüksiyon prensibine dayalı, kablosuz bir toprak nem izleme sistemi geliştirmiştir. ESP32 modülü ile kablosuz veri iletimi sağlayan bu sistem, çok katmanlı toprak analizine imkân tanıyan dört bobinli sensörlerden oluşmaktadır. 93 kHz frekansında çalışan bir devreyle uyarılan bu sistem, doğrusal yanıt kapasitesiyle farklı toprak tiplerinde test edilmiş ve 1:2 sarım oranı ile 50 mm çaplı prototipin en iyi performansı sunduğu belirlenmiştir. Geliştirilen sistem, düşük maliyeti, geniş alanlara uygulanabilirliği ve Wi-Fi tabanlı mimarisi ile hassas tarım uygulamaları için uygun bir çözüm olarak değerlendirilmiştir. Bayih ve ark. (2022), küçük ölçekli tarımda IoT ve kablosuz sensör ağlarının sürdürülebilirliğe katkılarını incelemiştir. 53 çalışmanın analiz edildiği bu sistematik derleme; toprak, iklim, zararlı kontrolü ve hayvancılık parametrelerinin izlenmesinde kullanılan sensörler, veri iletim protokolleri ve bilgi işlem yaklaşımlarının etkinliğini değerlendirmiştir. Çalışma, küçük çiftçiler için düşük maliyetli, modüler ve kullanıcı dostu sistemlerin önemine dikkat çekmiş; veri kalitesi, sensör kalibrasyonu ve kırsal altyapı gibi zorluklara çözüm önerileri sunmuştur.

Amiri-Zarandi ve ark. (2022), akıllı tarım uygulamalarında veri işleme süreçlerini iyileştirmek için bir platform yaklaşımı önermiştir. Mevcut sistemlerin heterojen veri yönetimi, güvenlik açıkları ve uyumluluk sorunlarını ele alan bu yaklaşım; birlikte çalışabilirlik, ölçeklenebilirlik, güvenlik ve düzenleme uyumu gibi temel ihtiyaçlara odaklanmış; uç bilişim ve blokzincir teknolojilerinin entegrasyonunu vurgulamıştır.

4.3. Zararlı ve Hastalık Tespiti

Bhujel ve ark. (2022), domates yaprağı hastalıklarını sınıflandırmak için dikkat mekanizmalarıyla desteklenmiş hafif bir CNN modeli geliştirmiştir. PlantVillage veri seti kullanılarak eğitilen model, CBAM modülünün %99.69 doğrulukla en iyi performansı sergilediğini ve parametre/veri işleme açısından oldukça verimli olduğunu ortaya koymuştur. Cruz ve ark. (2022), çilek tarımında IoT, uç bilişim, bilgisayarla görü ve makine öğrenimi entegrasyonu ile akıllı bir tarım platformu geliştirmiştir. YOLOv5s mimarisi ile hastalık tespiti yapılmış, modelin %92.8 doğruluk oranıyla yedi yaygın çilek hastalığını tespit ettiği gösterilmiştir. Liu ve ark. (2022), Alternaria yaprak lekesi hastalığını tespit etmek için iki aşamalı CNN tabanlı bir sistem geliştirmiştir. PSPNet ile yaprak segmentasyonu ve UNet ile hastalık bölgesi tespiti gerçekleştirilmiş, %96.41 sınıflandırma doğruluğu elde edilmiştir. Yao ve ark. (2022), kivi yaprağı hastalıklarını tespit etmek için YOLOX ve DeepLabv3+ modellerini içeren iki aşamalı bir sistem önermiştir. %96.6 doğruluk oranına ulaşan sistem, görsel segmentasyon ve sınıflandırma açısından etkili sonuçlar sunmuştur. Wang ve ark. (2024), süt ineklerinin vücut kondisyon skorlaması için derin öğrenme destekli Edge-IoT tabanlı bir platform geliştirmiştir. YOLOv7, EfficientID ve EfficientBCS modellerinin kullanıldığı sistem, %98.6 nesne tespiti ve %87'ye varan skor tahmin doğruluğu ile başarılı sonuçlar vermiştir. Monowar ve ark. (2022), etiketli veri ihtiyacını ortadan kaldıran ve yaprak hastalıklarını sınıflandıran öz denetimli bir öğrenme yaklaşımı sunmuştur. Siamese mimarili bu sistem, AutoEmbedder temelli olup k-means algoritması ile yüksek doğrulukla sınıflandırma gerçekleştirmiştir.

4.4. Seralarda İklim Kontrolü

Rizwan ve ark. (2024), sera ortamının iklimsel parametrelerini optimize etmek ve ürün izlenebilirliğini sağlamak amacıyla yapay zekâ ve blokzincir destekli bir yönetim sistemi geliştirmiştir. OCF protokolü ile veri toplayan sistem, Firefly algoritmasıyla enerji verimliliği sağlamış; fuzzy logic kontrol modülüyle ısıtma, soğutma ve havalandırma sistemlerini yönetmiştir. Sistemin %38 enerji tasarrufu sağladığı ve ürün takibini şeffaf biçimde gerçekleştirdiği belirlenmiştir.

4.5. Ürün Verimi ve Takibi

Sharma ve Shivandu (2024), AI ve IoT teknolojilerinin entegre kullanımını değerlendirerek, görüntü işleme, uzaktan algılama, robotik sistemler ve veri analitiği temelli yaklaşımların tarımda ürün verimi ve yönetim üzerindeki etkilerini incelemiştir. Derleme çalışmasında 5G/6G gibi yeni nesil bağlantı teknolojilerinin rolü vurgulanmış; küçük ölçekli çiftliklerde ölçeklenebilirlik ve karar destek sistemlerine dair araştırma boşluklarına dikkat çekilmiştir.

5. KARŞILAŞILAN ZORLUKLAR

Tarımda IoT sistemlerinin benimsenmesi ve güvenle uygulanabilmesi için yalnızca teknolojik altyapının değil, aynı zamanda güvenlik, veri yönetimi ve sistem kararlılığının da titizlikle değerlendirilmesi gerekmektedir. Tarımsal uygulamalarda kullanılan IoT sistemleri, büyük miktarda veri üretmekte ve bu verilerin gerçek zamanlı işlenmesini gerektirmektedir. Ancak bu durum, veri türü, depolama süresi ve aktarım stratejileri gibi başlıklarda çeşitli zorlukları beraberinde getirir. Örneğin, uç bilişim cihazlarda yürütülen görüntü işleme işlemlerinde, sadece öznitelik verilerinin saklanıp orijinal verinin silinmesiyle sistemin hafiflemesi sağlanabilir. Aynı şekilde, toplanan verilerin tamamının başka bir platforma aktarılmasına gerek duyulmayabilir; yalnızca özetlenmiş veya işlenmiş verilerin aktarılması yeterlidir. Bu bağlamda hem kısa vadeli hem de uzun vadeli veri yönetim planlarının yapılması kritik öneme sahiptir.

IoT tabanlı sistemlerin dağıtık doğası, görev dağılımı ve kaynak yönetimi açısından da zorluklar yaratmaktadır. Tarımda kullanılan uç–terminal–bulut mimarisi, görevlerin uygun şekilde ayrıştırılmasını gerektirir. Bu, her bir uç bilişim cihazının işlem kapasitesi, enerji kullanımı ve yanıt süresi dikkate alınarak uygulama bileşenlerinin farklı noktalara dağıtılması anlamına gelir. Bu görev paylaşımı yapılırken uygulamanın bütünlüğü korunmalı, aynı zamanda sistem performansı ve yanıt hızı maksimize edilmelidir. Güncel çalışmalarda yapay zekâ algoritmalarının kenarda ve bulutta bölünerek çalıştırılmasına yönelik modeller geliştirilmekte; bu da sistemin esnekliğini ve verimliliğini artırmaktadır.

Öte yandan, güvenlik ve gizlilik konuları da IoT uygulamalarının başarısını doğrudan etkileyen bir diğer önemli alandır. Özellikle seralar dışındaki açık tarım alanlarında kullanılan cihazlar yağmur, yüksek sıcaklık, nem ve rüzgâr gibi çevresel koşullara doğrudan maruz kalmakta ve bu durum cihaz performansını düşürebilmektedir. Bu nedenle, dış ortam koşullarına dayanıklı fiziksel donanımlar kullanılmalı ve cihazların güvenliği sağlanmalıdır. Ayrıca, toplanan tarımsal verilerin, çiftlik bilgilerinin ve ağ iletişiminin siber saldırılara karşı korunması gereklidir. Dağıtık sensör mimarilerinde tekil bir güvenlik protokolü yetersiz kalabileceğinden çoklu erişim kontrolü ve güvenli haberleşme yöntemleri tercih edilmelidir. Bununla birlikte, sistemin ölçeklenebilirliği ve tüm cihazların yönetilebilirliği açısından ağ protokollerinin güvenilir ve sürdürülebilir olması şarttır.

Son olarak, geniş tarım alanlarında sinyal gücünün zayıf olması sistem kararlılığını tehdit etmektedir. Hizmetlerin kesintisiz sürdürülebilmesi için sistemin; ayırt edilebilirlik, esneklik, izolasyon ve hata bildirimi gibi temel özellikleri sağlaması gerekmektedir. Örneğin, kritik görevlerin önceliklendirilmesi, arızalı bir bileşenin kullanıcıya bildirilmesi ya da yeni cihazların mevcut sistemle uyumlu çalışması gibi konular, tarımda IoT uygulamalarının güvenilirliğini artıracaktır.

6. SONUÇ VE DEĞERLENDİRME

Bu çalışma, dijital tarımın temel yapı taşlarından biri hâline gelen uç bilişim teknolojileri ve IoT uygulamalarının, tarımsal üretim süreçlerinde nasıl bütünleştiğini kapsamlı biçimde incelemiştir. Hassas tarım, çevresel izleme, sulama optimizasyonu, hastalık-zararlı tespiti ve

hayvancılıkta izleme gibi farklı alanlarda kullanılan mikrodenetleyici tabanlı sistemlerin; veri toplama, ön işleme, karar destek ve otonom yönetim mekanizmalarında kritik bir rol üstlendiği görülmektedir.

Literatürdeki çalışmalar, IoT tabanlı uç bilişim sistemlerinin, geleneksel bulut tabanlı yapılara kıyasla; düşük gecikme süresi, azalan bant genişliği gereksinimi, enerji tasarrufu ve modüler yapıları sayesinde saha koşullarına daha uygun çözümler sunduğunu ortaya koymaktadır. İncelenen kaynaklar, özellikle Raspberry Pi, Arduino, Nvidia Jetson ve ESP32 gibi gömülü sistem donanımlarının tarımsal uygulamalarda yaygın şekilde kullanıldığını göstermektedir. Bu donanımların, çeşitli sensör teknolojileri ile entegre edilerek gerçek zamanlı veri işleme ve karar destek süreçlerini desteklediği vurgulanmaktadır. Bununla birlikte, veri güvenliği, fiziksel çevre koşullarına dayanıklılık, maliyet ve sistem kararlılığı gibi konular, bu teknolojilerin yaygınlaşmasının önündeki temel engeller arasında yer almaktadır. Özellikle büyük ölçekli üretim sahalarında sistemin güvenilirliği, ağ protokollerinin sürdürülebilirliği ve görevlerin uç-bulut mimarisi arasında doğru biçimde paylaştırılması kritik önemdedir.

Gelecekteki çalışmalar için, uç bilişim destekli yapay zekâ algoritmalarının entegrasyonu, düşük maliyetli sensör-işlemci çözümlerinin geliştirilmesi ve kırsal alanlarda dayanıklı haberleşme altyapılarının yaygınlaştırılması hem akademik hem de sektörel uygulamalara önemli katkılar sağlayacaktır. Sonuç olarak, uç bilişim ve IoT tabanlı yaklaşımlar, sadece tarımsal verimliliği artırmakla kalmamakta; aynı zamanda sürdürülebilir, ölçeklenebilir ve çevresel olarak duyarlı bir tarımsal üretim sistemine geçişin temelini oluşturmaktadır.

THE ROLE OF ARTIFICIAL INTELLIGENCE IN THE TRANSFORMATION OF SMART AGRICULTURE: TECHNOLOGICAL APPROACHES AND APPLICATION AREAS

Dr. Öğretim Üyesi Zeynep EKİCİOĞLU KÜZECİ
Kırşehir Ahi Evran Üniversitesi, Mühendislik ve Mimarlık Fakültesi, Kırşehir
zeynep.kuzeci@ahievran.edu.tr, ORCID NO: 0000-0003-1487-6321

ABSTRACT

The agricultural sector faces increasing challenges due to global issues such as population growth, diminishing natural resources, and climate change. As a response, Artificial Intelligence (AI) technologies have emerged as a significant tool to improve productivity, reduce environmental impacts, and promote sustainability in agricultural production. This study aims to explore the current and potential applications of AI in agriculture and assess its contributions to agricultural processes. AI is being utilized in various critical agricultural activities, including crop health monitoring, disease and pest detection, soil structure analysis, water and fertilizer management, weather forecasting, yield prediction, and planting schedule optimization. Through the real-time analysis of sensor data, AI-based systems are developed to provide decision support for farmers. These systems play a crucial role in identifying the necessary nutrients for soil quality improvement and determining the optimal seed types and planting times. Furthermore, smart agricultural equipment can accurately calculate the ideal spacing between seeds and the optimal planting depth. Additionally, advanced AI technologies, such as 3D laser scanning and hyperspectral imaging, contribute to enhanced crop health assessments, providing high-precision data that support increases in both yield and quality. AI-powered applications like “Plant Health Monitoring Systems” allow for rapid and effective intervention by identifying crop health status and the required nutrients.

This paper presents a review on the role of AI in agriculture. It discusses the technologies in use, the agricultural parameters monitored, and their impact on agricultural production. The study concludes that AI not only enhances production levels but also optimizes resource utilization, thus serving as a vital tool in the transition toward sustainable and environmentally friendly agricultural practices. In this context, AI holds a strategic position in shaping future agricultural policies and technological transformations.

AKILLI TARIMIN DÖNÜŞÜMÜNDE YAPAY ZEKANIN ROLÜ: TEKNOLOJİK YAKLAŞIMLAR VE UYGULAMA ALANLARI

ÖZET

Tarım sektörü, artan nüfus, azalan doğal kaynaklar ve iklim değişikliği gibi küresel zorluklarla başa çıkmak için yeni ve yenilikçi teknolojilere ihtiyaç duymaktadır. Bu bağlamda, yapay zeka (YZ) teknolojileri, tarımsal üretim süreçlerinde verimliliği artırmak, çevresel etkileri azaltmak ve sürdürülebilirliği sağlamak amacıyla önemli bir çözüm aracı olarak öne çıkmaktadır. Bu çalışma, YZ'nin tarım sektöründeki güncel ve potansiyel uygulama alanlarını inceleyerek, teknolojinin tarımsal üretime olan katkılarını değerlendirmeyi amaçlamaktadır. YZ; bitki sağlığının izlenmesi, hastalık ve zararlı tespiti, toprak yapısının analizi, su ve gübre yönetimi, hava durumu tahmini, verim öngörüsü ve ekim zamanlaması gibi birçok kritik tarımsal faaliyette kullanılmaktadır. Özellikle sensör verilerinin gerçek zamanlı analiz edilmesiyle, çiftçilere karar destek mekanizmaları sağlayan sistemler geliştirilmektedir. Bu sistemler, toprak kalitesinin artırılması için gerekli besinlerin belirlenmesi, en uygun tohum türü ve ekim zamanının seçilmesi gibi uygulamalarda etkin rol oynamaktadır. Akıllı tarım ekipmanları sayesinde tohumlar arasındaki ideal mesafe ve ekim derinliği de hassas bir şekilde hesaplanabilmektedir. Ayrıca farklı görüntüleme teknikleri ve üç boyutlu lazer tarama gibi ileri düzey YZ tabanlı teknolojiler, ürün sağlığını değerlendirmede yüksek hassasiyetli veriler sağlayarak verim ve kalite artışına katkı sunmaktadır. “Bitki Sağlığı İzleme Sistemleri” gibi YZ destekli uygulamalar sayesinde, tarım ürünlerinin sağlık durumu ve ihtiyaç duyulan besin maddeleri tespit edilerek hızlı ve etkili müdahale imkânı sağlanmaktadır.

Bu bildiride, YZ’nin tarım alanındaki işlevsel rolü literatür temelli olarak analiz edilmiş; kullanılan YZ teknolojileri, bu teknolojilerin izlediği tarımsal parametreler ve üretim süreçlerine olan etkileri ele alınmıştır. Çalışma sonucunda, YZ' nin yalnızca üretim miktarını artırmakla kalmadığı, aynı zamanda kaynakların daha etkin kullanımını sağlayarak sürdürülebilir ve çevre dostu bir tarım anlayışına geçişte önemli bir araç olduğu sonucuna ulaşılmıştır. Bu yönüyle yapay zekâ, geleceğin tarım politikalarında ve teknolojik dönüşüm süreçlerinde stratejik bir konuma sahiptir.

Anahtar Kelimeler: Yapay Zeka, Akıllı Tarım, Hassas Tarım

1. GİRİŞ

Tarım endüstrisi, dünya nüfusunun hızla arttığı ve geleneksel yöntemlerin yetersiz kaldığı bir dönemde, yeni teknolojik yöntemlere ihtiyaç duymaktadır. İş gücü sıkıntısı, azalan çiftçi sayısı gibi zorluklarla karşılmakta ve bu durum teknolojik çözümler arayışını hızlandırmaktadır. Yapay Zeka, Nesnelerin İnterneti ve Makine Öğrenimi gibi yaklaşımlar, "akıllı tarım" uygulamaları ile tarım ürünlerinin kalite ve verimliliğini artırmak amacıyla kullanılmaktadır [1,2].

Makine öğrenmesi kullanılarak, tarımda pestisitlerin kullanımı optimize edilmektedir, bu yöntemle tarım kimyasalları, zaman, yer ve etkilenen bitkilere göre uygulanır [3]. Ayrıca tarımda su yönetimi konusunda makine öğrenimi kullanılmaktadır. Su yönetimi, tarımsal, iklimsel ve hidrolojik denge üzerinde büyük etkiye sahiptir. ML tabanlı uygulamalar, buharlaşma ve transpirasyonu günlük, haftalık veya aylık olarak tahmin edebilir, böylece sulama sistemlerinin daha verimli kullanılmasını sağlar [4]. Çiftçiler, tarımsal verimliliği artırmak ve çevresel etkiyi en aza indirmek için yapay zeka (YZ) ve makine öğrenimi (ML) modellerini her geçen gün daha fazla kullanmakta; bu gelişme, gıda teknolojisi sektöründe önemli faydalar sağlamaktadır. Örneğin doğru günlük çiğ noktası sıcaklık tahminleri, beklenen hava olaylarını tanımlama ve buharlaşma ile transpirasyon oranlarını tahmin etme konusunda önemli bir rol oynamaktadır [5].

Yapay zeka (YZ), son yıllarda hızla evrimleşmekte ve hesaplama gücündeki gelişmeler ile bulut bilişiminin yaygınlaşması, dünya ekonomisinin pek çok sektörünün YZ'nin avantajlarından faydalanmasına olanak tanımıştır. Tarım, bu faydaları erken benimseyen alanlardan biri olmuştur. YZ, mahsul hasat zamanlaması, toprak ve ürün sağlığının izlenmesi, yabancı ot kontrolü ve verim tahminleri gibi alanlarda önemli uygulamalara sahiptir. Son on yılda YZ ve makine öğrenimi (ML), farklı sektörlerde geliştirme araçları olarak test edilse de, tarımda bu teknolojilerin karar destek süreçlerine katkıları ancak son dönemlerde netleşmiştir. Çiftçiler, YZ teknolojisi kullanarak daha verimli kararlar alabilir, bu da tarımsal ve hayvansal üretimde verimliliği artırmaktadır. Tarım sektörünün, YZ'yi daha etkin bir şekilde kullanma isteği, özellikle artan veri miktarının kolay erişilebilir olmasıyla doğrudan ilişkilidir [6].

Ayrıca yapay zeka (YZ) ve makine öğrenimi (ML) tabanlı izleme sistemleri, tarımda mahsulleri izlemek, zararlıları tespit etmek ve toprak sorunlarını teşhis etmek için önemli bilgiler sunmaktadır, üreticilerin maksimum verim için optimal zamanda tohum ekmelerine de olanak sağlar [7]. Yabancı otlar, tarım faaliyetlerini olumsuz etkileyerek mahsul verimini düşürür, meraları istila eder, nadir durumlarda ise hayvanlar için tehdit oluşturur. YZ sensörleri, bu yabancı otları tespit etmek ve herbisid kullanımını yerinde optimize etmek için kullanılabilir. Ayrıca, YZ sistemleri, hava durumu tahminleri yapabilir, mahsul sağlığını analiz edebilir ve hastalıklar, zararlılar ya da besin eksiklikleri gibi bitki sorunlarını belirleyebilir. Çiftçiler, YZ destekli insansız hava araçları sayesinde mahsullerinin sağlığını izleyerek, uzmanlar tarafından analiz edilen görüntülerle çiftlik sağlık raporları alabilirler. Bu durum, çiftçilerin zararlılarla etkili bir şekilde mücadele etmelerine yardımcı olmaktadır. Ayrıca, tarım robotları, zaman alıcı ve fiziksel olarak zorlayıcı işleri yerine getirmek için giderek daha fazla kullanılmakta olup, bu robotlar manuel iş gücü maliyetlerini düşürerek işçi yükünü hafifletmektedir. Bu çalışmada, tarımda yapay zekanın farklı uygulamaları incelenmektedir.

2. YAPAY ZEKA

Yapay zeka (YZ), insan benzeri düşünme, öğrenme, problem çözme ve karar verme yeteneklerini taklit etmeyi amaçlayan bir disiplin olarak tanımlanmaktadır. YZ, bilgisayar bilimlerinin ve mühendisliğinin bir alt dalı olup, makinelerin ve yazılımların insan zekasına benzer işlevleri yerine getirmesini sağlamak için çeşitli algoritmalar, veri analizleri ve öğrenme teknikleri kullanır. Bu alan, makine öğrenimi (ML), derin öğrenme (DL), doğal dil işleme (NLP) ve robotik gibi teknolojileri kapsayarak, makinelerin çevresel verileri analiz etmesini ve o veriler doğrultusunda otonom kararlar almasını sağlar. Günümüzde YZ, tarımdan sağlığa, sanayiden eğitime kadar geniş bir yelpazede uygulama alanı bulmakta ve verimlilik, doğruluk ve hız açısından devrim yaratmaktadır.

Tarım özelinde ise belli konu başlıkları altında YZ çalışmaları toplanmaktadır ve bu başlıklar aşağıdaki gibi özetlenebilir [8].

1. Tarım Üretim Yönetimi: Tarım üretimi, karmaşık bir tedarik zinciri gerektiren bir süreçtir. Yapay zeka (YZ), bu süreçlerin her aşamasında, özellikle gıda üretimi, dağıtımı ve tüketimi üzerinde önemli etkiler yaratmaktadır. YZ teknolojileri, sulama, haşere kontrolü ve hastalık yönetimi gibi alanlarda verimliliği artırmayı amaçlayan uygulamalarla tarım üretimini daha verimli hale getirmektedir. Ayrıca, YZ, daha doğru tahminlerde bulunarak tarım yönetimini iyileştirmeye yardımcı olmaktadır.
2. Bitki İzleme: Geleneksel bitki sağlığı izleme yöntemleri genellikle zaman alıcı ve iş gücü yoğun olup, yapay zeka (YZ) bu süreçleri daha verimli hale getirmektedir. Derin öğrenme ve makine öğrenimi (ML) teknikleri sayesinde, bitki sağlığı, toprak besin seviyeleri ve zararlı tespiti daha hızlı bir şekilde gerçekleştirilebilmektedir. Bu teknolojiler, tarımda bitki hastalıkları ve zararlılarının erken tespiti konusunda önemli avantajlar sunmaktadır.
3. Veri Bilimi ve Tarım: Tarımda her gün büyük miktarda veri toplanmakta olup, yapay zeka (YZ) bu verilerin gerçek zamanlı olarak analiz edilmesini sağlayarak çiftçilerin daha bilinçli kararlar almasına yardımcı olmaktadır. Bu durum, doğal kaynakların daha verimli bir şekilde kullanılmasını ve sağlıklı ürünlerin yetiştirilmesini mümkün kılmaktadır. Veri analitiği, aynı zamanda bilimsel iş gücünün etkinliğini artırarak tarımsal üretimi iyileştirmektedir.
4. Hastalık Tespiti: Bitki hastalıkları, çevresel, ekonomik ve gıda güvenliği açısından ciddi tehditler yaratmaktadır. Yapay zeka tabanlı görüntü tanıma sistemleri, bu hastalıkları yüksek doğrulukla tespit edebilir ve mobil cihazlar aracılığıyla saha üzerinde hastalıkların tespiti gerçekleştirilebilir. Bu teknolojiler, tarımda zararlıların ve hastalıkların erken uyarılmasını sağlayarak sürdürülebilir tarım yöntemlerinin uygulanmasına katkı sunmaktadır.
5. Gıda Kalitesi ve Güvenliği: Yapay zeka ve makine görüsü, gıda güvenliği ve kalite kontrolünde kritik bir rol üstlenmektedir. Yapay zeka, gıda üretim süreçlerini optimize edebilir, verimliliği artırabilir ve insan gücüyle yapılan görevleri daha doğru bir şekilde yerine getirebilir. Bu, gıda kalitesini yükseltirken, hatalı ürünlerin piyasaya sürülmesini önler.

6. Tahminsel Analitik ve Uzaktan Algılama: Uzaktan algılama teknolojisi, tarımda ürün verimliliğini tahmin etmek amacıyla kullanılmaktadır. Yapay zeka, çiftçilere daha hassas verim tahminleri yapma imkânı sunarak, doğal kaynakların korunmasına ve çevresel etkilerin azaltılmasına katkı sağlar.

Makine ve derin öğrenme algoritmalarını kullanarak verilerden öğrenen ve bu verileri yorumlayarak insan zekasını taklit etmeyi amaçlayan yapay zeka (YZ), bilgisayar biliminin önemli bir dalıdır. Giriş ve çıkış değişkenleri arasında dinamik bağlantılar kurarak tahminlerde bulunan bu sistemler, hem basit hem de karmaşık problemlere yönelik çeşitli çözümler üretmede kullanılabilir. Günümüzde YZ destekli teknolojiler, mobil yüz tanıma uygulamalarından otonom araçlara kadar pek çok alanda hayatımızın bir parçası haline gelmiştir. YZ, en köklü sektörlerden biri olan tarımı da geleceğe taşımaktadır. YZ'nin tarımda oldukça geniş ve dikkat çekici uygulama alanları mevcuttur. Özellikle hassas tarımı mümkün kılan YZ, çiftçilere sulama, ekim, ürün seçimi, ürün rotasyonu, hasat ve zararlı kontrolü gibi alanlarda ML tabanlı verilerle rehberlik edebilmektedir [9].

3. UYGULAMA ALANLARI

Çiftçiler, tarımsal faaliyetleri gerçekleştirirken genellikle aşağıdaki adımları takip ederler:

Adım 1: Ürün Seçimi

Adım 2: Arazi Hazırlığı

Adım 3: Tohum Ekim

Adım 4: Sulama ve Gübreleme

Adım 5: Ürün Bakımı [pestisit kullanımı, budama vb.]

Adım 6: Hasat

Adım 7: Hasat Sonrası Faaliyetler

Yukarıdaki algoritmaya göre, tarıma ilişkin görevler üç ana alt alana ayrılmıştır. Bunlar; hasat öncesi, hasat sırasında ve hasat sonrasında dikkat edilmesi gereken parametreleri şu şekilde özetleyebiliriz. Hasat öncesi aşama; tohum, toprak, hastalık tespiti, ürün fenotiplemesi, pestisit ,yabani ot tespiti ve sulamadan oluşur. Hasat sırasında ise, meyve tespiti ve sınıflandırması, kabuk rengi, boyut, olgunluk yaşı, sertlik parametreleri ile ilgilenilir Hasat sonrası aşamada, sıcaklık, kalite, nem, meyve derecelendirme gibi durumlarla ilgilenilir.

Bu bölümde her aşamadaki parametrelerin alınması, değerlendirilmesi ve verilerin kaydedilmesi sırasında yapay zeka veya onun alt sınıfı olan makine öğrenmesi nasıl kullanılmakta olduğuna dair literatür araştırması yapılmıştır.

3.1 Tohum ve Toprak Değerlendirmesi

Tarımda toprak yönetiminin temel odak noktası, bitki verimliliğini artırmak amacıyla dinamik toprak parametrelerinin korunması ve iyileştirilmesidir. Toprakta verimlilik artışı etkili toprak kaynaklarının yönetimi ve mikro besin elementlerinin uygulanmasına yönelik düzeltici

önlemlerle sağlanabilir. İlk çalışmalarda toprak verimliliğini tahmin etmek amacıyla Yapay Sinir Ağları'nda (ANN) Levenberg-Marquardt tabanlı geri yayılım yöntemi kullanılmıştır [11]. Bir çalışmada, pH değerleri ve toprak verimlilik indekslerinin sınıflandırılması ve tahminine yönelik bir model sunmuştur. Bu modelde farklı aktivasyon fonksiyonları (sinüs, kare, gaussian radial basis, üçgen taban, hiperbolik tanjant ve sert limit) kullanılan aşırı öğrenme (ELM) adı verilen hızlı öğrenme sınıflandırma tekniği ile problem çözülmüştür. Böylece toprak parametrelerinin sınıflandırılması ve tahmini, gübre harcamalarını azaltmaya, kârlılığı artırmaya, kimyasal toprak analiz uzmanlarının zamanını tasarruf etmeye, toprak sağlığını ve çevre kalitesini iyileştirmeye yardımcı olmuştur. Çalışma sonucunda Gaussian radial basis fonksiyonu, dört problemden dördünde maksimum performans elde etmiş, her bir problemdeki doğruluk oranlarında genellikle %80'in üzerinde sonuçlar elde edilmiştir [12]. Ayrıca yer yüzeyindeki ve çeşitli derinliklerdeki ölçülen toprak sıcaklığı verileri, birçok konum için nadiren mevcuttur. Bu nedenle, meteorolojik parametreler gibi diğer mevcut verileri kullanarak farklı derinliklerdeki toprak sıcaklığını tahmin etmek için teorik yaklaşımlar geliştirmek, son derece önemli bir anlam taşımaktadır. Toprak sıcaklığı ve diğer iklim parametreleri arasında karmaşık bir ilişki bulunmaktadır. Bu tür karmaşık problemler, nöral ağlar (NN) ve doğa ilhamlı meta-sezgisel algoritmalar kullanılarak verimli bir şekilde çözülebilir; örneğin, monark kelebek optimizasyonu, solucan optimizasyonu algoritması, krill sürüsü algoritması, ve kukuma arama ile uyum arama algoritması gibi [13].

Geleneksel olarak, tohum kusurlarının sınıflandırılması genellikle renk, şekil ve doku özelliklerine dayanır. Bu yöntem ile büyük miktarda özellik bilgisinin tekrarlanan şekilde çıkarılmasını gerektirir, ancak bu bilgi tespitte verimli bir şekilde kullanılması zordur. Son yıllarda, yapay zeka öğrenme, görüntü tanıma alanında oldukça başarılı sonuçlar elde etmiştir ve tohum kalitesinin sınıflandırılmasına dair çalışmaları ilerletmiştir [14]. Tohumların fenotipik kusurları, kaliteyi belirlemek için kullanılan kriterlerden biridir. Tohum kusurlarını tespit etmenin geleneksel yöntemi, genellikle manuel muayeneye dayanır ve bu yöntem verimli ve objektif değildir. Bu nedenle, objektif ve otomatik bir tohum tarama yöntemi gereklidir. Araştırmacılar, tohum kalitesi testleri için yapay zeka teknolojisini uygulamışlardır [15,16]. Renk, doku, boyut ve şekil gibi özellikler, tohumların görüntülerinden çıkarılabilir ve bilgisayarla görme tabanlı çeşitli sınıflayıcılar kullanılarak tohum kusurları tespit edilebilir. Bu prosedür kolayca otomatikleştirilebilir ve insan emeğiyle yapılan denetimlere kıyasla çok daha verimli bir tohum ayırma yöntemi sağlar.

3.2 Bitki izleme ve Hastalık Tespiti

Bitki hastalıklarının erken teşhisi, tahmini ve izlenmesi; ürün kalitesi ve verimini doğrudan etkileyen kritik bir süreçtir. Bu alanda yapay zeka (YZ) ve derin öğrenme (DL) teknikleri son yıllarda yaygın bir şekilde kullanılmaktadır. Görüntü işleme, spektral analiz ve sensör verileri sayesinde bitki hastalıkları yüksek doğrulukla teşhis edilebilmektedir. Bitkilerde virüsler, mantarlar ve bakteriler gibi çeşitli patojenler nedeniyle oluşan hastalıklar, dünya genelinde tarım sektöründe önemli ekonomik kayıplara yol açmaktadır. Bitkilerin kalitesi ve verimi açısından hastalıkların izlenmesi, ürün güvenliği için oldukça önemlidir. Bu nedenle, bitki hastalıklarının tanınması hayati bir öneme sahiptir. Bitki hastalığı belirtileri genellikle yapraklarda belirginleşir. Bilgisayarla görme, derin öğrenme, few-shot learning ve yumuşak

hesaplama gibi teknikler, bitki hastalıklarını otomatik olarak tanımak için kullanılır. Bu teknikler, çiftçilere hızlı ve etkili önlemler alarak ürün kalitesinin korunmasına yardımcı olur. Bu yöntemler, hastalıkların özelliklerinin yanlış seçilmesinin veya manuel çıkarılmasının getirdiği dezavantajları ortadan kaldırır ve araştırma hızını artırır [17]. Bitki hastalıkları, genel olarak şu başlıklar altında toplanmaktadır; bakteriyel hastalık, viral hastalık, mantar hastalığı gibi. Son yıllarda derin öğrenme (DL) ve bilgisayarla görme alanındaki gelişmeler, cep telefonu üzerinden tanılama yapılmasını mümkün kılmakta ve bu da özellikle büyük çiftliklerde otomasyonun önemini artırmaktadır. Görsel belirtileri insan gözüyle algılamanın zor olduğu durumlarda, görüntü işleme tabanlı yazılımlar hastalık sınıflandırmasında büyük rol oynamaktadır. Öte yandan Makine öğrenmesi (ML) destekli yazılımlar, bitki sağlığının değerlendirilmesinde kullanılmakta, böylece pestisit uygulaması yalnızca kritik bölgelere yönlendirilebilmektedir. Büyük tarım işletmeleri, genellikle görsel ve termal veriler toplayan Nesnelerin İnterneti (IoT) cihazları ile entegre dijital platformlar kullanmaktadır [18]. Convolutional Neural Network (CNN) tabanlı yaklaşımlar, bitki yapraklarının görsel semptomlarına dayalı hastalık tespitinde oldukça başarılı sonuçlar vermektedir [19]. CNN modelleri, özellikle sınıflandırma ve nesne tanıma gibi görevlerde yüksek doğruluk oranları ile tercih edilmektedir. Bunun yanında, YZ algoritmalarının tarımsal uzaktan algılama ile entegre edilmesiyle geniş alanlarda hastalık izleme mümkün hale gelmiştir. Ayrıca, tahminleme süreçlerinde Recurrent Neural Network (RNN) ve zaman serisi analizleri ile iklimsel değişkenler göz önüne alınarak, hastalıkların gelişim süreci öngörülebilmektedir [20]. Bu tür yaklaşımlar sayesinde çiftçiler erken önlem alarak tarımsal kayıpların önüne geçebilmektedir. CNN, özellikle zaman serisi verisi nedeniyle sensör okumalarındaki hataları azaltmada faydalı olurken, geri beslemeli sinir ağı (RNN), sensörden kaynaklanan yanlılıkları azaltmak için zaman serisi yaklaşımı kullanan bir yöntem olarak ürün verimi tahmininde de kullanılmaktadır. Yani CNN algoritmaları, özellikle görsel veriler üzerinden bitki hastalıkları ve fenolojik aşamaların tanımlanmasında güçlüdür, çünkü zaman serisi verilerinden bağımsız olarak görsel özellikleri etkili bir şekilde çıkarır. Öte yandan, RNN algoritmaları, özellikle sensör verilerindeki zaman bağımlılıklarını ve yanlılıkları azaltarak tarımda verim tahminleri ve çevresel koşulların izlenmesi gibi görevlerde daha etkilidir.

3.3 Hassas Tarım Sistemleri

Hassas Tarım, tarla yönetimine yönelik bir yaklaşımdır ve bilgi teknolojilerini (BT) kullanarak bitkilerin ve toprağın tam olarak ihtiyaç duydukları unsurları almasını ve böylece optimum sağlık ve verimlilik düzeyine ulaşmasını sağlamayı hedefler. Hassas Tarım'ın amacı, kârlılığı, sürdürülebilirliği ve çevrenin korunmasını garanti altına almaktır.

Büyük ölçekli tarımda iş gücü maliyetleri, tarımın önemli harcama kalemlerinden biridir. Geleneksel tarımda hasat gibi işlemler büyük bir iş gücü gerektirir ve ürünlerin zamanında hasat edilmemesi, yatırımın geri dönüşünü olumsuz etkiler. Robotik hasat makineleri, ürünleri doğru zamanda ve doğru şekilde toplayarak bu sorunu çözer, böylece iş gücü maliyetlerini düşürür ve hasadın kalitesini koruyarak müşteriye zamanında teslim edilmesini sağlar. Toplanan verilerle hastalık ve zarar tespiti yapılır, böylece bitkilerin sağlığını ve meyve durumunu daha verimli bir şekilde izlenir. Drone'lar ise, önceden belirlenmiş rotalarla geniş alanlarda tarama yapar ve bilgisayarla görme teknolojisini kullanarak ürün analizi, bitki sağlığı izleme, yabani ot tespiti

ve hastalık analizi gibi işlemleri gerçekleştirir. Bu sistemler, çok spektral görüntüler oluşturarak bitki sağlığını, kuraklığın etkisini ve verimliliği değerlendirir. Sonuç olarak, bu teknoloji tarımsal verimliliği artırırken, üretim süreçlerinin daha hassas ve verimli olmasını sağlar. Ayrıca, robotlar yabani otları toplama ve kimyasal uygulamaları daha hassas bir şekilde yapma gibi işlevlerle de tarıma katkıda bulunur. Günümüzde tarım robotları, yorucu, zaman alıcı veya tehlikeli faaliyetlerde insan gücünün yerini almayı amaçlayacak şekilde geliştirilmektedir. Tarım robotik sistemleri; robotun türüne, sensörlerine, aktüatörlerine ve iletişim sistemlerine bağlı olarak farklılık gösteren pek çok avantaj sunmaktadır. Robotların karar verme yetenekleri, yapay zekâ (AI) algoritmalarına dayanmaktadır ve bu algoritmalar, çevreye ve duruma bağlı olarak belirli eylemleri gerçekleştirmesini sağlamaktadır [21].

Akıllı tarım uygulamaları, çevresel değişkenliğin yüksek olduğu bitki yetiştirme süreçlerinde, geleneksel yöntemlerin yetersiz kaldığı durumlarda etkin çözümler sunmaktadır. Özellikle sera tarımı gibi kontrollü ortamlarda, düşük bakım gereksinimi ve yönetilebilir ekosistem avantajları nedeniyle otomasyon sistemleri ve otonom araçlar önemli rol oynamaktadır. Bu kapsamda, belirli bitki türlerinin gereksinimlerine göre çevresel koşulların optimize edilmesi amacıyla IoT (Nesnelerin İnterneti) tabanlı sensör ve aktüatör sistemleri önerilmektedir [22]. Bu sistemlerde kullanılan yapay sinir ağları (ANN), sensör verilerini IoT bulutu aracılığıyla analiz ederek gerekli çevresel düzenlemeleri gerçekleştirmektedir. Kablosuz Sensör Ağları (WSN), tarımsal üretimde veri toplama, depolama ve paylaşım amacıyla yaygın şekilde kullanılmakta olup, gerçek zamanlı çevresel izleme sağlamak için etkin bir altyapı sunmaktadır. WSN teknolojisinin tarımsal uygulamalardaki önemini vurgulayarak, bu sistemlerin üretkenlik ve sürdürülebilirlik açısından sağladığı katkıları birçok çalışmada ele alınmıştır [23]. Tarımda otonom sistemlerin ve IoT entegrasyonunun yalnızca üretim verimliliğini artırmakla kalmayıp, aynı zamanda kaynak kullanımını optimize ederek çevresel sürdürülebilirliği de desteklediği görülmektedir.

IoT (Nesnelerin İnterneti) ve WSN (Kablosuz Sensör Ağları) tabanlı çözümler, tarımsal parametrelerin gerçek zamanlı olarak izlenmesini mümkün kıldığı için; akıllı tarım uygulamalarında toprak ve bitki sağlığının izlenmesi, verimliliğin artırılması ve kaynakların etkin kullanımı açısından önemlidir. Bir çalışmada çiftçilerin akıllı telefonları üzerinden sıcaklık, toprak nemi, pH ve hava nemi gibi çeşitli parametreleri anlık olarak görüntüleyebileceği bir toprak sağlığı izleme sistemi geliştirmiştir [24]. Goswami ve arkadaşları, azot (N), fosfor (P), potasyum (K) gibi makro besinler ile pH, toprak nemi ve toprak nemliliğini izleyebilen IoT tabanlı bir toprak sağlığı izleme sistemi geliştirmiştir [25].

Nesnelerin İnterneti (IoT), bu alanda yaygınlığını kanıtlamış teknolojilerden biridir. IoT; sensörler, aktüatörler ve ağ bağlantı modülleri gibi fiziksel cihazların akıllı ve zeki şekilde birbirine bağlanmasını sağlar. Bu sayede, cihazlar ile makineler ve insanlar arasında veri toplama, paylaşma ve alışverişi için sorunsuz iletişim kurularak, gerçek zamanlı senaryolarda iş birliğine dayalı bir ortam oluşturulur. Başka bir çalışmada, çeşitli veri kümelerinden gelen sensör verilerine dayalı heterojen verilerin yönetimini amaçlanmıştır. Çalışma, büyük ya da küçük ölçekli, kamu ya da özel üretici firmaların kârlılığı artırma yarışında olduğunu ve sürekli olarak kaydedilen ve erişilebilir hale gelen verileri en uygun şekilde kullanmanın, bu bağlamda öznel hedeflere ulaşmak için doğru bir tercih olabileceğini ortaya koymaktadır. Çalışmada,

karar verme ve veri işleme süreçlerinde Yapay Sinir Ağları, Doğrusal Regresyon ve Polinom Regresyon gibi Makine Öğrenmesi modellerinin kullanılmasını önermektedir [26].

Hassas tarım konusunda, Nesnelerin İnterneti (IoT) ve yapay zeka kullanımının ayrıntılı çalışmalarına ilgili referanstan ulaşılabilir [27].

3.4 Ürün ve Verim Yönetimi

Ürün verimi tahmini, özellikle ülkesel ve bölgesel (AB düzeyindeki) politika belirleyicileri için hızlı ve güvenilir karar desteği sunan kritik bir görevdir. Doğru bir verim tahmin modeli, çiftçilerin ekim planlaması (hangi ürünü ne zaman ekecekleri) ve kaynak dağılımı (gübre, sulama vb.) kararlarını optimize etmelerine olanak tanır. Ürün verimi tahminine yönelik yaklaşımlar, temelde bir makine öğrenmesi problemi olarak formüle edilir. Çevresel değişkenler (iklim, toprak nemi, sıcaklık gibi) ile tarımsal girdilerin (gübreleme, sulama miktarı vb.) verim üzerindeki etkileri, istatistiksel modeller veya gelişmiş ML teknikleri (ör. regresyon, ağaç tabanlı modeller, derin öğrenme) kullanılarak tahmin edilir. Elde edilen verim haritaları, Nesnelerin İnterneti (IoT) verileriyle entegre edilerek saha düzeyinde gerçek zamanlı verim izlemesi ve ayrıntılı arazi kullanım analizi yapılmasını mümkün kılar. Sensör ağları ve uydu görüntüleri gibi IoT kaynaklarından toplanan yerinde (in-situ) veriler, ML modellerine beslenerek tahmin doğruluğunu artırır ve hatta uyarı sistemleri aracılığıyla potansiyel verim düşüşlerine karşı önleyici tedbirlerin alınmasını sağlar. Literatürde, IoT tabanlı ML sistemlerinin doğrudan tarlaya entegre edilip gerçek zamanlı geri bildirim (ör. sulama kontrolü, pest yönetimi) sunduğu çalışmalar bulunmaktadır [28]. Bu sayede, tahmin modelleri yalnızca planlama aşamasında değil; operasyonel düzeyde de karar destek mekanizması olarak kullanılabilmektedir.

Ürün verimi tahmini, tarımsal karar destek sistemlerinin temel bileşenlerinden biri olup; bitki genotipi, çevresel koşullar, iklim verileri ve bu faktörler arasındaki etkileşimlerin karmaşıklığı gibi çok sayıda değişkene bağlıdır. Bu parametreler arasındaki işlevsel ilişkilerin doğru biçimde modellenmesi, hem büyük ölçekli veri kümeleri hem de bu verilerdeki gizli desenleri ortaya çıkarabilecek gelişmiş algoritmaların kullanımını gerektirir. Son yıllarda bu doğrultuda, ürün verimi tahmin problemleri derin öğrenme temelli yöntemlerle ele alınmaya başlanmıştır. Özellikle, yarı-parametrik derin sinir ağı mimarileri, bu alanda dikkat çekmektedir. Bu modeller, bir yandan verideki karmaşık doğrusal olmayan ilişkileri öğrenebilirken, diğer yandan da önceden bilinen parametrik yapılar ile gözlemlenemeyen kesitsel değişkenlikleri dikkate alarak tahmin performansını artırmaktadır. Bir çalışmada Brezilya'nın güneyindeki sezon içi soya verimini tahmin etmek için yapay zeka kullanılmış ve tatmin edici sonuçlar elde dilmiştir. Bu çalışmada LSTM ağları diğer algoritmalara göre daha yükske performans sergilemiştir [29]. Başka bir çalışmada ise, pirinç verimi tahmin için iki adet geri yayılımlı (BPNN) ile bağımsız tekrarlayan sinir ağı (lndRNN) mimarisini birleştiren bir mpdel kullanılmıştır [30].

4. TARIM ALANINDA YAYGIN YAPAY ZEKA YÖNTEMLERİ

4.1 Yapay Sinir Ağları (ANN)

Biyolojik sinir ağlarından esinlenerek geliştirilmiş, karmaşık ve çok boyutlu veriler arasındaki ilişkileri öğrenebilen hesaplama modelleridir. Akıllı tarımda ANN, toprak özellikleri, sıcaklık, nem, gübre miktarı gibi çoklu değişkenlere dayalı olarak ürün verimi tahmini, sulama yönetimi ve hastalık tespiti gibi görevlerde kullanılmaktadır.

Bu teknik kullanılarak yapılan çalışmalara bakıldığında; buğday tanelerindeki tane bitini tespit etmek amacıyla yapay sinir ağı modelleri geliştirilen bir çalışma literatürde mevcuttur ve girdi olarak kütle, eşdeğer çap, nem oranı ve sertlik kullanılmıştır. Toplam 100 model denenmiş ve radyal tabanlı fonksiyona sahip 4:10:1 yapısındaki ağ en iyi performansı göstermiştir. Bu modelin test verisi için RMSE değeri 0.25 olarak elde edilmiştir [31].

Başka bir çalışmada ise, hidroponik acı biber bitkilerindeki kök bölgesi sıcaklığı değişiminin bitki büyümesi üzerindeki dinamik yanıtlarını modellemek için NARX sinir ağı modeli kullanılmıştır. Modelin performansı, tahmin edilen ve gözlemlenen bitki büyümesi değerlerinin karşılaştırılmasıyla değerlendirilmiş ve sonuçlar oldukça yüksek doğruluk göstermiştir. Yazarlar, kullanılan sinir ağı türünün karmaşık süreçlerin tanımlanmasında etkili olduğunu belirtmişlerdir [32].

4.2 Konvolüsyon Sinir Ağları (CNN)

Konvolüsyon sinir ağları, görüntü işleme ve örüntü tanıma konularında oldukça başarılı olan derin öğrenme modelleridir. Akıllı tarımda özellikle bitki hastalıklarının yaprak görüntülerinden otomatik olarak tespitinde yaygın olarak kullanılır. CNN'ler elle özellik çıkarımı yapmaksızın görüntülerden doğrudan öğrenme sağlayarak sınıflandırma performansını artırır. Bir çalışmada, elma ağaçlarının yapraklarını sağlıklı, elma kabuk hastalığı, elma sediri pası ve birden fazla hastalık kategorilerinden birine sınıflandırmak amacıyla bir model geliştirilmiştir. Önerilen CNN model ile, doğrulama veri setinde %96,25 doğruluk elde etmiş ve birden fazla hastalığa sahip yaprakları %90 doğrulukla tespit edebilmiştir. Bu model, bitki sağlığını doğru ve zamanında tespit etme konusunda tarım sektöründe verimli bir çözüm sunmaktadır [33].

4.3 Tekrarlayan Sinir Ağları (RNN)

Tekrarlayan sinir ağları modelleri, sırayla işlenen veriler üzerinde çalışarak her adımda önceki durumdan gelen bilgiyi değerlendirir. Bu özellikleriyle, özellikle hava tahmini, bitki gelişimi ve otomatik sulama gibi zamana bağımlı tarımsal uygulamalarda kullanılır. Yapılan bir çalışmada önerilen RNN algoritması ile hava koşullarının daha doğru tahmin edilmesi sağlanmıştır. Geliştirilen yapı ile gizli katmanların sayısı artırılarak, zaman çizelgesine dayalı hava durumu güncellemeleri iyileştirilmiş olup, mevcut diğer makine öğrenmesi algoritması ile karşılaştırıldığında %98,76 doğruluğa ulaştığı tespit edilmiştir [34].

5. SONUÇLAR

Tarım sektörü, günümüzün en büyük küresel sorunları arasında yer alan nüfus artışı, iklim değişikliği ve doğal kaynakların tükenmesi gibi etkenlerle karşı karşıya kalmaktadır. Bu zorluklara karşı sürdürülebilir, verimli ve çevre dostu çözümler sunma potansiyeline sahip olan yapay zeka (YZ) teknolojileri, akıllı tarımın dönüşümünde stratejik bir rol üstlenmektedir. Yapılan literatür incelemeleri ve örnek uygulamalar göstermektedir ki; YZ destekli sistemler, toprak ve tohum analizinden ürün sağlığına, hasat optimizasyonundan verim tahminine kadar birçok tarımsal faaliyette hem karar destek mekanizması hem de otomasyon aracı olarak etkin şekilde kullanılmaktadır. Makine öğrenmesi, derin öğrenme ve görüntü işleme gibi YZ bileşenlerinin tarım süreçlerine entegrasyonu, sadece üretim miktarını değil, aynı zamanda kaliteyi de artırarak ekonomik verimliliği yükseltmektedir. Ayrıca, kaynakların (su, gübre, pestisit vb.) daha etkin ve bilinçli kullanılmasını mümkün kılarak, çevresel sürdürülebilirliğe önemli katkılar sağlamaktadır. IoT ve kablosuz sensör ağları ile bütünleşik çalışan bu sistemler, gerçek zamanlı veri analizi ile çiftçilerin doğru, zamanında ve isabetli kararlar almasına yardımcı olmaktadır. Gelecekte, YZ teknolojilerinin daha yaygın ve ölçeklenebilir hale gelmesiyle birlikte tarımsal üretimde dijital dönüşümün hız kazanması beklenmektedir. Bu bağlamda, yapay zekâ sadece bir teknoloji değil; aynı zamanda yeni nesil tarım politikalarının, eğitim programlarının ve kırsal kalkınma stratejilerinin merkezinde yer alması gereken bir paradigma olarak değerlendirilmelidir. Dolayısıyla, yapay zekâ temelli akıllı tarım uygulamaları, hem ekonomik hem çevresel hem de sosyal açılardan tarımın sürdürülebilirliğini güvence altına almak adına vazgeçilmez bir araç niteliğindedir. Bu çalışmada, yapay zekâ teknolojilerinin tarım sektöründeki dönüşümüne dair bir bakış açısı sunulmuş; mümkün olduğunca ana başlıklara yer verilerek güncel literatür özeti ortaya konmuştur. Böylece ileride akıllı tarım ile ilgili yapılacak olan deneysel çalışmaların yapısı hazırlanmıştır.

HISTORICAL DEVELOPMENT OF LAND CONSOLIDATION INHERITANCE MANAGEMENT AND LAND BANKING PRACTICES IN TURKİYE

Dr. Metin TÜRKER
Tarım ve Orman Bakanlığı, Bitkisel Üretim Genel Müdürlüğü
metin.turker@gmail.com
ORCID: 0000-0002-5488-0918

ABSTRACT

The small-scale, fragmented, and multi-share structure of agricultural lands is among the fundamental structural problems in Turkey's agricultural sector. According to 2024 data, the country has approximately 24 million hectares of agricultural land and 3 million agricultural holdings. The average farm size is only 5.99 hectares (TurkStat, 2024). Most farms operate on lands that are divided into an average of 11 parcels with 13 co-owners, which reduces productivity, increases production costs, and hinders the effective implementation of agricultural policies.

Land consolidation is a critical tool for addressing these challenges. Between 1961 and 2005, limited-scale land consolidation projects were carried out mainly in irrigated areas by various public institutions. The enactment of the Soil Conservation and Land Use Law No. 5403 in 2005 provided a legal and institutional framework for land consolidation as an integral part of land management. In 2008, basin-based and multi-purpose consolidation practices were initiated, particularly in the Southeastern Anatolia Project (GAP) region. The same year, satellite-based analyses identified 14.3 million hectares suitable for consolidation (TRGM, 2008).

By 2012, consolidation had been completed on approximately 1 million hectares, effectively addressing issues such as land fragmentation and access to roads and irrigation canals. However, the problems of multiple ownership and insufficient farm scale remained unresolved (Türker, 2025). Legal reforms in 2014 amended inheritance laws to prevent the uncontrolled division of agricultural lands. Between 2015 and 2023, 7.7 million parcels were transferred without further fragmentation (TRGM, 2024).

In 2018, the responsibility for land consolidation was transferred to the General Directorate of State Hydraulic Works (DSI), accelerating irrigation investments. However, this shift negatively impacted land banking practices managed by the General Directorate of Agricultural Reform. Therefore, resolving structural problems in agriculture requires a strong institutional framework and comprehensive legal regulations that integrate land consolidation and land banking efforts.

Keywords: Land consolidation, land fragmentation, inheritance management, land banking

TÜRKİYE'DE ARAZİ TOPLULAŞTIRMASI, MİRAS YÖNETİMİ VE ARAZİ BANKACILIĞI UYGULAMALARININ TARİHSEL GELİŞİMİ

ÖZET

Türkiye'de tarım arazilerinin küçük ölçekli, parçalı ve çok hisseli yapısı, tarım sektörünün temel yapısal sorunları arasında yer almaktadır. 2024 yılı verilerine göre, ülkede yaklaşık 24 milyon hektar tarım arazisi ve 3 milyon tarım işletmesi bulunmaktadır. Ortalama işletme büyüklüğü 59,9 dekardır (TÜİK, 2024). İşletmelerin büyük bir kısmı ortalama 11 parçalı ve 13 hissedarlı arazilerde üretim yapmakta olup, bu yapı verimliliği azaltmakta, maliyetleri artırmakta ve etkin tarım politikalarının uygulanmasını zorlaştırmaktadır.

Arazi toplulaştırması, bu sorunların çözümünde önemli bir araçtır. Ülkemizde 1961 yılından 2005 yılına kadar farklı kamu kurumlarınca daha çok sulama alanlarında basit arazi toplulaştırması yapılmıştır. 2005 yılında yürürlüğe giren 5403 sayılı Toprak Koruma ve Arazi Kullanım Kanunu ile arazi toplulaştırması arazi yönetiminin bir parçası olarak yasal ve kurumsal bir yapıya oturtulmuştur. 2008 yılında GAP bölgesinde havza bazlı ve çok amaçlı toplulaştırma modeline geçilmiş, aynı yıl uydu verileriyle yapılan çalışmalarda toplulaştırmaya uygun 14,3 milyon hektar alan tespit edilmiştir (TRGM, 2008).

2012 yılına kadar yaklaşık 1 milyon hektarlık alanda tamamlanan toplulaştırma uygulamalarının parçalılık, yol ve sulama kanallarına erişim gibi sorunları büyük oranda çözdüğü; ancak hisselilik sorunu çözmediği ve işletme ölçeğini büyütmediği görülmüştür (Türker, 2025). 2014 yılında miras hukukunda yapılan değişikliklerle, arazilerin kontrolsüz bölünmesi engellenmiş; 2015–2023 yılları arasında 7,7 milyon parselin parçalanmadan devri sağlanmıştır (TRGM, 2024).

2018 yılında toplulaştırma yetkisinin DSİ'ye devredilmesiyle sulama yatırımları hız kazanmış, ancak Tarım Reformu Genel Müdürlüğü'nce yürütülen arazi bankacılığı uygulamaları olumsuz etkilenmiştir. Bu çerçevede, tarımdaki yapısal sorunların çözümü için arazi toplulaştırması ve arazi bankacılığının entegre biçimde ele alındığı, güçlü bir kurumsal yapı ve yasal düzenlemeye ihtiyaç duyulmaktadır.

Anahtar Kelimeler: Arazi toplulaştırması, arazi parçalılığı, miras yönetimi, arazi bankacılığı,

1. GİRİŞ

Türkiye'de tarım arazilerinin küçük, parçalı, dağınık ve bozuk şekilli olması; sulama ve arazi verimliliğini olumsuz etkileyen ve tarımın sürdürülebilirliğini tehdit eden yapısal sorunların başında gelmektedir. Bu sorunun çözümünde arazi toplulaştırması ve tarla içi geliştirme hizmetleri önemli bir rol oynamaktadır. Ülkemizde 1961 yılında başlatılan toplulaştırma çalışmaları, ilk aşamada köy bazlı küçük sulama projeleri kapsamında, basit arazi toplulaştırması şeklinde uygulanmıştır.

1980'li yıllarda, arazi toplulaştırması, tarım reformu uygulamaları kapsamında tarımsal yapıyı düzenleme aracı olarak uygulanmaya başlanmıştır. Bu dönemde, Devlet Su İşleri (DSİ) tarafından inşa edilen sulama proje alanlarında, Tarım Reformu Genel Müdürlüğü (TRGM) tarafından "Tarım Reformu Uygulama Alanı" ilan edilen bölgelerde, 3083 sayılı *Sulama Alanlarında Arazi Düzenlemesine Dair Tarım Reformu Kanunu* kapsamında toplulaştırma çalışmaları yürütülmüştür.

2000'li yıllarda Güneydoğu Anadolu Projesi (GAP), Konya Ovası Projesi (KOP) ve Doğu Anadolu Projesi (DAP) gibi bölgesel kalkınma projelerinde, toplulaştırma; yatırımların maliyetini düşürmek ve uygulama süreçlerini hızlandırmak amacıyla etkili bir araç olarak kullanılmaya başlanmıştır. Bu süreçte toplulaştırma, yalnızca sulama yatırımlarını hızlandıran teknik bir işlem olmaktan çıkarılarak, kırsal kalkınmayı destekleyen çok yönlü bir politika aracı hâline gelmiştir. 2008 yılından itibaren toplulaştırma faaliyetleri, havza bazlı ve çok amaçlı projeler çerçevesinde daha geniş kapsamlı ve entegre bir yaklaşımla yürütülmeye başlanmıştır.

Ülkemizde tarım arazilerinin miras ve satış yoluyla bölünmesi, bu arazilerin verimli kullanımını engelleyen başlıca tehditlerden biri olmuştur. Tarım arazilerinin korunması ve etkin kullanımı amacıyla, 2005 yılında yürürlüğe giren 5403 sayılı *Toprak Koruma ve Arazi Kullanım Kanunu* ile başlayan yasal düzenlemeler, 2014 yılında çıkarılan 6537 sayılı Kanun ile daha da güçlendirilmiştir. Bu düzenlemelerle, tarım arazilerinin belirli büyüklüklerin altına bölünmesi yasaklanmış; miras ve satış yoluyla oluşabilecek parçalanmaların önüne geçilmesi hedeflenmiştir. Söz konusu sınırlamalar kısmen başarı sağlanmıştır. Ancak, kanunun amaçlanan etkileri bakımından beklenen gelişmelerin tam olarak sağlanamaması, uygulamada hâlen bazı eksikliklerin bulunduğunu göstermektedir (Türker, 2025)

Gelişmiş ülkelerde olduğu gibi ülkemizde de bu yapısal sorunların çözülmesi ve atıl tarım arazilerinin üretime kazandırılması için arazi bankacılığı sistemine ihtiyaç duyulmuştur. Bu kapsamda arazi bankacılığı ile ilgili yasal ve kurumsal altyapının geliştirilmesi için çalışmalar yürütülmüş, online sistemler kurulmuş ve uluslararası işbirlikleri geliştirilmiştir. Ancak uygulamaların gönüllülük esasına dayanması, yaptırım ve teşviklerdeki eksiklikler nedeniyle beklenen gelişmeler sağlanamamıştır. Bu nedenle arazi toplulaştırması ile birlikte arazi bankacılığı uygulamalarının yürütüleceği daha güçlü bir yasal ve kurumsal yapıya ihtiyaç duyulmaktadır.

Bu çalışmada arazi toplulaştırmasının tarihsel gelişimi ile miras uygulamaları ve arazi bankacılığı hakkında yapılan çalışmalar hakkında bilgiler verilmektedir.

2. TÜRKİYE'DE TARIMSAL YAPI VE SORUNLAR

2.1. Arazi Varlığı ve Kullanım Durumu

Türkiye'nin toplam yüzölçümü 78,4 milyon hektar olup, bunun %30,6'sı işlenebilir tarım arazisidir (yaklaşık 23,9 milyon ha). Ayrıca 14,6 milyon ha mera ve 23,2 milyon ha orman arazisi mevcuttur (Çizelge 1). Ekonomik olarak sulanabilir tarım alanı 8,5 milyon ha olup, bugüne kadar bunun %83,5'lik kısmı yani 7,1 milyon hektarı sulamaya açılmıştır.

2. Çizelge 1. Ülkemizde arazi varlığı ve kullanım durumu (2023)

Kullanım Şekli	Miktar (ha)	(%)
Tarım Alanı	23.942.000	30,56
Mera	14.617.000	18,65
Orman	23.245.000	29,67
Su Yüzeyleri	1.571.000	2,00
Yerleşim Alanları ve Diğer Alanlar	14.981.200	19,12
Toplam	78.356.200	100,00

Kaynak: TÜİK, 2024

Tarım; artan nüfusun beslenmesi, sanayiye hammadde sağlanması, istihdam yaratması ve ihracat potansiyeli açısından stratejik öneme sahiptir. Pandemiler, savaşlar ve iklim değişikliği gibi küresel gelişmeler, birçok ülkede tarımı milli güvenlik meselesi hâline getirmiştir.

Üç kıtanın kesişiminde yer alan Türkiye, stratejik ürünlerin üretimi ve tedarikinde önemli bir konuma sahiptir. 14,6 milyon ha merası, özellikle küçükbaş hayvancılık için kritik öneme sahiptir. Ancak hızlı kentleşme ve sanayileşme gibi nedenlerle tarım arazileri üzerindeki baskılar giderek artmaktadır. Son 30 yılda 2,7 milyon hektar tarım alanı tarım dışına çıkarılmıştır (TRGM, 2023). İklim değişikliği de tarımsal üretim üzerinde giderek daha fazla etkili olmaktadır. Bu nedenle mevcut tarım arazilerinin korunması, ıslah edilmesi ve verimli kullanımı hayati önem taşımaktadır.

2.2. Toprak ve Su Kaynakları Potansiyeli

Türkiye, kurak ve yarı kurak iklim kuşağında yer almaktadır. Ülke genelinde ortalama yıllık yağış miktarı 576 mm olup, yağış rejimi büyük ölçüde düzensizdir. Örneğin, Konya Ovası yılda ortalama 300 mm yağış alırken, Karadeniz Bölgesi'nde bu miktar 2.600 mm'ye kadar çıkmaktadır. Bitkisel üretim ise büyük ölçüde suya ve sulama olanaklarına bağlı olarak gerçekleştirilmektedir. Bu nedenle sulama, gıda arz güvenliği açısından kritik bir öneme sahiptir.

Ülkemizde yıllık kullanılabilir su potansiyeli 112 milyar m³ olup, bunun yaklaşık %77'si (yaklaşık 45 milyar m³) tarımsal sulamada kullanılmaktadır. Sulamaya açılan alanlar 7,1 milyon hektara ulaşmıştır. Sulamaya açılan alanın %67,7'si DSİ, %18,3'ü mülga KHGM ve %14'ü halk sulamaları oluşturmaktadır (Çizelge 2).

Çizelge 2. Sulamaya açılan alanlar (2023)

Sulama Alanları	**Milyon (ha)**	**Oran (%)**
DSİ	4,8	67,7
Mülga KHGM	1,3	18,3
Halk Sulamaları	1,0	14,0
Toplam	7,1	100,0

Kaynak: DSİ, 2024a

Sulamaya açılan alanların % 62'si açık kanal ve %38'i de basınçlı-borulu modern sulama sistemleri ile sulanmaktadır. Sulama oranı % 68 ve randımanı %50 seviyesindedir (DSİ 2024b). Görüldüğü gibi sulama oran ve randımanları düşüktür. Bunda; sulama şebekelerinin büyük bir kısmının eski olması, arazilerin küçük ve parçalı yapısı, sulama örgütlerinin kurumsal zayıflığı ve yaşlanan çiftçi nüfusu gibi nedenlerden kaynaklanmaktadır.

Ayrıca, kişi başına düşen yıllık kullanılabilir su miktarı 1.312 m³ ile ülkemiz, su kısıtı yaşayan ülkeler arasında yer almaktadır (DSİ, 2024b). Bu nedenle, sulama projelerinin kapalı sistem ve arazi toplulaştırması ile birlikte planlanması ve uygulanması önem taşımaktadır.

2.3. Tarımda Yapısal Sorunlar

İşletme ölçeği sorunu, Türkiye tarımının temel yapısal sorunlarından biridir. 2001 yılında yapılan son tarım sayımına göre ortalama işletme büyüklüğü 59,9 dekar olup işletmelerin %64,8'i, 50 dekarın altındadır. Bu küçük ölçekli yapı, tarımsal verimliliği sınırlamakta ve modern üretim tekniklerinin uygulanmasını zorlaştırmaktadır.

Parçalılık sorunu, 2013 yılında Tapu ve Kadastro Genel Müdürlüğü ile iş birliği yaparak 23,2 tapu ve 32,5 milyon tarım parseli sayısallaştırılarak Çiftçi Kayıt Sistemi (ÇKS) ile entegre edilmiştir. Buna göre bir tarım işletmesi ortalama 11 ayrı parselde tarım yapmaktadır. Bu durum ulaşım, işleme ve hasat maliyetlerini artırmakta, üretim süreçlerini zorlaştırmaktadır.

Hisselilik sorunu, çok sayıda ortak mülkiyet yapısı nedeniyle çözüm bekleyen önemli bir konudur. Türkiye'de 40 milyonun üzerinde hissedar bulunmakta, ancak sadece 3 milyon kişi araziyi fiilen işlemektedir. Hisseli yapı, üretim dışına itilen küçük parsellerle birlikte yatırımı ve etkin kullanımı engellemektedir. Örneğin, 1980'li yıllarda bir çiftçimize ait 10.000 m²'lik

bir parselin üç kuşak sonra 45 m²'ye kadar bölündüğü görülmüştür (Türker 2025). Bu durum çok küçülen parsellerde üretimi imkânsız hâle getirmektedir.

Parsele ulaşım sorunu, tarım parsellerinin yaklaşık %50'sinin yasal yolu bulunmamaktadır. Çiftçiler ulaşımı genellikle komşu araziler üzerinden veya sınırlardan sağlamakta, bu da hem sosyal sorunlara hem de üretim kayıplarına yol açmaktadır.

Sulama kanalına erişim sorunu, birçok parselin sulama kanalına doğrudan erişimi bulunmamaktadır. Su ihtiyacı komşu arazilerden karşılanmakta, bu da kayıpları ve komşuluk sorunlarını artırmaktadır. Bu sorunun çözümünde arazi toplulaştırması kritik bir araçtır.

Kayıtdışılık sorunu, tarımsal desteklerin ve üretimin izlenmesini güçleştirmektedir. 2023 itibarıyla ÇKS'ye kayıtlı 15,6 milyon hektar alan, toplam tarım arazilerinin yalnızca %65'ini kapsamaktadır. Sayısallaştırma ve entegrasyon çalışmalarına rağmen, mülkiyet sorunları nedeniyle kayıtlılık istenen seviyeye ulaşamamıştır (Türker, 2025).

3. ARAZİ TOPLULAŞTIRMASININ TANIMI VE ÖNEMİ

3.1. Arazi Toplulaştırmasının Tanımı

Arazi toplulaştırması; aynı kişiye veya çiftçi ailesine ait, çeşitli nedenlerle aşırı derecede parçalanmış, şekli bozulmuş ve dağınık hâlde bulunan küçük arazi parçalarının; ulaşım, sulama ve tarla içi geliştirme hizmetleriyle birlikte, verimli parseller hâline getirilerek yeniden düzenlenmesi işlemidir (Takka, 1993).

3.2. Arazi Toplulaştırmasının Faydaları

Arazi toplulaştırması hem üreticiler hem de kamu yatırımları için büyük önem taşımaktadır.

3.2.1. Çiftçiler açısından faydaları

- Parseller büyür, düzgünleşir; işlenen alan ve parsel verimliliği artar.
- Makine kullanımı kolaylaşır, modern tarım teknikleri uygulanabilir hale gelir.
- İşçilik, tohum, gübre, ilaç gibi girdilerde tasarruf sağlanır.
- Tarlaya ulaşım kısalır; zaman ve yakıt tasarrufu (50 L/ha) sağlanır.
- Sulama düzeni iyileşir, sulama verimliliği artar.
- Her parsel yola ve sulama kanalına kavuşur.
- Komşu anlaşmazlıkları azalır, sosyal huzur artar.
- Gelir artar, yaşam standardı yükselir.
-

3.2.2. Kamu yatırımları açısından faydaları (TRGM 2005)

Sulama projeleri ve karayolları gibi kamu yatırımlarının arazi toplulaştırması ile eş zamanlı yürütülmesi, kamu yatırımları açısından önemli avantajlar sağlamaktadır. Öncelikle, yol ve kanal gibi kamu inşaatları ile tarım arazilerinin parçalanması önlenmekte ve fiziki altyapı

yatırımlarındaki (örneğin sulama kanalları, yollar, şutlar, dirsekler vb.) azalmalar ile yatırım maliyetleri önemli ölçüde düşmektedir.

Özellikle yol ve sulama kanalı gibi ortak kullanım alanları için ihtiyaç duyulan araziler, kamulaştırma yerine, arazi toplulaştırması kapsamında %10'a kadar olan Düzenleme Ortaklık Payı (DOP) kesintisinden karşılanabilmektedir. Böylece yatırım maliyetlerinde %30 ila %45 arasında tasarruf sağlanabilmektedir (Çizelge 3)

Çizelge 3. Bazı sulama projelerinde toplulaştırma ile sağlanan tasarruflar

	Toplulaştırmasız Yatırım Maliyeti (TL/ha)	Toplulaştırmalı Yatırım Maliyeti (TL/ha)	Tasarruf Oranı (%)
Tokat İli Niksar, Zile ve Erbaa Ovalarında AT ve TİGH Projesi (9 köy)*	8.037	4.408	45
Karaman Merkez Kisecik sulama yenileme projesi**	7.270	4.910	32

(*)Mülga KHGM, Sulama Dairesi Başkanlığı dokümanları (1999, 2010)

(**) Mülga TRGM, Toplulaştırma ve TİGH Dairesi Başkanlığı dokümanları (2010)

Yine zarar-ziyan ve gelir kaybı ödemeleri ile inşaat süreçleri kesintiye uğramadan sürdürülebilmektedir.

Ayrıca Karaman Kisecik Sulama ve Toplulaştırma projesinde olduğu gibi toplulaştırmanın borulu sulama sistemleri ile birlikte yapılması ile % 64'lere varan oranlarda su tasarrufu sağlanabilmektedir (Türker ve Gencel 2010).

Arazi toplulaştırma çalışmaları çevresel açıdan ekolojik koridorlar, ağaçlandırma alanları ve koruma zonları oluşturarak habitatların korunmasını, erozyonun önlenmesini ve çevre dostu rekreasyon alanlarının planlanmasını sağlamaktadır. Sosyal açıdan ise komşu parseller arasındaki anlaşmazlıkları azaltarak yargı yükünü hafifletmekte ve toplumsal huzura katkı sunmaktadır.

4. TÜRKİYEDE ARAZİ TOPLULAŞTIRMASININ TARİHSEL GELİŞİMİ

Ülkemizde ilk arazi toplulaştırması 1961 yılında Konya Çumra Kargın köyünde yapılmıştır. Bu tarihten, toplulaştırma yetkisinin Devlet Su İşleri Genel Müdürlüğü'ne (DSİ) devredildiği 2018 yılına kadar, çeşitli kurumlar tarafından farklı mevzuatlara göre farklı nitelikte arazi toplulaştırma projeleri yürütülmüştür (Çizelge 4)

Çizelge 4. Ülkemizde arazi toplulaştırmasının tarihsel gelişimi (1961-2023)

No	Tarih	Sorumlu Kurum	Mevzuat	Alan (hektar)	Toplulaştırma Niteliği
1	1961-1984 1984-2005 1990-2008	Toprak-Su GM Köy Hizmetleri GM Tarım Reformu GM Toplam	AT Tüzüğü AT Tüzüğü 3083 SK	72.000 303.344 232.156 **607.500**	Basit arazi toplulaştırması

	1961-2018	GENEL TOPLAM		3.149.636	

(*) Bağlı kuruluş olan TRGM, 2011 yılında Merkez Genel Müdürlük olarak yeniden yapılandırılmıştır.

Çizelgede görüldüğü gibi 1961-2018 yılları arasında arazi toplulaştırma çalışmaları farklı kurumlarca yürütülmüştür ve ihtiyaçlara göre şekillenmiştir. 1961–1984 arasında Toprak-Su Genel Müdürlüğü 72.000 hektarda, 1984–2005 arasında Köy Hizmetleri Genel Müdürlüğü 303.344 hektarda, 1990–2008 arasında ise Tarım Reformu Genel Müdürlüğü 232.156 hektarda, sulama alanlarında basit toplulaştırma yapmıştır. Bu dönemde toplam 607.500 hektar alanda arazi toplulaştırması gerçekleştirilmiştir.

2009 sonrası dönemde, Tarım Reformu Genel Müdürlüğü tarafından 3083 sayılı Kanun kapsamında havza bazlı ve çok amaçlı projeler uygulanmaya başlanmıştır. Arazi toplulaştırmasıyla birlikte tarlaiçi geliştirme hizmetleri, mera düzenlemeleri, ekolojik koridorlar ile köy içme suyu temini ve arıtma tesisleri gibi sosyal altyapı hizmetleri de gerçekleştirilmiştir. Katılımcı yaklaşımla hazırlanan sosyal etüt raporları, sorunların tespiti ve toplulaştırma yoluyla çözümünde önemli bir açılım sağlamıştır. Bu dönemde toplam 1.091.520 hektar alanda toplulaştırma yapılmıştır.

İlk çok amaçlı ve büyük ölçekli toplulaştırma çalışmalarına GAP bölgesinde GAP Eylem planı (2008-2012) ile başlanmıştır. 7 ildeki 13 büyük sulama projesiyle 2,5 milyon hektarlık alan toplulaştırma kapsamına alınmıştır. Toplulaştırmanın DSİ'ye devredildiği 2018 yılına kadar 57.318 dekarlık arazi toplulaştırma ile ana kanal güzergâhı için ayrılmış, 22.500 km tarla yolu yapılmış, içmesuyu, foseptik ve yerleşim altyapıları tamamlanmış ve Harran Ovası'nda 120.000 hektarda drenaj çalışmalarıyla taban suyu ve tuzluluk sorunları giderilmiştir (TRGM 2018).

2008 yılında TRGM'nin kapasite yetersizliği nedeniyle kurumlara özel arazi toplulaştırma yetkisi verilmiş, ilk olarak DSİ bu yetkiyi kullanarak 423.000 hektarda toplulaştırma izni almış ve 2018 yılına kadar 70.000 hektar alanın toplulaştırmasını tamamlanmıştır (TRGM 2018). Karayolları Genel Müdürlüğü ise, kamulaştırma yerine toplulaştırma ile 38.749 dekar arazi temin ederek 16 milyar TL tasarruf sağlamıştır (KGM 2016).

2016-2017 yıllarında Tarım Reformu Genel Müdürlüğü, 35 projeyle 1.511.305 hektar alanda arazi edinimli toplulaştırma başlatmış ve altyapı geliştirme çalışmaları yapılmıştır. 2018'de arazi toplulaştırma yetkisi DSİ'ye devredilmiştir. Bu durum sulama yatırımlarını hızlandırırken TRGM'nin arazi bankacılığı çalışmalarını olumsuz etkilemiştir. 1961-2018 arasında toplam 7 milyon hektar alanda toplulaştırma çalışmalarına başlanmış ve 3.149.636 hektar alan tescil edilmiştir (Türker 2025).

5. TARIM ARAZİLERİNİN MİRAS VE SATIŞLA BÖLÜNMESİNİ ÖNLEYEN YASAL DÜZENLEME VE ARAZİ BANKACILIĞI UYGULAMALARI

Ülkemizde tarım arazilerinin miras ve satış yoluyla kontrolsüz biçimde parçalanması, tarımda verimlilik ve sürdürülebilirliğin önündeki başlıca engellerdendir. Yeter gelirli ölçeğin altına düşen, parçalı, çok hisseli ve mülkiyet sorunlu araziler; verimliliği artıracak önlemler ile yatırımları zorlaştırmakta, kırsalın cazibesini azaltarak kente göçü teşvik etmektedir.

Oysa gelişmiş ülkelerde tarım arazileri miras ile parçalanmamakta işletme bütünlüğü korunmaktadır (Çizelge 5).

Çizelge 5. Bazı gelişmiş ülkelerde işletme büyüklüğü ve miras uygulamaları

Ülke	İşletme Sayısı	Ort. İşletme Büyük. (ha)	Miras ile İlgili Uygulama
İngiltere	300.000	53,8	En büyük kardeşe devir.
Fransa	527.000	52,1	Kardeşlerden biri diğerlerine piyasa değerinden bedelini öder.
Almanya	371.000	45,7	Kardeşlerden biri diğerlerine tazminat öder.
İspanya	1.044.000	23,8	Ehil olan mirasçıya devir.
İtalya	1.679.000	7,6	Ehil olan mirasçıya devir.
AB (27 ülke ort)	13.700.000	12,6	
ABD	2.076.000	181,8	Bedeli karşılığı satılmakta.
Türkiye	3.022.000	5,9	Mirasçılara payları oranında intikal etmektedir.

Kaynak: http://ec.europa.eu/agriculture/agrista/2009/table_en/2009enfinal.pdf

Çizelgede görüldüğü gibi gelişmiş birçok Avrupa Birliği ülkesinde, tarım arazilerinin **miras yoluyla parçalanması yasal olarak sınırlandırılmış**, araziler genellikle **en büyük kardeşe veya ehil bir mirasçıya** devredilerek tarım işletmelerinin bütünlüğü korunmuştur. Ayrıca bu ülkelerde **genç çiftçilere yönelik özel devlet destekleri** sağlanmaktadır.

İngiltere, Fransa ve Almanya gibi ülkelerde ortalama işletme büyüklükleri 45–54 hektar arasında değişmekte ve araziler mirasla bölünmeden bir kişiye devredilmektedir. **İtalya ve İspanya** gibi ülkelerde de benzer uygulamalar görülmekte, araziler ehil mirasçıya bırakılmaktadır.

Buna karşın **Türkiye'de 3 milyondan fazla tarım işletmesi** bulunmakta olup ortalama işletme büyüklüğü sadece **5,9 hektardır**. Araziler mirasla **eşit şekilde tüm kardeşler arasında bölünmektedir**, bu da işletme ölçeğini küçülterek tarımsal verimliliği düşürmektedir.

Ülkemizde bu sorunu çözmek amacıyla, 2014 yılında 5403 Sayılı Toprak Koruma ve Arazi Kullanımı Kanunu'nda reform niteliğinde bir yasal düzenleme yapılmıştır. Yapılan değişiklikle, tarım arazilerinin miras ve satış yoluyla parçalanması sınırlandırılmış ve tarımsal bütünlüğün korunması hedeflenmiştir. Bu düzenlemenin temel amacı; tarım arazilerinin yeter gelirli arazi büyüklüklerinin altına düşmesini önlemek, üretim sürekliliğini sağlamak ve tarımsal verimliliği artırmaktır.

Bu kapsamda, Türkiye genelinde 81 il ve 920 ilçe için 'Yeter Gelirli Asgari Arazi Büyüklükleri; sulanan araziler (45–80 da), kuru tarım arazileri (120–240 da), örtüaltı (5 da) ve dikili (10 da) araziler olarak tespit edilmiş ve kanun ekinde yayınlanmıştır. Böylece belirlenen büyüklükler 'bölünemez arazi büyüklüğü' olarak kabul edilmiş ve altına düşecek bölünmeler yasaklanmıştır.

15 Mayıs 2014 tarihinde yürürlüğe giren bu kanun değişikliği, üç temel konuda düzenleme getirmiştir(Türker 2025):

1. Miras yoluyla mülkiyet devri,
2. Tarım arazilerinin alım-satım işlemleri,
3. Arazi edindirme (Bankacılığı) iş ve işlemleri.
4.

5.1. Miras Yoluyla Mülkiyet Devirleri

15 Mayıs 2014 tarihinden önce vefat eden kişilerin tarım arazileri, mirasçılar arasında elbirliği ya da paylı mülkiyet şeklinde intikal edilebilmektedir. Bu durumda, mirasçılar daha sonra aralarında anlaşarak devir, taksim veya üçüncü kişilere satış yapabilmektedirler. Ancak bu tarihten sonraki ölümler için, tarım arazilerinin daha fazla parçalanmasını önlemek amacıyla bazı yasal sınırlamalar getirilmiştir (Türker 2025).

Takbis (2023) verilerine göre ülkemizdeki tarım arazilerinin mülkiyet durumu çizelge 6'da verilmiştir. Görüldüğü gibi vasfı tarım olan 34,998.606 parsel olup 26.598.522 ha alana karşılık gelmektedir. Ayrıca 23.083.992 parsel tam mülkiyetli, 12.389.438 parsel paylı mülkiyet, 7.115.998 parsel elbirliği mülkiyet ve 7.111.062 parselde hem paylı hem de elbirliği mülkiyeti olan parsellerden oluşmaktadır. 2014 yılında miras ile ilgili düzenlemeden sonra normun altına olan parsellerde anlaşma olmaması durumunda elbirliği parsel olarak anlaşmayı beklemektedir. Ya da hak sahipleri rızai taksim ile kendine düşen bölümü işlemeye devam etmektedir.

Her geçen gün kronikleşen bu sorunların çözümü için arazi bankacılığının hayata geçirilmesi tüm taraflar açısından zorunluluk arz etmektedir.

Çizelge 6. Tarım arazilerinin mülkiyet durumu (2024)

Arazisi Niteliği	2023			
	Parsel Sayısı (Adet)	Oran (%)	Alan (Ha)	Oran (%)
Toplam Tarım Arazisi	34.998.606	100,00	26.598.522	100,00
Tam Hisseli	23.083.992	65,96	15.096.432	56,76
Paylı Mülkiyet	12.389.438		11.751.376	
Elbirliği Mülkiyet	7.115.998	34,04	6.009.386	43,24
Hem Paylı Hem Elbirliği Mülkiyet	7.111.062		6.007.249	

Kaynak: TAKBİS, 2024

2014 yılında miras hukukunda yapılan değişikliğe göre miras ile ilgili iş ve işlemler Şekil 3'te verilmiştir. Buna göre; **Miras yönetimi sürecine göre**, tarım arazilerinin devri için mirasın açılmasından itibaren **mirasçılara bir yıl süre** tanınmaktadır. Bu süre içinde taraflar, şu dört yöntemden birinde anlaşabilir:

1. Arazinin bir mirasçıya devri,
2. Aile malları ortaklığı kurulması,
3. Aile şirketi kurulması,
4. Arazinin satılması (tasfiye).

Eğer mirasın açılmasından sonra bir yıllık sürede anlaşma sağlanamazsa, Bakanlık mirasçılara tebligat göndererek 3 ay içinde anlaşma için ek süre tanımaktadır. Bu sürenin sonunda da devir yapılmazsa, Kardeşler dava açabildiği gibi Bakanlık da sulh hukuk mahkemesinde dava açma yetkisine sahip bulunmaktadır.

2016–2017 yılları miras ile mülkiyet devirlerinin en yoğun yapıldığı yıllardır. Mirasın açılmasından sonra kanunun verdiği 1 yıl süre dolmasına rağmen anlaşmayan 586.380 kişiye tebligat gönderilmiş ve varislerin 3 ay içinde anlaşmaları istenmiştir. Ancak sonraki yıllarda Bakanlık dava açma konusunda karar verememiş, tebligatlar durdurulmuş ve intikaller yeniden mirasçıların isteğine bırakılmıştır. Buna rağmen 2015-2023 yılları arasında toplam 471.111 kişi yaklaşık 10.916.748 dekar tarım arazisinin varisler arasında paylaşımı için başvuru yapmıştır. Yıllık ortalama 52.385 kişi miras paylaşımına başvururken 47.385 kişinin başvurusu (958.662 da) kabul edilirken, 12.203 kişinin başvurusu (285.686 da) kanun kapsamında reddedilmiştir.

5.2. Tarım Arazilerinin Satış İşlemleri

2014 yılında 5403 Sayılı Toprak Koruma ve Arazi Kullanım Kanununda yapılan değişikliklerle, tarım arazilerinin satış yoluyla devirlerinde önemli kısıtlamalar getirilmiştir. Arazilerin bölünemez büyüklükleri korunurken, satış işlemleri Tapu Müdürlükleri ve Tarım ve Orman Bakanlığı denetiminde yürütülmektedir.

31.12.2014 tarihli Resmî Gazete'de yayımlanan "Tarımsal Arazilerin Mülkiyetinin Devrine İlişkin Yönetmelik" ile satış işlemlerinde arazi sınıfı, ekonomik bütünlük, asgari büyüklük, yeter gelirli büyüklük, sınırdaşlık, ifraz ve hisselendirme gibi kriterler dikkate alınmaktadır. Ayrıca, hisselendirme, taksim, vasıf değişikliği gibi işlemler il/ilçe tarım müdürlüklerinin görüşüyle yapılmaktadır.

Paylı mülkiyetli taşınmazlarda, payların tamamı hisselendirilerek birleştirilebiliyorsa tapu müdürlüklerince işlem yapılabilmektedir. Asgari büyüklük altına düşmemek koşuluyla payların diğer paydaşlara devrine izin verilmektedir.

28.10.2020 tarihine kadar kadarki satışlarda yeter gelirli arazi büyüklükleri esas alınırken, bu tarihten sonra parsel bazlı düzenlemelere geçilmiş, hisse sayısı artırılmamak şartıyla parsel bazlı satışlara izin verilmiştir. Ayrıca ekonomik bütünlük arz etmeyen parsellerin (kuru ve sulu tarımda 10 dekar, dikili arazide 5 dekar, örtü altı tarımda 1 dekardan küçük) satışına izin verilmiştir.

2015-2023 yılları arasında toplam 4.046.104 tarım arazisi satış başvurusu (67.914.307 da) yapılmıştır. Bunların 260.730'u reddedilerek 10.966.924 dekar arazinin satışına izin verilmemiştir.

5.3. Arazi Edindirme (Bankacılığı) İş ve İşlemleri

5403 sayılı Kanunun 8K maddesi, Türkiye'de arazi edindirme (arazi bankacılığı) faaliyetlerinin yasal temelini oluşturmaktadır. Bu kapsamda Tarım ve Orman Bakanlığı; yeter gelirli tarımsal arazi büyüklüğünü artırmak, arazi değerlerini belirlemek, kredi temin etmek, ortakçılık ve kiracılığı düzenlemek, alım-satım ve kiralamalara aracılık yapmak gibi görevler üstlenmiştir. Amaç, tarımsal işletmelerin mülkiyet sorunlarını çözmek ve ölçeklerini büyütmektir. Uygulama, arazilerin alım-satımına aracılık edilmesi ve kiralama ya da ortakçılık gibi işlemler yoluyla yürütülmektedir.

Türkiye'de yaklaşık 3 milyon işletme, 40 milyondan fazla hissedara ait arazilerde faaliyet göstermektedir. Hissedarların çoğu arazilerinin yerini bilmezken, fiili kullanıcılar finansman eksikliği ve satış ortamının yetersizliği nedeniyle arazileri satın alamamaktadır. Bu nedenle satış süreçlerinin kolaylaştırılması ve uygun finansman mekanizmalarının sağlanması gerekmektedir. Tarım arazilerinin satış ve miras işlemleri, TAKBİS ile entegre çalışan TAY Portal üzerinden online yürütülmektedir. Tarımsal vasıflı araziler için Tarım il/ilçe Müdürlüklerinden uygunluk onayı alınmaktadır. Satışlarda tarafların anlaşamaması durumunda Tarımsal Gelir Değeri yöntemi uygulanmaktadır. Ayrıca, mirasçılar tapuya 20 yıl süreli değer artışı şerhi koydurabilmektedir.

Tarım arazileri ile ilgili önemli bir sorun da intikal işlemlerinin yapılmamasıdır. Mülkiyetin varislere devredilmemesi hem hukuki hem ekonomik sorunlara yol açmaktadır. Kanun, mülkiyet sorunlarını giderilmesi için kamulaştırma söz konusu ise bu görevi Tarım ve Orman Bakanlığının talebi ile Çevre, Şehircilik ve İklim Değişikliği Bakanlığı'na vermiştir. Ancak bu konuda bugüne kadar hiçbir uygulama yapılmamıştır.

2016 yılı sonrası arazi edindirme altyapısını güçlendirmek amacıyla çeşitli adımlar atılmış, özellikle sulama alanlarında toplulaştırma projeleriyle entegrasyon hedeflenmiştir. Mirasçılar için "miras kredisi" üzerinde çalışılmış, başarı sağlanamamıştır. Bunun yerine %25 faiz indirimli sübvansiyonlu kredi uygulamaya alınmıştır. 2017 yılında 15 ilde pilot projeler yürütülmüş, Miras, satış ve kiralama işlemlerinin online yapılması için TAY ve TED portalları hazırlanmıştır. 2019 yılında FAO iş birliğiyle Azerbaycan ve Özbekistan'ı da kapsayan arazi toplulaştırma kapasitesinin artırılması ve atıl arazilerin kiralanması ile ilgili proje başlatılmıştır.

Toplulaştırma yetkisinin DSİ'ye devredilmesiyle birlikte arazi bankacılığına yönelik çabalar hız kazanmıştır. Bu kapsamda atıl araziler tespit edilmiş; atıl bırakma nedenleri ve çözüm önerileri, 2018-2019 yıllarında yedi bölgede tüm paydaşların katılımıyla düzenlenen çalıştaylarda ele alınmıştır. Atıl arazilerin yeniden üretime kazandırılması için mevcut yasal ve idari yapının yetersiz olduğu; bu nedenle güçlü bir sistem kurulabilmesi için yasal ve idari düzenlemelere ihtiyaç duyulduğu değerlendirilmiştir.

Bu soruna çözüm olarak, 23 Mart 2023 tarihinde yürürlüğe giren 7442 Sayılı Kanun ile iki yıl üst üste işlenmeyen özel mülkiyete ait tarım arazilerinin, kira geliri arazi sahibine ait olmak üzere kiralanması yasal hale getirilmiştir. Bu kapsamda, kiralama işlemlerinin yerel veya dijital ortamda yürütülmesi amacıyla Arazi Tespit ve Kiralama Komisyonları kurulmuş; uygun arazilerin belirlenmesi ve ilan süreci başlatılmıştır. Kiracılar, belirlenen ürünleri üretmek ve toprağı korumakla yükümlü olacaktır. 2024-2025 yılları, izleme ve veri toplama süreci olarak

belirlenmiş olup, kiralama işlemlerine 2025 hasat döneminden sonra geçilmesi planlanmaktadır.

Tarım arazilerinin miras ve satış yoluyla bölünmesini önleyen yasal düzenleme başarıyla uygulanmaktadır. Kanunun yürürlüğe girdiği tarihten 2024 yılına kadar miras yoluyla bölünmeden mülkiyet devri yapılan parsel sayısı ile miras ve satış yoluyla parçalanması önlenen arazi miktarı Çizelge 7'de verilmiştir.

Çizelge 7.Tarım arazilerinin miras ve satış ile bölünmesinin önlenmesi istatistikleri (2015-2023)

İşlem	Miktar
Bölünmeden mirasçılara intikali sağlanan parsel adedi	7,7 milyon
Miras ve satış yolu ile bölünme ve hisselendirilmesi önlenen alan	1,9 Milyon ha.

Kaynak: TRGM 2024

Görüldüğü gibi 7,7 milyon parselin bölünmeden devri gerçekleşmiş, yaklaşık 1,9 milyon hektar alanın hisselendirilmesi önlenmiştir.

6. ARAZİ TOPLULAŞTIRMASI VE ARAZİ BANKACILIĞININ GELECEĞİ

Ülkemizde ilk arazi toplulaştırmasının yapıldığı 1961 yılından 2002 yılına kadar Mülga Toprak-su, Mülga Köy Hizmetleri ve Mülga Tarım Reformu Genel Müdürlükleri gibi farklı kurumlar tarafından yaklaşık 450.000 hektar alanda basit arazi toplulaştırması yapılmıştır. 2002-2008 döneminde Köy Hizmetleri'nin kapatılması ve sulama yatırımlarının hızlandırılmasıyla toplulaştırma daha kapsamlı ve havza bazlı olarak ele alınmaya başlanmıştır.

2008 sonrası özellikle GAP gibi büyük sulama bölgelerinde DSİ'nin yatırımlarına paralel olarak çok amaçlı toplulaştırma projelerine hız verilmiştir. Ancak 2012 yılına gelindiğinde mevcut toplulaştırma uygulamalarının yatırımların hızlandırılması ile birlikte küçük ve parçalı arazilerin birleştirilmesi, sulama kanalı ve yola kavuşturulmasında başarılı olduğu ancak mülkiyet sorunlarının çözülmesi ve işletme ölçeğinin büyütülmesinde yeterli olmadığı fark edilmiştir (Türker 2025).

Tarım arazilerinin miras ve satış yoluyla sürekli bölünmesi, toplulaştırmanın etkisini azaltmış, tarımın sürdürülebilirliğini tehdit etmiştir. Bunun üzerine 2014 yılında Cumhuriyet tarihinin en önemli reformu gerçekleştirilmiştir. Miras ile ilgili yasal düzenleme yapılmış ve tarım arazilerinin miras ve satışlarla belirli normların altına parçalanması yasaklanmıştır. Ayrıca arazi toplulaştırması ile birlikte arazi bankacılığının geliştirilmesi ile ilgili bir dizi çalışma yapılmıştır. Bu kapsamda arazi değerlemesi ve edindirme yönetmeliği için pilot proje, arazi edindirmeli toplulaştırma projeleri, arazi edindirme pilot projesi, uluslararası projeler, hizmetlerin online yapılacağı Tarım Arazileri Edindirme ve Değerleme Portalı (Ted Portal) gibi çalışmalar yürütülmüştür.

Toplulaştırma genellikle sulama projeleriyle birlikte yürütülmüş, özellikle DSİ'nin büyük sulama sahalarında TRGM tarafından uygulanmıştır. Ancak kurumlar arası koordinasyon sorunları nedeniyle 2018'de bu yetki DSİ'ye devredilmiş, böylece toplulaştırma ve sulama yatırımları aynı kurum tarafından yürütülmeye başlanmıştır.

Arazi toplulaştırmasının yıllar itibariyle gelişimi Çizelge 8'de verilmiştir. Görüldüğü gibi 2024 yılına kadar 7.360.577 ha alanda toplulaştırma tamamlanmıştır.

Çizelge 8. Arazi Toplulaştırmasının Tarihsel Gelişim (1961-2024)

Yıllar	Hektar(Tescil)
1961-2002	449.713
2003-2007	132.287
2008	25.500
2009	39.965
2010	47.668
2011	57.970
2012	14.341
2013	306.120
2014	171.091
2015	454.367
2016	453.895
2017	951.104
2018	496.000
2019	619.000
2020	544.832
2021	1.258.117
2022	759.365
2023	492.252
TOPLAM	**7.360.577**

Kaynak: DSİ 2024

2018 yılında arazi toplulaştırma yetkisinin Devlet Su İşleri (DSİ) Genel Müdürlüğü'ne devredilmesiyle birlikte, sulama yatırımları hız kazanmış; ancak Tarım Reformu Genel Müdürlüğü (TRGM) tarafından yürütülen arazi bankacılığı faaliyetlerinde beklenen ilerleme sağlanamamıştır. Bu durumun temel nedenleri arasında uygulamaların gönüllülük esasına dayanması ile yeterli teşvik ve yaptırım mekanizmalarının bulunmaması yer almaktadır.

Arazi toplulaştırması, günümüzde olduğu gibi gelecekte de tarımsal yapının iyileştirilmesi, kaynakların etkin kullanımı ve üretimin sürdürülebilirliği açısından stratejik bir araç olmaya devam edecektir. Bu kapsamda, öncelikle sulamaya açılmış alanlarda "birinci kuşak" toplulaştırma çalışmalarının tamamlanması büyük önem taşımaktadır. Devamında ise mülkiyet sorunlarını çözen, hisseliliği azaltan ve işletme ölçeğini büyütmeyi amaçlayan "ikinci kuşak" toplulaştırma projelerinin, Avrupa Birliği ülkelerinde olduğu gibi Türkiye'de de geliştirilerek uygulamaya geçirilmesi gerekmektedir.

8. SONUÇ VE ÖNERİLER

Küresel ölçekte artan krizler, salgınlar, savaşlar, kuraklık ve deprem gibi afetler tarımın ve gıda güvenliğinin stratejik önemini bir kez daha ortaya koymuştur. Bu çerçevede, güçlü bir tarım sektörü için sürdürülebilir arazi yönetimine ihtiyaç vardır. Bu yönetim; sağlam yasal düzenlemeler, etkin kurumsal yapı ve dijital bilgi sistemleriyle desteklenmelidir.

2005 yılında yürürlüğe giren 5403 sayılı Toprak Koruma ve Arazi Kullanım Kanunu ile tarım arazilerinin korunması, sınıflandırılması ve planlı kullanımı merkezi bir yapı altında toplanmıştır. Bu sayede tarım dışına çıkarılan arazi miktarında ciddi azalmalar sağlanmış, ayrıca büyük tarım ovaları koruma altına alınmıştır. Arazi toplulaştırması ve sulama yatırımları hızlandırılmıştır.

Avrupa Birliği ülkelerinde arazi bankacılığı, toplulaştırmayı destekleyen bir araç olarak kullanılırken; Türkiye'de de benzer bir sistemin kurulması ve atıl tarım arazilerinin üretime kazandırılması için çalışmalar başlatılmıştır.

Türkiye'de arazi toplulaştırması 1961 yılından bu yana uygulanmakta olup, 2005 sonrası süreçte GAP, KOP ve DAP gibi bölgesel kalkınma projeleriyle birlikte havza bazlı ve çok amaçlı projelere geçilmiştir. Sulama yatırımlarıyla entegre biçimde yürütülen toplulaştırma çalışmalarında önemli gelişmeler kaydedilmiştir. Ancak küçük, parçalı ve dağınık parsellerin birleştirilmesi, yol ve kanala erişim sorununun çözülmesine rağmen hisselilik sorunu çözülememiş ve işletme ölçeği büyütülememiştir. Bu nedenle, miras ve satış yoluyla arazilerin yeniden bölünmesini engelleyen 6537 sayılı Kanun 2014 yılında yürürlüğe girmiş ve yeter gelirli tarımsal arazi büyüklüğü tanımı getirilmiştir. Bu düzenleme, sektörde son 30 yılın en önemli yasal reformlarından biri olarak değerlendirilmiştir.

Ayrıca, dijital altyapı güçlendirilmiş; Ulusal Toprak Bilgi Sistemi (TAD Portal) ve Çiftçi Kayıt Sistemi (ÇKS) dijital ortama aktarılmıştır. Ancak, küçük ve hisseli parseller nedeniyle ÇKS kayıt oranı %65'te kalmıştır (ÇKS 2023a). 2015-2023 arasında yaklaşık 7,7 milyon parselin mirasçılara bölünmeden intikali sağlanmış, 1,9 milyon hektar alanın parçalanması önlenmiştir (TRGM 2023b). Mirasla ilgili düzenlemeler olumlu sonuçlar üretse de, aynı başarı arazi bankacılığı alanında elde edilememiştir.

2018 yılında arazi toplulaştırma yetkisinin DSİ'ye devredilmesiyle sulama yatırımları hızlanmış ve kamu kaynaklarında tasarruf sağlanmıştır. Ancak bu durum, Bakanlığın mülkiyet yönetimi ve arazi edindirme konularındaki etkisini sınırlamıştır. Bu nedenle atıl arazilerin üretime kazandırılması ve etkin bir arazi bankacılığı yapısının kurulması yönünde yeni çalışmalara ihtiyaç duyulmaktadır.

Sonuç olarak, Türkiye'de güçlü ve sürdürülebilir bir tarım sektörü için arazi toplulaştırması ile arazi bankacılığı uygulamalarının eşgüdüm içinde yürütülmesi büyük önem taşımaktadır. Mülkiyet sorunlarının çözülmesi, işletme ölçeklerinin büyütülmesi ve tarım dışı kalan arazilerin üretime kazandırılması için yasal, kurumsal ve dijital altyapının daha da güçlendirilmesi gerekmektedir.

ABSTRACT

Climate change is becoming increasingly evident in the regions of the Mediterranean Basin, including Turkey. IPCC reports predict that Turkey's temperature increase will be 40-50% faster than the global average (IPCC, 2021). Especially in 2020-2021, Turkey has experienced 11 dry years, 13 wet years and 17 normal years in the 1981-2021 period, and the risk of drought has gradually increased (MGM, 2021). This situation threatens water and food security by creating great pressures on agricultural production and water resources.

The average annual rainfall in Turkey is 573.4 mm, which corresponds to 450 billion m³ of rainfall per year. According to DSİ (2024) data, the safe groundwater and surface water potential is calculated as 112 billion m³/year. With 1312 m³/year of renewable water per capita, Turkey is not a water-rich country but a water-constrained country. By 2030, it is a country that may experience water scarcity with the risk of falling below 1,000 m³. The economic irrigable area in Turkey is 8.5 million ha, of which 7.2 million ha (84.7%) has been opened to irrigation to date. Of the water used, 76% is used for irrigation in agriculture. With climate change, the decline in water resources in many basins and excessive groundwater withdrawals are triggering a water crisis.

Drought also poses great risks in dry agricultural areas. Approximately 18.5 million hectares of Turkey's 24 million hectares of agricultural land are dry farmed (TKMSEP, 2023). In these areas, failure to meet water demand due to drought leads to significant yield losses in strategic crops such as wheat. For example, 2008 was recorded as the driest year on record with 445 mm of rainfall across the country, leading to serious reductions in agricultural production (MGM, 2021). In addition, during severe drought periods, water and food crises increase.

In Turkey, various strategies and action plans have been developed and implemented within the scope of combating and adapting to climate change. Among these, in addition to measures such as Climate Change Mitigation and Adaptation Strategy and Action Plan covering the years 2024-2030, Strategy and Action Plan for Combating Agricultural Drought (2023-2027), many projects and activities are being carried out such as dissemination of modern irrigation systems that save water, increasing sink areas through pasture improvement works and afforestation

projects, development of drought resistant plant varieties and risk management practices such as drought insurance.

As a result, Turkey's efforts to combat climate change and agricultural drought are coordinated at national and local levels. Aiming to reduce greenhouse gas emissions by 21% by 2030, the country is trying to manage this process through both strategic plans and practical projects to mitigate the potential impacts of drought and water crises (TUIK, 2024). The measures taken aim to ensure the sustainability of agricultural production while minimizing risks to water and food security.

Keywords: Climate Change, Drought, Water Crisis, Food Crisis, Irrigation

TÜRKİYE'DE İKLİM DEĞİŞİKLİĞİNİN SU VE GIDA KRİZİNE ETKİLERİ VE ALINMASI GEREKEN ÖNLEMLER

ÖZET

İklim değişikliği, Türkiye'nin de içinde bulunduğu Akdeniz Havzası'ndaki bölgelerde giderek daha belirgin hale gelmektedir. IPCC raporları, Türkiye'nin sıcaklık artışının küresel ortalamadan %40-50 daha hızlı olacağını öngörmektedir (IPCC, 2021). Özellikle 2020-2021 yıllarında, 1981-2021 dönemi itibariyle Türkiye'de 11 yıl kurak, 13 yıl nemli ve 17 yıl normal geçmiş olup, kuraklık riskinin giderek arttığı görülmüştür (MGM, 2021). Bu durum, tarımsal üretim ve su kaynakları üzerinde büyük baskılar oluşturarak su ve gıda güvenliğini tehdit etmektedir.

Türkiye'de yıllık ortalama yağış miktarı 573,4 mm olup, bu değer yıllık 450 milyar m^3 yağışa karşılık gelmektedir. DSİ (2024) verilerine göre, emniyetli yeraltı ve yerüstü su potansiyeli 112 milyar m^3/yıl olarak hesaplanmıştır. Türkiye, kişi başına düşen 1312 m^3/yıl yenilenebilir su miktarı ile su zengini bir ülke olmayıp, su kısıtı çeken bir ülkedir. 2030 yılı itibariyle, 1.000 m^3'ün altına düşme riski ile su kıtlığı yaşayabilecek bir ülke konumundadır. Türkiye'de ekonomik sulanabilir alan 8,5 milyon ha olup, bugüne kadar bunun 7,2 milyon hektarı (%84,7) sulamaya açılmıştır. Kullanılan suyun %76'sı tarımda sulamada kullanılmaktadır. İklim değişikliği ile birçok havzada su kaynaklarındaki azalma ve aşırı yeraltı suyu çekimleri su krizini tetiklemektedir.

Kuraklık, kuru tarım alanlarında da büyük riskler taşımaktadır. Türkiye'deki 24 milyon hektar tarım alanının yaklaşık 18,5 milyon hektarında kuru tarım yapılmaktadır (TKMSEP, 2023). Bu alanlarda, kuraklık nedeniyle su talebinin karşılanamaması, buğday gibi stratejik ürünlerde önemli verim kayıplarına yol açmaktadır. Örneğin, 2008 yılı, ülke genelinde 445 mm yağışla en kurak yıl olarak kayıtlara geçmiş olup, bu durum tarımsal üretimde ciddi azalmalara yol açmıştır (MGM, 2021). Ayrıca şiddetli kurak dönemlerde su krizi ve gıda krizleri artmaktadır.

Ülkemizde, iklim değişikliği ile mücadele ve uyum kapsamında çeşitli strateji ve eylem planları geliştirilmiş ve uygulamaya alınmıştır. Bunlar arasında 2024-2030 yıllarını kapsayan İklim Değişikliği Azaltım ve Uyum Strateji ve Eylem Planı, Tarımsal Kuraklıkla Mücadele Stratejisi ve Eylem Planı (2023-2027) gibi tedbirlerin yanı sıra su tasarrufu sağlayan modern sulama sistemlerinin yaygınlaştırılması, mera ıslah çalışmaları ve ağaçlandırma projeleri ile yutak alanlarının artırılması, kuraklığa dayanıklı bitki çeşitlerinin geliştirilmesi ve kuraklık sigortası gibi risk yönetimi uygulamaları gibi birçok proje ve faaliyet yürütülmektedir.

Sonuç olarak, Türkiye'nin iklim değişikliği ve tarımsal kuraklıkla mücadele çabaları, ulusal ve yerel düzeyde koordineli bir şekilde yürütülmektedir. 2030 yılına kadar sera gazı emisyonlarını %21 oranında azaltmayı hedefleyen ülke, kuraklık ve su krizlerinin olası etkilerini azaltmak için hem stratejik planlar hem de uygulamalı projelerle bu süreci yönetmeye çalışmaktadır (TÜİK, 2024). Alınan önlemlerle, tarımsal üretimin sürdürülebilirliği sağlanırken, aynı zamanda su ve gıda güvenliğine yönelik risklerin de minimize edilmesi hedeflenmektedir.

Anahtar Kelimeler: İklim Değişikliği, Kuraklık, Su Krizi, Gıda Krizi, Sulama

1. GİRİŞ

Küresel ısınma ve iklim değişikliği, günümüzde en çok konuşulan konuların başında gelmektedir. Son yıllarda iklim değişikliği ve olumsuz etkileri daha fazla hissedilmeye başlanmıştır. İklim değişikliği sadece çevrede değil, tüm ekosistemlerde ve ekonomide doğal dengenin bozulmasına yol açmakta ve krizleri tetiklemektedir. Ayrıca son yıllarda sıkça gündeme gelen "iklim krizi" ise, küresel ısınmanın bir sonucu olarak ortaya çıkan ve çoğunlukla insan etkinlikleri sonucunda tetiklenen hızlı iklim değişiklikleri olarak ifade edilebilir. Aslında iklim krizi, durumun önemini ve tedbirlerin acilliğini vurgulamaktadır. İklim değişikliğinin zararlarını vurgulamak amacıyla kullanılan bu tanım, artık hayatımızın bir parçası olmuştur.

İklim krizinin en önemli nedeninin fosil yakıtlar olduğu, bilim insanları tarafından kanıtlanmıştır. Özellikle sanayileşme ve kalkınma hamleleri, fabrikasyon ve mekanizasyondaki hızlı gelişmeler, fosil yakıtların kullanımını hızla artırmıştır. İklim odaklı riskler ve krizler devam etmekte olup, bunun farkında olan ülkeler, sürdürülebilir bir gelecek için çözümler aramaktadır.

Bugün dünya nüfusu yaklaşık 8 milyar olup, 2050 yılında bu nüfusun 9,8 milyar olması beklenmektedir. Bu nüfusun beslenebilmesi için gıda üretiminin en az %60 oranında artırılması gerekmektedir. FAO (2022) verilerine göre, yerküre üzerinde 39 ülkede gıda, 80 ülkede ise su sıkıntısı yaşanmaktadır. Birçok iklim uzmanına göre, iklim değişikliği ve kuraklık; dünyanın birçok bölgesinde verimli tarım arazilerinin azalmasına, toprak ve su kaynaklarının kirlenmesine ve üretimde verim kayıplarına neden olarak krizlerine yol açacaktır

Dünyada küresel ısınma ve iklim değişikliği, sanayileşmenin başladığı 1800'lü yıllardan itibaren kayıt altına alınan sıcaklık verileri ile incelenmektedir. Bu verilere göre sıcaklıklar 1800'lü yıllardan günümüze yaklaşık 1^{o}C artmıştır. Sıcaklık artışlarının gelecek 100 yılda da artarak devam edeceği öngörülmektedir. Yine en fazla sıcaklık artışı 2000'li yıllarda olmuştur. Bu artışlara bağlı olarak mevsimlerde kaymalar, yağış rejimlerinde değişmeler, kuraklık, sel, kasırga gibi doğal afetlerde artışlar gözlendiği ve bunların gelecek yüzyılda da devam edeceği tahmin edilmektedir. Küresel yüzey sıcaklığı dikkate alınarak yapılan tüm emisyon senaryolarında, sıcaklığın en azından yüzyılın ortalarına kadar artmaya devam edeceği öngörülmektedir. Yine önümüzdeki yıllarda CO2 ve diğer sera gazı emisyonlarında ciddi azalmalar olmazsa, 21. yüzyılda 1,5°C ve 2°C'lik küresel ısınma değerine ulaşılacaktır (IPCC 2013 ve 2022).

Hidrolojik döngüdeki dengenin bozulması, buzulların erimesi, deniz seviyesinin yükselmesi, sıcak hava dalgalarının şiddet ve sıklığının artması, bazı bölgelerde ekstrem yüksek yağışların ve ani yağışlara bağlı taşkınların artması, bazı bölgelerde ise kuraklıkların daha sık görülmesi ve şiddetinin artması gibi ekolojik sistemleri, sektörleri ve insan yaşamını etkileyecek önemli değişikliklerin oluşması beklenmektedir (Türkeş 2008).

İklim değişikliğine neden olan sera gazı emisyonunun azaltılması ve olası değişimlere uyum sağlanması, tüm dünyada ortak çözülmesi gereken konular olarak ele alınmaya başlanmıştır. Günümüzde iklim değişikliği, gelişmiş ve gelişmekte olan tüm ülkelerin öncelikli konuları arasına girmiştir. Bu kapsamda, iklim değişikliğine önem veren ülkeler, iklim değişikliğinin etkilerinin belirlenmesi, niteliğinin tahmin edilmesi ve etkilerinin azaltılması amacıyla gereken tedbirlerin alınması konusunda idari, hukuki, mali ve teknik nitelikli önemli çalışmalar yürütmektedirler.

Türkiye'de 2021 yılında, Çevre, Şehircilik ve İklim Değişikliği Bakanlığı'na bağlı İklim Değişikliği Başkanlığı kurulmuştur. 2011-2023 İklim Değişikliği Stratejisi ve Eylem Planı, Kalkınma Planları, 2053 Net Sıfır Emisyon Hedefi ve İklim Şurası Kararları dikkate alınarak, 2024-2030 yılları için revize edilip uygulanmaya başlanmıştır.

2. TÜRKİYE'DE ARAZİ VARLIĞI, KULLANIM DURUMU

Türkiye, kurak ve yarı kurak bölgede yer almakta olup, iklim değişikliğinden en fazla etkilenecek ülkeler arasında bulunmaktadır. 78,3 milyon hektar yüzölçümüne sahip olan ülkemizin, 23,9 milyon hektar tarım alanı, 14,6 milyon hektar mera alanı ve 23,2 milyon hektar orman alanı bulunmaktadır (TÜİK 2024). İklim değişikliğinden farklı bölgelerinin farklı şekilde etkilenmesi beklenmektedir (Çizelge 1).

Çizelge 1. Ülkemizde arazi varlığı ve kullanım durumu (2023)

Kullanım Şekli	Miktar (ha)	(%)
Tarım Alanı	23.942.000	30,56
Mera	14.617.000	18,65
Orman	23.245.000	29,67
Su Yüzeyleri	1.571.000	2,00
Yerleşim Alanları ve Diğer Alanlar	14.981.200	19,12
Toplam	78.356.200	100,00

Kaynak: TÜİK, 2024

Türkiye'de sulamaya açılan alanların artırılması, ülkenin ihtiyacı olan ürün çeşitliliğinin artırılması ile ülke ekonomisi açısından büyük önem taşımaktadır. TÜİK (2023) verilerine göre, tarım sektörü, 85 milyon ülke nüfusu ve 50 milyon turisti beslerken, 68,5 milyar dolar tarımsal hasıla ve 31 milyar dolar tarımsal ihracat geliri elde edilmesini sağlamıştır. Böylece Türkiye, AB'de 1'nci dünyada ise 10'uncu tarım ekonomisine sahip ülke olmuştur.

Dünyada ve ülkemizde tarım alanları, bir taraftan sanayileşme ve kentleşmenin baskısı altında azalmaya devam ederken, diğer taraftan iklim değişikliği sonucu yağış azalmaları, kuraklıkların şiddeti ve süresine bağlı olarak arazi bozunumları artmakta ve verimlilik düşmektedir. Tarım arazileri ile ilgili diğer önemli bir tehdit ise kirlenmedir. Yine, tarım alanlarında artan sanayi kaynaklı, evsel kaynaklı kirlilik ve tarımsal faaliyet kaynaklı kirlilik (ilaç ve gübre kullanımı), tarımı ve sürdürülebilir gıda sistemlerini tehdit etmektedir.

3. TÜRKİYE'DE SU KAYNAKLARI POTANSİYELİ VE KULLANIM DURUMU

Su, tüm canlılar için vazgeçilmez bir hayat kaynağıdır. Su, kalkınmanın itici gücü ve gıda arz güvenliğinin teminatıdır. Ülkemiz, kurak ve yarı kurak bir bölgede yer almaktadır. Uzun yıllar itibariyle yağış ortalaması yıllık 574 mm olup, en fazla yağış doğu Karadeniz Bölgesi'nde 2.500 mm/yıl, en az ise İç Anadolu Bölgesi'nde (Tuz Gölü çevresi) 250-300 mm/yıldır (DSİ 2024a).

Türkiye 25 nehir havzasından oluşmaktadır (Şekil 1). Yağışlar ve su potansiyeli havzalara göre değişmektedir.

Şekil 1. Türkiye Su Havzaları (DSİ 2024a)

Ülkemizde, DSİ (2024a) verilerine göre, kullanılabilir su potansiyeli 94 milyar m³/yıl yerüstü suyu ve 14 milyar m³/yıl yeraltı suyu olmak üzere toplam 112 milyar m³/yıldır. Bugün itibarıyla yaklaşık 57 milyar m³'ü kullanılmaktadır.
Türkiye'de, ekonomik sulanabilir 8,5 milyon hektar alanın 7,1 milyon hektarı (%83,5) sulamaya açılmıştır (Çizelge 3). Sulamaya açılan alanların %67,6'sı (4,8 milyon hektar) DSİ tarafından açılmıştır. Yine, tüm dünyada olduğu gibi, ülkemizde de fiilen kullanılan suyun en fazlası tarımda kullanılmaktadır. Toplam kullanılan suyun %77'si tarımda kullanılmaktadır.

Çizelge 3. Türkiye'de Sulamaya Açılan Alanlar (2023)

1. Sulama Alanları	2. Milyon 3. Ha	4. Oran 5. %
6. DSİ	7. 4,8	8. 67,1
9. Mülga KHGM	10. 1,3	11. 18,6
12. Halk Sulamaları	13. 1,0	14. 14,3
15. Toplam	16. 7.1	17. 100,0

Kaynak: DSİ 2024a

Ayrıca 7,3 milyon ha alanda toplulaştırma yapılmış olup, sulama yatırımları arazi toplulaştırma ile birlikte yapılmaktadır (DSİ 2024a). Böylece hem sulama yatırımlarını hızlandırılmakta hem de toplulaştırma ile parseller yol ve sulama kanalına erişim odaklı yeniden düzenlenerek modern tarıma uygun hale getirilmektedir. Böylece su ve girdilerin etkin kullanımı sağlanarak gıda arz güvenliğinin sürdürülebilirliği sağlanmaktadır.

1950-2023 arasında DSİ ve Mülga Köy Hizmetleri Genel Müdürlüğü tarafından değişik ölçeklerde 9000'in üzerinde sulama projesi tamamlanmıştır. 180 Sulama Birliği, 2500 Sulama kooperatifi, 605 Belediye başkanlığı ve 6000'den fazla Köy Muhtarlığı sulama tesislerini işletmektedir.

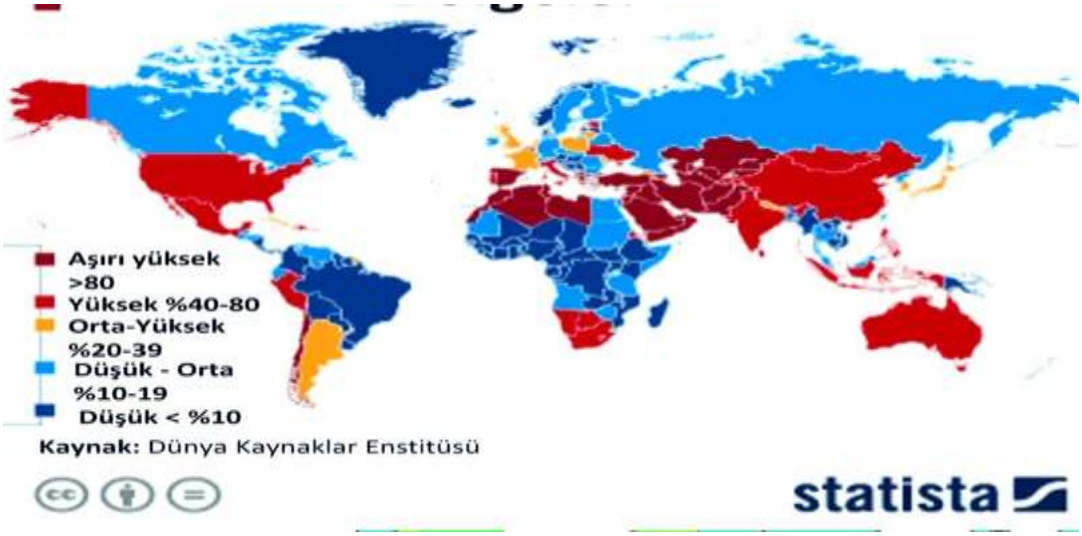
DSİ (2024b) verilerine göre sulama şebekelerinin %65'i açık kanal ve %35'i borulu sistemdir. Tesisler birçoğu eski ve bakım-onarım yenileme boyutundadır. Bu nedenler tarımda su verimli kullanılamamaktadır. Sulama oranı %70 ve sulama randımanı %50'ler düzeyindedir. Sulama şebekelerinin hızlı bir şekilde borulu ve akıllı sistemlere dönüştürülmesi gerekmektedir.

4. İKLİM DEĞİŞİKLİĞİNİN SU KAYNAKLARI ÜZERİNE ETKİSİ VE SU KRİZLERİ

Küresel ısınma sonucu ortaya çıkan iklim değişikliği, yağış rejiminde değişikliklere, ekstrem olaylarda artışa, kurak sezonların sayısı ve şiddetinin artmasına, yerüstü ve yeraltı su potansiyellerinde ise değişimlere, genelde de azalmalara yol açmaktadır

Dünya ekonomik forumu tarafından 2014 yılında hazırlanan Küresel Risk Raporuna göre olası bir "Su Krizi" dünya ekonomisinde en çok endişeye yol açan 3. Risk olarak belirlenmiştir. Bu nedenle, "su güvenliği" artık sadece yerel değil, küresel ölçekte ele alınması gereken bir sorun haline gelmiştir. Su krizi, belirli bir bölgede su kaynaklarının miktar ya da kalite açısından yetersiz ve riskli olması durumudur.

Birleşmiş Milletler'in su ve sanitasyon konularındaki çalışmalarını yürüten UN-Water'ın verilerine göre, bugün dünyada 2,2 milyar insan güvenli suya erişim sorunu yaşamaktadır. Bu sayının 2050 yılına kadar 3 milyara ulaşması beklenmektedir (UN-Water, 2020). Dünya genelinde 2040 sonrası su kıtlığı yaşanabilecek bölgeler arasında Türkiye de yer almakta (Şekil 2) ve "yüksek riskli" ülkeler arasında gösterilmektedir (WRI, 2020).

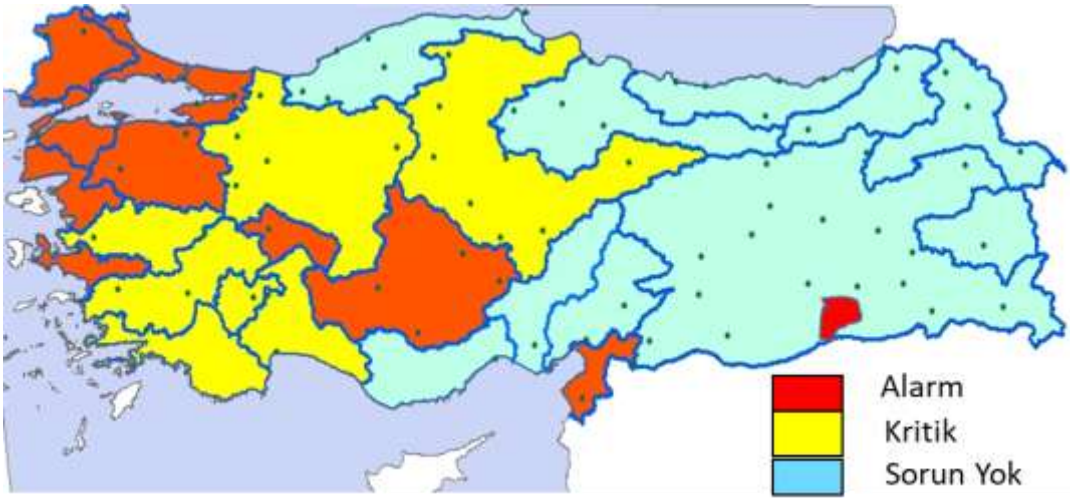


Şekil 2. 2040 sonrası su kıtlığı yaşanabilecek bölgeler (WRI 2020)

Ülkeler kullanılabilir su varlığına göre sınıflandırıldığında, kişi başına düşen kullanılabilir su miktarı **8.000 m³**'ün üzerindeki ülkeler **"su zengini"** olan ülkeler olarak kabul edilirken **2.000 m³'**den az olan ülkeler "**su azlığı (su kısıtı)**" **1000 m³**'den az ülkeler de **"su fakiri"** ülke kabul edilmektedir (DSİ 2016).

Türkiye'de kişi başına düşen yıllık su miktarı günümüzde yaklaşık 1.312 m³'tür. Bu değer, Türkiye'nin su zengini bir ülke değil, su stresi yaşayan bir ülke olduğunu ortaya koymaktadır. 2050 yılı projeksiyonlarına göre ise bu miktarın 1.000 m³'ün altına düşmesi beklenmektedir.

Yerüstü su kaynaklarının yetersiz olduğu bölgelerde, yeraltı suları hayati bir öneme sahiptir. Ancak, özellikle son yıllarda artan izinsiz kuyu açımları ve aşırı su çekimi, yeraltı su seviyelerinin ciddi şekilde düşmesine neden olmuştur. Yetersiz yağışlar, yeraltı sularının doğal beslenim-boşalım dengesini bozmakta ve bu da bazı bölgelerde obruk oluşumlarını hızlandırmaktadır. Entansif tarımın yaygın olduğu bölgelerde yeraltı suyu kullanımı kritik bir noktaya ulaşmıştır (Şekil 3.)



Şekil 3. Türkiye'de Havza Bazında Yeraltı sularının Durumu (DSİ 2016)

Su kıtlığı yaşanan bölgelerde; içme, kullanma, sanayi ve tarım gibi sektörlerin artan su taleplerini karşılamak giderek zorlaşmaktadır. Bu durum, sektörler arasında beklenmedik su tahsisi sorunlarına neden olabilmektedir. Bu bölgelerde su tahsisleri kapatılmakta, çok su tüketen ürünlere Bakanlık destekleri verilmemekte, su tasarrufu sağlayan yağmurlama ve damla sulama sistemleri %50 hibe ile desteklenmektedir. Bu nedenle, bu bölgelerde özellikle kar ve yağmur sularının toplanması, su hasadı, yeraltı barajları inşası, akiferlerin suni beslenmesi ve etkin su yönetimi büyük önem taşımaktadır

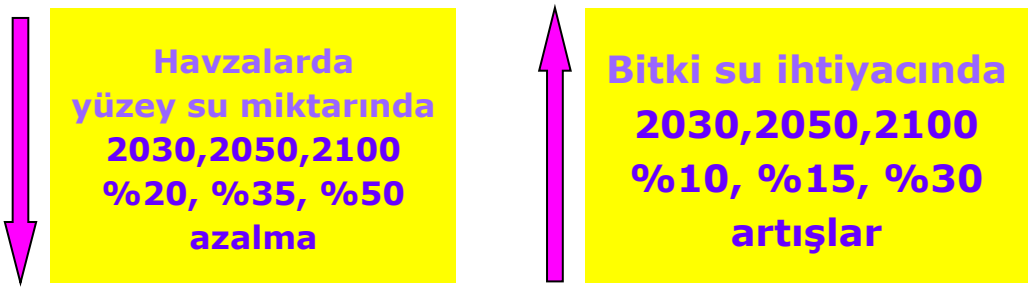
Küresel ölçekte yeryüzü sıcaklığı son yüzyılda ortalama 0,6°C artmış, 1970–2020 döneminde bu artış yaklaşık 1,5°C'yi bulmuştur. 2085 yılına kadar ise ortalama sıcaklık artışının 3,1°C seviyelerine ulaşacağı öngörülmektedir (IPCC, 2021). En sıcak 10 yılın büyük bir kısmı 2000 sonrası dönemde yaşanmıştır. Bu ısınma, yağış rejimlerini değiştirerek sel, kuraklık, dolu, fırtına, orman yangını gibi ekstrem doğa olaylarının sıklığını artırmakta, özellikle tarım sektörünü derinden etkilemektedir.

Türkiye, iklim değişikliğinden en fazla etkilenecek ülkeler arasında yer almaktadır. Dünya Kaynakları Enstitüsü tarafından 2020 yılında "Türkiye'nin Su Stresi Haritası" çıkarılmış (Şekil 4) ve bir su raporu hazırlanmıştır. Raporuna göre, Türkiye 2050 yılına gelindiğinde, su kaynaklarının %80'inden fazlasını tüketen ülkeler arasında olacak ve ciddi su stresi yaşayacaktır (WRI, 2020). İç Anadolu, Göller Yöresi, Doğu Akdeniz, Ege ve Çanakkale gibi bölgelerde su sorunları son yıllarda belirgin biçimde artmıştır.

Şekil 4. *Türkiye'nin su stresi haritası (WRI 2020)*

Su kaynaklarına olan taleplerin her geçen gün arttığı, sektörler ve su kullanıcılar arasında rekabetin krizlere yol açtığı bir dönemde mevcut su kaynaklarının verimli ve sürdürülebilir şekilde kullanımı hayati önem taşımaktadır. Tarım sektörü, mevcut su kaynaklarının büyük kısmını kullanmakta; içme, kullanma ve sanayi sektörlerinin ihtiyaçlarının da büyük oranda tarımdan karşılanması beklenmektedir. Kurak ve yarı kurak bölgelerde su varlığının azalması ve artan su açığı, bu kaynakların daha etkin yönetilmesini zorunlu kılmaktadır. İklim değişikliğini durdurmak mümkün olmasa da etkilerini azaltmak için önlemler alınması gerekmektedir (UNDP, 2007; IPCC, 2021).

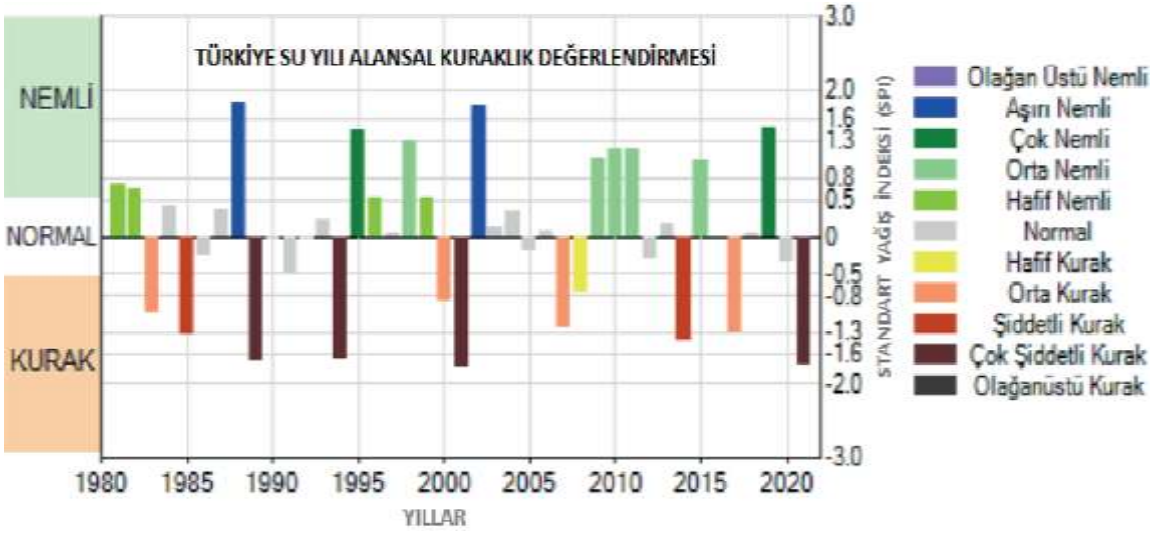
UNDP'nin 2007 yılında hazırladığı bir raporda, Gediz ve Büyük Menderes havzaları özelinde önemli tahminlere yer verilmiştir. Bu çalışmaya göre, 2030 yılına kadar bu havzalarda sıcaklıkların 1,2°C artması ve yağış miktarının %5 azalması beklenirken, 2050 yılına kadar ise sıcaklık artışının 2°C'ye, yağış azalmasının ise %10'a ulaşacağı öngörülmektedir. Aynı zamanda 2030, 2050 ve 2100 yılları olası yüzey su miktarlarındaki azalmalar ile bitki su ihtiyaçlarındaki olası artışlar da tahmin edilmiştir (Şekil 5).



Şekil 5. Gediz ve Büyük Menderes Havzaları İklim Projeksiyonları (UNDP 2007)

Son yıllarda yaşanan kuraklıklar bu tahminleri doğrular niteliktedir. Gediz ve Büyük Menderes havzalarında yerüstü su kaynaklarının azalması, kontrolsüz yeraltı suyu kullanımını artırmış, bu da su seviyelerinin ciddi şekilde düşmesine neden olmuştur. Aynı zamanda havzalarda barajlarda planlanan suyun birikmemesi İl Tarımsal Kuraklık Kriz Merkezlerinin su yönetimine müdahale etmesi ve kısıtlamalara gitmelerine yol açmıştır. Ayrıca Türkiye'nin yeraltı su potansiyelinin üçte birini oluşturan Konya Havzası'nda da durum farklı değildir. Bölgede açılan izinsiz kuyular ve aşırı yeraltı suyu çekimleri, su seviyelerinin yer yer 200 metrelerin altına düşmesine ve 2.500'ü aşkın obruk oluşumuna yol açmıştır.

Meteoroloji Genel Müdürlüğü'nün (2021) 1980–2020 yıllarını kapsayan kuraklık analizine göre, bu 41 yıllık dönemde 11 yıl kurak, 13 yıl nemli ve 17 yıl normal geçmiştir. Ancak özellikle 2010'lu yıllardan itibaren, rekor sıcaklıklarla birlikte kuraklık olaylarında belirgin bir artış gözlemlenmiştir (Şekil 6).



Şekil 6. Türkiye Kuraklık Değerlendirmesi 1980-2020 (MGM 2021)

İklim değişikliğinin su kaynakları üzerindeki etkileri, yalnızca çevresel sürdürülebilirliği değil, aynı zamanda tarımsal üretim kapasitesini ve dolayısıyla gıda güvenliğini de derinden etkilemektedir. Artan sıcaklıklar, azalan yağış miktarları ve sıklaşan kuraklık dönemleri,

özellikle sulamaya bağımlı tarımsal alanlarda ciddi ölçüde üretim ve verim kayıplarına yol açmaktadır (IPCC, 2021; UNDP, 2007).

Su kaynaklarının azalması, tarımsal üretim maliyetlerini artırmakta, bu durum gıda arzının düşmesine ve piyasalarda fiyatların yükselmesine neden olmaktadır. Küresel ölçekte yaşanan bu gelişmeler, düşük gelirli ve iklim kırılganlığı yüksek bölgelerde yaşayan nüfusların gıdaya erişimini zorlaştırmakta; böylece iklim değişikliğine bağlı su krizleri, doğrudan gıda krizlerini tetikleyen bir unsur haline gelmektedir (FAO, 2018; WRI, 2020). Bu çerçevede, iklim değişikliğinin su kaynakları üzerindeki etkileri ile gıda güvenliği arasındaki ilişki çok boyutlu ve stratejik öneme sahip bir konu olarak değerlendirilmektedir.

5. SUYUN GIDA ARZ GÜVENLİĞİ İÇİN ÖNEMİ

Her insanın yaşamını sağlıklı bir şekilde sürdürebilmesi için yeterli ve sağlıklı gıdaya ihtiyaç duymaktadır. Bunun için, gıda ürünlerinin sağlıklı bir şekilde üretilmesi, korunması ve tüketici sağlığına zarar vermeyeceğinin garanti altına alınması gerekmektedir. Bu bağlamda, gıda güvenliği ve gıda güvenilirliği kavramları önem kazanmaktadır. Gıda güvenliği genellikle miktar ile ilgili iken, gıda güvenilirliği kaliteyi temsil etmektedir.

Türkiye'de gıda üretiminin 2/3 ü sulu tarım alanlarında yapılan üretime dayanmaktadır (TOB 2021). Gıda arz güvenliği için su güvenliği şarttır Su, tarımsal üretimde bitki çeşitliliğini ve verimleri artıran en önemli kaynaktır. Tarımsal faaliyette toprağın tava gelmesinden, tohumun çimlenmesine ve hasata kadar ki tüm evrelerde suya ihtiyaç duyar. Bazı ürünlerin üretilmesi için gerekli olan su miktarları çizelge 4'te verilmiştir.

Çizelge 4. Bazı ürünlerin üretimi için gerekli olan su miktarları

18.	Ürün	19.	Su İhtiyacı
20.	1 kg buğday	21.	1 m^3 su
22.	1 kg pirinç	23.	3 m^3 su
24.	1 kg süt	25.	2,6 m^3 su
26.	1 kg peynir	27.	5 m^3 su
28.	1 kg biftek	29.	15 m^3 su

Kaynak: Hoekstra ve Chapagain, 2008

Sulama ile tarımsal verimi 3 ila 6 kat artırmak mümkündür. Hayvancılıkta yem temini, yem bitkileri üretimi açısından su en önemli girdilerden biridir. Ayrıca, hayvan başına günlük su tüketimi de hayvancılığın verimliliği açısından büyük önem taşır. Örneğin, günlük süt verimi 35–40 kg olan bir ineğin günlük su ihtiyacı 120–140 litre arasında değişmektedir. Normal bir sığır, her kilogram kuru madde tüketimi için 4,1 litre, her kilogram süt verimi için ise 2,6 litre suya ihtiyaç duymaktadır (Osborne, 2006).

Bu nedenle, büyük hayvancılık işletmeleri toplam hayvan sayısına bağlı olarak çok büyük miktarlarda suya ihtiyaç duyar. Yem bitkisi üretimi ve diğer hizmetler için gerekli olan su miktarları da eklendiğinde, su kaynaklarının kısıtlı olduğu, özellikle yeraltı suyunun kullanıldığı bölgelerde su kullanımı ciddi bir krize dönüşebilmektedir. Bu nedenle, yerüstü su

kaynaklarının bulunmadığı ve yeraltı su kaynaklarının da son derece sınırlı olduğu Konya ve Karaman gibi bölgelerde büyük ölçekli hayvancılık işletmelerine izin verilmemektedir.

Türkiye, iklim değişikliğinden en fazla etkilenecek riskli ülkeler arasında yer almaktadır. 2050 ve 2080 yılı projeksiyonları, ülkemizdeki yerüstü su miktarının %35 azalırken, bitki su ihtiyaçlarının %15 artacağını göstermektedir. Türkiye'de 7 coğrafi bölgede ve 5 temel üründe, Hadley iklim modeli kullanılarak yapılan 2050 yılı iklim projeksiyonlarına göre; buğday ve arpa veriminde %7,58, mısır veriminde %10,14, ayçiçeği veriminde %6,35 ve pamuk veriminde %2,19 azalma olacağı tahmin edilmektedir. Türkiye genelinde verimlilikte %2 ile %13 arasında bir azalma olabileceği, bunun ekim alanı ve üretim desenini değiştireceği, verimlilikteki düşüşün üretim miktarını gerileteceği ve bunun da fiyatlarda artışa yol açarak üretici refahını artıracağı, ancak tüketici refahını azaltacağı belirlenmiştir (Dellal ve Mc Carl, 2004)

Su krizi tüm dünyayı giderek daha fazla etkisi altına almaktadır. Uzmanlara göre 25 yıl içinde Dünyada gıda üretiminin yarısından fazlası kuraklıklardan dolayı tehlikeye gireceği uyarısı bulunmaktadır. Bugün dünya nüfusunun yarısından fazlası **su kıtlığıyla** karşı karşıyadır. 2022 yılında Hollanda'da kurulan **Global Su Ekonomisi Komisyonu'**nun yayımladığı raporda, dünyadaki su kaynaklarının bugüne kadar görülmemiş bir baskı altında olduğu ve taze su talebinin 10 yılda %40 oranında artacağı belirtilmiştir.

6. İKLİM DEĞİŞİKLİĞİNE KARŞI UYUM VE AZALTIM ÇALIŞMALARI

Küresel ısınma ve iklim değişikliğinin olumsuz etkileri, 1992 Rio Çevre ve Kalkınma Konferansı'nda imzaya açılan İklim Değişikliği Çerçeve Sözleşmesi (İDÇS) ile ele alınmıştır. 1994 yılında yürürlüğe giren bu sözleşmeye 184 ülke taraf olmuştur. Sözleşmenin amacı, sera gazlarının atmosferdeki konsantrasyonunu tehlikeli seviyelere ulaşmadan sabit tutmaktır. Ayrıca, sözleşme ile sera gazlarının insan kaynaklı etkilerini önlemek, ekosistemlerin iklim değişikliğine uyumunu desteklemek ve gıda üretiminin sürdürülebilirliğini sağlanması hedeflenmiştir.

İklim Değişikliği Çerçeve Sözleşmesi'ne (İDÇS) göre, Ek-1 ve Ek-2 listelerinde yer alan ülkelerin, sera gazı emisyonlarının sınırlandırılması ve azaltılması amacıyla belirli yükümlülükleri bulunmaktadır. Sözleşme, çevre koruma hedeflerinin ötesine geçerek küresel düzeyde kolektif eylemi teşvik eden bir yapı haline gelmiştir. Söz konusu gelişmeler, Taraflar Konferansı (COP) toplantılarında düzenli olarak izlenmektedir.

Paris Anlaşması (2015), 2020 sonrası dönemde iklim değişikliği tehdidine karşı küresel sosyo-ekonomik dayanıklılığın artırılmasını hedeflemektedir. Anlaşmanın uzun vadeli amacı, sanayi öncesi döneme kıyasla küresel sıcaklık artışını 2°C'nin olabildiğince altında, tercihen 1,5°C düzeyinde sınırlamaktır. Bu hedef doğrultusunda, taraf ülkeler sera gazı emisyonlarına ilişkin ulusal katkı beyanlarını sunmakta ve bu beyanlar doğrultusunda ulusal strateji ve eylem planlarını güncellemektedirler (UNFCCC, 2015; T.C. ÇŞİDB, 2023).

Türkiye, referans senaryoya göre 2030 yılına kadar sera gazı emisyonlarını azaltmayı taahhüt etmiş olup, bu kapsamda 2030 yılında emisyon miktarını 695 Mt CO_2 eşdeğeri düzeyine çekmeyi hedeflemektedir. Ayrıca, 2050 yılına kadar karbon nötr olmayı içeren uzun vadeli plan

çerçevesinde, orta vadede emisyon azaltım hedeflerine ulaşılması amaçlanmaktadır (ÇŞİDB, 2023).

İklim değişikliğinin etkilerinin farkında olan ülkeler, bu etkilerle mücadeleye yönelik stratejiler geliştirerek hem azaltım hem de uyum odaklı önlemler almakta ve uygulamaktadır. Türkiye'de, tarım sektöründe iklim değişikliği ile mücadele konusunda sorumlu kurum Tarım ve Orman Bakanlığı'dır. Bakanlığın çalışmaları, uyum ve azaltım hedefleri doğrultusunda iki temel grupta sınıflandırılmaktadır (TOB, 2023).

Sera gazı emisyonlarının azaltılması amacıyla Türkiye'de yutak alanların artırılmasına yönelik ağaçlandırma ve mera ıslahı faaliyetleri sürdürülmektedir. Bunun yanı sıra, iyi tarım uygulamaları ve organik tarım desteklenmekte; Avrupa Birliği Yeşil Mutabakat Eylem Planı kapsamında 2030 yılına kadar pestisit kullanımının %50, gübre kullanımının ise %20 oranında azaltılmasına yönelik çalışmalar başlatılmıştır. Ayrıca, arazi toplulaştırma faaliyetleri hızlandırılmış ve bugüne kadar yaklaşık 7,3 milyon hektarlık alan toplulaştırılmıştır. Bu çalışmalar sonucunda yıllık 365.000 tonluk mazot tasarrufu sağlandığı belirtilmektedir (TOB, 2023).

Yine Türkiye'de uyum kapsamında; Tarımsal Kuraklıkla Mücadele Strateji ve Eylem Planı (2023-2027), yağmurlama ve damla sulama sistemlerinin % 50 hibe ile desteklenmesi, Tarım Sigortalarının kapsamının genişletilmesi (Kuraklık Sigortası), yenilenebilir enerji (GES, RES, JES) yatırımlarının desteklenmesi, Konya'da Kuraklık Test Merkezi, Erzurum'da Soğukluk Test Merkezi, Kuraklığa dayanıklı bitkilerin geliştirilmesi ve ıslahı, kurak dönemlerde kısıntılı sulama programları (TAGEM SuET), iklim dostu akıllı tarım teknolojileri ve sulama ile ilgili eğitim ve yayım çalışmaları gibi çok önemli çalışmalar yürütülmektedir.

Ayrıca, Türkiye'de su kaynaklarının verimli kullanılması amacıyla DSİ tarafından inşa edilen sulama yatırımları, 2004 yılından sonra kapalı sistem olarak inşa edilmeye başlanmıştır. DSİ tarafından işletmeye açılan sulama alanlarının %21,5'i yağmurlama, %16,9'u damla sulama olmak üzere toplam %38,4'ü basınçlı sulama sistemleriyle sulanmaktadır. Oysa ICID (Uluslararası Sulama ve Drenaj Komisyonu) verilerine göre, İsrail ve Birleşik Krallık sulu tarım alanlarının tamamına yakınını, Brezilya %77'sini, İspanya %74'ünü ve ABD %57'sini basınçlı sulama yöntemleri ile gerçekleştirmektedir (ICID, 2018)

Sulama etkinliği açısından önemli bir yatırım da sulama alanlarında arazi toplulaştırması yapılmasıdır. Arazi toplulaştırması ile birlikte kapalı sulama şebekelerinin inşa edilmesiyle parseller büyümekte, her parsel yola ve sulama kanalına irtibatlandırılmaktadır. Böylece, verim artışları ile birlikte %30-60 su tasarrufu sağlanmaktadır. Ayrıca, ulaşım ve parsel içi makine verimliliği artmakta ve 50 Lt/ha tasarruf sağlanmaktadır (Türker ve Gencel, 2010).

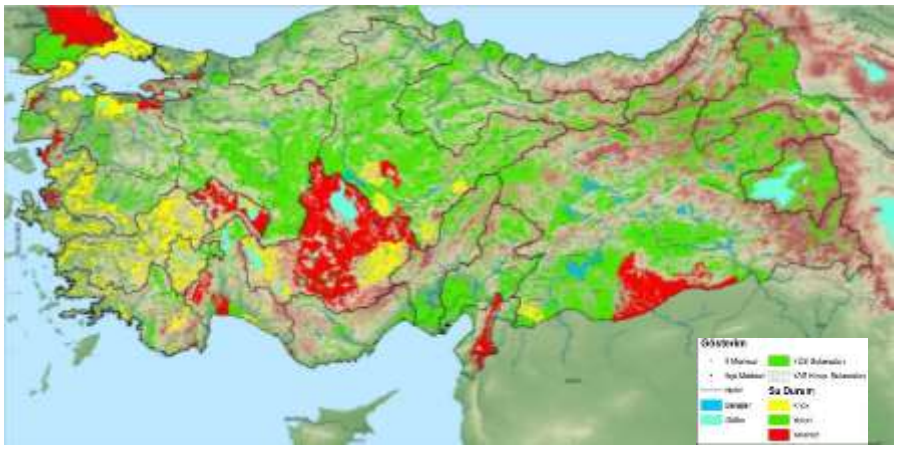
Türkiye'de arazi toplulaştırması çalışmalarına 2008 yılından sonra hız verilmiştir. Bugün itibariyle 7,4 milyon ha alanda toplulaştırma tamamlanmış, 2,3 milyon ha alanda da çalışmalar devam etmektedir.

Su kullanım etkinliği kapsamında yürütülen çalışmalardan biri de su tasarrufu sağlayan tarla içi modern sulama sistemlerinin (yağmurlama ve damla sulama sistemleri) Bakanlık tarafından %50 hibe ile desteklenmesi ve Ziraat Bankası ile Tarım Kredi Kooperatifleri aracılığıyla sübvansiyonlu kredilerle desteklenmesidir. Bu kapsamda, 2006 yılından günümüze kadar hibe

ve kredi desteği sağlanarak yaklaşık 350 bin üretici desteklenmiş ve yaklaşık 1,3 milyon hektar alan basınçlı sulama sistemine kavuşturulmuştur.

Türkiye'de havza bazlı destekleme modeli ile ürünlerin en uygun havzada üretilmesi amaçlanmaktadır. Havzada desteklenecek ürünlerin tespitinde esas alınan kriterlerden birisi de havzada su kısıtının olup olmadığıdır. Bu kapsamda, 2016 yılından beri azalan su kaynaklarımızın korunması ve suyun daha etkin kullanımı için DSİ, Tarım Reformu Genel Müdürlüğü (TRGM) ve Bitkisel Üretim Genel Müdürlüğü (BÜGEM) koordinasyonunda belirlenen su kısıtı olan bölgelerde, suyu az tüketen ürünlere ilave destekler verilmektedir.

Özellikle aşırı yeraltı suyu çekimlerinin olduğu ve su kısıtının bulunduğu bölgeler (11 il 52 İlçe) DSİ tarafından haritalanmış ve su kısıtına göre desteklemelerin yürütülmesi istenmiştir. Haritada işaretlenen su kısıtının bulunduğu ilçelerde yonca (1000 mm), pamuk (820 mm), şeker pancarı (780 mm), ayçiçeği (670 mm), dane mısır (650 mm), patates (645 mm) gibi çok su tüketen ürünlerin salma sulama ile sulanması yasaklanmış ve çok su tüketen bu ürünler yerine Kanola (440 mm) nohut veya mercimek (450 mm), K.Fasulye (545 mm), Buğday (550) ve soya (630 mm) gibi stratejik ürünlerin ekilmesi durumunda **%50 ilave destek** verilmektedir.



Şekil 7. DSİ Genel Müdürlüğü Su Kısıtı Haritası (DSİ 2016)

Sürdürülebilir üretim ve gıda arz güvenliği için önem taşıyan politikalardan birisi tarımda risk yönetimidir. Bu amaçla ülkemizde 2006 yılından beri uygulanan tarım sigortası (TARSİM) faaliyetlerin doğal afet risklerinin güvence altına alınmasında önemli tedbirlerinden biridir. Sigorta primlerinin **%50'si** devlet tarafından destek olarak ödenmektedir.

7. SONUÇ VE ÖNERİLER

Küresel ısınma ve iklim değişikliğine bağlı sorunlar, küresel olmakla birlikte, çözümler bölgesel ve yereldir. İklim krizi, su kaynaklarını ve gıda arz güvenliğini tehdit etmektedir. Su krizi, tüm dünyayı giderek daha fazla etkisi altına almaya başlamış olup bu etkinin gelecek yıllarda iklim krizine bağlı olarak artması beklenmektedir.

Ülke olarak, uluslararası gelişmeler yakından takip edilmekte ve uyum ile azaltım çalışmalarına devam edilmektedir. İklim Değişikliği ve Kuraklıkla Mücadele Stratejisi ve Eylem Planları hazırlanmış, ilgili kurumlar nezdinde tedbirler belirlenmiş ve uygulamalara devam edilmektedir. Bu kapsamda, DSİ tarafından sulamaya açılan alanlarda modern sulama sistemlerinin oranı %38,4'e ulaşmıştır. Ayrıca, 2006-2024 arasında 350 binden fazla çiftçiye yağmurlama ve damla sulama sistemleri için %50 hibe desteği ve faizsiz kredi kullandırılarak yaklaşık 1,3 milyon hektar alanın modern sulama sistemleri ile sulanması sağlanmıştır.

Türkiye'de iklim değişikliğine bağlı krizlerden en az etkilenmek ve sürdürülebilir gıda arz güvenliğine sağlamak amacıyla;

- İklim Yasası ve Su Yasası çıkarılmalı, su yönetiminde risk esaslı bir yaklaşım benimsenmeli,
- Su ile ilgili kurumlar yeniden yapılandırılmalı; su kaynakları yönetimi ile ilgili stratejiler, politikalar ve tedbirler kurumsal yapıda yeniden ele alınmalı,
- Sulama altyapısı modernize edilmeli ve açık kanal sistemleri kapalı sisteme dönüştürülmeli,
- Modern sulama sistemleri ve akıllı tarım uygulamaları yaygınlaştırılmalıdır.
- Tarım arazilerinde mülkiyet sorunlarının çözümü için arazi toplulaştırması ve arazi bankacılığı uygulamaları entegre şekilde uygulanmalı,
- Enerji verimliliği artırılmalı ve maliyetler düşürülmelidir.
- Sulama şebekeleri sayısallaştırılmalı, sağlıklı izleme ve değerlendirme sistemleri kurulmalı ve sulama verimliliği sürekli izlenmelidir.
- Su kullanıcı örgütleri yeniden yapılandırılmalı ve güçlendirilmelidir.
- Sulama ve Tarım Bilgi Sistemleri entegre edilmelidir.
- Erken uyarı sistemleri kurulmalı ve iklim değişikliğinin etkileri önceden tespit edilmelidir.

ABSTRACT

Climate change includes the increase in greenhouse gases and all values deviating from the average situation in the climate, together with the effect of global warming. An increase of over 30% has been observed in atmospheric carbon dioxide (CO_2) concentration in the last 50 years. It is predicted that this increase will continue. Climate change causes differences in temperature and precipitation during the year. These differences, which are also seen between years, are one of the other effects of climate change. Along with climate change, structural and species composition changes occur in the vegetation. There have been decreases in the number of plant species in some regions experiencing climate change. It is estimated that the number of cool season species will decrease even more, especially because they are more sensitive to rising temperatures. Global climate change significantly affects the yields of grasslands. The yield increases in the Western Hemisphere have been higher compared to the Eastern Hemisphere. In regions where the climate is cool, the effects of global warming are less felt. Efforts are being made to investigate the effects of climate change on the grassland ecosystem and to predict possible scenarios. Detailed studies are needed to be able to make reliable and guiding predictions about climate change for the future. According to current climate scenarios, it is predicted that global warming will have a significant impact on our country. Therefore, there is a need to develop drought stress tolerant plant varieties of forage crops, to select C_4 plant species that can adapt to various ecological regions, and to develop proper cultivation techniques for these species.

Keywords: Grassland, Climate, Greenhouse gas, Global warming, C_4 plant

İKLİM DEĞİŞİKLİĞİNİN ÇAYIR-MERA VEJETASYONLARI ÜZERİNDEKİ ETKİSİ

ÖZET

İklim değişikliği, küresel ısınmanın da etkisiyle beraber sera gazlarının artışını ve iklimde meydana gelen ortalama durumdan sapmış tüm değerleri içerir. Atmosferik karbondioksit (CO_2) konsantrasyonunda son 50 yılda %30'un üzerinde bir artış görülmüştür. Bu artışın devam edeceği öngörülmektedir. İklim değişikliği, yıl içinde yaşanan sıcaklık ve yağış miktarlarında ortaya çıkan farklara sebep olmaktadır. Aynı zamanda yıllar arasında da görülen bu farklar iklim değişikliğinin diğer etkilerinden birisidir. İklim değişikliğiyle beraber bitki örtüsünde de yapısal ve tür kompozisyonu bakımından değişimler ortaya çıkmaktadır. İklim değişikliği yaşanan bazı bölgelerde bitki tür sayısında azalmalar yaşanmıştır. Serin iklim bitkilerinin yükselen sıcaklıklara karşı daha duyarlı olmaları nedeniyle özellikle bu bitkilerin sayılarının daha da azalacağı tahmin edilmektedir. Küresel iklim değişikliği beraberinde meralardan alınan verimi önemli düzeyde etkilemektedir. Batı yarım küredeki verim artışları, Doğu yarım küreye bakılarak daha yüksek seviyelerde gerçekleşmiştir. İklim değişikliğinin çayır mera vejetasyonları üzerindeki etkilerini araştırmak ve olası senaryoları tahmin edebilmek için çaba harcanmaktadır. İklim değişikliği ile ilgili geleceğe yönelik güvenilir ve yol gösterici tahminlerde bulunabilmek için detaylı çalışmalara gerek duyulmaktadır. Mevcut iklim senaryolarına göre ülkemizde küresel ısınmanın önemli düzeyde etkili olacağı öngörülmektedir. Bu nedenle çayır mera yem bitkilerinde kuraklık stresine toleranslı bitki çeşitlerinin geliştirilmesi, çeşitli ekolojik bölgelere uyum sağlayabilecek C_4 bitki türlerinin seçilmesi ve bu türler için uyumlu yetiştirme tekniklerine ihtiyaç vardır.

Anahtar Kelimler: Çayır-Mera, İklim, Sera Gazı, Küresel Isınma, C4 bitkisi

1.GİRİŞ

İklim, bir yerde uzun dönemdeki atmosfer hareketlerini (sıcaklık, nem, hava basıncı, rüzgar, yağış, yağış şekli) ifade eder (NASA, 2019). Bir bölgenin iklimini anlamak ve tam olarak belirlemek için birçok unsura dikkat etmek gerekir. Geçmişten günümüze değişen dünyada iklim de aynı kalmamış ve birçok değişikliğe uğramıştır. Zaman içinde doğal oluşumlarla günümüze kadar gelen iklim son birkaç yüzyıl içinde insanoğlunun da etkisiyle gözle görülür ölçüde değişerek normal seyrinin dışına çıkmaya başlamıştır. İklim değişikliği ise kısaca, uzun bir zaman diliminde kendini gösteren iklim özelliklerinin ortalama durumdan sapması olarak tanımlanır (Türkeş, 2008).

Yeryüzünde yaşamsal faaliyetlerin gerçekleşmesi için ortam sağlayan atmosfer, birden fazla gazın bir araya gelmesiyle oluşur. Atmosferi oluşturan CO_2, CH_4, N_2O, O_3, CFC (kloroflorokarbon) gibi gazlar güneşten yeryüzüne gelen ısının bir kısmını tutarak yeryüzünün belirli bir ısıda kalmasını sağlarlar. Bunlarla beraber daha birçok gaz dünyanın sıcaklık dengesini korur ve yaşam koşullarını elverişli hale getirir (Akın, 2006).

İklim değişikliği denildiğinde akla gelen bir diğer konu da küresel ısınmadır. Küresel ısınma, insan faaliyetleri sonucu atmosferde bulunan sera gazlarının artması ve bununla beraber iklimde görülen değişikliklerdir (Bayraç ve Doğan, 2016). Atmosferde bulunan gazlardan en fazla sera etkisine sebep olan gazlar sırasıyla Karbondioksit (CO_2), Metan (CH_4), Diazotoksit (N_2O), Ozon (O_3), Karbon monoksit (CO) ve Halokarbonlar (CFC gibi)'dır. Bunun yanı sıra su buharı da bu gazlar arasında sayılmaktadır (Akın, 2006). Bu gazların artışı ilk olarak sanayi devriminde kendini göstermiş, fosil yakıtların da fazlaca kullanımıyla etkisini artırmıştır. Sera gazlarından etkinliği düşük ancak önemli bir yere sahip olan karbondioksit, 1950 yıllarına kadar 300 ppm civarında seyrederken, 1980-2014 yılları içerisinde 338ppm'den 398ppm'e yükselmiştir (Hatipoğlu ve ark., 2019). Günümüzde ise bu değer rekor miktara yükselerek 2021 yılının mayıs ayında 419,13 ppm olarak kaydedilmiştir.

2.İKLİM DEĞİŞİKLİĞİNİN GÖSTERGELERİ

Tüm iklim bilimcilerin hem fikir olduğu günümüzde de sıkça bahsedilen küresel ısınma belirtilerini gün geçtikçe iklim üzerinde göstermeye devam etmektedir. En başta sıcaklık artışı olarak karşımıza çıkan bu belirtiler kuraklık, çölleşme, yağışlarda görülen düzensizlikler ve dengesiz hava olayları olarak sıralanabilmektedir.

Küresel ısınma yeryüzündeki varlığını 1880 yılından bu yana devam ettirmektedir (Hatipoğlu ve ark., 2019). Hükümetlerarası İklim Değişikliği Paneli (IPCC)'nin 6.Değerlendirme Raporu'nda yer alan bilgilere göre; 2010-2019 yılları arasında görülen küresel ısınmanın 1850-1900 yıllarına göre 1,1 ºC arttığını, 2030 yıllarında ise tahmin edilen küresel sıcaklığın 1,5 ºC artacağı ve bu artışların devam edeceği öngörülmektedir (Kara ve Yereli, 2022).

Türkiye iklim yapısının değişkenli olması, üç tarafının denizlerle çevrili oluşu ve parçalı topoğrafik yapısıyla iklim değişikliğinden en fazla etkilenecek ülkelerden biri olacağı gibi etkilerinin bölgesel olarak da değişeceği bilinmektedir. Güneydoğu Anadolu ve İç Anadolu bölgesi gibi daha çok çölleşme tehdidiyle beraber kuraklığın hakim olduğu bölgelerle, yetersiz

su miktarına sahip olan yarı nemli Ege ve Akdeniz bölgeleri olası sıcaklık artışından etkileneceklerdir (Öztürk, 2002).

İklim değişikliğine bağlı yüzey sıcaklığında bölgesel olarak farklar Türkiye'nin doğu ve iç kısımlarında kış sıcaklıklarında daha çok artış, güney ve güneydoğu bölgelerinde ise yaz sıcaklıklarında daha fazla artış olarak beklenmektedir. Son dönemde yüzey sıcaklığı artışları, Türkiye'nin güneydoğu ile güneybatı bölgelerinde yaklaşık 6 ºC'ye ulaşırken, Karadeniz ve Marmara bölgelerinde sadece 3 ºC dolayında kalacağı tahmin edilmektedir (Hatipoğlu ve ark., 2019).

Küresel ısınma sonucunda Türkiye'nin yaşayacağı en ciddi problem kuraklıktır. Ülkenin büyük bir kısmı yarı-kurak iklim etkisindedir ve küresel ısınmadan oldukça fazla etkilenecek ülkelerin başında gelir. Bunun öncelikli nedeni Türkiye'nin yakın güneyinde çöl kuşağının bulunması ve ısınmayla beraber bu kuşağın kuzeye doğru hareket etmesidir. Sıcaklıkta görülecek 1-3.5 ºC arası artış, orta enlemlerin 150-500 km kutuplara doğru ilerlemesine neden olacaktır (Kanat ve Keskin., 2018).

IPCC, önümüzdeki birkaç on yıl içinde 1,5 ºC sıcaklık artışını aşma konusunda yüzde elli ihtimalin olduğuna dikkat çekmektedir. Örnek olarak yaz aylarındaki sıcaklık ortalamaları yükselirken kış ayları için sıcaklık ortlamalarının azalacağı değerlendirilmekte, dolayısıyla daha sıcak daha az yağış alan ve daha fazla buharlaşmanın olduğu iklim koşullarına maruz kalınacağı öngörülmektedir (Kara ve Yereli, 2022).

Güler ve Erlat.(2023) Türkiye'de yaşanan ortalama hava sıcaklıklarındaki en belirgin artışın yaz mevsiminde gerçekleştiğini bildirmişlerdir. 1950-2022 döneminde görülen ortalama sıcaklıklar istatistiksel olarak 0.01 düzeyinde anlamlı olmak üzere her on yıl için 0.22 ºC yükselme eğilimi göstermiştir. Bu artış eğilimi, son 73 yılda Türkiye'de yaz mevsiminde ortalama hava sıcaklıklarının 1.61 ºC yükseldiğini ortaya çıkarmaktadır. Yaz mevsiminden sonra artışlar kuvvetli olarak ilkbahar mevsiminde de devam etmektedir. 2021 Mayıs ayı son 73 yılın en sıcak Mayıs ayı olmuştur. Sonbahar mevsiminde ise 2010 yılından itibaren sıcaklık ortalamalarında belirgin olarak bir atış gözlemlenmiş ve 2015, 2017 ve 2020 yıllarında bu değer 21 ºC üzerine çıkmıştır (Güler ve Erlat, 2023).

İklim değişikliğinin bir diğer etkisi de iklimin yıl boyunca ve yıllar arasında büyük değişim ortaya çıkarmasıdır ve bu değişim ekolojik olarak fazlaca öneme sahiptir. 2100 yılında atmosferdeki CO_2 konsantrasyonun 538 ppm kabul edildiği teorilere göre Kuzey Avrupa ülkelerinde hem yaz hem de kış döneminde olmak üzere yağışların %10-20 artacağı öngörülmektedir. Bunun yanında Akdeniz bölgesinde kış dönemindeki yağışın %10, yaz dönemindeki yağışın ise %10-20 azalacağı tahmin edilmektedir (Hatipoğlu ve ark., 2019).

Türkiye'de yıllar boyunca yağış ortalaması 631 mm olmasına rağmen, 1999 yılında %15 oranında, 2000 yılında ise %7 oranında azalmıştır (Öztürk, 2002). Genellikle, yağış Türkiye'nin Ege ve Akdeniz kıyılarında azalmakta, Karadeniz kıyılarında ise artmaktadır. İç Anadolu bölgesinde yağış bakımından çok az veya hiçbir değişiklik görülmemektedir (Kanat ve Keskin, 2018).

Meteoroloji Genel Müdürlüğü (MGM) istatistiklerine göre Türkiye 2024 yılı kış mevsimi (2023 Aralık, 2024 Ocak, Şubat) yağışları normalin altında, önceki yıl kış mevsimi ise yağışlarının

üzerinde olmuştur. Kış mevsimi normali (1991-2020) 205.3 mm, geçen yıl kış mevsimi yağışı 114.8, 2024 yılı kış mevsimi yağışı ise 190.5 mm olarak gerçekleşmiştir. Mevsim yağışlarında normaline göre %7 azalma görülürken, geçen yıl kış mevsimi yağışlarına göre %66 artma gözlenmiştir. Bölgesel olarak değerlendirme yapıldığında ise Doğu ve Güneydoğu Anadolu bölgeleri normalleri üzerinde, diğer bölgeler altında yağış almıştır. En çok azalma gözlenen bölge %29 ile Ege Bölgesi olmuştur.

Küresel ısınmanın bir diğer etkisi de buzulların erimesidir. Geçmiş yirmi yıllık dönemde Grönland ve Antertika buz kalkanları ve adaları kütle kaybetmiş, buzullar küresel ölçekte erimesini sürdürmüş, Antik deniz buzunu ve Kuzey Yarım Küre ilkbahar kar örtüsü alansal olarak azalmasını devam ettirmiştir (Edemen ve ark., 2023).

3.İKLİM DEĞİŞİKLİĞİNİN ÇAYIR-MERALAR ÜZERİNDEKİ ETKİLERİ

Dünya tarihi boyunca yeryüzünde bulunan vejetasyonda çok önemli boyutta değişim gerçekleşmiştir. Bu değişimin en belirgin sebebi iklimde yaşanan farklılıklar olmuştur (Hatipoğlu ve ark., 2019).

Bütün canlılar için vazgeçilmez bir yere sahip olan bitkiler, iklim değişikliğinden fazlaca etkilenmektedir. Özellikle değişken olan iklim olaylarıyla birlikte bitki türlerinin tehdit altında olduğu ve türlerin %10 azalma riski ile karşı karşıya kaldığı bilinmektedir. Yağış ve sıcaklıklarda gerçekleşecek değişiklikler bu zamana kadar coğrafyalarındaki iklim tiplerine adapte olmuş bitkilerin, yeni iklim olaylarıyla karşı karşıya kalmalarına ve stres altında olmalarına sebep olacaktır (Aydın ve Sarptaş, 2018).

Günümüzden yaklaşık 66-144 milyon yıl önce yani dinazorların dünyada dominant olduğu dönemde buğdaygiller ve çift çenekli bitkiler ortaya çıkmıştır. 144-206 milyon yıl önceki dönemde ise iklim, günümüzde olan durumuna göre çok daha üniform bir şekilde sıcak ve nemli olduğu gibi tropikal ormanlar da yaygındı. Zaman geçtikçe iklimde faklılaşmalar görülmüş, nemli havalar yerini giderek kuru havalara bırakmış ve tropik ormanlar daralarak buğdaygil meraları genişlemiştir. Şimdiki zamandan 1,8-65 milyon önceki dönemde yeryüzü daha serin ve kurak hale gelmiş ve buğdaygil meraları daha da yaygınlaşmaya devam etmiştir. 2,5 milyon yıl önce yeryüzündeki soğuma artış göstermiş ve Avrupa kıtasındaki subtropik vejetasyon değişerek yerini ılıman iklim türleri kaplamıştır. Günümüzden 18000 yıl öncesine baktığımızda Kuzey-Batı Avrupa kısmen buzullarla kaplanmıştır. Kutup ikliminin etkili olduğu Batı Avrupa tundra vejetasyonuyla, Akdeniz bölgesi ise steplerle kaplı hale gelmiştir. Sadece Balkanlar'da iğne yapraklı ve geniş yapraklı ağaçların hayatlarını devam ettirebileceği bir habitat oluşmuştur. Kuzey Amerika'da halen 400-600 mm yağış görülen büyük ovaların günümüzden 12000-14000 yıl önce ladin ve yaprağını döken ağaçlarla örtülü olduğu bildirilmektedir. Grönland'da 1990-1992 yılları arasında yerin 3000 metre derinliğinden alınan buzul örnekleri Kuzey yarımküredeki sıcaklık değişimlerini net olarak ortaya koymuştur (Hatipoğlu ve ark., 2019). Mevcut zamanda olduğu gibi 9000 yıl öncesinde de kitleler halinde buzul erimesi görülmüştür. Bu ısınma dönemi 20 yıldan fazla sürmemesine rağmen buzulların erimesi aşırı yağışlara, deniz sularında ve akarsularda yükselmeye sebep olmuştur. Dünyanın kuzey bölgelerinin buzlarla kaplı olduğu zamanda Amazon bölgesinde iklimin oldukça kurak olduğu ve bu yerlerin seyrek bir şekilde ağaçların bulunduğu geniş savan bölgeleri olduğu anlaşılmıştır. Amazon bölgesinin kapalı ormanlarla kaplı hale gelmesi günümüzden 10000 yıl önce gerçekleşmiştir. Şu anda

ekstrem kurak bölge olarak bilinen Sahra bölgesinin oluşumu günümüzden 5000 yıl önce başlamış ve daha sonra çöl hızlaSahel bölgesine uzamıştır. 5000 yıl öncesinde Sahra bölgesinin bozkırla kaplı olduğu anlaşılmıştır. 900-1000 ile 1200-1300'lü yıllar arasında dünyada ortalama sıcaklık ortalamanın üzerinde görülmüştür. 1000-1300 yılları arasında ise İngiltere'nin güney bölgesinde üzüm bağlarının oldukça yaygın olduğu bildirilmektedir (Hatipoğlu ve ark., 2019).

Bu üzüm bağı sınırı günümüzde Fransa ve Almanya'daki üzüm bağı yetiştiriciliği sınırının 500 km kuzey enlemlerine uzaması olarak anlaşılır. Buzulların kuzeye doğru yayılmasıyla birlikte Arktik okyanus buz miktarında artışlar gözlenmiştir. İzlanda'da bulunan tarım arazileri buzullarla kaplanmıştır. İzlandalılar ciddi bir iklim değişikliği yaşayarak ülkelerini terk etmek zorunda kalmışlardır. Grönland' da bitki hasatları başarısız olmuş ve çiftlikler bırakılmıştır. Küçük buzul çağında küresel sıcaklık ortalama 1-2 derece düşmüş ve birkaç yüzyıl boyunca bu düşüş devam etmiştir. Baltık denizi ve Thames nehri donmuştur. Avrupa'da kıtlık ve hastalıklar yaygınlaşmış ekimler başarısız olmuştur.

Yukarıda yeryüzünde tarih içinde iklim değişikliğiyle ilgili olarak bahsedilenlerin aksine, Mann ve ark., (1998) son 1000 yılın iklim olaylarını incelediklerinde yıllık ağaç halkaları, buz çekirdeği, mercan ve silt örneklerine göre, kuzey kutbunda yaklaşık son 900 yılda sıcaklığın nispeten stabil olduğu, 1900'den sonra sıcaklığın aniden yükselmeye başladığı sonucuna ulaşmışlardır. McIntryre ve McKitrick (2005), Mann ve ark., (1998)' nın yönteminde hatalar olduğunu Mann ve ark., (1998)'ın iddia ettiği gibi yeryüzünde sıcaklık artışının 20. yüzyılda değil 15. yüzyılda olduğunu açıklamışlardır.

Günümüzde dünyanın tüm bölgelerinde ortalama sıcaklığın arttığı kabul edilmektedir. İklim değişikliğiyle beraber flora da değişmektedir. Son 30 yılda Avrupa'nın bazı bölgelerinde tür sayısı azalmıştır ve buna habitat kaybı ve iklim değişikliğinin sebep olduğuna inanılmaktadır. Buna karşılık Hollanda'yı da içeren batı Avrupa'nın belirli bölgelerinde artan sıcak iklim sebebiyle tür sayısı artmıştır. Bunun yanında serin iklim türlerinin sayısında azalma görülmüştür (Hatipoğlu ve ark., 2019). Serin iklim türlerinin yüksek sıcaklıklara uyum sağlayamaması nedeniyle 21. yüzyılda Avrupa'da tür sayısının fazlaca azalacağı tahmin edilmektedir. Sonuç olarak ise Hollanda'da bitkilerin büyüme zamanı son 30 yılda 10-14 gün uzamıştır.

3.1. KARBONDİOKSİT KONSANTRASYONU ARTIŞININ ÇAYIR-MERALAR ÜZERİNDEKİ ETKİLERİ

Fotosentez için mutlak gerekli unsurlardan biri karbondioksittir. CO_2 miktarında artışla beraber bitki büyüme hızı da artmaktadır. $C0_2$ seviyesinde görülen iki katı artış sıcaklık ve nem gibi diğer faktörlere bağlı olarak fotosentez oranını %30 ile %100 dolaylarında artırmaktadır. Fakat bitki türlerinin fotosentez sistemlerindeki farklılıklarından dolayı CO_2 artışına tepkileri de değişmektedir (Özer ve Özer, 2003). İsviçre ve Yeni Zelanda'da yürütülen çalışmalarda baklagiller ve diğer çift çenekli bitkilerin buğdaygillere göre yüksek CO_2 konsantrasyonuna daha çok tepki gösterdiği ileri sürülmüştür (Hatipoğlu ve ark., 2019).

C_3 bitkileri yeryüzünde sayıca fazla bulunan ve en fazla yayılım gösteren bitki grubudur. Bu bitkiler yeterli ışıklanma şartlarında 800-1000 µmol /mol CO2'ye ihtiyaç duyarlar. Bu yüzden

bu bitkiler mevcut atmosferik karbondioksit konsantrasyonu koşullarında doymamış fotosentez metabolizmasına sahip bitkilerdir. Bunun yanında fotosentez işlevi bakımından ikinci büyük bitki grubu olan C_4 bitkileri ise 370 ppm'lik mevcut atmosferik CO_2 konsantrasyonu koşullarında doymuş fotosentez metabolizmasına sahip bitkilerdir.

Mevcut atmosferde bulunan CO_2 miktarı C_3 bitkilerinin fotosentez etkinliğini sınırlamaktadır. Küresel iklim değişikliğiyle beraber olası CO_2 miktarının artması bu bitkilerin fotosentez etkinliğini olumlu yönde değiştirebilir. C_4 bitkileri ise C_3 bitkilerine göre CO_2 miktarı artışına daha az tepki göstermektedir (Yavaş ve Ünay, 2018). CO_2 konsantrasyonu 377 ppm'den 550 ppm'e artırıldığında kuru madde verimi artışı C3 bitkilerinde %10-20, C4 bitkilerinde ise %0-10 olduğu ortaya çıkmıştır. Cullen ve ark. (2009), atmosferde bulunan CO_2 miktarının 380 ppm'den 550 ppm'ye yükseldiği senoryada Güney Avustralya'da C_3 bitkilerinin yoğunlukta olduğu meralarda ortalama mera veriminin %24-29, C_4/C_3 bitkilerinin karışık olarak bulunduğu meralarda %17 ve C_4 bitkilerinin yoğun olduğu meralarda ise %9 artış göstereceğini tahmin etmişlerdir. Bitkilerin CO_2 artışına kuru madde verimi tepkilerinin linear olduğu kabul edildiğinde, atmosferdeki CO2'nin 1 µmol /mol artışı kuru madde veriminde %0,1-0,12 yükselmeye sebep olmaktadır. Bu bilgiler doğrultusunda endüstri devriminin başladığı yıldan 1990'lı yıllara kadar olan dönemde C_3 bitkilerinin kuru madde verimi CO_2 konsantrasyonunun 280 ppm'den 355 pppm'e çıkmış olması nedeniyle %7,5-9,0 artmış olması gerekir. Fakat, İngiltere'deki Rothamsted araştırma istasyonunda 100 yıldır otlatılmayan bir meradan alınan veriler CO_2 artışının herhangi bir kuru madde verimi artışına neden olmadığını ortaya koymuştur.

Yapılan bazı araştırmalara göre C_4 bitkilerinin artan karbondioksit konsantrasyonuna fotosentetik ve büyüme olarak ortalama tepkilerinin C_3 bitkilerine göre daha düşük olmasına karşılık bu farklılıkların beklendiği kadar yüksek olmadığı gösterilmiştir (Hatipoğlu ve ark., 2019).

Yükselen CO_2 miktarı bitki stomalarının kapanmasına neden olarak, daha az su kullanmalarını ve daha fazla karbonhidrat üretmelerini sağlamaktadır. Gerçekleşen bu kısmi kapanma, fotosentezden çok transpirasyona etki etmektedir. CO_2 konsantrasyonunda olan artış hem C_3 hem de C_4 bitkilerinde stoma geçirgenliğini %30-40 oranında azaltmakta ve terlemede %23-46 oranında azalma görülmektedir (Özer ve Özer, 2003).

Bitkilerde stoma kapanması transpirasyonu azaltmakta ve daha yüksek bitki ve toprak su potansiyeline sebep olarak su kullanımını artırıp daha fazla biyomas üretimine neden olmaktadır. Özellikle su faktörünün kısıtlayıcı olduğu doğal meralarda bu durum biyomas üretiminde fazlaca etkili olabilmektedir. Öte yandan, uzun zaman yüksek CO_2 konsantrasyonuna uğrayan C_3 bitkilerinin fotosentez miktarlarını düşürerek fotosentetik uyum sağlaması bu bitkilerin yüksek CO_2 şartlarında gösterdikleri fotosentez artışını azaltabilir ve hatta artışı tamamen ortadan kaldırabilir. Yükselen CO_2 konsantrasyonuna fotosentezin uyum sağlaması C_3 ve C_4 bitkileri arasındaki yüksek karbondioksite karşı gösterilen tepki farklılığını azaltır.

Kimi bitkiler karbon asimilasyonu ve bu asimilatların büyüme gelişmelerinde kullanımı arasındaki denge stratejilerindeki değişiklikler sebebiyle yüksek CO_2 konsantrasyonuna daha çok tepki gösterebilmektedirler. Otsu C_3 bitkilerinin karbondioksit artışına tepkisi, yabani C_3

bitkilerine göre daha fazla olduğu bildirilmektedir (Poorter, 1993). Ayrıca hızlı büyüyen yabani C_3 bitkilerinin yavaş büyüyen C_3 bitkilerine göre CO_2 konsantrasyon artışına gösterdiği tepki daha fazla olmaktadır.

Baklagiller CO_2'e en fazla reaksiyon gösteren bitki grubudur. Bu durumun nedenlerinden biri de bu bitkilerin atmosferik azotu fikse edebilmeleridir. Yeterli olmayan azot bitkilerin yüksek CO_2 konsantrasyonu şartlarına fotosentetik uyum göstermesi ve zayıf büyüme yapmasının en önemli nedenlerinden biridir. Bu yüzden baklagil bitkilerinin atmosferik azotu organik bileşiklere dönüştürmesi baklagil dışındaki bitkilere göre bir avantajdır. Ancak, baklagil bitkileri fosforca fakir topraklarda ve fazla miktarda azot uygulanan topraklarda bu avantajını kaybeder.

Geniş yapraklı bitkiler buğdaygillerle karşılaştırıldığında yüksek CO_2 konsantrasyonuna daha fazla reaksiyon gösterirler. Bunun nedeni ise tam olarak açıklanamamıştır.

Yüksek CO_2 konsantrasyonunda gelişim gösteren bitkilerin solunumu da etkilenebilir. Bu durum hem atmosfer hem de bitki açısından önemlidir. Çünkü, C_3 fotosentez mekanizmasında fikse edilen C'nun yarısı solunumla atmosfere geri gönderilebilir. Yüksek CO_2 koşullarında solunumun azaldığı ile ilgili bazı araştırma sonuçları vardır. Bununla birlikte CO_2 genellikle kök/sürgün oranını arttırdığı için ve kök sisteminin spesifik solunum oranı sürgünlerden daha fazla olduğu için CO_2 konsantrasyonu arttıkça bitki solunumu da artma gösterebilmektedir (Hatipoğlu ve ark., 2019).

3.2.KÜRESEL ISINMA VE YÜKSEK CO_2 KONSANTRASYONUNUN ÇAYIR-MERALAR ÜZERİNDEKİ ETKİSİ

İklim değişikliğinin olumsuz etkilerinden en belirgini, bitki gelişmesinde görülen yüksek sıcaklığın vermiş olduğu zararlardır. Bu durumun olumsuz etkileri genellikle tuzluluk ve kuraklık stresiyle beraber değerlendirilmektedir. Yükselen sıcaklıkların olumsuz etkileri arasında en önemli görüleni gelişme dönemi sürelerinin farklılaşması olarak belirtilmiştir. Sıcaklığın meristem/organ büyümesine yardımcı olarak daha hızlı gelişime neden olacağı ve bunun da daha küçük bitki organeli ve daha az biyokütle birikimine yol açacağı ve çoğunlukla generatif döneme erken geçişi teşvik edeceği söylenmiştir. Yüksek sıcaklıklar bitkiyi bütün gelişim evrelerinde etkilemekle birlikte özellikle tozlanma ve dane dolum gibi gelişme dönemlerinde daha fazla etkilemektedir (Yavaş ve Ünay, 2018).

Rustad ve ark. (2001), küresel ısınmanın etkileri sonucunda 21. Yüzyılda tundra, çayır-mera ve orman biyomlarında primer üretimin %19 artacağını tahmin etmişlerdir. Primer üretimin özellikle tundra gibi serin ekosistemlerde daha çok olacağı öngörülmüştür. Yüksek CO_2 konsantrasyonunun bitki büyümesindeki olumlu etkisi sıcaklık artışıyla doğru orantılı olarak artar. C_3 bitkilerinde yükselen sıcaklıklarda CO_2 artışı ile büyümenin teşvik edilmesi fotorespirasyondaki değişim ve CO_2'i fikse eden RuBisCo enziminin aktivitesi ile alakalıdır. Birden fazla bitkide yüksek sıcaklık karbonhidrat üretiminde kullanılacak CO_2 isteğini artırır ve böylece büyüme teşvik edilir. Bu yüzden, yüksek CO_2 konsantrasyonunun ılıman bölge çayır-meralarında primer üretime katkısının büyük ölçüde mevsime bağlı olması muhtemeldir (Hatipoğlu ve ark., 2019).

Gerçeğe yakın tahminlerin çoğunluğunda atmosferin CO_2 içeriğinin artması ve yüzey sıcaklığı ve yüzey sıcaklıklarında artışla çayır-meraların çoğunluğunda primer üretimin artacağı tahmin edilmektedir. Primer üretim artışının derecesi ise ekosistemlere ve diğer çevre koşullarına bağlı olarak değişecektir. Yüksek sıcaklığın primer üretimi artırıcı yönü özellikle düşük sıcaklıkların yüksek CO2 konsantrasyonuna tepkiyi azalttığı yüksek yerlerde ve yüksek ve orta enlem derecelerindeki bölgelerde bulunan çayır-meralarda olabilir.

3.3.YAĞIŞ, SICAKLIK VE YÜKSEK CO2'İN ÇAYIR-MERALAR ÜZERİNDEKİ ETKİSİ

Çayır-meralarda primer üretimdeki farklılıkların %90'ının sebebi yıllık yağışta görülen değişimlerdir. Gao ve ark., (2016), 1982-2011 yılları içerisinde sıcaklık ve yağış miktarlarını değerlendirerek iklim değişikliğinin yeryüzündeki meraların %40'ında verimi büyük ölçüde etkilediğini, bahsedilen dönemde iklim değişikliğinin çayır-meraların verimliliğindeki varyasyona katkısının %15,2-%71,2 olduğunu, uzun dönemde özellikle Kuzey Amerika, Orta Avrasya, Orta Afrika ve Okyanusya'daki meraların iklim değişikliğine duyarlı olduğunu, iklim değişikliğinin çayır-meraların verimindeki varyasyona katkısının batı yarım kürede doğu yarım küreye göre daha yüksek olduğunu bildirmişlerdir.

Nemi oldukça fazla ve verimli meralarda yağış miktarındaki farklılıklar çok büyük değişime yol açmayacaktır. Fakat mevsimlik üretim yağışın miktar ve dağılımıyla ilişkili olduğu için iklim değişikliği ile ilgili yağış rejimi değişimi bu tip meralarda da etkili olacaktır. Yağış miktarındaki artış çoğunlukla çayır-meralarda verime olumlu etki eder. Kuvvetli yağışlar yüzey akışı ve erozyon artışına sebep olacaktır. Küresel ısınmanın kuraklık etkisi iklim değişikliği ile yağışın fazla etkilenmeyeceği veya azalacağı dünyanın kurak veya yarı kurak kısımlarında özellikle önem kazanacaktır. Aynı zamanda CO_2 konsantrasyonunun artışı su kullanım etkinliğinin yükselmesine neden olacaktır. Bundan dolayı küresel iklim değişikliği sonucu yağış miktar ve dağılımında oluşacak değişime hidrolik ve bitkisel üretim açısından tepki yağışın sıcaklık ve karbondioksitle olan karmaşık interaksiyonlarına bağlıdır. Reeves ve ark. (2014), iklim değişikliği neticesinde ABD meralarında ortalama yıllık net primer üretimin %0.26 yükseleceği, ancak bu artışın 2030 yılına kadar bariz olarak ortaya çıkmayacağını ve artışın bölgelere göre önemli derecede farklılık göstereceğini bildirmişlerdir. ABD'nin güneybatı bölgelerinde bulunan meralarda 2100 yılına kadar net primer üretimde %7 azalma olacağı, kuzey ve güney ovaları, iç batı ve doğu ovalarındaki meralarda ise primer üretimin %25 artacağı öngörülmüştür.

3.4..İKLİM DEĞİŞİKLİĞİNİN ÇAYIR-MERALARDA BİTKİ ÜREMESİNE ETKİSİ

Üreme, tohumla çoğalan bitki türlerinin hayatta kalması ve evrimi için hayati öneme sahiptir. Üreme safhası bitki yaşam döngüsüne bakıldığında kısa olarak gözükse de, bu aşama özellikle olumsuz koşullara karşı oldukça hassastır (Gellesch ve ark., 2017).

Atmosferde görülen CO_2 konsantrasyonundaki artış ve iklim değişikliği bitkinin gelişmesi yanında bitki üremesinde de etkisi olması bakımından çayır-meralarda üretimi, tür kompozisyonunu ve özellikle biyoçeşitliliği etkiler. CO_2'in bitki popülasyonunda yeni türlerin

meydana gelmesi üzerine etkili olduğu birkaç mekanizma vardır. Yükselen CO_2 konsantrasyonu çoğunlukla tohum sayısında ve tohum büyüklüğünde artışa neden olur. Ancak bu olgu türlere ve çevre koşullarına bağlıdır. Genellikle artan CO_2 konsantrasyonu üreme ile alakalı bir özelliği olumlu etkilerken diğerini olumsuz etkiler (Hatipoğlu ve ark., 2019). Bu olumsuzluk tohum sayısı ve tohum iriliği arasında görülür. CO_2 konsantrasyonundaki artışın tohum sayısı, büyüklüğü ve dağılımı üzerindeki etkisi kurak ve yarı kurak bölge meralarında görüldüğü gibi fide oluşumunun tohum sayısını etkilediği durumlarda etkili olabilir. Bu durum nemli meralarda daha az önem taşır. Tohum iriliği üreme başarısının iyi bir belirtisi olmayabilir. Mera bitkilerinde çimlenme ve fide gelişimi için uygun toprak sıcaklığı ve nem önemli faktörlerdir. Bu yüzden toprak su dinamiğine etki eden sıcaklık ve yağıştaki herhangi bir farklılık çimlenme ve fide gelişimini de etkiler. Yüksek CO_2 konsantrasyonu bitki transprasyonunu azaltmasıyla beraber toprak su içeriğini olumlu yönde etkileyerek dolaylı olarak fide gelişimini de etkiler (Hatipoğlu ve ark., 2019).

3.5. İKLİM DEĞİŞİKLİĞİNİN ÇAYIR-MERALARDA BİTKİ KÖK BÜYÜMESİNE ETKİSİ

Çayır-meralarda bulunan bitkilerin kök sistemiyle birlikte yeraltı kısımlarının çoğunda C depolanmaktadır ve bu yüzden iklim değişikliğinden doğrudan etkilenmektedirler. Fakat bazı çalışmalarda ise sıcaklık ve CO_2 artışına kök sistemlerinin farklı tepkiler gösterdiği belirtilmiştir. Artan CO2 konsantrasyonunda kök üretimi çoğalabilir, azalabilir veya hiç yanıt vermez. Bugüne kadar sıcaklık artışı, yağış azalması ve artan CO_2'nin bitki kök bölgesi üzerine etkilerinin incelendiği çok az çalışma bulunmaktadır (Pilon ve ark., 2013).

Verimli çayır-mera alanlarında CO_2 artışına büyüme tepkisi çoğunlukla daha fazladır ve bu fazla büyüme toprak altı organlarında toprak üstü organlara göre daha fazladır. Küresel sıcaklığın artmasıyla birlikte toprak sıcaklığı da artar. Sonuç olarak ise toprak su besin maddeleri miktarı yeterli düzeyde olduğu kabul görüldüğünde kök üretimi ve ölümü artar. Su ve besin maddelerinin yeterli düzeyde olmadığı doğal ekosistemlerde artan sıcaklıklara karşı kök aktivitesinin reaksiyonlarını tahmin etmek zordur. Kuraklığın hakim olduğu meralarda yağış artışı kök aktivitesini artıracaktır. Nemli meralarda ise yağışın artmasıyla beraber kök aktivitesi hem olumlu hem de olumsuz sonuçlar verebilir. Kurak koşullarda artan yağışa toprak altı organların tepkisi besin maddeleri mineralizasyonunun ve kök aktivitesinin artması olarak sonuçlanacaktır. Nemli durumlarda köklerle ilgili olumsuz etkiler; mobil elementlerin yıkanması, azotun denitrifikasyon ile kaybı ve toprak erozyonu olabilir.

Atmosferik CO2'nin artışı verimi yüksek meralarda toprak altı sistemlerin verimini ağırlıklı ölçüde artırabilmesine karşılık, düşük verimli meralarda bu artış sınırlıdır (Hatipoğlu ve ark., 2019).

3.6.İKLİM DEĞİŞİKLİĞİNİN ÇAYIR-MERALARDAKİ BESİN MADDELERİ DÖNGÜSÜ VE TOPRAK ÜZERİNDEKİ DİĞER ETKİLERİ

İklim değişikliği, yağış rejimlerinde ve sıcaklık desenlerinde değişikliğe neden olarak topraktaki besin maddelerinin dağılımını ve miktarını etkileyebilir. Yükselen sıcaklıklar ve

azalan yağışlar bitki örtüsünü etkileyerek, bitkiler tarafından kullanılan besin maddelerinin miktarını değiştirebilir. Bunun sonucunda toprak verimliliği ve besin döngüsü üzerinde etkiler görülebilir. Yüksek CO_2 konsantrasyonlarında yapılan ve CO_2'e bağlı koşullarda verim değişikliğinin ortaya çıktığı çalışmalarda bitki toprak üstü aksamında azot içeriği düşük olmaktadır. Yüksek CO_2 koşullarında bitkinin kaynak kullanım etkinliğinin artması bu durumun kısmen nedenlerinden sayılabilir. Yüksek CO_2 konsantrasyonu sebebiyle verimin artışa geçmesi toprağa daha çok karbonlu madde girişine neden olur. Bu durumunda etkisiyle mikrobiyal büyümeyi gerçekleştirir ve başlangıçta toprak besin maddeleri hareketsiz kalır. Fakat, mikrobial biyomasın artışı sonucunda daha fazla besin maddesi mineralizasyonla toprağa geri döner. Uzun zaman içinde toprak besin maddesi döngüsü organik madde girişindeki değişimle uyum içine girer ve bitkilerin alabileceği formdaki besin maddeleri miktarı CO_2 zenginleşmesi sonucu ortaya çıkan talebi karşılayacak hale gelebilir. Yapılan denemelerin çoğunda CO_2 zenginleşmesi sonucu kök-sürgün oranının artışı karbondioksit zenginleşmesi sonucu bitkide ortaya çıkan azot açığına dolaylı bir tepki olarak yorumlanmıştır. Böyle durumlarda bitki topraktan alacağı azot miktarını artırmak için toprak altı organlara daha fazla karbonhidrat göndermektedir. Uzun süreli karbondioksit zenginleşmesi koşullarında bitkinin bu duruma uyum sağlayarak zaman içerisinde karbondioksit zenginleşmesine fotosentetik ve büyüme açısından daha az tepki göstermesinin bitkinin azot eksikliği koşullarında karbonhidrat depolaması ile ilgili olduğu ortaya çıkmıştır (Hatipoğlu ve ark., 2019).

Nemli bölgelerde görülen yüksek sıcaklıklar, çayır-meralarda daha çok organik madde ayrışmasına neden olabilir. Ancak bu durum kurak bölge meraları için geçerli değildir. Genellikle sıcak bölgelerde soğuk bölgelere kıyasla toprak solunumu ve organik madde ayrışmasının daha fazla olduğu bilinir. Bununla birlikte organik maddenin ayrışması sıcaklık ve toprak suyu ile ilgilidir. Bitki ihtiyaç duyduğu suyu bulamadığı için çürüme ve toprak solunumu üzerindeki sıcaklık etkisi azalır. Atmosferik karbondioksit konsantrasyonu artışı toprak su dinamiğini etkilediği ölçüde organik madde ayrışmasını da etkileyecektir (Hatipoğlu ve ark., 2019).

3.7. İKLİM DEĞİŞİKLİĞİNİN ÇAYIR-MERA BİTKİ TOPLULUĞUNA ETKİSİ

Bitkilerin dağılış şekilleri yağışın miktar ve dağılımı ile sıcaklıktan çok önemli boyutta etkilenir. Toprak-su dengesine etki eden herhangi bir iklim değişikliği bitki popülasyonunu büyük derecede etkileyecektir. İklim değişikliğiyle beraber dünyanın belirli yerlerinde yağışın artacağının öngörülmesi yanında yağış şiddetinin artması sebebiyle suyun arazi üzerindeki dağılımı düzensiz olacak ve bazı bölgeler daha kurak olacaktır. Çayır-meralara düşen yağış şekli suyun düşey dağılımını ve bitki kök sistemlerinin derinliğini önemli derecede değiştirecektir.

Bitki topluluklarının dağılımında önemli faktörlerden biri de sıcaklıktır. Bugün tropikal enlem derecelerinde C_4 buğdaygilleri daha yoğunlukta görülmektedir. İklim değişikliğinin hem sıcaklık hem de yağışlarda görülen etkilerini dikkate alan iklim modellerinde Kuzey ve Güney Amerika çayır-meralarında C_4 buğdaygillerinin artacağı ve C_3 buğdaygillerinin azalacağı tahmin edilmektedir.

Çayır-mera bitki topluluklarının küresel ısınma ve yağış değişikliklerine uzun dönemdeki tepkileri daha çok toprak besin maddeleri döngüsü ve su dinamiği tarafından belirlenecektir. Bitki topluluklarının yayılışının değişimi iklim değişikliğinin derecesine bağlı olacaktır (Hatipoğlu ve ark., 2019).

3.7.1. ATMOSFERİK CO2 KONSANTRASYONU ARTIŞININ BİTKİ TOPLULUĞUNA ETKİLERİ

Atmosferik karbondioksit konsantrasyonunun artışına bitkilerin bireysel tepkilerinin ne olduğu bakımından birçok araştırma yapılmıştır. Fakat, çeşitli bitkilerin bir araya gelerek karmaşık bir yapı oluşturduğu topluluklarda yapılan araştırmalarda bireysel bitkilerin CO_2 artışına tepkisinin söz konusu bitkinin karmaşık bitki topluluğundaki tepkisinin iyi bir göstergesi olmadığını göstermiştir. Örneğin, baklagiller CO_2'e karşı çok iyi tepki gösteren bitkilerdir. Bunun yanında, He ve ark. (2002), fazlaca tür zenginliği gösteren bitki topluluklarında N fikse eden bitkilerin yüksek CO_2 konsantrasyonlarında daha az miktarda biyomas ürettiğini belirlemişlerdir. Zengin çeşitlilik gösteren ekosistemlerin yükselen CO_2 konsantrasyonuna daha iyi adapte olduğu ve daha yüksek reaksiyon gösterebildiği açıklanmıştır. İklim değişikliğinde olduğu gibi atmosferik karbondioksit artışının su ve besin maddesi döngüsü üzerindeki uzun dönemdeki etkileri türlerin ve ekosistemlerin bu değişime tepkisini belirleyecektir.

3.7.2. ÇOK YÖNLÜ KÜRESEL DEĞİŞİMLERİN BİTKİ TOPLULUĞUNA ETKİSİ

Var olan bilgilere göre, C_3 fotosentez işleyişine sahip bitkilerin, geniş yapraklıların ve baklagillerin çoğalan atmosferik CO_2 konsantrasyonuna daha fazla tepki gösterecekleri ve sonuç olarak gelecekte CO_2'ce zengin çevrelerde daha geniş alanlara yayılacağı öngörülmektedir. Bununla birlikte, sıcaklık artışı ve yağış rejimindeki değişikliklerin bu bitkilerin yüksek CO_2 konsantrasyonlarına karşı reaksiyonlarını etkileyecektir. Sıcaklık ve kuraklığın daha fazla olduğu iklim modelleri C_4 metabolizmasını teşvik edecektir. Bu durumda sıcaklıktaki belirgin artış C_3 bitkilerinin yüksek CO_2 konsantrasyonunda meydana gelen avantajlarını kısıtlayacaktır. Ek olarak, atmosferde ozon ve N konsantrasyonunun artması gibi diğer küresel değişimler özellikle şehirleşmenin olduğu yerlerde yüksek CO_2'e tepkiyi etkileyecektir. Endüstriyel ülkelerin kırsal bölgelerinde kirliliğe sebep olan atmosferik ozon yükselişi buğdaygil-baklagil karışımlarında baklagil oranını azaltabilir. Hayvansal üretimin ve endüstriyel faaliyetlerin sonucunda artan azot birikimi çayır-meralara azot olarak döner.

4. SONUÇ

Atmosferde bulunan gazların içeriğinin ve miktarının değişmesi sonucunda iklimde görülen değişiklikler çayır-mera vejetasyonlarının dağılımına ve işlevine büyük etki yaratacağı ortadadır. Şu anda vejetasyonun iklim değişikliğine karşı gösterdiği tepkileri anlamak için fazlaca emek harcanmaktadır. Fakat, çayır-meralarda görülecek olan değişiklikler küresel boyuttadır ve bu durumun çözümü de bilimsel boyutta kısıtlamalarla karşı karşıyadır. Gelecekle ilgili öngörülerde bulunmak için detaylı araştırmalar yapılması gerekir.

İklim değişikliğinin çayır meralar üzerine etkisi ciddidir. Artan sıcaklık, iklim değişikliği ve ekstrem hava koşulları, çayır meraların üretkenliğini önemli derece etkilemektedir. Bu değişiklikler, ot türlerinin dağılımını ve çeşitliliğini değiştirmekte, mera verimliliğini ve hayvan otlatma kapasitesini olumsuz etkilemektedir. Ayrıca erozyon riski ve toprak kalitesindeki bozukluklar artabilmektedir. Bu nedenle iklim değişikliğiyle mücadelede çayır meraların korunması ve doğru biçimde yönetilmesi önemlidir. Sürdürülebilir tarım uygulamalarının ve iklim uyum stratejilerinin geliştirilmesi gerekmektedir.

ABSTRACT

Cannabis sativus L. belong to Cannabaceae family and the Cannabis genus. The species is a diploid in constitution with 2n = 20 chromosomes (9 autosomes + XX/XY sex chromosomes). Due to countless studies, especially genomic research, people are now able to better understand the plant. The haploid genome size of female individuals is approximately 818 Mb, while that of males is around 843 Mb. Studies to date have identified approximately 27,000 to 38,000 protein-coding genes in the cannabis genome, most of which are validated through transcriptome analyses. The chloroplast genome is approximately 153,850 bp, and the mitochondrial genome is about 415,837 bp in size. Tandem repeats constitute about 29% of the genome, while retrotransposons account for 28.8%, indicating active transposon activity during the evolution. The most extensively studied gene families in cannabis include those involved in cannabinoid biosynthesis, protection against pathogens, biotic and abiotic stress, flower biology, CBD, and THC terpene production. Despite this, there are many missing links in the current genomic sequence data, particularly in the rDNA gene family, centromeric regions, and some repetitive elements, remain insufficiently defined. Future studies are desired to fill data about missing gaps and generate high-accuracy related to annotated reference genome to resolve issues related to epigenomic modifications and understand gene-environment interactions and their expressions.

Cannabis sativa L. TÜRÜNÜN GENOM DİNAMİKLERİ

ÖZET

Cannabis sativus L., Cannabaceae familyasına ve Cannabis cinsine aittir. Tür, 2n = 20 kromozomlu (9 otozom + XX/XY cinsiyet kromozomları) diploid bir yapıya sahiptir. Sayısız çalışma, özellikle genomik araştırmalar sayesinde insanlar artık bitkiyi daha iyi anlayabiliyor. Dişi bireylerin haploid genom büyüklüğü yaklaşık 818 Mb iken, erkeklerinki yaklaşık 843 Mb'dir. Bugüne kadar yapılan çalışmalar, çoğu transkriptom analizleriyle doğrulanan, cannabis genomunda yaklaşık 27.000 ila 38.000 protein kodlayan gen tanımlamıştır. Kloroplast genomu yaklaşık 153.850 bp ve mitokondriyal genom yaklaşık 415.837 bp boyutundadır. Tandem tekrarlar genomun yaklaşık %29'unu oluştururken, retrotranspozonlar %28,8'ini oluşturur ve bu da evrim sırasında aktif transpozon aktivitesini gösterir. Kenevirde en kapsamlı çalışılan gen aileleri arasında kanabinoid biyosentezi, patojenlere karşı koruma, biyotik ve abiyotik stres, çiçek biyolojisi, CBD ve THC terpen üretimi ile ilgili olanlar yer alır. Buna rağmen, özellikle rDNA gen ailesinde, sentromerik bölgelerde ve bazı tekrarlayan elementlerde mevcut genomik dizi verilerinde birçok eksik halka vardır ve bunlar yeterince tanımlanmamıştır. Eksik boşluklar hakkında veri doldurmak ve epigenomik modifikasyonlarla ilgili sorunları çözmek ve gen-çevre etkileşimlerini ve ifadelerini anlamak için açıklamalı referans genomuyla ilgili yüksek doğruluk üretmek için gelecekteki çalışmalar istenmektedir.

Anahtar Kelimeler: Kenevir, *Cannabis sativa* L., Genom, Genetik

1. GİRİŞ

Kenevir (*Cannabis sativa* L.), Orta Asya ülkeleri (Tacikistan, Pakistan, Afganistan, Çin'in Sincan ve Henan eyaletleri), Japonya ve Tayvan'ın tıbbi, farmasötik, biyomalzeme ve bazı dini-kültürel alanlarında tarih boyunca değerli bir bitki olmuştur. Bu türdeki genomik çalışmaların ilerlemesi, türdeki bitkilerin çeşitli ontogenetik gelişim aşamalarında meydana gelen biyolojik potansiyeli ve moleküler mekanizmaları daha iyi anlamamızı sağlamıştır (Small, 2015; Zhang vd., 2018).

Kenevir, 9 çift otozom ve 1 çift cinsiyet kromozomundan (XX/XY) oluşan diploid (2n = 20) bir bitkidir (Divashuk vd., 2014). Cinsiyet kromozomlarıyla cinsiyet belirleme mekanizması nadir görülen bir durumdur. Dikotiledon formlarda, erkek bireyler XY ve dişi bireyler XX kromozom setlerine sahipken, monokotiledon bireyler sadece XX kromozom setlerine sahiptir ve cinsiyet genellikle epigenetik mekanizmalar tarafından belirlenir (Prentout vd., 2020).

Kenevirin haploid genom büyüklüğü dişi bireylerde yaklaşık 818 Mb ve erkek bireylerde yaklaşık 843 Mb olarak belirlenmiştir. Erkeklerde genom büyüklüğünün daha büyük olmasının nedeni cinsiyet kromozomlarıdır. Heterokromatik bölgenin Y kromozomunda yer aldığı kabul edilmektedir (Zhang vd., 2018).

İn silico analizlere göre, kenevir genomunda 27.000 - 38.000 protein kodlayan gen tanımlanmıştır. Bu genlerin yaklaşık 27.640'ı transkriptom analizleri yoluyla desteklenmekte ve doğrulanmaktadır (Laverty vd., 2019).

Filogenetik analizler, biyosentetik yolların evrimi ve plastid işlevlerinin anlaşılması için önemli olan kloroplast ve mitokondriyal genom boyutlarını sırasıyla 153.850 bp ve 415.837 bp olarak belirlemiştir (van Bakel ve ark., 2011).

Genomun büyük bir kısmı tekrarlayan DNA dizilerinden oluşur. Kenevir genomunun yaklaşık %29'u tandem tekrar dizilerinden oluşurken, %28,8'i transpozon elementlerinden oluşur. Bu durum, genomun evrimsel süreçte transpozon aktivitesine maruz kaldığının ve genom dinamiklerinin aktif olduğunun bir göstergesidir (Pisupati ve ark., 2018). Tekrarlayan elementler, genom çalışmalarında açıklanması en zor bölgelerden biridir. Kenevir genomunun yaklaşık %60'ını oluşturan tekrarlayan DNA elementleri, genomun hala dinamik olduğunu gösterir. Ayrıca genom boyutunu artıran ve seks kromozomu evriminde rol oynayan önemli bir faktör olduğu düşünülmektedir. Çünkü erkek çiçekler monoecious formlarda epigenetik mekanizmalar tarafından kontrol edilir ve epigenetik mekanizmalar doğrudan tekrarlayan DNA elemanlarıyla ilişkilidir (Prentout vd., 2020). C. sativa genomunda moleküler ve metabolik düzeylerde kritik rollere sahip gen aileleri bulunmaktadır. Bu gen aileleri bitkinin metabolit üretimi, stres toleransı ve gelişimsel süreçlerinin genetik kontrolünde rol oynar. Özellikle kanabinoid biyosentezi, terpen üretimi, stres tepkisi, çiçek biyolojisinin kontrolü ve patojen savunma sistemleri gibi süreçleri düzenleyen gen aileleri yoğun olarak araştırılmaktadır (Liu vd., 2021; Gülck & Møller, 2020). Bu gen aileleri, kenevirin biyotik ve abiyotik streslere verdiği yanıtlar, sekonder metabolit üretimi, çevresel adaptasyon ve tarımsal değerinin artırılması için kritik öneme sahiptir. Bu genlerin genom ve transkriptom düzeyinde karakterizasyonu hem temel biyoloji hem de endüstriyel uygulamalar için güçlü bir altyapı sağlar (Liu vd., 2021; Gülck & Møller, 2020; Laverty vd., 2019; Zhang vd., 2018; Booth vd., 2020; Zhao vd., 2021).

Şekil 1.1. Kenevirin kullanım alanları

2. KENEVİRİN GENOM DİNAMİKLERİ

Kenevir *(Cannabis sativa* L.) tıbbi, endüstriyel ve kültürel alanlarda tarih boyunca değerli bir bitki olmuştur. Özellikle bu türde yapılan genomik çalışmaların ilerlemesi, bu türün biyolojik potansiyelini ve moleküler mekanizmalarını daha iyi anlamamıza olanak sağlamıştır (Small, 2015; Zhang vd., 2018).

Kenevir, 9 çift otozom ve 1 çift cinsiyet kromozomundan (XX/XY) oluşan diploid (2n = 20) bir bitkidir (Divashuk vd., 2014). Cinsiyet kromozomları ile cinsiyet belirleme mekanizması nadir görülen bir durumdur. Çift evcikli formlarda erkek bireylerde XY, dişi bireylerde ise XX kromozom seti bulunurken, tek evcikli bireylerde ise sadece XX kromozom seti bulunur ve epigenetik mekanizmalarla cinsiyet oluşur (Prentout vd., 2020).

Kenevirin haploid genom büyüklüğü, dişi bireylerde yaklaşık 818 Mb, erkek bireylerde ise yaklaşık 843 Mb olarak saptanmıştır. Erkek bireylerde genom büyüklüğünün daha büyük

olmasının sebebi cinsiyet kromozomlarıdır. Y kromozomunda yer alan heterokromatik bölgeden kaynaklı olduğu düşünülmektedir (Zhang vd., 2018).

Yapılan *in silico* analizler doğrultusunda kenevir genomunda genomunda 27.000 – 38.000 arasında protein kodlayan gen tespit edilmiştir. Bu genlerin ~27.640 tanesi transkriptom analizleri ile desteklenmiş ve gen ifadeleri doğrulanmıştır (Laverty vd., 2019).

Filogenetik analizler, biyosentetik yolakların evrimi ve plastid işlevlerinin anlaşılması açısından önem taşıyan kloroplast ve mitokondri genom büyüklükleri sırasıyla 153.850 bp, ve 415.837 bp olarak tespit edilmiştir (van Bakel vd., 2011).

Genomun büyük bir kısmını tekrarlayan DNA dizileri oluşturmaktadır. Kenevir genomunun yaklaşık %29'u ardışık tekrar dizileri oluştururken, %28.8 kadarı transpozon elementlerinden oluşmaktadır. Bu durum, genomun evrimsel süreçte transpozon aktivitesine maruz kaldığını ve genom dinamiklerinin aktif olduğunun göstergesidir (Pisupati vd., 2018). Tekrarlayan elementler, genom çalışmalarındaki aydınlatılması en zor olan bölgelerdendir. Kenevir genomunun ~%60'ını oluşturan tekrarlayan DNA elementleri, genomun hala dinamik bir yapıda olduğuna işaret eder. Ayrıca Genom büyüklüğünü artıran ve cinsiyet kromozomu evriminde rol oynayan önemli faktörlerden birisi olduğu düşünülmektedir. Çünkü tek evcikli formlarda erkek çiçeklerin epigenetik mekanizmalarla kontrol edildiği düşünülmekte ve epigenetik mekanizmalar tekrarlayan DNA elementleri ile doğrudan ilişkilidir (Prentout vd., 2020).

Kenevir *(Cannabis sativa* L.) genomunda moleküler ve metabolik düzeyde kritik rol oynayan çeşitli gen aileleri bulunmaktadır. Bu gen aileleri, bitkinin metabolit üretimi, stres toleransı ve gelişimsel süreçlerinin genetik kontrolünde yer alır. Özellikle kanabinoid biyosentezi, terpen üretimi, stres yanıtı, çiçeklenme kontrolü ve patojen savunması gibi süreçleri düzenleyen gen aileleri yoğun olarak araştırılmıştır (Liu vd., 2021; Gülck & Møller, 2020). Bu gen aileleri, kenevirin biyotik ve abiyotik streslere yanıtları, ikincil metabolit üretimi, çevresel adaptasyonu ve tarımsal değerinin artırılması açısından kritik öneme sahiptir. Genom ve transkriptom düzeyinde bu genlerin karakterizasyonu, hem temel biyoloji hem de endüstriyel uygulamalar için güçlü bir altyapı sunmaktadır (Liu vd., 2021; Gülck & Møller, 2020; Laverty vd., 2019; Zhang vd., 2018; Booth vd., 2020; Zhao vd., 2021).

3. SONUÇ

i. Kenevir (*Cannabis sativa* L.) hem tıbbi hem de endüstriyel açıdan çok yönlü ve önemli bir bitkidir. Ancak uzun yıllar boyunca yasal kısıtlamalar nedeniyle tarım bitkilerine göre daha az araştırılmıştır. Son yıllarda güncellenen yasal düzenlemelerle beraber agronomik, ıslah ve tabiki genomik çalışmalar ivme kazanmıştır. Kenevir kannabinoidler yönünden zengin bir bitkidir ve onu tıbbi açıdan değerli kılar. Kannabinoid biyosentez yollarının moleküler temellerini anlamak, ıslahçıların da üzerine yoğunlaştığı yüksek oranlı CBD ve düşük oranlı THC sentezi için ışık tutacaktır. Lif, tohum ve ilaç amaçlı ıslah programlarında kenevir varyetelerinin genetik markörlerle, moleküler düzeyde çalışmaları önem arz etmektedir. Ayrıca ıslah programları için erken cinsiyet tespiti için gereklidir.

ii. Gerek filogenetik analizler gerek evrimsel olarak kenevirin aydınlatılması için yapılan genom çalışmaları önemlidir. Kenevir genomunda çalışılması gereken öncü konular

arasında yüksek tekrarlayan DNA bölgelerinin karakterizasyonu, cinsiyet kromozomlarının yapısı ve evrimi, kannabinoid ve terpen biyosentez lokuslarının yapısal varyasyonları, gen düzenleyici bölgelerin ve epigenetik profillerin belirlenmesi, popülasyon genetiği, organel genomları ve sitogenetik haritalama yer almaktadır.

iii. Kenevir genomunun çalışılması, hem bilimsel (temel biyoloji, genom evrimi, genetik varyasyon) hem de uygulamalı (ilaç, endüstri, tarım, ıslah) alanlarında önemli kapılar açmaktadır. Ancak tekrarlayan DNA bölgeleri, cinsiyet kromozomları, gen düzenleyici elementler ve metabolit biyosentez yolları gibi konular hala detaylı araştırılmamıştır. Bu eksiklerin tamamlanması, kenevirin tarımsal, endüstriyel ve farmasötik potansiyelini artırmada temel bir adım olacaktır.

ABSTRACT

Only approximately 5% of plant species worldwide (including cannabis) are dioecious. Therefore, for dioecious plants to produce fruit, a proper ratio of male and female plants must be present in the same field or garden. Cannabis sativa L. possesses a diploid genome structure with 2n = 20 chromosomes and carries a distinct XX/XY sex chromosome system, which is relatively rare among plant species. In dioecious plants, female individuals have an XX karyotype, while male individuals have an XY karyotype. Monoecious forms, on the other hand, carry only the XX karyotype and are therefore genetically predisposed to form female flowers. However, under the influence of hormones, stress conditions, or epigenetic factors, they can also develop male flowers. Studies in this field have shown that not only genetic, but also epigenetic mechanisms play active roles in the sex determination processes of cannabis. To this day, the instability of monoecious forms has not been fully clarified due to factors such as genetic heterogeneity, environmental influences, and epigenetic regulations. In the future, studies focusing on the construction of physical and genetic maps of cannabis's evolutionary sex chromosomes, complete sequencing of the Y chromosome, advancement of pachytene karyotype analyses, elucidation of molecular mechanisms in monoecious individuals, and functional analyses of epigenetic regulators will be of great importance. Such research is critical not only for basic science, but also for agricultural practices aimed at developing high-yielding and genetically uniform cannabis varieties. In this context, ongoing hybridization studies are being conducted at Yozgat Bozok University at both molecular and traditional levels with the goal of developing hybrid cannabis varieties.

XY VE XX SEKS KROMOZOMLARININ *Cannabis sativa* L. TÜRÜNDE TANIMLANMASI

ÖZET

Dünya çapında bulunan bitki türlerin (kenevir türü dahil) yalnızca ~ %5'i iki evciklidir (Dioik). Dolayısıyla, dioik bitkilerin meyve üretebilmeleri için bir bahçede dişi bitkiler ile beraber uygun miktarda erkek bitkilerin bulunmasının ihtiyaç duyulmaktadır. *Cannabis sativa* L. bitkisi, 2n=20 kromozomdan oluşan diploid bir genom yapısına sahiptir ve bitkiler aleminde oldukça nadir görülen belirgin bir XX/XY seks kromozom sistemi taşımaktadır. Çift evcikli bitki türlerde dişi bireyler XX, ve erkek bireyler ise XY karyotipine sahip olmktadırlar. Tek evcikli formlar yalnızca XX karyotipe sahiptir. Bu yüzden monoik bitki formlar genetik olarak dişi çiçek oluşturmaktadır., Ancak hormonal, stress koşullar veya epigenetik etkileri ile erkek çiçeklerde oluşturabilmektedir. Bu alanda yapılan çalışmalar, kenevirin sadece genetik değil, aynı zamanda epigenetik seviyede de cinsiyet belirleme mekanizmaların belirlenmesinde aktif rol oynamaktadırlar Günümüzde tek evcikli formların istikrarsızlığı; genetik heterojenlik, çevresel etmenlerin etkisi ve epigenetik düzenlemeler gibi unsurlar nedeniyle hâlâ açıklığa kavuşmamıştır. Gelecekte, kenevirin evremsel cinsiyet kromozomlarına dair fiziksel ve genetik haritaların oluşturulması, Y kromozomunun tam genom dizilenmesi, pakiten karyotip analizlerinin geliştirilmesi, tek evcikli bireylerin moleküler mekanizmalarının çözülmesi ve epigenetik düzenleyicilerin fonksiyonel analizi gibi çalışmalar ve çeşit geliştirilmesi gibi hibridleşme çalışmalarındaki önemi büyük önem taşımaktadır. Bu tür araştırmalar, sadece temel bilim açısından değil, aynı zamanda yüksek verimli ve homojen kenevir çeşitlerinin geliştirilmesi için de tarımsal uygulamalarda doğrudan katkı sağlamaktadır. Bu kapsamda, Hali hazırda Yozgat Bozok üniversitesinde hibrit çeşitler geliştirmek amacıyla hem moleküler hemde geleneksel seviyesinde çalışmaları devam etmektedir.

Anahtar Kelimeler: Kenevir, Erkek Bitkiler, Dişi Bitkiler, Sitogenetik, Moleküler Markörler

4. GİRİŞ

Kenevir (*Cannabis sativa* L.), hem dioik (iki evcikli) (Görsel 1.1.) hem de monoik (tek evcikli) formlarda bulunabilen nadir bir bitki türüdür. Dünya genelindeki bitki türlerinin yalnızca yaklaşık %5'i dioik özelliktedir; bu da dioik bitkilerin evrimsel açıdan daha sınırlı ve nadir bir üreme stratejisi sergilediğini gösterir (Renner & Ricklefs, 1995). Dioik bitkilerde, erkek ve dişi bireylerin ayrı bitkilerde bulunması, meyve ve tohum üretimi için aynı alanda uygun oranda erkek ve dişi bitkilerin varlığını zorunlu kılar (Small, 2015).

Görsel 1.1. Çift evcikli kenevir bitkisi. **(a)** Dişi form. **(b)** Erkek form. (Yozgat Bozok Üniversitesi, Kenevir Araştırmaları Serasında yetiştirilmiş bitkilere ait bir görseldir.)

Kenevir, 2n = 20 kromozoma sahip diploid bir türdür. 9 çift otozom ve 1 çift cinsiyet kromozomundan oluşur ve bitkilerde nadir görülen bir XX/XY cinsiyet kromozomu sistemi ile cinsiyet belirler. Dioik formlarda dişi bireylerde XX, erkek bireylerde ise XY karyotipi bulunur (Divashuk et al., 2014). Bu sistem, hayvanlardaki XY cinsiyet belirleme mekanizmasına ile benzerdir fakat bitkilerde bu durum evrimsel olarak dinamiktir. (Prentout et al., 2020). Kenevirin monoik formlarında ise yalnızca XX karyotipi gözlenir. Bunun anlamı monoik formların genetik olarak dişi olduğudur. Ancak epigenetik mekanizmalar aracılığı ile bu

bireylerde erkek çiçekler de gelişebilir. Ayrıca çevresel stres faktörleri (sıcaklık, ışık, su stresi) nedeniyle de cinsiyet değişikliği gözlenir (Sakamoto et al., 2005). Monoik bireylerin cinsiyet yönünden istikrarsızlığı (yani mevsimden mevsime veya çevresel koşullara bağlı değişken cinsiyet ifadesi), hâlen tam olarak anlaşılmamıştır. Bu istikrarsızlık; genetik heterojenlik, çevresel etkiler ve epigenetik mekanizmaların etkileşimiyle açıklanmaktadır (Prentout et al., 2020).

Kenevirde cinsiyet belirleme mekanizmalarını anlamak, tarımsal üretim, medikal kenevir geliştirme ve lif üretimi için büyük önem taşır. Özellikle dişi bireyler reçine ve kannabinoid üretimi için tercih edilirken, erkek bireyler lif üretimi için kullanılır. Bu nedenle erkenden cinsiyet tayini üretim amacına göre ekonomik kayıpların önlenmesinde kritik rol oynar (Divashuk et al., 2014).

Bu alandaki çalışmalar, sadece genetik düzeyde değil, epigenetik seviyede de cinsiyet regülasyonunun çözülmesine odaklanmaktadır. DNA metilasyonu, histon modifikasyonları ve küçük RNA'ların cinsiyet belirlemede etkili olabileceği öne sürülmektedir (Ming et al., 2011; Prentout et al., 2020).

Yozgat Bozok Üniversitesi, Kenevir Araştırmaları Enstitüsü hem moleküler düzeyde hem de geleneksel ıslah yöntemleriyle hibrit kenevir çeşitleri geliştirmek amacıyla çalışmalar yürütmektedir. Bu amaçla bazı kenevir genotiplerinin genetik çeşitliliği ve akrabalık dereceleri moleküler yöntemlerle belirlenmiştir (Alsaleh & Yılmaz, 2025). Enstitü bünyesinde yapılan çalışmalar, Türkiye de kenevirin endüstriyel üretim kapasitesinin artırılması ve yerel adaptasyon gösteren yüksek verimli çeşitlerin geliştirilmesi açısından büyük bir potansiyele sahiptir.

Bu bildiride kenevirin cinsiyet tayininin önemine ve cinsiyet belirleme mekanizmasının anlatılması amaçlanmıştır.

5. KENEVİRDE CİNSİYET TAYİNİ

Kenevir bitkisinin cinsiyetinin belirlenmesi fenotipik olarak gözlenebilmektedir. Erken dönem tespiti için bazı markörler kullanılır. Kenevir *(Cannabis sativa* L.), XX/XY cinsiyet belirleme sistemi taşıyan nadir bitki türlerinden biridir ve bu sistemin moleküler ve sitogenetik düzeyde aydınlatılması, cinsiyet kromozomlarının evrimi, yapısı ve işlevi hakkında bilgi verir (Divashuk et al., 2014; Alexandrov et al., 2014). Kenevirde yapılan ileri sitogenetik analizlerde kullanılan yöntemler ve bulgular sayıca az olmakla beraber önem arz etmektedir.

Kenevirde yapılan DAPI ve C-banding analizlerinde Y kromozomu diğer kromozomlara kıyasla daha belirgin heterokromatik bir yapıya sahip olarak gözlemlenmiştir. Bu durum Y kromozomundaki heterokromatin miktarı, onu X kromozomundan morfolojik olarak ayırt etmeyi mümkün kılmaktadır ve bu bulgu, Y kromozomunun transpozonlar ve tekrar dizileriyle zenginleştiğini ve evrimsel süreçte heterokromatinleştiğini gösterir (Divashuk et al., 2014). Ayrıca dişi ve erkek bireyler arasındaki genom büyüklüğü farklılığının da sebebi olduğu düşünülmektedir. CS-1 probu, *Cannabis sativa* genomuna özgü bir subtelomerik tekrar dizisidir. X kromozomunda hem kısa hem uzun kolda (iki uçta) bu subtelomerik tekrarların bulunduğunu ve Y kromozomunda ise sadece ökromatik kolda yer aldığı saptanmıştır. Bu

durum, Y kromozomunun heterokromatik kolunun tekrarlayan DNA elementleri ve yapısal farklılıklar nedeniyle CS-1 probu tarafından işaretlenmediğini gösterir. Böylece, X ve Y kromozomlarının uç bölgelerinin ayırt edilmesinde CS-1 probu önemli bir moleküler markör olmuştur (Alexandrov et al., 2014). Bir diğer önemli moleküler markör olan CS-237, kenevir genomunda türüne özgü bir tandem tekrar dizisi olarak tanımlanmıştır. FISH yöntemiyle yapılan analizlerde CS-237 tekrarlarının kenevir kromozomları üzerinde spesifik lokalizasyon gösterdiği özellikle heterokromatik bölgelerde zenginleştiği gözlenmiştir. CS-237 probu, kenevirin tür tanımlamasında, filogenetik analizlerde ve sitogenetik haritalamada kullanılabilecek özgül bir markördür. Bu tekrar dizisi, ayrıca cinsiyet kromozomu bölgelerinin ayırt edilmesinde de ek bilgi sağlar (Divashuk et al., 2014). Kenevirde yapılan moleküler sitogenetik çalışmalar, pseudo-otozomal bölge (PAR) adı verilen ve X ve Y kromozomlarının homolog dizileri paylaştığı bölgenin tanımlanmasını sağlamıştır. Bu bölgede X ve Y kromozomları rekombinasyon yapabilir. Kenevirde pseudo-otozomal bölgenin varlığı, cinsiyet kromozomları arasındaki evrimsel ilişkiyi ve homologlukları gösterir. Buna ek olarak Pseudo-otozomal bölge, cinsiyet belirleyici genlerin tespitinde ve Y kromozomunun genetik içeriğinin anlaşılmasında kritik bir ipucu sağlamaktadır (Prentout et al., 2020).

Yapılan ileri sitogenetik çalışmalara ek olarak moleküler çalışmalar erken cinsiyet tayini için önemlidir. MADC2 ve SCAR323, *Cannabis sativa* genomunda erkek bireylere özgü DNA dizileri olarak tanımlanmış moleküler markörlerdir. Bu belirteçler, erkek bireylerin Y kromozomu üzerinde bulunan özel DNA dizilerini hedef alır. Böylece erken dönem cinsiyet tayini sağlanmış, ıslah programlarında avantaj elde edilmiş olur. (Sakamoto et al., 1998; Törjék et al., 2002). Bu avantajlar arasında erkek bireyler sahadan erkenden elimine edilerek dişi-dominant popülasyonlar oluşturulması ve tohumluk üretiminde, kontrollü çaprazlama programlarında cinsiyet kontrolü sağlanması yer alır. Ek olarak, bu özellikler, tıbbi kenevir (CBD/THC üretimi) ve endüstriyel kenevir üretiminde verim ve kalite artışı sağlamaktadır. (Sakamoto et al., 1998; Divashuk et al., 2014).

6. SONUÇ

Kenevir (Cannabis sativa L.), tıbbi, endüstriyel ve kültürel önemi nedeniyle giderek artan bilimsel ilginin odağında yer almaktadır. Bitkinin 2n = 20 kromozomdan oluşan diploid bir genom yapısına sahip olması ve nadir görülen XX/XY cinsiyet kromozomu sistemi taşıması, genetik ve sitogenetik araştırmalar açısından eşsiz bir model sunmaktadır. Özellikle moleküler sitogenetik yöntemler (DAPI, C-banding, FISH-CS1, FISH-CS237) ve erkek özgül moleküler markerlar (MADC2, SCAR323), kenevirde cinsiyet kromozomlarının ve cinsiyet belirleme mekanizmalarının aydınlatılmasında önemli rol oynamıştır. Bu çalışmalar, erken dönemde cinsiyet tayini, cinsiyet kromozomlarının haritalanması, epigenetik regülasyonun anlaşılması ve genetik ıslah programlarına katkı sağlanması açısından doğrudan uygulama potansiyeline sahiptir .

Gelecekte, kenevir genom araştırmalarının; Y kromozomunun tam dizilenmesi, pseudo-otozomal bölgelerin karakterizasyonu, sentromer ve telomer bölgelerinin incelenmesi, epigenetik düzenleyicilerin işlevsel analizi ve genomik seleksiyon tabanlı ıslah stratejileri gibi öncü konulara odaklanması beklenmektedir. Bu çalışmalar, hem temel bilimde yeni bilgiler

üretilmesine, hem de yüksek verimli, hedefe yönelik ve homojen kenevir çeşitlerinin geliştirilmesine katkı sağlayacaktır .

Özetle, kenevir genomuna yönelik multidisipliner yaklaşımlar; genetik, moleküler biyoloji, sitogenetik, epigenetik ve genomik ıslah alanlarını birleştirerek, bitkinin potansiyelini hem bilimsel hem de endüstriyel düzeyde maksimuma çıkaracak stratejik bir temel oluşturmaktadır.

ABSTRACT

Drought is a global threat that results in increasingly destructive consequences due to global warming, possessing all living organisms. It leads to losses in water sources and in especially agricultural production. Due to its location in Mediterranean climate zone and varying climatic conditions across the region, Türkiye is one of the most dramatically impacted countries by drought stress. Strawberry is the most commercially produced and consumed berry in *Rosaceae* family owing to its rich nutrient value and high adaptation ability to grow various regions. Besides fresh fruit, it can be consumed by humans as processed products such as jam, jelly, beverage, yogurt. It has a significant market value in terms of imports and exports. Also, our country ranks 5th among strawberry producer countries in the world. But, strawberries are excessively sensitive to water deficit conditions on account of some morphological characteristics such as root system, leaf area, fruit texture etc. Depending on plant developmental stages, duration time and severity of stress, water deficiency could significantly reduce strawberry production and fruit quality and lead to even plant death. Even though there are some solutions such as efficient management of water sources, changing cultural practices etc., it is needed to find effectual solutions such as determination of drought tolerance existing cultivars and enhancement of new drought tolerant strawberry cultivars. For this purpose, it is requisite to understand the impact of drought stress on plants and plant responses to drought such as physiological response. In this review, various physiological responses of strawberries on water deficit condition will be discussed. Understanding those plant responses could provide valuable sights for drought tolerant strawberry cultivar enhancement. This study is supported by Çukurova University BAP Coordination Office within the scope of project number FDK-2023-15809.

Keywords: Strawberry, Drought, Stress, Physiological responses

ÇİLEK BİTKİLERİNİN KURAKLIK STRESİNE KARŞI FİZYOLOJİK TEPKİLERİ

ÖZET

Kuraklık, küresel ısınma nedeniyle giderek daha yıkıcı sonuçlara yol açan, tüm canlı organizmaları etkileyen küresel bir tehdittir. Su kaynaklarında ve özellikle tarımsal üretimde kayıplara yol açar. Türkiye, Akdeniz iklim kuşağında yer alması ve bölge genelinde iklim koşullarının değişmesi sebebiyle kuraklık stresinden en çok etkilenen ülkelerden biridir. Çilek, zengin besin değeri ve yüksek adaptasyon yeteneği nedeniyle Gülgiller familyasında en çok üretilen ve tüketilen meyvedir. Taze meyvenin yanı sıra reçel, jöle, içecek, yoğurt gibi işlenmiş ürünler olarak da insanlar tarafından tüketilebilir. İthalat ve ihracat açısından önemli bir pazar değerine sahiptir. Ayrıca, ülkemiz Dünyada çilek üreticisi ülkeler arasında 5. sırada yer almaktadır. Ancak çileğin kök sistemi, yaprak alanı, meyve dokusu vb. bazı morfolojik özellikleri nedeniyle su eksikliği koşullarında aşırı duyarlı olduğu belirlenmiştir. Bitkinin gelişim evrelerine, stresin süresine ve şiddetine bağlı olarak su eksikliği çilek üretimini ve meyve kalitesini önemli ölçüde azaltmakta ve hatta bitki ölümü bile neden olabilmektedir. Su kaynaklarının etkin yönetimi, kültürel uygulamaların değiştirilmesi vb. bazı çözümler olsa da, mevcut çeşitlerin kuraklığa dayanıklılığının belirlenmesi ve yeni kuraklığa toleranslı çilek çeşitlerinin geliştirilmesi gibi etkili çözümler bulmak gereklidir. Bu amaçla, kuraklık stresinin bitkiler üzerindeki etkisini ve bitkilerin kuraklığa karşı fizyolojik tepkilerini anlamak gerekir. Bu derlemede, çileklerin su eksikliği durumundaki çeşitli fizyolojik tepkileri tartışılacaktır. Bu bitki tepkilerinin anlaşılması, kuraklığa dayanıklı çilek çeşidinin geliştirilmesi için değerli bakış açıları sağlayabilir. Bu çalışma, Çukurova Üniversitesi BAP Koordinatörlüğü FDK-2023-15809 nolu proje kapsamında desteklenmektedir.

1. INTRODUCTION

Global climate change is among the most critical global issues impacting all organisms in the world due to its increasingly severe impact. As for, drought is one of the most devastating consequences of global climate change, which has restrictive impacts on the environment, agriculture, economic, social, and humanitarian. Rapid depletion of water sources restricts agricultural productivity and livestock activities, leading to crop yield and economic losses. Also, it limits biodiversity and species in flora and fauna. Regarding humankind, water deficiency directly is limiting access to food and to clean water, forcing people to migrate. In addition, it is expected that the world population will exceed 12 billion to 2100, which will make difficult to feed their growing populations for counties (Dockterman, 2014). To overcome these problems, all countries need to consider the impacts and future risks of climate change, adaptation and mitigation options.

The cultivated strawberry knows as *Fragaria* × *ananassa* Duch. is one of the most commercially produced berries, having a unique taste, flavor and attractive color. It has high essential nutrient value, such as vitamin C and Calcium (Ca), and is rich in phenolic compounds beneficial to human health. Besides fresh fruit, it can be consumed as processed products such as jam, jelly, beverage, and yogurt (Kafkas, 2016). Due to its high nutrient content and high market value, it is the most commercially produced and consumed berry, accounting for approximately 10.5 M tons from more than 400 ha area in the world (FAO, 2023). China, United States of America, Mexico, Spain and Türkiye are main strawberry producers, respectively. In our country, strawberry production is possible at altitudes from sea level up to 2000 m which providing us advantage both in terms of import and export activities (Aslantaş and Karakurt, 2007). Mediterranean, Aegean and Marmara regions are prominent strawberry producing regions.

Rising the severity of drought in recent years has negatively affected the regions where strawberry production is intensive worldwide (Figure 1.1) (Ariza et al.,2021). Türkiye possesses a wide range of different climatic zones and microclimate areas in terms of its geographical location and climate characteristics which provides cultivation of different agricultural products (Kapluhan, 2013). However, factors such as environmental and soil pollution, excessive use of groundwater, insufficient management of water resources, and excessive application of fertilizers and pesticides are among the main factors that accelerate drought and desertification processes in our country. Some experts state that alteration of climate structure and precipitation regime are results of global climate change, combined with these incorrect practices and behaviors mentioned, will bring about serious restrictions on agricultural production and economic losses in future (Özüpekçe, 2021).

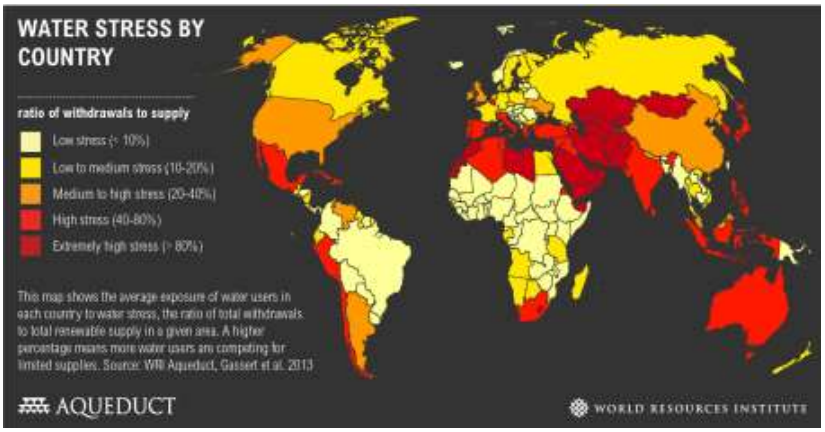

Figure 1. 1. World water stress map (Source: World Resources Institute)

As known, plants have been under pressure from some stress factors that negatively affect their growth and development. Drought is one of the most important abiotic stress factors affecting the growth, development and survival of plants caused by global climate change and cause ecological and economic losses (Akbaş, 2014). According to United Nations Convention to Combat Desertification (UNCCD, 1997), drought is termed as a natural event that causes land and water resources to be adversely affected and the hydrological balance to be disrupted due to precipitation falling significantly below normal levels. As agricultural drought is the consequence of the synergistic effect of meteorological, hydrological, and agricultural factors and defined as the lack of sufficient water in the soil to meet plant requirements. Cultivated strawberries are extremely sensitive to water deficit conditions since their wide leaf area, superficial root systems, and juicy fruit texture. It has been established that water deficiency could cause a decline in plant growth, fruit/crop quality and yield up to 70%, and eventually plant death (Boyer, 1982; Wandel et al., 2016). Depending on plant species, their growth stages, severity and duration of stress, exposure time and combination with other stress factors, it injures plants at various stages of development and undermines cellular activities (Du et al., 2020). It is known that water deficiency during especially flowering and fruit ripening stages in strawberry have limited its fruit size, quality and yield (GinÃ© Bordonaba and Terry, 2008).

Drought stress brings about a range of changes on plants such morphological, physiological, biochemical, and molecular changes. Leaves are the main indicator of drought stress. Insufficient water content inhibits plant growth and development such as decreases the leaf area, number and shoot length (Zhang et al., 2024). Water deficiency initially perceives from roots which triggers them extension deeper since decrease in turgor pressure in plants cells (Seleiman et al., 2021). This stress causes ABA (abscisic acid) synthesis in roots and ABA transportation to aerial parts of plants via xylem to protect plants against water losses. ABA accumulation in guard cells leads to stomatal closure (Brunetti et al., 2019). Hampering gas influx-exflux for plants due to closure reduces plant transpiration and photosynthesis. Low CO_2 and high O_2 levels in plant cells increases photorespiration (Mozafari et al., 2019) and enzyme

activity which disrupts the light and dark reactions. Drought stress also stimulation extensive production and accumulation of reactive oxygen species (ROS).

Their accumulation leads to losses in fruit production, its quality and yield losses and eventually plant death (Hossain et al., 2015; Dar et al., 2017; Gholami and Zahedi, 2019). Plants also synthesize some osmolytes and osmo-protectants which are secondary indicators of drought stress such as glycine betaine and proline. It is also inevitable that some gene expressions are responsible for drought stress such as transcription factors, some proteins (Heat shock (HSPs) proteins etc. (Yang et al., 2021).

Drought stress is one of the most detrimental abiotic stress factors affecting strawberry production, which is still to be well-characterized. It is requisite to determine the effect of drought stress on strawberries at blooming and fruit ripening stages and their responses. This review could be beneficial to understand the physiological responses of strawberries against water deficiency and to improve and enhance new drought tolerant strawberry cultivars in breeding studies.

1.1. Plant Drought Strategies

Drought stress disturbs plant structural and metabolic activities, delays plant growth and development, damages photosynthetic activity, disturbs protein synthesis and even plant death. However, plants show some response mechanisms to cope with stress factors (Figure 1.2). Their responses to drought stress depend on duration and severity of stress, genetic background of plants to be exposed to stress and their developmental stages. In strawberry, flowering and fruit ripening stages are critical stages in terms of exposing drought stress. However, stress factors could trigger the plant to adapt to adverse conditions. It is stated that severe stress causes irreversible distribution on plant physiology and even plant death while mild stress induces the defense mechanism of plants such as root extension deeper into soils, stomatal closure, accumulation of osmo-protectant etc. (Bandurska, 2022). Plants evolutionary have enhanced three basic strategies against drought stress: escape, avoidance and tolerance.

Escaping strategy from the drought stress allows the plant to adjust and shorten its life cycle to the appropriate time. Early flowering is a common escaping strategy for plants which inhibits plant growing period and but leads to production losses (Vassileva et al., 2023). Drought avoidance strategy is a plant adaptation that enhances water use efficiency (WUE) under dry conditions. This strategy can be focused on two main mechanisms: maximizing water uptake by the plant root system (water spender) and minimizing water loss from the shoot parts (water saver) (Basu et al., 2016; Delfin et al., 2021). But WUE depends on plant species and the duration and severity of drought. It is stated that plants having higher WUE is generally related to increased yields under water deficit condition (Hatfield and Dold, 2019). Water saver plants tend to limit water loss via maintaining metabolic activity at low stages such as stomatal closure, decreasing transpiration and photosynthesis rates or via morphological adjustments such as developing thicker cuticles, increased wax deposition, decreasing leaf area, radiation absorption and curling the leaf (Kim et al., 2007). In contrast, water spenders plants tend to increase root proliferation at depth especially deeper tap root to maintain water uptake and enhance hydraulic conductance (Mori et al., 2011; Caine et al., 2019). Although drought avoidance strategies could

be effective for plant water saving, it may lead to limited vegetative growth which reduces crop productivity. Drought tolerance is another mechanism that allows plants to produce and reproduce their economic product with minimum loss under water deficit environment. During this process, plants protect their cells by synthesizing protective substances such as osmolyte or osmo-protectants and overexpression of some drought-responsive genes and elements, transcription factors and some proteins against osmotic and ionic stress (Yang et al., 2021). Those plants also repair the damage that occurs when the stress ends.

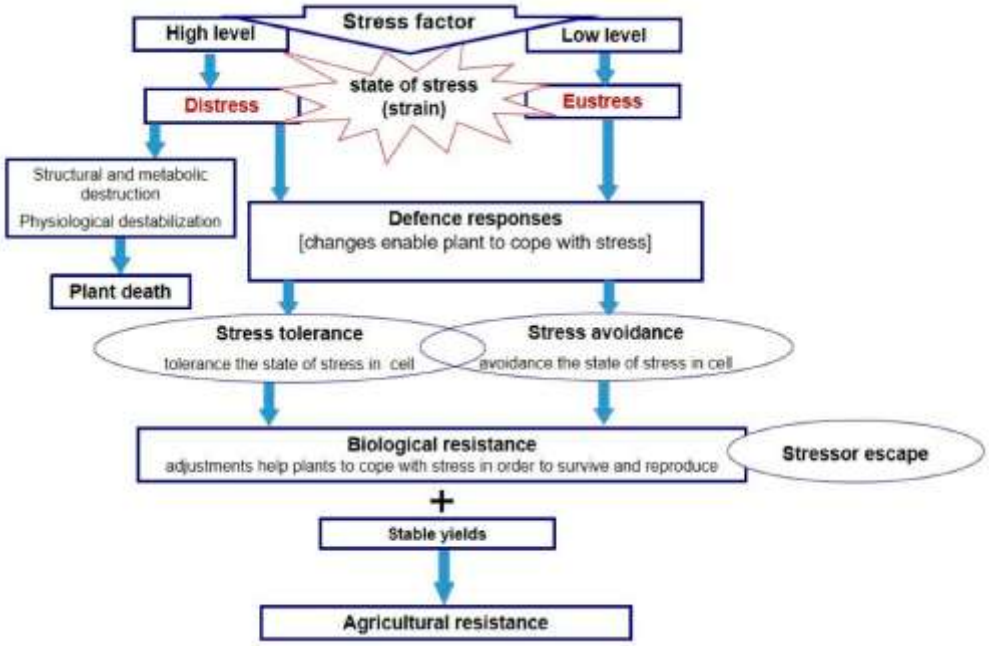

Figure 1.2. Plant responses mechanism to drought stress, escape, avoidance and tolerance (Bandurska, 2022).

1.2. Physiological Responses of Strawberry Plants Against Drought Stress

Drought stress is a multifaceted stress factor inhibits plant physiology and metabolic activity and further fruit quality and yield (Bhargava and Sawant, 2013). Strawberries are vulnerable to drought stress due to their morphological characteristics. Water deficiency is one of the main factors limiting growth, stomatal conductance and net photosynthesis in strawberry plants (Dehghanipoodeh et al., 2018). Limiting gas exchange between the plant and the environment due to stomatal closure cause stomatal conductivity, net photosynthesis and respiration to decrease in strawberry cultivars “Earlibrite, California and Sweet Charlie” (Ibrahim et al., 2022). High O_2 levels in the chloroplast promotes Rubisco oxygenase activity, increasing photorespiration. This energy-consuming process reduces photosynthetic efficiency and leads to carbon loss, further affecting plant growth.

Several studies showed that decline in relative water content (RWC), leaf water potential and osmotic potential are the main key indicators of drought stress. Ibrahim et al. (2022) determined that decrease in plant growth, transpiration rate, net photosynthesis, stomatal conductance and

relative water content depending on different strawberry cultivars under water deficit condition. It is also stated that total chlorophyll content and leaf water potential decreased when limited irrigation regime for strawberry cultivar "Camarosa" (Ödemiş et al., 2020). Accumulation of ABA induces higher amount of ROS production which causes oxidative stress in plant cell. Their accumulation disrupts cell membrane stability due to lipid peroxidation which enhances the electrolyte leakage (Zahedi et al., 2023). Quantum efficiency of photochemistry (Fv/Fm) is one of the most frequently used methods to measure amount of light absorbed by the chlorophyll which allows to accurate prediction on severity of stress via measuring the maximum photosystem II (PSII) quantum efficiency value (Arief et al., 2023). Conversely, it is considered that the increase in leaf canopy temperature of strawberries under drought stress due to stomatal closure thereby limiting gas exchange (Ödemiş et al., 2020). As mentioned above, plants also possess the drought stress tolerance mechanisms allowing them to produce their economic product with minimum loss. Several studies on strawberries have proved that tolerant cultivars have developed mechanisms to increase their water use efficiency (WUE) (Klamkowski and Treder, 2008; Ghaderi and Siosemardeh, 2011; Zahedi et al., 2020).

2. CONCLUSION

Drought stress is one of the most important stress factors that inhibit agricultural production and cause dramatic losses. Depending on plant species and their developmental stages, stress duration time and severity, drought stress limits vegetative growth, disrupts plant physiological and metabolic activities. Impact of drought stress on plant is like cascade containing the series of changes on plant starting with perceiving water deficiency by root ending up tolerance to stress or plant death. Even though efficient water sources management and better cultural practices is effective for agricultural production under water deficit conditions, determination of drought tolerant cultivars among current ones and enhancement of new tolerant ones could give better and accurate solutions. Integration of marker assistant selection (MAS), Quantitative trait locus (QTL) analysis, genetic engineering, genome editing technologies into traditional breeding to determine drought tolerant plants or their improvement would be beneficial for future of humankind against food scarcity and sustainable for agricultural production against global climate change.

3. ACKNOWLEDGEMENTS

The authors thanked to Çukurova University (Project no: FDK-2023-15809) to provide us financial support for strawberry drought stress studies.

ABSTRACT

This study was conducted to determine the effects of Lactobacillus plantarum (MF098786) strains isolated from homemade traditional pickles on the quality characteristics, microbiological structure and aerobic stability of barley straw (Hordeum vulgare) silages. In the study, three different L. plantarum strains were used in the experimental groups together with the control group (K): LP106 (LAB6), LP108 (LAB8) and LP109 (LAB9). Barley plants were harvested at the dough stage, chopped into 2,5-3,5 cm pieces, filled into 2 kg vacuum bags for each group and the bags were left to ferment for 90 days. After the fermentation period, chemical (pH, crude protein, ADF, NDF, etc.), physical (color, temperature, structure) and microbiological (lactic acid bacteria, yeast and mold counts) analyses were performed on the samples taken from the silages. In addition, microbiological evaluations were made after the aerobic stability process. According to the findings, pH values of 4.88 and 4.92 in LAB6 and LAB8 groups, respectively, indicated that fermentation was more effective and silage was preserved in a more acidic environment. Low pH prevented the growth of undesirable microorganisms, reduced nutrient loss and increased aerobic stability. Crude protein content in LAB6 group (9.90%) was higher than the control group (8.80%). Post-aerobic stability evaluations revealed significantly lower yeast counts and reduced CO_2 production in LAB6 and LAB9 groups, indicating enhanced shelf life and microbial quality. LAB6, in particular, produced the most favorable outcomes across all parameters. In conclusion, inoculation with *L. plantarum*, especially strain LAB6, significantly enhanced the fermentation quality, nutrient preservation, and aerobic stability of barley silage. The use of LAB6 as a microbial inoculant is therefore recommended as an effective biotechnological strategy for improving silage production under modern livestock feeding systems. In addition, the decrease in ADF and NDF contents indicates that digestibility increased. In the analysis after aerobic stability, it was observed that yeast counts decreased significantly and CO_2 production was reduced in LAB6

and LAB9 groups. These results reveal that the shelf life and microbiological quality of silage improved. Especially LAB6 strain gave the most favorable results in all parameters. In conclusion, the use of L. plantarum, especially LAB6 strain, as an inoculant is recommended as an effective biotechnological approach to improve fermentation quality, preserve nutritional values and improve aerobic stability in barley silages.

Keywords: Silage Fermentation, Aerobic Stability, Silage Quality, *Lactobacillus plantarum*

Lactobacillus plantarum'un ARPA HASILI SİLAJINDA MİKROBİYEL İNOKÜLANT OLARAK KULLANILMA OLANAKLARI

ÖZET

Bu çalışma, ev yapımı geleneksel turşulardan izole edilen *Lactobacillus plantarum* (MF098786) suşlarının arpa hasılı (*Hordeum vulgare*) silajlarının kalite özellikleri, mikrobiyolojik yapısı ve aerobik stabilitesi üzerindeki etkilerini belirlemek amacıyla yürütülmüştür. Araştırmada, kontrol grubu (K) ile birlikte üç farklı *L. plantarum* suşunun kullanıldığı deney grupları oluşturulmuştur: $LP10^6$ (LAB6), $LP10^8$ (LAB8) ve $LP10^9$ (LAB9). Arpa bitkisi, hamur olum döneminde hasat edilip 2,5–3,5 cm boyutlarında doğranarak, her grup için 2 kg'lık vakumlu torbalara doldurulmuş ve torbalar 90 gün boyunca fermentasyona bırakılmıştır. Fermentasyon süresinin ardından silajlardan alınan örnekler üzerinde kimyasal (pH, ham protein, ADF, NDF vb.), fiziksel (renk, sıcaklık, yapı) ve mikrobiyolojik (laktik asit bakteri, maya ve küf sayıları) analizler gerçekleştirilmiştir. Ayrıca, aerobik stabilite süreci sonrasında mikrobiyolojik değerlendirmeler yapılmıştır. Elde edilen bulgulara göre, LAB6 ve LAB8 gruplarında pH değerlerinin sırasıyla 4.88 ve 4.92 olması, fermentasyonun daha etkili gerçekleştiğini ve silajın daha asidik ortamda muhafaza edildiğini göstermiştir. Düşük pH, istenmeyen mikroorganizmaların gelişimini engelleyerek besin maddesi kaybını azaltmış ve aerobik stabiliteyi artırmıştır. LAB6 grubunda ham protein oranı (%9,90), kontrol grubuna (%8,80) göre daha yüksek bulunmuştur. Ayrıca ADF ve NDF içeriklerindeki azalma, sindirilebilirliğin arttığını göstermektedir. Aerobik stabilite sonrası yapılan analizlerde, LAB6 ve LAB9 gruplarında maya sayılarının belirgin şekilde azaldığı ve CO_2 üretiminin düşürüldüğü gözlemlenmiştir. Bu sonuçlar, silajın raf ömrünün ve mikrobiyolojik kalitesinin iyileştiğini ortaya koymaktadır. Özellikle LAB6 suşu, tüm parametrelerde en olumlu sonuçları vermiştir. Sonuç olarak, *L. plantarum*'un özellikle LAB6 suşunun inokülant olarak kullanımı, arpa silajlarında fermentasyon kalitesini artırmak, besin değerlerini korumak ve aerobik stabiliteyi geliştirmek açısından etkili bir biyoteknolojik yaklaşım olarak önerilmektedir.

Anahtar Kelimeler: Silaj Fermantasyonu, Aerobik Stabilite, Silaj Kalitesi, *Lactobacillius Plantarum*

1. GİRİŞ

Küresel ısınma, iklim değişikliği, artan yem maliyetleri ve azalan tarımsal kaynaklar, daha sürdürülebilir hayvancılık üretim sistemlerine olan ihtiyacı artırmıştır (FAO, 2021). Sera gazı emisyonlarının önemli bir kısmından sorumlu olan hayvancılık sektörü, yem verimliliğini optimize etme ve çevresel etkileri azaltma konusunda artan bir baskı altındadır (Gerber ve ark., 2013). Bu bağlamda, özellikle çeşitli agroekolojik koşullara uyum sağlayabilen ve kuraklıkla ilişkili riskleri azaltmak amacıyla erken hasat edilebilen arpa (Hordeum vulgare) gibi yem bitkileri için etkili silaj tekniklerinin uygulanması, otların korunmasında umut vadeden bir strateji olarak öne çıkmaktadır (Sleugh ve ark., 2000).

Yem bitkilerini silaj yapma, yıl boyu yem teminini sağlamak için yaygın olarak benimsenmiş bir yöntemdir. Ancak, kötü fermantasyon kalitesi ve aerobik stabilite, silajların besin değerini ve güvenliğini tehlikeye atmaktadır (Muck, 2010). Mikrobiyal inokülantların, özellikle *Lactobacillus plantarum* gibi homofermentatif laktik asit bakterilerinin kullanılması, pH'ı hızla düşürerek ve istenmeyen mikrobiyal büyümeyi baskılayarak silaj korumasını iyileştirmek için dikkat çekici bir yöntem olmuştur (Kung ve ark., 2018). Bu, yalnızca silaj kalitesini ve raf ömrünü iyileştirmekle kalmaz, aynı zamanda yem israfını azaltmaya da katkı sağlar. Bu da hayvan beslenmesinin sürdürülebilirlik önemli bir bileşenidir.

Lactobacillus plantarum, özellikle farklı silaj türlerinde adaptasyon kabiliyeti ve etkinliği ile dikkat çeken, bir fakültatif homofermentatif Laktik asit bakterisi (LAB) türüdür. Fermantasyon sırasında mikrobiyal ekosistemde baskın olma yeteneği, düzenli olarak laktik asit üretimini sağlar, bu da hem silajın stabilitesini hem de yapı özelliklerini iyileştirir (Kleinschmit ve Kung, 2006). Ayrıca, LAB suşlarını geleneksel ve bölgesel olarak uyarlanmış fermente gıdalardan örneğin ev yapımı turşulardan temin etmek, ticari inokülantlara düşük maliyetli bir alternatif sunar, bu da yerel dayanıklılığı ve döngüsel biyoteknoloji yaklaşımlarını artırır (Zheng ve ark., 2020).

İklim değişkenliği ve kaynak kıtlığı kısıtlamaları altında verimli yem yönetimi için artan talep göz önüne alındığında, bölgesel olarak temin edilen *L. plantarum* suşlarının arpa silajı üretiminde kullanılması, ruminant beslenmesinde daha büyük sürdürülebilirlik için geçerli bir yol sunabilir. Bu çalışma, ev yapımı turşulardan izole edilen *L. plantarum* suşlarının arpa yem silajının fermantasyon kalitesi, aerobik stabilitesi ve mikrobiyal gelişimi üzerindeki etkilerini değerlendirmeyi amaçlamaktadır.

2. MATERYAL VE METOT

Silaj materyali olarak kullanılan arpa bitkisi, Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü'ne ait araştırma alanından (Enlem: 39.1286°K, Boylam: 34.1078°D) temin edilmiştir. Arpa, hamur olum döneminde hasat edilmiş ve hasattan sonra 2,5–3,5 cm uzunluğunda olacak şekilde doğranmıştır. Doğrama işlemi tamamlandıktan sonra, 1000 g bitki materyali 2 kg'lık plastik torbalara konulmuş ve üzerine sırasıyla 1×10^6 kob/g, 1×10^8 kob/g ve 1×10^9 kob/g yoğunluklarında *Lactobacillus plantarum* laktik asit bakterisi püskürtülmüştür. Uygulama sonrası paketlerin içindeki hava, vakum cihazı yardımıyla boşaltılarak ortamdan uzaklaştırılmıştır. Çalışmada 4 farklı grup oluşturulmuş, her bir gruptan 4 tekrar olacak şekilde toplamda 32 silaj hazırlanmış ve laboratuvar koşullarında 18±2,5 °C sıcaklıkta, karanlık bir

ortamda 90 gün süreyle fermentasyona bırakılmıştır. Çalışma grupları: kontrol (K), Arpa hasılı + *L. Plantarum* 10^6 (LAB6), Arpa hasılı + *L. Plantarum* 10^8 (LAB8), Arpa hasılı + *L. plantarum* 10^9 (LAB9) olarak hazırlanmıştır. Silajlar hazırlandıktan sonra 90 gün süreyle fermentasyona bırakılmıştır. Belirtilen sürenin tamamlanmasının ardından, dört grup halinde ve her birinden üç paralel örnek alınarak; fiziksel analizler (sıcaklık, renk, pH), kimyasal (hava kuru madde, kuru madde, ham kül, ham yağ, ham protein, ham selüloz, ADF, NDF, suda çözünür karbonhidrat, aerobik stabilite), mikrobiyolojik (Laktik asit bakterisi, maya ve küf sayımı), ve istatistik analizleri yapılmıştır.

Silajların kuru madde (%KM), havada kuru madde (%HKM), ham protein (%HP), ham yağ içeriği (EE), ve ham kül (%HK) analizleri AOAC (1998) standart prosedürüne göre, AOCS (2005) protokolüne uygun olarak analiz edilmiştir. Ham selüloz (%HS), %ADF ve %NDF analizleri Van Soest ve (1991)'e göre ANKOM 200 Fiber Analyzer cihazı kullanılarak yapılmıştır. pH değerleri Chen ve ark. (1994); toplam çözülebilir madde (TÇM) içerikleri Singh ve ark. (2020)'de açıklandığı şekilde gerçekleştirilmiştir. Bu çalışmada silajların içerdiği laktik asit bakterisi, maya ve küf sayımı Seale ve ark. (1990) tarafından bildirilen yöntemler ile belirlenmiştir. Silajların TC (Total Carbonhydrate), NFE (Nitrogen Free Extract), NFC (Nitrogen Free Carbonhydrate) ile metabolize edilebilir enerji ve protein değerleri Filik (2020)'nin bildirdiği şekilde hesaplanmıştır. Silajların nispi yem değeri ve nispi yem kalitesi hesaplamaları ise Kılıç ve Abdiwali (2016) ve Filik (2020)'in bildirdiğine göre hesaplanmıştır. Çalışma sonucunda elde edilen bulguların istatiksel analizlerinde SAS (2001) paket programı kullanılmış olup, çalışmanın deneme modeline (tesadüf parselleri deneme planı) uygun olarak General Linear Model (PROC GLM) prosedürü ile varyans analizine tabi tutulup, deneme grupları arasındaki linear ilişkiler aynı paket programda ortogonal polinom kontrast uygulanarak belirlenmiştir. Duncan Çoklu Karşılaştırma Yöntemi kullanılarak gruplar arasındaki farkları çoklu karşılaştırmayla analiz edilmiştir (Genç ve Soysal, 2018)

3. BULGULAR VE TARTIŞMA

Tablo 1. Silajın fiziksel analiz sonuçları

Gruplar	Kontrol	LAB6	LAB8	LAB9
°C	23.03a±0.05	23.13a±0.27	23.10a±0.18	22.73a±0.05

C*	15.37a±0.95	16.04a±0.99	18.00a±2.24	17.20a±0.91

°C: Santigrat derece; **WSC**: Suda çözünebilir karbonhidrat (Brix derecesi 0- 25°); **L***: Açıklık; **a***: Kırmızılık; **b***: Sarılık; **ΔE***: Toplam renk farkı, **h**: hue aangle, **C***: Renk veya yoğunluk. ^{a,b,c} Aynı sütundaki ortak üst simge olmayan ortalamalar önemli ölçüde farklıdır ($p<0.01$). Kontrol: Arpa hasılı, LAB6: Arpa hasılı + L. Plantarum $1x10^6$, LAB8: Arpa hasılı + L. Plantarum $1x10^8$, LAB9: Arpa hasılı + L. plantarum $1x10^9$.

Tablo 1'de gösterildiği üzere, tüm gruplarda silaj paketlerinin açılmasının ardından yapılan pH değerleri 4,88 ile 6,00 arasında değişmiş, en düşük pH değeri LAB6 grubunda, en yüksek pH ise kontrol (K) grubunda ölçülmüştür. Bu durum, inokülant ilavesinin fermentasyon sırasında asitleşmeyi sağlamada daha başarılı olduğunu göstermektedir. Renk değerleri açısından bakıldığında, L*, a*, b*, ΔE* ve C* parametrelerinde anlamlı bir farklılık gözlenmemiştir. Ancak, LAB8 grubu en yüksek renk doygunluğu ve açıklığı değerlerini göstermiş, Kontrol grubunda ise diğer gruplara göre daha düşük renk farkı değerleri gözlenmiştir.

Tablo 2. Silajın yem kalitesi özellikleri

Gruplar	Kontrol	LAB6	LAB8	LAB9
SKM	$65.71^{c}\pm0.02$	$66.65^{a}\pm0.05$	$65.27^{d}\pm0.07$	$65.97^{b}\pm0.02$
KMI	$2.26^{a}\pm0.02$	$2.29^{a}\pm0.04$	$2.19^{a}\pm0.01$	$2.22^{a}\pm0.03$
TSB	$62.88^{a}\pm0.04$	$62.65^{b}\pm0.00$	$62.19^{c}\pm0.02$	$62.70^{b}\pm0.01$
NYD	$115.06^{ba}\pm1.04$	$117.96^{a}\pm2.39$	$110.84^{b}\pm0.46$	$113.24^{ba}\pm1.66$
NYK	$115.48^{a}\pm1.07$	$116.30^{a}\pm2.25$	$110.76^{a}\pm0.54$	$112.87^{a}\pm1.70$

Kontrol: Arpa hasılı, LAB6: Arpa hasılı + L. Plantarum $1x10^{6}$, LAB8: Arpa hasılı + L. Plantarum $1x10^{8}$, LAB9: Arpa hasılı + L. plantarum $1x10^{9}$, (%) kuru madde; **SKM**: Sindirilebilir kuru madde (%); **KMI**: Kuru madde alımı (Canlı ağırlık: LW, %); **TSB:** Toplam sindirilebilir besin maddesi(%); **NYD**: Nispi besleme değeri, **NYK**: Nispi hasıl kalitesi. ^{a,b,c} Aynı sütun içinde ortak üst simge içermeyen ortalamalar önemli ölçüde farklıdır, ($P<0.01$).

Gruplar arasında (Tablo 2), LAB6 ve LAB8 grupları, kontrol grubuna kıyasla daha yüksek SKM değerleri göstermiştir (sırasıyla %66,65 ve %65,27; kontrol %65,71). Daha yüksek SKM, daha iyi sindirilebilirlik anlamına gelir ve bu da yemler için arzu edilen bir özelliktir. Bu bulgular, daha iyi sindirilebilirliğin süt ineklerinde yem alımı ve süt verimiyle ilişkili olduğunu bildiren Oba ve Allen (1999) çalışmasıyla uyumludur. KMI değerleri gruplar arasında anlamlı farklılık göstermemiştir.

LAB6 ve LAB8 ayrıca daha yüksek TSB değerlerine vermiştir. LAB6 %62,65, LAB8 ise %62, 19, TSB ile kontrol grubunun (%62,88) üzerinde yer alarak besin değerinde iyileşme göstermiştir.

Tüm silajların NYD değerleri II. kalite yem (103-124) hesaplamalarına uygun olarak belirlenmiştir (Kılıç ve Abdiwalli, 2016). Silajların NYK değerleri, tüm silajların 18-24 aylık düvelerin ve kuru ineklerin beslenmesinde kullanılabilecek yemler (100-120) olduğu sonucuna varılmıştır (Filik, 2020). LAB6 grubu en yüksek NYD (117,96) ve NYK (116,30) değerlerini göstermiş, ardından LAB8 ve LAB9 gelmiştir. NYD ve NYK için P değerleri istatistiksel olarak anlamlı olmasa da ($P>0,05$) sayısal iyileşmeler, *Lactobacillus plantarum* ile inoküle edilen silajlarda kaba yem kalitesinin arttığını bildiren önceki çalışmalarla tutarlıdır (Kleinschmit ve Kung, 2006; Weinberg ve Muck, 1996).

Genel olarak LAB6 ve LAB8, arpa silajlarının sindirilebilirliğini ve enerji içeriğini artırmıştır;

Kontrol: Arpa hasılı, LAB6: Arpa hasılı + L. Plantarum 1x10^{6}, LAB8: Arpa hasılı + L. Plantarum 1x10^{8}, LAB9: Arpa hasılı + L. plantarum 1x10^{9}, g/kg hammadde, (%) kuru madde, **ADFom**=ADF kül, **NDFom,** NDF kül; **HKM**: Havada kuru madde (g/kg); **OM**: Organik Madde (%); **HK**: Ham Kül (%); **HP**: Ham Protein (%); **HY**: Ham Yağ (%); **HS**: Ham Selüloz (%); **ADF**: Asit Deterjan Lifi (%), **NDF**: Nötral Deterjan Lifi (%). [a,b,c,d] Veriler her bir muamelenin dört uygulamasının ortalamasını temsil etmektedir; aynı sütun içinde ortak üst simge içermeyen ortalamalar farklıdır (P<0.01).

Farklı *Lactobacillus plantarum* suşları ile muamele edilen arpa hasılı silajının besin kompozisyonuna ilişkin sonuçlar Tablo 3'te gösterilmiştir. Uygulama grupları arasında Kuru madde (KM) ve Organik madde (OM) içeriğinde önemli bir farklılık gözlenmezken (P>0,005), ham protein, ham lif ve ham yağ değerlerinde değişiklikler tespit edilmiştir.

Ham protein (HP) içeriği LAB8 (%12,90) ve LAB9 (%13,37) gruplarında kontrol grubuna (%13,58) kıyasla önemli ölçüde artmıştır (P<0,001); bu durum, inokülantların silolama sırasında proteolizi sınırlandırarak daha fazla azotlu bileşiği koruyabildiğini bildiren Oliveira ve arkadaşlarının (2017) bulgularıyla uyumludur. Benzer şekilde, Liu ve arkadaşları (2021) tarafından *L. plantarum* ile muamele edilen arpa hasılı silajlarında, düşük pH sayesinde protein parçalanmasının yavaşladığı gözlenmiştir. Ayrıca, ham selüloz, ADF ve NDF analizlerinde gözlenen azalma, sindirilebilirliğin arttığını ortaya koymakta olup, bu durum Oba ve Allen (1999) tarafından bildirilen bulgularla da tutarlıdır. Özellikle LAB6 uygulaması, gruplar arasında en iyi sindirilebilirlik profilini sunmuştur.

Ham selüloz (HS), Asit Deterjan fiber (ADF) ve Nötr Deterjan fiber (NDF) değerleri LAB6 ve LAB8 gruplarında önemli ölçüde azalmıştır, bu da selüloz sindirilebilirliğinin arttığını göstermektedir. En düşük NDF (%52,58) ve ADF (%28,87) değerlerine sahip LAB6, yem sindirilebilirliği açısından.

Buna karşılık, ham yağ (HY) içeriği, en düşük değer LAB6'da (%4,74) gözlenirken (P>0,005), aşılanan tüm gruplarda kontrole kıyasla hafifçe azalmıştır. Bu durum, Muck (2010) tarafından tartışıldığı gibi, fermantasyon sırasında bazı lipid bileşenlerinin mikrobiyal kullanımına bağlanabilir.

Bu sonuçlar, *L. plantarum'un*, özellikle LAB6 ve LAB8 suşlarının, proteinleri koruyarak ve ruminant yem verimliliği için kritik olan sindirilemeyen lifi azaltarak silajın beslenme kalitesini iyileştirebileceğini göstermektedir.

Tablo 4. Silajın enerji değerleri

Gruplar	Kontrol	LAB6	LAB8	LAB9
NFE	$50.99^{c}\pm0.04$	$52.32^{a}\pm0.02$	$51.50^{b}\pm0.17$	$51.71^{b}\pm0.09$
NFC[1]	$21.46^{a}\pm0.45$	$22.38^{a}\pm1.05$	$20.15^{a}\pm0.25$	$20.57^{a}\pm0.76$
TK[1]	$74.59^{c}\pm0.01$	$74.96^{a}\pm0.02$	$74.93^{a}\pm0.02$	$74.78^{b}\pm0.04$
SE	$2.77^{a}\pm0.00$	$2.76^{b}\pm0.00$	$2.74^{c}\pm0.00$	$2.76^{b}\pm0.00$
ME	$2.27^{a}\pm0.00$	$2.27^{a}\pm0.00$	$2.25^{b}\pm0.00$	$2.27^{a}\pm0.00$
NE_L	$1.42^{a}\pm0.00$	$1.42^{a}\pm0.01$	$1.40^{b}\pm0.00$	$1.42^{a}\pm0.00$
NE_M	$1.41^{a}\pm0.01$	$1.40^{a}\pm0.00$	$1.38^{b}\pm0.00$	$1.40^{a}\pm0.00$
NE_G	$0.82^{a}\pm0.00$	$0.82^{a}\pm0.00$	$0.80^{b}\pm0.00$	$0.82^{a}\pm0.00$

NFE: Azotsuz ekstrat (g/kg); **NFC**: Lifsiz karbonhidratlar (g/kg), **TK**: Toplam Karbonhidrat (g/kg), **SE**: Sindirilebilir enerji(Mcal/kg); **ME**: Metabolik enerji (ME Mcal/kg), **NE_L**: Net enerji laktasyon (Mcal/kg), **NE_M**: Net enerji metabolizması (Mcal/kg), **NE_G**: canlı ağırlık artışı (Mcal/kg). ^{a,b,c} Aynı sütundaki ortak üst simge olmayan ortalamalar önemli ölçüde farklıdır ($P<0.01$).

Lactobacillus plantarum inokülasyonunun arpa hasılı silajlarının enerjiyle ilişkili parametreleri üzerindeki etkilerini Tablo 3'te özetlenmektedir. Bu parametreler arasında azotsuz ekstrakt (NFE), lifsiz karbonhidratlar (NFC), toplam karbonhidratlar (TK), sindirilebilir enerji (SE), metabolik enerji (ME) ve net enerji değerleri (NEL, NEM, NEG) yer almaktadır.

LAB6, %52,32 ile en yüksek NFE içeriğini göstermiş ve bu değer, kontrol grubuna göre (%50,99) daha yüksek bulunmuştur. Bu artış, karbonhidrat fermentasyonunun ve enerji veriminin iyileştiğini göstermektedir. Benzer bir durum NFC ve TK değerlerinde de gözlemlenmiş olup, LAB6 sırasıyla 22,38 g/kg ve 74,96 g/kg ile kontrol grubunun üzerinde değerler vermiştir. ($P<0,01$).

Sindirilebilir enerji (SE) ve metabolik enerji (ME) değerleri de LAB6 ve LAB8 gruplarında anlamlı bir farklılık gözlenmemiştir.

Lactobacillus plantarum, özellikle LAB6 suşu, muhtemelen fermantasyon verimliliğini artırarak ve yapısal olmayan karbonhidratları koruyarak arpa hasılı silajının enerji profilini iyileştirmektedir.

Tablo 5. Silajın açılma zamanındaki mikroorganizma sayım sonuçları

Gruplar	Kontrol	LAB6	LAB8	LAB9
Laktik Asit Bakterisi (Log10^5 kob/g)	-	-	3.0±0.00	-
Maya (Log 10^5 kob/g)	1.0^a±0.00	1.0^a±0.00	1.0^a±0.00	-

Kontrol: Arpa hasılı, LAB6: Arpa hasılı + L. Plantarum 1x10^6, LAB8: Arpa hasılı + L. Plantarum 1x10^8, LAB9: Arpa hasılı + L. plantarum 1x10^9, ^{a,b,c} *Aynı sütundaki ortak üst simge olmayan ortalamalar önemli ölçüde farklıdır (P<0.01).*.

Tablo 6: Silajın aerobik stabilite sonrası pH_2, CO_2 değerleri ve mikroorganizma sayıları

Gruplar	Kontrol	LAB6	LAB8	LAB9
pH_2	5.97^a±0.08	5.14^b±0.16	5.02^b±0.08	5.00^b±0.11
CO_2	19.24^a±3.78	5.60^{b}a±1.83	3.40^b±0.13	15.65^{ba}±5.72
Aerobik stabilite sonrası Küf	-	1.00±-	-	-
Aerobik stabilite sonrası Maya (Log 10^5 kob/g)	64.67^a±2.67	12.0^b±0.00	55. 33^a±10.73--	17.33^b±5.20

Kontrol: Arpa hasılı, **LAB6**: Arpa hasılı + L. Plantarum 1x10^6, **LAB8**: Arpa hasılı + L. Plantarum 1x10^8, **LAB9**: Arpa hasılı + L. plantarum 1x10^9 **CO_2:** Karbondioksit miktarı, **pH_2**: Aerobik stabilite sonrası pH**, Maya:** Aerobik stabilite öncesi toplam maya.

Lactobacillus plantarum inokülasyonunun arpa hasılı silajlarının mikrobiyal sayımları ve aerobik stabilitesi üzerindeki etkilerini Tablo 5'de göstermektedir. Değerlendirilen parametreler arasında silaj açımında ve aerobik stabilite analizi sonrası pH, karbondioksit üretimi ve maya/küf gelişimi yer almaktadır. Aerobik stabilite sonrası pH değerleri, LAB ile muamele edilen gruplarda kontrol grubuna kıyasla anlamlı şekilde daha düşük bulunmuştur (Kontrol: 5,97^a; LAB6: 5,14^b; LAB8: 5,02^b; LAB9: 5,00^b). pH'nın düşmesiyle ortamda mikrobiyal gelişimin baskılandığı ve kontrol grubuna göre besin maddelerinin korunduğu anlamına gelmektedir.

Aerobik mikrobiyal solunumun bir göstergesi olan karbondioksit (CO_2) seviyeleri kontrol grubunda en yüksek düzeyde ölçülmüştür (19,24) ve LAB6 (5,60) ile LAB8 (3,40) gruplarında anlamlı şekilde azalmıştır. En düşük CO_2 üretimi LAB8 grubunda görülmüş, bu da aerobik mikrobiyal aktivitenin güçlü bir şekilde baskılandığını göstermektedir. Böylece, aerobik stabilite sonrası maya sayılarındaki düşüşle de paralellik göstermektedir: LAB6 (12,0 log kob/g) ve LAB9 (17,33) gruplarında kontrol grubuna (64,67 log kob/g; P<0,001) göre belirgin şekilde daha düşük maya sayıları kaydedilmiştir.

Aerobik stabilite sonrası sadece LAB6 grubunda küf sayısı tespit edilmiş olup, oldukça düşük bir düzeyde kalmıştır (1,00 log kob/g). Bu durum, tüm LAB uygulamalarında küf gelişiminin oldukça iyi baskılandığını göstermektedir.

Tablo 6'da görüldüğü üzere, LAB6 ve LAB9 grupları aerobik stabilite sonrası maya sayısını anlamlı derecede düşürmüş (sırasıyla 12,0 ve 17,33 log kob/g) ve CO_2 üretimini azaltmıştır. Bu da mikrobiyal bozulmanın azaldığını ve raf ömrünün uzadığını göstermektedir (Kleinschmit ve Kung, 2006; Muck, 2010). Ayrıca, LAB8 grubundaki laktik asit bakteri sayısı 3,0 log kob/g olarak belirlenmiş böylece inokülantın silaj ortamında başarılı şekilde çoğaldığını ve baskın hale geldiğini göstermektedir.

Bu sonuçlar, Weinberg ve Muck (1996) ve Oude Elferink ve ark. (2001) tarafından bildirilen bulgularla uyumludur. Söz konusu çalışmalarda, laktik asit bakterisi inokülasyonunun yalnızca fermentasyonu iyileştirmekle kalmayıp, maya ve küf gibi bozulma yapan organizmaların gelişimini sınırlayarak aerobik stabiliteyi de artırdığı ifade edilmiştir.

5. SONUÇ

Bu çalışmada, ev yapımı turşulardan izole edilen *Lactobacillus plantarum* suşlarının ($LP10^6$-LAB6, $LP10^8$- LAB8, $LP10^9$- LAB9), arpa (*Hordeum vulgare*) hasılı silajının kalite, kimyasal, enerji ve mikrobiyolojik analizleri yapılmış ve aerobik stabilitesi üzerindeki etkileri araştırılmıştır. Kontrol grubuna kıyasla, LAB6 ve LAB8 uygulamaları silajın pH'sını anlamlı şekilde düşürmüştür (sırasıyla 4,88 ve 4,92) ve bu durum daha verimli bir fermentasyona işaret etmektedir. Daha düşük pH değeri, bozulmaya karşı direnci artırarak aerobik stabiliteyi geliştirmektedir. Genel olarak, LAB6 suşu, mikrobiyal kaliteyi artırma, besin kayıplarını azaltma ve arpa hasılı silajının aerobik stabilitesini iyileştirme açısından en etkili suş olarak öne çıkmıştır. Bu sonuçlar, *Lactobacillus plantarum*'un mikrobiyal inokülant olarak değerini ortaya koymakta ve yem kıtlığı ile iklim-dostu tarım gibi güncel zorluklarla uyumlu, daha güvenli, verimli ve sürdürülebilir hayvan besleme uygulamalarına katkı sunduğunu göstermektedir.

Sonuç olarak, *Lactobacillus plantarum* inokülasyonu, özellikle LAB6 ve LAB8 suşları ile yapılan uygulamalar, pH seviyelerini düşük tutup, CO_2 salınımını azaltarak ve maya ile küf gelişimini anlamlı düzeyde sınırlamış arpa hasılı silajının aerobik stabilitesini artırmıştır. Bu durum, kimyasal ve enerji analizlerinden elde edilen önceki bulgularla uyuşmakta ve silaj kalitesinde pozitif iyileştirmeler gerçekleştirmiştir. Bu çalışmanın farklı materyallerle tekrar çalışılması önerilmektedir.

ABSTRACT

Temperate fruit cultivation has an important agricultural activity worldwide. In fact, these species constitute approximately 48% of global fruit production. Temperate fruit species have adapted to the temperate climate in the mid-latitudes; however, approximately 50% of these fruit species are grown in different climate zones in China, Turkey, USA, Brazil, Italy and Spain; these countries constitute the majority of the world's total production. The most effective use of unit area in fruit cultivation has also necessitated the planting of more production material on the land and the use of intensive inputs. Fruit species, whose consumption demand has increased in parallel with the increase in the world population, have had higher productivity per unit area due to the effect of intensive input use in recent years.

In particular, global warming, deteriorating soil structure and unsuitable environmental conditions, as well as biotic stress conditions, significantly threaten the productivity and spread of fruit cultivation. The use of more production material per unit area has enabled cultivation with different density and shape planting intervals depending on the use of compact species/varieties and rootstocks. While fruit trees grow more strongly on their own roots, they form smaller crowns on some clonal rootstocks. However, the fact that the tree grows slowly but forms large trees during the fruiting period, in other words, the long juvenile sterility period, does not indicate that the tree or rootstock is dwarf. Dwarfism can essentially be described as both compact development, the formation of small and numerous fruit branches, and a short juvenile sterility period. Many variables such as the rootstocks used, genetic factors, growth regulators, and maintenance techniques can affect the development strength and shape of dwarf trees. Dwarfism is also a mechanism that allows the tree to quickly reach a balance of vegetative and generative development. Many studies have been conducted to date in different fruit species

in the fields of morphology, anatomy, histology, and molecular in order to reveal this mechanism. In these studies, it was stated that dwarfing is closely related to carbon/assimilation/nitrogen ratios, and that it may be a mechanism provided by a complex interaction of root morphology, bark characteristics, density and dimensions of vascular bundles, water and mineral contents, and constitutional hormone levels.

This study aimed to summarize the publications investigating the mechanisms of dwarfing development under certain headings in temperate climate fruit trees and the current status of information on the dwarfing mechanism.

Keywords: Temperate fruit trees, rootstock, dwarfing mechanism, vigour

ILIMAN İKLİM MEYVE AĞAÇLARINDA BODURLUK VE MEKANİZMASI

ÖZET

Ilıman iklim meyve yetiştiriciliği, dünya genelinde önemli bir tarımsal faaliyet alanına sahiptir. Nitekim bu türler, küresel meyve üretiminin yaklaşık %48'ini oluşturur. Ilıman iklim meyve türleri, orta enlemlerdeki ılıman bölge iklimine adapte olmuştur; ancak bu meyve türlerinin yaklaşık %50'si Çin, Türkiye, ABD, Brezilya, İtalya ve İspanya'daki farklı iklim bölgelerinde yetiştirilmektedir; bu ülkeler dünyanın toplam üretiminin çoğunu oluşturmaktadır.

Meyvecilikte birim alanın en etkili şekilde kullanılması, araziye daha fazla üretim materyali dikimini ve yoğun girdi kullanımını da zorunlu kılmıştır. Dünya nüfusunun artışına paralel olarak tüketim talebi artan meyve türleri, son yıllarda yoğun girdi kullanımının etkisiyle birim alandan daha yüksek verimliliğe sahip olmuştur. Özellikle global ısınma, bozulan toprak yapısı ve uygun olmayan çevre koşulları ile birlikte biyotik stres koşulları da meyveciliğin verimliliğini ve yaygınlaşmasını önemli ölçüde tehtid etmektedir. Birim alana daha fazla üretim materyalinin kullanılması, kompakt gelişim gösteren tür/çeşit ve anaçların kullanımına bağlı olarak farklı yoğunlukta ve şekilde dikim aralıklarıyla yetiştiriciliğe imkân vermiştir. Meyve ağaçları kendi kökleri üzerinde daha kuvvetli büyürken, bazı klonal olarak nitelendirilen anaçlar üzerinde daha küçük taç yaparlar. Bununla birlikte ağacın yavaş büyümesi, fakat meyve döneminde büyük ağaçlar oluşturması yani gençlik kısırlığı periyodunun uzun olması o ağacın ya da anacın bodur olduğunu göstermez. Bodurluk asıl olarak hem kompakt gelişim, küçük ve çok sayıda meyve dalı oluşturma hem de gençlik kısırlığı periyodunun kısa olması olarak nitelendirilebilir. Bodur ağaçların gelişme kuvvetleri ve şekline, kullanılan anaçlar, genetik faktörler, büyüme düzenleyiciler ve bakım teknikleri gibi birçok değişken etki edebilmektedir. Bodurluk, ayrıca ağacın hızlı bir şekilde vejetatif ve generatif gelişim dengesine ulaşmasına da imkân veren bir mekanizmadır. Bu mekanizmanın açığa çıkarılması ile ilgili bugüne değin farklı meyve türlerinde morfolojijk, anatomik, histolojik ve moleküler alanlarda birçok çalışma yürütülmüştür. Bu çalışmalarda bodurluğun, karbon/ asimilasyon / nitrojen oranları ile sıkı bir ilişkide olduğu, kök morfolojisinin, kabuk özelliklerinin, iletim demetlerinin yoğunluk ve boyutlarının, su ve mineral içeriklerinin ayrıca bünyesel hormon düzeylerinin bir arada kompleks bir etkileşimle sağlanan bir mekanizma olabileceği belirtilmiştir.

Bu çalışma, ılıman iklim meyve ağaçları özelinde bodur gelişimin belli başlıklar altında mekanizmalarını araştıran yayınları ve bodurluk mekanizmasına ilişkin bilgilerin mevcut durumunu özetlemeyi amaçlamıştır.

Anahtar Kelimeler: Ilıman iklim meyve ağaçları, anaç, bodurluk mekanizması, gelişme kuvveti

1.Giriş

Vejetatif büyümenin kontrol edilmesi, daha küçük meyve ağaçlarının elde edilme isteği, uzun bir geçmişe dayanmaktadır. Bitki büyütücülerinin yönlendirilmesiyle sürgünlerin aşırı artmasını engelleme, sıcaklık ve meyve verimini teşvik etmek için yüzyıllar boyunca uygulanan bir yöntemdir. Antik bahçeciler ve modern meyve yetiştiricileri, büyümeyi kontrol altına almak veya düzenlemek için kabuk soyma, halka alma, bodur anaç kullanımı, budama ve dal yönlendirme gibi teknikler kullanmışlardır.

Bahçe yönetimi ve kaliteli meyve üretiminde ağaç büyüklüğü, kritik bir rol oynar. Bodur ağaçlar birçok avantaj sunar. Daha iyi ışıklanma ve fotosentez bu sayede ağaçların, daha fazla ve kaliteli meyveler üretimi sonucunu doğururur. Ayrıca bodur ağaçlarda püskürtülerek uygulanan çözeltilerin daha etkili dağılması mümkündür. Bu ağaçlarda hasat daha kolay, bahçecilik işlemlerinde daha az işgücü kullanımı söz konusudur. Bu avantajlarından dolayı bodur meyve ağaçlarına olan ilgi uzun süredir devam etmektedir (Eşitken, 2020).

Anaçların kalem gelişimi üzerindeki etkisinin doğru bir şekilde değerlendirilmesi oldukça önemlidir. Bodur anaçlar, kendi kökleri üzerinde büyüyen ağaçlara kıyasla önemli ölçüde daha küçük ağaç olma eğilimindeki anaçlardır. Ancak eğer bir ağaç yalnızca yavaş büyüyor ama yetişkinlik döneminde büyük bir taç oluşuyorsa, bu tür anaçlar her zaman bodur olarak kabul edilmez. Anaçların dallanma şekli ve sürgün uzunluğu üzerindeki etkilerin belirginleştiğinde bodurluk tanımından söz edilebilir. Bol ve kısa sürgünlü ağaçlar ile az sayıda fakat uzun sürgünlü ağaçlara karşı, kütle olarak benzer olmalarına rağmen, uzun sürgünlü ağaçların taç boyutu daha dayanıklı. Genellikle, yoğun dallanmış, kütlece büyük fakat küçük taç hacmine sahip ağaçlar bodur olarak nitelendirilebilir (Webster, 1995).

Bodurlaşma oranlarıyla ilgili olarak anatomik, yapısal ve kimyasal açıdan farklı seçenekler bulunmaktadır. Elma ağaçlarında bodurlaşma aralıkları üzerinde yapılan incelemeler, taç ve kök arasındaki iletimleri ve büyümeyi düzenleyen oksin, sitokinin, giberellin, absisik asit, nitrojen oranları ve fenoller gibi iç parametreleri kapsar. Bu maddeler, başlangıç büyüme süreçlerini kontrol ederek bodurlaşma üzerinde önemli bir etkiye sahiptir (Lockard ve Schneider, 1981).

2. Bodurluğu Etkileyen Faktörler

Meyve ağaçlarında bodurluk, birçok faktörden etkilenir ve bu faktörler genellikle bitkinin büyüme ve gelişme süreçleriyle yakından ilişkisi vardır. Öncelikle, genetik faktörler bodurluğun temel belirleyicisidir; bazı meyve ağaçları genetik olarak daha kısa ve kompakt bir yapıya sahipken, diğerleri daha uzun ve yayvan bir formda büyüyebilir. Bodurlaştırıcı işlevi morfolojik, anatomik, fizyolojik ve biyokimyasal değişiklikleri içerir. Meyve ağaçlarının bodurluğunu etkileyen faktörlerin dikkate alınması, tarımsal verimliliği artırmak için kritik öneme sahiptir.

2.1. Morfolojik ve Anatomik Faktörler

2.1.1. Anaç-Kalem Etkileşimi:

Aşılama, yeni bir bitki oluşturmak için hava kısmını (filiz) başka bir kısım (anaç) ile birleştiren çoğaltma tekniğidir (Koepke ve Dhingra, 2013). Anaçlar üzerine aşılanmış bitkiler farklı çevresel streslere karşı daha iyi bir tolerans sağlar (Darvis ve ark., 2008). Bahçe kuruluşunda uygun anaç seçimi, farklı ekolojik bölgelerde ağaç performansını etkilediği için en önemli kararlardan birisi içerisinde yer alır. Anaçlar meyve üretimini, kalitesini ve tadını artırır ve çeşitli stres koşullarına karşı toleransı artırarak besin emilimini ve taşımasını iyileştirmek için kullanılmaktadır (Castle, 2010).

Anaçlar ve aşı kalemleri arasındaki etkileşim hem çok geniş hem de karmaşıktır. Aşı kalemi karbonhidratları özümseyip bunları hormonlarla birlikte kök sistemine taşır. Öte yandan kök sistemi, toprakta emilen su ve besinlerle birlikte aşı kalemi için hormon da sağlayabilir. Bodur anaçların etkisinin periderm kalınlığı, korteks kalınlığı, öz yarıçapı ve elek borusu alanı, kuvvetli anaçlardan önemli ölçüde daha düşükken, floeme yakın damar alanı/elek borusu alanı, merkezi damar alanı/elek borusu alanı bodur anaçlarda son derece daha yüksektir (Li ve ark., 2019). Bodurlaştırıcı anaç ve ara anacın bitki boyunu, taç boyutunu ve ağaç hacmini kısıtlamaya katkıda bulunduğunu göstermiştir. Ancak kuvvetli anaçlarda aşılanan bitkiler daha fazla besin özelliğine sahip olurken daha düşük verime sahiptir (Lliso ve ark., 2004, Karlıdağ ve ark., 2014). Elma kalemlerinin bodur anaçlara aşılanması, sürgün büyümesinin erken durması ve daha yavaş uzama ile sonuçlanırken, boğum arası uzunluk genellikle etkilenmez (Seleznyova ve ark., 2008). Bu değişmiş sürgün büyüme deseni, sürgüne su taşınmasından etkilenebilir. Özellikle bodur anaçların köklerinde daha düşük hidrolik iletkenlik sıklıkla gözlemlenmektedir. Aşı birleşim yeri ksilem özsuyunun iyonik birleşimini etkilemektedir. M9 anacının birleşiminden son derece düşük akış hızıyla geçiş özsuyu ozmolalitesini ve Ca^{+2} iyon konsantrasyonunu azaltmıştır (Else ve ark., 2018). Kuvvetli anaçlarla karşılaştırıldığında, yarı bodur anaç M26 anacı üzerindeki Granny Smith elmasının yapraktaki Ca ve Fe konsantrasyonları optimum aralığın altında değerler sunmuştur. (Jobir ve ark., 2017). Bodur anaçlar üzerine aşılanmış elma ağaçlarının yapraklarında nişasta içeriğinin arttığı ve bu gözlemlemenin yanında erkenciliğe katkıda bulunan bir faktör olduğunu desteklemektedir (Zhou ve ark., 2020). Nişasta konsantrasyonları, M9 anacı köklerinde, gövdelerinde ve aşılanmış Royal Gala (RG) elma filizlerinde, iki kat daha yüksek seviyeler tespit edilmiştir. Glikoz ve Fruktoz seviyeleri, M9 anaç üzerine aşılanmış Royal Gala elma ağaçlarının üç dokusunda da önemli ölçüde azaldığı görülmüştür. Bu bulgular, bodur anaçların, muazzam nişasta rezervlerine sahip olmalarına rağmen, şeker tükenmesi ve azalmış hücresel aktiviteden yoksun olduğunu göstermektedir (Foster ve ark, 2017). Riparia Gloire anaçlarının genellikle filizlere sağladığı düşük canlılık, sürgünlere azot taşınmasının azalması ve köklere doğru daha fazla biyokütle tahsisi kombinasyonundan kaynaklanıyor olabilir (Rossdeutsch ve ark., 2021). Gjamovski ve Kiprijanovski (2011) yapmış olduğu çalışmada daha kuvvetli anaçlarla aşılanan 'Granny Smith' elma ağaçlarının, zayıf anaçlardan (Panjam 1, M.9 T337 ve Mark 9) daha yüksek vejetatif büyümeye sahip olduğunu belgelemiştir. Birkaç çalışma, bodur anaçlarına aşılanmış elma filizlerinin daha kısa sürgün uzunluklarına, daha düşük gövde kesit alanına (TCSA) ve zayıf büyüme özelliklerine sahip olduğunu göstermiştir. Bodur anaçlar üzerinde aşılı ağaçların yaprak üretiminin durmasını hızlandırdığı ve daha hızlı yaprak yaşlanmasını ve dökülmesine neden olduğu iddia edilmiştir (Marini ve ark., 2017).

2.1.2. Aşı Birleşiminin Etkileri

Bodur anaçlar üzerindeki elma ağaçlarında aşı birleşimi üzerinde özsu akışı sırasında besin maddelerinin tüketildiği bildirilmiştir (Jones, 1984). Jones'un çalışmalarında, aşı birleşiminin üst kısmındaki özsudaki çözünen madde konsantrasyonunun alt kısımdakine göre daha düşük olduğunu ortaya konmuştur. Ancak Webster (2004), bu hipoteze şüpheyle yaklaşmış ve East Malling deney istasyonunda yapılan çalışmalara dayanarak besin maddesi tüketiminin yalnızca düşük özsu akış hızlarında meydana geldiğini belirtmiştir. Webster'a göre, tipik özsu akış hızlarında bu tür bir tükenme gözlemlenmemektedir. Bu bulgular, bodur anaçların besin maddesi taşınmasında oluşturduğu etkilerin yalnızca belirli koşullarda ortaya çıktığını göstermektedir. Uyumsuz anaçların kullanımı uyumsuz kalem anaç kullanımıyla bodurluk oluşabilir. Ancak ticari olarak kullanılmaz. Quince C bodur anaç üzerine aşılanan armut çeşitleinde aşı birleşimindeki damarsal kesintiye nitelenecek küçük yaprak boyutu ve erken yaprak sararması gibi belirli uyumsuzluk belirtileri gözlemlenmiştir (Askari-Khorasgani ve ark., 2019). *Zizyphus nummularia* anacı üzerine aşılanan Ber kalem çeşiti, aşı uyuşmazlığı ile bodurluğa neden olabilir. (Saroj ve Singh, 2018). Dikimden 64 ay sonra Flying Dragon üzerine aşılanan 'Pera' portakalı arasında görsel uyumsuzluk belirtileri gözlemlenebilir. Bodurluk ve aşı uyuşmazlığı damar boyutu ve sıklığı ile kambiyal bölgenin boyutu ve düzensizliği ile bağlantılıdır (de Carvalho ve ark., 2018). Aşılamadan 10 ve 21 gün sonra, ParPAL1 (fenilalanin amonyak-liyaz) transkrip seviyeleri, *Prunus spp.*'nin uyuşmaz birleşmelerinde uyumlu birleşimlere göre üç kat daha fazla artış göstermiştir. Bu durum, ParPAL1'in uyumsuz aşı birleşmelerinde daha aktif olduğunu ve bu süreçte bitkinin stres yanıt merkez mekanizmalarına dahil olabileceğini düşündürmekterdir. Diğer yandan ParPAL2 transkript seviyeleri de incelenmiş ve özellikle uyuşmaz aşı birleşimelerinde yukarı doğru düzenlendiği görülmüştür. Bu durum ParPAL2'nin de uyumsuzluk süreçlerinde önemli bir rol oynayabileceğine işaret etmektedir. Ancak ParPAL1'e kıyasla, ParPAL2'nin biyolojik işlevleri ve uyumsuzluk süreçlerindeki spesifik rolü daha fazla araştırmayı gerektirmektedir. (Irisarri ve ark., 2016).

2.1.3.Ara Anaç Kullanımı

Bodur elma anaçları ve ara anaçlar yıllık büyüme döngüsü sırasında üretilen büyüme maddelerinin tipini, ayrıca erken çiçek açmaya geçiş yıllık sürgünlerin kompozisyonunu ve canlılığını da etkiler. Bu etki, özellikle bodur anaçlar tarafından tetiklenen çiçeklenmeye geçişle daha da artmaktadır. Yıllık sürgünün büyüme birimlerine bölünmesi, yaşın elma ağacı mimarisi üzerindeki etkilerini ölçmek ve modellemek için de yararlı olacaktır (Seleznyova ve ark., 2008). Yüksek verimliliği ve meyve kalitesinin olmasıyla hibrit HTR-051 anaçları turunçgil türlerinde bodurlaşmayı teşvik eder ve yüksek yoğunluklu bahçeler için iyi beklenti sunmaktadır. (de Carvalho ve ark., 2019). Dikim derinliği de bodurlaşma üzerine belirleyici faktörler arasında yer almaktadır. Derin dikim uygulamalarının, bodurlaşma etkisini artıracağı düşünülmektedir. Örneğin, Kviklys ve Samuolienė (2020), ara anaçların dikim derinliğine bağlı olarak farklı büyüme davranışları sergilediğini göstermiştir.

2.1.4. Kabuk kalınlığı

Kabuk kalınlığı ve bitki büyümesi arasındaki ilişki, özellikle bodur anaçlar ve oksin gibi büyüme düzenleyicilerle bağlantılı olarak dikkat çekmektedir. Oksinler, bitki büyümesini düzenleyen en önemli hormonlardan birisidir. Ancak oksinler, çeşitli enzimler tarafından parçalanarak etkisiz hale getirilir. Bu durum, bitkilerin büyüme hızını etkileyip sınırlayabilir. Kabuk kalınlığı fazla olan bitkilerde, oksinlerin parçalanma oranı daha yüksek olabilir. Bu da bu tür bitkilerin genellikle bodur bir yapıya sahip olmasına neden olur. Harrison ve ark. (2016), yaptığı araştırma, kabuk kalınlığı ile bitki büyümesi arasındaki ilişkiyi anlamak için önemli veriler sunmaktadır. Çalışmada, Royal Gala elma çeşidi ile aşılanmış iki farklı anaç türü olan M116 ve M27'nin kök kabuğu yüzdeleri incelenmiştir. Araştırmanın sonuçlarına göre, bodur bir anaç olan M27'nin kök kabuğu yüzdesi %85,3 olarak bulunmuştur. Buna karşın, yarı kuvvetli bir anaç olan M 116'nın kök kabuğu yüzdesi daha düşük olup %62,6 olarak ölçülmüştür. Bu sonuçlar, kabuk kalınlığı ile bitki büyümesi arasında güçlü bir negatif korelasyon olduğunu göstermektedir (Yang ve ark., 2016). Kabuk kalınlığının artması, bitki büyümesini çeşitli mekanizmalarla etkileyebilir. Öncelikle, kalın kabuklu bitkilerde su ve besin maddelerinin taşınmasında sınırlamalar oluşabilir. Bu durum, bitkinin büyüme hızını yavaşlatabilir. Ayrıca, kalın kabuklu bitkilerde oksinlerin parçalanma hızı daha yüksek olduğu için hücre bölünmesi ve uzaması sınırlanabilir. Bu durum, kabuk kalınlığının yalnızca köklerde değil, aynı zamanda sürgünlerde de büyümeyi olumsuz etkileyebileceğini göstermektedir. Özellikle meyve ağaçlarında bu durumun verim üzerinde önemli etkileri olabilir.

2.1.5. Aşı Yüksekliği ve Güneşlenme

Aşılama yüksekliği, anaçların büyüme hızı üzerine önemli bir etkiye sahiptir. Daha uzun anaç kısımlarının güneşe maruz kalması, büyüme düzenleyici hormonların başında gelen oksin gibi hormonların taşınmasını etkileyebilir. Hrotko ve Magyar (2004), aşılama yüksekliğinin artması ile filiz büyümesinin azaldığını bildirmiştir. Grzyb (2002), ise oksin taşımasının azalması ve kök kabuğunda ayrışmanın artmasının büyüme üzerinde etkili olabileceğini öne sürmüştür.

2.1.6. Budama

Budama yoluyla bodurlaşma elde edilebilir ve yavaş büyüyen ağaçların budamaya daha fazla tepki verdiği gözlemlenmiştir. Bodur ağaç, yan tomurcuk büyümesini uyaran sürgün apikal kısmının çıkarılmasıyla elde edilir. Budama yoluyla ağaç büyüklüğü kontrolü asma, elma ve bazı ılıman iklim meyve türleri ile sınırlıdır. M9 anaç üzerine aşılanmış Topaz elma çeşidinde, modifiye edilmiş ince iğ şeklinde yetiştirilen ağaçlar ince iğ şeklinde yetiştirilen ağaçlara kıyasla daha düşük kanopi hacmi ve daha iyi ağaç büyüklüğü kontrolü göstermiştir. (Mészáros ve ark., 2017). Gisela5 anaç üzerine aşılanmış ve iğ şeklinde yetiştirilen 0900 Ziraat kiraz çeşidi ağaçları daha düşük ağaç yüksekliği vermiştir (Aglar ve ark., 2016). Guttingen V şekli budama sistemiyle elma ağaçlarının ağaç canlılığını azalttırmıştır ve Geneva Y kafes budama sistemine (1680 ağaç/ha) kıyasla daha yüksek dikim yoğunluğuna (3000 ağaç/ha) olanak sağladığı gözlemlenmiştir (Dadashpour ve ark., 2019). Fuji elmasında dal bükme açıları arttıkça mahmuz sayısı ve yüzdesi artarken uzun ve orta boy sürgünlerin sayısı ve oranı azalmıştır (Zhang ve ark., 2017).

3. Fizyolojik Esaslar

Fizyolojik düzeyde bodurluk, bitkinin su, mineral ve fotosentez ürünlerini taşıma kapasitesinde yaşanan değişimlerle doğrudan ilişkilidir. Bodur anaçlar genellikle daha düşük iletim dokusu kapasitesine sahiptir. Bu ağaçlarda ksilem çapı ve iletim elemanlarının sayısı azalır, bu da hem su iletimini hem de mineral taşınımını sınırlandırır (Tworkoski ve Fazio, 2016). Özellikle su iletimi sınırlı olan bodur anaçlarda, gövde kısmındaki hücre bölünme sayısı azalmakta, bunun sonucunda internod uzunluklarının kısalmasına neden olmaktadır. Ayrıca, bu durum bodur anaçlarda karbon asimilasyonunu da azaltmaktadır. Bitkinin yaprak yüzeyi küçüldükçe, toplam fotosentez kapasitesi de azalır. Bu, meyve verimi üzerinde sınırlayıcı etki yaratırabilir; ancak kontrollü koşullarda bu durum üretim kalitesi açısından yararlı hale getirilebilir.

3.1.Hormonal Değişimler

Bitkilerde büyüme ve gelişme büyük ölçüde hormonların etkisi altındadır. Bodurluk durumunda hormonların sentezlenme miktarı, taşıma yolları ve etki alanları önemli derecede değişir.

3.1.1. Giberallinler (GA)

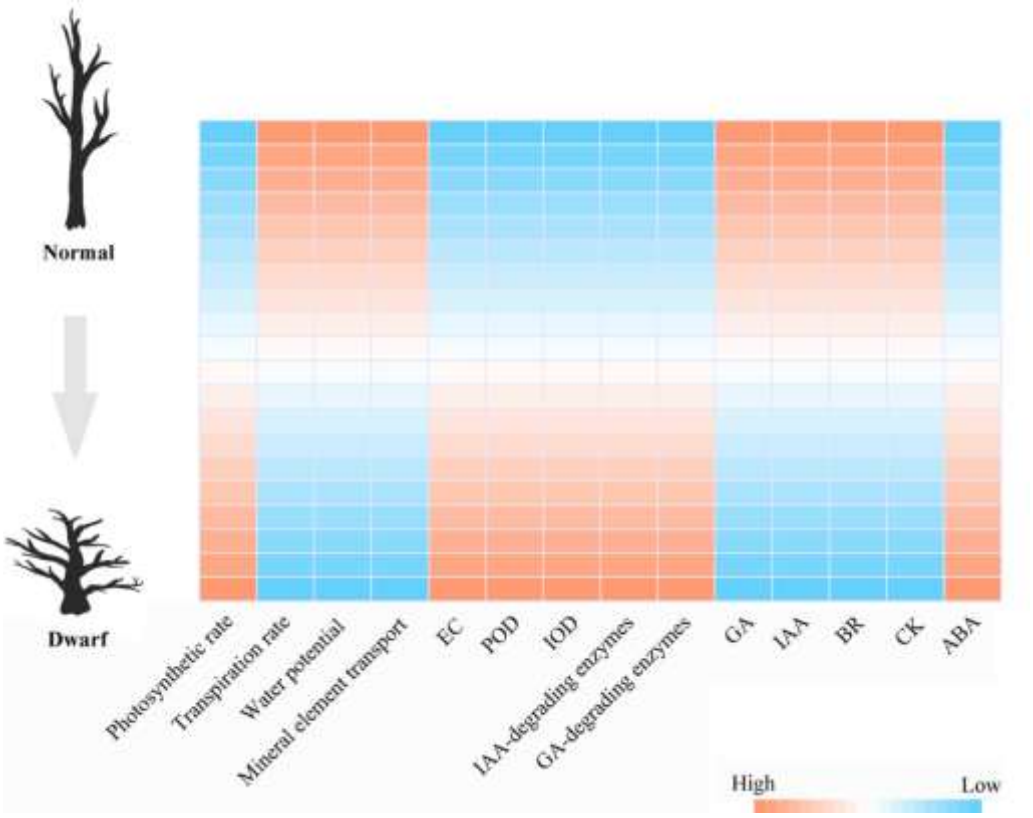
Gibberallinler, hücre uzamasını ve internod büyümesini teşvik eden başlıca hormon grubudur. Bodur anaçlarda GA biosentez genlerinin ekspresyonu düşüktür ya da bu hormonun yıkımına neden olan *GA2ox* genlerinin aşırı aktif olması nedeniyle gövde uzaması sınırlanabilir. GA_2-oksidaz (*GA2ox*), GA_1 dahil olmak üzere aktif GA'ların inaktif metabolitlere dönüşümünü katalize eder (Hedden, 2001;, Tworkoski ve Faizo 2016; Hu ve ark., 2018; Cheng ve ark., 2019). GA metabolizmasındaki bozulmalar bodurluğun indüklenmesinde önemli bir faktör olarak gösterilmiştir (Chu ve ark., 2023, Wang ve ark., 2024; He ve ark., 2024). Özellikle, bodur anaç M9 üzerine aşılanmış 'Royal Gala' elmasının ksilem özündeki GA_{19} konsantrasyonunun bodurlaşmayan anaçlardakinin iki katı olduğu bulunmuştur. Bodur anaçlara aşılanmış filizlerde GA uygulaması, birincil ve ikincil dallardaki nod sayılarının normalleşmesine ve tipik sürgün büyümesinin geri kazanılmasına yol açmıştır (Schomburg ve ark., 2003; van Hooijdonk ve ark., 2011). Bazı çalışmalar sonucunda bodur ağaçlara GA_3 uygulamasının geçici olarak gövde uzamasını artırdığı gösterilmiştir, bu da endojen GA eksikliğinin bodurluğun temel sebeplerinden biri olduğunu doğrulamıştır.

3.1.2. Sitokininler

Kökte sentezlenen sitokininler, gövdeye taşınarak hücre bölünmesini teşvik eder. Bodur anaçlarda sitokinin taşınımı yavaşladığından, gövdedeki meristematik aktivite azalır (Buban ve Faust, 1982). Ayrıca sitokin/oksin oranındaki dengesizlik, vegetatif gelişimi baskılayabilir. Sitokininler tomurcuk başlangıcı ve IAA taşınması için gereklidir. İlk çalışmalar, yetersiz CK sentezinden kaynaklanan aksiller tomurcuklardaki sınırlı IAA üretiminin elma ağaçlarındaki bodur fenotipte rol oynadığını öne sürmektedir (Şekil 1) (Tan ve ark. 2018).

3.1.3. Oksin (IAA)

Oksin, büyüme yönünün belirlenmesinde ve apikal dominansın sürdürülmesinde görev alır.bodur anaçlarda oksin taşınımına aracılık eden *PIN* proteinlerinin ekspresyonunda azalma gözlenmiştir (Gao ve Chu, 2020). Bu durum, ağaçlarda hormonal sinyalin yukarı taşınmasını sınırlandırır ve kalemin büyümesi olumsuz etkiler. Bodur meyve ağaçları ayrıca daha düşük IAA, BR ve sitokinin içerikleriyle de karakterize edilir (Şekil 1). 1997'de, beş elma anaç üzerinde yapılan bir çalışma, bodur anaçlarda kuvvetli olanlara kıyasla daha düşük IAA alımı ve taşınması olduğunu ortaya koymuştur (Kamboj ve ark. 1997). Kuvvetli anaçlara (Fuji/MM111) aşılanan elma ağaçlarında, bodur anaçlara (Fuji/M9) aşılananlara göre daha yüksek IAA konsantrasyonları gözlemlenmiştir (Song ve ark., 2016), bu da IAA eksikliğinin bodur fenotipe katkıda bulunduğunu göstermektedir.



Şekil 1. Bodur ve normal meyve ağaçlarının fizyolojik özelliklerinin karşılaştırmalı analizi. Bodur meyve ağaçları daha yüksek fotosentez oranı, elektriksel iletkenlik (EC), su potansiyeli, mineral element taşınması, terleme hızı ve peroksidaz (POD), indol-3-asetik asit oksidaz (IOD), IAA-parçalayıcı enzimler, gibberellik asit (GA)-parçalayıcı enzimler ve absisik asit (ABA) aktiviteleri sergiler. Bunun aksine, bodur bitkilerde daha düşük GA, IAA, brassinolid (BR) ve sitokinin (CK) seviyeleri gözlemlenmiştir. "Yüksek" ve "Düşük" bu fizyolojik özelliklerin göreceli seviyelerini gösterir (Chu ve ark., 2025).

3.1.4. Absisik Asit (ABA)

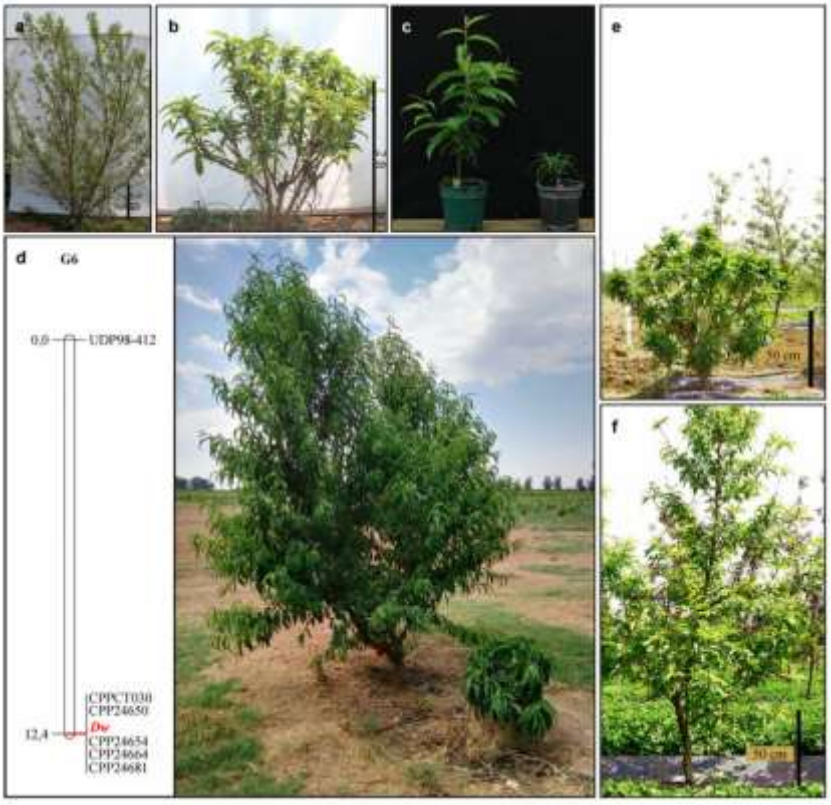
Absisik asit, genellikle stres koşullarında yükselir ve stomaların kapanmasını tetikleyerek büyümeyi sınırlandırır. Bodur anaçların genellikle daha düşük su iletim kapasitesine sahip

olması, endojen absisik asit düzeylerinin artmasını tetikleyerek büyümenin baskılanmasına katkı sağlamaktadır. ABA hem hava hem de kök büyümesini düzenler ve yüksek bitkilerde bodurlaşmaya neden olduğu bilinmektedir (Kavi Kishor ve ark., 2022, Lu ve ark., 2022, Michaud ve ark., 2023). Golden Delicious ve Cortland elmalarının bodur mutantlarında, tomurcuklardaki ABA konsantrasyonları yabani tip tomurcuklara kıyasla yüksekti (Jindal ve ark., 1974). Bodur anaçlar ayrıca gövde kabuğunda normal anaçlara göre daha yüksek ABA seviyeleri göstermiştir (Foster ve ark., 2017). Benzer şekilde, bodur anaçlara aşılanan elma bitkilerinin gövdelerindeki ABA konsantrasyonları standart anaçlara aşılanan bitkilerdekinden daha yüksekti (Tworkoski ve ark., 2016). Turunçgillerdeki benzer bulgular, yüksek ABA seviyelerinin sürgün büyümesini etkileyen kritik bir faktör olduğunu göstermektedir (Şekil 1).

3.2. Bodurluğun Genetik Temelleri

Bodurluk karakteri, bazı meyve türlerinde genetik olarak taşınan bir özelliktir. Elmada Dw1**,** Dw2, kirazda PpD gibi lokuslar tanımlanmıştır (Foster, 2022). Bu gen bölgelerindeki, hormonal sinyallerin iletimi, hücre duvarının uzaması ve ksilem gelişimi gibi büyümeyle ilgili çeşitli süreçleri düzenleyen genleri içerir. Örnek olarak, elmada *MdDWF4* geni gibberallinlerin biyosentezinde görev alırken, bodur çeşitlerde bu genin baskınlığı düşüktür. Kirazda ise *GAI* ve *RGL* genlerinin baskın aktivitesi, GA sinyallerini baskılayarak bodur fenotipin oluşumuna neden olmaktadır (Zhang, 2019).

Bitki genetik iyileştirmesi, sadece istenen özelliklerin altında yatan moleküler mekanizmaların derinlemesine anlaşılmasını değil, aynı zamanda bu özellikleri kontrol eden anahtar genlerin tanımlanmasını ve klonlanmasını da gerektirir. Çeşitli meyve ağacı türlerinde bodurlaşmanın düzenlenmesinde rol oynayan çok sayıda gen açıklanmıştır (Elmada Dw1, Dw2 ve Dw3 gibi) (Foster ve ark., 2017, Harrison ve ark., 2016). M9 ve MM106 nın yakın zamanda yapılan karşılaştırmalı genomik analizi, iki ayrışan popülasyonda bodurluk özelliği ile birlikte ayrışan, DwTE olarak adlandırılan 9.723 bp alel-spesifik uzun terminal tekrar retrotranspozon/ gypsy insersiyonunu ortaya koydu ve bunun bodur anaç ıslahında gelecekteki uygulama potansiyelini vurgulamıştır (Li ve ark., 2024). Şeftali'de çekinik bir bodurluk aleli (dw), GA reseptör geni GID1c'nin promotöründe anlamsız bir mutasyonla bağlantılıdır (Şekil 2) (Cantín ve ark. 2018; Hollender ve ark. 2016).



Şekil 2. Meyve ağaçlarında bodurlukla ilgili genlerin lokalizasyonu. a-c Haritalama popülasyonundan standart (Std) ve brakitik bodur (BD) şeftali ağaçlarının büyüme özellikleri. Dört yaşındaki Std (a) ve BD şeftali ağaçları (b); Bir yaşındaki Std (sol) ve BD (sağ) şeftali ağaçları (c) (Hollender ve Dardick, 2015, Hollender ve ark., 2016). Bodur (Dw) geninin pozisyonunu gösteren ve genetik ayrımların santimorgan cinsinden ifade edildiği Nv⊗ suşu için bir genetik harita. Sağdaki iki üç yaşındaki Nv⊗ bitkisinin görüntüleri, zıt fenotipleri vurgular: kısa boğum aralarına sahip bodur bitkiler ve tipik fenotip (Cantín ve ark., 2018). e–f İki yaşındaki 'FHSXT' (e) cüce ağacının ve 'QMH' (f) standart ağacının fenotipleri (Chen ve ark., 2016)

Erikte GID1'in susturulması da bodurlaşma ile sonuçlanmıştır ve bu da GID1c'nin cücelikteki rolünü doğrulamıştır. Bununla birlikte, meyve ağaçlarında bodurlaşmayla ilgili çok sayıda genetik ilişki bildirilmiş olsa da, söz konusu belirli genlerin daha fazla tanımlanması ve doğrulanması gerekmektedir (Lee ve ark. 2015). Belirlenen bodurlukla ilgili genlerin sayısı artmaya devam etse de, birçok meyve ağacında bodurluktan sorumlu olan anahtar genler yeterince karakterize edilmemiştir.

3.2.1. Giberallin Metabolizması ve Dengeleyici genler

Gibberellin (GA), hücre uzamasını ve meristem aktivitesini teşvik etmesiyle bodur anaçlarda düşük GA aktivitesi, büyümeyi baskılamaktadır. Bu durum da ***GA20ox*** **ve** ***GA3ox*** genleri,aktif GA formlarının sentezinden sorumlu olup bodur anaçlarda bu genler down-regüle edilir. ***GA20ox*** gen ailesi, ağaçlarda inaktif GA formlarını artırarak bodurluk oluşturmaktadır. Bu durumun en belirgin etkisi M9 elma anacında bu genlerin ekspreyonu yüksektir. Yine elma anaçlarında *MdGA2ox1* ve *MdGA2ox8* genlerinin bodurluğa doğrudan etki ettiği kanıtlanmıştır (Foster, 2015).

3.2.3 Della Proteinleri

DELLA proteinlerinde ise *GAI, RGLI, RGL2* gibi çeşitler büyüme sinyallerini baskılar ve GA ile parçalanmadıklarından hücre uzamasını durdurur. Kirazda *PaGAI ve PaRGLI* genleri bodur çeşitlerde etkileri aşırı derecede fazladır. Japon armudunda da bodur fenotipe yatkınlık sağlayan CRISPR/Cas9 ile *GAI* geninin mutasyonuyla elde edilmiştir (Liu ve ark., 2025).

3.2.4. Sitokinin Oksin Oranını Dengeleyici Genler

Sitokinin oksidaz/dehidrogenaz (*CKX*) genleri, bodur anaçlarda sitokinin düzeyini düşürürken bu durum M9 anacında *MdCKXI* ekspresyonu artmıştır (Wang ve ark, 2024). Oksin taşıma genleri de ise *PIN, AUX/LAX* ve *PILS* aileleri, oksin'in çift yönlü taşınımını düzenler. Örneğin; *MdPINI* ve *MdAUXI* bodur anaçlarda baskılanarak vegetatif büyümeyi kısıtlarken, bir başka durumda ise *ARF* gen ailesi (Auxin Response Factor) büyüme genlerinin aktivasyonunda yer alır ve bodur anaçlarda *ARF10/16* gibi baskılayıcı üyeler öne çıkar (Gao ve Chu, 2020).

3.2.5. Transkripsiyon Faktörleri ve Bodurluk

Transkripsiyon faktörleri, yüzlerce hedef geni kontrol ederek bodurluğu sistematik şekilde düzenler. Bunlardan NAC ailesi, meristem büyümesini ve hormonal tepkileri düzenlerken, bu durum elmada *MdNACI*'in aşırı ekspresyonu, sürgün apikal meristem (SAM) aktivitesini baskılayarak bodurluk oluşturmasıyla açıklanmıştır. TCP, MYB ve WRKY gen ailelerinde ise *TCP20* ve *TCP24'*ler hücre döngüsünü durdurarak bodurluk sağlayabilir. Stres durumunda da *MYB44* ve *MYB124* gen aileleri büyümeyi sınırlandırıcı rol oynar. Savunma mekanizmalarıyla büyüme arasında da WRKY genleri denge kurar, ağaç gelişimini dolaylı yoldan baskılar. Bodurluğa etkisi olan bir başka faktörde mikro-RNA'lar ve epigenetik etkidir. Mikro-RNA'lar, gen etkilerini post-transkripsiyonel düzeyde düzenleyerek bodurlukta önemli rol oynar. SPL transkripsiyon faktörleri büyümeyi teşvik eder, miR156 ise bu durumu baskılar. Bodur anaçlarda miR156 seviyesi yüksektir (Zhao ve ark., 2020). miR159, miR167, miR393 gibi diğer mikroRNA'lar oksin, gibberallin ve brassinosteroid sinyallerinin engellenmesini hedef alır. DNA metilasyonu ve histon modifikasyonları, bodurlukla ilişkili genleri kalıcı olarak baskılanmasını sağlayabilir (Tan ve ark., 2018).

4. Epigenetik Düzenleme ve Kültürel Uygulamalar

Bodurluğun yalnızca genetik düzeyde değil, aynı zamanda epigenetik yollarla da kontrol edildiği bilinmektedir. DNA metilasyonu gibi epigenetik mekanizmalar, büyüme ile ilgili genlerin baskılanmasına da sebep olmaktadır. Bu özellikleriyle doku kültüründe üretilen klonal anaçlarında ortaya çıktığı gözlemlenmiştir. Ayrıca kültürel uygulamalar (budama, sulama, azot dengesi gibi) da bodurluk fizyolojisine etki etmektedir. Örneğin yüksek azot uygulaması internod uzunluklarını artırarak gövde uzamasına neden olmaktadır (Chu ve ark.,2025).

5. Anaç Kalem Etkileşimi

Anaç ve kalem arasında gerçekleşen fizyolojik etkileşim, bodurluğun derecesini belirleyen temel faktörlerden biridir. Bodur bir anaç, aşılanan kalemin internod uzamasını ve vegetatif gelişimini sınırlar. Bu etki ise hormon taşınımı, ksilem ve floem çapı, anaç kalem uyumu, ve mikro-RNA ve epigenetik sinyal taşınımı gibi mekanizmalarla gerçekleşmektedir. Hormon taşınımında özellikle oksin ve sitokinin anaçtan kaleme taşınma miktarı azaldığında belirti gösterir. Ksilem ve floem çapları bodur anaçlarda daha dar iletim kanalları, su ve besin

taşınımını sınırlandırarak ağaçlarda bodur etkisi yaratır (Tworkoski ve Fazio, 2016). Anaç kalem uyumunda ise anaç-kalem birleşim bölgesindeki vasküler uyum, ağaçlardaki büyüme kapasitesini etkiler. Mikro-RNA ve epigenetik sinyalin taşınımında anaçtan kaleme taşınabilen küçük RNA'lar, kalemin gen ekspresyonunu modifiye edebilmektedir (Gao ve Chu, 2020).

6. SONUÇ

Meyve ağaçlarında bodurluk, modern bahçecilik uygulamalarında verimlilik, kalite ve yönetim kolaylığı açısından stratejik bir öneme sahiptir. Bodur ağaçlar, küçük taç yapıları sayesinde ışığı daha etkin kullanır, daha kaliteli meyve üretir ve özellikle sık dikim yapılan yüksek verimli bahçeler için büyük avantaj sunar. Ayrıca, hasat, budama, ilaçlama gibi işlemler bodur ağaçlarda daha az iş gücüyle, daha kolay ve düşük maliyetle gerçekleştirilebilir. Bodurluk olgusunu oluşturan genetik, fizyolojik, anatomik, hormonal ve epigenetik düzeyde gerçekleşen etkileşimler, bir ağacın büyüme kuvvetini doğrudan etkileyebilir. Özellikle anaç-kalem etkileşimi, bodurluğun derecesini belirlemede en temel unsurlardan biridir. Bodur anaçlar, aşılanan kalem üzerinde su ve besin taşınımını sınırlayarak vegetatif büyümeyi yavaşlatır. Bu sınırlama, iletim dokularının (ksilem ve floem) daha dar çaplı olması, hidrolik iletkenliğin düşmesi ve hormonların (özellikle oksin ve sitokinin) taşınmasındaki azalmayla ilgilidir. Hormonal düzenlemeler bodurluk mekanizmasının temel bileşenlerinden biridir. Gibberellin (GA) sentezinde görevli genlerin düşük ekspresyonu, bu hormonun yıkımında rol alan GA2ox genlerinin artmış aktivitesi, bitkide internod uzamasını sınırlar ve bodur gelişim profili oluşturur. Sitokininlerin kökten gövdeye taşınması yavaşladığında, meristematik hücre bölünmesi azalır ve büyüme hızı düşer. Aynı şekilde oksin taşınımında görevli PIN proteinlerinin azalması, büyüme yönünün düzenlenmesinde aksaklıklara yol açar. Ayrıca, stres hormonlarından biri olan absisik asit (ABA), bodur anaçlarda daha fazla üretildiğinden büyümeyi baskılayıcı rol oynar. Genetik ve moleküler düzeyde yapılan çalışmalar, bodurluğun birçok genetik bölgeyle ilişkili olduğunu ortaya koymuştur. Elmada Dw1 ve Dw2, kirazda GAI ve RGL gibi gen bölgeleri bodur fenotipe neden olan kritik lokuslar arasında yer alır. Bu bölgeler, hücre uzaması, hormonal sinyal iletimi ve iletim dokusu gelişimi gibi büyümeyle ilişkili süreçleri düzenler. Ayrıca, mikroRNA'lar ve DNA metilasyonu gibi epigenetik faktörler de bodurluğun kalıtsal olmayan düzenleyicileri arasında gösterilmiştir. Bu durum, doku kültürü gibi tekniklerle üretilen klonal anaçların bodurluk profillerinde değişikliklere yol açabilir. Araştırmalar, ayrıca kabuk kalınlığı, tomurcuklanma yüksekliği, güneşe maruz kalma süresi, budama şekilleri ve ekim derinliği gibi kültürel uygulamaların da bodurluk üzerinde belirleyici etkiler oluşturabileceğini göstermektedir. Bodurluk mekanizmasının tüm türlerde ortaya konması, yeni anaçların ıslahı ile ilgili çalışmalara da katkı sunacaktır. Bu doğrultuda yapılacak araştırmalar ve geliştirilecek yeni anaçlar, meyve üretiminde sürdürülebilirliği ve kaliteyi daha ileriye taşıyacaktır.

PASSIVE IMMUNITY AND ITS IMPORTANCE IN CALVES

Doç. Dr. Ertuğrul KUL,

ORCID NO: 0000-0003-4961-5607

ABSTRACT

Calf diseases cause significant economic losses in dairy cattle farm. The level of immunity conferred against various infections immediately after birth is crucial in determining calf mortality and morbidity rates. In ruminant, antibodies cannot be transferred to the fetus before birth; hence, calves rely on colostrum for acquiring necessary antibodies. It is critical that they receive high-quality colostrum within the first hours of birth. Therefore, effective development of passive immunity in calves relies on timely ingestion of colostrum in sufficient quantity and quality. Newborn calves require immune components from their mothers' colostrum during the first 28 d post-birth, known as the neonatal period, which extends until their immune system becomes active. Thus, passive immune transfer in newborn calves is assessed by measuring serum IgG concentrations between 24 h and 48 h after colostrum consumption. In this regard, the timely intake of colostrum in sufficient quantity and quality significantly contributes to the development of passive immunity in calves. There are five different Ig fractions in colostrum: IgM, IgG, IgA, IgD and IgE. Among these, IgG is the predominant antibody isotype, constituting approximately 75% of the total Ig level in bovine colostrum. Colostrum containing over 50 g/L IgG is classified as quality colostrum. Serum TP ≥5.5 g/dL is considered as sufficient colostral antibody level, while TP<5.5 g/dL is considered as insufficient. Effective colostrum management is, therefore, essential for ensuring calf health, survival, and future productivity. Successful passive transfer is associated with reduced veterinary expenses, increased live weight gain, improved performance, and longevity. Therefore, newborn calves should receive a minimum of 2 L of colostrum, approximately 10% of their birth weight, within 2 h of birth.

Keywords: Calf, Passive Immunity, Colostrum, IgG

BUZAĞILARDA PASİF BAĞIŞIKLIK VE ÖNEMİ

ÖZET

Buzağı hastalıkları süt sığırcılığı işletmelerinde önemli ekonomik kayıplara yol açmaktadır. Doğumdan hemen sonra çeşitli enfeksiyonlara karşı kazanılan bağışıklık düzeyi, buzağı ölüm ve hastalık oranlarını belirlemede oldukça önemlidir. Ruminantlarda, antikorlar doğumdan önce fetüse aktarılamaz; bu nedenle buzağılar gerekli antikorları edinmek için kolostruma ihtiyaç duyarlar. Buzağıların doğumdan sonraki ilk saatlerde yüksek kaliteli kolostrum almaları kritik öneme sahiptir. Bu nedenle, buzağılarda pasif bağışıklığın etkili bir şekilde gelişmesi, yeterli miktar ve kalitede kolostrumun zamanında alınmasına bağlıdır. Yenidoğan buzağılar, bağışıklık sistemleri aktif hale gelene kadar neonatal dönem olarak bilinen doğumdan sonraki ilk 28 gün boyunca annelerinin kolostrumundan gelen bağışıklık maddelerine ihtiyaç duyarlar. Nitekim, yenidoğan buzağılarda pasif bağışıklık transferi, kolostrum tüketiminden sonraki 24 saat ile 48 saat arasında serum IgG konsantrasyonlarının ölçülmesiyle belirlenir. Bu bağlamda, yeterli miktar ve kalitede kolostrumun zamanında alınması buzağılarda pasif bağışıklığın gelişmesine önemli ölçüde katkıda bulunur. Kolostrumda IgM, IgG, IgA, IgD ve IgE olmak üzere beş farklı Ig fraksiyonu bulunur. Bunlar arasında IgG baskın antikor izotipidir ve sığır kolostrumundaki toplam Ig seviyesinin yaklaşık %75'ini oluşturur. 50 g/L'den fazla IgG içeren kolostrum kaliteli kolostrum olarak sınıflandırılır. Serum TP ≥5.5 g/dL yeterli pasif transfer olarak değerlendirilirken TP<5.5 g/dL yetersiz olarak kabul edilmektedir. Bu nedenle, etkili kolostrum yönetimi buzağı sağlığını, hayatta kalmasını ve gelecekteki üretkenliğini sağlamak için gereklidir. Başarılı pasif transfer, veteriner masraflarının azalması, canlı ağırlık artışının artması, performansın iyileşmesi ve uzun ömürle ilişkilidir. Bu nedenle, yeni doğan buzağılar doğumdan sonraki 2 saat içinde doğum ağırlıklarının yaklaşık %10'u kadar en az 2 L kolostrum almalıdır.

Anahtar Kelimeler: Buzağı, Pasif Bağışıklık, Kolostrum, IgG

1. GİRİŞ

Yenidoğan buzağı ölüm ve hastalıkları süt çiftliğinde ekonomik kayıplara neden olur. Bu nedenle, doğumdan hemen sonra çeşitli enfeksiyonlara karşı kazanılan bağışıklık düzeyi, buzağı ölüm ve hastalık oranlarını belirlemede çok önemlidir (Murphy ve ark., 2005). Buzağıların genetik potansiyellerine ulaşmalarını sağlamak için onlara immünolojik kaynaklı uygun ve dengeli bir diyet sağlamak süt çiftliklerinin ilk işidir. Buzağıların temel besin kaynağı olan kolostrum (Indra ve ark., 2012), doğumdan sonra yeterli miktar ve kalitede derhal sağlanmalıdır. Bu nedenle etkili kolostrum yönetimi, buzağı sağlığını, hayatta kalmasını ve gelecekteki üretkenliğini sağlamak için esastır (Soufleri ve ark., 2019).

Plasentanın türü ve yapısı, farklı hayvan türlerine göre önemli ölçüde değişir. Doğum öncesi dönemde plasentadan yavruya antikor aktarma yeteneği doğrudan plasentanın tipi ve yapısından etkilenir (Arda, 1994). Ruminant plasentaları, antikorların doğumdan önce fetüse aktarılamadığı sindesmokorial tipe aittir ve bu nedenle buzağılar gerekli antikorları edinmek için kolostruma güvenirler. Bunun nedeni, makromoleküler yapıya sahip bağışıklık bileşenlerinin gebelik sırasında plasenta bariyerini geçememesi ve fetal dolaşıma girememesidir. Sonuç olarak, yeni doğan buzağılar, bağışıklık sistemleri aktif hale gelene kadar uzanan neonatal dönem olarak bilinen doğumdan sonraki ilk 28 gün boyunca annelerinin kolostrumundan gelen bağışıklık bileşenlerine ihtiyaç duyarlar (Kara ve ark., 2020). Bu nedenle, doğumdan sonraki ilk saatlerde yüksek kaliteli ve miktarda kolostrumun zamanında tüketilmesi buzağı sağlığı için çok önemlidir. Bu bağlamda buzağılarda yeterli miktar ve kalitede kolostrumun zamanında alımı pasif bağışıklığın gelişmesine önemli katkı sağlamaktadır (Zarei ve ark., 2017; Soufleri ve ark., 2019).

2. PASİF BAĞIŞIKLIK VE ÖNEMİ

Pasif bağışıklık transferi, buzağıların sindirim sistemi yoluyla kolostrumdan immünoglobulinleri (Ig) emerek bağışıklık kazandığı süreci ifade eder (Kara vd., 2020). Kolostrum, buzağılara pasif bağışıklık sağlayarak onları potansiyel olarak ölümcül bakteriyel enfeksiyonlara karşı koruyarak hayati bir avantaj sunar (Abdullahoğlu vd., 2019). Kolostrumu tüketmeden önce, buzağının kan serumu minimum Ig içerir ve bakterisidal ve lizozim aktivitesi ile bağışıklığı ya yoktur ya da çok düşüktür (Gerov vd., 1987). Buzağıların doğumdan sonraki ilk saatlerde yüksek kaliteli kolostrum almaları sağlıkları için kritik öneme sahiptir. Bu nedenle, buzağılarda pasif bağışıklığın etkili bir şekilde gelişmesi, yeterli miktarda ve kalitede kolostrumun zamanında alınmasına bağlıdır (Zarei vd., 2017).

3. PASİF TRANSFER YETERSİZLİĞİ

Pasif transfer yetersizliği, buzağılarda yaşamın ilk 36 saati içinde yetersiz serum IgG konsantrasyonu olarak tanımlanmaktadır. Gelişmiş hayvancılık ülkelerinde pasif bağışıklığın iyi bilinen önemine rağmen, önemli bir pasif transfer başarısızlığı oranı (%35-40) devam etmektedir (Demir ve Tütüncü, 2022). Başarılı pasif transfer, daha düşük veteriner masrafları, artan canlı ağırlık artışı, gelişmiş performans ve uzun ömür ile ilişkilidir (Dunn ve ark., 2017). Buzağılarda pasif transferin başarısızlığı daha yüksek ölüm ve hastalık oranlarına yol açar (Cummins ve ark., 2017). Bu nedenle, yeni doğan buzağılar doğumdan sonraki 2 saat içinde

doğum ağırlıklarının yaklaşık %10'u olan en az 2 L kolostrum almalıdır (Kehoe ve ark., 2007). Doğumdan hemen sonra kolostrum sağlanması kritik öneme sahiptir, çünkü yeni doğan buzağıların antikorları emme yeteneği zamanla hızla azalır (Kehoe ve ark., 2007; Yang ve ark., 2015).

4. PASİF TRANSFER DURUMUNUN TESPİTİ

Yenidoğan buzağılarda pasif bağışıklık transferi, kolostrum tüketiminden sonraki 24 saat ile 48 saat (36 saat) arasında serum IgG konsantrasyonlarının ölçülmesiyle değerlendirilir (Smith ve Foster, 2007; Godden, 2008). Bu dönemde serum IgG konsantrasyonları 10 g/L'nin altında olan buzağılar pasif transferin başarısız olduğu şeklinde tanımlanır (Filteau ve ark., 2003; Godden, 2008). Doğumdan 28 güne kadar uzanan neonatal dönem, en fazla buzağı kayıplarının yaşandığı dönem olması nedeniyle kritik öneme sahiptir (Yüceer ve Özbeyaz, 2010). Ancak, bir süt sığırcılığı çiftliğinin başarısı için buzağı sağlığının doğumdan sütten kesime kadar sağlanması esastır (Genc ve Coban, 2017). Bu nedenle, serum IgG konsantrasyonunun ve kolostrumun ölçülmesi esastır.

Kolostrum ve serum Ig konsantrasyonlarını belirlemek için çeşitli yöntemler kullanılmaktadır ve bazıları radyal immünodifüzyon (RID) ve doğrudan biyosensör SPR immünolojik testi gibi geleneksel laboratuvar tekniklerini kullanmaktadır. Ancak bu yöntemlerin yüksek maliyet, teknik ekipman gereksinimi ve laboratuvar olanaklarına bağımlılık gibi çeşitli dezavantajları vardır. Öte yandan dijital Brix refraktometreleri önemli avantajlar sunmaktadır: daha kolay, daha uygun maliyetli, kullanıcı dostu, dayanıklı ve süt çiftliklerinde dış etkilere karşı daha az hassastır (Abdullahoğlu vd., 2019). Çalışmalar, brix refraktometrelerinin saha koşullarında güvenilir araçlar olduğunu göstermiştir (Quigley vd., 2013; Demir ve Tütüncü, 2022).

5. KOLOSTRUM VE YAPISI

Doğumdan hemen sonra memeden salgılanan süte kolostrum veya ağız sütü denir (Christensen, 1999). Kolostrum renk ve bileşim bakımından normal süte göre oldukça farklı olup (Erdem ve Atasever, 2005), buzağılarda laksatif etki yaparak sindirim sistemini temizlemekte ve yavruya bol miktarda protein, mineral ve vitamin sağlamaktadır (Özhan ve ark., 2001).

Tablo 1. Kolostrumun içeriğinin normal sütle karşılaştırılması*

İçerik (%)	Kolostrum	Transit süt		Normal süt
	(1. gün)	(2. gün)	(3. gün)	
Kuru Madde	23.9	17.9	14.1	12.6
Yağ	6.7	5.4	3.9	3.6
Yağsız KM	16.7	12.2	9.8	9.6
Top. Protein	14.0	8.4	5.1	3.2
Laktoz	3.3	4.0	4.7	5.0
Mineral	1.03	0.90	0.81	0.74
Ig	6.0	4.2	2.4	0.09

*Wattiaux ve Howard, 1997; Erdem ve Atasever, 2005

Kolostrum, A, D, E ve B-12 vitaminlerinin yanı sıra fosfor (P), magnezyum (Mg), potasyum (K) ve çinko (Zn) gibi mineraller açısından zengindir (Bayram ve ark., 2008). Ayrıca, süt proteini ile birlikte vücut ısısının korunmasına yardımcı olan yağ ve şeker formundaki enerji kaynakları da içerir (Selk, 2007). Kas ve kıkırdak dokusunun onarımında etkili olan büyüme faktörleri de kolostrumun yapısında yer almaktadır (Christensen, 1999). Kolostrum, doğumdan sonra yaklaşık 48 saat içinde geçiş sütüne, 72 saat içinde ise olgun süte dönüşmektedir (Erdem ve Atasever, 2005). Tablo 1'de görüldüğü üzere kolostrum, diğer sütlerle karşılaştırıldığında daha fazla kuru madde, yağ, yağsız kuru madde, protein ve immünoglobulin içermektedir. Bununla birlikte, laktoz miktarı ise olgun süte kıyasla daha düşüktür.

Kolostrum, normal süte oranla yapısında daha fazla büyüme faktörü ve antimikrobiyal bileşen içermektedir. Büyüme faktörleri arasında büyüme hormonu (GH), insülin benzeri büyüme faktörleri (IGF-I ve IGF-II), IGF bağlayıcı protein, insülin, epidermal büyüme faktörü (EGF), fibroblast büyüme faktörleri (FGF1 ve FGF2) ile dönüştürücü büyüme faktörü-beta (TGF-β1, TGF-β2 ve TGF-β3) yer almakta olup, bu faktörler yeni doğanların büyümesini, gelişimini ve bağırsaklardaki hücre çoğalmasını desteklemektedir. Antimikrobiyal faktörler arasında ise immunoglobulinler, laktoferrin, lizozim, laktoperoksidaz, antikorlar, prolinden zengin polipeptitler (PRP), sitokinler, glikoproteinler ve tripsin inhibitörü bulunmaktadır. Bu bileşenler, yaşamın ilk haftalarında enfeksiyonlara karşı pasif bağışıklık sağlayarak koruyucu etki göstermektedir (Kul ve ark., 2014).

6. KOLOSRUMDA BULUNAN İMMONGLOBULİNLER

Kolostrumda IgM, IgG, IgA, IgD ve IgE olmak üzere beş farklı immünoglobulin (Ig) tipi bulunur (Butler, 1969; Aghakhani ve ark., 2022). Bu immünoglobulinler arasında en yüksek oranda bulunan IgG, toplam Ig miktarının yaklaşık %75'ini oluşturur (Korhonen ve ark., 2000; McGuirk ve Collins, 2004; Georgiev, 2008). Doğum öncesinde kandan meme epitel hücrelerine transfer edilen IgG, meme bezinde birikerek kolostrumdaki en baskın Ig haline gelir. Bu

nedenle, kolostrumdaki IgG düzeyi, buzağı sağlığı açısından büyük önem taşır. Bu bağlamda, kolostrumun kalitesini değerlendirmek için IgG konsantrasyonu belirleyici bir gösterge olarak kabul edilir (Conneely ve ark., 2013). IgG konsantrasyonu 50 g/L'nin üzerinde olan kolostrum, yüksek kaliteli kolostrum olarak nitelendirilir (McGuirk ve Collins, 2004).

7. KOLOSTRUM KALİTESİ ÜZERİNE ETKLİ FAKTÖRLER

Kolostrumun bileşimi ve kalitesi üzerinde birçok faktör etkili olmaktadır. Kolostrum ağırlığı ile kalitesi arasında önemli bir ilişki olduğu belirtilmektedir (Conneely ve ark., 2013; Chuck ve ark., 2017). Ayrıca, laktasyon sırası ile kolostral IgG konsantrasyonu arasında pozitif bir ilişki söz konusudur (Conneely ve ark., 2013; Dunn ve ark., 2017). Birden fazla doğum yapmış ineklerin, ilk doğumunu yapan ineklere kıyasla daha fazla kolostrum ürettiği bildirilmiştir (Zarei ve ark., 2017). Bunun temel nedeni, yaşça büyük ineklerin daha fazla hastalık etkeniyle karşılaşmış olması ve dolayısıyla kolostrumda daha fazla antikor üretmesidir (Göncü ve Gökçe, 2015). Bu durum, yaşlı ineklerin daha yüksek IgG konsantrasyonuna sahip kolostrum üretmesine yol açmaktadır (Larson ve ark., 1980).

Buzağılama mevsimi de kolostrum kalitesini etkileyen bir diğer faktördür. İlkbahar ve sonbaharda doğum yapan ineklerle karşılaştırıldığında, kış aylarında buzağılayan ineklerin kolostral IgG düzeyleri daha yüksek bulunmuştur (Zarei ve ark., 2017). Kısa kuru döneme sahip ineklerde ise kolostrum kalitesinin genellikle daha düşük olduğu ifade edilmektedir. Kuru dönem uzunluğu ve doğum sırasında VKP (Vücut Kondisyon Puanı) değişiklikleri, doğum sonrası hastalık görülme riski ve süt verimi üzerinde de etkili olmaktadır (Dirandeh ve ark., 2020; Melendez ve ark., 2020).

Bunun yanı sıra, annenin sağlık durumu (Imler ve ark., 2021), güç doğum (Perino ve ark., 1995), buzağının cinsiyeti (Filteau ve ark., 2003; Yüceer ve Özbeyaz, 2010; Martin ve ark., 2021), davranışsal faktörler (Arthington, 1999), doğum ağırlığı (Yüceer ve Özbeyaz, 2010; Pritchett ve ark., 1991; Conneely ve ark., 2013) ve çevresel stres etmenleri (Pritchett ve ark., 1991; Conneely ve ark., 2013) de kolostrum kalitesini etkileyen diğer önemli unsurlar arasında yer almaktadır.

7. SONUÇ

Doğumda bağışıklık sisteminin tam olarak gelişmediği ve bu nedenle yeni doğan buzağıların olgun ineklere göre enfeksiyon kapma riskinin daha fazla olduğu sonucuna varılmıştır. İmmünoglobulinler esas olarak doğumdan yaklaşık 24 saat sonra ince bağırsakta gelişigüzel bir pinositotik süreçle emilir. Kolostrumun buzağı sağlığını ve hayatta kalmasını belirlemedeki önemi iyi bilinmektedir. Zamanında ve yeterli kolostrum alımı, sütten kesilmemiş buzağılarda morbidite ve mortaliteyi etkileyen en önemli yönetim faktörüdür. Sığırlarda anneden yenidoğana bağışıklık aktarımı esas olarak kolostrum beslemesi yoluyla yapılır. Buzağılarda yüksek mortalitenin en önemli nedeni yetersiz kolostrum beslemesi ve yönetimidir. Bu nedenle buzağılara enfeksiyonlara ve hastalıklara karşı korunmak için ≥50 mg/mL IgG konsantrasyonuna sahip olan ve immünoglobulinler açısından zengin olan kolostrumu doğumdan en geç iki saat içerisinde canlı ağırlığın yaklaşık %10'u kadar tüketmeleri gerekmektedir

ABSTRACT

Survival, defined as the ability of a living creature to survive, is an important factor in sheep breeding, but it also determines the evaluation of fertility capacity on farms and also determines profitability in livestock farming. Fertility, defined as the ratio of offspring or the number of offspring produced by female mothers during the gestation period, is a term used in animal breeding. Animals with a high fertility produce as many offspring as possible in a gestation period and have a high survival rate. The number of live offspring at weaning is one of the most important criteria for determining fertility. It is very important to know the main factors affecting the survival in order to avoid unnecessary losses of lambs. Keeping animal losses in flocks at the lowest possible level is the most effective and important factor in all livestock and small ruminant farming in terms of economic production. These losses occur more frequently in young animals than in adult animals. Survival rate is expressed as the ability to survive from birth to a certain age and is an important indicator of adaptation to environmental conditions. In this context, the aim of this study was to investigate the factors affecting the survival of lambs and kids.

Keywords: Lamb, Kid, Survival, Weaning.

KUZU VE OĞLAKLARDA YAŞAMA GÜCÜ ÜZERİNE ETKİLİ FAKTÖRLER

ÖZET

Canlının hayatta kalabilme kabiliyeti olarak nitelendirilen yaşama gücü, koyun yetiştiriciliğinde önemli bir faktör olmakla birlikte işletmelerde ki döl verimi kapasitesinin değerlendirilmesinde ve aynı zamanda hayvancılıkta kârlılığı da tayin etmektedir. Gebelik döneminde anaç dişilerden elde edilen yavru oranı veya yavru sayısı olarak belirtilen döl verimi bir hayvan yetiştirme terimi olarak ifade edilir. Döl verimi yeteneği yüksek hayvanlar bir gebelik döneminde mümkün olduğu kadar fazla sayıda ve yaşama gücü yüksek yavrular meydana getirmektedir. Sütten kesimdeki canlı yavru sayısı döl veriminin belirlenmesinde en önemli kriterlerden biridir. Kuzularda yaşama gücünü etkileyen başlıca faktörlerin bilinmesi, gereksiz kuzu kayıplarının önlenmesi açısından son derece önemlidir. Sürülerde hayvan kayıplarının mümkün olan en az seviyede tutulması tüm çiftlik hayvanlarında ve küçükbaş hayvan yetiştiriciliğinde de üretimin ekonomik olmasında en etkili ve önemli faktördür. Yavrularda bu kayıplara ergin hayvanlardan daha yaygın olarak karşılaşılmaktadır. Yaşama gücü canlının doğumundan belirli yaşa ulaşıncaya kadar hayatta kalabilme yeteneği olarak ifade edilmekle birlikte çevre koşullarına uyumun önemli bir göstergesidir. Bu bağlamda bu çalışmada kuzu ve oğlaklarda yaşama gücü üzerine etkili faktörlerin incelenmesi amaçlanmıştır.

Anahtar Kelimeler: Kuzu, Oğlak, Yaşama Gücü, Sütten Kesim.

1. GİRİŞ

Hayvansal üretim dallarında başarılı olmanın ilk koşulu mevcut hayvanlardan düzenli döl alınmasıdır (Selvi, 2021). Koyun ve keçilerde döl verimi, üreme fizyolojisi ile gelişme kabiliyeti ve yaşama gücüne bağlıdır. Döl veriminin belirlenmesinde gebelik oranı, doğum oranı, doğumda kuzu sayısı gibi çeşitli kriterler kullanılır. Ancak pratikte kullanılan esas ölçü sütten kesimdeki kuzu ve oğlak sayısıdır (Akçapınar, 2000). Hayvansal üretimde temel amaç, yem ve diğer kaynakların etkin kullanımı ile maksimum büyümedir. Büyüme üzerine besinler, hormonlar, enzimler, sıcaklık gibi pek çok faktör etkilidir (Indu vd., 2014) ve bu süreç döllenmeden itibaren yetişkinliğe kadar olan döneme kadar değişerek devam eder. Hayvanların büyüme ve verim performansları, farklı stres etkenlerinden olumsuz etkilenir. Strese yanıt olarak artan glukokortikoid seviyeleri, ön hipofizden büyüme hormonu (GH) salgılanmasını engelleyen somatostatinin hipotalamik salgılanmasını uyarır. Hayvanların büyümesi bu stres hormonlarından etkilenir (Rushton, 2009).

Kuzu ve oğlaklarda yaşama gücü, koyun ve keçilerin genel üreme performansı üzerinde direkt bir etkiye sahip olmasının yanında, hayvan refahı noktasında da önemli bir göstergeyi oluşturması ile sürülerde büyüme, karlılık ve sürdürülebilirliğin temel göstergesidir (Mellor ve Stafford, 2004). Bu kriter üzerine hem genetik hem de sürü yönetim uygulamaları önemli rol oynamaktadır (Hinch ve Brien, 2014). Özellikle sürü yönetim uygulamaları içinde önemli bir yer tutan gebeliğin son döneminde koyunların doğru beslenmesi, yavrunun uterus içi gelişimi ve buna bağlı olarak doğum sonrası hayatta kalma noktasında önemlidir (Koyuncu ve Duymaz, 2017).

Gebeliğin ilk döneminde koyunun vücut kondisyonu, verilen yem miktar ve bileşimiyle ilişkili olup doğrudan plasenta gelişimi, uterus ve plasenta kan akışının etkilenmesi ile embriyonun gelişimi için önemli etkiye sahiptir (Koyuncu ve Duymaz, 2017; Şen, 2016). Gebeliğin başlangıcı ve doğuma kadar olan süreçte annenin beslenmesi yavrunun sağlıklı olmasını ve yaşama gücünü arttırır. Ayrıca bu dönemde annenin beslenme seviyesi plasenta yavru ilişkisi, yavrunun doğum ağırlığı ve doğumdan sonra yaşama gücü ile pozitif ilişkilidir (Brien vd., 2014; Oldham vd., 2011). Küçükbaş hayvan yetiştiricilerinin en çok karşılaştığı yönetim zorluklarından biri yeni doğan kuzu ve oğlakların canlı olması ve yaşatılmalarında devamlılığının sağlamasıdır (Dwyer, 2008). İşletmelerde verimliliği yükseltmede temel amaç, bir anaç başına doğan kuzu-oğlak sayısı ve dönem içinde kayıpları azaltarak büyütülen kuzu-oğlak sayısını arttırmaktır (Koyuncu ve Duymaz, 2017).

Bir kuzuyu ya da oğlağı doğumdan sütten kesime kadar ki yaşatma başarısı, fizyoloji, davranış, genetik, gebeliğin sonu, kuzulama-oğlaklama dönemi beslenme ve mevcut çevre koşulları gibi bir seri karmaşık bileşkenin sonucudur (Hatcher ve ark., 2010). Yavru kayıplarının önemli bir kısmı doğumu takiben ilk 48 saatte görülür (Brien ve ark., 2009) ve bunların büyük çoğunluğunda zor doğum, ananın kaybedilmesi ve besin yetersizlikleri gibi noktalar öne çıkmaktadır (Nowak ve Poindron 2006; Geenty ve ark., 2014).

Büyüme ağırlık ve boyut artışı olarak tanımlanır ve canlıların en önemli biyolojik özelliklerinden birisidir (Van der Merwe ve ark.,2019; Hızlı ve Yazgan, 2021). Yaşama gücü oranı canlının doğumundan itibaren belirli yaşlara kadar hayatta kalabilme yeteneği olarak tanımlanmaktadır (Özbey ve ark., 2000). Yaşama gücü karlı bir hayvancılık işletmesi için önemli bir kriterdir (Ünal ve ark.,2018). Büyüme ve hayatta kalma oranı üzerinde genotip ve

çevre faktörleri (cinsiyet, doğum ağırlığı, doğum tipi, doğum yılı, doğum mevsimi, ananın yaşı ile canlı ağırlığı ve bakım ve beslenme gibi) rol oynamaktadır (Akçapınar ve Özbeyaz, 1999; Ghotbaldini ve ark., 2019). Bu sebeple büyüme ve hayatta kalma oranı çevre koşullarına uyumun önemli bir göstergesi olarak kabul edilir ve kârlı hayvancılık yapabilmek için belli dönemlerde hesaplanmaktadır (Gürsoy, 2005). Farklı tür ve ırklarda yapılan çalışmada, farklı yaşlarda hayatta kalma üzerine ana yaşı, cinsiyet, doğum tipi, doğum mevsimi gibi farklı çevresel faktörlerin etkisinin olduğu bildirilmiştir (Çelik ve Oflaz, 2017; Koyuncu ve Duymaz, 2017; Taşkın ve ark., 2010; Türkyılmaz ve ark., 2021; Tüfekci, 2023)

2. DOĞUM AĞIRLIĞI, DOĞUM TİPİ, CİNSİYET

Araştırmacılar çevresel koşullar ve beslenmenin yanı sıra doğum ağırlığı, cinsiyet, yavru sayısı ve anaya ait davranışların yeni doğanlarda adaptasyon parametreleri üzerinde etkin rol oynadığını bildirmektedir (Awemu ve ark., 1999; Moors, 2005). Kuzu ve oğlaklarda yaşama gücü üzerine etkili olan faktörler olarak kuzunun doğum ağırlığı, doğum tipi, cinsiyet, ananın beslenmesi ve yaşı öncelikli olarak sıralanır (Hatcher ve ark., 2009). Bunlar içinde doğumu takip eden ilk birkaç günde yaşama gücü üzerinde en fazla etkisi olan yavrunun doğum ağırlığıdır. Yavru ölümlerinin önemli bir kısmı doğumdan sonraki ilk günlerde yoğunlaşır ve bu da genellikle doğum ağırlığı ile ilişkilendirilmektedir (Nowak ve Poindron, 2006). İdeal doğum ağırlığı aralığı, ırklar arasında farklılık göstermektedir. Reshauge ve ark., (2016) yaptıkları çalışmada düşük doğum ağırlığında doğan kuzuların aç kalmaya bağlı sorunlardan dolayı ölüm oranlarının daha yüksek olduğu bildirmişlerdir. Düşük canlı ağırlıkta doğan kuzular, vücut büyüklüğü ve enerji rezervleri ile ilişkili daha zayıf ısı düzenleme yeteneğine sahiptirler. Bu tip kuzularda gebeliğin son döneminde oksijen ve enerjinin yetersiz olması ile ilişkili olarak gelişimleri yavaşlamaktadır. Everett-Hincks ve Dodds (2008) tarafından ifade edildiği gibi optimum doğum ağırlığının ortalamanın 0.5-1 kg üzerinde olan kuzlarda açlığa bağlı ölüm riskinin düşük, zor doğum olgunun daha az ve kuzularda yaşama gücünün daha yüksek olduğu ifade edilmektedir. Daha ağır doğum ağırlığına sahip kuzularında azalan yaşama gücü, zor doğum ve doğumun uzun sürmesinin direkt bir sonucudur (Dwyer, 2003).

Doğumdan sonra yavrunun "yaşama gücü" göstergesi olarak kullanılabilecek iyi bir kriter olan canlılık puanı, özellikle doğum sonrası yavru ile doğum öncesini ve yavru büyümesini ele alan çalışmalarda yer alabilir (Konyalı ve ark., 2004). Hayvanın canlılığını subjektif olarak değerlendirmeyi hedefleyen ve çeşitli çalışmalarda canlılık puanının oluşturulmasında kullanılan en önemli kriterler oğlağın doğumdan sonra ilk defa ayağa kalkması ve anasını emme özellikleridir (Werning, 1993; Cloete ve Scholtz., 1998; Wollny, 2000; Leenhouvers ve ark., 2001). Doğum sonrası oğlak kayıplarının önemli bir nedeni düşük doğum ağırlığıdır (Husain ve ark., 1995; Perez-Razo ve ark., 1998; Miah ve ark., 2002). Doğum ağırlığı ile sütten kesim sonrası yaşama gücü arasında güçlü bir ilişki bulunmaktadır (Singh ve ark., 1991). Çoğuz doğan oğlaklarda, doğum ağırlıklarının tekiz doğanlara göre nispeten daha düşük olması nedeniyle ölüm riski daha yüksektir (Miah ve ark., 2002; Milligan ve ark., 2002).

Doğum tipinin tek başına kuzularda doğum ağırlığı üzerine önemli bir etkisi vardır (Gardner ve ark., 2007). Doğum tipi, kuzularda yaşama gücünü özellikle de ikiz kuzu kayıplarıyla önemli oranda etkiler. İkiz kuzularda ölüm nedenleri olarak açlık veya doğum sırasında yaralanma öne çıkarken, tekiz kuzularda ise ölü doğum veya zor doğum kaynaklı kayıplar daha yüksek

gerçekleşmektedir (Refshauge ve ark.,2016). Doğumdan sütten kesime kadar kuzu ölümlerinin önemli bir kısmı çoğuz doğan kuzularda görülmektedir. Çoğuz doğan kuzlarda yaşama gücünün düşük olmasına neden olan faktörler doğum güçlükleri, düşük doğum ağırlığı, doğum pozisyonu, vücut yağ rezervlerinin az olması, diğer kardeşi ile kolostrum ve süt içme rekabeti, ananın sütünün yetersiz olması olarak sıralanmaktadır (Hatcher ve ark., 2010).

Doğum tipi ve cinsiyetin kuzu ve oğlakların doğum ağırlıkları üzerine önemli bir etkisi vardır. Kuzu ve oğlaklarda doğum tipi, doğum ağırlığının değerlendirilmesinde dikkate alınması gereken bir faktördür. Doğum ağırlığı üzerinde cinsiyetin, erkeklerin dişilere nazaran daha yüksek doğum ağırlığına sahip olmaları şeklindeki bilinen etkisi (Ünalan ve Cebeci, 2001), ancak doğum tipinin de dikkate alınması koşuluyla doğru bir ifadedir (Daş ve Savaş, 2002). Bunun ötesinde doğum ağırlığı üzerinde oldukça belirgin bir cinsiyet-doğum tipi etkileşimi bulunmaktadır (Savaş, 2007).

3. BESLEME, BARINMA

Küçükbaş hayvanlarda beslenme, yavrularda yaşam boyu etkili olan prenatal dönemde etkisi olan önemli çevresel bir faktördür. Gebelik döneminde yetersiz beslenme ve aşırı beslenme fetal beslenmeyi olumsuz etkileyebilir (Igwebuike, 2010). Gebelik döneminde yetersiz beslenme gerekli besinlerin eksik alınmasına neden olur. Gebelikte yavru sayısı ve besin yetersizlikleri arasında önemli ilişki vardır (Igwebuike, 2010). Gebeliğin başlangıcından ortasına kadarki enerji alımının kuzu doğum ağırlığına etkisinin az (Gardner ve ark., 2007), gebelik öncesi vücut kondisyonu ve gebeliğin son dönemindeki enerji alımı ise doğum ağırlığına önemli etki etmektedir (Gardner ve ark., 2007; Igwebuike, 2010). Gebelik döneminde aşırı besin alımı plasental ve fetal büyümede gerileme ve ölüme (Wallace ve ark., 2003), gebelik süresinin düşmesine neden olabilir (Wallace ve ark., 2005). Gebelikteki beslenme karaciğer ve iskelet kasları gibi fetal organların büyümesini etkileyebilir (Brameld ve ark., 2000). Yetersiz besin alımı plasental büyümeyi etkileyerek fetal endokrin çevresinde değişmelere neden olup yumurtalık gelişimine zarar verebilir (Da Silva ve ark., 2003). Aynı zamanda bu durum kemik gelişimini ve organların ağırlıklarını olumsuz etkileyebilir (Osgerby ve ark., 2002), erken doğuma ve düşük doğum ağırlığına neden olabilmektedir. İvesi koyunlarında annenin doğumdaki canlı ağırlığı ve vücut kondisyon puanının kuzu doğum ağırlığına etkisi önemli olduğu belirtilmiştir (Şireli, 2019). Tozlu Çelik ve Tüfekci, (2022) yaptıkları çalışmada; plasenta gelişimi, yavru doğum ağırlığını etkilediği, laktasyon sırası ve yaşa göre besleme yapılması plasenta gelişimini olumlu etkileyebileceği ve kuzu yaşama gücüne doğum ağırlığının etkisinin oldukça önemli olduğu bildirilmiştir.

Gebeliğin son döneminde ek yoğun yemlemeyle koyunlarda ağırlık kaybının azaldığı ve erken laktasyon devresinde süt veriminin artışı yanında kuzularda doğum ağırlığı ve yaşama gücünün yükseldiği bildirilmiştir (Treacher, 1970; Ergin ve ark., 1989). Koyunlarda fötüsün gelişmesi gebeliğin 4. ayından itibaren hızlanmaktadır. Bu dönemde fötüste protein, yağ, Ca ve P birikimi sonucunda ağırlık artmaktadır. Diğer yandan süt bezlerinin laktasyon için hazırlanması da bu dönemde olmaktadır. Gebeliğin son 6 haftalık süresi olan bu dönemdeki besleme ve kuzuların doğum ağırlıkları ile yaşama güçleri ve gelişme hızları arasında bir ilişki olduğu da saptanmıştır (Orr and Treacher, 1984; Apolant and Chestnutt, 1985).

Hooda ve ark. (2014) yaptıkları çalışma sonucunda, yem kısıtlaması ve termal stresin fizyolojik reaksiyonlar, mineral dengeleri, enzim aktiviteleri, hormon salgısı ve kan metabolitlerinde meydana gelen değişikliklerle ortaya çıktığı üzere oğlaklar üzerinde ciddi etkileri olduğu bildirilmiştir. Ayrıca yem kısıtlaması ve termal strese maruz kalan grup daha fazla stres yaşamış ve bu grupta vücut ağırlığında meydana gelen kayıplar grup stres sonrası dönemde telafi edilemediği bildirilmiştir.

Araştırmacılar çevre sıcaklıklarının ani değişimleri sonucu termal değişimden kaynaklanan sıcaklık stresi gibi olumsuzlukların yavru kayıplarına neden olabileceğini bildirmektedir (Ayağ ve Konyalı, 2019). Solunum ve vücut sıcaklığı gibi fizyolojik parametreler, özellikle yeni doğanların başarılı bir şekilde hayatta kalabilmeleri üzerinde önem taşırken, kötü sürü idaresi ve uygun olmayan barınak koşulları, kuzu ve oğlaklarda doğumdan hemen sonraki erken dönem için bir risk faktörü oluşturmakta aynı zamanda fizyolojik kondisyonun gelişimini önemli derecede olumsuz yönde etkileyebilmektedir (Piccione ve ark., 2007).

Ardahan (2018) yaptıkları çalışmada; büyütme döneminde yapılan hataların, oğlakların ömür boyu verimliliğini etkilediğini ve bu nedenle oğlaklara büyütme sırasında optimum çevre koşullarının sağlanması olmazsa olmaz ön koşul olduğunu bildirmiştir. Ek olarak oğlakların çevre koşullarına duyarlılıklarının üst seviyede olduğu bu dönemde, besin madde gereksinimlerini tam anlamıyla karşılayacak şekilde beslenmeleri, iklimsel isteklerine uygun barındırılmalarına dikkat edilmesi gerektiği belirtilmiştir.

Ölüm nedeni olarak soğuk etkisi, geniş ölçüde sonuç niteliğindedir. Soğuk, rutubetli ve rüzgarlı havalarda vücut ısısının düşmesi ile ölümlerin artması kuzuların emememe nedenine dayanır ve aç kalırlar. Diğer yandan düşük doğum ağırlığı, doğum zedelenmeleri ve seyrek yapağı soğuktan etkilenmeyi artırır. Halbuki bu gibi kuzuların yumuşak hava koşullarında yaşama şansları daha yüksektir. Soğuğa maruz kalma nedeniyle meydana gelen ölümlerin fizyolojik esası; ısı kaybı ve ısı üretimi arasındaki ilişkilidir. Kuzuların ısı yitirmeleri, ısı üretme kapasitelerini aştığı durumlarda vücut ısıları düşmeye başlar ve ölümler görülür. Bu gibi durumlarda en önemli ölüm nedeni; aşırı soğukla karşı karşıya kalan kuzuların vücut rezervlerinin tükenmesi ile "şok" a girmeleri ve ağız sütü alamamalarından aç kalmalarıdır. Yeni doğan kuzuların ilk 36 saat içinde ekstrem soğuk hava koşulları ile karşılaşması durumunda yalıtım ile vücut ısısının düzenlenmesi yaşamsal önem taşımaktadır (Demirören et al. 1992).

Alexander (1964) ve Dupchak (1991)'in farklı yıllarda yaptıkları araştırmaları sonucunda, doğum mevsiminden başka, doğum yılının yaşama gücüne etkisinin bulunduğunu, büyük batın genişliğinden dolayı, düşük ağırlıklı kuzuların soğuk yıllarda yaşama güçlerinin daha düşük olduğunu bildirmişlerdir.

Besleme ve barınak gibi çevresel faktörler kuzu yaşama gücünü etkileyen önemli unsurlardan biridir. Kuzuların barınak içinde doğdukları durumlarda daha çok hastalıklara direnç ve kolay kuzulama, yaşama gücünün belirleyicisi olarak önem kazanır (Orr and Treacher, 1984).

4. BAZI STRES FAKTÖRLERİ

Değişen iklim koşulları tüm canlıların yaşamlarını etkilemektedir. İklim değişikliği sıcaklıkların ani değişmesine neden olarak yem ve su kaynaklarında azalma ve otlaklarda yem

bitkilerinde tür ve çeşitliliğinin azalmasına neden olmaktadır. Küçükbaş hayvan yetiştiriciliği meraya dayalı olarak yapılmaktadır. Yem ve su kaynaklarındaki değişim strese sebep olmaktadır. Stres hastalıklara yakalanmayı kolaylaştırmakta tedavi için ilaç kullanımını artırmaktadır (Altınçekiç ve Koyuncu, 2012). Yüksek ortam sıcaklıkları, bağıl nem (RH), hava akışı ve güneş radyasyonu ile birlikte vücut sıcaklığını kritik seviyenin üzerine çıkarır. Bu da hayvansal üretimde fizyolojik yan etkilere neden olmaktadır (Kadim vd., 2008). Sıcaklık stresinin etkisinde, hayvanlar gıda alımını ve sindirim kapasitesini azaltacak ve sonuç olarak besin emilimi daha küçük olacaktır. Bu durumda, ilk etkilenecek olan üreme, ardından üretim ve büyüme olacaktır. Sıcaklık stresinin ileri safhalarında sadece hayati faaliyet için enerji kullanılacaktır (McManus ve ark., 2020). Kuzularda termoregülasyon merkezinin olgunlaşmaması nedeniyle sıcaklık stresini daha az tolere ederken, laktasyondaki koyunlar daha yüksek metabolik hıza ve metabolik ısı üretimine sahip oldukları için yüksek sıcaklıklara daha az toleranslıdır (Macías-Cruz ark., 2018).

Sakar (2024) yaptığı çalışmada belirli agroklimatik koşullar altında büyüme, bir koyun ırkının hayvanın konforunun azalmasıyla birlikte performansının düşmesine neden olan bir uyarlanabilirlik parametresi olduğunu bildirmiştir. Çalışma sonucunda incelenen iklim indeks değerlerinin genel olarak soğuk koşullarda kuzuların büyüme ve gelişme değerleri üzerinde olumsuz bir etkiye sahip bulunmazken, sıcak koşullarının hayvanları olumsuz yönde etkilediği bildirilmiştir.

Yapılan bir çalışmada kronik sıcaklık stresine maruz kalan kuzularda iskelet kasına özgü glikoz metabolizmasının bozulduğu bildirilmiştir (Barnes ve ark., 2019). Elde edilen çalışma sonuçlarında daha önce varsaydıkları gibi, sıcaklık stresinin en azından kısmen kronik inflamatuar ve adrenerjik tepkiler yoluyla kuzularda büyümeyi ve metabolik verimliliği azalttığı sonucuna varmışlardır (Barnes ve ark., 2019).

Yapılan çalışmalarda; sıcaklık stresi koşulları altında, kuzuların termal dengelerini yeniden sağlamak için farklı fizyolojik ve metabolik ayarlamaları aktive ettiği bildirilmiştir (Macías-Cruz ve ark., 2018a; Macías-Cruz ve ark., 2016, Macías-Cruz ve ark., 2018b). Ayrıca, su alımını artırarak ve yeterli vücut su dengesini koruyarak homeotermiyi gerçekleştirirler (Al-Dawood, 2017). Bununla birlikte, bu termoregülasyon mekanizmalarının aktivasyonu, sıcaklık stresine maruz kalan kuzularda büyüme hızını ve yem verimliliğini azaltır, çünkü termoregülasyon nedeniyle bakım için artan enerji gereksinimleri ile kuru madde alımını korurlar (Macías-Cruz ve ark., 2013; Vicente-Pérez ve ark., 2020).

Nicolás-López ve ark. (2021) yaptıkları çalışmada; erkek kuzuların mevsimsel sıcaklık stresinin üretken performansları, fizyolojik yanıtları, metabolizmaları ve hematolojik profilleri üzerine etkisini değerlendirmeyi amaçlamışlardır. Sonuç olarak, yaz mevsiminin kronik koşullarına yanıt olarak kuzuların büyümesi yavaştı, ancak fizyolojik, metabolik ve endokrin düzenlemelerin aktivasyonu nedeniyle hipertermiden kaçındığı bildirilmiştir.

Mahjoubi ve ark. (2014) Afshari koyunlarında yaptıkları çalışmada, besi kuzularında orta derecede sıcaklık stresine yanıt olarak kuru madde tüketimini değiştirmeden ortalama günlük canlı ağırlık kazancında bir azalma olduğu bildirmiştir. Mahjoubi ve ark. (2015) yaptıkları çalışmada; Afshari kuzularında döngüsel ve şiddetli ısı stresinin büyüme performansı ve metabolizma üzerine etkisini araştırmışlardır. Çalışma sonucunda sıcaklık stresinin büyüme

sırasında kilo alımının enerjisini önemli ölçüde değiştirdiğini ve sıcaklık stresinin etkilerinin ısı yükünün şiddetine bağlı olduğu bildirilmiştir.

Shi ve ark. (2020) yaptıkları çalışmada, sıcaklık stresinin kuzuların antioksidan durumu ve immün yanıtı üzerindeki etkilerini değerlendirmeyi amaçlamışlardır. Çalışma sonucunda, sıcaklık stresinin kuzuların antioksidan durumunu ve immün yanıtını olumsuz yönde etkilediğini ve sıcaklık stresinin olumsuz etkilerinin sadece stres süresi ile değil, stres şiddeti ile de ilişkili olduğunu bildirmişlerdir.

Öğdüm (2010) yaptıkları çalışmada Akkeçilerin Orta Anadolu koşullarında yaz aylarında etkili olan yüksek sıcaklığa karşı fizyolojik tepkilerini belirlemeyi amaçlamıştır. Yaz aylarında dakikada solunum sayısı oğlaklarda 53.3 adet, çebiçlerde 51.6 adet ve keçilerde 50.1 adet olarak bulunmuştur. Çalışma sonucunda ortalama nabız sayısı oğlaklarda 111.7 adet/dakika, çebiçlerde 106.4 adet/dakika ve keçilerde 105.8 adet/dakika olarak bulunmuştur. Elde edilen sonuçlar Akkeçi oğlak, çebiç ve keçisinin ölçüm yapılan 19 hafta boyunca yüksek sıcaklık ve nemden etkilendiklerini göstermiştir. Oğlaklar yüksek sıcaklık stresinden en çok etkilenen grup olurken, çebiç ve keçiler özellikle de keçiler sıcak zorlanımından daha az etkilenmişlerdir.

Kayabaşı (2011) yaptığı çalışma sonucunda; sırası ile Şubat (soğuk çevre), Nisan (optimal çevre), Haziran (sıcak çevre) aylarında rektal sıcaklık değerleri; Çukurova Saaneni keçilerde 39.52ºC, 39.72ºC, 40.02ºC, Balcalı keçilerinde ise 39.56 0C, 40.02 0C ve 40.00 0C olarak bulmuştur. Nabız sayısı bakımından aynı koşullarda Çukurova Saanen keçilerinde 69.84, 72.64, 80.86 adet /dk. Balcalı keçilerinde 69.10, 72.54, 79.32 adet/dk., solunum hızı bakımından da Çukurova Saanen keçilerinde 42.76, 49.82, 54.32 adet/dk., Balcalı'da ise 40.54, 52.88, 51.77 adet/dk. olarak bulunmuştur. Sonuç olarak her 2 genotip için elde edilen verilerden fizyolojik adaptasyon parametreleri yönünden Balcalı grubunun daha avantajlı bir konumda olduğu ve sıcak, nemli koşullardaki sıcaklık direncini Saanen genotipine oranla daha yüksek olduğu bildirilmiştir.

Çeşitli araştırmalar, termal maruziyet sırasında büyüme parametrelerinde değişiklik olduğunu bildirmiştir (Habibu ve ark., 2016; Popoola ve ark., 2014). Çeşitli büyüme değişkenleri arasında, canlı ağırlık, hayvancılıkta sıcaklık stresi nedeniyle etkilenen ilk ve en önemli faktördür. Yaz sıcağı stresine (32.9°C) maruz kalan Batı Afrika Cüce keçilerinde yapılan bir çalışmada, ortalama günlük kazancın azaldığı bildirilmiştir, bu da bu hayvanlarda yem alımındaki azalmaya bağlanabilir (Popoola ve ark., 2014). Ayrıca, benzer olarak Habibu ve ark. (2016)'da yaptıkları çalışmada termal (38.8° C) maruziyetten sonra Sahel ve Red Sokoto oğlaklarında vücut kitle indeksinde önemli bir azalma olduğunu bildirmiştir.

5. SONUÇ VE ÖNERİLER

Hayvansal üretimde üreme sürecinin sorunsuz olarak tamamlanabilmesi, doğumların sorunsuz bir şekilde gerçekleşebilmesinin yanında doğan yavrunun da hayatta kalabilmesi önemlidir. Çiftlik hayvanı yetiştiriciliğinde, üretim sistemlerindeki sorunların, yeni doğanlarda ölüm oranlarının artmasına ve bunun yanında ciddi ekonomik kayıpların oluşmasına neden olduğu bilinmektedir. Bu açıdan doğum ve doğum sonrası dönemde yavruya ait özelliklerin iyi tanınmasının, yavrunun maruz kaldığı etkilere karşı fizyolojik adaptasyon yeteneğinin incelenmesi ve mevcut sorunların daha iyi irdelenebilmesi ile gerekli üretim stratejilerinin

geliştirilebilmesi açısından faydalı olabilir. Kuzu ve oğlaklarda mortalite ve yaşama gücü üzerine etkili faktör sayısının oldukça çok olduğu bilinmektedir. İşletmelerdeki doğum dönemi ve sonrasındaki kuzu kayıpları refah probleminin ve önemli bir ekonomik kaybın göstergesidir. Doğum ve doğum sonrasına ilişkin bazı özellikler ile yaşamın ilerleyen dönemlerinde kuzu ve oğlakların yaşama gücü ve performans özellikleri üzerine birçok çalışma yapılış olmasına karşın bu alanda yapılacak yeni çalışmalarla refah anlamında sergileyecekleri tavır arasındaki ilişkilerin anlaşılması ve değerlendirilmesine gereksinim duyulmaktadır.

ABSTRACT

Sheep farming is an important sector of the livestock industry with meat and milk production, which plays an important role in human nutrition worldwide. Sheep farming not only meets the need for animal protein for global food security and a healthy nutrition, but is also important for the utilisation of land that is not suitable for agricultural production and for the livelihoods of low-income families, especially in rural areas. According to research, global demand for food is estimated to increase by 35-50% between 2012 and 2050. The quantity and quality of products obtained from sheep can vary depending on genetic structure and environmental effects. Changes in environmental factors can have a positive or negative effect on the quantity and quality of the product.

Milk obtained from sheep is important for the cheese industry. Various types of cheese, yoghurt, butter, etc. are made from the milk obtained. In recent years, organic products have become increasingly popular. In sheep farming, sheep-derived products are in demand by consumers, as the animals are generally kept under extensive production conditions. In addition, it is becoming increasingly important in sheep farming to support and economise traditional breeding with production for the welfare of the animals and the authenticity of the products. This study aims to highlight the production and importance of sheep milk.

Keywords: Sheep Milk, Milk Yield, Milk Components, Milk Production.

KOYUN SÜTÜ ÜRETİMİ VE ÖNEMİ

ÖZET

Koyun yetiştiriciliği, dünya genelinde insan beslenmesinde önemli yeri olan başta et ve süt üretimiyle hayvancılık sektöründe önemli bir alandır. Küresel gıda güvenliği ve sağlıklı beslenmede hayvansal protein ihtiyacını karşılamanın yanı sıra tarımsal üretim için kullanıma uygun olmayan alanların değerlendirilmesi ve özellikle kırsal bölgelerde dar gelirli ailelerin geçimi için koyun yetiştiriciliği önemli bir yere sahiptir. Yapılan araştırmalara göre gıda ürünlerine yönelik küresel talebin, 2012 ile 2050 yılları arasında %35-50 oranında artacağı tahmin edilmektedir. Koyunlardan elde edilen ürünlerin miktar ve kalitesi genetik yapı ve çevresel etkilere bağlı olarak değişebilmektedir. Çevresel etkilerin değişimi ürün miktar ve kalitesini olumlu ya da olumsuz olarak etkileyebilmektedir.

Koyunlardan elde edilen süt peynir endüstrisi için önemlidir. Elde edilen sütten farklı peynir çeşitleri, yoğurt, tereyağı vb. ürünler üretilmektedir. Son yıllarda organik ürünler daha fazla tercih edilmektedir. Koyun yetiştiriciliğinde yaygın olarak hayvanların ekstansif üretim şartlarında yetiştirilmesi sebebiyle elde edilen ürünler tüketici tarafından talep edilmektedir. Ayrıca koyun yetiştiriciliğinde hayvan refahına ve ürünün özgünlüğüne yönelik üretime sahip geleneksel yetiştirmenin desteklenmesi ve ekonomik hale getirilmesi giderek önemli hale gelmektedir. Bu çalışmada koyun sütü üretimi ve öneminin ortaya konulması amaçlanmıştır.

Anahtar Kelimeler: Koyun Sütü, Süt Verimi, Süt Bileşenleri, Süt Üretimi.

1. GİRİŞ

Gelişmekte olan ülkelerde koyun yetiştiriciliği, ticari fayda değil, öncelikle geçim güvenliği amaçlıdır (Mohapatra ve ark., 2019). Koyun yetiştiriciliği, dünya genelinde insan beslenmesinde önemli yeri olan başta et ve süt üretimiyle hayvancılık sektöründe önemli bir alandır. Küresel gıda güvenliği ve sağlıklı beslenmede hayvansal protein ihtiyacını karşılamanın yanı sıra tarımsal üretim için kullanıma uygun olmayan alanların değerlendirilmesi ve özellikle kırsal bölgelerde dar gelirli ailelerin geçimi için koyun yetiştiriciliği önemli bir yere sahiptir.

Dünya genelinde yaklaşık 10,5 milyon ton, Avrupa'da ise yaklaşık 3,1 milyon ton koyun sütü üretilmektedir. Avrupa'da koyun sütü üretimi son yıllarda biraz durgunlaşmıştır ve şu anda küresel üretimin yaklaşık 1/3'ünü oluşturmaktadır. Yüksek kuru madde, süt yağı, toplam protein ve kazein içeriği nedeniyle koyun sütü peynir üretimi için mükemmel bir hammaddedir. Süt işleme ve peynir yapımı sadece ekonomik açıdan önemli değil, aynı zamanda genellikle kırsal ve az gelişmiş bölgelerde gerçekleşen uzun bir geleneğe dayanan kültürel mirasın bir parçasıdır. Süt üretimi ve kalitesi üzerine etkili faktörler oldukça karmaşıktır ve en önemlileri ırk, besleme, vücut kondisyonu, laktasyon dönemi, sağım, meme sağlığı ve çevresel faktörler olmak üzere çok sayıda faktörden etkilenir. Buna ek olarak, ısı stresi, beslenme stresi, sütten kesme stresi, kırkım stresi gibi farklı stres türleri koyunların refahı ve sağlığı üzerinde olduğu kadar üretilen süt miktarı, kimyasal bileşimi, işleme özellikleri ve sürünün ekonomik verimliliği üzerinde de önemli bir etkiye sahiptir. Son yıllarda, iklim değişikliği nedeniyle, ısı stresinin koyunların üreme ve üretim özelliklerinin yanı sıra refah ve sağlıkları üzerindeki etkileri üzerine artan sayıda çalışma yapılmıştır. Buna ek olarak, ısı stresi genellikle yem ve su eksikliği ile ilişkilendirilmektedir. Stresin etkileri özellikle koyun yetiştiriciliğinde yaygın olan ekstansif koyun yetiştiriciliğinde ve süt üretiminde daha belirgindir (Mioč ve ark., 2024).

Küresel koyun sütü üretimi son yıllarda önemli ölçüde artmıştır; daha fazla artış için açık bir eğilim de belirgindir (Pulina ve ark., 2018). İnek sütünün aksine, koyun sütü doğrudan tüketilmemekte, daha çok başta yoğurt veya peynir ürünleri olmak üzere çeşitli süt ürünleri üretiminde kullanılmaktadır (Dennett, 2016). Dünya genelinde koyun sütünün en büyük kısmı Asya'da (yaklaşık %45) (özellikle Çin ve Türkiye'de); daha küçük bir kısmı Avrupa'da (yaklaşık %30) (özellikle Fransa, Yunanistan, İtalya ve İspanya'da) ve Afrika'da (yaklaşık %25) (özellikle Cezayir'de); en az kısmı ise Amerika kıtasında (özellikle Meksika'da) ve Okyanusya'da (toplamda %2'den az) üretilmektedir (Skapetas and Kalaitzidou, 2017; Pulina ve ark., 2018). Küresel olarak, süt koyunu çiftlikleri çoğunlukla ılıman ve tropikal bölgelerde yer almaktadır. Bu bölgelerde, koyun sütünden elde edilen süt ürünleri yerel halkın beslenmesinde önemli bir yer tutmaktadır (Katsarou ve ark., 2024).

(Balthazar ve ark. (2017) yaptıkları çalışmada; koyun sütünün diğer evcil türlerin sütlerine kıyasla yüksek besin değerine ve yüksek konsantrasyonlarda protein, yağ, mineral ve vitamin içerdiğini belirtmiştir. Ayrıca koyun sütünün fizikokimyasal ve besinsel özellikleri, fonksiyonel gıda pazarında ana kategoriler olan prebiyotik bileşenler ve/veya probiyotik bakteriler içeren ürünlerin üretimi için avantajlı olabileceğini bildirmiştir. Ek olarak; koyun sütü mükemmel bir besin kaynağıdır ve yüksek peynir verimine katkıda bulunan yüksek toplam katı madde içeriği nedeniyle çoğunlukla peynir üretiminde kullanılır. Bununla birlikte, bu gıda matrisinin fonksiyonel faydaları süt endüstrisi tarafından keşfedilmemiştir. Endüstriyel ölçekte ürünlerin

geliştirilmesi, bu matrisin kendine has özellikleri nedeniyle teknik bilgi ve mevcut protokollerin uyarlanmasını gerektirmektedir. Peynir, yoğurt, dondurma ve diğer sütlü tatlılar gibi koyun sütü ürünlerine probiyotik mikroorganizmaların ve özellikle prebiyotik bileşenlerin eklenmesinin etkilerini araştırmak için daha fazla çalışmaya ihtiyaç vardır.

2. DÜNYA'DA VE TÜRKİYE'DE KOYUN SÜTÜ ÜRETİMİ

Dünya sağılan hayvan varlığında 2022 yılı verilerine göre; koyun 247 milyon baş, sığır 277 milyon baş, keçi 214 milyon baş ve manda 72 milyon baştır. Dünyada toplam sağılan hayvan varlığının %30,4'ü koyun, %34,3'ü sığır, %26,4'ü keçi ve %8,8'i mandadan oluşmaktadır.

FAO'ya göre 2021 yılında 936 milyon ton olan dünya süt üretimi (inek, manda, koyun, keçi) 2022 yılında yaklaşık %1 oranında azalarak 926 milyon ton gerçekleşmiştir (Tablo1).

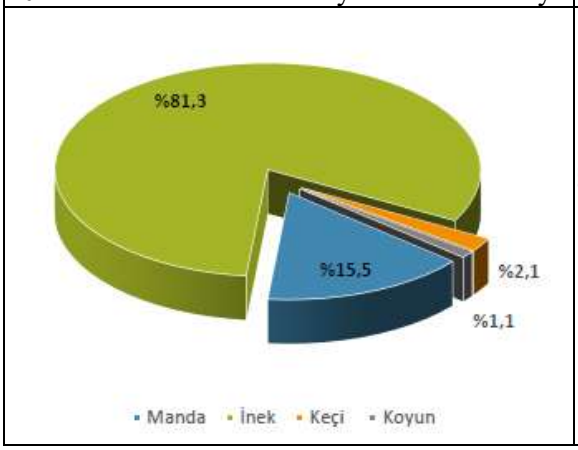
Tablo 1. 2016-2022 Yılları arası bazı ülkelerin inek, manda, koyun ve keçi hayvan varlığı, süt üretimi ve süt verimi (FAO, 2023, Anonim, 2023)

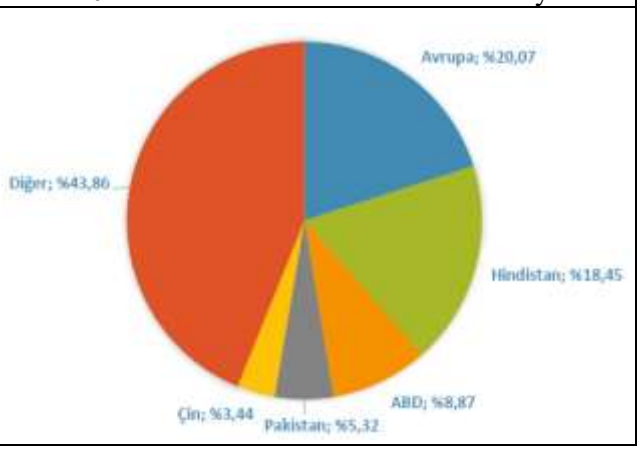
		2016	2017	2018	2019	2020	2021	2022	2016-2022 Değişim %
Sığır	Sağılan hayvan varlığı (milyon baş)	270	270	272	277	275	275	277	2,6
	Süt üretimi (milyon ton)	671	685	701	715	742	757	753	-12,2
	Süt verimi (kg/baş)	24.521	25.356	25.914	26.213	26.813	27.490	27.160	-10,8
Manda	Sağılan hayvan varlığı (milyon baş)	67	68	70	71	70	71	72	7,5
	Süt üretimi (milyon ton)	120	126	132	137	137	149	144	-20
	Süt verimi (kg/baş)	2	2	2	1,94	1,97	2,10	2,00	-11,1
Koyun	Sağılan hayvan varlığı (milyon baş)	246	246	248	257	256	248	247	-0,4
	Süt üretimi (milyon ton)	10	10	10	11	10	10	10	0
	Süt verimi (kg/baş)	41	42	42	41	41	42	41	0
Keçi	Sağılan hayvan varlığı (milyon baş)	207	210	214	224	222	212	214	3,4
	Süt üretimi (milyon ton)	19	20	20	20	21	19	19	0
	Süt verimi (kg/baş)	94	96	96	91	95	92	90	-4,3

Toplam süt üretiminde 2022 yılında en büyük payı %81 (753 milyon ton) ile inek sütü alırken, manda sütü %15 (144 milyon ton), koyun sütü %1 (10 milyon ton) ve keçi sütü %2 (19 milyon ton) paya sahiptir.

Dünya süt üretiminde (koyun, keçi, inek, manda) AB-28 %20 üretim payı ile ilk sırada yer alırken %18 ile Hindistan ikinci sırada yer almaktadır. Dünyanın en büyük süt üreticisi olan AB 2022 yılında bir önceki yıla göre %0,44 düşüşle 232 milyon ton üretim gerçekleşirken, ikinci en büyük üretici olan Hindistan 2022 yılı üretimi %3,31 düşüşle 214 milyon ton olmuştur.

AB, Hindistan ve ABD dünya süt üretiminin (inek, manda, koyun, keçi) yaklaşık %47'sini oluşturmaktadır.

2022 Yılı Türlere Göre Dünya Süt Üretim Payı	2022 Yılı Ülkelere Göre Süt Üretim Payı
	


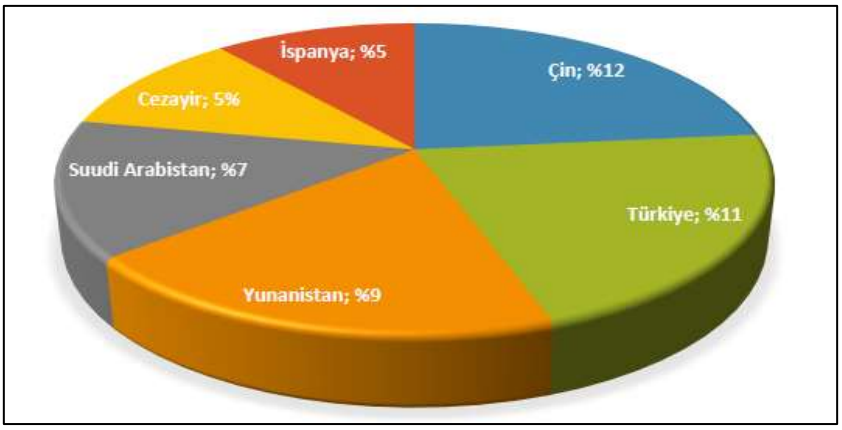


Şekil 1. 2022 Yılı türlere göre dünya süt üretim payı ve ülkelere göre süt üretim payı (FAO, 2023, Anonim, 2023)

Dünya koyun sütü üretimi 2022 yılında, 2021 yılına göre %2 artarak 10.087 bin ton olarak gerçekleşmiştir. AB dünya koyun sütü üretiminin %28 gibi büyük bir payını karşılarken Çin dünya koyun sütünün %12'lik kısmını üretmektedir. Türkiye 1.166 bin ton ile koyun sütü üretimi ile Çin'den sonraki en büyük üretici ülkesi olmuştur.

Tablo 2. 2021-2022 Yılı Ülkelerin Koyun Sütü Üretimi (FAO, 2023, Anonim, 2023)

Sıra	Ülkeler	2021 (bin ton)	2022 (bin ton)
1	Çin	10.292	10.087
2	Türkiye	1.273	1.166
3	Yunanistan	1.144	1.067
4	Suriye	952	956
5	İspanya	703	707
6	Cezayir	525	547
DÜNYA		10.292	10.087

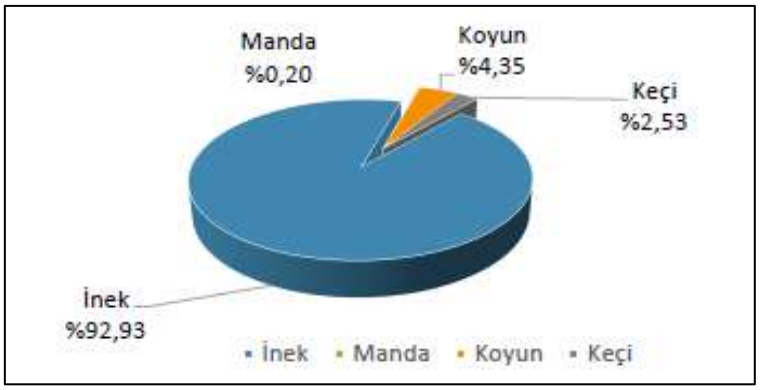


Şekil 2. 2022 Yılı Ülkelerin Koyun Sütü Üretim Payı (FAO, 2023, Anonim, 2023)

Ülkemiz toplam süt üretiminin %92,93'ünü inek sütü, %4,35'ini koyun sütü, %2,53'ünü keçi sütü ve %0,20'sini ise manda sütü oluşturmaktadır.

Tablo 3. 2020-2023 Yılları türlere göre süt üretimi ve değişimi (TÜİK, 2023, Anonim, 2023)

Miktar (Ton)	2020	2021	2022	2023	2022/23 Değişimi (%)
Toplam	**23.503.790**	**23.200.306**	**21.563.492**	**21.481.567**	-0,4
İnek Sütü	21.749.342	21.370.116	19.912.135	19.961.908	0,3
Manda Sütü	63.767	63.643	43.589	43.025	-1,3
Koyun Sütü	1.101.065	1.143.762	1.067.342	933.576	-12,5
Keçi Sütü	589.617	622.785	540.426	543.058	0,5



Şekil 3. Türkiye 2023 yılı türlere göre süt üretimi (TÜİK, 2023, Anonim, 2023)

İllere göre süt üretimine bakıldığında 2022 yılında küçükbaş hayvan sütü üretiminin %25'i Van, Şanlıurfa, Konya, Diyarbakır ve Mersin illerinden sağlanmaktadır. Koyun sütü üretiminde Van, Konya, Şanlıurfa, Diyarbakır; keçi sütü üretiminde Mersin, Antalya ve Şırnak en önemli illerdir.

Şekil 4. 2022 yılı illere göre küçükbaş hayvan süt üretimi (TÜİK, 2023, Anonim, 2023)

3. KOYUN SÜTÜ ÖZELLİKLERİ

Sütün fiziko-kimyasal özellikleri, belirli bir hayvan türü için bileşimi ile ilgilidir. Koyun sütünün bileşimi ve fiziko-kimyasal özellikleri hakkında bilgi, koyun sütü endüstrilerinin başarılı bir şekilde gelişmesi ve ürünlerin pazarlanması için gereklidir (Park ve ark., 2007).

Süt, fiziksel özellikleri ve bileşimi türler arasında farklılık gösteren bir memeli bezi salgısıdır. Yağ, proteinler, laktoz, mineraller, enzimler, hücreler, hormonlar, immünoglobulinler ve vitaminler içeren kompleks bir su içinde yağ emülsiyonudur. Proteinler, laktoserumda bulunan çözünmeyen proteinler (kazeinler) ve çözünen proteinler (peynir altı suyu proteinleri) olarak kategorize edilir. Kazeinler αs1, αs2, β ve κ-kazeinleri içerir, ancak peynir altı suyu proteinleri α-laktalbumin ve β-laktoglobulindir. Süt ayrıca serum albümini, immünoglobulinler, laktoferrin, transferrin, kalsiyum bağlayıcı protein, prolaktin, folat bağlayıcı protein ve proteosepton gibi önemli minör proteinler de içerir (Selvaggi ve ark., 2014).

Koyun sütünün kimyasal bileşimi, laktasyon dönemi, mevsim, çevre sıcaklığı, laktasyon verimliliği, hayvanın yaşı ve beslenmesi, genetik faktörler (tür ve ırk) ve meme hastalıkları gibi çeşitli faktörlere bağlı olarak zaman içinde ve hayvanlar arasında değişiklik gösterir (Tamime ve ark., 2011; Claeys ve ark., 2014). Mevsimsel farklılıklar, merada beslenen hayvanların yem bileşimindeki değişiklikler nedeniyle yağ asidi bileşimini güçlü bir şekilde etkiler (Zlatanos ve ark., 2002; Revilla ve ark., 2017). Diğer süt bileşenlerinin yanı sıra lipitler de genetik, fizyoloji ve çevresel faktörler nedeniyle değişkenliğe maruz kalmaktadır. Mevsimsel ve iklimsel değişiklikler (Jaworski ve Kuncewicz, 2008), hayvan yemlerindeki besin maddelerine ve dolayısıyla hayvan fizyolojisine müdahale ederek süt kalitesini etkilediği için son derece önemli hale gelmiştir.

Koyun sütünün besin değeri keçi ve inek sütünden daha yüksektir; insan sağlığı için gerekli protein, lipit, mineral ve vitaminleri daha yüksek oranda içerir ve kalori değeri 5932 kJ/kg'a karşılık gelir (Haenlein, 2001; Kaminarides ve ark., 2007; Park ve ark., 2007; Barłowska ve

ark., 2011). Tablo4 ve Tablo 5'de farklı türlerden elde edilen bazı süt bileşenleri, fizikokimyasal özelliklere ait ortalama değerler ve süt yağlarının yağ asidi dağılımı verilmiştir.

Koyun sütü yağı, %11 kısa ve orta zincirli yağ asitleri ile yüksek oranda doymuştur (65 ila 75 g/100 g to-tal yağ asidi) (Revilla ve ark., 2017); koyun sütünün yağ asidi içeriği, bütirik asit (C4:0) içeriği bakımından inek sütünden önemli ölçüde farklılık göstermez, ancak kaproik (C6:0), kaprilik (C8:0) ve kaprik (C10:0) asitler gibi daha fazla doymuş yağ asidi içerir. Kaproik, kaprilik ve kaprik asitler vücut ağırlığını ve vücut yağını azaltabilmesine rağmen, düşük bütirik asit konsantrasyonları insan kanser hücre hatlarının vitroof inhibisyonuna katkıda bulunur (Rasmussenand ve ark., 2010; Foglietta ve ark., 2014)

Koyun sütü yağındaki çoklu doymamış yağ asitleri (PUFA'lar) esas olarak linoleik (cis-9, cis-12 C18:2) ve α-linolenik (cis-9, cis-12, cis-15 C18:3) asitlerin yanı sıra bunların daha az miktarda konumsal ve geometrik izomerlerinden oluşur (Recio ve ark., 2009). Koyun sütündeki tekli ve çoklu doymamış yağ asitleri, Balthazar ve ark. (2016) tarafından açıklandığı gibi, aterojenik ve trombojenik indeksler nedeniyle kardiyovasküler hastalıkların önlenmesine katkıda bulunabilir.

Tablo 4. Koyun, keçi ve inek sütlerinde bazı süt bileşenleri ve fizikokimyasal özelliklere ait ortalama değerler

Bileşenler	Keçi	Koyun	İnek	İnsan
Yağ (%)	3,8	7,9	3,6	4,0

Koyun sütü çoğunlukla peynir yapımında kullanıldığından, peynir olgunlaşması sırasında biyoaktif peptitlerin oluşumu özel bir ilgi konusudur. Peynir olgunlaşmasında rol oynayan proteolitik sistemlerin çeşitliliği ve peynir türüne bağlı olarak olgunlaşma sırasında farklı proteoliz yoğunlukları nedeniyle peynirler önemli bir peptit kaynağı oluşturmaktadır. Bununla birlikte, peynir gibi karmaşık matrislerde biyolojik olarak aktif peptitlerin tanımlanması zor bir görev olduğundan, koyun peynirinin olgunlaşması sırasında kazeinden serbest kalan peptitlerin ACE inhibitör aktiviteleri ile ilgili sadece birkaç makale vardır (Recio ve ark., 2009). G´omez-Ruiz ve ark. (2002, 2004) Manchego peynirlerinden (İspanya'nın La Mancha bölgesinde üretilen tipik pas-teurize edilmemiş koyun sütü) ACE-inhibitör aktiviteye sahip 2 peptit (VRYL ve KKYNVPQL) izole etmiştir. Rizzello ve ark. (2005), bazıları koyun sütü ile formüle edilmiş çeşitli İtalyan peynir çeşitlerinin suda çözünür ekstraktından antibakteriyel özelliklere sahip 4 peptit (GLSPEVLNENLL, RFVVAPFPE, VVAPFPEV ve RFVVAPFPE) izole etmiştir. Pisanu ve ark. (2015) çiğ koyun sütü veya pastörize koyun sütü kullanılarak üretilen peynirleri peptit profilindeki farklılıklar açısından karşılaştırmış ve çiğ koyun sütü peynirlerinde bağışıklık düzenleyici ve ACE inhibitörü özelliklere sahip peptitlerin önemli ölçüde daha fazla olduğunu gözlemlemiştir. Bu farklılıklar muhtemelen çeşitli süt bileşenlerinin ısıya maruz kalmasıyla ilgilidir, bu da hem proteinlerin enzimatik bölünmeye uygunluğu hem de olgunlaşma sırasında peptitlerin oluşumundan sorumlu olan yerli bakteriler veya proteolitik enzimler üzerinde etkili olabilir.

Koyun sütü tatlı ve yumuşak bir tada, aromaya ve süt içinde dağılmış küçük yağ globüllerinin varlığı nedeniyle kremsi bir dokuya sahiptir ve bu da sütün daha kolay sindirilmesini sağlar (Park ve ark., 2007). Koyun sütünde, bu benzersiz aromadan sorumlu olan serbest yağ asidi seviyeleri nedeniyle koyunsu olarak bildirilen ayırt edici bir lezzet gözlenir (Chandan ve ark., 1992). Bu tat, tereyağı ve peynir gibi koyun sütü türevlerinde de görülmektedir (Jooyandeh and Aberoumand, 2010). Lipaz süt üretiminde önemli bir rol oynar. Doğal koyun sütü lipazı trigliseritleri katalize ve hidrolize ederek yağ asitlerinin üretimine neden olur, ancak koyun sütündeki lipaz aktivitesi inek sütündekinin yaklaşık onda biri kadardır (Chandan ve ark., 1968). Ayrıca koyun sütü, uzun zincirli yağ asitlerine kıyasla orta zincirli yağ asitleri içeren trigliseritler için daha yüksek bir hidroliz oranı sunar (Ch´avarri ve ark., 1998).

Koyun sütü proteinleri çoğunlukla kazein (ısıya dayanıklı) ve peynir altı suyu proteinlerinden (ısıya duyarlı) oluşur ve bunlar yoğurdun dokusundan ve viskozitesinden sorumludur ve koyun sütüne benzersiz özellikler sağlar. Bu özellikler, yoğurt üretimi durumunda kıvam arttırıcılar, süt tozu veya membran teknolojisi ile elde edilen konsantre süt gibi katı maddeler eklenmeden sütün peynir ve yoğurda kolayca dönüştürülmesini sağlar (Tamime ve ark., 2011). Koyun sütünün yüksek katı madde içeriği ile koyun yoğurdu yüksek jel gücüne sahiptir ve inek ve keçi yoğurtlarına kıyasla minimum sinerezis gösterir. Yüksek titre edilebilir asitlik ve kalsiyum içeriği nedeniyle, koyun yoğurdu hafif grenli bir gövdeye ve dokuya sahip olma eğiliminde olabilir (Wendorff, 2005).

Tablo 5. Koyun, keçi, inek ve manda süt yağlarının yağ asidi dağılımı (%)

Yağ Asidi	Keçi	Koyun	İnek	Manda

4. SONUÇ VE ÖNERİLER

Koyun sütü besin elementlerinin zenginliği ve beslenmeye yönelik faydaları bakımından, özellikle yaşlı ve çocukların beslenmesinde önemli role sahiptir. Koyun sütünün bileşimi diğer türlerde de olduğu gibi beslenme, ırk, yaş, doğum sayısı, doğum tipi, mevsim, laktasyon periyodu, canlı ağırlık, vücut kondisyon puanı, sürü yönetimi ve çevresel koşullardan etkilenmektedir. Ayrıca hayvancılık açısından bakıldığında süt üretimi üzerine mevsimsellikte etkilidir. Koyun sütü; keçi ve inek sütünden daha yüksek kuru madde oranına sahiptir. Kazein ve yağ oranı yüksek olduğundan, içme sütünden ziyade, peynir, yoğurt ve tereyağı üretiminde tercih edilmektedir. Yüksek yağ içeriğine rağmen, koyun sütünde yağ globülleri ince, tekdüze dağılımlıdır ve kolay sindirilebilirliği bakımından dikkat çekicidir. Ayrıca koyun sütünün anti-kanserojen özellik gösteren yüksek linoleik asit miktarı gibi ayırt edici özelliklerinden ve sağlık açısından önemlidir.

Koyun sütünün içme sütü olarak kullanımı yaygın değildir. Genellikle tek başına veya keçi ve inek sütleri ile karıştırılarak çeşitli ürünlere dönüştürülerek tüketilmektedir. Bu ürünlerin başında peynir gelmektedir. Özellikle Ege bölgesinde ve Çanakkale civarında üretimi yapılan Ezine peynirinin üretiminde keçi, koyun ve inek sütleri karışımı kullanılmaktadır. Bunun dışında koyun ve keçi sütleri çiğ olarak veya pastörize edilerek tek başlarına da peynir üretiminde kullanılabilmektedirler. Koyun sütünün daha fazla elde edildiği yaz aylarında "kış yoğurdu" olarak bilinen yoğurt çeşidi Türkiye'nin çeşitli bölgelerinde üretilmek te ve elde edilen bu ürün kış mevsiminde tüketilmektedir.

Koyun sütünün beslenme ve özellikle sağlık üzerine olumlu etkilere sahip olması, elde edilen ürünlerin karakteristik hoş bir tat ve aroma içerdiği bilinmektedir. Kırsal kesimde geleneksel olarak birçok ailenin tükettiği koyun sütü ve ürünleri, lezzeti, aroması ve kalitesiyle önem kazanmış, kentsel yoğunlaşma ve turizmin gelişmesiyle de giderek aranır hale gelmiştir. Koyun sütünün pazarlanmasında üreticiler alıcılara tam bağımlıdır. Elde edilen sütün bir kısmı işletme içinde tüketilmekte, bir kısmı ise süt işleyen işletmelere çiğ olarak pazarlanmakta, bir kısmı da

peynire işleyerek yerel pazarlarda satılmakta veya tüccarlara pazarlanmaktadır. Küçük ve dağınık işletmelerin büyümesi ve birleştirilmesi, uzmanlaşmış işletmeler durumuna dönüştürülmesi, bu üreticilerin aynı zamanda işleyici de olması sağlanması ile koyun sütü üretimi desteklenebilir.

ABSTRACT

Strawberries belong to the genus Fragaria, from the family Rosaceae, and the cultivated strawberry cultivars are known as octoploid (2n = 8x = 56), and have a haploid chromosome number of n = 7. Strawberry is the most commonly known cultivated and preferred among berry fruit groups due to, its unique aroma, economic significance, high nutritional quality, and benefit to human health. In recent years, studies on the aroma and its benefits to human health have been intensified in strawberry breeding studies. Especially in strawberry breeding, quality parameters such as sugar, organic acid, brix, and aroma are also critical factors that directly affect consumer satisfaction and market success. For this reason, strawberry breeding studies focus on the development of new fruit varieties that meet the expectations of consumers stand out in terms of aroma, sugar, and organic acid in market competition, and are less sensitive to stress conditions. In strawberry breeding, the use of QTL and GWAS methods to identify genes associated with sugar, organic acid, and aroma and to select superior individuals in terms of these traits at an early stage by molecular analysis and to transfer the genes controlling these components to the fruit or to change the expression of existing genes in a shorter time provides significant convenience in breeding strategy. Consequently, many strawberry breeding programs aim to enhance new varieties that have improved yield, resilience, and fruit quality traits, such as sweetness, firmness, aroma, and shelf life. The aim of this study is to review the recent studies on the determination of the genomic location of QTLs associated with biochemical fruit quality traits, disease and pest tolerance traits in strawberries through some biotechnological approaches in strawberry breeding studies and to create a data pool.

Keywords: Strawberry, breeding, quality parameters, QTL, GWAS

ÇİLEK VERİM VE MEYVE KALİTE ÖZELLİKLERİ BAKIMINDAN GENOMİK ISLAH STRATEJİLERİ ÜZERİNE BİR DERLEME

ÖZET

Çilek, Rosaceae familyasından Fragaria cinsine ait olup ve kültüre alınmış çilek çeşitleri oktoploid (2n = 8x = 56) ve haploid kromozom sayısı n = 7 olarak bilinmektedir. Çilek, kendine özgü aroması, ekonomik önemi, yüksek besin değeri ve insan sağlığına olan faydaları nedeniyle üzümsü meyve grupları arasında en çok bilinen, yetiştirilen ve tercih edilen meyvedir. Son yıllarda çilekte yapılan ıslah çalışmalarında aroma ve insan sağlığına faydaları konusunda çalışmalar yoğunluk kazanmaktadır. Özellikle çilek ıslahında şeker, organik asit ve aroma gibi kalite paramatreleri, aynı zamanda tüketici memnuniyetini ve pazar başarısını doğrudan etkileyen kritik bir faktörlerdendir. Bu nedenle çilek ıslah çalışmaları, tüketicilerin beklentilerini karşılayan ve pazar rekabetinde aroma, şeker ve organic asit bakımından öne çıkan, ayrıca stres koşullarına az duyarlı yeni meyve çeşitlerinin geliştirilmesine odaklanılmaktadır. Çilek ıslahında şeker, organik asit ve aroma ile ilişkili genlerin belirlenmesi ve moleküler analizlerle bu özellikler bakımından üstün bireylerin erken aşamada seçilmesi ve bu bileşenleri kontrol eden genlerin meyveye aktarılması veya mevcut genlerin ekspresyonunun değiştirilmesi gibi işlemlerin daha kısa sürede yapılması için QTL, GWAS yöntemlerinin kullanılması ıslah stratejisinde önemli kolaylıklar sağlamaktadır. Sonuç olarak, birçok çilek ıslah programının amacı, verim, dayanıklılık ve tatlılık, sertlik, lezzet ve raf ömrü gibi meyve kalitesi özelliklerini geliştiren yeni çilek çeşitlerini geliştirmektir. Bu nedenle, bu çalışmanın amacı, çilek ıslah çalışmalarında bazı biyoteknolojik yaklaşımlar aracılığıyla çileklerde biyokimyasal meyve kalitesi özellikleri, hastalık ve zararlılara karşı toleranslılık özellikleri ile ilişkili QTL'lerin genomik konumlarının belirlenmesi hakkında mevcut çalışmaları özetlemek ve bir veri havuzu oluşturmaktır.

Anahtar Kelimeler: Çilek, ıslah, kalite parametreleri, QTL, GWAS

INTRODUCTION

Strawberry belongs to the genus Fragaria of the Rosaceae family, and cultivated strawberry varieties are known as octoploid (2n = 8x = 56) and have n = 7 haploid chromosome number. The strawberry plant is not very selective in terms of climate demand, but since it has high adaptation abilities, it can be widely cultivated in a wide geographic area. For this reason, strawberry is a very preferred fruit for consumers among berries. In addition, the strawberry fruit is a very useful fruit for human health. Since it does not contain excess calories, it is especially ideal among the diet fruits. Because of this reason, its cultivation has become quite widespread worldwide. According to FAO (2025), China is the leader with 4.216.716,93 tonnes of strawberry production in the world. When we observe the distribution of Türkiye's strawberry production by provinces, Mersin ranks first with 135.527 tonnes, Aydın ranks second with 112.877 tonnes, and Konya ranks third with 80.192 tonnes (TUIK, 2025). In recent years, determination of various biochemical compounds such as aroma, sugar, organic acids, total phenol, total phenol, total anthocyanin, brix, and colour values has become important in strawberry breeding studies. Nowadays, many strawberry producers and researchers have started to prefer and focus on strawberry varieties with high quality in terms of some quality parameters such as uniform fruit shape, firmness, rich in volatile compounds, large fruits, high colour appeal, rich in fruit quality parameters such as sugar, organic acids, brightness and also resistant to diseases and pests of strawberry plants, high resistance to abiotic and abiotic conditions. Thus, researchers are focusing not only on fruit quality parameters but also on the development of new genotypes or lines that are resistant or tolerant to various abiotic and biotic stress conditions of strawberry plants. In addition to these, strawberry breeding strategy emphasizes new and rapid breeding methods. However, it will be possible to select promising lines resistant to various abiotic stress conditions with traditional breeding methods as well as biotechnological approaches in strawberry breeding. In fruit breeding, identifying minor or major QTL regions associated with such complex traits, which are intensely influenced by environmental factors and regulated by multiple genes, is an inherently difficult and time-consuming task in genetically heterozygous and open-pollinated plants in terms of fertilisation biology. In strawberry breeding studies, the development of new varieties with high season-long productivity, tolerance to post-harvest diseases, resistance to long-distance transport, high fruit firmness and very good fruit quality parameters has long been the primary objective. For this reason, many studies and projects are intensively carried out not only in European countries but also in countries such as the USA and China on the breeding of new varieties with the above-mentioned characteristics (Kafkas 2023; Karci et al., 2022; Prohaska et al 2024). For example, the Breeding Value project, supported by the European Union's Horizon 2020 research and innovation programme, aims to develop new breeding strategies for resistant and high-quality strawberry, blueberry, and raspberry varieties by ensuring genetic diversity and meeting consumer demands for quality and sensory attributes. In addition, the PRIMA MedBerry project has international project units aimed at developing new breeding strategies to ensure genetic diversity and to achieve high-quality berries (strawberries, blueberries, and raspberries) that are road and storage resistant and respond to the quality and sensory preferences of the consumer. The aim of this study is to review the recent studies on the determination of the genomic location of QTLs associated with biochemical fruit quality traits, disease, and pest tolerance traits in strawberries through some biotechnological approaches in strawberry breeding studies and to create a data pool.

Studies on morphological and biochemical traits in strawberry

The use of QTL mapping and GWAS (genome-wide association studies) techniques to understand the morphological, biochemical, and genetic characteristics of strawberries in strawberry breeding studies is increasing gradually. These new breeding techniques, in addition to the research carried out from the past to the present, make an important contribution to the determination of important genetic regions related to fruit quality, plant resistance to diseases, yield, and morphological variations in plants. For example, in a study conducted by some researchers to determine the genome of wild woodland strawberry (Fragaria vesca) they determined that the genome of wild woodland strawberry (Fragaria vesca) is 240 Mbp (megabits) with GWAS (Shulaev et al.,2011). In another study, high-resolution genetic mapping using GWAS analysis and SNP markers was reported to be an effective technique for breeders to use such techniques in fruit species in the Rosaceae family to obtain new varieties (Yamamoto and Terakami, 2016; Zahid et al 2022). In a study conducted by Ayvaz Sonmez et al. (2024), genetic maps of 'Fortuna × Rubygem' F1 strawberry population were analysed using these techniques to identify quantitative trait loci associated with various agronomic traits. Then, they examined the locus with the highest association with phenotypic variation in Turkey, and researchers found that the Ax-184476583 marker had a significant QTL with a LOD score of 5.24 and a phenotypic variance (PV) value of 13.3% for xylose, and these values were located within 5.2 Mb of Fvb2-3. They reported that the markers associated with the lightness value of the flesh colour were produced in the range of 5.6 and 25.3% PV, and the Ax-184139018 marker for the chroma value of the flesh colour separated the accessions according to their phenotype. As a result, they reported that they detected a total of 28 QTL for 9 quality traits in the strawberry population used in this study (Ürün et al. 2025).

In another study, Amaya et al., (2025) conducted a study on the determination of carotenoid levels and fruit flesh colour in cultivated strawberries (*Fragaria* × *ananassa*), which are desirable traits for their visual appeal and nutritional contribution. By analysing a population segregating for yellow and white flesh, they successfully identified an important quantitative trait locus (QTL), qYellow Flesh-4B, located on chromosome 4B. They explained that this region accounts for 82% of the variation observed in fruit pigmentation.Rehman et al. (2025) investigated the genetic basis of powdery mildew resistance in strawberry by genome-wide association and multivariate analyses. They used a population crossed between the wild ancestors *Fragaria chiloensis* and *Fragaria virginiana*. Field observations were carried out over multiple growing seasons under natural disease pressure and the researchers used a dense set of 20,779 SNP markers and identified a novel major QTL q.LPM.Rec-3B.2 marker located on chromosome 3B. They found that this locus consistently contributed to high levels of powdery mildew resistance in both leaves and fruits. In conclusion, these QTL values contribute significantly to the understanding of disease resistance in strawberry and support the application of marker-assisted selection in breeding programmes. In a molecular study conducted in the strawberry species *Fragaria vesca*, they found that the FveTRM5 protein plays a crucial role in the shape of strawberries. It was reported that FveTRM5 protein plays an important role in the regulation of strawberry fruit shape by affecting cell elongation and cell division, providing an excellent target gene for breeding new fruit-shaped varieties (Zheng et al., 2025).

Muñoz et al. (2023) analysed vitamin C in samples from crosses of 'Candonga' X 'Senga Sengana' cultivars and identified candidate genes that may be associated with vitamin C

content. According to the results of this study, environmentally stable QTLs for AsA content were detected in linkage group (LG) 3A, LG 5A, LG 5B, LG 6B and LG 7C. They identified candidate genes within the stable QTL intervals and suggested that the GDP-L-Galactose Phosphorylase FaGGP(3A) and the AsA transporter gene located in the chloroplast [FaPHT4;4(7C)] could be the genetic factors underlying the QTLs in LG 3A and 7C, respectively.

In another study, researchers developed a high-density genetic map in strawberry (*Fragaria* × *ananassa*) and identified QTL regions associated with fruit traits such as soluble solids content, fruit width, fruit length and fruit weight using the ddRAD-seq approach. As a result of this study, 12,698 SNP markers were identified and 1,554 of them were found to follow the expected Mendelian segregation patterns. Furthermore, six QTL values were reported for fruit length, which accounted for 24% to 35% of the phenotypic variance. In addition, four QTL values were identified for fruit width, fruit weight and water soluble solids content, explaining 21-42%, 24-54% and 23-50% of the phenotypic variation, respectively (Natarajan et al., 2020).

Fan et al 2024 analyzed at QTL regions associated with soluble solid content and yield in a total of 3399 Florida strawberry cultivars. They reported that they identified two stable quantitative trait loci (QTL) on chromosomes 3B and 6A for soluble solid content. On the other hand, favourable haplotypes at both QTL for this soluble solid content reduced yield, but they identified optimal allelic combinations with decreased affect on yield.

In a study by Serra et al. (2021), fruit variability was analysed over four growing seasons from 2016 to 2019, evaluating samples from two populations for several traits, including fruit shape, firmness and taste. Through QTL mapping in the 'FC50 × FD54' population, they identified a total of 33 consistent QTL. In particular, they emphasised that three genomic regions, LG 3A, LG 4D and LG 6D, were associated with fruit shape traits.

Siddique et al. (2021) used two independent F2 mapping populations (BS-F2 and BC-F2), an Axiom 35K strawberry chip, and genotyping-by-sequencing-derived single nucleotide polymorphisms to create linkage maps and identify the quantitative trait loci (QTLs) controlling leaf chlorophyll content. Seven QTLs were identified across the strawberry genome, including those with major and minor effects and those that were common or specific to populations. These QTLs explained phenotypic variation (R^2) ranging from 1.4% to 26.4%. Candidate genes associated with photosynthesis and chlorophyll content were inferred in the commonly detected QTLs.

Alafraj et al. (2021) constructed linkage groups using SNP markers in an F1 population and performed QTL analysis related to fruit quality traits. They developed a linkage map consisting of 28 linkage groups (LGs) representing the whole genome of the octoploid strawberry Rg × H population. The map covered a total genetic length of 2624.7 centimorgans (cM), with an average distance of 0.7 cM between SNPs, and included 3933 SNP markers. Among the linkage groups, LG6.1 and LG5.2 had the highest and lowest number of mapped SNPs, with 272 and 72 markers, respectively.

In another study, Petrasch et al. (2022) identified a total of nine QTLs associated with resistance to *Botrytis cinerea*, a fungal pathogen that significantly limits the shelf life of strawberry fruits. Although the effects of these QTLs were relatively minor, eight were located on the LD linkage group, while one was found on the EM group.

CONCLUSIONS

In conclusion, QTL and GWAS studies in strawberry provide useful tools to understand the genetic control of important fruit quality traits, especially in strawberry breeding, as well as traits expected in breeding and to integrate this information into breeding programmes. It is thought that the use of such advanced techniques in breeding will make a significant contribution to the development of new strawberry varieties that are more productive, high quality, resistant to diseases and adaptable to different growing conditions. In addition, it contributes significantly to yield, disease and pest resistance, adaptation to different climatic conditions, genome-wide association studies, understanding the basis of complex traits (complex genetic characters), rapid and direct candidate gene identification, marker-assisted selection studies, genomic selection, accelerating the breeding of new varieties. However, studies on new methods that can be used in much more detailed and breeding in the future are continuing at a rapid speed. It is thought that this study may shed light on future studies.

PHYTOPATHOLOGICAL PROBLEMS OBSERVED IN TOMATO PLANTS IN KIRŞEHİR AHI EVRAN UNIVERSITY R&D GREENHOUSE DURING THE CULTIVATION SEASON

Öğr. Gör. Dr. Ayşe ÇANDAR
Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi, Bitki Koruma Bölümü, Kırşehir,
ayse.candar@ahievran.edu.tr, ORCID NO: 0000-0003-2385-5602

ABSTRACT

Kırşehir Ahi Evran University R&D Greenhouse was established in 2020 within the scope of Pilot Agriculture and Geothermal Coordinatorship - Clustering in Thermal Greenhouses Project, it is a Venlo-type unit with a full automation system, heated by geothermal source and where various R&D projects are carried out. In addition, the R&D Greenhouse, which constitutes the infrastructure of the 'Geothermal Advanced Greenhouse Technologies and Production Techniques Collaborative Application and Research Center (JISTUAM)' established in partnership with Ankara and Selçuk University under the coordination of Kırşehir Ahi Evran University, is established on a total area of 1512 m^2 and consists of a total of 7 compartments, one with soil, one with a nursery and 5 hydroponic compartments. In various R&D and production projects carried out in the greenhouse, vegetables such as tomato, pepper, cucumber and melon were cultivated.

Tomato is one of the most cultivated product groups in the R&D greenhouse. Although all nutritional and plant protection precautions are practiced during the cultivation season, some phytopathological problems may occur. While greenhouse cultivation provides the optimum conditions required for the cultivation of horticultural crops, the same conditions provide an environment for the rapid propagation of disease agents and make it difficult to control diseases. The aim of this study was to share the results of the observations in terms of tomato diseases and tests carried out for some viral diseases, in the R&D greenhouse during the cultivation season and to propose solutions to common phytopathological problems in tomato cultivation.

Phytopathological problems observed during tomato cultivation in the R&D greenhouse were blossom-end rot, vascular wilt diseases and virus diseases such as *Tomato mosaic tobamovirus* (ToMV), *Cucumber mosaic cucumovirus* (CMV), *Tomato spotted wilt orthotospovirus* (TSWV), *Tomato brown rugose fruit tobamovirus* (ToBRFV). Blossom-end rot, vascular wilt and ToMV, CMV, and TSWV are diseases observed on tomato plants from time to time whereas ToBRFV was observed in the winter growing period 2024-2025. In this paper, symptomatological examination photographs of the disease symptoms and DAS-ELISA test results for virus diseases, are presented to provide information about the diseases and suggestions for control.

Keywords: Tomato, Tomato Diseases, Tomato Viruses.

KIRŞEHİR AHİ EVRAN ÜNİVERSİTESİ AR-GE SERASINDAKİ DOMATES BİTKİLERİNDE YETİŞTİRME SEZONU BOYUNCA GÖZLENEN FİTOPATOLOJİK SORUNLAR

ÖZET

Kırşehir Ahi Evran Üniversitesi Ar-Ge Serası, Pilot Tarım ve Jeotermal Koordinatörlüğü-Termal Seralarda Kümelenme Projesi kapsamında 2020 yılında kurulmuş, tam otomasyon sistemine sahip, jeotermal kaynakla ısıtılan Venlo tipinde ve çeşitli Ar-Ge projelerinin yürütüldüğü bir birimdir. Ayrıca, Kırşehir Ahi Evran Üniversitesi koordinatörlüğünde Ankara ve Selçuk Üniversitesi ortaklığında kurulan 'Jeotermal İleri Sera Teknolojileri ve Üretim Teknikleri Ortak Uygulama ve Araştırma Merkezi (JİSTUAM)' altyapısını oluşturan Ar-Ge Serası toplam 1512 m^2 alanda kurulu olup biri topraklı, bir tanesi fidelik ve 5 âdeti de topraksız olmak üzere toplam 7 kompartımandan oluşmaktadır. Serada yürütülen çeşitli Ar-Ge ve üretim projelerinde domates, biber, hıyar, kavun gibi sebzelerin yetiştiriciliği yapılmıştır.

Ar-Ge serasında en çok yetiştiriciliği yapılan ürün gruplarından birisi de domatestir. Yetiştirme sezonu boyunca tüm besleme ve bitki koruma önlemleri alınmasına rağmen bazı fitopatolojik sorunlar oluşabilmektedir. Örtü altı yetiştiriciliği, bahçe bitkileri ürünlerinin yetiştiriciliği için gereken optimum koşulları sağlarken, aynı koşullar hastalık etmenlerinin hızlı bir şekilde çoğalmasına ortam hazırlamakta ve hastalıklarla mücadeleyi zorlaştırmaktadır. Bu çalışma, Ar-Ge serasındaki domates bitkilerinde yetiştirme sezonu boyunca yapılan gözlemlerin ve özellikle viral hastalıklar konusunda yapılan testlerin sonuçlarını paylaşmak ve domates yetiştiriciliğinde sık karşılaşılan fitopatolojik sorunlara çözüm önerileri sunmak amacıyla ele alınmıştır.

Ar-Ge serasındaki domates yetiştiriciliği sırasında gözlemlenen fitopatolojik sorunlar, çiçek burnu çürüklüğü, vasküler solgunluk hastalıkları ve *Tomato mosaic tobamovirus* (ToMV), *Cucumber mosaic cucumovirus* (CMV), *Tomato spotted wilt orthotospovirus* (TSWV) ile *Tomato brown rugose fruit tobamovirus* (ToBRFV) gibi virüs hastalıkları olmuştur. Çiçek burnu çürüklüğü, vasküler solgunluk ve ToMV, CMV, TSWV zaman zaman domates bitkilerinde gözlenen hastalıklar olup ToBRFV ise 2024-2025 kış yetiştirme periyodunda gözlenmiştir. Bu bildiride hastalıklar sonucu meydana gelen hastalık belirtilerine ait simptomatolojik inceleme fotoğrafları ve özellikle virüs hastalıkları konusunda yapılan DAS-ELISA test sonuçlarına dayanarak hastalıklar konusunda bilgi verilmiş ve mücadele önerileri sunulmuştur.

Anahtar Kelimeler: Domates, Domates Hastalıkları, Domates Virüsleri.

1. GİRİŞ

Domates (*Solanum lycopersicum* L.), patatesten sonra dünyada en çok yetiştiriciliği yapılan sebzelerden birisidir. Meyvelerinin besleyici ve insan sağlığına faydalı (içeriğindeki likopenin antikanser özelliği) özelliklerinden dolayı dünyanın hemen hemen her yerinde hem açık alanda hem de örtü altında yetiştirilmektedir (Ally et al., 2023). Patates, biber, patlıcan gibi *Solanaceae* familyası üyesi olan domates (Gebhardt, 2016), Güney Amerika ve And dağları kökenli olup 16. yüzyılda Avrupa'ya tanıtıldıktan sonra Orta Doğu, Asya ve Afrika'ya yayılmıştır (Naika et al., 2019). Meyveleri yenen bir sebze olan domates sofralık olarak taze şekilde tüketilmesinin yanında yemeklerin içinde pişirilerek de tüketilmektedir (Anonim, 2024). Ayrıca sanayilik olarak domates meyvelerinden konserve, püre, sos, salça ve ketçap üretilmekte (Anonim, 2024); kurutulmuş, salça ve konserve domates gibi ürünler, üretimin zayıf olduğu dönemlerde taze domatese göre daha uygun fiyatlı olduğundan ekonomik açıdan avantaj sağlamaktadır (Ally et al., 2023).

Tüketimdeki artışa paralel olarak domates üretimi, dünyada katlanarak artmaktadır (Khan, 2018). 2020-2021 döneminde küresel domates üretiminde 251 milyondan 257 milyon tona %2.5'luk bir artış olmuştur. 2023 yılında dünya domates üretimi, 6.572.247 hektar ekili alanda 263 milyon tona ulaşmıştır (FAO, 2025). Domates sektörünün önümüzdeki yıllarda (2020-2025) genişlemeye devam etmesi ve küresel olarak üretilen domatesin kg değerinin 51.930 ABD dolarına ulaşması beklenmektedir (Branthôme, 2020). Kısa sürede ürün vermesi ve iyi verim vermesi nedeniyle domates ekim alanları her geçen gün genişlemektedir. Öyle ki, domates üretimi gelişmekte olan ülkelerde kırsal ve yarı-kentsel üreticinin çoğu için önemli bir gelir kaynağı haline gelmiştir. Üretim miktarları incelendiğinde Çin, Hindistan, Türkiye ve ABD, büyük miktarlı üretimleriyle ilk sıralarda yer almaktadır (Nag, 2020). Türkiye 2023 yılında 13.3 milyon tonluk domates üretimiyle Çin ve Hindistan'ın ardından 3. sırada yer almıştır (FAO, 2025).

Domates bitkilerinin optimum sıcaklık isteği 23-27°C arasında değişmekte olup sıcaklık 15°C'nin altına düştüğünde ya da 35°C'nin üzerine çıktığında domates üretimi olumsuz etkilenmektedir. Ilık sıcaklıklar ve bol güneş ışığı domates bitkilerinin büyümesi için ideal ortam yaratmaktadır. Kış aylarında ışık seviyesindeki azalma, meyve veriminin düşmesine sebep olmaktadır. Domates bitkileri, derine giden ve yayılmış kök sistemine sahip olduğundan yetiştiriciliği için iyi drene edilmiş topraklar idealdir. Optimum toprak PH'sı isteği 6-7.5 arasında olup çimlenme için fazla miktarda yağışa ihtiyaç duymadığından kurak mevsimlerde de iyi yetişebilmektedir (Naika et al., 2019).

Domates hem açık alan hem de örtü altı yetiştiriciliğine uygun bir bitkidir. Özellikle son yıllarda kontrollü koşullarda üretime izin veren örtü altı domates yetiştiriciliği (yüksek tüneller ve seralarda), tarımda yeni bir trend haline gelmiştir (Ally, 2023). Öyle ki, 2024 yılında Türkiye'nin 8 milyon tonluk toplam örtü altı sebze üretiminin 4.2 milyon tonluk %52.5 gibi önemli bir kısmını domates oluşturmuştur (TÜİK, 2025). Seralarda domates yetiştiriciliği yapmanın ürünlerin mevsimi dışında da yetiştirilmesine izin vermesi, kısıtlı alandan daha yüksek verim elde edilmesi ve yetiştiricilikte daha az işçilik gerekmesi gibi bazı avantajları bulunmaktadır (Goncharova, 2004; Ally, 2023). Öte yandan, domates gibi sebzelerin yetiştirilmesi için sağlanan optimum ortam koşulları (sıcaklık, nem, ışık vb.), hastalıkların hızlı

bir şekilde çoğalması ve yayılması için elverişli ortam yaratmaktadır. Özellikle yüksek sıcaklık ve nem, hastalık oluşumuna zemin hazırlamaktadır (Mohapatra ve Sahoo, 2023).

Yetiştirme döneminden hasat sonrası aşamaya kadar domates bitkileri 200'den fazla hastalığa karşı hassastır. Bitki hastalıkları domates üretimini sınırlandıran en önemli faktör olup ciddi verim ve dolayısıyla ekonomik kayıplara neden olmaktadır (Singh et al., 2017). Sözü edilen bitki hastalıkları, abiyotik ve biyotik (mikrobiyal) hastalıklar olmak üzere iki gruba ayrılmaktadır. Seralarda yetiştirilen domatesleri etkileyen abiyotik yani bulaşıcı olmayan hastalıklar, yüksek sıcaklık ve nem gibi elverişsiz iklim koşulları, sulama düzenindeki değişiklikler ve besleme bozuklukları gibi faktörlerden kaynaklanmaktadır. Öte yandan, mikrobiyal hastalık olarak da isimlendirilen biyotik hastalıklar (bulaşıcı hastalıklar), ise fungus, bakteri ve virüs gibi patojen mikroorganizmalar tarafından meydana getirilmektedir. Patojenlerin neden olduğu hastalıklar, ortam koşulları uygun olduğunda hızlı bir şekilde çoğalmakta ve bir bitkiden diğerine hızlı bir şekilde yayılmaktadır (West et al., 2012). Bu nedenle sera yapılarının yetiştiriciliğe uygun şekilde kurulması, basit sera yapıları yerine yetiştiricilik için modern sera sistemlerinin tercih edilmesi, özellikle nemin uzaklaştırılması ve yüksek sıcaklığın düşürülmesi amacıyla iklim kontrollü koşulların sağlanması, uygun yetiştiricilik ve bitki koruma yöntemlerinin uygulanması hastalıklarla mücadelede önem arz etmektedir (Yıldız vd., 1990; Javis et al., 1993).

Kırşehir Ahi Evran Üniversitesi Ar-Ge Serası, YÖK tarafından açılan 'Bölgesel Kalkınma Odaklı Misyon Farklılaşması' çağrısı kapsamında üniversitenin tarım ve jeotermal alanda Pilot Üniversite seçilmesiyle onaylanan 5 proje içerisindeki 'Termal Seralarda Kümelenme Projesi' kapsamında kurulmuş bir birimdir. Projenin amaçlarından birisi olan bölgede yer alan jeotermal kaynakların sera ısıtmasında kullanılması ve jeotermal seracılığın bölgede yaygınlaştırılması kapsamında kurulduğu günden bu yana (2020), Ar-Ge serasında çok çeşitli araştırma-geliştirme ve üretim projeleri yürütülmüştür. Alt projeler kapsamında elde edilen başarılar sonucunda Kırşehir Ahi Evran Üniversitesi Koordinatörlüğü, Ankara ve Selçuk Üniversiteleri ortaklığında kurulan 'Jeotermal İleri Sera Teknolojileri ve Üretim Teknikleri Ortak Uygulama ve Araştırma Merkezi (JİSTUAM)'nin alt yapısını da yine Ar-Ge serası oluşturmaktadır.

KAEÜ Ar-Ge Serası, toplam 1512 m^2 alana kurulu 7 kompartımana sahip tam otomasyon sistemli Venlo tipinde bir işletmedir. Kompartımanlardan birisi fidelik olarak kullanılmakta olup sulama ve iklimlendirme sistemleri oldukça modern şekilde tasarlanmıştır. Ayrıca seranın diğer 4'ü topraksız, 1'i hidroponik (su kültürü) ve 1'isi topraklı olmak üzere 6 kompartımanı tüm gelişmiş sistemlerle donatılmıştır. Serada yetiştiricilik teknikleri, bitki ıslahı, topraksız tarıma uygun alternatif ortamların geliştirilmesi, biyosistem (enerji, kısıntılı sulama, iklimlendirme vb.) ve bitki koruma alanlarında pek çok Ar-Ge çalışması yürütülmüştür. Bu çalışmalar sırasında domates, kavun, hıyar, biber gibi sebzeler yetiştirilmiş olup Ar-Ge serasında en çok deneme kurulan ve yetiştiriciliği yapılan ürün grubu domates olmuştur. 2020 yılından bu yana hemen hemen her dönem domates bitkileri Ar-Ge çalışmalarında ve üretim programlarında kullanılmıştır.

Seramız her ne kadar otomasyon sistemli ve modern üretim teknikleriyle Ar-Ge çalışmalarının yürütüldüğü bir sera olsa da bazı dönemlerde bazı fitopatolojik sorunlar ortaya çıkabilmektedir. Bu hastalıklardan bazıları koruyucu ve tedavi edici önlemlerle kontrol edilebilir nitelikte olup bazıları dönem dönem görülebilmektedir. Bu çalışmada Ar-Ge serasında görülen hastalıklar

sonucu meydana gelen hastalık belirtilerine ait simptomatolojik inceleme fotoğrafları ve özellikle virüs hastalıkları konusunda yapılan DAS-ELISA test sonuçlarına dayanarak hastalıklar konusunda bilgi verilmiş ve mücadele önerileri sunulmuştur.

2. ABİYOTİK HASTALIKLAR

Domates bitkilerindeki abiyotik hastalıklar, aşırı sıcaklıklar, normal olmayan aydınlatma koşulları, besin eksiklikleri, su alımındaki dengesizlikler, genetik mutasyonlar ve hatalı kimyasal uygulamalar sonucunda meydana gelmektedir (Volesky et al., 2021). Abiyotik faktörlerin neden olduğu hastalıklardan birisi de çiçek burnu çürüklüğüdür. Çiçek burnu çürüklüğü başta domates olmak üzere, biber, karpuz ve patlıcan gibi çeşitli kültür bitkilerini etkileyen en yıkıcı fizyolojik bozukluklar arasında yer almaktadır (Díaz-Pérez and Hook 2017; Taylor and Locascio 2004). Bu fizyolojik bozukluk ile ilgili yapılan ilk çalışmalarda çiçek burnu çürüklüğü, bitkilerin üst aksamında gerçekleşen transpirasyon hızı ve amonyum bazlı gübre kullanımından kaynaklı ürün kayıplarıyla ilişkilendirildiği için önemli bir endişe kaynağı olmuştur (Chamberlain, 1933; Topçu et al., 2022; Wedgworth et al., 1927).

Çiçek burnu çürüklüğü, sulama düzensizliğine bağlı meyvedeki kalsiyum eksikliğinden kaynaklanan abiyotik bir hastalıktır. Bilindiği gibi kalsiyum hücre duvarının sağlamlığına katkıda bulunan önemli bir bitki besin elementi olup eksik olması durumunda hücrelerin parçalanması (hücre plazmolizi) nedeniyle meyvelerin çiçek ucu dediğimiz dip kısmında kahverengi suda ıslanmış gibi görünen açık renkli, küçük lekeler meydana gelmektedir (Saure, 2001; Volesky et al., 2021). Çiçek burnu çürüklüğünden etkilenen alanlar daha sonra genişlemekte ve kahverengi nekrotik bir hal almaktadır. Bu nekrotik alanlar genellikle meyvenin büyük bir kısmını kaplamaktadır (Hochmuth and Hochmuth, 2009). Çiçek burnu çürüklüğünden etkilenen alanlar, genellikle *Alternaria* spp. gibi saprofitik fungus türlerinin saldırısına açık hale gelmektedir (Brust, 2004; Topçu et al., 2022). Domateste çiçek burnu çürüklüğünün ilk belirtileri, tozlaşmanın ardından ikinci haftada görülürken; tozlaşmadan sonraki ilk beş hafta içinde de oluşabilmektedir (Rached et al., 2018). Belirtilerin tozlaşmadan hemen sonra ortaya çıkması durumunda hastalık daha tahripkâr seyretmekte ve meyveler hiçbir zaman istenen ya da olması gereken boyuta ulaşamamaktadır (Brust, 2004). Çiçek burnu çürüklüğü simptomları, genellikle meyvenin dip kısmındaki perikarp üzerinde görülmekle birlikte bazen uç kısımda belirti görülmeden uç bölümün iç kısmında yer alan plasenta dokusunda da oluşabilmektedir (Hochmuth and Hochmuth, 2009).

2.1. KAEÜ Ar-Ge Serasında Çiçek Burnu Çürüklüğü Hastalığının Durumu

Domates yetiştiriciliği yapılan tüm alanlarda olduğu gibi KAEÜ Ar-Ge serasında da çiçek burnu çürüklüğü, yetiştirme sezonu boyunca gözlenen en önemli abiyotik hastalıktır. 2020 yılından bu yana domates yetiştiriciliği yapılan tüm sezonlarda meyvelerde çiçek burnu çürüklüğü belirtileri görülmüştür. Ancak bazı sezonlarda hastalık belirtileri birkaç bitkinin meyveleri ile sınırlı kalırken bazı sezonlarda bitkilerin çoğunda gözlenmiştir. Bu fizyolojik bozukluğa ait simptomatolojik inceleme fotoğrafları Şekil 1'de görülmektedir.

Şekil 1. KAEÜ Ar-Ge serasından çiçek burnu çürüklüğü hastalığı belirtileri gösteren meyvelerden görünüm.

Çiçek burnu çürüklüğü yaklaşık 120 yıldan daha uzun bir süre önce domateste düzensiz sulamanın neden olduğu bir fizyolojik bozukluk olarak tanımlanmış (Selby, 1896) ve bu kavram günümüze kadar geçerliliğini korumuştur (Topçu et al., 2022). Ar-Ge serasında yürütülen kısıntılı sulama denemesinde %15 ve 30 kısıntılı sulama uygulanmış domates bitkilerinin meyvelerine göre %45 kısıntılı sulama uygulanmış meyvelerde daha fazla çiçek burnu çürüklüğü görülmüştür. Bu durum sulama düzensizliğinin çiçek burnu çürüklüğü belirtilerinin ortaya çıkmasındaki etkisini doğrular niteliktedir. Hastalık üzerine yapılan araştırmalar, Ca^{2+} dengesinin ve çevresel strese bağlı olarak reaktif oksijen türevlerinin (ROS) birikiminin hastalığın gelişiminde kritik rol oynadığını ortaya koymuştur. Dolayısıyla çevresel stres ve beslenme faktörlerinin kombinasyonu, çiçek burnu çürüklüğü simptomlarının ortaya çıkma sıklığını büyük ölçüde etkilemektedir (Görlach et al., 2015).

Çiçek burnu çürüklüğü ile ilgili yapılan araştırmalar domatesin meyve morfolojisi ve bitkinin genetik özelliklerinin de hastalığın ortaya çıkma sıklığı ile ilişkili olduğunu ortaya koymuştur. Domateste meyve büyüklüğü ve çiçek burnu çürüklüğü arasında pozitif bir ilişki bulunmaktadır (Marcelis and Ho, 1999; Heuvelink and Körner 2001). Dünya genelinde yapılan çalışmaların hiçbirisinde domatesin yabani akrabalarında ve küçük meyveli çeşitlerinde çiçek burnu çürüklüğü belirtisi rapor edilmediği, sadece kültür bitkilerinde bulunduğu için ıslah çalışmaları sırasında hastalığın tetiklendiği düşünülmektedir (Ho and White 2005; Topçu et al., 2022). Seramızda ıslah çalışmalarında kullanılan yabani domates bitkilerinin meyvelerinde çiçek burnu çürüklüğü belirtilerine rastlanmazken küçük meyveli kültür domates çeşitlerinde büyük meyveli çeşitlere oranla daha az oranda olmakla birlikte hastalık belirtileri gözlenmektedir (Şekil 1). Domateste hücre boyutu düzenleyici (*CSR= Cell Size Regulator*) olarak görev yapan

FW11.3/CSR geni, hücre boyutunu arttırarak meyve ağırlığında da artış sağlamaktadır (Mu et al., 2017). *CSR*'den türemiş alleli taşıyan *FW11.3* yakın izogenik hatlarda (NIL'ler), yabani tip alleli taşıyan *FW11.3* NIL'lere kıyasla daha yüksek oranda çiçek burnu çürüklüğü belirtileri gelişmiştir. Bu durum, *FW11.3/CSR*'nin çiçek burnu çürüklüğü gelişiminde bir rolü olabileceğini göstermektedir (Mu, 2015). Bu meyve ağırlığı genleri ile çiçek burnu çürüklüğü ilişkisinin dolaylı olduğu, nedensel olmadığı düşünülmektedir. Çünkü *CSR*'den türemiş meyve ağırlığı geni alleline sahip birçok domates çeşidinin çiçek burnu çürüklüğüne dayanıklı olduğu görülmüştür (Topçu et al., 2022).

Fizyolojik faktörlere ek olarak, domates çeşitleri farklı derecelerde çiçek burnu çürüklüğü belirtileri göstermekte, bu durum da hastalığın genetik bir temeli olduğunu düşündürmektedir (Adams and Ho 1992; Ho et al. 1995; Ho and White 2005). Çiçek burnu çürüklüğünün genetik temelleri üzerine yapılan çalışmalarda, Ca^{2+} iletimi ve meyve büyüme hızı ile ilgili genlerin hastalık gelişimine katkıda bulunduğu ortaya koyulmuştur (Ikeda et al., 2016; 2017). Çalışmalar sırasında bir lokus üzerinde yer alan 78 genden birinin hastalığı kontrol ettiği düşünülmüş (Ikeda et al., 2017) olsa da bu lokus ayrıntılı olarak haritalandırılamamıştır (Matsumoto et al. 2021). KAEÜ Ar-Ge serasında domates ıslah çalışmaları sırasında yetiştirilen genotiplerin farklı derecelerde çiçek burnu çürüklüğü göstermelerinin sebebinin hastalığın genetik arka planı ile ilgili olduğu düşünülmektedir. Öyle ki, bazı genotipler hastalığa oldukça hassas reaksiyonlar verirken bazı genotiplerin ise oldukça dayanıklı olduğu gözlenmiştir.

2.2. Çiçek Burnu Çürüklüğü Hastalığıyla Mücadele Önerileri

Çiçek burnu çürüklüğü ile ilgili yapılan çalışmalar ve Ar-Ge serasında domates bitkilerinde yaptığımız gözlemler değerlendirildiğinde, beslenme düzensizliği ve çevresel stres faktörlerinin kombinasyonu, bu fizyolojik bozukluğun ortaya çıkma oranını büyük ölçüde etkilemektedir. Bundan dolayı açık alan ve sera domates yetiştirme koşullarında hastalığın mücadelesi oldukça zordur. Yetiştiricilere hastalığa karşı dikkatli olmaları, özellikle seralarda etkili su drenajı, uygun sulama sistemi seçimi, dengeli gübreleme programı tercih etmeleri ve topraklı yetiştiricilikte tuzun kök bölgesinden uzaklaştırılması gibi kontrol stratejileri önerilmektedir (Machado and Serralheiro, 2017; Hagassou et al., 2019). Her ne kadar Ar-Ge serasında çiçek burnu çürüklüğünü azaltmak için kalsiyumlu gübreleme programları uygulanıyor olsa da farklı domates çeşitlerinin yetiştirildiği denemelerde hastalığın önüne geçilmesi mümkün olamayabilmektedir. Bu nedenle, ticari olarak yapılan yetiştiricilikte farklı çeşitlerin bir arada bulundurulmaması önerilmektedir. Bunun nedenlerinden birincisi her bir çeşide özgü gübreleme programı yapılmasının zor olması, ikincisi ise farklı çeşitlerin çiçek burnu çürüklüğüne hassasiyetinin farklı olmasıdır.

Çiçek burnu çürüklüğünün bitki ve meyve büyüme hızıyla da ilişkisi bulunmaktadır. Hızlı büyüme gösteren bitkilerde, özellikle de meyvelerde sağlıklı bir kalsiyum iletimi sağlanamamaktadır. Bu nedenle, çiçek burnu çürüklüğünün simptomlarını hafifletebileceği düşünüldüğünden, özellikle ticari domates yetiştiricileri için bazı büyüme geciktiricilerin kullanımı önerilmektedir. Öte yandan, yapılan çalışmalar sonucunda çiçek burnu çürüklüğünü en azından azaltmak için domates germplazmındaki genetik çeşitlilikten yararlanmaya vurgu yapılmıştır. Örneğin yüksek antioksidan üreten aksesyonlar, lipit ve protein oksidasyonunu, membran parçalanmasını, hücre plazmolizini ve dolayısıyla da çiçek burnu çürüklüğünü

engelleyeceği için ıslah programlarında bu aksesyonlardan yararlanılması önerilmektedir. (Topçu et al., 2022). Daha önce de bahsedildiği üzere farklı domates genotipleri çiçek burnu çürüklüğüne farklı hassasiyet göstermektedir. Bu duruma neden olan genetik faktörler tam olarak haritalanmamış olsa da en azından seleksiyon yapılırken çiçek burnu çürüklüğüne toleranslı ya da dayanımlı genotiplerin seçilmesi, bu hatların ıslah programlarında ve yetiştiricilikte kullanılması hastalığın ortaya çıkma sıklığının düşürülmesinde büyük fayda sağlayacaktır.

3. FUNGAL VE BAKTERİYEL HASTALIKLAR

Hava sirkülasyonunun zayıf olduğu sera yapıları nemli koşullar meydana getirmekte, bu nemli koşullar ise açık alan domates yetiştiriciliğinde sık rastlanmayan külleme ve yaprak küfü gibi fungal hastalıkların gelişme sıklığını arttırmaktadır (Scherer and Meadows, 2020). Buna ek olarak, seralarda nemli koşullar altında gelişen bakteriyel hastalıklar nedeniyle ciddi boyutlarda ürün kayıpları meydana gelmektedir (Kolomiets et al., 2017). Öte yandan, uygun iklim koşullarının sağlanamadığı, düşük sıcaklık ve yüksek nemin hâkim olduğu sera ve yüksek tünellerde ise domateste kurşuni küf ve mildiyö gibi hastalıklar yaygın bir şekilde görülmektedir (Liao et al., 2019).

Seralarda yetiştirilen domates bitkilerinde en sık görülen bakteriyel hastalıkları; bakteriyel kanser ve solgunluk (*Clavibacter michiganensis* subsp. *michiganensis*), bakteriyel benek (*Pseudomonas syringae* pv. *tomato*) ve leke (*Xhanthomonas campestris* pv. *vesicatoria*), domates öz nekrozu (*Pseudomonas corrugata*, bazı floresan *Pseudomonas*'lar ve bazı *Erwinia* türleri) hastalıklarıdır. Öte yandan en yaygın görülen fungal hastalıklar ise; yaprak küfü (*Cladosporium fulvum*), kurşuni küf (*Botrytis cinerea*), erken yanıklık (*Alternaria solani* ve *Alternaria tomatophila*), mildiyö (*Phytophthora infestans*), solgunluk (*Fusarium oxysporum* f. sp. *lycopersici* ve *Verticillium* spp.) ve külleme (*Leveillula taurica, Oidium neolycopersici* ve *Oidium lycopersici*) şeklinde sıralanmaktadır (Tsitsigiannis et al., 2008; Yadeta and Tohomma, 2013; Ally et al., 2023).

3.1. KAEÜ Ar-Ge Serasında Fungal ve Bakteriyel Hastalıkların Durumu

Kırşehir Ahi Evran Üniversitesi Ar-Ge Serası, tam otomasyon sistemine sahip iklimlendirmesi uygun koşullarda yapılan bir seradır. Bu nedenle serada, sıcaklık ve nem gibi fungal ve bakteriyel hastalıkların gelişmesi için ortam yaratan faktörler etkili bir şekilde kontrol altında tutulmaktadır. Nemin ya da sıcaklığın arttığı koşullarda havalandırma yapılmakta ve bu sayede özellikle neme ihtiyaç duyan külleme, mildiyö, erken yanıklık, kurşuni küf gibi fungal hastalıklara çok sık rastlanmamaktadır. Ayrıca, bu hastalıkların domates bitkilerinde meydana gelmesini önlemek için uygun fungisitlerle koruyucu ilaçlama programları da uygulanmaktadır. Öte yandan, örtü altında yetiştirilen domates bitkilerini en çok etkileyen bakteriyel leke ve benek gibi bakteriyel hastalıklara da yetiştirme sezonu boyunca yapılan simptomatolojik incelemelerde rastlanmamıştır.

Serada yetiştirme sezonunda epidemi seviyesinde olmamakla birlikte bazı domates bitkilerinde tek tük solgunluk belirtileri görülebilmektedir. Domates bitkilerinde solgunluk belirtilerine neden olan bakteriyel patojenler, bakteriyel solgunluk ve kanser etmeni *Clavibacter*

michiganensis subsp. *michiganensis*, *Pseudomonas corrugata* başta olmak üzere öz nekrozuna neden olan diğer floresan *Pseudomonas* türleri ve patlıcangiller solgunluğu hastalığına neden olan *Ralstonia solanacearum* şeklinde sıralanmaktadır. Bunlara ek olarak, fungal patojenlerden *Fusarium oxysporum* f. sp. *lycopersici* ve *Verticillium* spp. de solgunluğa neden olmaktadır (Yadeta and Tohomma, 2013). Ar-Ge serasında yetiştirme döneminde domates bitkilerinde gözlenen solgunluk belirtilerine hangi patojenin neden olduğu bilinmemekle birlikte koruyucu ve tedavi edici fungusitler ve bakırlı preperatlarla (Tablo 1) hastalıkların önüne geçilmektedir. Tüm kontrol önlemlerine rağmen solgunluk belirtisi gösteren bir-iki bitki gözlenmesi durumunda ise bitkiler sökülerek seradan uzaklaştırılmakta ve ortam dezenfekte edilmektedir. Böylece hastalıkların başka bitkilere bulaşması ve yayılması önlenmektedir. Ayrıca, fungal ve bakteriyel hastalıkların kontrol altına alınması için kültürel işlemler sırasında hijyen koşullarına dikkat edilmekte, hastalıkların bir bitkiden diğerine yayılmasını önlemek amacıyla vektör böceklerle etkin şekilde mücadele edilmektedir.

3.2. Domates Fungal ve Bakteriyel Hastalıklarıyla Mücadele Önerileri

Fungal ve bakteriyel hastalıklara neden olan patojenler, sera gibi korunaklı alanlara; (i) Bulaşık, alet, ekipman ve giysi kullanımı, (ii) Patojenlerle enfekteli domates tohumlarının yetiştiricilikte kullanılması, (iii) Kültürel işlemler sırasında hijyen koşullarına dikkat edilmemesi, (iv) Bulaşık sulama suyu veya topraksız yetiştirme ortamı (kokopit gibi), (v) sera dışındaki enfekte bitkilerden hava akımlarıyla sera içine giren fungal sporlar, (vi) Yağmurlama sulama tercih edilen seralarda fungal sporların ve bakterilerin su damlacıkları içinde taşınması, (vii) Fungal ve bakteriyel hastalıkların yayılmasını destekleyen yüksek nem ve zayıf hava sirkülasyonu, (viii) Bitkilerin sık dikilmesi nedeniyle hava sirkülasyonuna izin verilmemesi gibi yollarla bulaşmakta ve bitkiden bitkiye hızla yayılmaktadır (Ally et al., 2023). Bununla birlikte, açık alan domates yetiştiriciliğinin aksine örtü altı yetiştiriciliğinin temel avantajı, hastalık yükünü optimize etmek için abiyotik ve biyotik faktörlerin etkilerini azaltacak çevre kontrollü üretim gerçekleştirilebilmesidir (Simko et al., 2007).

Domates bitkilerinde yaygın olarak görülen hastalıkların şiddetini azaltmaya yardımcı olacak sera içi iklim koşullarını sürdürme imkânı ve farklı hastalık etmenlerine karşı daha etkili bir kontrolün uygulanabiliyor olması, örtü altı domates yetiştiriciliğinden daha yüksek verim elde edilmesiyle sonuçlanmaktadır (Iddio et al., 2020). Bu nedenle, KAEÜ Ar-Ge serasında sıraladığımız yayılma yollarının engellenmesi adına tüm kültürel önlemler alınmakta ve hijyen koşullarına dikkat edilmektedir. Ayrıca, nemin seradan uzaklaştırılması amacıyla uygun şekilde havalandırma yapılmakta, otomasyon sistemiyle iklim koşulları kontrol altında tutulmaktadır.

Tablo 1. Ar-Ge serasında domates fungal ve bakteriyel hastalıkları için koruyucu ve tedavi edici kimyasal uygulamalar sırasında kullanılan etken maddeler ve dozları.

Etken Madde	**FRAC Kodu**	**Hedefe Göre Grubu**	**Etkili Olduğu Hastalık/ Etmen Adı**	**Uygulama Dozu**
%80 Fosetyl-Al	U:33	Sistemik Fungisit	Domates Mildiyösü (*Phytophhtora infestans*)	250 g/ 100 l su
%50 Captan	M4	Koruyucu ve Tedavi Edici Kontak Fungisit	Domates Mildiyösü (*Phytophhtora infestans*)	300 g/ 100 l su
			Yaprak Küfü (*Cladosporium fulvum*)	250 g/100 l su
			Kurşuni Küf (*Botrytis cinerea*)	
%13,3 Mancozeb + %30 Metalik bakıra eşdeğer bakıroksiklorür ve bakırsülfat + %4 Cymoxanil	M3; M1	Kontakt Fungisit	Domates Mildiyösü (*Phytophhtora infestans*)	250 g/ 100 l su
			Bakteriyel Benek (*Pseudomonas syringae* pv. *tomato*)	
			Domates Erken Yaprak Yanıklığı (*Alternaria solani*)	300 g/ 100 l su
%14 Metalik bakıra eşdeğer bakır hidroksit + %14 metalik bakıra eşdeğer bakır oksiklorid	M1	Fungisit	Domates Mildiyösü (*Phytophhtora infestans*)	225 g/da
%40 Iminoctadine tris (albesilate)	M7	Geniş Spektrumlu Kontak Fungisit	Kurşuni Küf (*Botrytis cinerea*)	45 g/ 100 l su
200 g/L Azoxystrobin + 125 g/L Difenoconazole	C3:11; G1:3	Hem Kontak Hem Sistemik Fungisit	Domates (Sera) Küllemesi (*Leveillula taurica*)	100 ml/ 100 l su
200 g/L Fluopyram + 200 g/L Tebukonazol	C2:7; G1:3	Kontakt ve Translaminar Fungisit	Domates (Sera) Küllemesi (*Leveillula taurica*)	30 ml/ 100 l su
%26,7 Boscalid + %6,7 Pyraclostrobin	C2:7; C3:11	Kontakt, Translaminar ve Lokal-sistemik Fungisit	Domates Küllemesi (*Leveillula taurica*)	Sera 60 g/ 100 l su
				Tarla 60 g/da

			Kurşuni Küf (*Botrytis cinerea*)	150 g/ 100 l su
500 g/l 8-Hydroxyquinoline sulphate	-	Sistemik Fungisit	Domates Bakteriyel Kanser ve Solgunluk Hastalığı (*Clavibacter michiganensis* subsp. *michiganensis*)	400 ml/da
			Fide Kök Çürüklüğü (Çökerten) (*Rhizoctonia solani*, *Fusarium* spp., *Pythium* spp)	200 ml/da
%50 Metalik bakıra eşdeğer bakır oksiklorid	M1	Kontakt ve Koruyucu Fungisit	Domateste Bakteriyel Leke (*Xhanthomonas campestris* pv. *vesicatoria*)	300 g/ 100 l su (1. ilaçlama) 400 g/ 100 l su (2. ilaçlama)
			Domateste Bakteriyel Benek (*Pseudomonas syringae* pv. *tomato*)	
			Domates Mildiyösü (*Phytophhtora infestans*)	300 g/ 100 l su
			Domates Erken Yaprak Yanıklığı (*Alternaria solani*)	500 g/100 l su

Tüm kültürel ve hijyen önlemlerinin alınmasına rağmen bazen hastalıklar ortaya çıkabilmektedir. Bu nedenle, Ar-Ge Serasında fungisitlerle ve bakteri hastalıklarının ortaya çıkmasını engellemek için bakırlı preparatlarla koruyucu ve tedavi edici ilaçlamalar yapılmaktadır. Tablo 1'de dönem dönem kullanılan etken maddeler verilmiştir. Ar-Ge serasında bazı durumlarda kimyasal mücadele yapılıyor olsa da çoğu zaman alınan kültürel önlemler, iklim kontrolü ve hijyen önlemleri yeterli olmaktadır. Kimyasal mücadele yapılırken doz ayarlamasına ve ilaçlama ile hasat arasındaki süreye dikkat edilmesi en önemli konulardan birisidir. Ayrıca hastalıklı bitki görüldüğünde bu bitkiler sökülerek seradan uzaklaştırılmakta, budama makasları ve kültürel işlem aletlerinin ise dezenfekte edilmesine dikkat edilmektedir.

4. VİRÜS HASTALIKLARI

Örtü altında yetiştirilen domates bitkilerini etkileyen ana viral hastalık etmenleri, *Tobacco mosaic tobamovirus* (TMV), *Tomato mosaic tobamovirus* (ToMV), *Cucumber mosaic cucumovirus* (CMV) ve *Tomato spotted wilt tospovirus* (TSWV)'tür (Tsitsigiannis et al., 2008; Ally et al., 2023). Son yıllarda, domates yetiştiriciliğinde oldukça yaygın hale gelen yeni *Tobamovirus* cinsi üyesi *Tomato brown rugose fruit virus* (ToBRFV), dünyanın dört bir yanındaki seralardan rapor edilmeye başlanmıştır (Zhou et al., 2024).

Virgaviridae familyası üyesi olan TMV, ToMV ve ToBRFV gibi tobamovirüsler, asıl bulaşma ve taşınması bitki özsuyu ile mekanik olarak gerçekleşen, domateste tohumla bulaşması ise oldukça düşük oranda olan viral etmenlerdir (Ally et al., 2023; Davino et al., 2020; Salem et al., 2022; Tsitsigiannis et al., 2008). Bu virüslerin virionları oldukça stabil olup bulaşık tohum,

meyve, bitki artıkları, kültürel işlemler sırasında kullanılan alet-ekipman, işçilerin ellerinde ve kıyafetlerinde uzun süre hastalık yapma yeteneğini kaybetmeden kalabilmektedir. Bahsettiğimiz tüm bu bulaşık materyal tobamovirüslerin seralarda önemli bulaş kaynaklarını oluşturmaktadır (Ally et al., 2023; Chanda et al., 2021a; Klap et al., 2020). Öyle ki, yapılan çalışmalarda ToMV'nin topraksız besin solüsyonunda 6 aydan fazla enfeksiyon yeteneğini kaybetmeden stabil kalabildiği rapor edilmiştir (Pares et al., 1992). Benzer şekilde, TMV ve ToMV gibi tobamovirüslerin bitki artıklarında veya kuru toprakta 2 yıl boyunca enfeksiyon yeteneğini kaybetmeden kalabildiği, ancak iyi drene edilen topraklarda sadece bir ay kalabildiği bildirilmiştir (Fillhart et al., 1998). *Tobamovirus* cinsinin yeni üyesi olan ToBRFV'nin ise hidroponik sistemlerde bulaşıcılığını yitirmeden uzun süre kalabildiğini ve seradaki tüm bitkileri enfekte etmek için tek bir enfekteli bitkinin dahi yeterli olabileceğini ortaya koyan çalışmalar bulunmaktadır (Panno et al., 2020; Zhou et al., 2024).

Domates bitkilerinin en tahripkâr hastalıklarından olan TMV ve ToMV'nin tekli ya da karışık enfeksiyonları sonucunda domates bitkilerinin yapraklarının damarları arasında mozaik belirtileri görülmektedir. Ayrıca, yapraklarda yukarı doğru (kaşık şeklinde) kıvrılma, nekrozlar, şekil bozukluğu ve normalden küçük yaprak oluşumu gözlenebilmektedir. TMV ve ToMV enfeksiyonlarının diğer belirtileri ise bitkide cüceleşme, çiçek dökülmesi ve meyvelerde kahverengi lekeler şeklinde sıralanmaktadır (Chin and Miller, 2010; Pozharskiy et al., 2022). Bu virüslere bağlı enfeksiyon oranı virüs ırkı, domates çeşidi ve çevre koşullarına bağlı olarak %10 ile %100 arasında değişmekte; domates yetiştiriciliğindeki kayıpların %20'lik kısmı sadece bu iki virüs nedeniyle gerçekleşmektedir (Pozharskiy et al., 2022).

Tobamovirus cinsinin nispeten yeni üyesi olan ToBRFV, ilk kez 2014-2015 üretim döneminde Orta Doğu (İsrail)'da keşfedilmesinden bu yana, dünyanın yaklaşık 40 ülkesinde rapor edilmiştir. Bu ülkeler arasında Türkiye de yer almaktadır (EPPO, 2025). Hızla yayılan bu virüsün birincil konukçusu domates olup ToBRFV, temas ve tohumla taşındığı için dünya çapında tahmin edilenden daha ciddi şekilde yayılmaktadır (Zang et al., 2022). ToBRFV enfeksiyonu sonucunda test edilen domates çeşitlerinin *Tm-22* dayanım geni bulundurup bulundurmaması önemli olmaksızın meyve veriminde %15 ila 55 oranında azalmaya neden olduğu rapor edilmiştir (Avni et al., 2021).

ToBFV'nin enfeksiyonları sonucunda oluşan belirtiler, diğer tobamovirüsler, özellikle de ToMV'nin belirtileriyle oldukça benzerdir (Alon et al., 2021). Enfeksiyon sonucunda meydana gelen yaprak belirtileri, bitkilerin genç tepe yapraklarında daha az olmakla birlikte domates bitkilerindeki tipik simptomları klorotik, benekli ya da mozaikli yapraklar ve nekrotik, benekli veya kahverengi rugoz meyveler şeklindedir. Simptom şiddeti virüsün varyantı, bitki türü ve çeşidi, vejetasyon aşaması ve yetiştirme koşullarına göre değişebilmektedir (Salem et al., 2016).

CMV seralarda domates üretimini sınırlandıran bir diğer bitki virüsüdür. CMV'nin 1916 yılında hıyar ve kabakgil bitkilerinde tespit edilmesinden bu yana özellikle ılıman ve subtropik bölgelerde 800'den fazla türde kültür bitkisini enfekte edebildiği görülmüştür. Virüsün özellikle seralarda afitlerle (birincil vektörü *Myzus persicae*) bir bitkiden diğerine hızlı bir şekilde yayılabildiği bilinmektedir (Suresh et al., 2017; Zitter and Murphy, 2009). Enfekteli domates meyvelerinde şekil bozukluğu ve iyi gelişememe şeklinde simptomlara neden olan CMV, yapraklarda yeşil beneklenme, kloroz ve nekroz gibi belirtiler oluşturmaktadır. Bazı CMV

ırkları, yaprak ayasında ciddi baskı oluşturmak suretiyle yaprakların cılız bir şekilde gelişmesine neden olmaktadır (Suresh et al., 2017).

Bir diğer önemli domates virüsü TSWV, *Frankliniella occidentalis* ve *Thrips tabaci* başta olmak üzere birçok trips türüyle taşınmaktadır. Enfekte tohumlarla taşınamayan TSWV enfeksiyonları sonucunda, genç yapraklarda küçük, koyu lekeler oluşurken hastalığın ilerleyen dönemlerinde gövdede koyu renkli çizgiler, olgunlaşan meyvelerde koyudan kırmızıya beneklenme gözlenmektedir (Suresh et al., 2017). Dünya genelinde tarımsal üretimi sınırlandıran en tahripkâr virüs hastalıkları arasında yer alan TSWV enfeksiyonları nedeniyle domates bitkilerinde %75-100 arasında kayıp yaşanmakta (Gitaitis et al., 1998); domateste meyve enfeksiyonları sonucunda ürünler, %96 gibi ciddi bir oranda pazarlanamaz hale gelmektedir (Sevik and Arlı-Sokmen, 2011).

4.1. KAEÜ Ar-Ge Serasında Viral Hastalıkların Durumu

2024 üretim dönemi boyunca KAEÜ Ar-Ge serasında virüs benzeri simptomlar gösteren bitkilerden yaprak örneği alınmış, bu örnekler TMV, ToMV, CMV ve TSWV'ye spesifik antikorlar kullanılarak firmanın protokolüne göre (Bioreba, 2017; Clark and Adams, 1977) DAS-ELISA ile test edilmiştir. Örnek alınan bitkilerdeki öne çıkan simptomlar yapraklarda hafif veya şiddetli kloroz, mozaik, kabarcıklı mozaik, şekil bozukluğu, yaprak kenarlarında nekrotik alanlar; bitkide gelişme geriliği ve cüceleşme şeklinde görülmüştür. Bitkilerin hiç birisinde herhangi bir meyve belirtisi gözlenmemiş olup yaprak belirtileri enfekteli bitkilerde oldukça yoğun olmuştur (Şekil 2).

Şekil 2. KAEÜ Ar-Ge serasında bitkilerde gözlenen virüs benzeri simptomlar.

Serada yetiştirilen domates bitkilerinden üretim dönemi boyunca alınan virüs belirtili toplam 52 yaprak örneğinin DAS-ELISA test sonuçları Tablo 2'de verilmiştir. Buna göre test edilen örneklerin 46 adetinde (%88.5) araştırılan virüslerin tekli ya da karışık enfeksiyonları saptanmıştır. Domates yaprak örneklerinin 20 tanesinde saptanan CMV, %38.5 enfeksiyon oranıyla en yaygın görülen virüs olurken bunu sırasıyla toplam 18 bitkide bulunan TSWV (%34.6), örneklerin 14'ünde bulunan TMV (%26.9) ve 10 adetinde bulunan ToMV (%19.2) izlemiştir. KAEÜ Ar-Ge serasında yetiştirilen simptomlu domates bitkilerinde karışık enfeksiyonların durumu değerlendirildiğinde ise örneklerin %11.5'inde TMV+CMV+TSWV ve %7.7'sinde CMV+TSWV enfeksiyonu belirlenmiştir. TMV, ToMV, CMV ve TSWV için test edilen 6 örnek, DAS-ELISA testi sonucunda negatif bulunmuş olup bu örneklerin *Tomato*

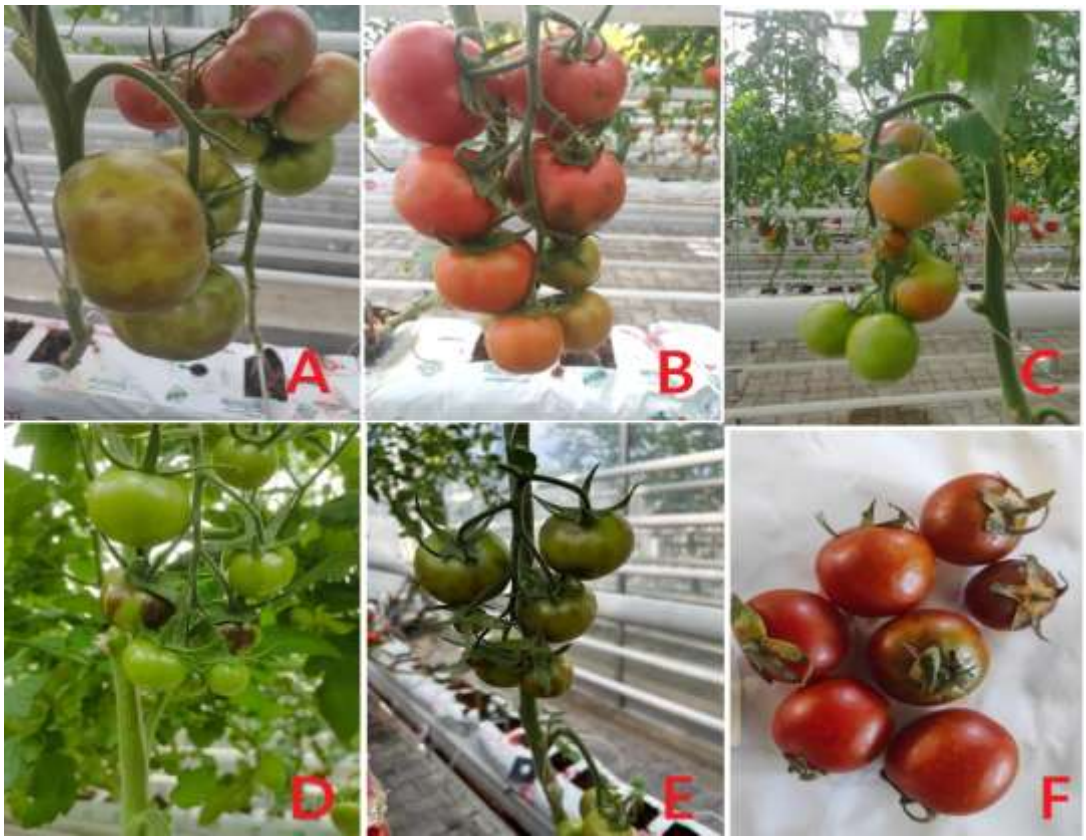
yellow leaf curl virus (TYLCV), *Potato virus* Y (PVY) veya *Potato virus* X (PVX) gibi açık alanda veya örtü altında yetiştirilen domates bitkilerinde yaygın bulunan (Arlı-Sökmen and Sevik, 2006) diğer virüslerle enfekteli olabileceği düşünülmüştür.

Tablo 2. Domates yaprak örneklerinde belirlenen virüs enfeksiyonları ve % bulunma oranları.

Saptanan Virüs	**Toplam Enfekteli Örnek Sayısı**	**Virüs Enfeksiyon Oranı (%)**
TMV	8	8/52 (15.4) 14/52 (26.9)*
ToMV	10	10/52 (19.2)
CMV	10	10/52 (19.2) 20/52 (38.5)*
TSWV	8	8/52 (15.4) 18/52 (34.6)*
CMV+TSWV	4	4/52 (7.7)
TMV+CMV+TSWV	6	6/52 (11.5)
Toplam Enfekteli Örnek Sayısı	**46**	**46/52 (88.5)**
Toplam Testlenen Bitki Sayısı	**52**	

* Karışık enfeksiyonlarla birlikte hesaplanan % enfeksiyon oranı

Ar-Ge serasında 2024-2025 kış üretim döneminde bitkilerin bazılarında çiçeklenme aşamasında bazı anormalilerin olduğu görülmüş, iri tomurcuk (stolbur) hastalığından şüphelenilmiştir. Ancak bu anomaliler birkaç bitkide gözlenmiş ve kısa sürede bitkiler toparlanarak normal meyve verimine başlamıştır. Yetiştirme döneminin başlangıcından itibaren gözlemlere devam edilmiş ve bitkilerde herhangi bir yaprak simptomu olduğu belirlenmemiştir. Belirli bir sürenin sonunda domates meyvelerinde nekrotik alanlar şeklinde belirtiler oluşmaya başlamıştır. Meyve olgunlaşma dönemine yakın yeşil meyvelerde başlayan ToBRFV belirtileri zamanla seradaki pek çok bitkiye yayılarak epidemi seviyesine ulaşmıştır. ToBRFV'nin Ar-Ge serasında yetiştirilen domates bitkilerindeki belirtileri Şekil 3'te görülmektedir.



Şekil 3. Domates bitkilerinde gözlemlenen ToBRFV belirtileri. A-B: Beef tipi domates çeşitlerinde yeşil ve olgunlaşmış meyvelerde kahverengi rugosite, C: Salkım tipi domates çeşitlerinin olgun meyvelerinde renk değişimleri, D-E: Salkım domateslerin olgunlaşmamış yeşil meyvelerinde kahverengi rugosite, F: Kokteyl tipi domates çeşitlerinin meyvelerinde kahverengi rugosite ile kaliks ve pedinküllerde nekroz.

ToBRFV'nin neden olduğu belirti tipi ve şiddeti, yetiştirme koşulları, virüsün ırkları veya varyantı ve bitki çeşidine göre değişmektedir (Salem et al., 2016). Öyle ki, dünya genelinde ToBRFV kayıtları incelendiğinde; Ürdün izolatı ile enfekte olan serada yetiştirilen domates bitkilerinin meyvelerinde şiddetli kahverengi rugosite gözlenirken bunun aksine bitkilerde çok hafif yaprak simptomu görüldüğü (Salem et al., 2016); Güney İsrail'de ağ evlerde yetiştirilen enfekte domates bitkilerinin yapraklarında hafif ile şiddetli arasında değişen oranda mozaik belirtileri ve hastalıklı bitkilerden elde edilen meyvelerin ise %10-15 oranında sarı benekli olduğu rapor edilmiştir (Luria et al., 2017). Yaprak daralması, klorotik beneklenme ve koyu yeşil şişkinlikler gibi yaprak belirtileri, Almanya ve Hollanda'dan gelen raporlarda belgelenmiş (Menzel et al., 2019; van de Vossenberg et al., 2020) ve Amerika Birleşik Devletleri ve Çin'de pediküller, kaliksler ve çiçekler üzerinde kuruma ve kahverengi nekroz lekeleri gözlenmiştir (Chanda et al., 2021b; Yan et al., 2019). Ülkemizde ToBRFV'nin ilk kaydı olan raporda, Antalya'nın Demre ilçesindeki seralarda yetiştirilen domates bitkilerinin yapraklarında klorotik mozaik, beneklenme, buruşukluk ve ara sıra daralma olduğu bildirilmiştir. Ayrıca, enfekteli bitkilerin yaprak sapı, pedinkül ve kalikslerinde nekrotik lekelerin olduğu; meyvelerin klorotik

ve nekrotik rugosite gösterdiği belirtilmiştir (Fidan et al., 2019). KAEÜ Ar-Ge serasında yetiştirilen beef tipi domates bitkilerinin olgunlaşmış ve olgunlaşmamış meyvelerinde nekrotik rugoz belirtilerinin yaygın olduğu, salkım tipindeki domates çeşitlerinin bazılarının meyvelerinde klorotik renk değişimlerinin, bazılarında ise nekrotik rugositenin olduğu gözlenmiştir. Serada yetiştirilen hiçbir domates çeşidinde yaprak belirtileri gözlenmezken, kokteyl tipi domates meyvelerinde nekrotik rugositeye ek olarak kaliks ve pedinküllerde de nekrotik lekelerin ve kurumaların olduğu tespit edilmiştir. Virüsün biyolojik, serolojik ve moleküler karakterizasyonu konusundaki çalışmalar seramızda devam etmektedir.

4.2. Domates Virüs Hastalıklarıyla Mücadele Önerileri

Bitki virüs hastalıklarının kontrolü için doğrudan etkili kimyasal mücadele stratejileri bulunmadığından dolayı hastalık yönetimi için pratikte virüslerin bitkilere bulaşma kaynaklarının azaltılması ya da mümkünse yok edilmesini sağlayacak ve böcek vektörleriyle yayılmalarını engelleyecek önlemler üzerinde yoğunlaşılmaktadır (Ally et al., 2023; Tsitsigiannis et al., 2008). Bugüne kadar virüs hastalıklarıyla ilgili yapılan çalışmalarda bazı kontrol önlemleri oldukça önemli olmuş ve bu doğrultuda örtü altında yetiştirilen domates bitkilerinde virüs hastalıklarının önüne geçilmesi amacıyla yetiştiricilere bazı önerilerde bulunulmuştur. Bu öneriler aşağıdaki şekilde sıralanabilmektedir;

- Fide üretimi yapılacak toprağın tohum ekiminden önce sterilize edilmesi; fideliklerin virüslerden ari, domateslerde yaygın görülen virüslere hassas *Solanaceae* familyası bitkilerinin yetiştirildiği alanlardan uzak bölgelerde kurulması (Özellikle TMV, ToMV ve ToBRFV gibi toprakta ve bitki artıklarında enfeksiyon yeteneğini yitirmeden uzun süre stabil kalabilen virüslerin üretim materyaline bulaşmasının engellenmesi için) (Cerkauskas, 2004; Panagopoulos, 2000).
- TMV, ToMV ve ToBRFV gibi tobamovirüsler toprakta, kokopit gibi topraksız tarım ortamlarında ve solüsyonlarında, sulama suyunda uzun süre stabil kaldıkları için seralarda bulaşık ortamların kullanılmamasına özen gösterilmesi (Ally et al., 2023; Chanda et al., 2021a; Klap et al., 2020; Pares et al., 1992).
- Tobamovirüsler başta olmak üzere örtü altı domates yetiştiriciliğinde zarar yapan virüslerin çoğunluğu tohumla taşındıkları için temiz tohumluk kullanılması veya enfekteli olduğundan şüpheli tohumların sodyum hipoklorit gibi uygun kimyasallarla dezenfekte edilmesi (Panagopoulos, 2000; Zitter, 1991).
- Seralarda enfekteli domates bitkilerinin vakit kaybetmeden sökülerek üretim alanından uzaklaştırılması ve kültürel işlemler sırasında bulaşmaların önüne geçebilmek için işçilerin hijyen önlemlerine dikkat etmesi (Panagopoulos, 2000; Tsitsigiannis et al., 2008; Zitter, 1991).
- Virüsün konukçu grubunu oluşturan ve virüse karşı hassas tepkiler veren bitki tür ve çeşitlerinin aynı serada polikültür halinde yetiştirilmesinden kaçınılması (Panagopoulos, 2000).
- Pek çok bitki virüsünün en önemli yayılma yollarından birisi olan enfekteli bitki artıklarının etkin bir şekilde sera ortamından uzaklaştırılması (Himmel, 2003; Panagopoulos, 2000; Zitter, 1991).

- Afitler (CMV kontrolü için), tripsler (TSWV için), beyaz sinekler (TYCLV için) ve domates güvesi *Tuta absoluta* (ToBRFV için) gibi virüslerin yayılmasında etkili olan böcek vektörlerle etkili bir şekilde mücadele edilmesi (Carusa et al., 2024; Himmel, 2003; Salati et al., 2002; Zitter, 1991).
- Mümkünse yetiştiricilikte virüslere dayanıklı ya da toleranslı olduğu bilinen çeşitlerin kullanılması (Tsitsigiannis et al., 2008).

5. SONUÇ VE ÖNERİLER

Bu çalışma, Kırşehir Ahi Evran Üniversitesi Ar-Ge serasında yetiştirilen domates bitkilerinde yetiştirme sezonu boyunca karşılaşılan önemli fitopatolojik sorunları ortaya koymayı amaçlamıştır. Serada yapılan gözlemler, simptomatolojik incelemeler ve analizler sonucunda, en sık rastlanan hastalıkların sulama düzensizliği, kalsiyum alınımı ve kalsiyumun bitki içindeki iletiminde dengesizlik sonucunda ortaya çıkan abiyotik bir hastalık olan çiçek burnu çürüklüğü; CMV, TSWV, TMV ve ToMV, 2024-2025 yetiştirme döneminde ise ToBRFV gibi viral hastalıkların olduğu tespit edilmiştir. Ar-Ge serasında fungal ve bakteriyel hastalıkların durumu değerlendirildiğinde ise etkin iklim kontrolü sağlanması, koruyucu ve tedavi edici kimyasal mücadele önlemlerinin etkin bir şekilde alınması dolayısıyla yaygın olmadığı belirlenmiştir.

Bildiri kapsamında abiyotik veya biyotik hastalıkların yönetiminde uygulanabilecek kontrol önlemleri tartışılmıştır. Araştırma sonuçlarımız ışığında, AR-GE serasında ve benzeri üretim ortamlarında domates yetiştiriciliğinde fitopatolojik sorunların etkin bir şekilde yönetilmesi için aşağıdaki öneriler sunulmaktadır:

- Kimyasal mücadeleye alternatif olarak veya kimyasal mücadeleyi destekleyici nitelikte biyolojik mücadele ajanlarının (örneğin, antagonist mikroorganizmalar, faydalı böcekler) ve kültürel uygulamaların (örneğin, uygun havalandırma, sulama ve besleme programlarının doğru yapılması, budama gibi kültürel işlemler sırasında mekanik bulaşmaları önleyici önlemlerin alınması, hastalıklı bitkilerin ve artıklarının üretim alanlarından uzaklaştırılması) entegre bir şekilde kullanılması hastalık ve zararlı baskısını azaltmada önemli rol oynayacaktır.
- Hastalık ve hastalıkları taşıyan zararlıların erken evrede tespit edilmesi için düzenli bitki kontrollerinin yapılması, uygun teşhis araçlarının (örneğin, yaprak analizleri, tuzak kullanımı) kullanılması ve elde edilen verilerin kayıt altına alınarak riskli dönemlerin belirlenmesi önemlidir.
- Seralarda sık karşılaşılan fitopatolojik sorunlara karşı dayanıklı veya toleranslı çeşitlerin tercih edilmesi hem abiyotik hem de biyotik hastalıklardan kaynaklı ekonomik kayıpları önemli ölçüde azaltmaktadır. Bu nedenle, ıslah programlarında hastalıklara dayanıklılık özelliklerinin belirlenmesine yönelik çalışmalara öncelik verilmelidir.
- Sera içerisine hastalıklı bitki materyali girişinin engellenmesi, kullanılan alet ve ekipmanların düzenli olarak dezenfekte edilmesi ve hasat sonrası bitki artıklarının seradan uzaklaştırılması gibi hijyen önlemleri hastalıkların yayılmasını önlemede kritik öneme sahiptir.
- Sera içi sıcaklık, nem ve havalandırma koşullarının bitki fizyolojisi için ideal aralıklarda tutulması, bitkilerin stres koşullarına karşı direncini artırarak hastalıkların olumsuz

etkilerini azaltmaktadır. Bu nedenle Ar-Ge serasında olduğu gibi otomatik iklim kontrol sistemlerinin örtü altı yetiştiriciliğinde yaygınlaştırılması önerilmektedir.

- Örtü altı domates yetiştiricilerine yönelik düzenli bilgilendirme ve eğitim etkinlikleri ile yaygın fitopatolojik sorunların tanınması, yayılma yolları ve kontrol yöntemleri hakkında farkındalık oluşturulması, mücadele stratejilerinin etkin bir şekilde uygulanmasına katkı sağlayacaktır.

ABSTRACT

Biological control agents or bio-agents have been used as an alternative to chemical control against many diseases and pests in recent years because they are environmentally friendly and do not harm human health. Bio-agents, called biofungicides, are substances of biological origin used to control fungi and fungi-like organisms (such as Oomycetes) that cause plant diseases and have been successful against different plant diseases in many studies. In recent years, the effect of these biofungicides on viral diseases has also started to be investigated.

Plant pathogenic viruses are very difficult to control due to their complex structure and the lack of effective chemicals. Therefore, there is a need to develop alternative control strategies. Secondary metabolites of some bio-agents, which are effective as biofungicides, or directly themselves, reduce infections by promoting plant growth and plant defence mechanisms and suppressing virus multiplication or spread.

The aim of this study was to determine the possibilities of biofungicides against plant virus diseases, their application methods to plants and their potential effects on reducing infections by reviewing the world literature. The main biofungicides investigated for their use against plant virus diseases are some *Bacillus* spp. species, also called plant growth promoting bacteria (PGPR bacteria), and some endophytic fungi, especially *Trichoderma* spp. species. The effects of these biofungicides on *Tobacco mosaic tobamovirus* (TMV), *Tomato mosaic tobamovirus* (ToMV) and *Cucumber mosaic cucumovirus* (CMV); *Tomato yellow leaf curl begomovirus* (TYLCV), *Potato potyvirus* Y (PVY) and other viruses were evaluated in the studies. In this paper, information about the mechanisms of action, possibilities of use and application methods of some biofungicides on virus diseases that can be reached within the scope of the research is given.

BAZI BİYOFUNGİSİTLERİN BİTKİ VİRÜS HASTALIKLARINA ETKİSİ ÜZERİNE ARAŞTIRMALAR

ÖZET

Biyolojik kontrol ajanları veya biyo-ajanlar, çevre dostu olmaları ve insan sağlığına zarar vermemelerinden dolayı son yıllarda pek çok hastalık ve zararlıya karşı kimyasal mücadeleye alternatif olarak kullanılmaktadır. Biyofungisit olarak adlandırılan biyo-ajanlar, bitki hastalıklarına neden olan fungus ve fungus benzeri organizmaları (Oomisetler gibi) kontrol etmek için kullanılan biyolojik kökenli maddeler olup yapılan birçok çalışmada farklı bitki hastalıklarına karşı başarılı olmuştur. Son yıllarda bu biyofungisitlerin viral hastalıklara etkisi de araştırılmaya başlanmıştır.

Bitki patojeni virüslerin kompleks yapısı ve mücadelesinde etkili kimyasalların bulunmaması nedeniyle kontrolü oldukça zor olmaktadır. Bu nedenle, alternatif kontrol stratejilerinin geliştirilmesine ihtiyaç duyulmaktadır. Biyofungisit olarak etkili olan bazı biyo-ajanların sekonder metabolitleri veya doğrudan kendileri, bitki büyümesi ile bitkinin savunma mekanizmasını teşvik ederek ve virüsün çoğalmasını veya yayılmasını baskılayarak enfeksiyonları azaltıcı özellik göstermektedir.

Bu çalışma, dünya literatürü taranarak biyofungisitlerin bitki virüs hastalıklarına karşı kullanım olanakları, bitkiye uygulama yöntemleri ve enfeksiyonları azaltıcı potansiyel etkilerinin saptanması amacıyla ele alınmıştır. Bitki virüs hastalıklarına karşı kullanım olanakları araştırılan başlıca biyofungisitler, bitki gelişimini teşvik edici bakteriler (PGPR bakterileri) olarak da adlandırılan bazı *Bacillus* spp. türleri ve *Trichoderma* spp. türleri başta olmak üzere bazı endofitik funguslardır. Yapılan çalışmalarda bu biyofungisitlerin başta *Tobacco mosaic tobamovirus* (TMV), *Tomato mosaic tobamovirus* (ToMV) ve *Cucumber mosaic cucumovirus* (CMV) olmak üzere; *Tomato yellow leaf curl begomovirus* (TYLCV), *Potato potyvirus* Y (PVY) ve diğer virüsler üzerine etkileri değerlendirilmiştir. Bu bildiride, araştırma kapsamında ulaşılabilen virüs hastalıklarına bazı biyofungisitlerin etki mekanizmaları, kullanım olanakları ve uygulama yöntemleri hakkında bilgiler verilmiştir.

Anahtar Kelimeler: Biyofungisitler, Biyolojik Kontrol, Bitki Virüs Hastalıkları, Virüs Hastalıklarının Kontrolü

GİRİŞ

Küresel tarım sektörü, artan dünya nüfusunu besleme ve sürdürülebilir gıda üretimi sağlama gibi hayati zorluklarla karşı karşıyadır. Bu zorlukların en önemlilerinden biri, bitki sağlığını tehdit eden ve verimliliği önemli ölçüde azaltan bitki hastalıklarıdır. Fungus, bakteri ve virüslerin neden olduğu biyotik bitki hastalıkları, ekonomik açıdan önemli pek çok üründe verimi sınırlandırmakta ve ürün kalitesini etkileyerek ciddi ekonomik kayıplara neden olmaktadır (Manjunatha et al., 2022). Sözü edilen biyotik hastalık etmenleri arasında yer alan bitki virüslerinin, dünya genelinde meydana gelen bitki hastalığı epidemilerinin %47'lik kısmına neden olduğu bilinmektedir (Anderson et al., 2004).

Bugün tanılanmış olan 25'ten fazla bitki virüsü ailesi, geniş bir konukçu dizininde hastalık oluşturabilmekte ve dünya çapında ciddi ekonomik kayıplara neden olmaktadır (He and Krainer, 2020). Öyle ki, 1980'li yıllarda bitki virüs hastalıklarına bağlı kayıplar, 15-20 milyar ABD doları arasında seyrederken, 2014 yılına geldiğinde ekonomik kaybın değeri 30 milyar ABD dolarını aşmıştır (Jones, 2021). Küresel çapta bitki virüs hastalıklarının ekonomik etkisinin bu denli artmasındaki ana nedenler, iklim faktörlerindeki değişimler, bitki virüslerinin bu faktörlere bağlı olarak hızlı şekilde evrimleşmesi ve tarım ürünlerinin hızlı ticareti şeklinde sıralanabilmektedir (Chung et al., 2013; Rubio et al., 2020).

Bitki virüsleri, karmaşık konukçu-patojen etkileşimleri ve obligat parazit olmalarından kaynaklı olarak etkili doğrudan mücadele yöntemlerinin sınırlı olması ve kimyasal kontrol önlemlerinin başarısız olması nedeniyle tarımsal üretimde tehdit olmaya devam etmektedir (Manjunatha et al., 2022). Bitki patojeni virüslerin kontrol stratejileri arasında, yetiştiricilikte temiz üretim materyali ve dayanıklı veya toleranslı çeşitlerin kullanılması, hijyen önlemlerine dikkat edilmesi ve virüs taşıyan vektörlerle etkili şekilde mücadele edilmesi gibi sınırlı önlemler yer almaktadır (Varma, 2007). En sık kullanılan ve hastalık kontrolü için kaçınılmaz yöntemlerden birisi de virüs vektörlerinin kontrol altında tutulması, bu sayede üretim alanlarında viral hastalıkların bulaşmasının ve yayılımının engellenmeye çalışılmasıdır. Geleneksel olarak bitki virüslerinin vektörleriyle mücadelede sentetik kimyasal pestisitler yaygın olarak kullanılmaktadır. Ancak, bu kimyasalların aşırı ve bilinçsiz kullanımı, çevresel kirlilik, biyoçeşitliliğin azalması, hedef dışı organizmalar üzerinde toksik etkiler ve patojenlerde direnç gelişimine neden olabilmektedir (Aktar et al., 2009).

Bitki hastalıklarının ve onları taşıyan vektörlerin kontrolünde yoğun olarak kullanılan sentetik pestisitlerin çevre ve insan sağlığına olumsuz etkileri, çevre dostu, insan sağlığına daha az zararlı ve sürdürülebilir tarımsal üretim stratejisine uygun alternatif mücadele yöntemlerine ihtiyacı giderek arttırmaktadır. Bu nedenle, son zamanlarda biyolojik mücadeleye yoğun bir ilgi oluşmuştur (Elnahal et al., 2022; Whipps, 2001). Sentetik fungisitlere göre çok daha çevre dostu olan biyofungisitler, günümüzde pek çok bitki patojeni fungus ve Oomisetler gibi fungus benzeri organizmaların kontrolünde başarılı bir şekilde kullanılmaktadır (Daryaei et al., 2016; Nihorimbere et al., 2010; Thind, 2021; Verma et al., 2020). Biyofungisit tanımlamasına giren ürünler, doğal kaynaklardan elde edilen ve bitki fungal hastalıklarına baskılayıcı etki gösteren mikroorganizmalar (mikrobiyal biyofungisitler), bitki özleri (fitofungisitler: bitkisel kökenli biyofungisitler) ve doğal metabolitlerden üretilen nanopartiküller (nano-biyofungisitler) şeklinde sınıflandırılmaktadır (Meena, 2021; Whipps, 2001).

Biyofungisitler, fungal patojenler üzerinde; doğrudan patojen gelişimini ve çoğalmasını engelleme, bitkinin doğal savunma mekanizmalarını (Uyarılmış Sistemik Dayanıklılık- ISR) tetikleme, besin ve alan rekabeti yaratarak patojenin bitki dokuları içinde kolonizasyonunu önleme ve patojenin konukçu bitki dokularına girişini engelleme gibi çok çeşitli etki mekanizmalarına sahiptir (Fenta and Menkonnen, 2024). Sentetik alternatiflerine kıyasla daha özgül etki gösteren biyofungisitlerin, hedef dışı organizmalara zarar verme riskinin düşük olması, doğada genellikle hızlı parçalanmaları (Köhl et al., 2019) ve daha düşük sera gazı emülsiyonuna neden olmaları (Ayilara et al., 2023) dolayısıyla çevre dostu olmaları gibi avantajları bulunmaktadır.

Obligat intraselüler parazit olan virüslerin neden olduğu bitki hastalıklarının kontrolünde antiviral etkili kimyasalların geliştirilmesi ve bunların bitki dokularına uygulanması oldukça zordur. Mevcut mücadele stratejileri, genellikle virüsün yayılımını engellemeye (vektör kontrolü, sanitasyon), dayanıklı çeşitlerin kullanımına ve bitki bağışıklık sistemini güçlendirmeye odaklanmaktadır (Varma, 2007). Bu nedenle son yıllarda bitki bağışıklık sistemini güçlendirme ve savunma sistemlerini harekete geçirme özelliği olan biyofungisitlerin bitki virüs hastalıklarının yönetimindeki potansiyel rolleri konusundaki araştırmaların sayısı giderek artmaktadır (Manjunatha et al., 2022). Mikrobiyal kökenliler başta olmak üzere bazı biyofungisitlerin, virüsleri bitkiden bitkiye taşıyan vektör organizmalar üzerindeki etkileri, bitkilerde sistemik direnci tetikleme yetenekleri ve genel bitki sağlığını iyileştirerek virüs enfeksiyonlarının olumsuz etkilerini azaltma potansiyelleri umut vericidir.

Bu çalışma, güncel literatürdeki araştırmaları derleyerek, bazı önemli mikrobiyal biyofungisit gruplarının bitki virüs hastalıkları üzerindeki potansiyel etkilerini kapsamlı bir şekilde incelemeyi amaçlamaktadır. Söz konusu incelemede, farklı mikrobiyal biyofungisitlerin bitki virüs hastalıklarına etki mekanizmaları, virüs enfeksiyonlarını engelleme veya şiddetini azaltma potansiyelleri, antiviral ajan olarak kullanımındaki zorluklar ve konuyla ilgili gelecekteki araştırma yönleri ele alınmıştır. Buna ek olarak çalışma, sürdürülebilir tarım sistemlerine entegre edilen bazı mikrobiyal biyofungisitlerin bitki virüs hastalıklarını kontrol etmedeki olası katkılarının daha iyi anlaşılmasını hedeflemektedir.

2. BİTKİ VİRÜSLERİNİN KONTROLÜNDE MİKROBİYAL BİYOFUNGİSİTLER

Biyofungisit terimi, fungal patojenlerin gelişmesini ve çoğalmasını sınırlandıran veya tamamen engelleyen, canlı organizma konsorsiyumlarından (birlikteliklerinden) geliştirilen biyolojik kaynaklı formülasyonları ifade etmektedir (Kubheka et al., 2020). Bu biyolojik kökenli maddeler elde edildikleri organizma grubuna göre fitofungisit (bitkisel kökenli), mikrobiyal biyofungisit (bakteri, fungus, virüs, mavi-yeşil alg, likenlerden elde edilebilirler) ve nano-biyofungisit gibi farklı isimler almaktadır (Commisso et al., 2021; Meena, 2021; Whipps, 2001). Literatürde, mikrobiyal kökenli biyofungisitlerin etken maddesini oluşturan biyolojik kontrol ajanlarının antifungal etkilerinin araştırıldığı pek çok çalışma bulunmaktadır. Ayrıca günümüzde ticari pek çok mikrobiyal biyofungisit formülasyonu da piyasada mevcuttur ve tarım sektöründeki gelişmelerle birlikte bu formülasyonlar, organik tarım yapılan alanlarda entegre zararlı yönetimi stratejisine başarılı bir şekilde dahil edilmiştir (Subba and Mathur, 2022).

Önceki yıllarda yapılan çalışmaların birçoğunda bitki patojenlerinden ve zararlılardan bitkilerin korunması için mikrobiyal biyofungisitlerin etken maddesini oluşturan yararlı mikroorganizmaların önemine değinilmiştir (Bouizgarne, 2012; LeCocq et al., 2017; Siegel and Latch, 1991). Ancak transgenik yaklaşımlar ve kimyasal pestisitlere kıyasla aktinobakteriler, bitki gelişimini teşvik eden bakteriler (PGPR), endofitik mikroorganizmalar ile fungal ajanlar gibi yararlı heterojen grupların viral aktiviteyi doğrudan baskılayabildiği ve virüs vektörü böceklerin yumurtlama kapasitesini düşürebildiği veya engelleyebildiği son yıllarda yapılan çalışmalarla kanıtlanmıştır (Clay, 1988; Li et al., 2016; Maksimov et al., 2018; Maksimov et al., 2019).

2.1. Bakteriyel Biyofungisitler

2.1.1. Aktinobakteri grubu biyolojik kontrol ajanları

Aktinobakteriler, tarımsal açıdan önemli ve tedavi edici biyolojik aktiviteye sahip çok çeşitli sekonder metabolitleri yoğun şekilde üreten gram pozitif özellikte önemli bir bakteri sınıfıdır (Kunoh, 2002; Pandey et al., 2021). Sadece 1988-1992 yılları arasında aktinobakteri kaynaklı 1000'in üzerinde sekonder metabolit karakterize edilmiştir. Bu bileşiklerin çoğu *Streptomyces* cinsinin çeşitli üyeleri tarafından üretilmekte olup biyo-insektisit ve herbisitlerin %60'ının *Streptomyces* spp. kaynaklı olduğu rapor edilmiştir. (Tanaka and Omura, 1993). Aktinobakterilerin ürettikleri antibakteriyel, antifungal, nematisidal ve herbisidal etkili antibiyotik bileşiklerin birçoğu tarımda yaygın şekilde kullanılmaktadır. *Streptomyces* cinsi aktinobakterilerin çok sayıda antibiyotik ürettiği bilinmekte olup ürettikleri validamisin ve kasugamisin gibi pek çok antibiyotik bileşik, biyofungisit olarak ticarileştirilmiştir (Tanaka and Omura,1993; Mathivanan et al., 2008).

Birçok biyofungisitin üretiminde kullanılan *Streptomyces* türü aktinobakterilerin ve onların sekonder metabolitlerinin çeşitli bitki patojeni virüslere karşı etkilerinin araştırıldığı çalışmalar, Tablo 1'de özetlenmiştir. Yapılan çalışmalarda, *Streptomyces ahygroscopicus*, *Streptomyces* sp. ZX01 ve *S. noursei* var. *xichangensis* gibi türlerin, tütün bitkilerinde sinyal moleküllerinin üretimini arttırarak bitki savunma yollarını aktive ettiği ve bu şekilde *Tobacco mosaic virus* (TMV)'e karşı antiviral etki gösterdiği ortaya koyulmuştur (Dong et al., 2006; Han et al., 2014; Wang et al., 2006; Zhang et al., 2015). Ayrıca yapılan benzer bir çalışmada, *S. ahygroscopicus* ile hazırlanan solüsyonun TMV ile enfekteli *Nicotiana glutinosa* ve *N. tabacum* bitkilerinin özsuyunda virüsü inaktive ettiği rapor edilmiştir (Xing et al., 2012). Chen vd. (2019), TMV'yi bitki özsuyunda inaktive ederek antiviral özellik gösteren bileşiğin *S. ahygroscopicus*'un ürettiği 3454-4352 Da'luk ε-poli -l- lizin (ε-PL) olduğunu bildirmiştir (Chen et al., 2019).

Tablo 1. Aktinobakteri grubu biyo-kontrol ajanlarının bitki patojeni virüslere etkileri.

Aktinobakteri Grubu Biyokontrol Ajanı	**Hedef Virüs***	**Konukçu**	**Antiviral Etki**	**Kaynaklar**
Streptomyces ahygroscopicus	TMV	*Nicotiana glutinosa* ve *N. tabacum*	Özsuda virüs inaktivasyonu	Xing et al., 2012; Chen et al., 2019
			Sinyal moleküllerinin üretimini arttırarak bitki savunma sisteminin aktivasyonu	Dong et al., 2006; Wang et al., 2006
Streptomyces sp. ZX01				Zhang et al., 2015
S. noursei var. *xichangensis*				Han et al., 2014
Streptomyces olivaceus	TMV	*Nicotiana glutinosa* ve *Chenopodium quinoa*	Nekrotik lokal lezyon sayısında azalma	Mohamed and Galal, 2005
	PVY			
	CMV			
	CMV	Hıyar	Enfekteli bitki sayısında azalma	Latake and Borkar, 2017

* TMV: *Tobacco mosaic virus*; CMV: *Cucumber mosaic virus*; *Potato virus* Y

Streptomyces olivaceus denizlerde yaşayan aktinobakterilerden birisidir. Bu bakteri türünün *N. glutinosa* ve *Chenopodium quinoa* bitkilerinde TMV, *Cucumber mosaic virus* (CMV) ve *Potato virus* Y (PVY) enfeksiyonları sonucu meydana gelen nekrotik lokal lezyonların sayısını azalttığı görülmüştür (Mohamed and Galal, 2005). 28 farklı deniz aktinobakteri izolatı metabolitlerinin CMV'ye karşı antiviral aktivitesinin değerlendirildiği çalışmada ise bir izolatın tohum uygulaması ve yapraklara püskürtülerek uygulanması durumunda, sera koşullarında çift inokulasyonla hıyar bitkilerinde oluşturulan CMV enfeksiyonlarını azalttığı belirlenmiştir. Ardından anti-CMV etkisine sahip olan metabolitin elde edildiği izolat, moleküler olarak karakterize edilmiş; bu izolatın *Streptomyces olivaceus* olduğu morfolojik, fizyolojik ve biyokimyasal karakterizasyonla da doğrulanmıştır (Latake and Borkar, 2017).

2.1.2. *Bacillus* türü biyolojik kontrol ajanları

Biyofungisit olarak kullanılan biyokontrol ajanı bakteri gruplarından bir diğeri de Firmicutes şubesinde yer alan gram pozitif özellikteki *Bacillus* türleridir. *Bacillus* türlerinin ürettiği zwittermisin A (Smith et al., 1993), bacillomisinler, fungisin (Koumoutsi et al., 2004), kanosamin, rizoktisin C, iturinler (Kloepper et al., 2004; Paulitz and Belanger, 2001), ve saltavalin gibi birçok antibiyotik ve termostabil antimikrobiyal peptitler, bitki hastalıklarına karşı kullanılmaktadır (Emmert and Handelsman, 1999; Kavitha et al., 2005; Leclere et al., 2005; Zhao et al., 2010). Ayrıca, *Bacillus* spp.'nin ürettiği bakteriosinlerin gıdalarda biyo-koruyucu ve tarımda biyokontrol ajanı olarak kullanımı pek çok çalışmada rapor edilmiştir (Bais et al., 2004). Thurisin, thurisin 7, thurisin S, thurisin CD 19, thurisin 439A, thurisin 439B, bacthurisin F4, tochisin, kurstakin 18 ve entomosin gibi bakteriosinlerin ise antibiyotiklerin öncülleri olarak görev yapan sekonder metabolitler olabileceği bildirilmiştir (Sansinenea and Ortiz, 2011). *Bacillus* türü biyokontrol ajanlarının bitki virüs hastalıklarına karşı etkisinin belirlendiği birçok ümit verici çalışma olmasına rağmen bu etkisini hangi sekonder metabolit

ve etken madde sayesinde gerçekleştiğini kanıtlayan çalışmalar oldukça kısıtlıdır. Bitki virüslerine etkisi en fazla araştırılan türler *Bacillus amyloliquefaciens* ve *Bacillus subtilis* olmuştur (Tablo 2).

Tablo 2. *Bacillus* türü biyo-kontrol ajanlarının bitki virüslerine etkisi.

***Bacillus* türü Biyokontrol Ajanı**	**Hedef Virüs***	**Konukçu**	**Antiviral Etki**	**Kaynaklar**
Bacillus amyloliquefaciens	TSWV	*Nicotiana benthamiana*	Sinyal moleküllerinin üretimini arttırarak simptomlarda azalma, viral yükte azalma ve bitki büyümesinin teşviki	Khan et al., 2024
	TMV	*Nicotiana tabacum*	Test bitkilerinde lokal nekrotik lezyon sayısında azalma, bulaşık makasların daldırılması ile dezenfeksiyon ve tarladaki bitkilere püskürtüldüğünde enfeksiyon oranında %50 azalma	Shen et al., 2013
		Domates	Virüs inokülasyonundan 24 saat önce ve sonra yaprağa püskürtüldüğünde enfeksiyonda %90 azalma	Abdelkhalek et al., 2022a
	TYLCV	Domates	Bitkiler bakteri süspansiyonuna batırıldıktan sonra beyaz sinekle virüs inokulasyonu yapıldığında enfeksiyon oranı ve hastalık şiddetinde %48-52 azalma	Guo et al., 2019
Bacillus subtilis	ToMV	Domates	Enfekte fidelere bakterinin ürettiği antimikrobiyal bileşik surfaktin ile sulandığında simptomlarda önemli derecede azalma	Hussein et al., 2016
	PVY	Patates	Bitkilere virüs inokülasyonundan 48 saat önce ve 10 gün sonra yaprağa püskürtülerek ve topraktan uygulanmasıyla virüs simptomlarında ve konsantrasyonunda azalma	Amin et al., 2023
Bacillus subtilis subsp. *subtilis*	CMV	*Arabidopsis*	Virüs konsantrasyonunda ve hastalık şiddetinde azalma	Elsharkawy et al., 2022

* TSWV: *Tomato spotted wilt virus*; TMV: *Tobacco mosaic virus*; TYLCV: *Tomato yellow leaf curl virus*; ToMV: *Tomato mosaic virus*; PVY: Potato virus Y; CMV: Cucumber mosaic virus.

B. amyloliquefaciens'in *N. benthamiana* bitkilerindeki TSWV enfeksiyonlarına etkisi üzerine yapılan çalışmada bitkide sinyal moleküllerinin üretimini arttırarak simptomlarda azalmaya sebep olduğu, enfekte bitkilerdeki viral yükü azalttığı ve bitki büyümesini teşvik ettiği ortaya koyulmuştur. Yürütülen sera denemeleri, farklı ırkların %75 ila %88 oranında *Tomato spotted wilt virus* (TSWV) replikasyonunu azaltmasıyla sonuçlanmıştır (Khan et al., 2024). Aynı tür ile yürütülen başka bir çalışmada ise bakteri süspansiyonu *N. tabacum* türü test bitkilerine TMV inokulasyonundan önce, sonra ve eşzamanlı olarak püskürtülerek uygulanmış, en iyi sonuç inokulasyonla eşzamanlı yapılan uygulamada olmakla birlikte, bitkilerdeki lokal nekrotik lezyon sayısında önemli bir azalma gözlenmiştir. Ayrıca çalışmada TMV ile bulaşık makasların, bakteri süspansiyonuna daldırıldığında dezenfekte olduğu belirlenmiştir. Çalışmanın ikinci aşamasında tarla denemeleri yapılmış olup antiviral etki gösteren ningnanmycinin etkisine bağlı olarak 2009 yılında enfeksiyon oranında %49 ve 2010 yılında ise %50.5 azalma olduğu tespit edilmiştir (Shen et al., 2013). *B. amyloliquefaciens*, TMV inokülasyonundan 24 saat önce ve sonra domates bitkilerinin yapraklarına püskürtüldüğünde enfeksiyonda %90 azalmaya neden olmuştur (Abdelkhalek et al., 2022a). Benzer bir araştırmada, domates bitkileri *B. amyloliquefaciens* süspansiyonuna batırıldıktan sonra beyaz sineklerle *Tomato yellow leaf curl virus* (TYLCV) inoküle edilmiştir. Bitkilerin enfeksiyon oranında ve hastalık şiddetinde %48-52 oranında azalma olduğu gözlenmiştir (Guo et al., 2019).

Bir diğer önemli bakteriyel biyofungisit grubu da *Bacillus subtilis* ve bu bakterinin ürettiği metabolitlerdir. *B. subtilis*'in *Tomato mosaic virus* (ToMV) enfeksiyonlarına etkisinin araştırıldığı bir çalışmada, enfekte domates fideleri bu bakterinin ürettiği mikrobiyal bileşik surfaktin ile sulanmıştır. Uygulama sonunda fidelerin simptomlarında önemli azalmaların olduğu kaydedilmiştir (Hussein et al., 2016). *Bacillus subtilis* subsp. *subtilis* CMV inokule edilen *Arabidopsis* bitkilerine uygulandığında ise benzer şekilde virüs konsantrasyonunda ve hastalık şiddetinde önemli azalmalar olmuştur (Elsharkawy et al., 2022). Son olarak, patates bitkilerine PVY inokulasyonundan 48 saat önce ve 10 gün sonra yaprağa püskürtülerek ve toprağa olmak üzere 2 farklı *B. subtilis* uygulaması yapılmıştır. Bitkilere virüs inokulasyonundan önce *B. subtilis* bakteri süspansiyonu topraktan uygulandığında, uygulama yapılmamış kontrol bitkilerine göre simptomlarda ve virüs konsantrasyonunda önemli bir azalma olduğu hatta bazı bitkilerin serolojik olarak negatif sonuçlar verdiği gözlenmiştir. İnokulasyondan 10 gün sonra bakteri uygulaması yapılan bitkilerde PVY birikim oranında %32.8 azalma olduğu, bu azalmanın inokulasyondan 35 gün sonra %72.3'e kadar devam ettiği tespit edilmiştir. Bu veriler, topraktan *B. subtilis* uygulamasının PVY birimini ve enfeksiyon şiddetini azaltmada önemli bir rolü olduğunu göstermiştir (Amin et al., 2023).

2.2. Fungal Biyofungisitler

Endofitik funguslar, tarım ürünlerini yaygın görülen başta fungal patojenler olmak üzere virüs ve bakteri gibi hastalıklar ve nematodlar, akarlar gibi zararlılara karşı korumaktadır (Grabka et al., 2022). Bu nedenle, bazı fungal endofitler ve/veya onların çeşitli metabolitleri kullanılarak çok çeşitli mikrobiyal biyofungisitler üretilmiş ve bunların fungal patojenlerin hiflerini, klamidosporlarını, konidia, sporangia ve zoosporlarını parçalayarak hastalıklara karşı bitkilerin korunmasına katkı sağladığı tespit edilmiştir (Verma et al., 2020). *Ampelomyces, Aspergillus, Coniothyrium, Gliocladium, Laetisaria, Penicillium, Phlebiopsis, Sporodesmia, Talaromyces,*

Tilletiopsis, *Trichoderma*, *Trichothecium* ve patojenik olmayan *Fusarium* gibi pek çok cinste yer alan fungal biyo-kontrol ajanlarının bitki patojenlerini kontrol etme potansiyeli yüksek olan biyolojik olarak aktif sekonder metabolitleri ürettiği bilinmektedir (Doumbou et al., 2001; Prabavathy et al., 2008; Ramesh, 2009). Sözü edilen sekonder metabolitler bitki patojenlerine karşı antimikrobiyal özellik göstermekte ve özellikle biyofungisit olarak en yaygın kullanılan *Trichoderma* türlerinin uçucu ve uçucu olmayan metabolitleri, çeşitli patojenler için antibiyotik etki sağlamaktadır. Bu fungal antibiyotiklerden en bilineni ise antrakinonlardır (Verma et al., 2020).

Fungal endofitler, ya bitki savunmasını arttırarak ya da virüsleri taşıyan böcek vektörlere karşı entomopatojenik etki göstererek viral hastalıkları kontrol altına almaktadır. Endofitik biyo-kontrol ajanı fungusların bitki virüslerine karşı antiviral özelliklerini araştıran çalışmalar oldukça kısıtlı olmakla birlikte, genellikle bu çalışmalar endofit uygulanmış bitkilere virüslerin yapraktan inokulasyonu ile yürütülmüştür (Jaber and Salem, 2014). *T. viride*, *T. virens*, *T. harzianum* ve *T. koningii* trikodermin, viridol, peptaiboller, pironlar, akaronlar, daucene, trikoderrmol, emodin, steroller, heterosiklik azot bileşikleri (alkaloidler) ve seskiterpenler gibi sekonder metabolitlerin en iyi üreticileridir (Vyas and Mathur, 2002; Wiest et al, 2002; Mathivanan vd., 2008). Endofitik funguslar tarafından sentezlenen sekonder metabolitlerin, fungal biyofungisit ile virüs arasındaki etkileşim mekanizmasında doğrudan rolü olduğu düşünülmektedir. Ayrıca, yapılan araştırmalarda bitkilere fungal endofit uygulaması sonucunda üretilen alkaloidlerin antiviral özelliklere sahip olduğu belirlenmiştir (Jaber and Salem, 2014). Bu nedenle, bitki patojenlerine etkisi en çok araştırılan biyo-kontrol ajanları *Trichoderma* türleri olmuş; viral bitki hastalıklarının kontrolünde en başarılı sonuçların alındığı fungal biyofungisitlerin de bu türlerden oluştuğu belirlenmiştir (Tablo 3).

Tablo 3. Biyo-kontrol ajanı olarak endofitik *Trichoderma* türlerinin bitki virüslerine etkisi.

Biyokontrol Ajanı Olarak Endofitik Funguslar	**Hedef Virüs***	**Konukçu**	**Antiviral Etki**	**Kaynaklar**
Trichoderma spp. (*T. harzianum*, *T. polysporum* ve *T. atroviridae* konsorsiyumu)	PepLCV	Biber	%50'ye varan virüs inhibisyonu ve bitkide %183'ten fazla fenolik birikimi	Rochal et al., 2021
T. harzianum	TMV	Domates	Bitkide virüs enfeksiyonlarında azalma	Kolase et al., 2007
	ToMV		Bitkideki lokal nekrotik lezyon sayısında %51.5 azalma	Megahed et al., 2013
	CMV		Enfeksiyon oranında önemli derecede azalma	Vitti et al., 2015
T. asperallum	CMV	Hıyar	Virüsün çoğalmasını engelleyerek enfeksiyonu önleme	Tamandegani et al., 2021
	BCMV, BYMV, BLCV	Fasulye	Hastalık şiddetinde %91'e ve vektör popülasyonunda %96'ya varan azalma	Hossain et al., 2023
T. hamatum	TMV	Domates	Virüs birikiminde %85 azalma	Abdelkhalek et al., 2022b
T. viridae	PVY	Patates	Bitki gelişiminin teşviki ve bitki savunmasının tetiklenmesi	Aseel et al., 2023

* PepLCV: *Pepper leaf curl virus*; TMV: *Tobacco mosaic virus*; ToMV: *Tomato mosaic virus*; CMV: *Cucumber mosaic virus*; BCMV: *Bean common mosaic virus*; BYMV: *Bean yellow mosaic virus*; BLCV: *Bean leaf curl virus*; PVY: *Potato virus* Y.

Rochal vd. (2021)'nin yaptıkları araştırmada *T. harzianum*, *T. polysporum* ve *T. atroviridae*'den oluşan *Trichoderma* karşımının biber bitkilerine uygulandığında, *Pepper leaf curl virus* (PepLCV)'ü %50'ye varan oranda inhibe ettiği ve bitkide %183'ten fazla savunmayla ilişkili fenolik birikimine neden olduğu bildirilmiştir. Ayrıca bu fungal ajanlar, bitki dokularını endofitik olarak kolonize ederek oksin miktarında önemli bir yükselme sağlamış ve bitki büyüme hormonu oksinin biyolojik verimliliğini arttırmıştır. Farklı benzer çalışmalarda *Trichoderma harzianum* türü uygulanan domates bitkileri sırasıyla TMV, ToMV ve CMV ile inokule edilmiştir. Yapılan araştırmaların sonucunda TMV ve CMV ile enfekteli bitkilerde virüs enfeksiyonlarında önemli derecede azalma olduğu (Kolase and Sawant, 2007; Vitti et al., 2015), CMV ile enfekteli bitkilerde ise lokal nekrotik lezyon sayısında %51.5'lik bir düşüş olduğu rapor edilmiştir (Vitti et al., 2015).

Bitki virüs hastalıklarına potansiyel etkilerinin belirlenmesi amacıyla çalışma yapılan bir diğer fungal endofit ise *Trichoderma asperallum*'dur. Sözü edilen endofitin CMV inokule edilmiş bitkilere sulama suyuyla verilmesinden sonra virüs çoğalmasını engelleyerek bitkilerdeki enfeksiyonu önlediği ortaya koyulmuştur (Tamandegani et al., 2021). Benzer şekilde, *T.*

asperallum ile ıslatılmış toprakta yetiştirilen *Bean common mosaic virus* (BCMV), *Bean yellow mosaic virus* (BYMV) ve *Bean leaf curl virus* (BLCV) enfekteli fasulye bitkilerinin hastalık şiddetinde %91'e ve virüsün vektör popülasyonunda ise %96'ya varan azalma olduğu kaydedilmiştir (Hossain et al., 2023). Son olarak *T. hamatum*, TMV enfekteli bitkilere uygulandığında bitki dokularındaki virüs birikiminde %85 azalma sağlarken (Abdelkhalek et al., 2022b); PVY enfekteli patates bitkilerine *T. viridae* uygulandığında hem bitki savunması tetiklenmiş hem de bitki gelişimi önemli bir oranda teşvik edilmiştir (Aseel et al., 2023).

3. MİKROBİYAL BİYOFUNGİSİTLERİN ANTİVİRAL ETKİ MEKANİZMALARI

Son yıllarda, mikrobiyal biyofungisitlerin etken maddesini oluşturan biyo-ajanların bitki virüs hastalıklarına olan potansiyel etkilerine yönelik pek çok çalışma yapılmış ve çeşitli mekanizmalarla antiviral etki gösterdikleri kanıtlanmıştır. Bu mekanizmalar;

3.1. Doğrudan Antiviral Etki

Dezenfektan olarak adlandırılan bazı kimyasal bileşikler, bitki virüslerinin kılıf proteininin veya genetik materyalinin (DNA veya RNA) yapısını bozarak doğrudan antiviral etki gösterebilmektedirler. Örneğin, biyofungisitlerin üretildiği önemli bir biyo-kontrol ajanı olan *Bacillus amyloliquefaciens* solüsyonuna TMV ile bulaşık budama makasları daldırıldığında viral partiküllere zarar vererek dezenfeksiyon etkisi gösterdiği kanıtlanmıştır. Aynı çalışmada, bu in-vitro etki, tütün tohum yataklarına ve fidelik toprağına da uygulanarak da teyit edilmiş olup bakterinin ürettiği ningnanmisin isimli antibiyotik bileşikten kaynaklı doğrudan antiviral etki olduğu bildirilmiştir. Aynı antibiyotik maddenin *Streptomyces noursei* var. *xichangensis* isimli aktinobakteri tarafından da üretildiği bilinmektedir (Shen et al., 2013). Bununla birlikte, bitki dokuları içerisindeki virüslere doğrudan antiviral etki kavramı, bakteriyel ve fungal patojenlere göre biraz daha farklı bir yaklaşımı gerektirmektedir.

Bitki dokuları içindeki virüslere doğrudan antiviral etki kavramından anlamamız gereken biyo-kontrol ajanlarının bazı bileşikler üreterek virüsün çoğalmasını, replikasyonunu ya da kılıf protein üretimini engellemesidir. Öyle ki, fungal endofitlerden *Trichoderma asperallum*'un ürettiği antimikrobiyal bileşikler, CMV'nin bitki dokularında çoğalmasını engellemiştir (Tamandegani et al., 2021). Yapılan bazı araştırmalarda biyo-kontrol ajanlarının ürettiği antibiyotiklerin virüsle enfekte olmuş bitkilere verildiğinde virüslerin inhibisyonunun yanı sıra simptom ifadesinin de azalmasına yol açtığı bildirilmektedir (Kluge and Paunow, 1975; Misra and Nienhaus, 1977). Buna rağmen, antibiyotiklerin bitki virüslerine doğrudan etkileri, insan patojenleri üzerindeki etkileri kadar net bir şekilde aydınlatılamamıştır. Örneğin, kloramfenikolün bilinen birkaç antibiyotik aktivitesi arasında, esas olarak protein sentezine müdahale etmesi yer almaktadır (Malik, 1972). Aynı şekilde, antibiyotik daunomisin de birkaç protein sentezi basamağında etkiye sahiptir ve aktinomisin D'ye benzer olarak nükleik asit metabolizmasını engellemektedir (Conti, 1968). Ancak, daunomisinin konukçu bitki dokularındaki viral RNA sentezini önemsenebilecek düzeyde engellememesi, bu antibiyotiğin fitopatojen virüs partikülleri üzerinde doğrudan etkisi olduğunu düşündürmektedir (Betto et al., 1971).

Aktinobakteriler tarafından (özellikle *Streptomyces* spp.) üretilen aktinomisin D ve mitomisin C antibiyotiklerinin de nükleik asit metabolizmasını etkilediği ve DNA ile kompleks oluşturduğu tespit edilmekle birlikte, enfeksiyonun çok erken evreleri hariç bitki patojeni virüs sentezini engelleyebilecek kadar etkiye sahip olmadığı rapor edilmiştir (Dawson and Schlegel, 1976; Ohashi and Shimomura, 1972). Öte yandan CMV enfeksiyonlarının, DNA'ya bağımlı RNA sentezini engellediği bilinen miharamisin A antibiyotiği tarafından etkili şekilde baskılandığı birkaç çalışmada gösterilmiştir (Noguchi et al., 1968).

Ribonükleazlar, transkripsiyonun birkaç kritik aşamasında ribonükleik asitin (RNA'nın) daha küçük birimlere parçalanmasını dimerize ve katalize ederek virüs çoğalmasını engelleme özelliği olan bir grup hidrolitik enzim olup bağışıklık sisteminin klasik bileşenleridirler (Ilinskaya and Mahmud, 2014). Bakteriler tarafından sentezlenen ve dış ortama salınan binaz, baRNaz ve balifaz gibi ribonükleazların küçük konsantrasyonları, bitki büyümesini teşvik ederken; yüksek konstrasyonları viral RNA'nın yapısını bozarak antiviral özellik sergilemektedirler. *Bacillus* sp. TS2 ve *B. subtilis* 26D gibi yüksek endofitik oranlara ve RNaz aktivitesine sahip bakteriyel biyo-kontrol ajanları biyofungisit geliştirmek için kullanılmaktadır. Bilindiği üzere patates bitkilerinde yaygın olarak bulunan *Potato virus* S (PVS)+*Potato virus* Y (PVY) ve *Potato virus* M (PVM)+*Potato virus* Y (PVY) karşık enfeksiyonları, bu virüslerin tekli enfeksiyonlarına göre daha yüksek hastalık şiddetine neden olmaktadır (Hameed et al., 2014). Sorokan vd. (2020), yaptıkları çalışmada *Bacillus* sp. TS2, *Bacillus* sp. STL-7 ve *B. subtilis* 26D kültürlerinde daha yüksek oranda RNaz aktivitesi olduğunu ve bu endofit bakteri suşlarının birlikte uygulandığı durumda bitki dokularının içini daha iyi kolonize ettiğini göstermişlerdir. Ayrıca, bahsedilen bakteri konsorsiyumunun patates bitkilerinde PVM, PVS ve PVY tekli veya karşık enfeksiyon oranını ve hastalık şiddetini önemli ölçüde azalttığı rapor edilmiştir.

3.2. Bitki Savunma Mekanizmalarının Uyarılması ve Bitki Büyümesinin Düzenlenmesi

Biyo-kontrol ajanlarının bitki virüs hastalıklarıyla mücadelede sağladığı faydalardan en önemlisi bitki savunma mekanizmalarının uyarılmasını sağlayarak antiviral etki göstermesidir. Polisakkaritler, polisakkarit peptitler ve proteinler fungal biyo-kontrol ajanlarının ürettiği başlıca antiviral bileşiklerdir. *Trichoderma pseudokoningii* SMF2 fungusunun ürettiği peptaibol ve trikokoninler gibi antimikrobiyal maddeler, TMV'ye karşı dayanım sağlayan uyarılmış sistemik direnç (ISR) mekanizmasının belirleyici faktörüdür (Shen et al., 2009). Benzer şekilde, fungal ajanların ürettiği alkaloidlerin de antiviral özellikleri olduğu ortaya koyulmuştur (Wang et al., 2004). Örneğin *Trichoderma harzianum* ISR mekanizmasını aktive ederek domates bitkilerindeki TMV simptomlarını azaltmıştır (Kolase and Sawant, 2007).

Farklı bir *Trichoderma* türüyle yapılan başka bir çalışmada, *T. asperallum*'un CMV enfekteli hıyar bitkilerinde virüs enfeksiyonunu engellediği bildirilmiştir. Aynı çalışmada, *T. asperallum* tarafından uyarılan aracılı direncin altında yatan moleküler mekanizmalar Q-PCR (quantitive polymerase chain reaction) ile araştırılmış ve fungal biyo-kontrol ajanının, CMV'ye karşı dayanımla ilgili *pr1*, *pal1*, *etr1*, *sod*, *rip* ve *lox1* genlerinin ifadesini transkripsiyon seviyesinde etkili bir şekilde arttırdığı tespit edilmiştir. Reaktif oksijen türevleri (ROS) ve ROS temizleyici enzimlerin (SOD, LOX1, POX ve CAT) bitkide ifade edilme seviyesi incelendiğinde ise tek başına veya *T. asperallum* uygulandıktan sonra CMV ile inokule edilen bitkilerde gözlenen

hidrojen peroksit (H_2O_2) artışının önemli ölçüde birbirinden farklı olduğu gözlenmiştir. Ayrıca, sözü edilen çalışmada, ROS'un bitki savunma tepkilerinden sorumlu olduğu doğrulanmıştır. Sonuç olarak, Q-PCR ve enzimatik test sonuçları, jasmonik asit (JA)/etilen (ET)/salisilik asit (SA) üretimi ile ilgili genlerde ve enzimlerde önemli bir artış olduğunu göstermiş olup *T. asperallum*'un JA/ET/SA sinyal yolunu aktive ederek CMV'ye karşı sistemik direnci uyardığı düşünülmüştür (Tamandegani et al., 2021).

Streptomyces türleri başta olmak üzere 80'den fazla aktinobakteri cinsi bitki korumada etkin olarak kullanılan sekonder metabolitleri yoğun olarak üretmektedir. Biyofungisit formülasyonlarının %50'si aktinobakteri veya onların sekonder metabolitlerinden oluşmaktadır (Magarvey et al., 2004). Aktinobakteri *Strepcomces noursei* var. *xichangensis*'ten ekstrakte edilen ve yeni bir sitozin nükleozit peptit bileşiği formundaki antibiyotik ningnanmisin, bitkisel üretimde kullanıldığında TMV enfeksiyonlarını engellemede en başarılı olan mikrobiyal biyofungisittir (Zhao et al., 2015). Ningnanmisin, bitkide birden fazla savunma mekanizmasını uyarmaktadır. Yapılan çalışmalarda bu antimikrobiyal metaboltin peroksidaz (POD), fenilalanin amonyak liyaz (PAL), süperoksit dismutaz (SOD) aktivitesinin uyarılması ve asidik PR (patojen related: patojenle ilişkili) proteinleri grubunun aktivasyonu yoluyla TMV ile enfekte olmuş bitkilerde virüse karşı artan dirençten sorumlu olabileceği ortaya koyulmuştur. Ayrıca, bitkide *NPR1* ve *Jaz3* genlerinin artan ifadesinin TMV'nin kılıf protein sentezlemesini engelleyici etkisi olduğu yapılan çalışmalarla kanıtlanmıştır (Han et al., 2014).

Uzun yıllardır antibiyotiklerin bitki patolojisinde, özellikle de bitki virolojisinde kullanımının kritik öneme sahip olduğu varsayılmaktadır. Galal (2006), *Streptomyces* türlerinin virüs enfeksiyonlarına karşı bitkilerde sistemik kazanılmış direnci (SAR) teşvik ettiğini; Li vd. (Li et al., 2018) ise *S. pactum* Act12'nin domates bitkilerinde TYLCV'ye karşı ISR mekanizmalarını aktive eden SA ve JA konsantrasyonlarını arttırdığını bildirmişlerdir. Endonükleazları ve çeşitli fitohormonları salgılayan *Bacillus subtilis* 26D ve *B. subtilis* Ttl2 bakteri suşlarının patates bitkilerinde *Potato virus* X (PVX) ve PVY'yi inhibe ettiği rapor edilmiştir. 26D ve Ttl2 suşlarının her ikisi de transkripsiyonel genleri aktive ederek bitkilerde ISR'yi tetiklemiş ve PVX veya PVY ile enfekteli bitkilerde büyüme düzenleyici hormonlardan stokininlerin miktarını arttırırken, indol asetik asit seviyesini azaltmıştır (Veselova et al., 2022).

4. MİKROBİYAL BİYOFUNGİSİTLERİN KULLANIMINDAKİ ZORLUKLAR VE GELECEKTEKİ ARAŞTIRMA YÖNELİMLERİ

Literatürden de anlaşılacağı üzere mikrobiyal biyofungisitler, virüsler de dahil bitki patojenlerinin kontrolünde gelecek vaat etmektedir. Öte yandan, mikrobiyal kaynaklı bu preperatların kullanımı ve etkililiği konusunda bazı zorluklar ve sınırlılıklar bulunmaktadır. Birçok araştırmacı, özellikle ticari olmayan biyolojik ajanlardan geliştirdikleri mikrobiyal biyofungisitleri kullanarak bitki hastalıklarının kontrolü açısından laboratuvarda ve sera gibi kontrollü koşullarda büyük başarılar elde etmiştir. Ancak bu başarı üretim alanlarına yani sahaya aktarılmak istendiğinde bitki hastalıklarının tutarlı bir şekilde kontrol altına alınamamasıyla sonuçlanmıştır (Nicot et al., 2016). Mikrobiyal biyofungisitlerin sahada tutarsız sonuçlar vermesi ve etkinliklerinin azalmasının bazı nedenleri bu bölümde ele alınmıştır.

4.1. Ürün Geliştirme ve Formülasyon

Mikrobiyal biyofungisitler başta olmak üzere genel olarak biyofungisitlerin sahaya aktarımı, çoğu kez zor olmuştur (Handelsman, 2002). Bu durum formülasyon ve dolayısıyla ürün geliştirmenin zor olmasından kaynaklanmaktadır. Biyo-kontrol ajanlarını canlı, etkililiğini kaybetmeden ve amacına uygun şekilde kullanılabilir özellikte tutmak için özel formülasyon ve depolama teknikleri gerekmektedir (Usta, 2013). Biyo-kontrol ajanlarını diğer kontrol tekniklerinden ayıran en önemli özellik, canlı olmalarıdır. Ortam koşullarının (mikro iklim) değişimine oldukça hassas olmalarından dolayı mikrobiyal biyofungisitler için özel formülasyonlara ihtiyaç duyulmasının yanında, bu biyofungisitlerin depolanması, sevkiyatı ve kullanımı sırasında da özel işlemler gerekebilmektedir (Elad and Stewart, 2007).

Mikrobiyal biyofungisitlerdeki biyo-kontrol ajanı veya onun ürettiği sekonder metabolitlerin konsantrasyonu, ürün formülasyonunda karşılaşılan bir diğer sorundur. Yapılan in vitro ve in vivo denemede, pek çok faktörün biyolojik kontrol ajanının veya ürettiği sekonder metabolitlerin konsantrasyonunu değiştirebileceği sonucuna varılmıştır (Fenta and Menkonnen, 2024). Örneğin, *Trichoderma pseudokoningii* SMP2'nin ürettiği trichokoninler, pürifiye edilerek TMV enfekteli tütün bitkilerine uygulanmıştır. Bu peptaibol bileşiklerinin 100 nM konsantrasyonda viral RNA'yı %60 oranında azaltarak belirti şiddetinde düşüşe sebep olduğu belirlenmiştir. Ancak bu dozun üretim alanlarında etkili olup olmadığı konusunda daha fazla araştırmaya ihtiyaç olduğu rapor edilmiştir (Mendoza-Figueroa et al., 2014). Ayrıca, yapılan pek çok çalışmada etkili virüs kontrolünün bakteriyel biyo-kontrol ajanının konsantrasyonu, uygulama zamanı ve uygulama yöntemine bağlı olduğu bildirilmiştir (Manjunatha et al., 2022).

Biyofungisit üretim proseslerinin ürün canlılığı ve etkinliği üzerinde etkisinin oldukça fazla olması da biyolojik kontrol ürünlerinin geliştirilmesinde karşılaşılan bir diğer zorluktur. Yapılan çalışmalarda, konidial yaş ve üretim sıcaklığı da dahil olmak üzere birçok faktörün, fungal biyo-kontrol ajanlarının çimlenmesi ve biyoaktivitesi üzerinde önemli etkisi olduğu tespit edilmiştir. Örneğin, *Trichoderma atroviride* 25°C'de maksimum gelişme potansiyeline ulaşırken, maksimum çimlenme ve biyoaktivite 30°C'de üretilen konidilerde gözlenmiştir (Fenta and Menkonnen, 2024). Bu durum kültür koşullarının mikrobiyal biyofungisitlerin formülasyonları üzerinde önemli bir etkiye sahip olduğu anlamına gelmektedir.

Mikroorganizmalardan elde edilen ve biyolojik kontrol etkinliği olan çeşitli sekonder metabolitler, genellikle düşük miktarlarda bulunmakta ve büyük ölçekte saflaştırılmaları ise oldukça zor olmaktadır (Jairo et al., 2012). Mikroorganizma bazlı metabolitlerin standartlaştırılmış ekstraksiyon yöntemlerinin olmaması ürün geliştirme konusunda yaşanan temel sorunlardan biridir. Farklı ekstraksiyon yöntemleri, hastalık kontrol ürünlerini farklı şekilde etkilemekte, dolayısıyla bu durum geliştirilen formülasyonun etkinliğini de değiştirmektedir. Örneğin, *T. harzianum*, *T. viride* ve *T. longisporum* gibi fungal biyo-kontrol ajanı hücresiz kültür özütlerinin domateste TMV'yi inhibe etmede etkili olduğu kanıtlanmıştır. Farklı çözücülerde ekstrakte edilen biyo-kontrol ajanlarının etkinlikleri de farklı olmuştur. Yapılan çalışmada benzen ve asetonda ekstrakte edilen *Trichoderma* türleri daha etkili olurken, bunu etil alkol ekstraktları izlemiştir. Çalışmanın diğer bölümünde ise asetonda ekstrakte edilen *T. harzianum* ve etil alkolde ekstrakte edilen *T. viride* kombinasyonunun domates bitkilerindeki TMV enfeksiyonlarının kontrolünde daha etkili olduğu sonucuna varılmıştır (Kolase and Sawant, 2007).

4.2. Birden Fazla Konukçuyu Etkileyen Bir Virüs İçin Ürün Geliştirilmesi

Fitopatojenlerin biyolojik olarak kontrol etmenin zorlukları arasında ürün geliştirme sorunu da yer almaktadır. Yaygın ve birden fazla konukçuyu etkileyen hastalıklarının kontrolü için geliştirilen ürünler, ancak tüm konukçulara ve farklı üretim sistemlerine entegre edilebildiğinde optimum başarı sağlamaktadır. Virüslerin karmaşık yapısı, bitkilerle ve diğer organizmalarla olan etkileşimleri, farklı konukçularda ve coğrafi koşullarda etkili çözümler oluşturmayı zorlaştırmaktadır (Nega, 2014). Ayrıca, yapılan pek çok araştırmada fungal endofitler tarafından bitkilerde tetiklenen savunma tepkilerinin aynı bitki türünü enfekte eden farklı virüslere karşı aynı olmadığı görülmüştür. Örneğin *Trichoderma harzianum* ve *Metarhizium anisopliae* uygulanmış mısır bitkileri, endofit uygulaması yapılmamış kontrol bitkilerine kıyasla *Sugarcane mosaic virus* (SCMV)'e daha fazla dayanım gösterirken, aynı bitkiler *Maize chlorotic mottle virus* (MCMV)'e daha hassas tepkiler vermiştir (Kiarie et al., 2020).

4.3. Çevresel Değişkenlerin Mikrobiyal Biyofungisitler Üzerindeki Etkileri

Biyolojik mücadele ajanlarının farklı iklim ve çevre koşullarına uyum sağlama yeteneği ve çeşitli senaryolarda hedef hastalığa karşı önemli bir etkinliğe sahip olup olmaması, sera ve tarla koşullarındaki etkinliğini belirleyen en temel faktördür. Özellikle sıcaklık, bağıl nem ve UV ışınlar biyo-kontrol ajanlarının ömrünü etkileyen başlıca unsurlardır (Nunes, 2012). Sözü edilen bu çevresel faktörler, sera ortamında kolay bir şekilde kontrol altında tutulabilirken tarlada biyo-kontrol ajanları ve onların antimikrobiyal özelliğe sahip sekonder metabolitleri, sürekli olarak sıcaklık ve bağıl neme maruz kalmaktadır.

Biyolojik mücadele teknikleri, patojenin enfeksiyon yapması için gerekli çevresel koşullar ile biyo-kontrol ajanlarının gelişmesi için ihtiyaç duyduğu ortam koşullarının uyumsuz olması nedeniyle çoğu kez başarısızlıkla sonuçlanmaktadır. Örneğin, yapılan bir çalışmada *N. benthamina* bitkilerinde PVY enfeksiyonlarının en iyi 10-20ºC'de geliştiği, 20ºC'nin üzerindeki sıcaklıklarda ise enfeksiyonda gerilemeler olduğu tespit edilmiştir (Chung et al., 2016). Bu virüsü kontrol eden *Trichoderma* türleri, 25-30ºC'de en iyi şekilde gelişim göstermektedir (Singh et al., 2014). Biyolojik kontrol ajanlarının en iyi geliştiği, dolayısıyla etkinliğinin en yüksek olduğu sıcaklık derecelerinde PVY bitkide zaten kolonize olmuş ve enfeksiyonları ciddi boyutlara ulaşmış olacaktır.

Çevresel faktörler, ayrıca fitopatojen virüslere karşı bitki savunma mekanizmalarının endofitlerle uyarılmasında da önemli rol oynamaktadır. Örneğin, domates bitkilerine *Piriformospora indica* uygulanması, daha yüksek ışık yoğunlukları altında sürgünlerdeki *Pepino mosaic virus* miktarını azaltırken, meyve biyokütlesini önemli ölçüde arttırmaktadır (Fakhro et al., 2010). Özetlediğimiz tüm bu nedenlerden dolayı, bitki virüs hastalıklarının etkili bir şekilde biyolojik kontrolü için farklı çevre koşullarında etkili olabilen farklı biyo-kontrol ajanlarının veya ürettikleri metabolitlerin bir arada yer aldığı formülasyonların geliştirilmesi gerekebilmektedir.

4.4. Uygulama Süresi ve Diğer Ürünlerle Karışabilirlik

Mikrobiyal fungisitlerin bitki virüs hastalıklarına etkisi koruyucu ve bitki savunmasını uyarıcı nitelikte olup tek başına herhangi bir virüs hastalığını tedavi etme durumu oldukça nadirdir (Hodgson et al., 2014). Bu nedenle, biyo-kontrol ajanlarının etkili şekilde kullanılmasını sağlamak için bilgi yoğun bir hastalık yöntemine ihtiyaç duyulmaktadır. Patojenin biyolojisinin ve konukçu virüs etkileşimlerinin bilinmesi, biyo-kontrol ajanının ne zaman ve nerede kullanılması gerektiğinin belirlenmesi ve en iyi hastalık yönetimi stratejisinin geliştirilmesinde yardımcı olabilmektedir. Bir biyo-kontrol ürününün en iyi uygulama süresinin, uygulamanın yapıldığı zaman dilimine bağlı olduğu tespit edilmiştir (Arnold et al., 2000).

Virüs hastalıklarının etkin bir şekilde kontrol edilmesi için birçok koruyucu önlemin bir arada kullanıldığı entegre mücadele stratejilerinin uygulanması önem taşımaktadır. Mikrobiyal fungisitlerin antiviral etkilerinden yararlanılırken, virüs hastalıklarının yayılmasını sağlayan vektörlerle ve virüs rezervuarı yabancı otlarla mücadele adımı çoğu kez göz ardı edilememektedir. Bu nedenle, üretim alanlarında hem biyolojik kontrol ajanı uygulaması hem de vektörlere veya virüs kaynağı yabancı otlara karşı sentetik pestisit uygulaması kaçınılmaz olmaktadır. Mikrobiyal biyofungisitler canlı organizma kaynaklı formülasyonlar olduğundan sentetik pestisitlerle veya bitki besin elementleriyle karışmaları durumunda nasıl bir senaryonun ortaya çıkacağı bilinmek zorundadır. Bu konuyla ilgili netlik sağlanabilmesi için de daha fazla araştırmanın yapılması gerekmektedir.

5. SONUÇ VE ÖNERİLER

Bu çalışmada, *Streptomyces* spp., *Bacillus* spp. ve *Trichoderma* spp. kaynaklı yaygın şekilde kullanılan mikrobiyal biyofungisitlerin önemli bitki virüs hastalıkları üzerindeki potansiyel etkileri mevcut literatür ışığında kapsamlı bir şekilde değerlendirilmiştir. İncelenen çalışmalar, *Streptomyces*, *Bacillus* ve *Trichoderma* kaynaklı bazı metabolitlerin bitki sistemik direncini teşvik ederek ve bazen doğrudan antival etki göstererek TMV, ToMV, CMV, TSWV ve PVY başta olmak üzere farklı bitki virüslerinin enfeksiyonlarını önemli ölçüde azalttığını göstermiştir. Bu bulgular, mikrobiyal fungisitlerin doğrudan kimyasal mücadelesi mümkün olmayan virüs hastalıklarına karşı alternatif kontrol yöntemi olabileceğinin altını çizmektedir.

Mikrobiyal biyofungisitlerin etkinliği uygulanan doz, uygulama zamanı ve süresi, çevresel koşullar ve diğer pestisitlerle veya farklı biyolojik kontrol ürünleriyle karışabilme durumuna göre değişkenlik gösterebilmektedir. Farklı biyofungisit gruplarının birlikte kullanılması durumunda, çeşitli virüs-bitki etkileşimlerine etkisi daha detaylı bir şekilde araştırılmalıdır. Ayrıca, mikrobiyal biyofungisitlerin tarla koşullarındaki uzun vadeli performansı ve ekonomik uygulanabilirliği konularında daha fazla araştırmaya ihtiyaç bulunmaktadır.

Konuyla ilgili gelecekte yapılacak araştırmalarda, farklı biyofungisit grubu karışımlarının ve kimyasal mücadele yöntemleriyle entegrasyonunun bitki virüs hastalıklarına potansiyel birleşik veya sinerjik etkileri üzerine yoğunlaşılmalıdır. Ayrıca, mikrobiyal biyofungisitlerin bitkiler ve virüsler üzerindeki etki mekanizmalarının moleküler düzeyde aydınlatılması, daha özgül ve yüksek etkili biyolojik kontrol stratejilerinin geliştirilmesinin önünü açacaktır. Sonuç olarak, mikrobiyal biyofungisitlerin bitki virüs hastalıklarına potansiyel etkileri umut vaat etmektedir. Bu çalışmalar, biyo-kontrol ajanlarının ve ürettikleri metabolitlerin fitopatojen virüslerin kontrolüne özgüleştirilmesi ve ileride virüsit formülasyonlarının geliştirilmesine ışık tutucu niteliktedir.

ABSTRACT

Phosphorus (P) is one of the most important macro plant nutrients for optimum growth and development of plants. Plants' P needs are met by the application of P fertilizers to soils. Phosphorus fertilizers are obtained from raw phosphate materials. Direct application of raw phosphate to basic soils does not provide a significant contribution to the P nutrition of plants.. The aim of this study was to determine the effect of applying raw phosphate materials and elemental sulphur to soils on available phosphorus content. Raw phosphate is a material obtained by grinding rock phosphate and is stable under natural conditions and does not turn into a form that plants can take up. In this study, soil taken from an area with low available P content, raw phosphate and elemental sulphur were used as materials. The experiment was carried out in the form of a pot experiment according to a randomized plot design with 3 replications. 0, 0.08 g, 0.16 g, 0.32 g powdered raw phosphate and 0, 0.08 g, 0.16 g, 0.32 g elemental sulphur were applied to the soils (1 kg) and mixed thoroughly. Samples were taken from the soils brought to field capacity on the 45th, 90th and 135th days and the soils were analysed. According to the obtained data, elemental S and raw phosphate application decreased the pH value of the soils at a statistically significant level ($p<0.01$) at the end of the experiment. In the application of elemental S and raw phosphate to the soils, the available P concentrations in the soils increased depending on the raw phosphate dose and this increase was found to be statistically significant ($p<0.01$). This situation shows that the application of raw phosphate

materials mixed with elemental S can be considered as an alternative for feeding plants with P. However, it would be beneficial to test the application with detailed field trials.

Keywords: Soil, Raw Phosphate, Elemental Sulfur, Available Phosphorus

TOPRAKLARA HAM FOSFAT VE ELEMENTEL KÜKÜRT UYGULAMALARININ ALINABİLİR FOSFOR İÇERİĞİNE ETKİSİ

ÖZET

Fosfor (P), bitkilerin optimum büyümesi ve gelişmesi için en önemli makro bitki besin elementlerinden birisidir. Bitkiler P ihtiyacı, fosforlu gübrelerin topraklara uygulaması ile karşılanmaktadır. Fosforlu gübreler ise ham fosfat materyallerinden elde edilmektedir. Ham fosfatın bazik topraklara direk uygulanması bitkilerin P ile beslenmesine önemli bir katkı sağlamamaktadır. Bu çalışmanın amacı; ham fosfat materyali ile elementel kükürdün (S) topraklara birlikte uygulanmasının bitkiler tarafından alınabilir P içeriği üzerine etkisini belirlemektir. Ham fosfat, fosfat kayasının öğütülmesi ile elde edilen bir materyal olup bazik koşullarda stabil kalmakta ve bitkilerin alınabileceği forma dönüşmemektedir. Bu çalışmada materyal olarak daha alınabilir P içeriği düşük alandan alınan toprak, ham fosfat ve elementel kükürt kullanılmıştır. Deneme tesadüf parselleri deneme desenine göre 3 tekerrürlü olarak saksı denemesi şeklinde yürütülmüştür. Topraklara (1 kg) 0, 0.08 g, 0.16 g, 0.32 g dozlarında toz haline getirilmiş ham fosfat ve 0, 0.08 g, 0.16 g, 0.32 g elementel kükürt uygulanıp iyice karıştırılmıştır. Tarla kapasitesine getirilen topraklardan 45., 90. ve 135. günlerde örnekler alınmıştır ve topraklarda alınabilir P analizleri yapılmıştır. Elde edilen verilere göre elementel S ve ham fosfat uygulaması deneme sonunda toprakların pH değerini istatistiksel olarak önemli ($p<0.01$) düzeyde azaltmıştır. Topraklara elementel S ve ham fosfat uygulamasında topraklarda alınabilir P içeriği ham fosfat dozuna bağlı olarak artış göstermiştir ve bu artış istatistiksel olarak önemli ($p<0.01$) bulunmuştur. Bu durum, ham fosfat materyallerinin elementel S ile karıştırılarak uygulanmasının, bitkilerin P ile beslenmesinde bir alternatif olarak değerlendirilebileceğini göstermektedir. Ancak, uygulama açısından detaylı tarla denemeleri ile arazi koşullarında test edilmesinde fayda vardır.

Anahtar Kelimeler: Toprak, Ham Fosfat, Elementel Kükürt, Alınabilir Fosfor

1.GİRİŞ

Türkiye topraklarının genel olarak organik madde içeriği az, % kireç içeriği ve pH'sı yüksek olduğu için topraklara gübreler ile uygulanan fosfor (P), bitkiler tarafından alınamaz forma dönüşür. Topraklara uygulanan fosforun ancak %10-30 bitkiler tarafından alınabilir (Korkmaz ve ark., 2009; Saltalı ve Nedirli, 2021). Fosfor bitki gelişimi için mutlaka gerekli makro bitki besin elementlerinden birisidir. Fosfor; bitkinin bünyesi, kök gelişimi, verim ve kalite, enerji dönüşümü ve taşınması, enzimatik reaksiyonlar, generatif üreme vb. alanlarda etkili bir elementtir (Korkmaz ve ark., 2004).

Yüksek pH'lı topraklarda P fiksasyonunu azaltmak ve alımını artırabilmek için bu toprakların pH'sının optimum seviyelere düşürülmesi gerekmektedir (Güneş ve ark., 2000). Kahramanmaraş topraklarının kireç miktarının yüksek olması pH seviyelerini yükseltmektedir. Bu durumda kükürt (S) uygulamasının bölgede etkili olabileceği tahmin edilmektedir. Kükürt uygulamalarının P yarayışlılığı üzerine etkisine dair farklı çalışmalar gerçekleştirilmiştir. Chouliaras ve Tsadilas (1996), kireçli topraklarda S uygulamalarının toprak pH'sını düşürmesi ile yarayışlı P, demir (Fe) ve mangan (Mn) konsantrasyonlarında önemli miktarda artışların olduğunu rapor etmişlerdir. Erdal ve ark., (2000) da benzer şekilde kireçli topraklarda S uygulamalarının pH seviyesini düşürdüğünü ve buna bağlı olarak mısır bitkisinde P alımının arttığını rapor etmişlerdir. Nour ve Elfaki (2019)'de, alkalin topraklara elementel S0 uygulamasının toprak reaksiyonun azalmasına ve topraklarda alınabilir P içeriğinin artmasına neden olduğunu, bu nedenle bazik topraklarda alınabilir P içeriğinin artırılması için elementel S0 uygulamasını önermişlerdir.

Kurak ve yarı kurak bölgelerde alkalin veya kireçli toprakların pH'nın düşürülmesi amacıyla elementel S0 kullanılabilmektedir. Bu uygulamalar sadece toprak pH'sını düşürmekle kalmayıp birçok besin elementinin yarayışlılığını da arttırmaktadır. (Mengel ve ark., 2001). Toprak pH'sının biyoaktiviteyi ve besin maddelerinin bitkiler için kullanılabilirliğini etkilediğini ileri sürmektedir. Alkalin topraklarda elementel S0 kullanımı toprak pH'sını düşürmekte, bu da bitki besin maddelerinin, özellikle de fosforun kullanılabilirliği için uygun koşullar yaratmaktadır (Deluca ve ark., 1989). Aynı zamanda, kireçli topraklara elementel S0 uygulanması Fe klorozunun düzeltilmesine de yardımcı olmaktadır (Saroha ve Singh 1980).

Kireçli ve alkalin topraklara uygulanan elementel S0, toprakta 3-4 ay içerisinde oksidasyona uğrayarak önce SO4 formuna oksitlenmekte daha sonra H2SO4'e dönüşmektedir. Kükürdün oksitlenerek H2SO4'i oluşturması toprak reaksiyonunun azalmasına ve topraklarda stabil besin elementlerinin çözünürlüklerinin artmasını sağlamaktadır (Mengel ve ark., 2001). Topraklarda kükürdü, kükürt oksitleyici bakteriler okside etmekte (Etesami ve Jeong, 2021) ve okside kükürt ile üretilen asitli bileşikler de topraklarda alınamaz formda bulunan fosforun çözünürlüğünü artırmaktadır (Khan ve ark., 2020).

Toprağa uygulanan elementel S0 etkinliği, parça iriliği, uygulama dozu, uygulama zamanı ve uygulama yapılan toprağın pH değeri gibi özelliklere bağlıdır (Ülgen ve Yurtsever, 1988; Aktaş, 1991). Bu konu ile ilgili yapılan çalışmalarda, Elementel S0' ün parça büyüklüğü azaldıkça oksidasyonunun hızlandığı ve alkalin toprağın S oksidasyonunun artırıldığı bildirilmiştir (Nor ve Tabatabai, 1977; Li ve Caldwell, 1966; Attoe ve Olsen,1966).

Orman ve Kaplan (2000), aşırı kireçli ve yüksek kireçli iki farklı topraklara, artan dozlarda uygulanan elementel S0 ve Keçiborlu Kükürt Fabrikası flotasyon atığını uygulamışlardır.

Deneme sonucunda 5. ve 10. haftalarda ölçülen pH değerlerinin 0.35– 1.05 birim düştüğünü görmüşler ve bu düşüşlerin istatistiksel açıdan önemli olduğunu bulmuşlardır. Elementel S0 uygulamasının toprak pH'sı üzerine yapılan başka bir çalışmada alkalin reaksiyonlu topraklara S0 uygulamalarında, %2'lik kükürt dozunun pH'yı 7.80'den 7.17'ye düşürerek en etkili doz olduğunu belirtilmiştir (Pınar, 1994).

Ham fosfat kaynaklarından elde edilen fosforlu gübreler, alkalin ve kireçli topraklara uygulandıklarında, Ca ve kireç ile reaksiyona girerek zaman içerisinde çözünemez formlarda kalsiyum fosfatlı bileşikleri oluşturmaktadır (Korkmaz ve ark., 2009). Türkiye topraklarının genellikle alkalin reaksiyon gösterdiği ve kireç içerdiği dikkate alındığında fosfor elementinin bu topraklarda yarayışlılığı düşük olan kalsiyum fosfatlar biçiminde çökelmesi kaçınılmazdır. Fosforun topraktaki optimum çözünürlüğünün pH 6.5-7.0 aralığında olduğu göz önünde bulundurulduğunda ülkemizde kurak ve yarı kurak bölgeler topraklarında da bu türden reaksiyonlar gelişmektedir.

Son yıllarda gübre fiyatlarının hızla artması fosforlu gübrelere göre maliyeti daha düşük kaynaklara yönelimi artırmıştır. Fosforlu kimyasal gübre uygulama maliyetini azaltmak için alternatif besin girdisi kaynaklarının kullanımı, bitkisel üretim maliyetini azaltacağı tahmin edilmektedir. Sentetik gübre kullanımını azaltmanın böyle bir yolu, bitkilere kullanılabilir fosfor sağlamak için sentetik fosfatlı gübrelerden daha ucuz olduğu düşünülen fosfat kayası (PR) kullanımıdır (Lorion, 2004). Kaya (ham) fosfatları fosforlu gübrelerin ham maddesini oluşturmaktadır. Bu mineralin asitlerle reaksiyonu sonucunda ise fosforlu kimyasal gübreler elde edilmektedir. Bu durum, endüstriyel işlemler gerektirdiğinden maliyetli bir işlemdir. Ham fosfatlar asit topraklara uygulandığında fosforlu gübrelerin yerine geçebilmekte ve maliyetin düşmesine neden olabilmektedir.

Ham fosfat, fosfat kayasının öğütülmesi ile elde edilen bir materyal olup bazik koşullarda stabil kalmakta ve bitkiler tarafından alınabilir forma dönüşmemektedir. Ham fosfatların bazik topraklara elementel S0 ile birlikte uygulandığında kükürdün oksitlenmesi ve asidik bileşiklerin oluşması ile toprak reaksiyonunun azalacağı ve toprakta alınabilir P içeriğini artıracağı tahmin edilebilmektedir. Bu durumda, fosforlu gübreler yerine elementel S0 ile ham fosfatların uygulaması mümkün olabilecek ve fosforlu gübre maliyeti de azalabilecektir. Bu tür çalışmaların farklı toprak ve iklim koşullarında araştırılmasına ihtiyaç vardır.

Bu çalışmanın amacı; topraklara farklı dozda ham fosfat ve elementel S0 uygulamalarının toprakların alınabilir P içeriğine etkisini araştırmaktır.

2.MATERYAL VE METOT2.1. MATERYAL

Bu çalışmada, alkalin ve kireçli toprak, Mısır'dan ithal edilen ham (kaya) fosfat ve elementel S0 materyal olarak kullanılmıştır.

2.2. METOT

Deneme tesadüf parselleri deneme desenine göre 3 tekerrürlü olarak saksı denemesi şeklinde yürütüldü. Ham fosfat toplam %25 P2O5 içermektedir. Topraklara öğütülmüş 0.08 g kg-1 (20 kg da-1 ham fosfat = 5 kg P2O5 da-1), 0.16 g kg-1 (40 kg da-1 ham fosfat = 10 kg P2O5 da-1)

ve 0.32 g kg-1 (80 kg da-1 ham fosfat = 20 kg P2O5 da-1) ham fosfat ile 0.08 g kg-1 (20 kg da-1), 0.16 g kg-1 (40 kg da-1), 0.32 g kg-1 (80 kg da-1) elementel kükürt (S0) karıştırılarak uygulandı. Ham fosfat ve elementel S0 topraklar ile homojen olacak şekilde karıştırıldı. Ardından topraklara 400 ml su uygulanarak tarla kapasitesine getirildi. İhtiyaca göre zaman içerisinde saksılara tarla kapasitesine getirilecek düzeyde su ilave edildi. Deneme yaklaşık 5 ay sürdü ve 45., 90. ve 135. günlerde toprak örnekleri alındı. Denemede saksı içerisindeki topraklardan 3 derinlikten (en üst kısım, orta ve alt kısım) olmak üzere örnekler alınmıştır. Alınan örnekler gölgede kurumaya bırakılmıştır. Kuruyan örnekler ağzı kilitli poşetlere koyularak serin bir ortamda muhafaza edilmiştir.

Toprak örneklerinde pH değeri 1/2.5 toprak su oranı kullanılarak oluşturulan çözeltilerde cam elektrotlu pH metre ile ölçülmüştür. Aynı çözeltide EC metre ile elektriksel iletkenlik değeri belirlenmiştir (Black, 1965). Toprak örneklerinden % kireç içeriği kalsimetre yöntemine göre bulunmuştur (Gülçur, 1974). Toprak örneklerinde P tayini) Olsen ve Sommers (1982) tarafından bildirilen 0.5 M NaHCO3 yöntemine göre yapılmıştır (Kuo,1996). Organik madde Nelson ve Sommers (1996), tekstür ise Gee ve Bouder (1986) tarafından geliştirilen yönteme göre yapılmıştır.

Araştırmada elde edilen verilerin karşılaştırılması için varyans analizi (ANOVA) yapıldı ve ortalamalar arasındaki farklılıkların belirlenmesinde Tukey Çoklu Karşılaştırma Testi kullanılmıştır.

3. BULGULAR ve TARTIŞMA

Deneme kullanılan topraklar ve ham fosfata ait özellikler Çizelge 1'de verilmiştir.

Çizelge 1. Denemede kullanılan toprakların ve ham fosfatın bazı özellikleri

Toprak ve Ham Fosfat Özellikleri	Birimler	Değeri	
Toprak			
Silt	%	11	
Kum	%	71	
Kil	%	18	
pH	1/2.5	7.80	
EC	µS cm^{-1}	330	
Organik Madde İçeriği	%	2.01	
Kireç	%	18.84	
Fosfor (P)	mg kg^{-1}	5.90	
Ham Fosfat			
pH*	-	2.43	18.10
EC*	dS m^{-1}		
Toplam P	%	25	

*Ham fosfat pH ve EC değerleri 1/12.5 oranında belirlenmiştir.

Denemede kullanılan topraklar alkalin ve fazla kireçli sınıfında yer almakta olup tekstürü kumlu killi tındır. Araştırma materyali olarak kullanılan ham fosfatın toplam P içeriği % 25,

elementel kükürdün (S0) toplam S ise % 98'dir. Toprağın organik madde içeriği orta düzeyde olup fosforu azdır.

3.1. Elementel Kükürt (S0) ve Ham Fosfat Uygulamasının Toprakların pH ve % Kireç İçeriğine Etkisi

Araştırmada 45. gün ham fosfat ve elementel S0 uygulamalarının ortalama toprak pH değerleri üzerine etkisi incelendiğinde çok azda olsa bir düşme söz konusudur (Çizelge 2). Ancak, ham fosfat ve elementel S0 uygulamalarının toprak pH değeri üzerine etkisi istatistiksel olarak önemli değildir. Çizelge 2'de görüldüğü gibi ortalamalar aynı grupta yer almaktadır. Elementel S0 ve ham fosfat uygulamalarının 90. günde toprak pH değerleri üzerine istatistiksel olarak önemli düzeyde bir etki göstermemiş olup aynı grupta yer almıştır. Denemenin 135. Gününde elementel S0 uygulama dozuna bağlı olarak toprak pH değerleri azalmıştır ve bu azalma istatistiksel olarak $p<0.01$ düzeyinde önemli bulunmuştur.

Çizelge 2. Elementel S0 ve ham fosfat uygulamalarının pH ortalama değerleri

	Ort.	7.96AB	8.06A*	7.91B	7.90B	

**:$p<0.01$, *:$p<0.05$

Elementel kükürdün farklı dozlarının uygulanmasında, ortalama değerler açısından en yüksek pH değeri 0 kg da-1 kükürt uygulama dozunda 8.09 olarak elde edilirken en düşük pH değeri 80 kg da-1 elementel S0 uygulamasında (pH: 7.83) elde edilmiştir. Elementel S0 uygulaması ile 135 günde alınan topraklarda toprak pH değerinin azalması, elementel kükürdün zamanla asit bileşikler oluşturacak şekilde oksitlenmesine ve asidik bileşiklerin ($2S+3O2+ 2H2O \rightarrow 2H2SO4$) toprak pH'sını düşürmesine bağlanabilir. Güneri ve ark. (2009), yüksek kireçli ve alkalin topraklara elementel S0 uygulamasının toprakların pH değerlerinin düşürülmesinde

etkili olduğunu ve bu nedenle bu tür topraklarda yetiştirilen portakalın verim ve kalitesinin artırılması için elementel S0 uygulamasını önermişlerdir. Cui ve ark. (2004), topraklara 200 mmol S uygulaması ile 7.7 olan toprak pH değerinin 54 gün sonra 0.30 birim düştüğünü rapor etmiştir. Okalebo ve ark. (2006), yaptığı bir çalışmada, S uygulamasının toprak pH'sını önemli düzeyde düşürdüğünü belirtmişlerdir. Yapılan diğer bir çalışmada ise kireçli topraklara uygulanan kükürt dozunun artmasına bağlı olarak toprak pH'sının 5. haftaya kadar düştüğü belirlenmiş olup ve sonraki haftalarda toprak pH'sında artış başladığı tespit edilmiştir (Parham ve ark., 2002). Yüksek kireçli topraklara asit bileşikler uygulamasının başlangıçta toprak pH değerini düşürdüğü ve zamanla bu düşüşün kalıcı olmadığı ileri sürülmektedir (Maltaş ve Kaplan, 2016).

Elementel S0 ve ham fosfat ve uygulamalarının 45., 90. ve 135. günde toprağın %kireç içeriği üzerine etkisi Çizelge 3'te verilmiştir. Çalışmada 45. gün elementel S0 uygulama dozlarında toprakların %kireç içeriği en yüksek kontrol grubunda 19.85, en düşük 40 kg da-1 dozunda 18.21 bulunmuştur. Ham fosfat x elementel S0 interaksiyonu $p<0.05$ düzeyinde önemli bulunmuştur. Ancak, elementel S0 dozlarından 0 ile 80 kg da-1 uygulama dozu aynı grupta yer almıştır. Bu nedenle bir etkisinin görüldüğünü söylemek mümkün değildir.

Elementel S0 ve ham fosfatın farklı dozlarının uygulanmasında toprakların % kireç içeriği üzerine 90. günde de önemli bir etki görülmeyip ortalamalar aynı grupta yer almıştır. Farklı dozda elementel S0 uygulamasına bağlı olarak toprakların % kireç içeriğinde istatistiksel olarak önemli bir farklılık olmasa da, çok azda olsa bir azalma eğiliminin olduğu görülmektedir.

Elementel S0 ve ham fosfat uygulamalarının denemenin 135. gününde toprakların % kireç içerikleri üzerine istatistiksel olarak önemli bir etkisi gözlenmemiştir. Elementel S0 asidik karakterli bir toprak düzenleyici olmasına rağmen etkisinin gözlenmemesi toprakların yüksek kireçli olmasına bağlanabilir. Çünkü en fazla elementel S0 uygulama dozu 80 kg da-1 olup topraklarda yaklaşık 50 ton da-1 kireç bulunmaktadır.

3.2. Elementel S0 ve Ham Fosfat Uygulamasının Toprakların Alınabilir P İçeriğine Etkisi

Elementel S0 ve ham fosfat uygulamalarının 45. günde topraktaki ortalama P değerleri üzerine etkisi incelendiğinde, elementel S0 uygulamasının P üzerine önemli bir etkisi olmayıp ortalamalar aynı grupta yer almıştır (Çizelge 4). Ham fosfat uygulamalarında ise uygulama dozuna bağlı olarak, topraklarda alınabilir P miktarı istatistiksel olarak önemli ($p<0.01$) düzeyde artmıştır. Ham fosfatın kontrol grubunda ortalama 6.23 mg kg-1 olan alınabilir P içeriği en yüksek ham fosfat uygulama dozunda 23.22 mg kg-1 bulunmuştur. Çizelge 4'te görüldüğü gibi ham fosfat x elementel S0 interaksiyonu da önemli bulunmuştur. Bu durum, ham fosfat x elementel S0 uygulamasının birlikte etkili olduğu şeklinde değerlendirilebilir.

**:$p<0.01$, *:$p<0.05$

Denemenin 90. Gününde, elementel S0 ve ham fosfat uygulamasının alınabilir P üzerine etkisi $p<0.05$ düzeyinde önemli bulunmuştur. Elementel S0 uygulaması ile 0 dozda ortalama 10.58 mg kg-1 olan alınabilir P miktarı, 80 kg da-1 uygulamasında 11.07 mg kg-1 yükselmiştir. Denemede 90. günde elde edilen alınabilir P miktarı 45. güne göre yaklaşık 2 mg kg-1 düzeyinde daha azdır. Bu durum, elementel S0 uygulaması ile ortaya çıkan bileşiklerin yeniden

topraklarda P ile çökelmesine bağlanabilir. Saltalı ve Nedirli (2021), topraklara P uygulaması sonrası topraklardan örnekler almışlar ve 10., 15. ve 30. günlerde topraklarda alınabilir P içeriği bakımından fark olmadığını, ancak zamana bağlı olarak topraklarda alınabilir P içeriğinin azaldığını rapor etmişlerdir. Ham fosfat ve elementel S0 uygulamalarının 90. günde topraktaki P üzerine etkisi incelendiğinde ham fosfat dozlarının artması ile alınabilir P miktarları önemli ($p<0.01$) düzeyde artmıştır. En yüksek P miktarı 20 kg da-1 dozunda 17.47 mg kg-1 elde edilirken en düşük P miktarı 5.64 mg kg-1 kontrol grubunda elde edilmiştir. Nour ve Elfaki (2019), bazik topraklara elementel kükürt uygulamasının toprak reaksiyonun azalmasına ve topraklarda alınabilir P içeriğinin artmasına neden olduğunu, bu nedenle bazik toprakların iyileştirilebilmesi ve P içeriğinin artırılması için elementel kükürt uygulamasını önermişlerdir. Topraklarda kükürdü, kükürt oksitleyici bakteriler okside etmekte (Etesami ve Jeong, 2021) ve okside kükürt ile üretilen asitli bileşikler de topraklarda alınamaz konumda bulunan fosforun çözünürlüğünü artırmaktadır (Khan ve ark., 2020).

Denemenin 135. gününde elementel S0 ve ham fosfat uygulamasında, elementel S0 uygulama dozlarında en yüksek alınabilir P miktarı 11.52 mg kg-1, en düşük 10.17 mg kg-1 elde edilmiştir. Elementel S0 uygulamasının alınabilir P üzerine etkisi $p<0.01$ düzeyinde önemli bulunmuştur. Elementel S0 uygulamasına bağlı olarak topraklarda alınabilir P konsantrasyonunun artması, kükürdün oksidasyonundan kaynaklı asit bileşiklerin toprakların pH değerini düşürmesine ve dolayısıyla P serbestlenmesine bağlanabilir. Khan ve ark. (2017), kaya fosfatı kompost ve elementel S0 ile karıştırarak kireçli ve alkalin bir toprakta yaptıkları çalışmada; uygulama dozlarına bağlı olarak topraklarda alınabilir P miktarının arttığını ve buna bağlı olarak bitkinin P alımında da artışlar olduğunu rapor etmiştir. Diğer yandan elementel S0 ve ham fosfat uygulaması ile ham fosfat uygulama dozu arttıkça topraklarda ortalama alınabilir P miktarını istatistiksel olarak önemli ($p<0.05$) düzeyde artırmıştır. Aynı zamanda, elementel S0 x ham fosfat interaksiyonu $p<0.05$ düzeyinde önemli bulunmuştur. Bu durum, ham fosfatın ve elementel S0 uygulamasında, zamanla ham fosfatın mineralizasyonundan kaynaklandığı düşünülmektedir. Ayrıca, elementel kükürdün zamanla oksidasyonu ve asitli bileşiklerin oluşması da topraklarda ham fosfattan P serbestlenmesine katkı sağlayabilir. Yüksek kireçli ve alkalin topraklara elementel S0 uygulamasının toprakların pH değerleri üzerine etkisinin de araştırıldığı bir çalışmada; elementel S0 uygulamasının toprak pH değerinin düşürülmesi konusunda etkili olduğunu ve portakal yetiştirilen yüksek kireçli ve alkalin topraklarda verim ve kalitesinin artırılması için elementel S0 uygulanması önermişlerdir (Güneri ve ark., 2009). Okalebo ve ark. (2006)'da, yaptığı bir çalışmada S0 uygulamasının toprak pH'sının düşürülmesinde elementel kükürdün etkili olduğunu vurgulamışlardır. Kaya fosfat, elementel S0 ve kompostun farklı dozları ile buğday bitkisinin verimi üzerine yapılan bir çalışmada; kaya fosfat + elementel S0 uygulamasının buğdayın P alımını ve verimi artırdığı rapor edilmiştir. Aynı çalışmada, kaya fosfat + elementel S0 + kompost karıştırılması durumunda bitki P alımının ve verimin daha da yükseldiği vurgulanmıştır (Khan ve ark., 2017).

4. SONUÇ VE ÖNERİLER

Bu çalışmada, kaya fosfatın öğütülmesi ile elde edilen ham fosfat materyalleri ile elementel kükürdün topraklara birlikte uygulanmasının alınabilir P içeriği üzerine etkisi araştırılmıştır. Çalışma saksı denemesi şeklinde yürütülmüştür. Elde edilen verilere göre, elementel S0

uygulaması ile toprakların pH değeri istatistiksel olarak önemli düzeyde azalmıştır. Elementel S0 ve ham fosfat uygulamasının toprakların % kireç içeriği üzerine herhangi bir etkisi gözlenmemiştir. Topraklara elementel S0 ve ham fosfat uygulamasında, toprakların alınabilir P konsantrasyonu ham fosfat dozuna bağlı olarak istatistiksel olarak önemli düzeyde ($p<0.01$) artmıştır. Benzer şekilde, elementel S0 uygulamalarının da denemenin 90. ve 135. Gününde alınabilir P içeriğini artırdığı belirlenmiştir. Fosforlu gübrelerin, ham fosfat ve elementel kükürdün ekonomik özellikleri değerlendirilerek, ham fosfat kaynaklarının elementel S0 ile karıştırılarak uygulanması, bitkilerin P ile beslenmesinde bir alternatif olarak değerlendirilebilir. Ancak, detaylı tarla denemeleri ile test edilmesinde fayda vardır.

ABSTRACT

Black cumin seed (*Nigella sativa L.*), one of the medicinal and aromatic plants, is used as a natural medicine due to the presence of antimicrobial, antioxidant and other pharmacological properties. After the ban of growth stimulant antibiotics in poultry nutrition, researchers have intensified their studies on natural alternative products that can be used to protect the health and improve the performance of animals. The presence of a large number of essential nutrients and various pharmacological active compounds in its composition makes black cumin seeds a potential alternative feed raw material for poultry rations. In studies on the use of black cumin seed in poultry nutrition, it has been reported that it increases growth performance, feed consumption and feed efficiency of animals, as well as positive effects on intestinal health, intestinal microbiota and some blood parameters. When the feeding studies on black cumin are examined, studies on the use of black cumin seed and oil obtained from black cumin seed are more intensively encountered.

In this review, the effects of the use of black cumin seed, black cumin oil and the remaining pulp of black cumin seed after the oil is extracted from black cumin seed on poultry are summarised in the light of the literature.

Keywords: Black cumin seeds, Broiler chickens, Laying hens, Quail

KANATLI HAYVANLARIN BESLENMESİNDE ÇÖREK OTU TOHUMU KULLANIMI

ÖZET

Tıbbi ve aromatik bitkilerden biri olan çörek otu tohumu (*Nigella sativa L.*), antimikrobiyal, antioksidan ve diğer farmakolojik özelliklerinin varlığı nedeniyle doğal bir ilaç olarak kullanılmaktadır. Kanatlı hayvanların beslenmesinde büyüme uyarıcı antibiyotiklerin yasaklanmasından sonra araştırmacılar hayvanların sağlığını korumak ve performansını artırmak için kullanılabilecek doğal alternatif ürünler üzerine çalışmalarını yoğunlaştırmıştır. Bileşiminde bulunan çok sayıda temel besin maddesinin ve çeşitli farmakolojik aktif bileşiklerin varlığı, çörek otu tohumlarını kanatlı hayvanlarının rasyonları için potansiyel bir alternatif yem hammaddesi haline getirmektedir. Çörek otu tohumunun kanatlı hayvanların beslenmesinde kullanımı ile ilgili çalışmalarda hayvanların büyüme performansını, yem tüketimini ve yem verimliliğini artırdığı, bununla birlikte bağırsak sağlığı, bağırsak mikrobiyotası ve bazı kan parametreleri üzerine olumlu etkilerinin olduğu bildirilmektedir. Çörek otu ile ilgili yapılan besleme çalışma irdelendiğinde, çörek otu tohumu ve çörek otu tohumundan elde edilen yağın kullanımı ile ilgili çalışmalara daha yoğun rastlanılmaktadır.

Bu derlemede özellikle çörek otu tohumu, çörek otu yağı ve çörek otu tohumundan yağı alındıktan sonra geri kalan küspesinin kanatlı hayvanlarda kullanımının hayvanlar üzerindeki etkileri literatür ışığı altında özetlenmiştir.

Anahtar Kelimeler: Çörek otu tohumu, Etlik piliç, Yumurta tavuğu, Bıldırcın

GİRİŞ

Kanatlı hayvan yetiştiriciliği hayvancılık sektörleri içerisinde, yüksek biyolojik değere sahip hayvansal protein sağlayan, dünya çapında en kazançlı üretim sektörlerinden biridir. 2006 yılına kadar kanatlı hayvan beslemede, antibiyotikler büyük bir yere sahipti ve piliçlerde büyüme destekleyicileri olarak yaygın olarak kullanılmaktaydı. Kanatlı rasyonlarında yoğun olarak antibiyotik kullanımına bağlı olarak özellikle insanlarda ortaya çıkan bakteriyel dirençle birlikte büyüme uyarıcı antibiyotiklerin kullanımı yasaklanmış ve araştırmacılar alternatif olabilecek doğal, güvenli ve gelişmeyi uyarıcı madde arayışları başlamışlardır (Asgar ve ark., 2022).

Doğal kaynaklarının hayvan beslemede tercih edilmesindeki temel etken bitkisel kökenli unsurların insan sağlığını olumsuz etkileyebilecek beklenmedik bir etkiye sahip olmaması ve güvenilir kaynak olmalarıdır. Doğal ürünler sentetik antioksidanlara alternatif olmaları nedeniyle tercih edilmektedirler (Yanishleva ve ark., 2001; Barreira ve ark. 2008; Bouaziz ve ark., 2008; Bulca, 2014). Bitkisel kökenli yem katkı maddelerinin; hücreye zarar veren molekülleri temizleyerek oluşabilecek hasarlardan korunmaya yardımcı olması ve gıdalarda mikrobiyal, fiziksel ve kimyasal özelliklerin korunması, gıdanın dış görünüşünü, tadını, kokusunu olumsuz yönde etkilememesi bu tip doğal ürünlere olan ilgiyi arttırmaktadır (Etherton ve ark., 2002).

Entansif besleme uygulamaları ile hayvanlardan kısa zamanda daha hızlı canlı ağırlık kazancı hedeflendiğinden, hayvanların genetik kapasitesi doğrultusunda uygun rasyonlarla beslenmeleri gerekmektedir. Bununla birlikte bu performans değerlerini yakalamak için rasyonlara büyümeyi uyarıcı maddeler de ilave edilmektedir. Antibiyotikler uzun yıllar kanatlı hayvanların beslenmesinde büyüme uyarıcı olarak kullanılmıştır. Büyüme uyarıcı maddelerin doğal kökenli olmaları ve etki mekanizmalarının ortaya konmasıyla birlikte hayvan beslemede ve hayvansal ürünlerin işlenmesinde antibiyotiklere alternatif olabileceği düşünülmektedir (İpçak ve ark., 2017). Yemlerin korunması ve besleme sonucu elde edilen ürünlerin raf ömrünün uzatılması için antioksidanlar; hayvanların sağlıklı gelişimi için de antimikrobiyal etkili hammaddeler kullanılmaktadır (Bilal ve ark., 2008). Gerek laboratuvar gerekse canlı hayvanlar üzerinde yapılan çalışmalar sonucunda bitki ve ekstraktlarının alternatif yem ham maddesi veya yem katkı maddesi olarak kullanılabileceği ortaya konmuştur (Bilal ve ark., 2008).

İçeriğinde bulunan çok fazla sekonder metabolitler ile antioksidan ve antimikrobiyal etkiye sahip tıbbi ve aromatik bitkilerden biri de çörek otu tohumudur. Yapılan çalışmalarda çörek otu tohumu, besin madde içeriğinin yüksek olmasının yanında vitamin-mineral bakımından da iyi bir kaynak olarak tanımlanmakta, bileşimindeki maddelerin farmakolojik özellikleri sayesinde destek ve tedavi amacı ile de yüzyıllardır kullanılan bir bitki olarak bilinmektedir.

Çörek Otu Tohumu

Çörek otu (*Nigella sativa* L.) bitkisi, *Ranunculaceae* familyasına ait olup adaptasyonu yüksek olması nedeniyle çoğu bölgede yetiştirilebilen, tek yıllık, otsu, ortalama 25- 55 cm boya sahip bir bitki olarak tanımlanmaktadır (Kılıç ve Arabacı, 2016; Çelik, 2022). Nigella kelimesi Lâtince siyahımsı anlamında kullanılan nigellus'tan türetilmiştir. Türkçe de Nigella sativa

bitkisinin karşılığı olarak çörek otu, ekilen çörek otu, kara çörek otu veya siyah kimyon isimleri gelmektedir (Shoshin, 2015).

Ranunculaceae bitki ailesinden Nigella cinsinin yirmi türünden biri olan ve kutsal tohum olarak bilinen çörek otunun, tıpta kullanılan bitkiler içinde zengin tarihsel ve mistik bir geçmişe sahip olduğu, uzun yıllar yiyecekleri koruyucu ve lezzeti arttırmak amacıyla kullanıldığı bilinmektedir (Ragaa, 2010; Kılıç ve Arabacı, 2016). Türkiye'de; ekmek, çörek ve peynir çeşitlerinde kullanımı yoğun olan çörek otu tohumları yüzyıllardır hekimler tarafından farklı hastalıkların (ağrı kesici, nefes açıcı, sindirim sistemi problemlerinde tedavi, menstürasyonu düzenleme) tedavisinde kullanılmaktadır (Yüncü ve ark., 2013). Bununla birlikte Orta Doğu ve Uzak Doğu ülkelerinde astım, bronşit, baş ağrısı, dizanteri, enfeksiyonlar, şişmanlık, sırt ağrısı, hipertansiyon, farenjit, grip, paralizi, karın ağrısı ve mide bağırsak yolları problemleri gibi birçok hastalık grubunun tedavisinde de kullanılmaktadır (Kanter ve ark., 2005; Salem ve ark., 2010; Ahmad ve ark., 2013; Yüncü ve ark., 2013). İçeriğinde bulunan çeşitli metabolitlerin göstermiş olduğu terapötik etkinliklerinin farklı olması nedeniyle pek çok farklı farmakolojik etkiye sahiptir.

Çörek otu tohumunun çok eski çağlardan beri kullanıldığının göstergeleri arasında, Tutankamon'un mezar buluntuları arasında ortaya çıkması, iyileştirici ve güzelleştirici etkilerinden dolayı Kleopatra tarafından da kullanılması bunlara örnek verilmektedir. Bununla birlikte; Dioskorides tarafından ağrı kesici ve antihelmentik etkisi, Hipokrat tarafından ise karaciğer hastalıklarında ve sindirim sistemi şikâyetlerini gidermesi amacıyla kullanılmıştır. İbni Sina'nın tıp tarihi açısından önemli bir kaynak olarak kabul gören eseri "Kanun" da çörek otunun metabolizmayı uyaran ve halsizlik-uyuşukluk giderici etkisi vurgulanmaktadır. Peygamberimiz Hz. Muhammed (SAV) "Çörek otunu kullanın, ölümden başka her şeye devadır" sözü çörek otunun inançlı bir biçimde ve kitlesel olarak kullanılmasını etkilemesi açısından anlamlıdır (Gün, 2012).

Çörek otunda farmakolojik anlamda etken maddeler olarak %0.5-1.6 arasında uçucu yağlar (timokinon, timohidrokuinon, nigellon, timol, karvakrol, α ve β pinen, d-limenonene, p-simen), alkoloidler, steroller (betaso- sterol, sykloeikolenol, sykloartenol, sterol esterler, sterol glukosidler), saponinler ve quinonlar bulunmaktadır. Yapılan çalışmalar çörek otu tohumunun antibakteriyel, antioksidan immun sistemi destekleyici, helmintleri öldürücü, antidiabetik ve antitümoral aktivite gösterdiğini ortaya koymuştur (Tufan ve ark., 2015). Çörek otu bu farmokolojik özellikleri sayesinde insan sağlığı üzerine etkisi ile ilgili çok sayıda çalışma bulunmaktadır. Çörekotu ve çörekotundan elde edilen maddeler birçok hastalığın tedavisinde kullanılmaktadır. Çörekotunun antioksidan etki yaptığı ve çörekotundan elde edilen timokinon adlı maddenin süper oksit, hidrojen peroksit, nitrik oksidi ve oksidatif stresi azalttığı bildirilmiştir (Ayaş, 2024).

Çörek otu tohumuna ait besin madde içerikleri Tablo 1'de, aminoasit, yağ asidi ve vitamin içeriklerine ait değerler ise Tablo 2'de verilmiştir.

Tablo 1. Çörek Otu Tohumu Besin Maddesi Bileşenleri (100 g kuru madde için)

Bileşen	**Miktar (g) / mg / %**
Nem	5.02 ± 0.01 g
Ham protein	21.07 ± 0.01 g
Ham yağ	39.02 ± 0.09 g
Ham lif	6.01 ± 0.06 g
Toplam karbonhidrat	25.86 ± 0.10 g
Toplam kül (mineral)	3.02 ± 0.02 g
Enerji değeri	644.88 kcal

Tablo 2. Çörek otu tohumunun aminoasit, yağ asidi ve vitamin içerikleri (Tetik, 2020)

Amino Asit	**Miktar (%)**	**Yağ Asidi**	**Miktar (%)**	**Vitamin**	**Miktar (mg/kg)**
Leusin	6.00	Linoleik Asit	57.71	**α-tokoferol**	25.59
Valin	4.77	Oleik Asit	24.46	**β-tokoferol**	14.21
Lizin	3.86	Palmitik Asit	12.17	**γ-tokoferol**	242.83
Treonin	3,86	Stearik Asit	2.31	**Toplam tokoferoller**	282.63
Fenilalanin	3,70	Arachidik Asit	0.33	**B1 (Tiamin)**	13–18
Metiyonin	1,88	Eikosadienoik Asit	2.52	**B6 (Piridoksin)**	4–15
Histidin	2,79	Myristik Asit	0.19	**Niasin (B3)**	33–97
İzolösin	3,69	Palmitoleik Asit	0.14	**Folat (B9)**	400–870
Tirozin	3,35	Linolenik Asit	0.12		
Sistin	1,17				

Çörek Otu Tohumunun Kanatlı Hayvanlarda Kullanımı

Dünyada ve ülkemizde hayvansal protein gereksiniminin karşılanmasında ilk sırada yer alan kanatlı hayvan sektöründe kullanılan katkı maddelerinin büyük miktarının ithal olması nedeniyle girdiler oldukça yüksektir. Bununla birlikte, hayvan beslemede yem katkı maddeleri hem yemden yararlanmayı artırmak hem de minimum giderle olası en yüksek miktar ve kalitede hayvansal ürün elde etmek amacıyla kullanılmaktadır (Gölcü ve Duru, 2023).

Özellikle kanatlı hayvanların beslenmesinde büyüme uyarıcı antibiyotiklerin yasaklanmasından sonra araştırmacılar hayvanların sağlığını korumak ve performansını artırmak için kullanılabilecek doğal alternatif ürünler üzerine çalışmalarını yoğunlaştırmıştır.

Bitkisel katkı maddelerinin doğal olmaları ve hem de hayvan sağlığını olumlu yönde etkilemeleri yem katkı maddesi olarak kullanılmasında önemli avantajlarıdır. Ayrıca bu bitkisel ürünlerin dolaylı yoldan hayvansal ürünlere geçerek tüketilmesi sağlık, ürün kalitesi ve lezzeti yönünden olumlu etkiler gösterebilmektedir.

Bu doğal tıbbi bitkilerden biri olan çörek otu tohumunun ve farklı bileşenlerinin kanatlı hayvanlar üzerindeki etkileri değerlendirildiğinde; yemin lezzetini, sindirilebilirliğini, hayvanlarda canlı ağırlığı, yumurta verimini ve yem değerlendirmeyi artırdığı belirlenmiştir. Bununla birlikte, içeriğinde bulunan sekonder metabolitler sayesinde bağışıklık sistemini güçlendirip patojen mikroorganizmaların baskılanmasını sağlamaktadır. Bununla birlikte antilipidemik etkisiyle düşük kolesterollü hayvansal ürün eldesi açısından önem arz etmektedir.

Tablo 3'de farklı kanatlı hayvan türlerinde çörek otu tohumu ve tohumundan elde edilen bileşenlerin kullanıldığı güncel çalışmalar özetlenmiştir.

Tablo 3. Farklı kanatlı hayvan türlerinde çörek otu tohumu ve bileşenlerinin kullanımı

Hayvan	Kullanım Şekli	Doz	Etkiler	Kaynak
Etlik piliç	Çörek otu tohumu	% 0, 0.5, 1 ve 1.5	Çörek otu tohumunun canlı ağrılık artışı ve yemden yararlanmayı olumlu yönde etkilediği, serum kolesterol değerini düşürdüğünü bildirmişlerdir.	Singh ve Kumar (2018)
Etlik piliç	Çörek otu tohumu ve çemen tohumu	0, 5 ve 10 g/kg	Çörek otu tohumunun ttlik piliçlerde performans, yem tüketimi ve kan bileşenlerini etkilemediği, abdominal yağ içreğini azalttığı, bağışıklık sistemini güçlendirdiği bildirilmiştir.	Laudadio ve ark. (2020)
Etlik piliç	Çörek otu yağı ve kekik yağı	0, 100 ve 250 mg/kg	Etlik piliç rasyonlarında kekik yağı ve çörek otu yağı kullanımı, performans parametrelerini ve sekum esansiyel yağ asitlerini etkilememiş, ancak bağırsak sağlığı üzerinde olumlu etkileri olmuştur.	Özlem ve Yıldız (2020)
Japon bıldırcını	Çörek otu tohumu	%0, 0.5, 1 ve 2	Erkek bıldırcın rasyonlarına çörek otu tohumu ilavesinin performans, testis özellikleri, serum parametreleri ve üreme hormonları üzerine istatistiki bir etkisinin olmadığı, ancak %0,5 ilavesinde testis ağırlığı/canlı ağırlık oranında artma	Sevim ve ark. (2021)

			ve serum FSH seviyesinin düşme eğiliminde olduğu bildirilmiştir.	
Japon bıldırcını	Çörek otu tohumu	% 0, 1, 2 ve 4	%2 ilaveli grubun diğer gruplara göre; canlı ağırlığı, canlı ağırlığı artışı ve yem dönüşüm oranını iyileştirdiği, et kalite özelliklerinin daha iyi olduğu ve raf ömrünü iyileştirdiğini bildirmişlerdir.	Asgar ve ark. (2022)
Etlik piliç	Çörek otu tohumu küspesi	0, 20, 40 ve 60 g/kg	Etlik piliç performans özelliklerini iyileştirmiş, antioksidan, bağışıklık ve et kalitesini artırmış ve patojenik bakteri papülasyonunu azaltmıştır.	Fathi ve ark. (2023)
Etlik piliç	Çörek otu tohumu küspesi ve Hindistan cevizi küspesi	%0, 5 ve 10	Her iki alternatif yem hammaddesinin etlik piliçlerin performansını iyileştirdiği, karkas randımanını artırdığı ve bağırsak sağlığını iyileştirmiştir.	Zazaa ve ark., (2023)
Japon bıldırcını	Çörek otu tohumu	%0, 0.5, 1 ve 2	Hayvanların performansını etkilemediği, kanda AST, laktat dehidrogenaz, üre, glutatyon peroksidaz düzeyleri, kolseterol ve LDL değerlerini azalttığı kan ve karaciğer parametrelerini olumlu yönde etkilediği bildirilmiştir.	Çimrin ve ark., (2023)
Yumurta tavuğu	Çörek otu tohumu	0, 10 20 ve 30 g/kg	Günlük canlı ağırlık artışı ve yumurta ağırlığını etkilemediği, en yüksek yumurta veriminin 30 g/kg ilaveli gruptan elde edildiği ve yumurta verimliliğini önemli derecede etkilediği bildirilmiştir.	Ali ve ark., (2023)
Etlik piliç	Çörek otu tohumu	0, 5, 10, 15 ve 20 g/kg	Etlik piliçlerin performansını etkilemediğini bağırsak histomorfolojik parametrelerini iyileştirdiği ve bağırsak mikrobiyatısını olumlu yönde etkilediğini bildirmişlerdir.	Abdollai ve ark. (2024)

Yapılan güncel çalışmalar ile ilgili Tablo 3 genel olarak değerlendirildiğinde; çörek otunun farklı bileşenlerinin (tohumu, yağı ve küspesi) farklı kanatlı hayvan türlerinin rasyonlarında kullanımı ile yemin lezzetini, sindirilebilirliğini, canlı ağırlığı, yumurta verimini, yemden yararlanmayı bağırsak sağlığı ve morfolojisi ile bağışıklık sistemi üzerinde olumlu etkilerinin olduğu görülmektedir.

Sonuç

Sağlıklı, dengeli ve sürdürülebilir bir yaşam için insanların tükettikleri besin maddelerinin güvenilir ve insan sağlığı açısından hiçbir risk taşımaması gerekmektedir. Bilinçli tüketici ve sağlıklı hayvansal ürünlere olan talep tıbbi ve aromatik bitkilerin önemini giderek artırmaktadır. Genel bir anlayış olarak, sağlıklı ve dengeli beslenmemizde tarladan ya da hayvancılık işletmesinden sofraya gelinceye kadar her türlü üretilen ürünün denetlenebilir ve güvenilebilir olması beklenmektedir.

İnsanların beslenmesinde temel bir protein kaynağı durumunda olan kanatlı hayvanların ürünleri de sağlık açısından herhangi bir risk taşımamalıdır. Antibiyotiklere alternatif olarak düşünülen ve tamamen doğal olan tıbbi ve aromatik bitkilerin antimikrobiyal, antibakteriyel, antifungal, antiviral, ve antioksidan etkilerine yönelik elde edilen sonuçlar olumlu yöndedir.

Bu tıbbi ve aromatik bitkilerden biri olan çörekotu ve çörekotundan elde edilen maddeler insanlarda tedavi edici ve koruyucu olarak kullanıldığı gibi hayvan beslemede özellikle de kanatlı beslemesinde yaygın olarak kullanılmaktadır. Kanatlı karma yemlerine çörek otu tohumu ve bileşenlerinin ilavesi yem tüketimini, yemin sindirimini, bağırsak villus gelişimini, günlük canlı ağırlık artışını, immün sistem aktivitesini, bazı kan parametrelerini ve et kompozisyonunu olumlu yönde etkileyebilmektedir. Sonuç olarak son dönemde popülerliği artan çörekotu ve çörekotundan elde edilen maddelerin kanatlı hayvanların beslenmesinde kullanılmasının birçok faydası bulunmaktadır.

ABSTRACT

In the Mediterranean climate, longer periods of heat and drought have been observed in spring and summer for recent years. Long high temperature periods and extreme hot conditions in semi-arid regions reveal water scarcity in crop production. Identifying the rapidly changing ecological conditions in the world in a short time and creating solutions and ensuring adequate and healthy nutrition of the increasing population due to this change is only possible by developing agricultural production systems suitable for this change. Evaluating the variability of drought stress on morphological, yield and quality parameters will lead to strategic measures to be taken in order to achieve optimal yield and quality characteristics depending on the stress conditions that will increase with climate change. A field experiment was conducted to determine the effects of four different irrigated and limited irrigation (based on water holding capacity (WHC)) treatments (water scarcity: 25%, 50% WHC, and irrigated: 75%, 100% WHC) on two different soybean varieties (Cinsoy and Altınay) on grain quality properties of soybean. For this reason, protein ratio (%), ash ratio (%), fiber ratio (%) and oil ratio (%) of soybean seed was analyzed by NIRS (Near Infrared Reflectance Spectroscopy). According to the variance analysis results of the experiment, it was observed that limited irrigation practices had significant effects especially on protein and oil ratio. In the study, year, water and year*water interactions were statistically significant at 0.01 level. In the experiment, protein ratio varied between 32.24-35.62%, oil ratio 18.68-20.45%, ash ratio 4.03-4.60% and fiber ratio 5.03-5.10%. These changes clearly show that water scarcity conditions not only affected yield and plant growth in soybean, but also caused significant changes in grain quality.

Keywords: Climate change, drought, soybean, water stress, protein, oil

TAM VE KISITLI SULAMA ŞARTLARI ALTINDA SOYA FASULYESİ (*Glycine max*. L. Merr) TANESİNDE BAZI KALİTE ÖZELLİKLERİNİN DEĞİŞİMİ

ÖZET

Akdeniz ikliminde, son yıllarda ilkbahar ve yaz aylarında daha uzun süreli sıcaklık ve kuraklık dönemleri gözlenmektedir. Yarı kurak bölgelerdeki uzun yüksek sıcaklık dönemleri ve aşırı sıcak koşullar, bitkisel üretimde su kıtlığını ortaya çıkarmaktadır. Dünyada hızla değişen ekolojik koşulların kısa sürede tespit edilerek çözüm üretilmesi ve bu değişime bağlı olarak artan nüfusun yeterli ve sağlıklı beslenmesinin sağlanması ancak bu değişime uygun tarımsal üretim sistemlerinin geliştirilmesi ile mümkündür. Kuraklık stresinin morfolojik, verim ve kalite parametreleri üzerindeki değişkenliğinin değerlendirilmesi, iklim değişikliği ile artacak stres koşullarına bağlı olarak optimum verim ve kalite özelliklerinin elde edilmesi için stratejik önlemlerin alınmasına yol açacaktır. İki farklı soya fasulyesi çeşidi (Cinsoy ve Altınay) üzerinde dört farklı sulu ve sınırlı sulama (su tutma kapasitesine (WHC) dayalı) uygulamasının (su kıtlığı: %25, %50 ve sulu: %75, %100 WHC) soya fasulyesinin tane kalite özellikleri üzerindeki etkilerini belirlemek için bir tarla denemesi yürütülmüştür. Bu nedenle soya fasulyesi tohumunun protein oranı (%), kül oranı (%), lif oranı (%) ve yağ oranı (%) NIRS (Near Infrared Reflectance Spectroscopy) ile analiz edilmiştir. Deneme varyans analiz sonuçlarına göre, kısıtlı sulama uygulamalarının özellikle protein ve yağ oranı üzerinde önemli etkileri olduğu görülmüştür. Çalışmada yıl, su ve yıl*su interaksiyonlarının 0.01 seviyesinde istatistiki olarak önemli farklar oluşturduğu görülmüştür. Denemede protein içeriği %32,24-35,62, yağ içeriği %18,68-20,45, kül içeriği %4,03-4,60 ve lif içeriği %5,03-5,10 arasında değişmiştir. Bu değişimler, su kıtlığı koşullarının soyada sadece verim ve bitki büyümesini etkilemediğini, aynı zamanda tane kalitesinde de önemli değişikliklere neden olduğunu açıkça göstermektedir.

Anahtar Kelimeler: İklim değişikliği, kuraklık, soya fasulyesi, su stresi, protein, yağ

INTRODUCTION

Soybean (Glycine max. L. Merr.) is one of the most widely cultivated legumes in the world due to its valuable seed composition. Soybean has an extremely important position in human and animal nutrition due to its fat (18-20%), protein (36-40%), carbohydrate (30%), mineral matter (5%) content (Shea et al., 2024). Soybean is one of the most important oilseed crops worldwide and contains high amounts of protein for human food and animal feed (Wysokinski et al., 2024). Soybean (Glycine max. (L.) Merr) is one of the field crops with the largest economic importance in the world. Annual production is around 370 million/ton. Soybean is a highly nutritious legume both for human consumption and as animal feed, with high protein and fat content (Statista, 2023). Since soybean is a legume plant, it has a special importance in increasing soil fertility with its ability to bind the free nitrogen of the air to the soil. For this reason, it is an important crop rotation plant. Soybean is a taprooted legume plant that can form nodules called nodules with Rhizobium bacteria and bind the free nitrogen of the air to the soil. The bacterial race that can form effective nodules in soybean is Bradyrhizobium japonicum bacteria group (Miransari, 2016).

Drought conditions are the most limiting factor for crop production in the world. Water resources available for crops are limited except for rainfall. Therefore, it is important to select plant species that can best adjust the water use efficiency of plants under drought stress. Water use efficiency is defined as the ratio of biomass production to plant transpiration, which is the amount of water used by the plant (Bacon, 2009). In the Mediterranean climate, the increase in temperature periods in recent years has exposed water scarcity in crop production (Parkes et al., 2022). Extreme weather events such as droughts reduce crop production, making it difficult to obtain and distribute crops worldwide. High temperatures during plant growth periods cause yield and quality losses in crops, posing a major threat to food. Temperature plays a critical role in plant growth and development. Average temperatures are projected to increase worldwide by an average of 0.3^0C every 10 years, increasing by 1.5^0C by 2050 and up to 4^0C by 2100. These temperature increases are one of the most important abiotic stress factors threatening plant growth and yield (Poudel et al., 2023).

Plants try to survive under the influence of different environmental factors. These environmental factors can be named as biotic and abiotic factors. In order to obtain an economic product, the optimum environmental demands that the plant species or variety grown must meet the optimum environmental demands that it can adapt to itself. Drought, which is one of the abiotic stress factors, is defined in different ways by many researchers and is defined as the presence of moisture in the soil at the wilting point of the plant (Lynch, 1995). Soybean is a plant with moderate water requirements (mesophyte). It has better drought tolerance than legumes such as broad bean (Vicia faba L.) and pea (Pisum sativum L.). This resistance mechanism is due to genetic adaptations such as leaf and stem hairiness, which reduces excessive transpiration at high temperatures, and a taproot system that spreads into deep layers of the soil (Staniak et al., 2023).

For high yield in soybean, total water requirement should be 450-700 mm. It has been reported that available water in the soil should reach 50-85% for germination of soybean seeds and that they are very sensitive to water deficiency during flowering and grain filling periods (Silva et al., 2020). Productivity under drought conditions varies depending on the intensity and duration

of the stress and the phenological stages of development. In soybean cultivation, there are 3 critical periods related to increased water demand. The first is the period from sowing to emergence, the second is the flowering period, and the third is the pod setting period (Lewandowska and Kotcchi, 2020). The most damaging periods of temperature and water stress during the generative period are flowering and pod development. Yield losses are related to photosynthetic performance during the generative period. In drought stress, stomata in leaves are closed and the production of assimilates such as starch is limited, which negatively affects photosynthetic performance. Inadequate assimilate delivery to flowers and pods, together with high temperatures, leads to smaller grains and thus lower yields. Water stress during the flowering period stresses the plant, causing flower and pollen losses and reducing seed yield (Soba et al., 2022).

Arıoğlu (2007) reported that soybean seeds contain 18-24% oil, depending on the variety, and that soybean oil contains important fatty acids such as 19-30% oleic acid, 44-62% linoleic acid, 4-11% linolenic acid, 7-14% palmitic and 1.4-5.5% stearic acid. It has been revealed that soybean oil ratio and fatty acid composition can be affected by many factors such as variety and the region where it is grown (Galao et al., 2014). Piper and Boote (1999) reported that the oil and protein content of the seed is closely related to environmental factors, especially with the increase in temperature during the growth period, the oil content increases and the protein content decreases. Under arid conditions, soybean seed protein content increases while crude oil content decreases and these ratios change linearly with increasing stress (Sobko et al., 2020). Ravelambola (2022) reported that drought can affect protein structure as well as protein synthesis and that the transfer of amino acids to the leaf is hampered by hydration of the decomposed proteins. In addition, Specht et al. (2014) reported that when soybean plants are subjected to water stress, the oil content increases while the protein content decreases. Since palmitic fatty acid belongs to the group of saturated fatty acids, it is desired to have a low ratio. When the water stress was increased from 20% to 40% in different developmental stages, it was observed that the dry matter content of soybean decreased by 25-34% and yield decreased by 18-30% (Vearela, 1998). There is a positive relationship between temperature and fat content. In addition, an increase in protein content was found with the increase in temperature. They also found an increase in methionine amino acid composition in protein (Shi et al., 2023). Wilson (2004) reported that the temperature during the growing period was effective on the oil content in soybean and the oleic acid content increased when the day and night temperatures increased together during the growing period.

In this study, it was aimed to investigate the effects of full and limited irrigation practices on some grain quality parameters in soybean varieties, which is one of the important plants for sustainable agriculture. In this study, it was aimed to develop soybean cultivation in sustainable agricultural systems under high temperature and water scarcity conditions in Aydın ecological conditions.

MATERIAL AND METHOD

The field studies of the experiment were carried out in Aydın ecological conditions (37o45' N, 27o45' E location) during the soybean vegetation period of 2020 and 2021. Two medium-early soybean varieties (Cinsoy and Altınay) were obtained from Izmir Aegean Agricultural Research

Institute as material to evaluate the quality characteristics of soybean in the experiment. The experiment was established according to a randomized block split-plot design. The experiment consisted of 2 soybean cultivars (Cinsoy and Altınay) and 4 different irrigation treatments (water scarcity: 25%, 50% and irrigated: 75% and 100%). The experiment was established as 24 plots in total. Each plot consisted of 4 rows, 70 cm between rows, 5.4 cm above rows, 5 m in length, 2.80 m in width and 14 m2 in total.

The soil characteristics of the land where the research was conducted are low in organic matter (1.7%) and has a sandy loam soil structure. Soil pH is alkaline (7,92) and has a salt-free structure. According to the soil analysis, it was determined that lime content was high (7,93%), sodium (89 ppm), potassium (224 ppm), calcium (2481 ppm) and phosphorus (11,53 ppm) levels were medium useful.

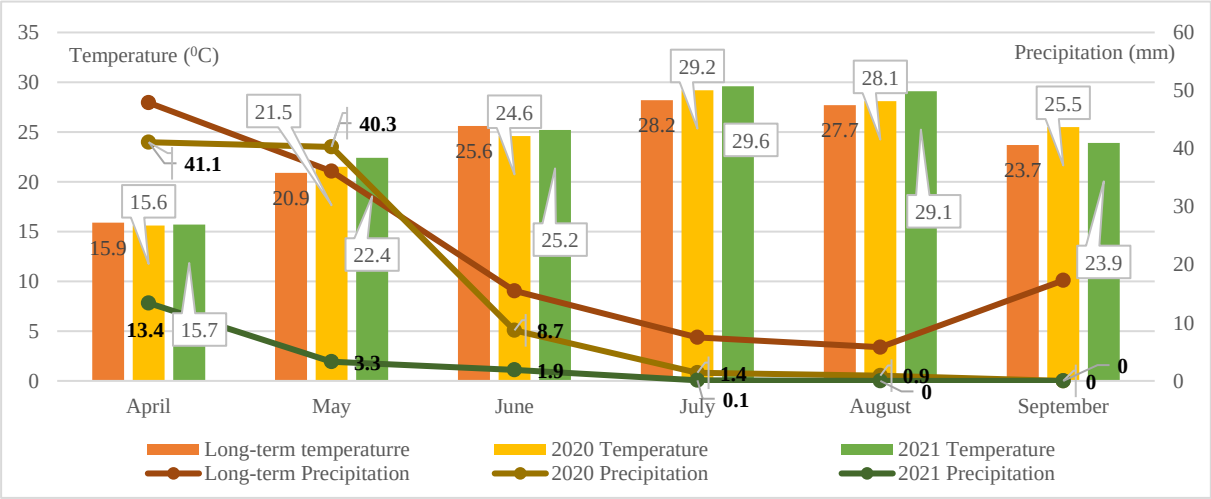

Figure 1. Monthly and long-term temperature and precipitation values (General Directorate of Meteorological Affairs, Station: Koçarlı/Aydın)

The comparison of temperature and precipitation values in Aydın province during the soybean growing period of 2020 and 2021, when the experiment was conducted, with the long-term average values is given in Figure 1. It is seen that the average monthly precipitation amounts in both trial years in April-September, which is the soybean growing period, are well below the long-term rainfall average. In general, when temperature comparisons are made on a yearly basis, temperature averages have been close to each other except for the high daily average temperatures experienced in different months.

It was observed that daily high temperature averages during the vegetative periods in both trial years caused significant differences. Although monthly temperature values during the phenological development periods were higher in the second year compared to the first year, daily temperature averages did not exceed 35^0C in the second year of the experiment. In 2020, temperatures hovered around 25^0C on sowing dates and temperatures hovered around 35^0C until the flowering period. In the 2021 experimental year, it was determined that the daily high temperature averages were above 35^0C throughout the vegetation period from the date of sowing.

Figure 2. General images of the soybean trial

In the experiment, controlled irrigation applications were carried out by making calculations for four different water treatments (Water scarcity: 25%, 50%, and Irrigated: 75% and 100%). The amounts of irrigation water to be applied to the plots were calculated with different coefficients according to the evaporation amounts obtained from the Class A evaporation pan (US Weather Bureau Class A Pan) (Kanber, 1984), and applications were made regularly every seven days with drip irrigation system according to the following equation.

I=Kpc.Ep.P.A [I:amount of irrigation to be applied to the plot, Kpc:evaporation contanier coefficient 100%, Ep:cumulative evaporation amount(mm), P:plant cover(%), A:plot area(m^2)]

In both years of the experiment, controlled irrigation was started when the first flowers (BBCH 61) appeared and controlled irrigation was gradually terminated according to the ripening periods. During the growth and development period in 2020, a total of 858.77 mm irrigation water was given to soybean in 100% water application, 644.05 mm in 75% water application, 399.37 mm in 50% water application and 199.67 mm in 25% water application. In the 2021 experimental year, 816.98 mm in 100% water application, 612.73 mm in 75% water application, 376.99 mm in 50% water application and 169.99 mm in 25% water application.

Figure 3. Analysis images of soybean trial

In this study, protein rate (%), ash rate (%), fiber rate (%) and oil rate (%) of soybean seeds were analyzed by NIRS (Near Infrared Reflectance Spectroscopy). The analysis of variance of the data obtained in both years of the field trials were evaluated in TARIST package program in accordance with the randomized block split plots experimental design. In the comparison of the means, the EKÖF comparison test was used (Açıkgöz et al., 1994).

RESULTS AND DISCUSSION

In this study, the effects of different restricted water applications on some quality characteristics of soybean varieties were investigated in order to ensure the continuity of soybean production in sustainable agriculture by taking into account the importance of climate change. According to the results of the analysis of variance, limited irrigation practices were found to be statistically significant at 0.01 level ($p \leq 0.01$) on protein, oil and ash ratios which are quality parameters (Table 1). The factors applied in the experiment did not make a statistical difference on the fiber ratio. In terms of variety factor, only the protein ratio was found to be statistically significant at 0.05 level ($p \leq 0.05$). In the experiment, Year*Water interaction was found statistically significant at 0.01 level ($p \leq 0.01$) in protein, fat and ash ratio, while Variety*Water interaction was found significant only in protein ratio at 0.05 level ($p \leq 0.05$).

Protein Ratio (%)

Limited irrigation conditions lead to water deficit in tissues and hinder various physiological processes such as photosynthesis, transpiration and stomatal conductance. This affects plant growth and development as well as seed yield and grain composition (Staniak et al., 2023). Under drought conditions, soybean seed protein content increases while crude oil content decreases and these ratios change linearly with increasing stress (Sobko et al., 2020). Ravelambola (2022) reported that drought can affect protein structure as well as protein synthesis and that the transfer of amino acids to the leaf is hindered by hydration of the proteins that are decomposed. In addition, in the study investigating the changes of limited irrigation and drought on protein, oil ratio and fatty acid content in soybean seeds, it was reported that 25% water application and drought increased the protein ratio by 4.4% and decreased the oil ratio by 2.9%.

Table 1. Mean values of soybean quality parameters for the combined trial years

Experimental Factor	Protein Ratio (%)	Oil Ratio (%)	Ash Ratio (%)	Fiber Ratio (%)
Mean Year (A)				
2020	35,62a	19,24	4,60a	5,10
2021	32,24b	19,87	4,22ab	4,82
Mean Variety (B)				
Cinsoy	34,41a	19,62	4,45	4,90
Altınay	33,44b	19,49	4,37	5,03
Mean Irrigation (C)				
%25	35,09a	18,29b	4,65a	4,94
%50	33,98ab	19,60ab	4,41ab	5,00
%75	33,91ab	19,60ab	4,35ab	4,85
%100	32,73b	20,74a	4,24b	5,03
LSD Values				
A	0,68**	ns	0,32**	ns
B	0,48**	ns	ns	ns
C	0,68**	0,67**	0,13**	ns
A*B	ns	ns	ns	ns
A*C	0,96**	0,95**	0,18**	ns
B*C	0,96*	ns	ns	ns
A*B*C	ns	ns	ns	ns

ns: non- significant; *: significant at 0.05 level; **: significant at 0.01level

In Table 1, year, water and variety factors were found to be statistically significant at p≤0.01 level (Table 1). While the average protein ratio was 35.62% in 2020, it was 32.24% in 2021. Among the average limited water treatments, the highest protein value was obtained in 25% water treatment (35.09%). Among the variety averages, Cinsoy variety (34.41%) stands out. Poeta vd. (2016) reported that the increase in protein content was positively and linearly correlated with water stress condition and negatively correlated with oil content. Unal and Onder (2008) obtained grain protein content as 34.40-38.61%, Devi (2013) obtained 34.40-36.71%, Cevheri and Yilmaz (2018) obtained 39.31-41.74% protein content in their study. In our study, the fact that the highest protein ratio was obtained in the 25% water restricted treatment and the highest oil ratio was obtained in the 100% water treatment shows that the data in the experiment are largely in agreement with important studies.

Oil Ratio (%)

Alsajri et al. (2020) reported that the oil and protein content of the seed is closely related to environmental factors, especially with the increase in temperature during the growth period, the oil content increases while the protein content decreases. In addition, Specht et al. (2001) reported that oil content increases and protein content decreases when soybean plants are subjected to water stress. High daily temperatures decrease oil content and increase protein content in soybean seeds (Gibson and Mullen, 1996; Dornbos, 2020). Borowski and Michalek (2014) reported that oil content decreased (13.8%) and grain protein content increased (6.2%) in soybean varieties with limited irrigation under drought conditions. Water factor ($p \leq 0.01$) and Year*Water interaction ($p \leq 0.01$) were found to be statistically significant on oil ratio (Table 1). There were no significant differences between the years of the experiment. The average values of oil in grain were 19.24% in 2020 and 19.87% in 2021. The treatments did not cause a statistical difference on variety averages. The average oil ratios of the varieties were 19.62% and 19.49% for Cinsoy and Altınay varieties, respectively. There was a statistically significant difference on the oil ratios of soybean in water restricted treatments. The average oil ratios in irrigation treatments were determined as 20.74% in 100% water application and 18.29% in 25% water application. When the previous studies on grain oil ratios were examined; Akınerdem et al. (2014) obtained the crude oil ratio value between 19.15-19.89%, Ay (2012) between 16.66-19.30%, Kılınç and Arıoğlu (2018) reported it as 18.65%, and Gaweda et al. (2017) reported that it varied between 7.20-18.60%. Poeta et al. (2016) reported that fatty acid components did not change proportionally, but high temperature and limited irrigation decreased polyunsaturated fatty acid ratios. The oil values obtained in our study were found to be compatible with previous studies (18.29-20.74%) and the oil contents were not affected by all the treatments in our study.

Ash Ratio (%)

In Table 1, the effects of years, water treatments and Year*Water interactions on ash ratio of grain were found significant at 0.01 ($p \leq 0.01$) level. There was no statistical difference between the varieties. In terms of limited water treatments, the highest ash content was obtained in 25% water treatment (4.65%). In 2020, the ash ratio was 4.60% and 4.22% in 2021. While the average ash rate was 4.45% in Cinsoy variety, it was 4.37% in Altınay variety. Sıulapwa and Mwambungu (2014) examined the changes in grain content of soybean seeds by applying different treatments and reported that the ash rate in grain varied between 4.4 and 7.3%. The averages of ash values obtained in our study were generally consistent with the literature.

Fiber Ratio (%)

In Table 1, it is seen that the factors applied in the experiment, years, water treatments and variety interactions did not make a statistical difference on grain fiber ratio. Among the limited water treatments, the fiber ratio was 4.94% in 25% water treatment and 5.00% in 100% water treatment. In 2020, the fiber rate was 5.10% and in 2021 it was 4.82%. While the average fiber ratio was 4.90% in Cinsoy variety, it was obtained as 5.03% in Altınay variety. Sıulapwa and Mwambungu (2014) examined the changes in grain content by applying different treatments on

soybean seeds and reported that the fiber ratio in grain varied between 5.4 and 7.5%. The averages of fiber values obtained in our study were generally below the literature values.

CONCLUSION

One of the most important issues in agricultural production is to determine the rate at which the applications made during plant growth and development periods affect yield and quality parameters. Limited irrigation is an important production alternative in reducing the water requirement in agricultural production, increasing the water use efficiency of plants and utilizing non-irrigated lands. It is important to investigate the responses of plants to restricted irrigation conditions under different climatic and soil conditions. In this study, the effects of restricted irrigation practices on soybean grain quality in soybean, which is one of the important crops for sustainable agriculture, were investigated. According to the results obtained from the experiment, it has important results in revealing the effects of irrigation practices and their interactions with high temperature values on grain quality potentials in soybean varieties. It was observed that limited water applications and soybean varieties had significant effects on the average values obtained. The fact that the highest protein content was obtained in the 25% limited water treatment and the highest oil content was obtained in the 100% full water treatment shows that the data in the experiment are largely in agreement with important studies. These effects clearly show that water scarcity conditions not only affect yield and plant growth in soybean, but also cause significant changes in grain quality. In general, it was concluded that soybean grain quality traits are dependent on environmental and genetic factors, but the results obtained should be supported by more comprehensive studies in the future.

ABSTRACT

Smart agricultural applications have initiated a significant transformation process towards increasing the efficiency, sustainability and quality level of agricultural production. In this transformation, unmanned ground vehicles have the potential to autonomously perform many agricultural activities such as soil analysis, plant monitoring, planting, spraying and harvesting. This study aims to examine the application areas, technological requirements and technical difficulties encountered in agricultural production of unmanned ground vehicles in Turkey and internationally. Open access academic publications published in recent years were examined with a comprehensive literature review method. Within the scope of the reviewed literature, the effectiveness of unmanned ground vehicles in tasks such as mission planning, Global Positioning System-based navigation, artificial intelligence-supported image processing, multi-sensor integration, crop harvesting, weed control, material transportation and environmental data collection were evaluated. The findings showed that unmanned ground vehicles reduce the dependence on manpower in agricultural activities, optimize resource use, make production processes more planned and measurable and feed decision support systems by continuously collecting data. On the other hand, technical limitations such as adaptation of systems to field conditions, battery type and life, global positioning system and sensor accuracy are still waiting to be solved. In addition, field tests of many prototype systems remain limited, they do not provide universal ease of use, and low-cost production models cannot be developed for commercial use. Recent studies have highlighted new battery technologies such as lithium iron phosphate, artificial intelligence-supported image processing, multi-sensor fusion, modular structure and multi-functionality, real-time kinematic positioning using Global Positioning Systems, and new approaches such as end-to-end data processing. For these technologies to become widespread in Turkey, it is of great importance to encourage university-industry collaborations, support local research and development and prototyping studies, conduct academic studies supported by field applications, and increase digital education content for farmers.

AKILLI TARIMDA İNSANSIZ KARA ARAÇLARI: UYGULAMALAR, ZORLUKLAR VE ÇÖZÜMLER

ÖZET

Akıllı tarım uygulamaları, tarımsal üretimin verimliliğini, sürdürülebilirliğini ve kalite düzeyini artırma yönünde önemli bir dönüşüm süreci başlatmıştır. Bu dönüşümde insansız kara araçları, toprak analizi, bitki takibi, ekim, ilaçlama ve hasat gibi birçok tarımsal faaliyeti otonom olarak gerçekleştirme potansiyeline sahiptir. Bu çalışma, insansız kara araçlarının Türkiye'de ve uluslararası alanda tarımsal üretimdeki uygulama alanlarını, teknolojik gereksinimlerini ve karşılaşılan teknik zorlukları incelemeyi amaçlamaktadır. Son yıllarda yayımlanmış açık erişimli akademik yayınlar kapsamlı bir literatür taraması yöntemiyle incelenmiştir. İncelenen literatür kapsamında insansız kara araçlarının görev planlama, Küresel Konumlama Sistemleri tabanlı navigasyon, yapay zekâ destekli görüntü işleme, çoklu sensör entegrasyonu, ürün hasadı, yabancı otla mücadele, malzeme taşıma ve çevresel veri toplama gibi görevlerdeki etkinliği değerlendirilmiştir. Bulgular, insansız kara araçlarının tarımsal faaliyetlerde insan gücüne olan bağımlılığı azalttığını, kaynak kullanımını optimize ettiğini, üretim süreçlerini daha planlı ve ölçülebilir hale getirdiğini ve sürekli veri toplayarak karar destek sistemleri beslediğini göstermiştir. Öte yandan, sistemlerin arazi koşullarına adaptasyonu, batarya tipi ve ömrü, küresel konumlandırma sistemi ve sensör doğruluğu gibi teknik sınırlılıklar hâlâ çözülmeyi beklemektedir. Ayrıca, birçok prototip sistemin tarla testleri sınırlı kalmakta, evrensel bir kullanım kolaylığı sunamamakta ve ticari kullanıma geçişte düşük maliyetli üretim modelleri geliştirilememektedir. Son dönem çalışmalarda lityum demir fosfat gibi yeni batarya teknolojileri, yapay zekâ destekli görüntü işleme, çoklu sensör füzyonu, modüler yapı ile çoklu işlevsellik, Küresel Konumlama Sistemleri kullanarak gerçek zamanlı kinematik konumlandırma ve uçtan uca veri işleme gibi yeni yaklaşımların öne çıktığı görülmektedir. Türkiye'de bu teknolojilerin yaygınlaşması için üniversite-sanayi iş birliklerinin teşvik edilmesi, yerli araştırma-geliştirme ve prototipleme çalışmalarının desteklenmesi, saha uygulamalarıyla desteklenen akademik çalışmaların yapılması ve çiftçilere yönelik dijital eğitim içeriklerinin artırılması büyük önem taşımaktadır.

Anahtar Kelimeler: insansız kara aracı, akıllı tarım, tarımsal otomasyon, tarım robotları, otonom sistemler

1. GİRİŞ

Akıllı tarım, tarımsal verimliliği artırmak, maliyetleri azaltmak ve çevresel sürdürülebilirliği sağlamak amacıyla bilgi teknolojilerinin tarım süreçlerine entegre edilmesidir. Bu yaklaşım, tarla ve ürün yönetiminde doğru zamanda doğru müdahalelerin yapılmasını sağlamaktadır (Özlüoymak, 2024). Son yıllarda sensörler ve kameralar gibi donanımların makine öğrenmesiyle uyumlu hale gelmesi, tarımda gerçek zamanlı veri toplama ve karar destek sistemlerinin kullanımını kolaylaştırmaktadır (Özgüven, Eminoğlu, & Çolak, 2024). Bu dijital dönüşümün bir parçası olarak İnsansız Kara Araçları (İKA) tarımsal üretimde giderek önemli bir rol oynamaya başlamıştır. Tarımsal mekanizasyondan otonom sistemlere geçiş, Tarım 4.0 kavramı ile ivme kazanmıştır. Tarım 4.0 ile beraber bilgisayar kontrollü makineler, sensör teknolojileriyle entegre ekipmanlar ve otonom araçlar gibi ortaya çıkan birçok yenilik tarım sektörünün geleceğini şekillendirmektedir (Özlüoymak, 2024). Günümüzde sürücüsüz traktörler, otonom tarım makineleri ve tarım robotları gibi ticari ürünler tarımsal üretim süreçlerinde kullanılmak üzere piyasaya sunulmaya başlamıştır (Özgüven, Eminoğlu, & Çolak, 2024). Örneğin, büyük üreticiler otonom olarak operasyon yapan traktörlerin prototiplerini tanıtmıştır.

Özel amaçlı tarım robotlar meyve toplama, yabancı ot temizleme gibi işlemleri gerçekleştirebilir duruma gelmiştir. Bu gelişmeler, tarımda insan gücüne olan bağımlılığı azaltarak verimliliği yükseltme potansiyeli olduğunu göstermektedir (Gossett, 2025).

İKA'lar, entegre edilen sensörler ve yapay zekâ algoritmaları ile çevresini algılayıp otonom karar verebilen sistemlerdir. Akıllı tarım kapsamında İKA'lar, sahada önceden belirlenmiş rotalarda hareket ederek veya gerçek zamanlı çeşitli görevleri yerine getirebilmektedir. Tarımsal insansız kara araçları, genellikle elektrikle çalışan ve tarımsal görevleri otonom şekilde yerine getirebilen robotlardır. Bu araçlar, çeşitli kontrol sistemleri, konumlandırma, ölçüm birimleri ve bazı durumlarda robotik kollar gibi çeşitli sensör ve donanımlarla donatılmıştır. Bu sayede çevresel verileri toplamakta, işler ve fiziksel müdahale gerektiren işlemleri insan kontrolü olmadan gerçekleştirmektedir (Agelli, Caglayan, 2024).

Bu bildiride, akıllı tarımda İKA kullanımının mevcut durumunu kapsamlı biçimde ele alınmaktadır. İKA Uygulamaları bölümünde toprak analizi, bitki sağlığı izleme, ekim, ilaçlama ve hasat gibi görevlerde bu araçların nasıl kullanıldığı örneklerle açıklanacaktır. Teknolojik gereksinimler kısmında bir İKA'nın etkin çalışması için gereken Küresel Navigasyon Uydu Sistemleri (GNSS) tabanlı navigasyon, yapay zekâ destekli görüntü işleme, çoklu sensör entegrasyonu ve batarya sistemleri incelenecektir. Karşılaşılan Zorluklar başlığı altında arazi şartlarına uyum, konumlandırma hassasiyeti, sensör kalibrasyonu, maliyet ve test sorunları ele alınacaktır. Son olarak Mevcut Çözümler ve Öneriler kısmında, literatürde önerilen yeni batarya teknolojileri, Yüksek hassasiyetli konumlama, modüler tasarım yaklaşımları, yapay zekâ algoritmaları ile performans iyileştirmeleri ve Türkiye'de üniversite-sanayi iş birliği gibi konular tartışılarak geleceğe yönelik öneriler sunulacaktır.

2. İKA UYGULAMALARI

Toprak Analizi ve Örnekleme

İnsansız kara araçları, tarla üzerinde önceden tanımlanmış konumlara otomatik olarak yönlenerek, sondaj mekanizması aracılığıyla fiziksel toprak örnekleri alabilmektedir. Aracın üzerinde bulunan sensörler sayesinde nem, sıcaklık ve elektriksel iletkenlik gibi temel toprak verilerini eş zamanlı olarak ölçmektedir. Böylece hem fiziksel örnekleme hem de dijital sensör verisi toplanarak tarımsal analiz için zengin bir veri seti oluşturulmaktadır (Kitić, 2022). Bu sistemler sayesinde çiftçiler, gübreleme uygulamalarını daha etkin şekilde yaparak toprak verimini artırmaktadır (Fountas vd., 2020).

Bitki Sağlığı İzleme ve Ürün Takibi

Bitkilerin sağlık durumlarını sürekli izlemek, ürün kayıplarını önlemede önemlidir. İnsansız kara araçlarının üzerine entegre edilen kamera sistemleri ile bitkilerin renk değişimleri ve yapıları yüksek çözünürlükte izlenmektedir. Derin öğrenme algoritmaları sayesinde yaprak, gövde ve meyve gibi bitki organlarında ortaya çıkan hastalık belirtileri ve zararlı etkileri erken tespit etmekte, böylece müdahale zamanında ve etkili şekilde yapılmaktadır (Çetin & Aydın, 2024; Bajraktari & Toylan, 2025). Bu yaklaşım, özellikle geniş tarım arazilerinde insan gözleminin yetersiz kaldığı durumlarda bitki sağlığı izlemesine olanak sağlamaktadır.

Ekim ve Dikim

Ekim ve dikim işlemlerinde insansız kara araçları, konumlandırma ve yönlendirme sistemleri ile tohumları belirlenen sıra ve aralıklarla toprağa yerleştirmektedir. Örneğin, FarmDroid isimli proje, tohumun konumunu hafızaya alarak ileride yapılabilecek işlemlere (örneğin yabancı ot temizliği) zemin hazırlarken, aynı zamanda tohumun ideal derinlik ve aralıkta ekilmesini sağlayarak son ürünün homojenliğini sağlamaktadır (Gossett, 2025).

İlaçlama ve Hassas Püskürtme

Görüntü işleme algoritmalarıyla insansız kara araçları, tarımsal uygulamalarda hassasiyet kazandırarak çevresel etkilerin azaltılmasını sağlamaktadır. Bu sistemler, tüm alana kimyasal uygulamak yerine yalnızca zararlı otların tespit edildiği bölgelere ilaç sıkarak gereksiz ilaç kullanımının önüne geçmektedir. İKA üzerinde bulunan görüntü işleme sistemi sayesinde zararlı otlar yüksek doğrulukla tanımlanmakta, hedefli noktalara otomatik olarak ilaç püskürtülmektedir. Bu sayede hem kimyasal tüketimi azaltılmakta hem de ekonomik verimlilik sağlanmaktadır. Böyle uygulama İKA teknolojisinin sadece mekanik hareket kabiliyetiyle değil, yazılım ve algılama sistemleriyle de modern tarımda önemli bir etkiye sahip olduğunu göstermektedir (Akdan vd., 2023).

Hasat ve Ürün Toplama

Hasat ve ürün toplama, tarımın en fazla emek gerektiren süreçlerinden biri olup, bu alanda otomasyon sistemlerinin kullanımı giderek yaygınlaşmaktadır. Özellikle meyve ve sebze gibi hassas ürünlerin toplanmasında kullanılan insansız kara araçları ve robotik sistemler, insan iş gücüne olan ihtiyacı azaltmakta ve ürün hasadını daha hızlı, verimli ve düzenli hâle getirmektedir. Kamera ve robotik kollarla donatılmış bu sistemler, meyve olgunluğunu tespit edebilen sensörlerle, ürüne zarar vermeden hasat yapabilmektedir (Gossett, 2025).

3. TEKNOLOJİK GEREKSİNİMLER

Konumlandırma Sistemleri

İKA'ların arazide istenen şekilde hareket edebilmesi için hassas konumlandırma sistemlerine ihtiyaçları vardır. İstenen hassasiyete ulaşılması için RTK-GNSS teknolojileri kullanılır. GNSS (Küresel Konumlama Uydu Sistemleri), uydular aracılığıyla dünya üzerindeki konumları kesin olarak belirleyen sistemlerdir. RTK (Gerçek Zamanlı Kinematik Doğrulama) ise GNSS uydu sinyallerini yerel bir baz istasyonu referansı kullanarak hassas şekilde sağlayan bir sistemdir (Fredeluces, Ozeki, Kubo & El-Mowafy, 2024). İKA'ların üzerine yerleştirilen GPS veya GNSS sensörleri aracın anlık konumunu görebilmesini ve görev güzergahını takip etmesini sağlamaktadır. Yer istasyonundaki ikinci bir sensör, araç ile sürekli iletişim kurar ve gerçek zamanlı kinematik doğrulama yaparak aracın konum hassasiyetini santimetre düzeyine indirmektedir. GPS sinyali kesildiğinde ise atalet ölçüm birimi (IMU) ve pusula gibi yardımcı sensörler ile konumlandırma doğruluğu korunmalıdır (Özlüoymak, 2024).

Yapay Zekâ Destekli Görüntü İşleme

İKA'ların çevrelerini algılayabilmeleri için üzerlerinde çeşitli kameralar bulunmaktadır. Bu kameralar tarafından elde edilen görüntüler, derin öğrenme algoritmalarıyla analiz edilerek bitki sağlığı, zararlı ot varlığı ve çevresel engelleri tespit etmektedir. Özellikle YOLO gibi nesne tanıma modelleri, görüntüleri anında işleyerek aracın anlık kararlar verebilmesini sağlamaktadır. Kameralar ve sensörler, değişken ışık ve hava koşullarına karşı dayanıklı hâle getirilmelidir (Agelli & Caglayan, 2024).

Çoklu Sensör Entegrasyonu

İKA'ların üzerinde birçok sensör bulunmaktadır. Konumlandırma, ivmeölçer, jiroskop, LiDAR (ışık algılama ve mesafe ölçüm sistemi), radar, ultrasonik ve kamera gibi farklı sensörler bir arada kullanılmaktadır. Bu çoklu sensör sistemi, farklı verileri birleştirilerek güvenilir bir karar mekanizması oluşturmasını sağlamaktadır. Örneğin, konumlandırma sinyali kesildiğinde ivme, jiroskop ve LiDAR verileri ile aracın konumu tahmin etmektedir. Sensör füzyonu, çevresel algılamanın yanı sıra haritalama, engel tanıma ve yön bulma gibi işlevleri de desteklemektedir (Ušinskis vd., 2025). Ancak bu sistemlerin verimli çalışabilmesi için düzenli kalibrasyon ve çevresel dayanıklılık gereklidir.

Batarya ve Enerji Sistemleri

İKA'lar çoğunlukla elektrik depolayan ve elektrikli motorlarla çalışan sistemlerdir. Bu nedenle enerji yönetimi önemli bir konudur. Genellikle Lityum iyon veya Lityum Demir Fosfat (LiFePO4) tipi bataryalar tercih edilmektedir. Ağır yük taşıyan İKA'larda dizel motor kullanımı da yaygındır, fakat bu İKA'lar daha çok askeri amaçlarda kullanılmaktadır. Arazi koşullarında enerji tüketimini azaltmak için sistemler verimli çalışacak şekilde yapılandırılmalı, gerektiğinde uyku moduna geçebilmeli ve güneş panelleri gibi destekleyici sistemlerle çalışabilmelidir. Enerji sistemi arazi koşullarına, hava durumuna ve iş yoğunluğuna göre hesaplanmalı ve tasarlanmalıdır.

4. KARŞILAŞILAN ZORLUKLAR

İnsansız kara araçlarının tarımda yaygınlaşmasında çözülmesi gereken zorluklar bulunmaktadır. Bu zorluklar, sistemin araziye uyumu, konumlandırma doğruluğu, sensörlerin güvenilirliği, enerji kısıtları, maliyet faktörü ve kullanıcı deneyiminin sınırlılığı gibi alanlarda yoğunlaşmaktadır.

Zorlu Arazi Koşullarına Uyum

Tarım arazileri çoğu zaman düzensiz, eğimli, çamurlu veya tozludur. Bu tür zemin koşullarında İKA'ların operasyonu için çekiş gücü, süspansiyon sistemleri ve yerden yüksekliği önemli faktörlerdir. Arazi yapısına uygun olarak tasarlanmayan sistemlerde aracın patinaj yapma veya devrilme riski artmaktadır (Gossett, 2025). Bu nedenle İKA'ların mekanik tasarımlarının, özellikle bağımsız süspansiyon sistemlerinin ve tahrik düzeneklerinin engebeli araziye uyum sağlayacak şekilde modüler şasi yapısı ile geliştirilmesi gereklidir (Grimstad & From, 2017).

Konumlandırma Hassasiyeti ve Sürekliliği

İKA'ların verimli çalışması için yüksek doğrulukta konum verisi gereklidir. Ancak bitki örtüsü, atmosferik koşullar veya fiziksel engeller konumlandırma sinyallerini zayıflatmaktadır. RTK-GNSS sistemleri iki noktadan referans aldığı için bu sorunu kısmen çözse de sinyal kaybı yaşanan anlarda konum doğruluğu düşmektedir (Fredeluces vd., 2024). Bu kayıplar sırasında ivmeölçer, jiroskop, LiDAR ve diğer sensörlerin desteği ile görev istikametinin korunması gerekmektedir (Saleem vd., 2015).

Sensör Kalibrasyonu ve Güvenilirliği

Tarımda kullanılan sensörler, toz, nem, çamur ve darbe gibi dış etkenlere maruz kalmaktadır. Bu koşullar sensör ölçümlerinde sapmalara veya veri kaybına yol açmaktadır. Çoklu sensör sistemlerinde her bileşenin düzenli kalibrasyonu gereklidir. Bu, özellikle kamera ile püskürtme memesi gibi entegre sistemlerde hassasiyet açısından büyük önem taşımaktadır (Ušinskis vd., 2025). Sensör tiplerine ve ortam koşullarına bağlı olarak günlük veya haftalık olarak temizlenmelidir. Hassas sensörlerin temizlikleri izopropil alkol ve yumuşak fırça ile yapılmalı, kamera ve lidar gibi objektifi olan sensörler ise çizilmeye neden olmayacak mikrofiber bezler ile temizlenmelidir (Zhou vd., 2023). Kullanıcıların temizlik konusunda teknik bilgi eksikliği, uygun temizlik malzemelerine erişimin zorluğu ve rutin temizliğin aksatılması aracın operasyonuna engel olmaktadır.

Enerji ve Batarya Kısıtları

Batarya ile çalışan İKA'ların sınırlı çalışma süresi, büyük alanlarda kesintisiz operasyonu zorlaştırmaktadır. Benzinli veya dizel araçların aksine, bataryalı araçların operasyon süresi 45 dakika ile 2 saat arasındadır. Gün boyu sürecek bir görevde defalarca kez şarj edilmesi gerekmektedir. Güneş enerjisi desteği ve hızlı batarya değiştirme sistemleri bu soruna çözüm olabilir fakat bu sistemler ağırlığı ve karmaşıklığı artırmaktadır. Batarya performansı, yüksek sıcaklık veya aşırı soğuk gibi çevresel koşullardan doğrudan etkilenmekte olup, operasyon süresini belirgin şekilde azaltmaktadır (Loukatos vd., 2024).

Yüksek Maliyet

Sensör, motor, batarya ve kontrol sistemlerinin maliyetleri, İKA'ların seri üretime geçmemesi nedeniyle oldukça yüksektir. Orta ve küçük ölçekteki çiftçiler için bu yatırımı karşılamak zordur. Bu durum, teknolojinin yaygınlaşmasını yavaşlatmaktadır (Özlüoymak,2024).

Saha Testlerinin Sınırlılığı

Birçok sistem sadece laboratuvar ortamında test edilmekte, tarla koşullarında uzun soluklu kullanım, güvenilirlik ve bakım süreçlerine dair yeterli veri bulunmamaktadır. Bu durum, üretici ve kullanıcılar arasında güven problemi yaratmaktadır.

5. MEVCUT ÇÖZÜMLER VE ÖNERİLER

Gelişmiş Batarya Teknolojileri

LiFePO4 gibi yeni nesil batarya teknolojileri, yüksek çevrim ömrü ve ısıl kararlılığı ile tarımsal uygulamalarda güvenli ve uzun süreli kullanım sağlamaktadır. Ayrıca hızlı şarj desteği ve değiştirilebilir modüler sistemler, operasyon süresini artırmak için etkili çözümler sunmaktadır (Loukatos vd., 2024). LiFePO4 bataryalar, kurşun-asit akülere göre çok daha hafiftir ve daha az yer kaplamaktadır. Lityum iyon bataryalara kıyasla daha uzun ömürlüdür, daha hızlı şarj olur ve yanma-patlama riski yoktur. Ayrıca diğer bataryaların aksine 0 ila 45 °C arasındaki hava sıcaklıklarında güvenli şekilde çalışabilmektedir (Loukatos vd., 2024). Bazı İKA modellerinde, batarya bittiğinde hızlı şekilde değiştirilebilen modüler batarya sistemleri uygulanarak duraksız görev yürütülmesi amaçlanmaktadır.

RTK-GNSS Tabanlı Konumlama

RTK destekli GNSS sistemleri ile santimetre düzeyinde konum hassasiyeti sağlamaktadır. NTRIP ağları ve mobil referans istasyonları, açık alanlarda sinyal gücünü artırarak konum doğruluğunu iyileştirmektedir (Fredeluces vd., 2024). GNSS kayıplarını azaltmak amacıyla jiroskop, ivmeeölçer, pusula, LiDAR ve kamera gibi sensörlerin verileri entegre edilerek konum takibi kesintisiz hâle getirilmektedir (Saleem vd., 2015).

Modüler Yapı

Tarımsal İKA'lar için geliştirilen modüler sistemler, farklı görevler için kolayca değiştirilebilen şasi ve sensörler ile esneklik sağlamaktadır (Kemeshi vd., 2025; Gadekar vd., 2023). Örneğin Thorvald II projesindeki İKA, tek bir hareket sistemi üstünde değiştirilebilir üst gövdeleri ile seralarda, açık tarlalarda ve bağlarda uyarlanabilir şekilde değiştirilebilmektedir (Grimstad & From, 2017).

Yapay Zekâ Tabanlı Algoritmalar

İKA'ların üzerilerindeki bilgisayarlarda YOLO, R-CNN, ByteTrack gibi yapay zeka tabanlı algoritmalar çalıştırılarak, gerçek zamanlı zararlı ot ve hastalık tespiti yapılmaktadır. Pekiştirmeli öğrenme ve yol planlama algoritmaları ile İKA'ların çevresel koşullara uyumu ve görevlerindeki başarı oranları artırılmaktadır (Bajraktari & Toylan, 2025). Potansiyel alan ve görsel sıra takibi gibi algoritmalar ile İKA'ların karmaşık bahçelerde, ağaç sıraları arasında ya da dar geçitlerde güvenle gezinmeleri sağlanmaktadır (Ye vd., 2024; Zhang vd., 2023; Shi vd., 2023).

Üniversite-Sanayi İş Birlikleri

TÜBİTAK ve Teknofest gibi oluşumlarla desteklenen Ar-Ge projeleri, yerli üretimin artmasına ve sahada test edilen prototiplerin geliştirilebilmesine olanak sağlamaktadır (Özgüven, Eminoğlu & Çolak, 2024).

Standartlar ve Eğitim

Çiftçilere yönelik dijital eğitimler, uzaktan kontrol ve güvenlik üzerine kılavuzlar hazırlanmalıdır. Sanal çit, acil durdurma sistemleri gibi güvenlik önlemlerinin standartları belirlenmelidir (Yang vd., 2023). Ayrıca sahadan elde edilen verilerin açık kaynak olarak paylaşılması hem akademik çalışmalar hem de endüstriyel Ar-Ge açısından veri havuzu oluşturulmasına katkı sağlayacaktır.

6. SONUÇ

İnsansız kara araçları, tarımda otomasyonun önemli aktörlerinden biri hâline gelmiş, çeşitli uygulama alanlarında somut faydalar sağlamaya başlamıştır. Bu çalışmada elde edilen bulgular, İKA'ların tarla operasyonlarında insan gücüne olan bağımlılığı azalttığını, veri temelli karar alma süreçlerini desteklediğini ve üretim verimliliğini artırdığını göstermektedir. Toprak analizi, bitki sağlığı takibi, hassas ekim, ilaçlama ve hasat gibi temel işlemlerde kullanılan İKA'lar, zaman ve kaynak kullanımı verimli, düzenli ve tekrarlanabilir hale getirmiştir. Türkiye üzerinde değerlendirildiğinde, tarımda teknolojik dönüşümün hızlandırılması için İKA'ların daha erişilebilir hâle gelmesi, yerli üretimin teşvik edilmesi ve saha odaklı araştırmalara ağırlık verilmesi gerekmektedir. Özellikle genç nüfusa yönelik teknoloji tabanlı tarım modelleri, uzun vadede bu alana ilginin artmasını, bahsi geçen teknolojilerin geliştirilmesini, en önemlisi de yerli olarak prototiplerin üretilmesini sağlayacaktır.

Çalışmada vurgulanan teknik zorluklar, hâlihazırda İKA sistemlerinin yaygınlaşmasının önünde önemli engeller oluşturmaktadır. Ancak batarya teknolojilerindeki gelişmeler, hassas konumlama çözümleri, modüler sistemler ve yapay zekâ algoritmalarının sahaya entegre edilmesi gibi yenilikçi yaklaşımlar, bu engellerin aşılmasına yönelik çözümler sunmaktadır. Gelecekte, akıllı tarım sistemlerinde İKA'lar, yalnızca büyük ölçekli işletmelere değil, küçük ve orta ölçekli çiftçilere de hitap edeceği düşünülmektedir. Bunun için devlet destekli teşvik modelleri, kiralama sistemleri ve bölgesel eğitim programları gibi çok yönlü stratejiler gerekmektedir.

Bu bildiride aktarılan içerik ve bulgular, İKA teknolojilerinin tarımsal üretimdeki rolünü daha iyi anlamaya katkı sağlamayı ve gelecekteki araştırmalara yön vermeyi amaçlamaktadır.

ABSTRACT

From past to present, products derived from beekeeping activities such as honey, pollen, propolis, royal jelly, and bee venom have been utilized as fundamental food sources in healthy diets due to their content of primary and secondary nutrients. In addition to promoting general health, these products have been increasingly used in apitherapy practices for the supportive treatment of various diseases among the public. Scientific studies have demonstrated that these bee products possess a range of biological effects, including antibacterial, antiviral, anticancer, antioxidant, and antirheumatic properties. In recent years, they have also attracted growing interest in the field of animal nutrition. Following the prohibition of antibiotic use as feed additives in animal husbandry, there has been a rising demand for natural alternatives. Scientific research on propolis and pollen has shown that these products can positively influence animal performance by enhancing feed intake, body weight gain, and feed conversion efficiency. With their growth-promoting characteristics, bee products are considered promising natural alternatives for use in animal feeding practices.

This review aims to compile studies investigating the effects of dietary supplementation with bee pollen and propolis on sheep performance parameters, such as body weight gain, feed efficiency, and reproductive traits, within the framework of sustainable sheep farming. The objective is to provide a valuable resource for researchers and producers interested in this area.

Keywords: Sheep, lamb, animalnutrition, beepollen, propolis,

SÜRDÜRÜLEBİLİR KOYUN BESLEMEDE ALTERNATİF YEM KATKI MADDESİ OLARAK ARI POLENİ VE PROPOLİSİN ETKİLERİ

ÖZET

Geçmişten günümüze, arıcılık faaliyetleri sonucunda elde edilen bal, polen, propolis, arı sütü ve arı zehri gibi arı ürünleri, içeriklerindeki birincil ve ikincil besin maddeleri sayesinde sağlıklı beslenmede temel gıda maddeleri olarak kullanılmaktadır. Sağlıklı beslenmenin yanı sıra, bu ürünler halk arasında apiterapi uygulamaları kapsamında çeşitli hastalıkların destekleyici tedavisinde de yaygın şekilde kullanılmaktadır. Antibakteriyel, antiviral, antikanserojen, antioksidan, antiromatizmal gibi birçok biyolojik etkisi bilimsel çalışmalarla ortaya konan arı ürünleri, son yıllarda hayvan besleme alanında da ilgi görmeye başlamıştır. Hayvan beslemede antibiyotiklerin yem katkı maddesi olarak kullanımının yasaklanmasıyla birlikte, antibiyotiklere alternatif doğal ürünlerin kullanımına yönelik arayışlar artış göstermiştir. Bu bağlamda, propolis ve polen gibi arı ürünleri üzerine yapılan bilimsel araştırmalar, bu ürünlerin hayvanların yem tüketimi, canlı ağırlık artışı ve yemden yararlanma oranı gibi performans kriterleri üzerinde olumlu etkiler oluşturabileceğini göstermektedir. Arı ürünleri, gelişmeyi teşvik edici bu özellikleri sayesinde, hayvan beslemede kullanılabilecek alternatif doğal ürünler olarak değerlendirilmektedir. Bu derlemede, sürdürülebilir koyunculuk uygulamalarına katkı sağlamak amacıyla, koyunların günlük diyetine eklenen arı poleni ve propolisin canlı ağırlık kazanımı, yemden yararlanma performansı ve üreme gibi verimlilik parametreleri üzerindeki etkilerini araştıran çalışmalar derlenmiş ve bu alanda araştırma yapmayı planlayan akademisyenlere ve üreticilere yol göstermek hedeflenmiştir.

Anahtar Kelimeler: Koyun, kuzu, hayvan besleme, arı poleni, propolis,

1. GİRİŞ

Arıcılık faaliyetleri sonucunda elde edilen propolis, polen, arı sütü ve arı zehri gibi ürünler; antibakteriyel, antioksidan, antikarsinojenik, immün sistemi uyarıcı, antifungal gibi birçok biyolojik özelliğe sahip, çok yönlü doğal bileşiklerdir (Premratanachai ve Chanchao, 2014). İnsanlar binlerce yıldır bal arıları (*Apis mellifera*) tarafından üretilen ve primer ile sekonder metabolitler bakımından zengin olan bal, propolis, polen, arı ekmeği, arı zehri ve arı sütü gibi arı ürünlerini sağlıklı beslenme, bağışıklık sisteminin güçlendirilmesi ve çeşitli hastalıkların tedavisinde kullanmaktadır. Bu ürünler arasında özellikle arı poleni ve propolis ön plana çıkmaktadır. Arı poleni, çiçekli bitkilerden bal arıları tarafından çiçek nektarı ve sindirim enzimleri ile karıştırılarak toplanan doğal bir protein kaynağıdır. Polenler, çiçeklerin erkek üreme hücrelerini oluşturmakla birlikte, yüksek düzeyde besin öğeleri ve fitokimyasal bileşikler içerir ve sekonder metabolitler açısından oldukça zengindir. Arı poleninin başlıca biyolojik bileşenleri; polifenolik bileşikler, fenolik asit türevleri, hidroksisinnamik asitler ve flavonoid glikozitlerdir. Flavonoid bileşikleri ise antioksidan, antiinflamatuar, antikarsinojenik, antiaterosklerotik ve kardiyoprotektif etkiler başta olmak üzere pek çok farmakolojik ve fizyolojik fayda sağlamakta; ayrıca yaşlanma karşıtı etkiler göstererek endotel fonksiyonlarını iyileştirmektedir (Martín-Muñoz ve ark., 2010). Propolis (arı tutkalı), bal arıları (*Apis mellifera*) tarafından çeşitli ağaç ve bitki türlerinin salgılarından ve tomurcuklarından toplanan maddelerin, balmumu ve polenle karıştırılıp enzimatik değişime uğratılmasıyla elde edilen doğal bir reçineli üründür (Seven ve ark., 2010; Yücel ve ark., 2014). Propolis, kimyasal yapısında yer alan flavonoidler, fenolik asitler, yağ asitleri, steroidler, alkoller ve ketonlar gibi sekonder metabolitler ve biyoaktif bileşenler sayesinde antioksidan, antibakteriyel, antifungal, antiviral, antiinflamatuar, antiparaziter, antimetanojenik, immünmodülatör ve antikanser özellikler göstermektedir (Rufatto ve ark., 2018; da Silva ve ark., 2019). Ayrıca, propolisin antibakteriyel, antifungal, antiviral, antiparaziter, antiinflamatuar, immün stimülatör, antitümör, lokal anestezik ve antioksidan aktiviteleri bilimsel çalışmalarla da desteklenmiştir (Bogdanov, 2017; González-Búrquezz ve ark., 2017). Son yıllarda, çiftlik hayvanlarının besin madde ihtiyaçlarının karşılanması, performanslarının artırılması ve bağışıklık sistemlerinin güçlendirilmesi amacıyla antibiyotiklerin yerine, primer ve sekonder metabolitler bakımından zengin doğal ürünlerin (bal, propolis, polen, arı ekmeği, arı zehri ve arı sütü) kullanımı teşvik edilmektedir. Arı poleninin koyun, koç ve kuzuların diyetlerine yem katkı maddesi olarak eklenmesinin; döl verimi, besi performansı, yem dönüşüm oranı, canlı ağırlık artışı, sperm ve yumurta kalitesi ile sütten kesim ağırlığı gibi birçok verimlilik parametresi üzerinde olumlu etkiler sağladığı çeşitli bilimsel çalışmalarla gösterilmiştir (Gaafar, 2024; Ayman ve ark., 2024; Liang-zhong ve ark., 2023; Kaabi ve ark., 2022; Banana, 2020; Fodail ve ark., 2018).

Benzer şekilde, çiftlik hayvanlarının yemlerine propolis ilavesinin, rumen mikrobiyal fermantasyonunu dengeleyerek patojen bakteri sayısını azaltabileceği ve besin maddelerinin daha verimli kullanımını sağlayarak geviş getiren hayvanların performansını artırabileceği bilimsel araştırmalarla desteklenmiştir (Cécere ve ark., 2021; Abd-Allah ve Daghash, 2019; Yılmaz ve ark., 2004; Kupczyński ve ark., 2012; Zawadzki ve ark., 2011; De Melo Garcia ve ark., 2023).

Bu derleme çalışmasında, sürdürülebilir koyun beslemede günlük diyete arı poleni ve propolis eklenmesinin, koyunların canlı ağırlık artışı, yemden yararlanma performansı, sütten kesim ve üreme gibi verimlilik özelliklerine etkilerini inceleyen çalışmaları bilimsel bir çerçevede bir

araya getirerek, konu hakkında araştırma yapmak isteyen akademisyenlere ve üreticilere yol gösterilmesi amaçlanmıştır.

2. YÖNTEM

Bu derleme makalesinin hazırlanmasında literatür taraması amacıyla Google Scholar ve Web of Science gibi uluslararası veri tabanları kullanılmıştır. Literatür taraması, sırasıyla "Arı Poleni", "Arı Poleni ve Koyun Besleme", "Propolis" ve "Propolis ve Koyun Besleme" anahtar kelimeleri kullanılarak gerçekleştirilmiştir. Tarama sonucunda elde edilen çalışmalar arasından, makalenin kapsamı ve amacıyla uyumlu olan literatürler seçilmiş, ilgili bilgiler özetlenmiş ve bilimsel bütünlük içerisinde derlenerek bu makale tamamlanmıştır.

3. ARI POLENİ VE KİMYASAL BİLEŞİMİ

Arı poleni, çiçekli bitkiler tarafından üretilen erkek üreme hücrelerinin sporlarından oluşmakta olup, bal arıları (Apis mellifera) tarafından kendi sindirim enzim salgıları ve çiçek nektarı ile karıştırılarak toplanan doğal bir protein kaynağıdır. Polenler, arıların temel besin kaynağını oluşturmalarının yanı sıra, yüksek düzeyde besin ve fitokimyasal bileşikler içermekte ve sekonder metabolitler bakımından oldukça zengin bir yapıya sahiptir. Arı poleni; primer ve sekonder metabolitlerin pek çoğunu içermekte olup, başlıca biyolojik bileşenleri arasında polifenolik bileşikler, fenolik asit türevleri, hidroksisinnamik asitler ve flavonoid glikozitler yer almaktadır. Flavonoid bileşikleri, yaşlanma karşıtı, antioksidan, antiinflamatuar, antikarsinojenik, antiaterosklerotik ve kardiyoprotektif gibi çeşitli farmakolojik ve fizyolojik etkiler göstermekte, ayrıca endotel fonksiyonlarını desteklemektedir (Martín-Muñoz ve ark., 2010). Çiçek polenleri, arıların yaşam döngüsü içerisinde hayatta kalmalarını ve üremelerini destekleyen lipitler, yağ asitleri, proteinler, esansiyel amino asitler (EAA), karbonhidratlar, mineraller, vitaminler ve karotenoidler gibi temel besin ögelerinin önemli bir kaynağı olarak kabul edilmektedir (Carpes ve ark., 2008). Arı poleni üzerine yapılan araştırmalar, bu ürünün fonksiyonel gıda takviyesi olarak kullanılabileceğini ve sahip olduğu biyoaktif bileşikler ile antioksidan özellikler sayesinde çeşitli terapötik faydalar sunabileceğini göstermektedir. Arı poleni, protein (%25), esansiyel amino asitler, yağ (%6) gibi birçok önemli bileşen bakımından zengin olup, yaklaşık %51'den fazlası çoklu doymamış yağ asitlerinden (PUFA) oluşmaktadır (%13 linoleik asit, %20 palmitik asit ve %39 linolenik asit). Ayrıca, 28'den fazla mineral, 12 vitamin, 11 enzim veya koenzim, karbonhidratlar (%35–%61; ağırlıklı olarak sakkaroz, glikoz ve fruktoz olmak üzere 11 farklı şeker türü), karotenoidler, flavonoidler ve fitosteroller içermektedir (Xu, Sun, Dong ve Zhang, 2009).

4. ARI POLENİ VE KOYUN BESLEME

Gaafar (2024), arı poleninin emziren Rahmani kuzuların diyetlerine yem katkı maddesi olarak eklenmesinin bağışıklık tepkisi, hastalık enfeksiyonu, ölüm oranı, büyüme performansı ve sütten kesim ağırlığı üzerine etkilerini araştırmıştır. Çalışmada, emziren kuzulara 1 g/kuzu/gün düzeyinde arı poleni verilmesinin bağışıklık tepkisini iyileştirdiği, hastalık enfeksiyonu ve ölüm oranını azalttığı, ayrıca sütten kesim ağırlığı ile toplam ve ortalama günlük canlı ağırlık artışını

artırdığı bildirilmiştir. Ayman ve ark. (2024), Ossimi kuzularının diyetlerine farklı seviyelerde hurma poleni (DPP) ilavesinin büyüme performansı, besin sindirilebilirliği, besin değerleri, yem dönüşüm oranı ve kan parametreleri üzerindeki etkilerini incelemiştir. Araştırma sonucunda, özellikle daha yüksek hurma poleni takviyesi düzeylerinde günlük büyüme oranlarında, besin sindirilebilirliğinde ve bazı kan parametrelerinde anlamlı iyileşmeler sağlandığı belirtilmiştir. Liang-zhong ve ark. (2023), Hu koyunlarının bozulmamış arı poleni ile beslenmesinin büyüme performansı, bağışıklık fonksiyonları ve ekonomik verimlilik üzerine etkilerini değerlendirmiştir. Çalışmada, arı poleni ile uygun düzeyde yapılan yem takviyesinin yem maliyetlerini azaltabileceği, büyüme performansını ve serum bağışıklık fonksiyonlarını iyileştirdiği ve ekonomik kazançları artırdığı ortaya konmuştur. Hu koyunları için günlük 2 g bozulmamış arı poleni takviyesi önerilmiştir. Kaabi ve ark. (2022), koyun yumurtalarının (oosit) in vitro olgunlaşma (IVM) ortamına uygulanan Nigella sativa balı, doğal Suudi Sider balı ve bal arısı poleninin olası etkilerini araştırmıştır. Çalışmada, IVM ortamına düşük yoğunluklarda doğal bal ve arı poleni eklenmesinin in vitro olgunlaşma oranlarını artırdığı, glutatyon seviyesini yükselttiği ve olgunlaşan oositlerde gen ekspresyonunu iyileştirdiği rapor edilmiştir. Al-Amery ve Banana (2020), farklı seviyelerde sulu ve alkollü arı poleni ekstraktlarının 5 °C'de farklı saklama süreleri boyunca Awassi koçlarının semen özellikleri üzerindeki etkilerini değerlendirmiştir. Araştırma sonucunda, arı poleni ekstraktlarının tüm uygulamalarda sperm hareketliliği ve canlılığında anlamlı artış sağladığı, sperm anormalliği ve malondialdehit (MDA) konsantrasyonunda ise anlamlı azalma görüldüğü belirtilmiştir. Fodail ve ark. (2018), doğum öncesi ve sonrası dönemde Rahmani koyunlarının temel diyetine farklı dozlarda (3, 6 ve 9 g) oral yolla verilen arı poleninin süt verimi, süt kompozisyonu, kan parametreleri, kolostrum içeriği ve yeni doğan kuzuların büyüme performansı üzerindeki etkilerini araştırmıştır. Sonuç olarak, 9 g arı poleni ilavesinin süt verimini ve kompozisyonunu, kan parametrelerini ve kolostrum kalitesini iyileştirdiği, ayrıca kuzuların büyüme performansını olumlu yönde etkilediği bildirilmiştir. Taghian ve ark. (2017) ise hurma poleni, arı poleni ve arı ekmeğinin büyüme faktörü olarak rasyona ilave edilmesinin Saidi koçlarının vücut ağırlığı, günlük canlı ağırlık artışı, yem alımı ve yem dönüşüm oranı üzerindeki etkilerini değerlendirmiştir. Çalışma, bu doğal ürünlerin söz konusu performans parametrelerinde iyileşmelere yol açtığını ortaya koymuştur.

5. PROPOLİS VE KİMYASAL BİLEŞİMİ

Propolis, ya da diğer adıyla arı tutkalı, bal arıları (Apis mellifera) tarafından çeşitli ağaç ve bitki türlerinin salgılarından ve tomurcuklarından toplanarak, balmumu ve polenle karıştırılıp kendi enzimleri aracılığıyla kimyasal olarak değişime uğratılmasıyla elde edilen doğal, reçineli bir maddedir (Seven ve ark., 2010; Yücel ve ark., 2014). Propolis; flavonoidler, fenolik asitler, yağ asitleri, steroidler, alkoller ve ketonlar gibi sekonder metabolitler veya biyoaktif bileşenler içermesi nedeniyle antioksidan, antibakteriyel, antifungal, antiviral, antiinflamatuar, antiparaziter, antimetanojenik, immünmodülatör ve antikanser özellikler göstermektedir (Rufatto ve ark., 2018; da Silva ve ark., 2019).

Bu biyoaktif özellikler, propolisin bileşiminde bulunan bileşenlerin çoğunun bitkilerde doğal olarak bulunması ile ilişkilidir ve propolisi insan ve hayvan tüketimi için güvenli bir gıda maddesi haline getirmektedir. Bu doğrultuda, son yıllarda propolisin, hayvan ve insan

beslenmesinde antibiyotiklere alternatif bir yem katkı maddesi olarak kullanımı üzerine yoğun bilimsel araştırmalar yapılmaktadır (Morsy ve ark., 2015). Propolis bileşiminin, arıların toplama yaptığı alanlardaki bitki örtüsünün floristik ve ekolojik özelliklerine bağlı olarak doğal bir değişkenlik gösterdiği bildirilmektedir (Alencar ve ark., 2007; Toreti ve ark., 2013). Kimyasal olarak propolis; yaklaşık %50 oranında reçineler, %30 oranında balmumu, %5 oranında polen, %10 oranında uçucu yağlar ve %5 oranında vitaminler (B1, B2, B3, B6), steroidler, benzoik asit, ketonlar, yağ asitleri, kinonlar, esterler, laktonlar ve şekerler gibi diğer organik bileşenlerden oluşmaktadır (Abdulkhani ve ark., 2017).

6. PROPOLİS VE KOYUN BESLEME

Kısıtlanmış erkek kuzuların günlük rasyonlarına farklı seviyelerde kırmızı propolis özütü (RPE) ilave edilmesinin rumen ve bağırsak performansı ile histomorfometrik parametreleri, ayrıca karaciğer ve böbreklerin histopatolojik özellikleri üzerindeki etkilerini değerlendirmek amacıyla yürütülen bir çalışmada, günlük 21 mL RPE takviyesinin rumen ve bağırsakta emilim yüzey alanını artırarak bağırsak sağlığını iyileştirdiği, glikojen hepatik indeksini geliştirdiği ve böbrek ya da karaciğer hasarına yol açmadan kapalı sistemde yetiştirilen erkek kuzularda toplam ağırlık artışını artırabildiği bildirilmiştir (De Melo Garcia ve ark., 2023). Kurak koşullarda yetiştirilen ve geç gebelik ile laktasyon dönemlerinde bulunan Barki koyunlarına uygulanan propolisin biyo-hematolojik parametreler, antioksidan enzim aktiviteleri ve üretkenlik üzerine etkilerini araştıran bir diğer çalışmada ise, doğum öncesi dönemde Çin propolisi takviyesinin süperoksit dismutaz (SOD), haptoglobin (HP), nitrik oksit (NO) konsantrasyonları ve malondialdehit (MDA) düzeylerini iyileştirdiği, bağışıklık sistemi fonksiyonlarını geliştirdiği, ayrıca süt verimi ile kuzuların sütten kesim ağırlığını artırdığı ve antioksidan durumu olumlu yönde etkilediği rapor edilmiştir (Shedeed ve ark., 2019). Propolis tozu veya tutkal özütünün farklı konsantrasyonlarda kullanılarak, sentetik antibiyotiklerle karşılaştırıldığı ve koçların semen kalitesi, bakteriyel kontaminasyona karşı dirençleri ile doğurganlık oranları üzerindeki etkilerinin değerlendirildiği bir çalışmada ise, doğal propolis kullanımının uzatılmış koç spermasında antimikrobiyal etki göstererek sperm kalitesini, bakteriyel inhibisyon bölgelerini ve doğurganlık oranını artırdığı belirlenmiştir (Mohamed, 2017). Brezilya propolisinin Santaines koyunlarında kuzulama performansı, süt üretimi ve kan metabolitleri üzerine etkilerini inceleyen bir çalışmada, propolis uygulamasının toplam lökosit sayısını, protein, globülin ve glikoz konsantrasyonlarını artırdığı, somatik hücre sayısını azalttığı, süt verimi ile süt yağ, protein ve laktoz oranlarını iyileştirdiği tespit edilmiştir. Ayrıca, propolis uygulaması ortalama canlı ağırlık artışı ve yemden süte dönüşüm oranını artırırken, kuzuların doğum ve sütten kesim ağırlıkları üzerinde anlamlı bir etki göstermemiştir. Doğum öncesi dönemde uygulanan propolis ekstraktının, hem kuzular hem de koyunlar açısından gebelikten laktasyona geçiş dönemini olumlu etkilediği bildirilmiştir (Morsy ve ark., 2016). Yeşil propolis, kahverengi propolis ve monensin sodyumun kuzuların davranışları ve besi performansları üzerindeki etkilerini karşılaştırmak amacıyla yapılan bir başka çalışmada, yeşil propolis ile günlük 67,0 mg flavonoid sağlanan diyetin, besi kuzularında canlı ağırlık artışını ve yem dönüşümünü azalttığı; buna karşılık kahverengi propolis ile sağlanan 20,2 mg flavonoid uygulamasının ise, monensin sodyuma benzer şekilde yem dönüşümünü ve besi performansını iyileştirdiği rapor edilmiştir. Araştırmacılar, propolis özütünün besi kuzularının günlük rasyonlarında monensin sodyuma alternatif potansiyel bir gıda takviyesi olabileceğini, ancak

biyoekonomik olarak verimli optimum takviye düzeylerinin belirlenebilmesi için daha fazla çalışmaya ihtiyaç duyulduğunu vurgulamışlardır (İtavo ve ark., 2011).

7. SONUÇ VE ÖNERİLER

Mevcut bilimsel çalışmalar doğrultusunda, arı poleni ve propolisin belirli düzeylerde koyun, koç ve kuzuların diyetlerine eklenmesinin, bu hayvanların üretkenlik, verimlilik ve bağışıklık durumlarını iyileştirdiği sonucuna varılmıştır. Ancak, elde edilen bulguların doğruluğunun artırılması ve genellenebilirliğinin sağlanabilmesi için daha fazla araştırmaya ihtiyaç duyulmaktadır. Arı poleni ve propolisin bileşimlerinin, arıların ziyaret ettiği toplama alanlarındaki bitki örtüsünün floristik ve ekolojik özelliklerine bağlı olarak değişkenlik göstermesi nedeniyle, bu doğal ürünlerin etkilerini daha kapsamlı şekilde değerlendirebilmek adına, kontrollü laboratuvar çalışmaları ve farklı koşullarda gerçekleştirilecek hayvan denemeleri ile desteklenen ilave bilimsel araştırmalar yapılması önerilmektedir.

*NorQuest College, Alberta Routes Program -present

My academic journey, which encompasses an Honorary Doctor of Philosophy in Generic Education from Abide University and Institute and a Doctor of Divinity from North Central Theological Seminary, has been deeply influenced by the Arthurian legend. This collection of tales about King Arthur, his knights, and their quests holds significant cultural and historical importance. It has been a central theme in my exploration of cross-cultural communication, offering a unique perspective to understand the relationship between myth, culture, and science. I believe this perspective, which emphasizes the importance of noble ideals and heroism, can provide insights into the study of rural development. The Arthurian legend, focusing on noble ideals and heroism, can be a compelling lens through which to understand the challenges and opportunities in rural development. The legend's emphasis on noble ideals and heroism can be seen as a metaphor for the dedication and courage required to pursue sustainable rural development. It also serves as a persuasive avenue to investigate how sound influences the artistic and architectural features of the medieval era, symbolizing the shaping of societal norms and values.

*Doctor of Divinity, North Central Theological Seminary, Minneapolis, United States, 2023 - present
The University of Alberta (Bachelor of Education after Degree in Elementary, Faculty of Education, Community Service-Learning Certificate and Certificate in International Learning (CIL) – 2012-2022

My international experiences have significantly broadened my academic perspective, particularly in understanding how the Arthurian legend resonates across cultures with its universal themes of heroism and noble ideals. This exposure has enriched my understanding of global issues, including rural development and gender inequality. It has connected me with a broader educational network and prompted me to examine our shared cultural heritage through the lens of the Arthurian legend. This cultural phenomenon transcends national borders, and our collective inquiry can lead to a deeper understanding of shared human experiences, including the diverse interpretations and applications of the Arthurian legend regarding gender and empowerment issues in rural development.

Public Affairs, August 1-15, 2022, Online
Intern at the Digital Museum and Diaspora, Migration, GRFDT, New Delhi, India (April 2021- March 2022, Online)

During my time as a Book Pecker Fellow at Peace X, India, I was honoured to be named the top fellow in the social science department. In this capacity, I researched the cultural significance of the Arthurian legend, which motivated me to continue my academic endeavours. Additionally, I earned a computer literacy certificate in Migration Studies from GRFDT, New Delhi, India. My research on the cultural significance of the Arthurian legend has provided unique insights into the field of rural development, particularly in the context of India.

ABSTRACT

Rural development is crucial and urgent for achieving the United Nations' Sustainable Development Goals (SDGs). It plays a significant role in reducing poverty (SDG 1), ending hunger (SDG 2), providing access to clean water and sanitation (SDG 6), and creating sustainable communities (SDG 11). The urgency and importance of these issues are underscored by the fact that many people live in rural areas, which is vital for agriculture and food security. Focusing on rural development supports SDG 2, which aims to end hunger and ensure everyone can access safe and nutritious food throughout the year. This involves promoting sustainable farming practices, increasing the productivity and income of small farmers, and improving their working and living conditions. Rural development also plays a crucial role in tackling poverty (SDG 1), as about 75% of the world's poor live in rural regions. We must improve access to essential services, build infrastructure, and strengthen social protection systems to combat this rural poverty. Supporting sustainable farming can secure food and increase family incomes. Another key part of rural development is providing clean water and sanitation (SDG 6). Many rural communities still lack safe drinking water and proper sanitation.

Investing in these facilities is essential for health and can also reduce poverty by lowering healthcare costs and increasing productivity. SDG 11 aims to make cities and human settlements inclusive and sustainable, which is also relevant for rural areas. We should promote sustainable development in rural communities by ensuring access to essential services, improving transport, and respecting cultural and natural heritage. Rural development is not isolated; it connects to other goals, such as SDG 3 (Good Health and Well-being), SDG 4 (Quality Education), SDG 5 (Gender Equality), and SDG 10 (Reduced Inequalities). Addressing the challenges in rural areas is crucial for creating a fairer and more sustainable world. To achieve effective rural development, we need to use approaches that consider social, economic, and environmental factors. Linking rural and urban areas, promoting cooperation, investing in infrastructure, and providing access to markets, technology, and education are all essential strategies. The need for these practical strategies in rural development is a call for action. They are paramount as they ensure the successful planning and implementation of initiatives. A question arises: How does rural development help achieve the United Nations Sustainable Development Goals (SDGs) related to reducing poverty and hunger, providing access to clean water, and promoting community sustainability? This essay will review existing research and publications on rural development and its impact on the SDGs. This will highlight key themes, challenges, and successful strategies in rural areas.

Keywords: Rural Development, Sustainable Development Goals (SDGs), Gender Equality.

Introduction

The rural environment is a complex system where differences in development are visible both within countries and between them. Analyzing these rural areas is challenging because of their diversity and the lack of comparable indicators (Mihai, F.-C., & Aitu, C., 2020). This makes it hard to create objectives and indicators that meet both national and international needs. Although the common goal should make harmonization easier, policies and strategies often lack coherence. [1]Documents like Agenda 2030 outline ways to achieve good practices and reliable results, even if they do not provide universal answers. Political decisions at all levels are crucial but do not always support the best outcomes for rural areas. There are many different situations, and applying the same models everywhere may not work due to the unique conditions at the regional and local levels. Still, more mechanisms must be developed to align international sustainable development goals with local needs, especially in rural regions.

[2]Agenda 2030 has 17 sustainable development goals and 169 targets supported by the United Nations (Mihai, F.-C., & Aitu, C., 2020). This global effort addresses poverty, climate change, environmental pollution, and social inequality. It builds on the previous Millennium Development Goals, which started in 2000 (Mihai, F.-C., & Aitu, C., 2020). It focused on issues like poverty, hunger, disease, and education, promoting gender equality and environmental sustainability until 2015[3]. The Paris Agreement[4] seeks to tackle climate change and help developed and developing countries adapt. It aims to create clean, climate-resilient communities. The Paris Agreement (Mihai, F.-C., & Aitu, C., 2020) and Agenda 2030 are the most ambitious international initiatives to address economic development while considering social and environmental sustainability. These actions must reduce the significant gaps between rural and urban areas, especially concerning social and economic conditions. Even with [5]rural-urban migration, many people still live in rural areas, facing dangers from climate change, poverty, and a lack of infrastructure, particularly in developing countries. Reducing inequalities (Mihai, F.-C., & Aitu, C., 2020) in access to basic needs should be a priority at the international level. Rural areas provide urban regions with essential resources like food, energy, and raw materials while protecting natural habitats, flora and fauna, and cultural heritage (Mihai, F.-C., & Aitu, C., 2020). Therefore, sustainable rural development is a complex issue that combines environmental, economic, and social factors. It requires the same level of attention from academics, international organizations, national and local authorities, professionals, and community members as urban development does.

Literature Review

The Role of Rural Development in Achieving the United Nations Sustainable Development Goals. Rural development is a multifaceted approach integral to achieving the United Nations Sustainable Development Goals (SDGs). Multiple studies have explored the impact of rural

development on poverty alleviation, food security, and sustainable community building, highlighting its importance in addressing global challenges. Poverty remains a pressing issue in rural areas, where limited access to resources and markets exacerbates socioeconomic disparities. According to the Food and Agriculture Organization (2017), rural development initiatives that enhance agricultural productivity and provide access to basic services can significantly reduce poverty. The United Nations Development Programme (2019) also emphasizes that targeted rural development strategies can uplift rural communities by providing income-generating activities and promoting local entrepreneurship. Food security is intricately linked to rural development. The 2019 Food and Agriculture Organization Report indicates that investments in rural infrastructure, such as roads and storage facilities, are crucial for reducing food waste and improving market access for farmers.

An FAO (2020) study reveals that enhancing agricultural practices and supporting smallholder farmers can increase food production and improve nutrition in rural populations, thus addressing global hunger challenges. Access to clean water and sanitation is essential for sustainable rural communities. A report by UNICEF (2020) highlights that rural areas often face challenges accessing safe drinking water and sanitation facilities. Effective rural development programs focusing on water resource management and sanitation infrastructure can significantly improve rural residents' health outcomes and quality of life. A case study in India demonstrated that community-led initiatives in water management improved access to safe water for over a million people (Pandey et al., 2021). Creating sustainable communities is fundamental to rural development. Research suggests that integrating environmental sustainability into rural development strategies promotes resilience against climate change. The International Fund for Agricultural Development (2018) discusses how sustainable agricultural practices, such as agroecology, contribute to environmental sustainability and socioeconomic stability in rural communities. Moreover, a longitudinal study by Smith et al. (2021) identifies that rural communities adopting sustainable practices benefit from improved ecosystem services and increased biodiversity. Gender inequality remains a critical issue in rural development contexts. Schreiber et al. (2019) emphasize that empowering women through education and resource access is crucial for sustainable rural development. Their study found that the success rates of rural development projects significantly improved.

Methodology

This research's methodology on rural development's role in achieving the United Nations Sustainable Development Goals (SDGs) involves qualitative and quantitative approaches to provide a comprehensive understanding of the interplay between rural development and the SDGs. A thorough review of the existing literature has been conducted to identify key themes, challenges, and successes in rural development related to the SDGs. This has included analyzing academic journals, books, and reports from international organizations such as the United Nations, World Bank, and non-governmental organizations (NGOs). Selected case studies of rural development projects that align with specific SDGS have been analyzed. This approach has provided a deeper understanding of successful strategies and practices that can be replicated in other rural contexts. Surveys have been distributed to individuals and communities in various rural settings. Questions will focus on access to resources, perceptions of

development initiatives, and the impact of these initiatives on their lives. Data from surveys and existing databases have been analyzed quantitatively to identify patterns, correlations, and trends related to rural development and achieving specific SDGs. This analysis aims to quantify the impact of rural development initiatives on poverty reduction, hunger alleviation, and access to clean water and sanitation. To ensure the research is grounded in the realities of rural communities, participatory methods have been employed. Community workshops and focus groups will be organized to engage residents and solicit their feedback on development initiatives. This approach has promoted inclusivity and empowered communities to voice their concerns and aspirations. The findings from both qualitative and quantitative research will be synthesized to develop a set of recommendations for policymakers and practitioners. These recommendations focus on improving the effectiveness of rural development strategies in achieving the SDGs, emphasizing collaboration, sustainability, and community engagement. The study results have been disseminated through academic publications, policy briefs, and community reports.

Efforts have been made to present the findings at relevant conferences and workshops to reach a broader audience and encourage dialogue around rural development and the SDGs. This multifaceted methodology aims to comprehensively understand rural development's critical role in achieving the United Nations Sustainable Development Goals, highlighting challenges and opportunities for sustainable progress. Women participate in decision-making processes. Women's empowerment is essential for achieving SDG 5 and enhancing community resilience and food security (World Bank, 2020). Rural development is central to achieving several interlinked Sustainable Development Goals. Comprehensive strategies addressing poverty, food security, clean water access, sustainable community building, and gender equality can create holistic and sustainable solutions to the challenges faced by rural populations. This review contextualizes rural development within the framework of the Sustainable Development Goals and summarizes key findings from existing literature.

Discussion: [6]The Paris Agreement aims to take decisive action to fight climate change and adapt to its impacts in developed and developing countries. It seeks to create clean and climate-resilient communities. Along with the Agenda 2030, it is one of the most ambitious global efforts to tackle critical issues related to future economic growth, social well-being, and environmental sustainability (Mihai, F.-C., & Aitu, C., 2020). These actions must address the significant differences in socioeconomic conditions between urban and rural areas and highlight rural communities' risks from climate change, poverty, and lack of necessary infrastructure, especially in developing and transition countries. It is crucial to prioritize reducing these geographical and social inequalities at the international level. (Mihai, F.-C., & Aitu, C., 2020) On the other hand, rural areas provide essential resources for urban areas, including raw materials, energy, food, and water. They also contribute labour and help protect the natural habitats of unique plants and animals and essential landscapes. Rural communities are vital for preserving cultural and historical heritage. Therefore, sustainable rural development is a complex issue that combines environmental, economic, and social factors. It needs to receive as much attention from researchers, international organizations, government agencies, professionals, and civil society as urban development does (Mihai, F.-C., & Aitu, C., 2020).

[6] Sustainable Rural Development under Agenda 2030. Introduction. Paragraph 4th.

7Rural communities face many challenges due to climate change, land degradation, deforestation, loss of biodiversity, and fragmented natural habitats. In developing countries in Africa, Asia, and Latin America, the rural population suffers more from extreme poverty, famine, social exclusion, and environmental injustice (Mihai, F.-C., & Aitu, C., 2020). 8These communities rely on their local environment, such as climate, natural resources, landscape, socioeconomic conditions, and demographics, for economic development through agriculture, industry, or tourism. (Mihai, F.-C., & Aitu, C., 2020) Many rural areas still depend on subsistence agriculture, which makes them vulnerable to natural disasters like extreme weather, floods, landslides, erosion, and drought. This can lead to low agricultural productivity, famine, extreme poverty, land abandonment, and large-scale migration. 9Poverty and poor infrastructure are the main reasons for underdevelopment and environmental damage. Rural areas need access to basic public services to ensure a decent quality of life, especially in places without major geographical barriers. [10]Globally, there are significant gaps between rural and urban areas regarding access to essential services like drinking water, sanitation, electricity, and waste management. This is especially true in low- and middle-income countries (Mihai, F.-C., & Aitu, C., 2020). Rapid urban growth in these countries causes many poor people to move to cities, often ending up in crowded slums without access to basic urban services. This situation threatens public health and the local environment. Uncontrolled urban growth spreads into surrounding rural lands, creating informal settlements. [11]Currently, 1.9 billion rural people lack proper waste management services, with coverage rates below 50% in 105 countries. This critical situation leads to millions of tons of household waste generated each year that goes uncollected. Waste often ends in nature through illegal dumping, disposal in water bodies, or burning. Freshwater ecosystems are harmed by this uncontrolled waste disposal, which can contaminate water bodies downstream, especially during heavy rains and floods, and eventually reach the ocean (Mihai, F.-C., & Aitu, C., 2020). [12]Plastic pollution severely affects wildlife, and rural communities contribute to this problem directly through fishing and indirectly through poor waste management practices. [13]A study looks at rural infrastructure in China. [14]It divides it into three main areas: facilities for living and work (such as drinking water, irrigation, electricity, roads, wastewater treatment, and waste management), development infrastructure (like education and healthcare), and environmental infrastructure (including clean energy, green housing, and environmental protection systems). Improving public transport is vital to help

people reach education (like high schools and universities), healthcare services, justice, and social programs (Mihai, F.-C., & Aitu, C., 2020). [15]In developed countries, many people move from cities to nearby rural areas to escape noise and air pollution. [16]There is a lot of rural land development for housing, transportation, and commercial or industrial uses near these "peri-urban" (Mihai, F.-C., & Aitu, C., 2020) areas, including tourism and recreation. As a result, farming in these areas is being replaced by manufacturing and various services close to big cities. This contrasts with remote rural communities focusing primarily on farming and using natural resources. [17]Small and medium-sized businesses in rural areas use local resources, support the local economy, create jobs, develop infrastructure, and engage with the community. Small-scale farmers who use eco-friendly practices (Mihai, F.-C., & Aitu, C., 2020) can provide diverse and nutritious food while protecting the environment. Long-term growth policies should support small farmers instead of large agribusinesses to ensure food security and social fairness in tropical regions. [18]New relationships between urban and rural areas can encourage nearby farmers to adopt better management practices and engage in non-farming activities, such as tourism, environmental conservation, and forest restoration or urban-rural migration. Rural households often face challenges when trying to sell their products. They are usually limited to local markets or must sell to mediators at low prices. This issue is common in [19]Eastern European countries, where dispersed villages, poor roads, and limited urban services make it hard for local farmers to connect directly with city customers. [20]Creating farmer associations can help these producers access regional or national markets, shorten supply chains, and reduce reliance on food imports, particularly in agricultural countries like Romania (Mihai, F.-C., & Aitu, C., 2020). These countries should shift from being cheap raw material providers for exports to developing manufactured products and services, such as furniture, food products, organic farming, renewable energy, and agritourism. [21]Digital technologies can change how farmers find price and market information. They can help coordinate resources like transport, logistics, finance, and production techniques, benefiting the agriculture sector in developing countries. [22]To support sustainable development, improvements in water harvesting, growing drought-resistant crops, and better local governance are necessary. This can include integrated resource management and accessible public services. Better connections between urban and

[22] Sustainable Rural Development under Agenda 2030. Pathways towards sustainable development goals(SDG's). Paragraph 5th.

rural areas can also help. [23]The "Smart Village" initiative is one positive step. It aims to provide energy access to remote villages and improve related areas like clean water, sanitation, education, healthcare, and gender equity, which align with the Sustainable Development Goals (SDGs). [24]In poorer rural areas of developing countries like Bangladesh, where energy comes from wood or dried cattle dung, household bioenergy systems, such as anaerobic digestion of waste, could help achieve several SDGs. Despite facing challenges like poverty, low education, and cultural barriers, these systems offer societal and environmental benefits. [25]Training and awareness programs can help address these issues. [26]Fortunately, domestic biogas projects are emerging in countries like Pakistan, India, China, Vietnam, and others in Asia, Africa, and South America. Rural tourism, agritourism, religious tourism, and ecotourism (Mihai, F.-C., & Aitu, C., 2020) are alternatives or complementary economic activities that could further stimulate rural entrepreneurship while decreasing rural community dependency on one primary economic sector (agriculture, forestry, energy, mining, or fishing). Rural communities face many challenges, including natural disasters, policy changes, economic issues, and security problems. Managing these risks helps strengthen the community's resilience. Sustainable development relies on three key social, financial, and environmental areas (Mihai, F.-C., & Aitu, C., 2020).

Conclusion

This study highlights the importance of addressing the issues we found while also recognizing the positive results that emerged. We must consider how these findings will affect future strategies and practices to promote sustainable progress and practical solutions. Building a teamwork culture and encouraging open conversations among all stakeholders is vital. This approach will help us face challenges and achieve common goals. By working together, we can make meaningful progress towards our shared objectives.

PLANT PRODUCTION PLANNING AND SUPPORT IN TURKİYE

Selahattin ÇINAR
Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi, TÜRKİYE
s.cinar@ahievran.edu.tr
ORCID NO: 0000-0002-9049-0044

ABSTRACT

In recent years, global climate changes, water restrictions, rapid population growth, pandemics, geopolitical risks and conflicts in our nearby geography have increased the importance of food supply security. In order to minimize the impact of these negativities and ensure food supply security, an effective planning process that adopts the most appropriate use of natural resources has become mandatory.

The purpose of the Agricultural Production Planning implemented in Turkey is to prevent excess or deficiency in production and to ensure supply security in strategic products. In this direction, minimum and maximum production quantities will be determined according to the country's needs, and the product or product groups to be produced on the basis of the agricultural basin will be determined by taking into account the supply and demand amounts of the products.

With the amendment to the Agricultural Law published in the Official Gazette on April 5, 2023, and the Regulation on Agricultural Production Planning published on September 14, 2023, production planning in plant production has been started as of September 01, 2024. In the planning, the planning of the technical committee established in each province is taken into account and the decision is made by the Planning Board located in the center.

With plant production planning, 13+1 products were included in the planning scope. While selecting these products; their importance in human and animal nutrition, foreign trade status, sufficiency rates within the country, raw material status used in industry, food safety and food security and rotation were taken into consideration.

With plant production planning, which product will be produced in which quantity and in which basin, and products that can be produced in regions with water restrictions were determined. One of the most important incentives of production planning has been the new support policy. Planning is guided by supports, but in cases where the production of products subject to planning is not complied with, there are sanctions.

With the supports to be given in planning, supports can be provided from 25% to the full coverage of fertilizer and fuel oil expenses. In regions with water restrictions, the entire fertilizer and fuel oil expense for production will be covered by the Ministry of Agriculture.

TÜRKİYE'DE BİTKİSEL ÜRETİM PLANLAMASI VE DESTEKLEMELER

ÖZET

Son yıllarda yaşanan küresel iklim değişiklikleri, su kısıtı, hızlı nüfus artışı, pandemi, jeopolitik riskler ve yakın coğrafyamızda yaşanan çatışmalar gıda arz güvenliğinin önemini artırmıştır. Yaşanan bu olumsuzlukların etkisini en aza indirerek gıda arz güvenliğini sağlayabilmek için doğal kaynakların en uygun kullanımını ilke edinen etkin bir planlama süreci zorunlu hâle gelmiştir.

Türkiye'de uygulamaya konulan Tarımsal Üretim Planlamasının amacı; üretimde arz fazlası veya eksikliğinin oluşmasının önüne geçmek ve stratejik ürünlerde arz güvenliğinin korunmasını sağlamaktır. Bu doğrultuda ülke ihtiyacına göre asgari ve azami üretim miktarları tespit edilecek, ürünlerin arz ve talep miktarı dikkate alınarak tarım havzası bazında hangi ürün veya ürün gruplarının üretileceği belirlenecektir.

5 Nisan 2023 tarihinde Resmi gazetede yayınlaann Tarım kanunu değişikliği, 14 Eylül 2023 te yayınlanan Tarımsal Üretimin Planlanması hakkındaki Yönetmelik ile 01.09.2024 tarihi itibariyle bitkisel üretimde üretim planlamasına başlanılmıştır. Planlamalarda her ilde kurulu teknik Komitenin planlaması dikkate alınarak merkezde bulunan Planlama kurulu tarafından karara bağlanmaktadır.

Bitkisel üretim planlaması ile 13+1 ürün planlama kapsamına alınmıştır. Bu ürünler seçilirken; insan ve hayvan beslenmesindeki önemleri, dış ticaret durumları, ülke içerisinde yeterlilik oranları, sanayide kullanılam hammadde durumu, gıda güvenliği ve gıda güvencesi ve münavebe dikkate alınmıştır.

Bitkisel üretim planlaması ile hangi ürünün ne miktarda hangi havzada üretileceği, su kısıtı olan bölgelerde üretilebilecek ürünler belirlenmiştir. Üretim planlamasının en önemli teşviklerinden birisi yeni destekleme politikası olmuştur. Planlama destekler ile yönlendirilmektedir ancak planlamaya tabi ürünlerin üretimine uyulmadığı durumlarda yaptırımda sözkonusudur.

Planlamada verilecek destekler ile gübre ve mazot giderlerinin % 25'inden tamamının karşılanmasına kadar destekler verilebilecektir. Su kısıtı uygulanan bölgelerde üretim için yapılan gübre ve mazot giderinin tamamı tarım bakanlığı tarafından karşılanacaktır.

Anahtar Kelimeler: Bitkisel Üretim, Planlama, Yeterlilik, Gıda Arz Güvenliği, Su Kısıtı

1. GİRİŞ

Dünyada son 50 yıl içerisinde dünya nüfusu katına, kentleşme oranı % 37'den % 57'ye, doğal afetler ise 5 katına çıkmıştır. Doğal afetlerin ekonomik zararı 250 milyar $, bu ekonomik kaybın % 50 si ise tarım sektöründe gerçekleşmiştir (Dünya Bankası, 2023).

Yapılan projeksiyonlarda 2050 yılında dünya nüfusunun 10 milyar, Türkiye nüfusunun 105 milyon olacağı, 2050 yılında gıda talebine bağlı olarak bugünkü üretimin % 70 oranında artması, gıda üretimi için ise fazla su tüketiminin % 15 artabileceği tahmin edilmektedir (FAO, 2023).

Türkiyenin mevcut su potansiyeli 2024 yılı itibariyle 112 milyar m^3 iken 2030 yılı için 93.3 milyon nüfusa karşılık 91 milyar m^3 su potansiyeli tahmin edilmektedir. Bu süreç içerisinde nüfus artışının % 9.5 olacağı, su potansiyeli azalışının ise % 18.7 olacağı, mevcutta kişi başı yıllık su miktarının 1313 m3 iken 2030 yılında su putansiyeli azalışı ve nüfus artışına göre yapılan hesaplamalar ile kişi başı su tüketim miktarının 975 m3'e düşeceği, Türkiyenin su stresi çeken bir ülke konumundan su fakiri bir ülke konumuna düşebileceği hesaplanmaktadır (TOB, 2024a)

Türkiyede bitkisel üretim alanları son yıllarda artan nüfus ve tarım dışına çıkarılan arazilerin artışından dolayı 1990 yılında 4.9 da/kişi iken 2022 yılı verilerine göre bu alanın 2.8 da/kişi'a düştüğü belirlenmiştir.

Türkiye'de son 21 yılda arazi kullanımındaki değişiklikler Çizelge 1'de görülmektedir.

Çizelge 1. Türkiye arazi valığındaki değişim (bin ha)

Yıl	Tarla	Nadas	Meyve	Sebze	Süs Bitkileri	Toplam
2001	17.917	4.914	2.610	909	0	26.350
2016	15.575	3.998	3.329	804	5	23.711
2017	15.498	3.697	3.348	798	5	23.346
2018	15.421	3.513	3.457	784	5	23.180
2019	15.398	3.387	3.519	790	5	23.099
2020	15.628	3.173	3.559	779	5	23.144
2021	16.062	3.059	3.591	755	5	23.472
2022	16.510	2.960	3.671	718	6	23.865

Türkiye'de son 21 yılda tarla bitkileri ekim alanının % 8, sebze üretim alanlarının % 21, nadas alanlarının % 40 azaldığını buna mukabil meyve bahçelerinin alanlarının % 41 arttığını, toplam ekili dikili alanın ise 2022 yılında 2002 yılına göre % 9 azaldığı Çizelge 1'de görülmektedir.

Son yıllarda yaşanan küresel iklim değişiklikleri, su kısıtı, hızlı nüfus artışı, pandemi, jeopolitik riskler ve yakın coğrafyamızda yaşanan çatışmalar gıda arz güvenliğinin önemini artırmıştır.

Yaşanan bu olumsuzlukların etkisini en aza indirerek gıda arz güvenliğini sağlayabilmek için doğal kaynakların en uygun kullanımını ilke edinen etkin bir planlama süreci zorunlu hâle gelmiştir.

Artan nüfusa karşılık azalan tarım alanları, iklim değişikliği, gıda güvenliği ve güvencesinin ön plana çıkmış olması tarımda planlamayı zorunlu hale getirmiştir.

2. BITKISEL ÜRETIM PLANLAMASI

Bitkisel Üretim Planlamasının amacı; üretimde arz fazlası veya eksikliğinin oluşmasının önüne geçmek ve stratejik ürünlerde arz güvenliğinin korunmasını sağlamaktır. Bu doğrultuda ülke ihtiyacına göre asgari ve azami üretim miktarları tespit edilerek, ürünlerin arz ve talep miktarı dikkate alınarak tarım havzası veya işletme bazında hangi ürün veya ürün gruplarının üretileceği belirlenmektedir (TOB, 2024b).

Tarımda bitkisel üretim planlaması ile;

- Suyu merkeze alarak iklim değişikliğine uyumlu üretim yapılması,
- Stratejik ürünlerin en uygun yerde yetiştirilmesi,
- Üretimde verim ve kalitenin artırılması,
- Kaynakların etkili kullanılması,
- Verimlilik ve tarımsal üretimde artış sağlanması,
- Üreticilerin yaşadığı pazarlama sorunlarının önüne geçilmesi,
- Üreticilerin refah düzeyinde artış sağlanması,
- Sanayinin ihtiyaç duyduğu hammadde tedarikinin sağlanması,

amaçlanmaktadır.

2.1. Yasal Değişiklik

23 Mart 2023 tarihinde TBMM'de Kabul edilen değişiklik ile Tarım Kanununun 7. Maddesinde yapılan değişiklik ile tarımsal üretim planlaması ile Tarım ve Orman Bakanlığı yetkili kılınmıştır. Değişiklik 5 Nisan 2023 tarihli Resmi Gazete ile yayınlanarak yürürlüğe girmiştir. Yine 14 Eylül 2023 tarihli Resmi Gazetede yayımlanan *Tarımsal Üretimin Planlanması Hakkında Yönetmelik* yayımlanarak üretim planlaması mevzuatı oluşturulmuştur.

2.2. Bitkisel Üretim Planlaması Kapsamı

Bitkisel üretim planlaması çalışmaları sürecinde öncelikle planlama kapsamına alınacak ürünler, bu ürünlerin yetiştirilebileceği azami ve asgari miktarları ve bu ürünlerin yetiştirilebileceği havzalar belirlenmektedir.

Planlama kapsamına alınacak ürünler belirlenirken; stratejik ürünlerde yeterlilik, gıda güvenliği ve güvencesi, hayvan beslenmesi, münavebe, tarıma dayalı sanayi ve dış ticaret durumu dikkate alınmaktadır.

Türkiye'de sebze, meyve ve bazı tarla bitkilerinde yeterlilik oranları Şekil 1'de görülmektedir.

Şekil 1. Türkiye'de bazı ürünlerin yeterlilik oranları (2022)

Şekil 1'de görüldüğü üzere Türkiye'de sebze ve meyve grubunda yeterlilik oranları % 100'ün üzerinde iken tarla bitkileri grubunda bazı ürünlerde yeterlilik oranı % 100'ün altındadır. Bunları buğday, mısır, pirinç, arpa, ayçiçeği, k.mercimek ve soya olarak sayabiliriz.

Gıda arz güvenliği, stratejik önemi, hammadde temini, insan ve hayvan beslenmesi gözönüne alındığında bitkisel üretim planlamasına esas olmak üzere 13+1 ürün belirlenmiştir. Bunlar; hububat (buğday, arpa, dane mısır) baklagil (mercimek, nohut, kuru fasulye), yağlı tohumlar (ayçiçeği, soya, pamuk, kanola, aspir), tüm yem bitkileri ve kuur soğan ve patatestir.

Bir kanuna tabi olan bazı ürünler (çay, çeltik, şeker pancarı, fındık, zeytin) ile stratejik olarak değerlendirilmeyen bazı ürünler (triticale, çavdar, yulaf) olarak planlama kapsamına alınmamıştır.

Her bir üründe azami asgari üretim miktarları hesaplanırken krtiter olarak; nüfus, turist sayısı, ithalat, ihracat, yurtiçi tüketimi, tohumluk, sanayide kullanım miktarı ve iklimsel faktörler gözönüne alınmaktadır.

Ürün-havza eşleştirmelerinde; mevcut durum analiz edilmekte, uzman görüşleri dikkate alınarak ürün uygunluk haritalarına göre eşleştirmeler yapılmaktadır. Ürün uygunluk haritaları; iklim, toprak, topoğrafya ve sulama durumuna göre belirlenmiştir.

Tarımsal üretim planlamasının yönetimi, merkezde Tarımsal Üretim Planlama Kurulu, illerde ise çeşitli sivil oplum kuruluşları ve ilgili paydaşları içerisine alan Teknik Komite tarafından yapılmaktadır.

11 ilde bulunan 52 ilçe, tarımsal yer altı su kısıtı olan alan konumundadır. Bu ilçelerde yeni bir hayvancılık işletmesinin açılması ve sulu ürün yetiştirilmesi izne tabidir. Bu alanlarda özellikle şekerpancarında olduğu gibi bir münavebe uygulanacak ve 4 yılda bir ancak sulanabilen ürün yetiştirilebilecektir (Şekil 2).

Şekil 2. Su kısıtı olan il, ilçe ve havzalar

Bitkisel üretim planlaması kapsamında; % 6 eğimin üzerindeki tarım alanlarında meyve bahçesi tesisi bakanlığın iznine tabidir. Bir alanın % 80 ve üzeri alanı meyvecilik alanı ise kalan alanda izne gerek olmayıp bu kalan alanda da meyve bahçesi kurulabilecektir. Kendine yeterlilik oranı % 150'nin üzerinde olan ürünler Bakanlık iznine tabidir.

Bitkisel üretim planlaması 3 yıllık yapılmaktadır ancak her bir yıl değişiklik yapılabilmektedir.

Kuruda ikili, suluda ise üçlü münavebe uygulaması esas olup ÇKS başvurusu üzerinden ve gerektiğinde atrazide yerinden controller yapılabilecektir.

2.3.Bitkisel Üretim Planlaması Kapsamında Yaptırımlar

Tarımsal Üretim Planlaması kapsamında Bakanlığın belirlediği kurallara uymayan çiftçilere aşağıdaki yaptırımlar uygulanacaktır:

- Bakanlıkça belirlenen ürün veya ürün gruplarının üretimine başlanmadan önce planlamaya uymadığı tespit edilen çiftçiler, İl/İlçe Müdürlükleri tarafından 12 ay içinde planlamaya uygun üretim yapmaları konusunda yazılı olarak (Tebligat Formu ile) uyarılacaktır.

- Uyarıldığı tarihi takip eden 12'nci ayın sonunda uygun olmayan faaliyete devam eden çiftçiler, 5 yıl süre ile Bakanlığın hiçbir destekleme programından yararlanamayacaktır. Bu kararla ilgili gerekli bilgi ve belgeler İl/ İlçe Müdürlüğü tarafından düzenlenerek mahallî mülki amire sunulacaktır.

- Yazılı olarak uyarılan, 5 yıl süreyle destekleme programından yararlanamaz kararı verilen ancak bir sonraki takvim yılında da planlamaya aykırı faaliyetine devam eden çiftçilere, üretimini yaptığı ürün veya ürün grubuna göre elde edeceği yıllık brüt hasılasının %1'inden

5'ine kadar idari para cezası uygulanacaktır. İl/İlçe Müdürlüğü tarafından idari para cezası uygulanması için gerekli bilgi ve belgeler düzenlenerek mahallî mülki amire sunulacaktır.

- Eğer söz konusu üretim faaliyeti çok yıllık ise yazılı uyarı ve destekleme programından yararlandırılmama işlemleri tesis edilmesine rağmen çiftçi bu üretimine devam ediyorsa aykırı faaliyette bulunduğu tespit edilen her yıl için bu faaliyetten elde edeceği yıllık brüt hasılasının %1'inden 5'ine kadar idari para cezası uygulanacaktır.

- 5488 sayılı Tarım Kanunu kapsamındaki idari yaptırımlar, kabahate konu ürünün yetiştirildiği işletmenin bulunduğu mahallî mülki amir tarafından uygulanacaktır.

- İdari para cezası tutarının hesaplanmasında çiftçinin üretim yaptığı ürün veya ürün grubuna ait TÜİK tarafından yayımlanan il geneline ait o yılın ortalama verimi ile üretici satış fiyatı dikkate alınarak brüt hâsıla hesaplanacaktır. TÜİK tarafından verim ve fiyatı yayımlanmayan ürünlerin verim miktarı ile üretici satış fiyatı İl Müdürlüğü tarafından havza bazında belirlenecektir.

3.DESTEKLEMELER

Bitkisel üretim planlamasında kullanılacak araçlar, destekleme modeli, tarımsal krediler, hibeler, sözleşmeli üretim, kayıtlılık-tarım sayımı, işlenmeyen arazilerin üretime kazandırılmasıdır.

Özellikle yeni destekleme modeli, bitkisel üretimde yönlendirici bir araç olarak kullanılacaktır.

Bitkisel üretimde 2027 sonunda halen ortalama 35 milyon ton olan hububat üretiminin % 13 artışla 39.5 milyon tona, 1.2 milyon ton olan baklagil üretiminin % 17 artışla 1.4 milyon tona, 4.6 milyon ton olan yağlı tohumlar üretim miktarının ise % 22 artışla 5.6 milyon tona çıkarılması hedeflenmektedir.

Yeni destekleme modeli ile tüm bitkisel üretime temel destek olarak ifade edilen destekleme ile alan bazlı olmak üzere üretimde kullanılan mazotun % 50'si, gübrenin ise % 25'i destek olarak üreticiye ödenecektir. Planlamaya tabi ürünleri bakanlık tarafından belirtilen alanlarda belirtilen ürünlerin üretilmesi halinde üretimde kullanılan mazotun tamamı, gübrenin ise yarısı, bu ürünlerin su kısıtı olarak ilan edilen havzalarda (ilçe) üretilmesi halinde gübre ve mazotun tamamı bakanlık tarafından üreticiye ödenecektir. Her yıl desteğin miktarı ürünün ekim zamanında ilan edilecektir.

4.SONUÇ

Türkiye nüfusu, ziyarete gelen turist sayısı, misafir göçmenler ile birlikte yılda ortalama 100 milyon nüfusu beslemek ve yıllık belirli bir tarımsal ihracatı yapmak durumundadır. Diğer taraftan bunu su kısıtını gözeterek yapmak durumundadır. Bundan dolayı bitkisel üretimini, tarımsal üretimini planlamak amacıyla 2023 yılında mevzuat değişikliğine gidilmiştir.

Planlamanın esas amacı stratejik ürünlerde kendine yeterlilik, gıda güvenliği ve güvencesinin sağlanması, hangi ürünün nerede ne miktarda üretileceğinin belirlenmesidir. Planlamanın yaptırımdan daha ziyade teşvikler ile yönlendirme yapılarak yapılması esas alınmıştır.

Türkiye'de mevcut ekili dikili tarımsal alana bakıldığında meyve bahçeleri lehine bir genişleme tarla tarımı ürünlerine karşılık bir daralma sözkonusudur.

Bitkisel üretim planlaması bir anlamda insan ve hayvan beslenmesinde kullanılan tarla tarımı ürünlerinin yetiştiriciliğinin güvence altına alınmasıdır denilebilir.

ABSTRACT

Considering that feed costs constitute 70% of the total inputs of livestock enterprises, the supply of affordable and high-quality roughage is critically important for livestock activities. Roughage sources are primarily obtained from pastures, meadows, and forage crop cultivation within agricultural fields. However, the misuse of pastures and meadows, overgrazing, and the effects of climate factors have decreased the quantity and quality of these areas. This situation has emphasized the necessity of forage crop farming.

Despite the importance of forage crops for both animal nutrition and soil improvement, breeding efforts targeting these crops have historically lagged behind compared to other plants. Significant advancements in plant breeding have been achieved with the development of modern molecular genetic methods, enabling the creation of more productive forage crop varieties. Turkey, located at the crossroads of the Mediterranean and Near East, is rich in genetic diversity for forage crops, providing an ideal environment for breeding activities.

In Turkey, forage crop breeding gained momentum with the establishment of the Pasture, Meadow, and Forage Crops Branch in 1952. Today, among the 3,834 registered field crop varieties in the country, 290 belong to forage crops. Alfalfa, Italian ryegrass, vetch, and forage pea are the most registered forage crops, with a prominent role played by the private sector in breeding activities for these species. Following 2010, the use of biotechnological methods in breeding has led to a significant increase in breeding activities.

The development of forage crop breeding in Turkey is crucial for sustainable agriculture. Supporting these studies and integrating biotechnological innovations will contribute significantly to the agricultural and livestock sectors in the future.

TÜRKİYE'DE YEM BİTKİLERİ ISLAH ÇALIŞMALARI

ÖZET

Türkiye'de yem maliyetlerinin hayvancılık işletmelerinin toplam girdilerinin %70'ini oluşturduğu göz önünde bulundurulduğunda, ucuz ve kaliteli kaba yem temini hayvancılık faaliyetleri için kritik öneme sahiptir. Kaba yem kaynakları temel olarak çayır, mera ve tarla tarımı içerisindeki yem bitkileri yetiştiriciliğinden elde edilmektedir. Ancak, çayır ve mera alanlarının tekniğine uygun kullanılmaması, ağır otlatma ve iklim faktörlerinin etkisiyle bu alanlardan elde edilen ot miktarı ve ot kalitesinü düşürmektedir. Bu durum, tarla tarımı içerisinde yem bitkileri tarımının gerekliliğini artırmaktadır.

Yem bitkilerinin hayvan beslenmesi ve toprak ıslahı açısından önemli olmasına rağmen, tarih boyunca bu bitkilere yönelik ıslah çalışmaları diğer bitkilere göre daha geç başlamıştır. Modern moleküler genetik yöntemlerin gelişmesiyle birlikte, bitki ıslahında önemli ilerlemeler kaydedilmiş ve yem bitkilerinde yeni çeşitler geliştirilmiştir. Türkiye, Akdeniz ve Yakındoğu geçiş bölgesinde bulunması nedeniyle yem bitkileri genetik çeşitliliği açısından zengin bir kaynaktır ve bu bitkilerin ıslahı için ideal bir ortam sunmaktadır.

Ülkemizde yem bitkileri ıslah çalışmaları, tarım Bakanlığı bünyesinde 1952 yılında Çayır, Mera ve Yem Bitkileri Şubesinin kurulmasıyla hız kazanmıştır. Günümüzde 3834 tescilli tarla bitkisi çeşidi arasında 290 yem bitkisi çeşidi yer almaktadır. Yonca, tek yıllık çim, fiğ ve yem bezelyesi en fazla tescil edilen yem bitkileri olup, bu türlerde özel sektörün ıslah çalışmaları daha belirgindir. 2010 sonrası dönemde biyoteknolojik yöntemlerin kullanımıyla ıslah faaliyetlerinde önemli bir artış gözlenmiştir.

Türkiye'de yem bitkileri ıslahının geliştirilmesi, sürdürülebilir tarım için hayati öneme sahiptir. Bu alandaki çalışmaları desteklemek ve biyoteknolojik yenilikleri uygulamak, gelecekte tarımsal üretime katkı sağlayacaktır.

Anahtar Kelimeler: Yem Bitkileri, Yem Bitkileri Islahı, Türkiye'de Yem Bitkileri Islahı

1. GİRİŞ

Yerleşik hayatla birlikte başlayan tarım faaliyetleri, insanların temel besin kaynaklarının üretimini sağlamaktadır. Tarım, insanların ihtiyaç duyduğu besin maddelerini üretme sürecidir ve bu süreç, taze meyve ve sebzeler, tahıllar, baklagiller, et ve süt ürünleri gibi çeşitli gıda kaynaklarının elde edilmesini sağlar. Bu gıdalar, vücudun günlük enerji ihtiyacını karşılamanın yanı sıra, protein, vitamin, mineral ve lif gibi hayati besin maddelerini de sağlar. Dengeli ve sağlıklı bir beslenme, doğrudan tarım faaliyetleri ile ilişkilidir. Dengeli ve sağlıklı bir beslenme için, insanların hem bitkisel hem de hayvansal kaynaklı gıdaları yeterli miktarda tüketmeleri gerekmektedir. Gelişmiş ülkelerde insanların sağlıklı ve dengeli olarak beslenmesinde hayvansal proteinlerin payının artırılması, temel bir hedef haline gelmiştir. Yapılan araştırmalarda yetişkin bir insanın günlük 70 gr protein tüketmesi ve bunun %40'ının hayvansal kaynaklı proteinlerden oluşması gerektiği belirtilmektedir (Yeditepe Hastaneleri, 2025). Hayvansal proteinler, insan beslenmesinde hayati öneme sahip makro besin maddeleridir. Vücut fonksiyonlarının düzgün çalışması, hücrelerin yenilenmesi ve genel sağlığın sürdürülmesi için gereklidir. Bu protein kaynakları, yüksek biyoyararlanım oranlarına sahiptir ve vücudun ihtiyaç duyduğu tüm esansiyel amino asitleri içerirler. Hayvansal proteinler, bitkisel proteinlerle karşılaştırıldığında, daha yüksek kaliteli proteinler olarak kabul edilir. Hayvansal protein kaynakları arasında et, balık, yumurta ve süt ürünleri gibi gıdalar yer alır ve bu gıdaları elde etmenin yolu hayvancılık faaliyetleridir.

Tarımsal faaliyetler içerisinde yer alan hayvancılık; çeşitli evcil hayvanları besleme, onların ürünlerinden ve gücünden yararlanma işlerini kapsamaktadır (Şahin ve Doğanay, 2000 s.256). İnsanlığın en eski ekonomik faaliyetlerinden biri olan hayvancılık, günümüz dünyasında çok yönlü bir ekonomik sektöre dönüşmüştür. Nüfusun gıda ihtiyacı ve istihdamını sağlayan hayvansal üretim maddeleri; aynı zamanda sanayinin birçok alanında hammadde olarak kullanılmaktadır. Ayrıca, hayvansal üretim maddeleri, ihracat potansiyeli bakımından ülkelerin ekonomik kaynakları arasında önemli bir yer tutmaktadır. Hayvancılık, ülke ekonomisini geliştiren, birim yatırıma en yüksek katma değer oluşturan ve en düşük maliyetle istihdam imkânı sağlayan bir sektördür (Demir, 2012). Günümüzde hayvancılık bütün dünyada özellikle de gelişmiş ülkelerde önemli bir endüstri haline gelmiş ve ekonominin ayrılmaz bir parçası olmuştur.

Bununla birlikte hayvancılığı etkileyen ıslah, pazarlama, araştırma, bakım ve idare, besleme gibi birçok faktör bulunmaktadır. Ancak bunların en önemlisini yem üretimi oluşturmaktadır. Bir hayvancılık işletmesinin toplam girdilerinin %70'ini yem maliyeti oluşturduğu düşünüldüğünde hayvancılık faaliyetleri için yem teminin önemi ortaya çıkmaktadır (Tarım ve Orman Bakanlığı (TOB), 2025). Bu konuda hem nispi olarak ucuz olan hem de ruminantların sindirim faaliyetlerini olumlu yönde etkileyen kaba yemler, bu yemlerin kaynakları ve alternatif kaba yem kaynakları ön plana çıkmaktadır (Özkan ve Şahin Demirbağ, 2016). Kaba yem; doğal halde %14'ten daha fazla su içeriğine ya da kuru maddede %16-18'den daha yüksek ham selüloz içeriğine sahip olan her tür materyaldir. Hayvancılık için en önemli ve en ucuz yem kaynağı kaba yemler otçul hayvanların rasyonlarının ana kısmını oluşturan doğal şartlarda yetişen düşük enerjili yemlerdir. Aynı zamanda kaba yemler; geviş getiren hayvanların beslenme fizyolojilerine uygun olup hayvanlarda mekanik tokluk sağlaması tarafıyla büyük öneme sahiptir.

Kaliteli kaba yem, çayır ve meralar ile tarla tarımı içerisindeki yem bitkileri yetiştiriciliği olmak üzere iki önemli kaynaktan sağlanmaktadır. Çayır ve meralar hayvan beslenmesinde çok önemli kaba yem kaynaklarıdır. Aynı zamanda flora ve fauna çeşitliliğinin ve gen kaynaklarımızın gelecek nesiller için korunması, tarımsal faaliyetlerin ve hayvancılığın etkili bir şekilde sürdürülmesi için, korunması ve geliştirilmesi mutlak suretle gerekli olan alanlardır. Fakat çayır ve mera alanlarının amaç dışı kullanımı, ağır otlatma, iklim faktörleri gibi sebeplerle günden güne bu alanların yeterliliği ve kalitesi azaltmaktadır. Hem çayır ve mera alanlarının yetersiz gelmesi hem de bu alanlardan yıl boyu üretim yapılamaması yem bitkileri tarımını zorunlu kılmıştır.

2.YEM BİTKİLERİNİN ÖNEMİ VE KÜLTÜRE ALINMASI

Yem bitkisi, hayvan yemi olarak yetiştirilen, ancak bunun yanında toprak ve suyu muhafaza etme, ekim nöbeti içerisinde kendinden sonra gelen ürünlerin verimini artırma özellikleri taşıyan, doğrudan doğruya veya sonradan yedirilmek üzere hasat edilerek kurutulan veya silajı yapılan bitkilerdir (Bilgili, 2018). Kaba yem olarak tanımlanan yem bitkileri en ucuz besin kaynağıdır. Hayvanların mide mikroflorası için lüzumlu besin maddelerini içermektedir. Mineral ve vitamin kaynağı olmaları nedeniyle hayvanların verim ve üreme performanslarını etkilerler. Yem bitkilerinin yem olma niteliğinin yanında daha birçok faydalı yönleri vardır. Tarımsal üretimin esas kaynağı olan toprağın yerinde tutulmasında yani toprak ve su erozyonlarının önlenmesinde en etken silahtır. Özellikle baklagiller ailesinden olan yonca, korunga ve fiğ gibi yem bitkileri, azot fiksasyonu vasıtasıyla, havanın serbest azotunu toprağa aktararak hiçbir zararlı yan etkisi bulunmayan tabii bir gübreleme yaparlar. Aynı zamanda toprağın derin tabakalarında çözünmez halde bulunan bazı besin elementlerini (fosfor gibi) çözündürüp, toprağın üst tabakalarına taşıyarak kendinden sonra gelecek ürün için hazır hale getirirler. Başka yabancı otların gelişmesine müsaade etmezler. Böylece girmiş oldukları ekim nöbeti sistemi (münavebe) içerisinde toprak verimliliğini artırarak kendinden sonra gelen ürünün hem veriminin artmasına hem de kaliteli ve lezzetli ürünlerin üretilmesine imkân sağlarlar. Buğdaygil ve baklagil yem bitkileri ekildikleri toprakları yalnız verimli hale getirmekle kalmazlar. Aynı zamanda bol miktarda bırakmış oldukları kök ve toprak üstü artıkları ile toprağın organik madde miktarını artırarak yapısını düzeltirler. Toprağın organik madde yönünden zenginleşmesi ise, özellikle yağışı az olan yerlerde çok önemli husus olan toprağın su tutma ve besin maddeleri kapasitesini artırır (Şeker, 2002).

Gerek hayvan beslenmesi açısından gerekse de toprak ıslahı açısından bu denli önemli olmasına rağmen, yem bitkilerinin önemi oldukça geç fark edilmiştir. İnsanoğlunun kendi beslenmesi için kullandığı bitkiler üzerindeki ıslah çalışmaları oldukça eskiye dayanmasına karşılık, günümüzde insanlar tarafından ekimi dikimi yapılarak hayvanların beslenmesinde kullanılan ve yem bitkisi olarak adlandırılan bitkilerin ıslahına ise gıda olarak kullanılan bitkilerin ıslahından çok daha sonra başlanılmıştır. Çünkü, günümüzde yem bitkisi olarak kullanılan bitkiler gıda olarak kullanılan bitkilere göre insanoğlu tarafından çok daha sonra kültüre alınmıştır. İnsanoğlunun göçebe yaşam tarzında yüzyıllarca daha çok doğal çayır meralara dayalı olarak beslediği hayvanlarını göçebe hayatını bırakıp yerleşik hayata geçmesiyle yerleşim yerindeki doğal meraların hayvanlar için yıl boyu yem üretememeleri nedeniyle yem bitkileri tarımı yaygınlaşmaya başlamıştır (Hatipoğlu ve ark., 2023).

Her ne kadar yem bitkileri gıda olarak kullanılan bitkilere göre daha geç kültüre alınmışlarsa da bazı yem bitkilerinin kültürü tarihin eski devirlerine kadar uzanmaktadır. Örneğin yoncanın 3000 yıl kadar önce Ön Asya'da tarımının yapıldığı bilinmektedir. MÖ 1400-1200 yıllarına ait Hitit tabletlerinde hayvanlara yonca yedirildiği kayıtlıdır. Arkeolojik bulgulara göre adi fiğ, burçak ve bezelye tarımı MÖ 6000-5000 yıllarına kadar inmektedir. Korunganın 1000 yıldan bu yana tarımı yapılmaktadır. Yunanlı yazarlar MÖ 500-250 yıllarında şalgam, acıbakla, çayır üçgülü ve fiğ türlerinin yeşil gübre ve toprak ıslah edici özelliklerinden bahsetmişlerdir (Hatipoğlu ve ark., 2023).

Yem bitkilerinin geniş olarak kültüre alınması Avrupa medeniyetinin bir ürünüdür. İngiltere'de kuru ot üretimi MÖ 750 yıllarına dayanmaktadır (Açıkgöz, 2021). Ancak, İngiltere'de kapalı meraların MS 800'lerde kurulmaya başlanması, daha sonra 1400'lerde "ley farming" in temeli olan 2 yıl buğday-5 yıl mera ekim nöbetinin başlaması ile yem bitkilerine özellikle buğdaygillere talebi artırmıştır. Büyük bir olasılıkla bu meralarda ilk kez İngiliz çimi ekimi yapılmıştır. Avrupa'da başta çayır üçgülü ve çim türleri olmak üzere yem bitkilerinin tarımı 16. yüzyılda yayılmıştır. Çayır üçgülü gerçek anlamda ilk kez 1550 yıllarında İtalya'da kültüre alınmış, 1650'lerde İngiltere'de tanınmıştır. Ardından ak üçgül ve gazal boynuzu tarımına başlanmıştır. Avrupa'da tarımına başlanan serin mevsim baklagil ve buğdaygil yem bitkileri 19. yüzyılda Amerika kıtasına götürülmüştür. Rodos otu ilk kez Güney Afrika'da 1895 yılında kültüre alınmış, 1900'lü yıllarda Avustralya ve ABD'ye götürülmüştür. ABD'de Sudan otu tarımına 1909 yıllarında Sudan'dan gelen tohumlarla başlanmıştır. Ayrık ve brom türlerinin tohumları 1900'lü yıllarda Doğu Avrupa ülkelerinden getirilmiştir. Nohut geveni, alaca taç otu gibi bazı bitkiler ise son yıllarda kültüre alınmışlardır (Hatipoğlu ve ark., 2023).

3.ISLAH ÇALIŞMALARININ TARİHSEL GELİŞİMİ VE MODERN YEM BİTKİLERİ ISLAH YÖNTEMLERİ

İstenilen amaca yönelik ve bir hedef doğrultusunda bitki cins, tür ve çeşitlerinin genomik bilgisini, genetik ve sitogenetik yöntemlerden yararlanarak planlı şekilde değiştirme ve geliştirmeye bitki ıslahı denir (Tosun, 2015). Kromozom sayısı, kromozomların morfolojisi ve benzerlikleri türler arasındaki ilişkiyi açıklamada, bitkilerin taksonomisini belirlemede, karyotiplerinin incelenmesinde ve genetik sisteminin fiziksel olarak gösteriminin sağlanmasında bilgi vermektedir (Öz, 1995).

Bitkilerin kültüre alınması ile başlayan bitki ıslahı, başlangıçta, gıda ve giyinme amaçlı hedef bitkilerin seçimine yönelik faaliyetleri kapsarken; zamanla daha fazla verim, süsleme, boyama ve beğeni gibi çoğalan ve farklılaşan ihtiyaçlara yönelik olarak çeşitlenmiş ve genetik yanında daha önce kullanılmayan çok farklı bilim dallarının da dahil edildiği faaliyetler haline dönüşmüştür (Oğlakçı ve Tiryaki, 2014).

Islahçı ve araştırmacılar, çalışmalarında kullanım amacına bağlı olarak, kültürü yapılan bitki genotiplerinde gördükleri eksik ya da fazla bitkisel karakterleri tamamlama ya da elemine etme yoluna gitmişlerdir. Islahçılar, bu süreç içerisinde karşılaştıkları sorunları çözümleme yanında, mevcut bitkisel ürünleri çeşitlendirme ya da günümüz ihtiyaçlarına yönelik yeni bitkilerin kültüre alınması imkân ve olanaklarını da bulmak zorunda kalmışlardır (Oğlakçı ve Tiryaki, 2014).

Başlangıçta sanatsal veya eksperlik yönleri daha etkin olan bitki ıslahı çalışmalarında, hücre yapısı ve bitki fizyolojisi alanında ortaya konulan yeni bilgiler, gen ve kalıtıma yönelik genetik ilkelerin ortaya konması, ıslah çalışmalarının bilimsel yönünü kuvvetlendirmiştir. Modern teknolojilerin canlı organizmalara uygulanabilir hale gelmesi ile birlikte biyoteknolojik yöntemler geliştirilmiş ve bunlar ilgili ıslah programlarına entegre edilmeye başlanmıştır (Oğlakçı ve Tiryaki, 2014).

Geçen yüzyılın sonları ve bu yüzyılın başlarında moleküler genetik alanında kaydedilen ilerlemeler, bitki ıslahçılarının inceledikleri bitkisel karakterleri daha önceden hayal edemeyecekleri seviyelerde inceleme ve saptama olanağı tanımıştır. Bu nedenle, günümüz bitki ıslahçıları, kendilerinden önce bu alanda çalışan bilim insanlarının sahip olmadığı yeni yöntemler ve teknikleri, yürüttükleri ıslah programlarına uyumlu hale getirmek ve ilgili bilim dallarından yararlanmak durumundadırlar (Begley ve Hill, 2010).

Bu kapsamda, bu uygulamaların başında bitki biyoteknolojisi gelmektedir. Genetik mühendisliği ve rekombinant DNA teknolojisi, geliştirilecek yeni bitki çeşitlerinin daha etkin ve kısa bir sürede elde edilmesine imkân tanırken, birçok farklı bilim dalını da bitki ıslahçısının çalışmalarına entegre etmeleri ve bu bilim dallarında da uzmanlaşmaları gerekmektedir (Begley ve Hill, 2010).

Son yıllarda büyük bir hızla üretilen moleküler verilerdeki artışlar günümüzde devasa boyutlara ulaşmıştır. Bitki ıslahı açısından, üretilen bu moleküler bilginin var olan ya da geliştirilecek yeni teknoloji ve bilim dalları ile ıslah programlarına adaptasyonu gerekmektedir (Oğlakçı ve Tiryaki, 2014).

Hücre doku ve organelleri ve tüm canlı organizmanın moleküler seviyedeki davranışlarının bilimsel temellerini anlamaya çalışan yeni Omiks (omics) teknolojilerinden: Genomiks (genomics) (organizmaların genomik yapısını inceleyen bilim kolu) (gen ve gen fonksiyonlarının çalışıldığı), Proteomiks (Proteomics) (protein ve genom terimlerinin birlikte ifadesi) (organizmanın yaşamsal faaliyetlerinde rol alan proteinlerle ilgili) ve Sistem Biyolojisi (System Biology), Biyoinformatik (Bioinformatik) ve bilgisayar araçlarının etkin kullanılabilirliği, bitki ıslahçılarının yakın zamanda fazlaca karşılaşacakları yeni teknolojiler ve bilim dalları olarak karşımızda durmaktadır (Begley ve Hill, 2010).

4.TÜRKİYE YEM BİTKİLERİ GENETİK KAYNAKLARI

Genetik kaynaklar bitkilerde performansların artırılması ve yeni çeşitlerin geliştirilmesi amacıyla yabani ve modernize olmuş çeşitleri de içeren temel canlı kaynaklar olarak tanımlanmaktadır (Şakiroğlu, 2010). Bu kaynaklar özellikle ülkelerin tarımsal anlamda geliştirilmesinde önemli bir role sahiptirler.

Dünyanın çok farklı yerlerine dağılan bitkiler değişik iklim ve toprak koşullarına adaptasyon sağlayarak çok geniş bir varyasyon ve çeşitliliğin meydana gelmesine neden olmuştur. Böylelikle oluşan yerel popülasyonlar ile doğal florada bulunan türler ve yabani akrabalarından oluşan bitki kaynakları biotik ve abiotik streslere dayanımın kaynaklarını sağlamaktadır (Harlan, 1965). Bitki ıslahının yegâne kaynağı olan bitki genetik kaynaklarının korunması, değerlendirilmesi ve kullanılması önem arz etmektedir (Şehirali ve Özgen, 1987; Özgen ve ark., 2000; Tan, 2009; Tan, 2010).

Bitki ıslahı için geniş bir genetik tabana ihtiyaç olduğuna ilk kez Rus genetikçi N.I. Vavilov değinmiştir. Vavilov ve arkadaşları dünyanın tüm bölgelerinden kültürü yapılan bitkileri ve bunların yabani akrabalarını toplamışlardır. Bunlar üzerinde yapılan çalışmalardan sonra Vavilov 8 ana, 3 yan gen merkezi belirlemiştir. Bunlar üzerinde bazı değişiklikler yapılmakla birlikte, Vavilov'un teorisi halen geçerliliğini sürdürmektedir. Yem bitkisi türlerinin gen merkezleri oldukça çeşitli olmakla beraber, çoğu eski dünya kökenlidir (Yem Bitkileri Islahı, 2025).

Akdeniz ile Yakındoğu arasında bir geçit olan ülkemiz birçok yem bitkisinin doğal yetişme alanı içerisinde yer almaktadır. Ilıman bölge yem bitkilerinin hemen hemen tamamı ülkemizde doğal olarak yetişmektedir. Bu nedenle bu yem bitkilerinin ıslahı için Türkiye iyi bir kaynak durumundadır (Yem Bitkileri Islahı, 2025). Türkiye, çeşitli araştırıcılar tarafından tanımlanan gen merkezleri ve orijin merkezlerinin hepsinde yer almaktadır (Harlan, 1951; Zohary, 1970; Harlan, 1971; Paroda ve Arora, 1991). Bunun yanında bir çok bitki türü için ilk ya da ikincil farklılaşma merkezi olması Türkiye'nin doğal florasının bitki genetik kaynakları açısından zengin kaynaklara ve potansiyele sahip olduğunu göstermektedir. Harlan (1971), ülkemizi buğday, nohut, bezelye, mercimek, fiğ gibi birçok bitkinin ilk kültüre alındığı yer olarak bildirmiştir. Davis (1970), Türkiye'de yalnızca baklagillere ait 900 türün var olduğunu belirtirken, bunlardan 6 adet fiğ, 11 adet üçgül, 3 adet mürdümük ve 1 adet yonca türünün de Türkiye için endemik bitkiler arasında yer aldığını saptamıştır. Cocks (1999), 372 tür geven (Astragalus), 94 tür üçgül (Trifolium), 59 tür fiğ (Vicia), 58 tür mürdümük (Lathyrus), 46 tür korunga (Onobrychis) ve 30 tür yoncanın (Medicago) Türkiye florasında tespit edildiğini belirtmiştir. Bitki genetik kaynakları konusunda ülke çapında çalışmaların yürütülmesinden sorumlu olan Ege Tarımsal Araştırma Enstitüsü (ETAE)'nde 1964-1997 yılları arasında 8364 adet baklagil ve buğdaygil yem bitkisi toplanmıştır. Miktar bakımından uzun süreli saklama için yeterli olmayanlar ile generatif muhafaza ünitesinde miktarı azalan ya da çimlenme güçleri düşen tohum örneklerinde üretim-yenileme çalışmaları yapılmıştır (Sabancı ve ark., 1999).ETAE tarafından tescil ettirilen adi fiğ (Vicia sativa), tüylü fiğ (Vicia villosa) ve macar fiği (Vicia pannonica) çeşitleri, Türkiye'nin değişik yörelerinden toplanan materyal kullanılarak seleksiyon yöntemi ile geliştirilmişlerdir (Ürem, 1985; Sabancı, 1994; Sabancı ve ark., 1995). Kurt ve ark. (1990) mera ıslahında kullanılabilecek potansiyele sahip tek veya iki yıllık yonca türleri olan Medicago rigidula, M. turbinata, M. lupulina üzerinde çalışmışlardır. Fırıncıoğlu ve ark. (1996) Orta Anadolu Bölgesinde yazlık olarak yetiştirilen çiftçi popülasyonlarının kullanıldığı denemelerde fiğ (Vicia sativa), burçak (Vicia ervilia), koca fiğ (Vicia narbonensis) ile mürdümük (Lathyrus sativus), nohut mürdümüğü (Lathyrus cicera) türlerinin değişik özelliklerini incelemişlerdir. Türkiye'de doğal floradan topladıkları domuz ayrığı (Dactylis glomerata) popülasyonları üzerinde çalışan araştırıcılar değişik özelliklerini belirledikleri bitkilerin seleksiyon çalışması yapılarak kültüre alınmalarını önermişlerdir (Tükel ve Hatipoğlu, 1994; Tosun ve Sağsöz, 1994; Sağsöz ve ark., 1996).

Bununla birlikte ülkemizde iki adet gen bankası bulunmaktadır. Bunlardan ilki Ege Tarımsal Araştırma Enstitüsü (ETAE) `nde uluslararası standartlarda Ulusal Tohum Gen Bankası'dır. Burada ıslah edilmemiş kültür bitkileri çeşitleri (köy çeşitleri), bunların yabani akrabaları, ekonomik önemi olan yabani bitkiler ve doğal florada mevcut diğer bitki türlerinin (endemik türler dahil) kaybolma tehlikelerine karşı takibi, gözlem altında tutulmaları ve toplanması; uzun süreli muhafazası (exsitu ve insitu), karakterizasyonu, değerlendirilmesi ve bunlara ilişkin tüm

bilgilerin dokümantasyonu yapılmaktadır. Değişik bitki gruplarından 55 bini aşkın tohum örneği burada saklanmakta, bu bitkilerin birçoğunun herbaryum örnekleri de mevcut bulunmaktadır. 5000`in üzerinde vejetatif materyal ise muhafaza bahçeleri şeklinde oluşturulan arazi gen bankalarında muhafaza edilmektedir. Ayrıca yerinde muhafaza (insitu) çalışmaları da yürütülmektedir. Bu merkez, tohum bankası bakımından dünya genelinde 12. sırada yer almakta olup, bu bitkisel ürünler açısından bir garanti görevi üstlenmektedir. Diğer gen bankamız 30 Mart 2010 tarihinde Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğüne bağlı Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü bünyesinde açılışı yapılan Türkiye Tohum Gen Bankası'dır. Bu merkez kapasite bakımından dünyada 2. en büyük gen bankasıdır. Bankanın faaliyetlerine 10 bin adet tohum örneğiyle başlanmış olup, toplam kapasitesi 300 bin adettir. Öncelikle bitki tohumlarının burada kayıtları yapılmakta, ayrıca kısa, uzun ve orta dönemde kullanımını sağlamak üzere değişik sıcaklıklarda koruma altına alınmaktadır. Ancak her iki gen bankamızda şu an itibariyle kapasitelerinin çok altında hizmet vermektedirler. Çok değişik destek kaynaklarıyla yapılan toplama projeleri ile ülkemizde bulunan bitki türleri toplanmaya devam etmektedir. Bu çalışmalar sonucunda toplanan tüm örneklerin yukarıdaki gen bankalarımıza gönderilerek koruma altına alınması çok büyük önem taşımaktadır. Bu konuda gerekli yasal altyapının oluşturulması gen kaynaklarımızın korunması konusunda büyük önem arz etmektedir (Yem Bitkileri Islahı, 2025).

5.DÜNYA'DA VE TÜRKİYE'DE YEM BİTKİLERİ ISLAH ÇALIŞMALARININ TARİHSEL GELİŞİMİ

Yem bitkilerinde modern ıslah yöntemleri ilk kez 20. yüzyılın başlarında İngiltere'de uygulanmıştır (Açıkgöz, 2021). Welsh Bitki Islah istasyonunda çok geniş buğdaygil koleksiyonu ile ıslah çalışmalarına başlanmıştır. 1930-40 yılları arasında S26 domuz ayrığı, S23 ve S24 İngiliz çimi, S100 ak üçgül ve S123 çayır üçgülü çeşitleri ıslah edilmiştir. Bu çeşitler 50 yıl süre ile üretimde kalmışlardır. Benzer çalışmalar, aynı yıllarda, Svalöf Araştırma Enstitüsünde (İsveç) uygulanmıştır. ABD'de ilk kez Minnesota Üniversitesinde Çayır Kelp Kuyruğu ıslahı başlamış, daha sonra, Cornell ve Minnesota Üniversiteleri (ABD), Saskatchewan Üniversitesi ve Swift Current Araştırma Enstitüsü (Kanada)'nde yem bitkileri ıslahına özellikle 1950'lerden sonra hız verilmiştir. ABD ve Kanada'nın kışları çok sert ve kurak geçen kuzey bölgelerinde serin mevsim baklagil ve buğdaygil yem bitkilerinin ıslahı ön plana alınmıştır. Örneğin, *Agropyron* türleri üzerinde çalışmalar 1920'li yıllarda başlamış, 1932 yılında Kanada'da diploid Fairway ve ABD'de 1953 yılında tetraploid Nordan çeşitleri ıslah edilmiştir. Bu iki çeşit ABD ve Kanada'da halen üretimde kullanılmaktadır. Daha sonra yapılan ıslah çalışmalarında kurak ve soğuk bölgeler için serin mevsim yem bitkilerinden birçok yeni çeşit ıslah edilmiş ve tarıma kazandırılmıştır. ABD'nin güney eyaletlerinde ise sıcak mevsim yem bitkilerine ağırlık verilmiştir. Örneğin, Köpekdişi ayrığı ABD'nin güney eyaletlerinde pamuk ve mısır tarımında yabancı ot olarak nitelenirken, 1943 yılında Coastal F1 çeşidi ıslah edilmiştir. Rizom ile kolayca üretilen bu çeşit tüm Güney ABD eyaletlerine yayılmıştır. Daha sonraki yıllarda; verim, hastalık ve zararlılara dayanıklılık ve kalite özellikleri yönünden üstün birçok yeni Köpekdişi Ayrığı çeşidi ıslah edilmiştir. Bugün bu çeşitler çok geniş alanlarda özellikle otlatma amacı ile yetiştirilmektedir (Hatipoğlu ve ark. 2023).

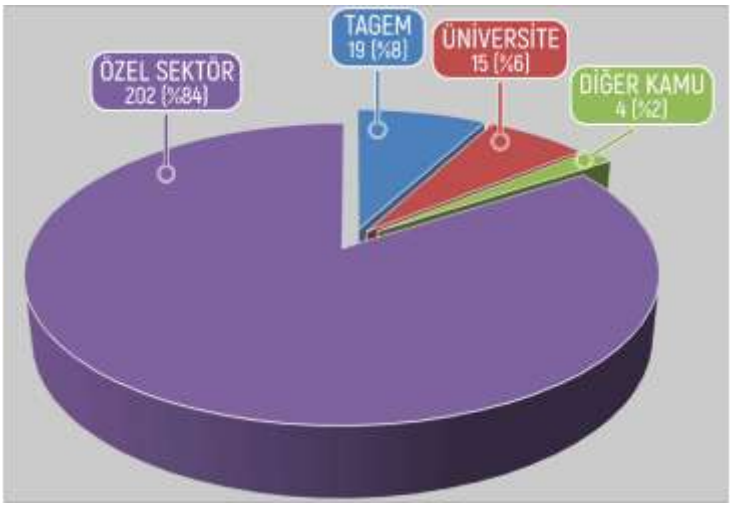
2021 yılı verilerine göre dünyada 731.8 milyon dolar tutarında yem bitkileri tohumu ihracatı ve 706.2 milyon dolar tutarında yem bitkileri tohum ithalatı yapılmıştır. Dünyada en fazla yem bitkisi tohumu ihraç eden ülkeler ABD, Danimarka ve Hollanda, en fazla yem bitkisi tohumu ithal eden ülkeler ise Hollanda, Fransa ve Almanya olmuştur (Hatipoğlu ve ark. 2023).

Türkiye'de bitki ıslahı çalışmaları 1926 yılında Ankara ve Eskişehir'de tohum ıslah istasyonlarının kurulmasıyla başlamıştır. Bu istasyonlarda 1950'li yıllara kadar daha çok tahıllarda çeşit geliştirme çalışmaları yapılmıştır. Yem bitkileri ıslahı çalışmaları ise 1952 yılında Tarım Bakanlığı bünyesinde Çayır, Mera ve Yem Bitkileri Şubesinin kurulması ile hızlanmıştır (Avcı, 2013). 1961 yılında Adana'da Çayır, Mera ve Yem Nebatları Tohum Üretme Merkezi Müdürlüğü kurulmuş ve bu kuruluş 1964 yılında Yem Bitkileri Üretme ve Zootekni Deneme İstasyonu Müdürlüğü adını almıştır. Söz konusu kuruluş ve Eskişehir Tohum Islah İstasyonu'nda yerli ve yabancı kaynaklardan temin edilen yem bitkisi tür ve çeşitlerine ait tohumlarla adaptasyon denemelerine başlanmıştır. 1964 yılında bugünkü adıyla Geçit Kuşağı Tarımsal Araştırma Enstitüsünde yapılan seleksiyon çalışmaları sonucu Sazova adıyla bir yonca çeşidi tescil ettirilmiştir. 1965 yılında kurulan Çayır, Mera Zootekni Araştırma Enstitüsü başta olmak üzere, 1963 yılında kurulan Ege Tarımsal Araştırma Enstitüsü, 1969 yılında kurulan Doğu Anadolu Tarımsal Araştırma Enstitüsü ve Merkez Tarla Bitkileri Araştırma Enstitüsünde yapılan seleksiyon çalışmaları sonucu bir yıllık baklagil yem bitkilerinde çok sayıda çeşit geliştirilmiştir.

6.TÜRKİYE TOHUM TESCİL VE ISLAH MERKEZLERİ

Ülkemizde, tohumluk sertifikasyonu ile ilgili faaliyetlere ilk olarak Ankara Üniversitesi Ziraat Fakültesi'nde başlanmıştır. Daha sonra, aynı amaçla 1959 yılında "Tohumluk Kontrol ve Sertifikasyon Enstitüsü" kurulmuş ve bu tarihten itibaren tohumluk sertifikasyonu ile ilgili hizmetler bu enstitü tarafından yürütülmüştür. Ülkemizde araştırma ve geliştirme faaliyetlerinin bir sonucu olarak yeni çeşitlerin ortaya konulması ve bu çeşitlerin tarafsız bir kuruluşça tescil edilmesi gereği üzerine 1960 yılında "Bölge Çeşit Deneme Enstitüsü" kurulmuştur. Aynı yıllarda ülkemizde tohumluk sertifikasyon hizmetlerini yaygınlaştırmak amacıyla Samsun, İstanbul, İzmir, Antalya ve Mersin'de tohumluk sertifikasyon laboratuvarları kurulmuştur. 21.08.1963 tarihinde 308 Sayılı "Tohumlukların Tescil, Kontrol ve Sertifikasyonu Hakkında Kanun" kabul edilmiş ve tohumlukların sertifikasyonuna ilişkin faaliyetler bu Kanun hükümlerine göre yürütülmüştür. Aynı yıl Ülkemiz ISTA'ya (Uluslararası Tohum Test Birliği) üye olmuştur. 1966 yılında ise sırasıyla şekerpancarı, hububat, mısır, ayçiçeği, soya, pamuk ve çayır, mera ve yem bitkilerinde OECD (Ekonomik Kalkınma ve İşbirliği Teşkilatı) tohumluk sertifikasyon sistemine dahil olmuş, 18 Kasım 2007 tarihi itibariyle de UPOV'a (Uluslararası Yeni Bitki Çeşitlerini Koruma Birliği) üye olmuştur. Tarım ve Köy İşleri Bakanlığı'nın teşkilat ve görevleri hakkındaki 3161 sayılı Kanun çerçevesinde 01.08.1986 tarihinde yapılan reorganizasyon sonucunda "Tohumluk Kontrol ve Sertifikasyon Enstitüsü" ve "Bölge Çeşit Deneme Enstitüsü" birleştirilmiştir. 01.01.1987 tarihinde yapılan yeni düzenleme ile Kuruluş "Tohumluk Tescil ve Sertifikasyon Merkez Müdürlüğü" olarak bugünkü adını almıştır (Tarım ve Orman Bakanlığı, 2025). Günümüzde Tarım ve Orman Bakanlığına bağlı olarak Tohumluk Tescil ve Sertifikasyon Merkez Müdürlüğü tarafından tohum ıslah çalışması yürüten kurum ve kuruluşlar yetkilendirilmekte ve kayıt altına alınmaktadır. Hali hazırda ıslah ve çeşit geliştirme

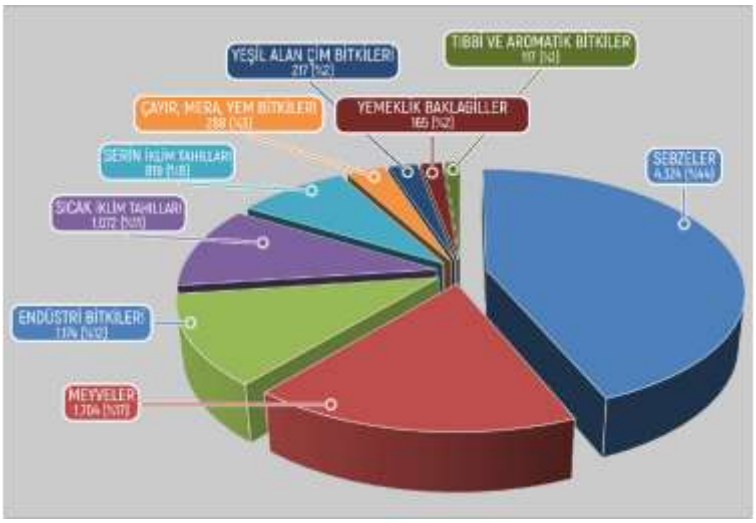
faaliyetleri yürütebilecek statüde yetkilendirilmiş ve kayıt altına alınmış 240 kurum ve kuruluş bulunmaktadır. Bu kuruluşlardan 202 tanesi özel sektör kuruluşu olmakla birlikte 15 tanesi üniversite kuruluşu, 19 tanesi Tarım ve Orman Bakanlığı Tarımsal Araştırmalar Genel Müdürlüğü'ne bağlı enstitü ve araştırma istasyonu ve 4 tanesi de diğer kamu kurumlarına bağlı kuruluşlardır (Şekil 1).



Şekil 1. Çeşit Geliştirme Faaliyetleri İçin Yetkilendirilmiş Kuruluşlar (TTSM, 2025)

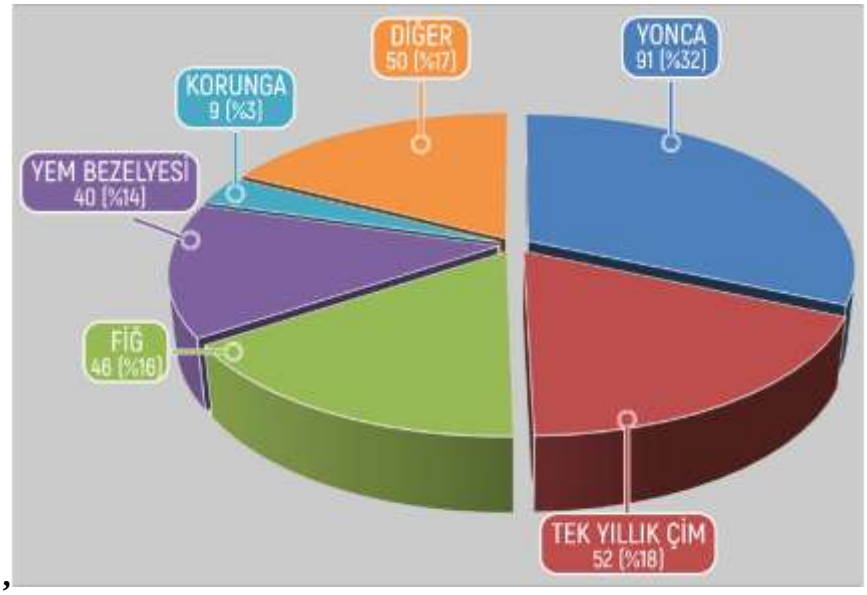
7.YEM BİTKİLERİNDE TESCİLLİ ÇEŞİTLER

Tarım ve Orman Bakanlığı, Tohum Tescil ve Sertifikasyon Müdürlüğü (TTSM) tarafından yayımlanan Milli Çeşit Listesinde ülkemizde tescil edilmiş 9880 adet çeşitten 3852 adedi tarla bitkilerine ait olup bunlardan 288 adedi çayır, mera ve yem bitkileridir (Şekil 2).



Şekil 2. Ürün Gruplarına Göre Çeşit Sayıları (TTSM, 2025)

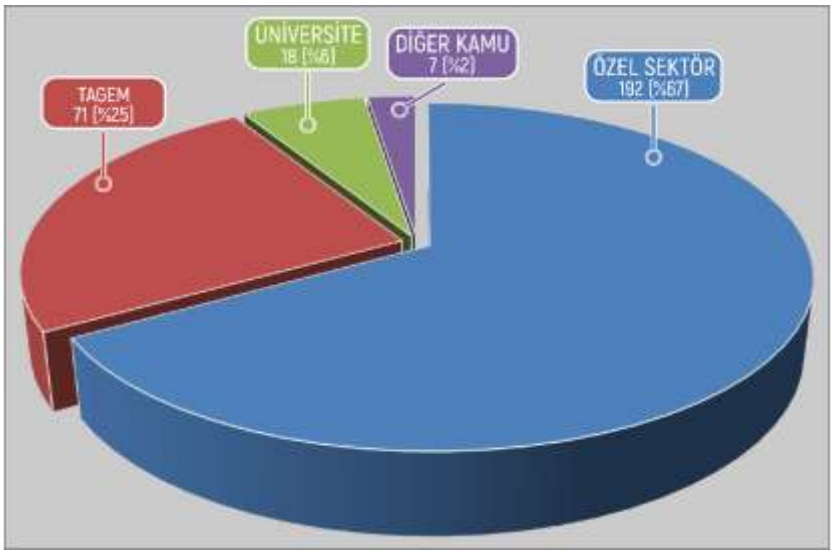
Çayır, mera, yem bitkilerinde türlere göre 91 adet tescilli çeşit sayısı ile yonca, 52 adet tescilli çeşit sayısı ile Tek Yıllık Çim, 46 adet tescilli çeşit sayısı ile Fiğ ve 40 adet tescilli çeşit sayısı ile Yem Bezelyesi en çok tescil edilen çeşitlerdir (Şekil 3). Yonca, tek yıllık çim, fiğ ve yem bezelyesi haricindeki diğer çayır, mera, yem bitkilerinde geliştirilen çeşit sayıları oldukça azdır. İklim değişikliğinin de etkisiyle su kaynaklarına ilişkin sorunlar, küresel anlamda ekonomik, sosyal ve çevresel boyutlarda problemlere neden olmaktadır. İklim değişikliği yanında, büyüme hızı ve su tüketim alışkanlıklarının değişmesiyle su kaynakları üzerindeki baskılar daha da artmaktadır. Bu sebeple, gelecek nesillere sağlıklı ve yeterli su bırakabilmesi için ülkemizde de kaynakların çok iyi korunup, akılcı kullanılması gerekmektedir. Yem bitkileri özellikle abiyotik stres faktörlerine karşı alternatif olabilecek birçok yem bitkisini türüne sahiptir. Ancak görüldüğü üzere alternatif yem bitkilerinin ıslah çalışmalarında yetersiz kalınmıştır.



,

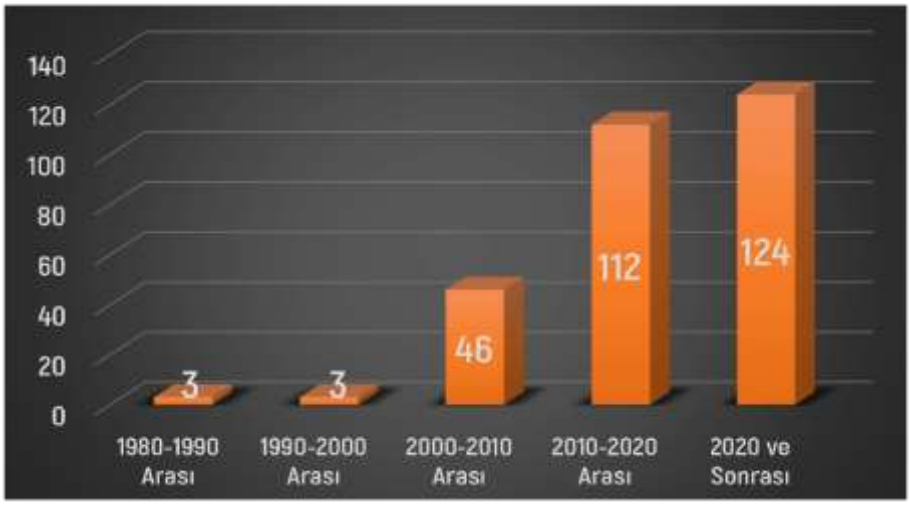
Şekil 3. Yem Bitkilerinde Türlere Göre Çeşit Sayıları (TTSM, 2025)

Bununla birlikte kurum ve kuruluş türüne göre tescil edilmiş çayır, mera, yem bitkileri grubundan çeşit sayılarına göre özel sektör 192 çeşit sayısına sahipken kamuya ait ıslah kuruluşlarının bunun oldukça gerisinde kaldığı görülmektedir. Kamuya ait ıslah kuruluşlarına ait tescil edilmiş 96 adet çeşidin 18 tanesi Üniversitelere bağlı kuruluşlar tarafından tescil ettirilmiştir (Şekil 4). Tüm dünyada olduğu gibi ülkemizde de üniversiteler eğitim, araştırma ve topluma katkı boyutlarını bir araya getirir. Bu yüzden üniversiteler ve üniversitelerde kurulan araştırma ve uygulama merkezlerinin kuruluş amaçları, toplumsal ihtiyaçları ve sorunları belirleme ve bu doğrultuda çözümler üretmektir. Ancak ıslah çalışmalarının ciddi bir altyapı ve kaynak gerektirmesi nedeniyle üniversiteler ıslah çalışmalarında gerektiği noktaya ulaşamamıştır. Kâr amacı gütmeyen kamu kurumları ve üniversitelere bağlı ıslah kuruluşlarının amaca ve konjonktüre uygun çeşit ıslahı noktasında desteklenmesinin stratejik öneme sahip olduğu düşünülmektedir.



Şekil 4. Tescil Sahibi Kurum Tipine Göre Tescil Sayıları (TTSM, 2025)

Çayır, mera, yem bitkilerinde tescil edilen çeşit sayılarının tarihsel gelişimine bakıldığında 2010 yılına kadar tescil edilmiş çeşit sayısının sadece 52 olduğu ancak 2010 sonrasında ciddi bir gelişme kat ederek yaklaşık 15 yıllık süreçte 200'den fazla yem bitkisi çeşidinin tescil edildiği görülmektedir (Şekil 5). Bu durumun ana nedeninin biyoteknolojik yöntemlerin yem bitkileri ıslahında geleneksel ıslah yöntemlerini tamamlayıcı araçlar olarak kullanılması ve moleküler tekniklerin yem bitkileri ıslahında kullanılmaya başlaması olarak değerlendirilmektedir.



Şekil 5. Yıllara Göre Yem Bitleri Çeşit Tescil Sayıları (TTSM, 2025)

8. SONUÇ

Türkiye, sahip olduğu coğrafi ve iklimsel çeşitlilik sayesinde yem bitkileri açısından yüksek potansiyele sahiptir. Ancak, bu zenginliğe rağmen ülkemizde işlenebilen tarım alanlarının yalnızca %11'inde yem bitkisi tarımı yapılmaktadır.

Ülkemizde yem bitkileri ıslah çalışmaları, Tarım Bakanlığı bünyesinde 1952 yılında Çayır, Mera ve Yem Bitkileri Şubesinin kurulmasıyla sistematik hale gelmiş ve zamanla ivme kazanmıştır. 2025 yılı itibarıyla Tarım ve Orman Bakanlığı Tohum Tescil ve Sertifikasyon Müdürlüğü (TTSM) verilerine göre, toplam 9880 tescilli bitki çeşidinden 3852'si tarla bitkisi, bunların 288'i ise çayır, mera ve yem bitkileri grubuna aittir. Bu çeşitler arasında 91 adet yonca, 52 adet tek yıllık çim, 46 adet fiğ ve 40 adet yem bezelyesi öne çıkmaktadır. Tescil edilen çeşitlerin %33'ü kamu kurumları tarafından geliştirilmiştir.

2010 sonrası dönemde modern ıslah tekniklerinin kullanımının yaygınlaşmasıyla birlikte tescilli çeşit sayısında belirgin bir artış yaşanmış; yalnızca 15 yıl içinde 200'den fazla yeni yem bitkisi çeşidi tescil edilmiştir. Bu gelişme olumlu bir tablo ortaya koymakla birlikte, ıslah çalışmalarının daha geniş bir tür yelpazesine yayılması gerekmektedir. Çayır, mera ve yem bitkileri ıslah çalışmaları özellikle kuraklığa toleranslı ve toprak ıslah edici özellikleri yüksek türler üzerine yoğunlaştırılmalıdır.

Yem bitkilerinin tohumlarının küçük olması, mekanizasyonunun tam gelişmemesi ve yeterli sayıda araştırmacının bulunmaması, bu alandaki ıslah çalışmalarının istenilen düzeye ulaşamamasına neden olmaktadır.

Tescil edilen çeşitlerin ticari haklarını alan firmaların yeterli düzeyde tohum üretmelerini sağlamak amacıyla yasal düzenlemelere ihtiyaç vardır. Tescilin ötesine geçerek tohum üretimi ve yaygınlaştırılması konusunda kamu-özel sektör iş birliği geliştirilmelidir.

Sonuç olarak, yem bitkileri ıslahına yönelik araştırma ve geliştirme altyapısının güçlendirilmesi, genetik kaynakların korunması ve değerlendirilmesi, üniversite ve kamu araştırma kuruluşlarının desteklenmesi ile birlikte; ülkemizde yem bitkileri tohumluk ithalatının azaltılması, yem bitkileri ekim alanlarının artırılması, sürdürülebilir hayvancılık ve tarım sistemine katkı sağlayacaktır.

ABSTRACT

Sarılop is the most important dried fig cultivar of Türkiye, and *Bursa Siyahı* is the most important table cultivar, and these two cultivars hold significant importance in the country's export. These cultivars are *Smyrna* type, and pollination is essential for fruit formation. Fertilization is achieved through a special process called caprification, which involves the transfer of caprific synconiums to female fig trees. However, the caprification process has several disadvantages, such as time sensitivity, difficulties in obtaining caprifig fruits, the risk of disease transmission, and the labor requirement. In many fruit species, plant growth regulators in the auxin group can be used to induce parthenocarpic fruit formation without fertilization.

This study primarily aimed to reveal the effects of two different doses (1000 ppm and 2000 ppm) of IBA (Indole-3-butyric acid), a plant growth regulator from the auxin group, on parthenocarpic fruit formation for competing for the disadvantages of the caprification process. Additionally, it aimed to test the validity of the common claims among fig growers that physical stimulation of ostiol and application of olive oil to ostiole may induce parthenocarpic fruit formation. For these aims, a randomized plots experimental trial with three replications was established at the central experimental orchard of the Fig Research Institute, located in İncirliova district of Aydın province. A total of 10 trees were used. Synconiums on selected branches from different orientations on trees were isolated on May 25 using a special tulle that prevents the passage of fig wasps (*Blastophaga psenes*). Four different treatments were carried out: (1) 1000 ppm IBA spray, (2) 2000 ppm IBA spray, (3) physical stimulation of the ostiole using a stiff brush, (4) physical stimulation combined with an olive oil application to the ostiole. All treatments were carried out by two repetitions on 25 and 31 May. The fruit set was monitored regularly after applications, and the final fruit counts were made 20 days after the region's current caprification date.

None of the treatments induced parthenocarpic fruit formation, and all synconiums dropped in *Bursa Siyahı* cultivar. In *Sarılop* cultivar, only the 2000-ppm IBA treatment resulted in parthenocarpic fruit formation with a percentage of 28.5%, similar to the specific fruit characteristics of the cultivar. However, since the high synconium drop rate due to this treatment, it is concluded that it is unsuitable for commercial use and cannot be an alternative to caprification. Furthermore, parthenocarpic fruits obtained from this treatment were compared with naturally pollinated fruits in terms of quality and drying characteristics. The study also revealed that neither physical stimulation of the ostiole nor the combination of stimulation with olive oil application had affected parthenocarpic fruit formation. Thus, the results of our study

concluded that the claims of growers regarding these ostiole stimulations are not scientifically correct.

Keywords: *Ficus carica* L., caprification, parthenocarpy, IBA, ostiol situmulation

IBA VE OSTİOL UYARIMI UYGULAMALARININ "SARILOP" VE "BURSA SİYAHI" İNCİR (*Ficus carica*) ÇEŞİTLERİNDE PARTENOKARPİK MEYVE OLUŞUMU ÜZERİNE ETKİLERİ

ÖZET

Türkiye'nin en önemli kurutmalık incir çeşidi olan *Sarılop* ile en önemli sofralık çeşidi olan *Bursa Siyahı*, ülke ihracatında büyük paya sahiptir. Bu çeşitler, "*Smyrna"* tipi incir grubuna dâhildir ve meyve tutumu için kesin döllenmeye ihtiyaç duyarlar. Döllenme, "ilekleme" adı verilen, erkek incir synconiumlarının dişi ağaçlara taşınması yoluyla sağlanmaktadır. Ancak ilekleme işlemi, ilek meyvelerinin temin zorlukları, hastalık taşıma riski ve işgücü gerektirmesi gibi çeşitli dezavantajlara sahiptir. Oksin grubu bitki gelişim düzenleyiciler birçok meyve türünde döllenme olmadan partenokarpik meyve oluşumunu sağlamak için kullanılabilmektedir.

Bu çalışmada öncelikli olarak ilekleme işleminin dezavantajlarını azaltmaya yönelik olarak, oksin grubundan bir bitki gelişim düzenleyicisi olan IBA'nın (Indol-3 bütirik asit) iki farklı dozunun (*1000 ppm* ve *2000 ppm*) partenokarpik meyve tutumuna etkisini ortaya koymak amaçlanmıştır. Ayrıca, incir üreticileri arasında yaygın olan ostiolün fiziksel uyarılması ve ostiole zeytinyağı uygulanmasının partenokarpik meyve oluşumunu teşvik ettiği iddialarının geçerliliğinin test edilmesi amaçlanmıştır. Aydın İli İncirliova İlçesinde bulunan İncir Araştırma Enstitüsü Müdürlüğü merkez üretim parselinde, *Sarılop* ve *Bursa Siyahı* çeşitlerinde Tesadüf Parsellerinde faktöriyel deneme desenine göre 3 tekerrürlü bir deneme kurulmuştur. Her iki çeşitte toplam 10 ağaç kullanılmış, ağaçların farklı yönlerinden seçilen dallar üzerindeki tüm synconiumlar 25 Mayıs tarihinde, ilek arıcığı (*Blastophaga psenes*) geçişini engelleyen özel tüllerle izole edilmiştir. Deneme kapsamında dört farklı uygulama gerçekleştirilmiştir; 1000 ppm IBA, (2) 2000 ppm IBA, (3) Ostiole sert fırça ile fiziksel uyarım, (4) Fiziksel uyarım + ostiole zeytinyağı uygulaması. Tüm uygulamalar 25 ve 31 Mayıs tarihlerinde olmak üzere iki defa yapılmıştır. Uygulamalar sonrasında meyve tutumları düzenli olarak takip edilmiş ve bölgedeki ilekleme işleminin üzerinden 20 gün geçtikten sonra nihai meyve sayımı yapılmıştır.

Bursa Siyahı çeşidinde hiçbir uygulamanın partenokarpik meyve oluşumunu sağlamadığı ve tüm synconiumların döküldüğü görülmüştür. Sarılop çeşidinde ise yalnızca 2000 ppm IBA uygulamasında, %28,5 oranında çekirdeksiz, çeşide özgü özellikleri taşıyan partenokarpik meyveler oluşmuştur. Ancak bu uygulama sonucunda meyve döküm oranının oldukça yüksek olması nedeniyle, yöntemin ticari üretim açısından ekonomik olmadığı ve ileklemeye alternatif teşkil edemeyeceği belirlenmiştir. Sarılop çeşidinden elde edilen partenokarpik meyvelerin doğal döllenme yoluyla elde edilen meyvelerle kalite ve kuruma özellikleri bakımından karşılaştırılması yapılmıştır. Ostiolün fiziksel yollarla uyarılması ve fiziksel uyarı ile birlikte zeytinyağı uygulamalarının da partenokarpik meyve oluşumu üzerinde herhangi bir etkisinin bulunmadığı ve bu uygulamalara yönelik üretici kaynaklı söylentilerin bilimsel olarak doğru olmadığı sonucuna varılmıştır.

Anahtar Kelimeler: *Ficus carica* L., ilekleme, partenokarpi, IBA, ostiol uyarımı

1. GİRİŞ

İncir (*Ficus carica* L.) ülkemizde yaygın olarak yetiştirilen çok özel bir meyve türüdür. Türkiye incir üretiminde, üretim miktarı ve çeşitlilik bakımından dünyada önemli ülkelerden biridir. Dünyada 2022 yılı itibarı ile 296.753 ha alanda, 1.242.449 ton incir üretimi gerçekleşmiştir . Türkiye'de ise 57.459 hektar alandan yaklaşık 350.000 ton incir üretimi yapılmaktadır. Hem Türkiye hem de dünya incir üretim alanlarında ve üretim miktarında artış trendi bulunmaktadır (FAOSTAT, 2024; TUİK, 2024). Türkiye incir üretimi ve ihracatındaki en önemli çeşitler Sarılop ve Bursa Siyahı çeşitleridir. Sarılop incir çeşidi, üstün kuru meyve kalitesi ile Bursa Siyahı çeşidi ise taze sofralık kalitesiyle ön plana çıkmaktadır (Aksoy ve ark., 2007; Çalışkan, 2012). Kuru incir ihracatı Sarılop, Sofralık incir ihracatı da büyük ölçüde 'Bursa Siyahı' çeşidiyle yapılmakta ve bu çeşide ait bahçelerin sayısı son yıllarda giderek artmaktadır (Arpaci, 2017; Çalışkan, 2012; Koşar, 2023).

Üretim ve ihracatımızdaki önemli bu iki çeşit, "Smyrna" tipi incir grubuna dahildir ve karakteristik meyve gelişimleri için zorunlu olarak döllenmeye ihtiyaç duyarlar. Sarılop incir çeşidi, Türkiye'de özellikle Aydın yöresinde yoğun olarak yetiştirilir en yüksek ekonomik öneme sahip çeşidimizdir (Arpaci, 2017). Sarılop meyveleri ostiol kısmı kapalıya yakın, çatlamaya ve bozulmaya karşı dayanıklıdır. Meyvelerinin iç kısmı dolgun ve homojen olup, düşük çekirdek oranına sahiptir. Ortalama meyve ağırlığı 40–60 gram arasında, toplam çözünür kuru madde miktarı %20–25 arasındadır ve yüksek şeker oranına sahiptir (Ayar ve ark., 2019). Sarılop çeşidinde ikinci ürün meyveleri (iyilop) esas önemli olan üründür ve mutlaka döllenmesi gerekmektedir (Aksoy ve Şahin, 2001; Aksoy ve ark., 2007; Özbek, 1949). Bursa Siyahı çeşidi ise önemli sofralık incir çeşitlerinden biri olup meyveleri iri yapılı (ortalama 50–70 g), uzunca armudi formda ve olgunluk döneminde koyu mor-siyaha yakın kabuk rengine sahiptir. Kabuk yüzeyi parlak olup tüketici açısından görsel çekicilik taşır. Meyve eti açık kırmızıdan bordo renge kadar değişmekte, sulu, yumuşak ve yoğun aromalıdır (Çalişkan ve Polat, 2008; Kaynas ve ark., 1997; Koşar, 2023). Şeker ve toplam kuru madde içeriklerinin yüksek olması, düşük asit oranı, Bursa Siyahı'nı sofralık tüketim için uygun hale getirmektedir. Ostiol kısmı orta açıklıkta olup, dikkatli hasat yapılmadığında meyve çürüklüğü riski taşıyabilir. Yüksek pazar değeri, özgün lezzeti ve üstün dış görünüm özellikleri nedeniyle hem iç hem dış pazarda büyük talep görmektedir (Çalişkan ve Polat, 2008; Çalışkan ve Polat, 2012; Koşar, 2023; Polat ve Calışkan, 2008). Avrupa Birliği tarafından "coğrafi işaret" tescili almış olması, Bursa Siyahı'nın uluslararası düzeyde tanınırlığını ve ticari değerini daha da artırmıştır (ci.turkpatent.gov.tr, 2025).

İncir üretiminde döllenmenin sağlanabilmesi için, kaprifikasyon (ilekleme) adı verilen biyolojik bir uygulama gerekmektedir (Condit, 1920; Tribolet, 1912). Bu yöntemle erkek incir ağaçlarından elde edilen ilek meyveleri, dişi ağaçlardaki çiçeklerin tozlanmasını sağlamak amacıyla kullanılır. İlekleme ilek arıcığı (*Blastophaga psenes*) denilen ve erkek incir meyvelerinde simbiyotik halde yaşayan bir arıcık vasıtasıyla meydana gelmektedir (Çalışkan ve Bayazit, 2012). Sarılop çeşidi için tam olarak olmasa da Bursa Siyahı'nın yetiştirildiği ekolojilerde, tozlanmadan (kaprifikasyon) kaynaklanan sorunlar nedeniyle meyve veriminde dalgalanmalar görülebilmektedir (Çalışkan, 2012). Tozlayıcı olarak kullanılan erkek incirlerin (*Ficus carica* L. var. caprificus) özellikle ilek tarafından taşınan hastalıklardan ari olması, başarılı ve sağlıklı bir ileklemenin temel koşullarından biri olarak kabul edilmektedir (Ferguson ve ark., 1990). Dişi incir meyvelerinde karşılaşılan iç kararması (endopsis) problemi, genellikle

erkek incirlerden dişi meyvelere ilek arıcığı aracılığıyla *Fusarium moniliforme* gibi fungal patojenlerin taşınması sonucunda ortaya çıkmaktadır. Aynı zamanda kuru incir üretiminde kaliteyi ve pazarlanabilirliği olumsuz yönde etkileyen aflatoksin kontaminasyonunun, meyveye ilk bulaşmasının da ilek arıcıkları ile gerçekleşebileceği bildirilmektedir (Aksoy ve ark., 2001; Aksoy ve Şahin, 2001). Bunun yanında ilekleme işleminin ilekleme zamanlamasının hassasiyeti, ilek meyvelerinin temin zorlukları, işgücü gerektirmesi gibi birçok dezavantajlara sahiptir.

Oksin grubu bitki gelişim düzenleyiciler, özellikle tozlanma ya da döllenmenin yetersiz olduğu koşullarda meyve tutumunun artırılmasında önemli bir tarımsal araç olarak değerlendirilmektedir. Oksin grubu bileşikler, hücre bölünmesi ve uzaması, kök oluşumu, apikal dominansi ve meyve gelişimi gibi bitkisel süreçlerde kritik rol oynayan doğal veya sentetik bileşiklerdir (Taiz ve ark., 2015). Birçok meyve türünde, özellikle çekirdeksiz meyve üretimi hedeflendiğinde, oksinlerin partenokarpik meyve oluşumunu başarıyla sağladığı bilimsel çalışmalarla kanıtlanmıştır (Srivastava ve Handa, 2005). Oksin grubu bitki büyüme düzenleyicilerin, domates (*Solanum lycopersicum*), elma (*Malus domestica*), hıyar (*Cucumis sativus*) gibi birçok kültür bitkisinde, partenokarpiyi teşvik ettiği bilinmektedir (De Jong ve ark., 2009). Çekirdeksiz üzüm çeşitlerinde ise sitokinin ve oksinlerin birlikte kullanımıyla partenokarp meyve oluşumunun anlamlı düzeyde artırılabildiği belirlenmiştir (Güleryüz, 1982). Öte yandan, ayvalarda oksin türevi olan giberellik asit uygulamalarının (Mesejo ve ark., 2010), kirazlarda (*Prunus avium* L.) giberellik asit ve oksin karışımlarının (Özgüven, 1994), siyah mersin bitkisinde (Myrtus communis L.) gibberellik asit (GA_3) uygulamalarının partenokarpik meyve tutumu sağlayarak yetiştiricilikte bazı avantajlar sağladığı bildirilmektedir. Bunun dışında IAA, IBA, NAA, GA, 2,4-D gibi gelişim düzenleyicilerin meyve türlerinde meyve tutumu ve partenokarpik meyve oluşumu için kullanılabilmesi söz konusudur (Çimen, 1988).

Diğer meyve türlerine benzer şekilde incirlerde de döllenme olmadan meyve tutumunun oluşması istenen bir durum olmuştur (Crane ve Blondeau, 1949). San Pedro ve Adriyatik tipi incirlerde de hem döllenmeye ihtiyaç olmayan ve hem ihtiyaç duyulan çiçeklenme evrelerinde partenokarpik meyve tutumunun artırılması istenen bir durumdur. Ülkemizde de üreticiler ileklemenin zorluğu ve yıldan yıla farklı düzeylerde gerçekleşen meyve tutum oranları nedeniyle partenokarp meyve elde edilmesine ilgi duymuşlardır. İncirin ostiol kısmına fiziksel uyartıların yapılmasının ve ostiole zeytinyağı sürmenin meyve tutumunu artıracağı hatta döllenme olmadan meyve oluşumunu sağlayacağı yönünde inanışlar ve söylentiler ortaya çıkmıştır. Araştırmacılar, incirlerde kaprifikasyonun standartlaştırılması veya tamamen ortadan kaldırılmasına, partenokarpik meyve tutumunun artırılmasına yönelik olarak çok sayıda araştırma yürütmüşlerdir. Bu konudaki ilk ve öncü çalışmaların Kaliforniya'da Calymrna incirleri üzerinde Crane ve Blondeau (1949) başta olmak üzere Baskaya ve Crane (1950); Blondeau ve Crane (1948) tarafından yürütüldüğü görülmektedir. Bu çalışmalara ilerleyen yıllarda başka araştırmacılar tarafından devam edilmiştir (Lodhi ve ark., 1969). İncirde partenokarpiyi sağlamak üzere en fazla denenen bitki gelişim düzenleyicileri 2-4 D, 2-3-4 T, Naftoksi Asetik Asit (NA), Beta Naftoksi Asetik Asit (NOA), Giberellik Asit (GA_3), Kristal benzotiyazol-2-oksi-asetik asit ve Para-klorofenoksiasetik asit (PCPA), Indol-3 Bütirik Asit (IBA) ile NA+IBA ve NA+PCPA karışımlarıdır (Crane, 1952; Crane ve Blondeau, 1949; Crane ve Blondeau, 1951; Lodhi ve ark., 1969; Stewart ve Condit, 1949).

Günümüz şartlarında da geleneksel ilekleme yöntemine alternatif olabilecek, döllenme gerektirmeyen (partenokarpik) meyve oluşumunu teşvik eden yöntemlerin araştırılması incir üretiminin geleceği açısından önemlidir. Bu nedenle, bu çalışmada, incir üretiminde karşılaşılan ilekleme kaynaklı sorunlara çözüm arayışının bir parçası olarak, öncelikle oksin grubundan sentetik bir bitki gelişim düzenleyicisi olan Indol-3 Bütirik Asit'in (IBA) iki farklı konsantrasyonunun (1000 ppm ve 2000 ppm) Sarılop ve Bursa Siyahı çeşitlerinde partenokarpik meyve tutumuna olan etkilerinin incelenmesi amaçlanmıştır. Çalışmanın bir diğer amacı da incir üreticileri arasında yaygın olarak dile getirilen ve bilimsel bir dayanağı henüz tam olarak kanıtlanmamış olan ostiolün fiziksel olarak uyarılması ve bu uyarımın zeytinyağı uygulamasıyla desteklenmesinin partenokarpik meyve oluşumuna yol açtığı yönündeki iddiaların bilimsel geçerliliğini test etmektir. Elde edilen bulgularla incir üretiminde ileklemeye alternatif olabilecek potansiyel yöntemlerin belirlenmesi için literatüre katkı ve üreticiler için kontrollü bir deneme sonucunda elde edilmiş güvenilir bilgiler kazandırılmaya çalışılmıştır.

2. MATERYAL VE METOT

2.1. MATERYAL

Çalışma, İncir Araştırma Enstitüsü Müdürlüğü'ne ait Aydın İli İncirliova İlçesi Erbeyli Mahallesi, Merkez Yerleşkesinde yer alan Sarılop ve Bursa Siyahı çeşitlerine ait ağaçlar üzerindeki iyilop syconiumların üzerinde yürütülmüştür. Deneme yerinin deniz seviyesinden yüksekliği 60 m civarında olup; 37051ı50.72ıı K ve 27039ı50.39ıı D koordinatlarında yer almaktadır.

2.2. METOT

Deneme tesadüf parsellerinde faktöriyel deneme desenine göre, her bir uygulama için 3 tekerrür olacak şekilde planlanmıştır. Deneyde, her iki incir çeşidinden sağlıklı ve benzer gelişime sahip toplam 10 adet olgun ağaç kullanılmıştır. Denemede çeşitlere ait ağaçlarının farklı yönlerindeki dallar üzerinde bulunan aynı gelişim evresindeki synconiumlar 25 Mayıs tarihinde, ilek arıcığının içeriye girişini ve dolayısıyla doğal döllenmeyi engelleyecek ince gözenekli, özel tüllerle izole edilmiştir. Şekil 1'de deneme başlangıcında dallardaki syconiumların izole edildiği evreye ait fotoğraflar verilmiştir.

Şekil 1: İlek arıcığı (*Blastophaga psenes* L.) geçişini engellemek için kullanılan tüller (orijinal)

Deneme kapsamında toplam dört farklı uygulama (kontrol dışında) gerçekleştirilmiştir. Bunlar;

1-1000 ppm IBA Uygulaması: İzole edilen synconiumlara 1000 ppm konsantrasyonunda IBA çözeltisinin püskürtülerek uygulanması,

2-2000 ppm IBA Uygulaması: İzole edilen synconiumlara 2000 ppm konsantrasyonunda IBA çözeltisinin püskürtülerek uygulanması,

3-Ostiolün Fiziksel Uyarılması: İzole edilen synconiumlara, ostiol kısımlarından, steril ve yumuşak kıllı bir fırça yardımıyla nazikçe ve standart bir şekilde fiziksel uyarı yapılması,

4-Fiziksel Uyarım + Ostiole Zeytinyağı Uygulaması: İzole edilen synconiumların ostiol kısımlarına öncelikle yukarıda belirtildiği gibi fiziksel uyarının yapılması ve ardından sızma zeytinyağının ince bir tabaka halinde sürülmesi uygulamalarıdır.

Bunun dışında uygulamaların etkisini karşılaştırmak için Kontrol parseli oluşturulmuştur. Kontrol grubundaki syconiumlara herhangi bir uygulama yapılmamış sadece tül ile izole edilmişlerdir. Tüm uygulamalar (1-2-3-4), partenokarpik meyve gelişimini uyarmak amacıyla, çiçeklenme döneminin başlangıcına yakın iki farklı tarihte, 25 ve 31 Mayıs günlerinde olmak üzere iki kez tekrarlanmıştır. Uygulamaların tamamlanmasının ardından, dallardaki meyve tutumları düzenli aralıklarla gözlemlenmiş ve kayıt edilmiştir. Bölgedeki geleneksel ilekleme işleminin tamamlanmasından yaklaşık 20 gün sonra, muamele gören dallardaki nihai meyve sayısı belirlenerek meyve tutum oranları hesaplanmıştır. Ayrıca, Sarılop çeşidinde partenokarpik olarak elde edilen sınırlı sayıdaki meyvenin, aynı bahçedeki doğal döllenme yoluyla oluşmuş olgun meyvelerle bazı temel kalite parametreleri (meyve ağırlığı, ostiol genişliği, asitlik, suda çözünür kuru madde miktarı vb.) özellikleri bakımından karşılaştırmaları yapılmıştır.

3.BULGULAR VE TARTIŞMA

Sarılop ve Bursa Siyahı çeşitlerine ait ağaçlarda gerçekleştirilen IBA 1000 ve 2000 ppm uygulamaları ile fiziksel uyartı ve fiziksel uyartı+zeytinyağı uygulamaları ve kontrol grubunda kullanılan meyve sayıları (n), ara sayımda gözlemlenen meyve sayıları ve nihai olarak elde edilen partenokarp meyvelerin sayıları Tablo 1'de verilmiştir. Elde edilen verilerin deneme desenine uygun olarak gerçekleştirilen varyans analiz özeti sonuçları da Tablo 2'de verilmiştir. Denemenin uygulamalarında kullanılan meyve sayıları (n), dallar üzerinde eşit miktarda meyve bulamamaktan kaynaklı olarak 49 ile 65 adet arasında değişmiştir. Bu nedenle, ara sayımlarda dalda kalan elde edilen meyvelerin miktarı ve partenokarp meyve tutumları daha iyi bir karşılaştırma yapmak için yüzde (%) olarak ifade edilmiştir. İstatistiki analiz sonucunda; Ara sayımda dalda bulunan meyve sayısı üzerine herhangi bir faktörün etkili olmadığı belirlenirken, partenokarpik meyve tutumu üzerine çeşit faktörünün ve çeşit x uygulama interaksiyonun etkisi istatistiki olarak önemli bulunmuştur. İzole edilen dallardaki, ara sayımda meyve sayıları yüzde olarak %11,5 ile %36,8 arasında değişiklik göstermiştir ancak bu farklılık istatistiki olarak önemli bulunmamıştır (Tablo 2).

Tablo 1: Sarılop ve Bursa Siyahı çeşitlerinde IBA ve diğer uygulamaların partenokarpik meyve tutumu oranları (%)

Çeşitler *	Uygulamalar	Uygulamada kullanılan meyve sayısı (n)	Ara sayımdaki syconium yüzdesi (%) (25 Temmuz)	** Elde edilen partenokarp syconium yüzdesi (%) (8 Ağustos)
Sarılop	IBA - 1000	62	12,4 ± 6,9	0,0 ± 0,0 b
	IBA-2000	59	36,8 ± 3,9	28,5 ± 2,8 a
	Fiziksel Uyarı	57	19,5 ± 6,4	0,0 ± 0,0 b
	Fiziksel Uyarı + Zeytinyağı	65	15,0 ± 3,0	0,0 ± 0,0 b
	Kontrol (İzolasyon)	53	11,5 ± 1,1	0,0 ± 0,0 b
Sarılop ort.		59,2 ±2,1	19,1 ± 3,1	5,7 ± 3,1 **A**
Bursa Siyahı	IBA - 1000	54	14,5 ± 4,5	0,0 ± 0,0 b
	IBA-2000	57	16,2 ± 4,5	0,0 ± 0,0 b
	Fiziksel Uyarı	53	20,5 ± 8,4	0,0 ± 0,0 b
	Fiziksel Uyarı + Zeytinyağı	62	17,5 ± 3,9	0,0 ± 0,0 b
	Kontrol (İzolasyon)	49	16,4 ± 2,2	0,0 ± 0,0 b
Bursa Siyahı ort.		55,0 ±2,2	17,0 ± 2,0	0,0 ± 0,0 **B**
Genel ortalama		57,1 ±1,6	18,0 ± 1,8	2,9 ± 1,6

Aynı sütunda farklı harfle gösterilen ortalamalar arasındaki fark **çok önemlidir ($p<0.01$), * önemlidir ($p<0.05$)

Tablo 2: Sarılop ve Bursa Siyahı çeşitlerinde IBA ve diğer uygulamaların partenokarpik meyve tutumu oranlarına ilişkin varyans analiz özeti.

Bursa Siyahı çeşidinde uygulanan hiçbir yöntemin partenokarpik meyve oluşumuna yol açmadığı gözlemlenmiştir (Tablo 2). Sonuçlar, Bursa Siyahı çeşidinin partenokarpik meyve gelişimi için test edilen IBA konsantrasyonlarına ve diğer uyartı uygulamalarına tepki vermediğini göstermekte ve genetik olarak partenokarpik meyve verme eğiliminin de olmadığına işaret etmektedir. IBA dışındaki diğer bitki gelişim düzenleyicilerin partenokarpik meyve oluşumunu sağlama ihtimali bulunmakta olup bu durum yürütülecek başka çalışmalarla belirlenmelidir. Diğer gelişim düzenleyicilerin olası etkileri ortaya konuluncaya kadar Bursa Siyahı çeşidinde döllenmeyi sağlayan ilekleme işleminin meyve tutumu için mutlak bir gereklilik olduğunu söylemek mümkündür.

Sarılop çeşidi incelendiğinde, partenokarpik meyve oluşumu açısından sadece 2000 ppm IBA uygulamasının sınırlı bir başarı sağladığı görülmektedir (Tablo 2). Şekil 2'de 2000 ppm IBA uygulaması sonucu elde edilmiş partenokarp Sarılop incirlerine ait fotoğraflar verilmiştir. Tablo

2'de de görüleceği üzere 2000 ppm IBA uygulamasında, %28,5 oranında ortalama partenokarpik meyve tutumu elde edilmiştir. Diğer uygulamalar (1000 ppm IBA, fiziksel uyarım tek başına ve fiziksel uyarım + zeytinyağı uygulaması) Sarılop çeşidinde de partenokarpik meyve oluşumu sağlamamıştır (% 0.00). Bu durum, ostiolün fiziksel olarak uyarılmasının veya bu uyarımın zeytinyağı ile desteklenmesinin Sarılop çeşidinde partenokarpik meyve gelişimine neden olmadığını açıkça ortaya koymaktadır. Ayrıca, daha düşük konsantrasyondaki IBA (1000 ppm) uygulamasının da partenokarpiyi oluşturmada etkisiz olduğu görülmektedir.

Ayrıca, her iki çeşitte de kontrol grubunda partenokarpik meyve oluşumu gözlemlenmemiştir. Bu durum, izolasyon işleminin etkili olduğunu göstermesi yanında, çeşitlerin doğal partenokarpik meyve verme eğilimlerinin düşük ya da olmadığına işaret etmektedir. İzole edilen syconiumlarda yapılan ara sayımlarda Sarılop çeşidinde istatistiki olarak önemli olmasa da daha fazla oranda syconiumun dallar üzerinde bulunduğu belirlenmiştir. Açıkça görülmektedir ki çeşit faktörü partenokarpik meyve oluşumu üzerinde önemli bir etkiye sahiptir (Tablo 2). Crane ve Blondeau (1949) tarafından yürütülen çalışmada da Calmyrna incirlerinde izole edilmiş ve herhangi bir gelişim düzenleyicinin kullanılmadığı kontrol grubunda meyve tutumunun gerçekleşmediği bildirilmiştir.

Deneme alanındaki izolasyon ve herhangi bir uygulama yapılmamış ağaçlardan alınan Sarılop meyveleri ile IBA uygulaması sonucunda oluşan partenokarpik meyvelerin bazı özellikleri karşılaştırmalı olarak Tablo 3'te verilmiştir. Yapılan pomolojik ölçümlerde partenokarpik Sarılop meyvelerinin ağırlıklarının 55-60 gr arasında olduğu ve normal döllenmeyle oluşan meyvelere göre %15 düzeyinde daha hafif olduğu belirlenmiştir. Ayrıca, partenokarp meyvelerde ostiol açıklığının normal meyvelerdekinden daha küçük olduğu ve 5,12-5,21 mm arasında değiştiği belirlenmiştir. Gerçekleştirilen analizlerde ise partenokarpik Sarılop meyvelerinin SÇKM değerlerinin % 2 düzeyinde düşük olduğu ve asitlik değerlerinin normal döllenmeyle oluşmuş meyvelerinkine çok yakın değerlerde olduğu belirlenmiştir. Crane ve Blondeau (1949) tarafından yapılan çalışmada da benzer sonuçlar bildirilmiştir. Araştırmacılar Caliymrna incirlerinde, partekonarpik meyvelerde döllenme ile oluşan normal meyvelere göre % 7 ağırlık azalması olduğunu, büzüşmelerin olduğunu ve dış kabuk renginin daha açık olduğunu belirlemişlerdir.

Şekil 2: Olgunlaşan partenokarp Sarılop meyve örnekleri (orijinal)

Tablo 3: İlekleme ve IBA uygulaması sonucunda oluşan partenokarp Sarılop meyvelerinin karşılaştırmalı bazı özellikleri

İçerik	Sarılop (İlekleme ile oluşan)	Sarılop (IBA 2000 ppm uygulaması sonucu oluşan)
SÇKM (%)	22-23	20-21
Asitlik (%)	0,134-0,138	0,136-0,138
Ostiol (mm)	6,03-6,09	5,12-5,21
Meyve Ağırlığı (gr)	65-70	55-60

4.SONUÇ

Bu çalışma ile "Sarılop" incir çeşidinde IBA (2000 ppm) uygulaması ile sınırlı oranda partenokarpik meyve oluşumu sağlanabileceği belirlenmiştir. Ancak, meyve tutum oranlarının düşük, meyve döküm oranlarının yüksek olması nedeniyle uyarıcı kimyasal uygulamaların ticari üretim açısından ekonomik olamayacağı ve ileklemeye (caprification) alternatif teşkil edemeyeceği sonucuna varılmıştır. Bursa Siyahı çeşidinde hiçbir uygulamanın partenokarpik meyve oluşumunu sağlamadığı ve tüm synconiumların döküldüğü görülmüştür. Bu durum, bu çeşidin partenokarpik meyve gelişimine karşı genetik olarak dirençli olduğunu düşündürmektedir. Ayrıca, Bursa Siyahı'nın meyve bağlaması için dölleyici arıcığın varlığına mutlak ihtiyaç duyduğu bir kez daha doğrulanmıştır. Ostiolün fiziksel yollarla uyarılması ve fiziksel uyarı ile birlikte zeytinyağı uygulamalarının da partenokarpik meyve oluşumu üzerinde

herhangi bir etkisinin bulunmadığı ve bu uygulamalara yönelik üretici kaynaklı söylentilerin bilimsel olarak doğru olmadığı sonucuna varılmıştır.

Çalışma sonuçları, incirde partenokarpik meyve oluşumunun karmaşık bir süreç olduğunu ve mevcut oksin uygulamalarının özellikle Bursa Siyahı çeşidi için yetersiz kaldığını ortaya koymaktadır. Sarılop çeşidi için elde edilen sınırlı başarı ise, farklı oksin türlerinin, uygulama zamanlarının, dozlarının ve uygulama yöntemlerinin detaylı bir şekilde araştırılması gerektiğini göstermektedir. Gelecekteki araştırmalar, sadece kimyasal uyarıcıları değil, aynı zamanda genetik yaklaşımları ve farklı kültürel uygulamaları da içeren multidisipliner bir bakış açısıyla yürütülmelidir. İleklemeye alternatif olabilecek sürdürülebilir, ekonomik ve çevre dostu uygulamaların geliştirilmesi incirdeki kültürel işlemlerin kolaylaştırılması açısından öneme sahiptir. Bu bağlamda, partenokarpiye yatkın incir çeşitlerinin ıslahı ve biostimulantlar gibi farklı yaklaşımların da incelenmesi, gelecek araştırmalar için önemsenmesi gereken konular olduğunu düşünmekteyiz.

ABSTRACT

Throughout history, significant genetic diversity has emerged in figs (*Ficus carica* L.) grown in Anatolia due to diverse geographical conditions and interactions. Many local fig varieties from this diversity have gained national and international importance, leaving significant marks on global fig cultivation. Currently, Turkey hosts considerable fig populations primarily in the Aegean Region, as well as coastal areas of Marmara, Black Sea, and Mediterranean regions, as well as river valleys in Central Anatolia and Southeastern Anatolia. Apart from well-known varieties, these regions feature fig varieties with substantial variations in pollination characteristics, fruit morphology, peel and pulp color, seediness, maturation period, consumption methods, taste, aroma, and texture. Some fig varieties, notable for their distinctive characteristics, cultural significance, and historical value, have been registered with Geographical Indications (GI). Geographical indications are primarily important as quality marks that indicate and guarantee to consumers the origin of the product, its distinctive characteristics, and the relationship between these characteristics and the geographic area. However, consumers and experts do not know the descriptive, distinctive, and prominent quality characteristics of these registered GI figs. This study aims to introduce GI fig varieties in Turkiye, to reveal their characteristics, assess their current status, and provide future-oriented evaluations. The information obtained from the Turkish Patent Institute database, registration-holding institutions, research findings, and existing literature was analyzed in the study.

The first applications for geographical indication registrations of figs in Turkey were initiated in 2003 from İzmir and Aydın from the Aegean Region. Applications gained momentum after 2018, resulting in registrations for six different geographical regions. Currently, there are eight GI-registered figs in Turkey, namely Aydın Fig, Bursa Black Fig (Bursa Black, Black Bursa Fig), Ege Fig, Fethiye Kaya Fig, Havran Black Fig, Melli Fig, Midyat Fig, and Silopi Behnat Fig. In addition, five fig varieties, Buharkent Fresh Fig, Dalaman Fig, Hasankeyf Benati Fig, Payamlı Bardacık Fig, and Tekkeköy Patlıcan Fig are in the application stage of registration. Aydın Fig and Bursa Black Fig are the most important Geographical Indicated figs, have also been registered in the European Union, and are the most recognized varieties globally and the most produced varieties in Turkey. The production of the Aydın Fig and the Ege Fig is based on the “Sarılop” variety, Bursa Black Fig on the “Dürdane” variety, and the Fethiye Kaya Fig on the “Kaya” variety. Other figs are cultivated using local varieties as indicated in their

registered names. Their production and consumption quantities are limited and newly gaining national recognition. To fully realize the benefits expected from the GI system for figs, crucial measures must be undertaken to ensure consumer confidence and sustainability. Recommendations include correcting inadequacies and errors in product descriptions, scientifically defining and enhancing distinguishing characteristics, conducting detailed studies on product quality and nutritional properties, accelerating the registration for other valuable local fig varieties, conserving genetic resources, and strengthening cooperation with relevant expert institutions.

TÜRKİYE'NİN COĞRAFİ İŞARETLİ İNCİRLERİ

ÖZET

Anadolu'da çağlar boyunca yetiştirilen incirlerde (*Ficus carica* L.), coğrafi koşullar ve etkileşim sayesinde, önemli bir genetik zenginlik oluşmuştur. Bu çeşitlilik içerisinden birçok yerel incir varyetesi, ulusal ve uluslararası düzeyde önem kazanarak dünya incir yetiştiriciliğinde izler bırakmıştır. Günümüzde Türkiye'de, Ege Bölgesi başta olmak üzere Marmara, Karadeniz ve Akdeniz Bölgelerinin kıyı kesimlerinde, İç Anadolu ve Güneydoğu Anadolu bölgelerinde nehir vadilerinde hatırı sayılır incir varlığı bulunmaktadır. Bu bölgelerde, tanınan çeşitlerin dışında, döllenme özelliği, meyve morfolojisi, kabuk ve iç rengi, çekirdeklilik, olgunlaşma tarihi, değerlendirme şekli, tat, aroma ve tekstür bakımından önemli derecede varyasyon gösteren incir varyetelerine rastlanmaktadır. Kendine özgü karakteristiklere sahip, kültürel ve tarihi değerleri ile öne çıkan bazı incir varyetelerinin Coğrafi İşaret (Cİ) tescilleri yapılmıştır. Coğrafi İşaretler temel olarak, tüketiciler açısından ürünün kaynağını, karakteristik özelliklerini ve bu özellikler ile coğrafi alan arasındaki bağlantıyı gösteren ve garanti eden kalite işareti olması açısından önemlidir. Mevcut Coğrafi İşaretli incirlerimizin tanımlayıcı, ayırt edici ve ön plana çıkan kalite özellikleri, tüketiciler ve uzmanlar tarafından yeterince bilinmemektedir. Bu çalışmada, Türkiye'deki Coğrafi İşaretli incir çeşitlerinin tanıtılması, özelliklerinin ortaya konulması, mevcut durumlarını değerlendirmek ve geleceklerine yönelik değerlendirmenin yapılması amaçlanmıştır. Çalışmada, Türk Patent Enstitüsü veri tabanı, tescil sahibi kurumlardan alınan bilgiler, araştırma sonuçları ve literatür bilgileri kullanılarak elde edilen bilgiler analiz edilmiştir.

Türkiye'de incirlerin coğrafi işaretine yönelik ilk başvurular, 2003 yılında Ege Bölgesinde İzmir ve Aydın illerinden yapılmıştır. 2018 yılından sonra başvurular hız kazanmış ve 6 farklı coğrafi bölge için tesciller gerçekleştirilmiştir. Mevcut durumda, Türkiye'de, *Aydın İnciri, Bursa Siyah İnciri, Ege İnciri, Fethiye Kaya İnciri, Havran Siyah İnciri, Melli İnciri, Midyat İnciri ve Silopi Behnat İnciri* olmak üzere 8 farklı coğrafi işaret tescili olan incir bulunmaktadır. Bunların dışında, *Buharkent Taze İnciri, Dalaman İnciri, Hasankeyf Benati İnciri, Payamlı Bardacık ve Tekkeköy Patlıcan İnciri* adları ile henüz tescili gerçekleşmemiş, 5 farklı coğrafi işaret başvurusu aşamasındadır. *Aydın İnciri* ve *Bursa Siyah İnciri* Avrupa Birliği nezdinde tescillenmiş, dünyada da en fazla tanınırlığa sahip, ülke çapında en fazla üretimi yapılan en önemli Coğrafi İşaretli incirlerimizdir. *Aydın İnciri* ve *Ege İnciri*'nin üretimi "Sarılop", *Bursa Siyah İnciri*'nin "Dürdane" çeşidi ile yapılmaktadır. Diğerlerinin tamamında ise üretim, tescil adlarında belirtilen yerel incir varyeteleri ile gerçekleşmektedir. Üretim ve tüketim miktarları sınırlıdır ve ülke çapında yeni tanınmaya başlamışlardır. İncirlerde, Coğrafi İşaret sisteminden beklenen faydaların tam olarak elde edilebilmesi, tüketici güveninin ve sürdürülebilirliğin sağlanması için yapılması gereken önemli işler bulunmaktadır. Ürün tanımlamalarındaki eksiklik ve hataların giderilmesi, ayırt edici özelliklerin bilimsel yöntemler kullanılarak belirlenmesi ve geliştirilmesi, ürün kalite özelliklerinin besin içerikleri yönünden detaylı incelenmesi, diğer kıymetli yerel incir varyetelerinin tescil çalışmalarına hız verilmesi ve genetik kaynak olarak korunmaya alınması, konuyla ilgili uzman kurumlarla iş birliğinin güçlendirilmesi önerilmektedir.

Anahtar Kelimeler: Coğrafi işaret, İncir, *Ficus carica* L., Kırsal kalkınma

1. GİRİŞ

İncir (*Ficus carica* L.), insanlık tarihi boyunca özellikle Akdeniz ve Orta Doğu coğrafyasında hem önemli bir besin kaynağı hem de kültürel miras unsuru olmuştur (Ayar, 2023; Kislev ve ark., 2006). Antik dönemlerden bu yana sağlık ve refahın simgesi olarak kabul edilen bu meyve (Flaishman ve Aksoy, 2022), Latince adını, antik çağda "Caria" olarak bilinen ve günümüzde Aydın, Denizli ve Muğla illerinin bir bölümünü kapsayan bölgeden alır (Boyd, 1974; Ghazanfar ve Kogan, 2022; Starr ve ark., 2003). Anadolu günümüzde incirin sekiz gen merkezinden biri olarak kabul edilir ve binlerce yıllık yetiştiricilik geçmişi sayesinde zengin bir genetik çeşitlilik barındırmaktadır (Ayar, 2022; Ergül ve ark., 2021; Ikten ve ark., 2010; Simsek ve ark., 2020). Bu çeşitlilik içerisinden, kendine özgü morfolojik ve pomolojik özelliklere sahip çok sayıda yerel incir varyetesi ortaya çıkmıştır (Condit ve Başkaya, 1948; Çalişkan ve Polat, 2011). Bir zamanlar yerel olan bu varyetelerimiz arasından bazıları, üstün nitelikleri sayesinde ulusal ve uluslararası düzeyde önem kazanarak dünya incir yetiştiriciliğinde önemli izler bırakmıştır (Condit, 1920; Condit, 1955; Condit, 1957; Stover ve ark., 2007).

Günümüzde Türkiye, dünya incir üretiminin %25-27'sini yaparak ve tüm dünyaya incir satan en önemli üretici ülke konumundadır (FAOSTAT, 2025; Polat, 2024). İncir yetiştiriciliği, Türkiye'de tarım kültürünün önemli bir parçasıdır (Aksoy, 2019). Doğal olarak, incir yetiştirilen bölgelerde insanlar ve ürün arasında farklı şekillerde etkileşimler meydana gelmiş ve bazı bölgelerimiz incirleri ile tanınır olmuştur (Günal, 1999). İncir üretiminin Türkiye genelinde en yoğun olarak gerçekleştirildiği bölge Ege Bölgesidir, bunu Akdeniz ve Güneydoğu Anadolu Bölgeleri izlemektedir. Kurutmalık incir üretiminden en yüksek gelir Ege Bölgesi'nde sağlanırken, taze incir üretimi açısından Akdeniz Bölgesi öne çıkmaktadır (Aksoy, 2019; Çalışkan, 2012). Bununla birlikte, birçok bölgede yerel düzeyde incir üretimi geleneksel bilgi birikimi ve kültürel tercihlerle sürdürülmektedir. Ege Bölgesinde incir hem doğal hem de beşerî faktörlerle yoğun bir etkileşim içerisindedir (Çiftçi, 2019; Çobanoğlu, 2013; Günal, 1999). İncirlerdeki genetik çeşitlilik gibi, tüketim şekilleri de oldukça çeşitlidir. Anadolu'da incir esas olarak taze ve kurutularak tüketilmekle birlikte geleneksel gıda ürünlerinin üretimine ve çeşitli etnobotanik kullanım örneklerine de rastlamak mümkündür (Fujita ve ark., 1995; Lansky ve Paavilainen, 2011).

Türkiye'nin son yıllardaki Avrupa Birliğine uyum çabalarına paralel olarak, Coğrafi İşaret (Cİ) uygulamaları ulusal ve uluslararası düzeyde önem kazanmaya başlamış ve birçok ürünün tescili gerçekleştirilmiştir (İbiş, 2025; Kan ve ark., 2019). Eski çağlardan günümüze, Anadolu'da üretilen ve dış pazarlara gönderilen en özgün tarımsal ürünlerimizden birisi olan incir de bu süreçte çok geçmeden ilk coğrafi işaretlemenin yapıldığı ürünler arasında yerini almıştır (İbiş, 2025; TÜRKPATENT, 2025b). Coğrafi işaretler, belirli karakteristik özellikleri, nitelikleri veya ünleri, üretildikleri bölgeyle doğrudan ilişkili olan ürünleri tanımlamak ve benzerlerinden ayırmak için kullanılan önemli etiketlerdir. Bu işaretler, ürünleri doğal ve beşeri unsurların ortak etkileşiminden kaynaklanan özgün, ayırt edici özellikler ve tarihsel derinlik temelinde farklılaştırır (Vandecandelaere ve ark., 2018). Bu nedenle, ülkemiz incirlerinin coğrafi işaret sürecine dâhil edilmesi şaşırtıcı değildir. Bu bağlamda, incirin coğrafi işaretleme sürecine dâhil edilmesi, ürünün yüksek kalitesi ve tarihsel derinliği dikkate alındığında anlamlı ve doğal bir sonuçtur

"Coğrafi işaretler" terimi, geniş anlamıyla, uluslararası antlaşmalarda ve ulusal/bölgesel hukuk sistemlerinde kullanılan çeşitli kavramları kapsamaktadır Bunlar, Menşe Adı (AO), Menşe Adı Koruması (PDO) ve Coğrafi İşaret Koruması (PGI) gibi kavramlardır (WIPO, 2025). Avrupa Birliğindeki uygulanmasında ise Menşe Adı (PDO: Protected Designation of Origin), Mahreç İşareti (Coğrafi İşaret) (PGI: Protected Geographical Indication) ve İçkilerin Coğrafi İşareti (GI: Geographical Indication of Spirit Drinks) olmak üzere üç farklı şekilde işaretleme gerçekleştirilmektedir. Menşe Adı, ürünün tüm üretim süreçlerinin belirli bir coğrafi bölgede gerçekleşmesini zorunlu kılarken, Mahreç İşareti ürünün belirgin bir niteliğinin, ününün veya diğer özelliklerinin bir coğrafi bölge ile özdeşleşmesi durumunu ve korunmasını tanımlar. Mahreç işaretli ürünlerin, tanımlanmış özelliklerden en az birini bulundurması şartıyla adını aldıkları bölgenin dışında da üretilebilmeleri mümkündür. Avrupa Birliğinde son yıllarda coğrafi işaret dışında, geleneksel ürünlerin kalitesini garantileyen Traditional Speciality Quaranteed (TSG) ve dağ ürünü (Mountain Product) gibi zor doğal koşullarda üretilen ürünleri etiketleme yaklaşımı da geliştirilmiştir. Bu işaretler, fikrî mülkiyet hakları (IPR: Intellectual Property Rights) kapsamındadır ve sahipleri için hukuki bir koruma oluştururlar (eAmbrosia, 2025). Bir coğrafi işaret hakkı, bu işareti kullanma hakkına sahip kişilere, ürünleri ilgili standartlara uymayan üçüncü tarafların bu işareti kullanmasını engelleme imkânı tanır (WIPO, 2025). Türkiye'de coğrafi işaret tescil ve takibi Türk Patent ve Marka Kurumu (TÜRKPATENT) tarafından yürütülmektedir. Kurum coğrafi işaret uygulamalarını Avrupa Birliği normlarını referans alan ulusal mevzuat çerçevesinde gerçekleştirmektedir. Bununla birlikte, Türkiye'deki mevzuat Avrupa Birliğinde tanımlı coğrafi işaretleme kategorilerinden hepsini değil sadece Menşe Adı (PDO), Mahreç İşareti (PGI) ve Geleneksel Ürün (TSG) kategorilerini desteklemektedir (TÜRKPATENT, 2025a)

Türkiye'de özellikle Ege Bölgesi başta olmak üzere, farklı iklim ve topoğrafik koşullara sahip pek çok bölge, çeşitli incir varyetelerine dayalı olarak coğrafi işaret tescili almıştır. Güncel olarak 7'si Menşe Adı (PDO), 1'i Mahreç İşareti (PGI) kapsamında olmak üzere toplam 8 farklı Coğrafi İşaretli incir bulunmaktadır (TÜRKPATENT, 2025b). Bu ürünler arasında, "Aydın İnciri" ve "Ege İnciri" ile "Bursa Siyah İnciri", üretim miktarı, ekonomik büyüklük ve ilgilendirdiği üretici kitlesi açısından öne çıkmaktadır. Her ne kadar tüm coğrafi işaretli incir ürünleri yaygın olarak pazarda yer almasa da bazılarına market raflarında rastlamak mümkündür. Ayrıca, henüz mevzuat kapsamında yer almamakla birlikte "Dağ İnciri" etiketiyle satılan ürünler de bulunmaktadır (daginciri.com, 2025). Bu etiket, Türkiye'deki sınıflandırmalarda resmi olarak tanımlanmamış olsa da Avrupa Birliği'nin "Dağ Ürünü (Mountain Product)" kategorisine benzer bir anlam taşımakta ve yeni bir sınıflandırma ihtiyacını gündeme getirmektedir. Coğrafi işaret tescilli incirlerimiz arasında öne çıkan "Aydın İnciri" ve "Bursa Siyah İnciri", son yıllardaki çabalarla Avrupa Birliği nezdinde de tescil edilmiştir (eAmbrosia, 2025). Ayrıca, Fethiye Kaya İnciri için de AB başvuru süreci devam etmektedir (ftso.org.tr, 2023a; ftso.org.tr, 2023b). "Aydın İnciri" ve "Ege İnciri" kurutmalık incir üretim ve ihracatımızdaki en önemli varyetemiz olan "Sarılop" (Aksoy, 2019; Arpaci, 2017), "Bursa Siyah İnciri" ise taze incir üretim ve ihracatımızın en önemli çeşidi olan "Dürdane" varyetesine (yaygın bilinen adıyla "Bursa Siyahı") (Çalışkan, 2012) dayanmaktadır. Bu çeşitlerin kalitelerinin yüksek olması ve geleneksel anlamda ticari hacimlerinin yüksek olmasından dolayı en fazla tanınırlığa sahip coğrafi işaretli incirlerimiz olduğunu söylemek mümkündür. Diğer coğrafi işaretli incirler ise daha sınırlı üretim alanlarına ve düşük tanınırlığa sahiptir.

Coğrafi işaretler, yerel ürünlerin tanıtımı, katma değerlerinin artırılması ve iç-dış pazarlarda etkin şekilde yer bulmaları açısından stratejik öneme sahip araçlardır (Demir, 2020; Pektaş ve ark., 2018). Bu bağlamda, coğrafi işaretli incirler yalnızca ekonomik getirisi yüksek tarım ürünleri değil, aynı zamanda Türkiye'nin kültürel kimliğini yansıtan, ulusal ve uluslararası tanınırlığına katkı sağlayan değerlerdir. Ülkemizdeki yeri ve potansiyeli göz önünde bulundurulduğunda incir, diğer yerel ürünler için hem öncü hem de model olabilecek nitelikte bir üründür. Bu çalışma, Türkiye'deki coğrafi işaretli incirlerimizin önemlerinin vurgulanması, değerlerinin anlaşılması ve tanıtımlarına katkı sağlamak amacıyla tescil süreçleri, üretimleri ve organizasyon yapıları, yetiştirilen varyeteler ve bunların özelliklerinin bilimsel bir bakış açısı ile incelenmesi ve mevcut durumlarının ve potansiyellerinin değerlendirilmesi için yapılmıştır.

2. MATERYAL VE METOT

Bu çalışmada esas veri kaynağı olarak, Türk Patent ve Marka Kurumu (TÜRKPATENT) tarafından yayımlanan çevrimiçi veri tabanındaki güncel coğrafi işaret tescil listeleri, başvuru belgeleri ve bu listeye dayalı raporlar kullanılmıştır (TÜRKPATENT, 2025b). Buna ek olarak, Avrupa Birliği Coğrafi İşaret Tescil Sistemi aracılığıyla Türkiye menşeli incir ürünlerinin uluslararası tescil durumları kontrol edilmiştir (eAmbrosia, 2025). Ayrıca tescil sahibi kurum ve kuruluşlarla doğrudan iletişime geçilerek ürün tanımlamaları, ayırt edici özellikleri ve üretim süreçlerine ilişkin bilgiler temin edilmiştir. Ulusal ve uluslararası literatürde yer alan bilimsel makaleler, raporlar ve istatistiksel veriler de destekleyici bilgi kaynakları olarak kullanılmıştır.

Tüm kaynaklardan elde edilen verilerden; Coğrafi işaretli incirlerin sınırları, tarihçeleri, üretim miktarları, üretim ve pazarlama organizasyonları, yetiştirilen incir varyetelerinin tanımlayıcı meyve özellikleri, tüketim şekilleri, yerel ve kültürel bağlamda öne çıkan özellikleri derlenmiştir. Derlenen bu veriler, ürünlerin tanınmasına katkı sağlama amacı yanında, tüketiciler başta olmak üzere, üreticilerin, konu uzmanlarının, politika yapıcıların ve karar vericilerin bilgilendirilmesine yönelik olarak düzenlenmiş ve tablolar halinde sunulmuştur. Coğrafi işaretli incirlerin güçlü ve zayıf yönleri ile eksiklikleri değerlendirilmeye çalışılmış ve coğrafi işaretlemeden beklenen faydaların sağlanabilmesi için önerilerde bulunulmuştur.

3. BULGULAR VE TARTIŞMA

Türkiye'de incirlerin coğrafi işaretlenmesine yönelik ilk başvurular, üretimin en yoğun olarak gerçekleştiği Ege Bölgesi'nden, İzmir ve Aydın illerinden başlamıştır. Bu başvurular, 2003 yılı itibarı ile yapılmış olup, "Ege İnciri" 2006, "Aydın İnciri" ise 2007 yılında tescil edilmiştir. İncire ilişkin coğrafi işaret başvuruları, uzun bir aradan sonra, 2017 yılında Burdur ilinden "Melli İnciri" başvurusu ile yeniden başlamış ve 2024 yılına kadar toplam 12 farklı başvuru yapılmıştır. Bu dönemde yapılan başvuruların 4'ü yine Ege, 3'ü Güneydoğu Anadolu, 2'si Marmara, 1'er tanesi ise Akdeniz ve Karadeniz Bölgelerinden gelmiştir. Sonraki dönemde yapılan başvuruların 6'sı tescille sonuçlanmış olup 5'inin değerlendirme süreci devam etmektedir. Güncel olarak, toplam tescil edilmiş Coğrafi İşaretli İncir sayısı 8 olup, bunlar (alfabetik sıra ile) *Aydın İnciri, Bursa Siyah İnciri, Ege İnciri, Fethiye Kaya İnciri, Havran Siyah İnciri, Melli İnciri, Midyat İnciri ve Silopi Behnat İnciri*'dir. Tescillenmiş coğrafi işaretli incirlerimizin adları, kullanılan logoları ve tescili yapan kuruluş tarafından yayınlanmış

fotoğrafları Tablo 1'de verilmiştir (TÜRKPATENT, 2025c). *Buharkent Taze İnciri, Dalaman İnciri*, *Hasankeyf Benati İnciri, Payamlı Bardacık ve Tekkeköy Patlıcan İnciri* adları ile yapılan başvurular halen değerlendirme aşamasındadır (Tablo 5). Tescillenmiş ve başvuru aşamasındaki incirlerimize ilişkin bilgiler, Tablo 2 ve Tablo 3'te ayrı ayrı gösterilmiştir. Tablo 2'den de görüleceği üzere, bunlardan 7'si "Menşe Adı" (PDO) kapsamında tescillenmiş olup, yalnızca Silopi Behnat İnciri "Mahreç İşareti" (PGI) kapsamındadır. Benzer şekilde, başvuru aşamasındaki incirler arasında yalnızca *Hasankeyf Benati İnciri* için Mahreç İşareti başvurusunda bulunulmuş, diğer başvurular ise Menşe Adı kapsamında gerçekleştirilmiştir (TÜRKPATENT, 2025b).

"Ege İnciri" dışında tüm coğrafi işaretli incirlerin coğrafi sınırları, isminin de işaret ettiği il ve ilçe idari birimleri ile sınırlıdır. Ege İnciri ise diğerlerinden farklı olarak, İzmir'in belirli ilçeleri ile Aydın İlinin tüm ilçelerini de içine alan daha geniş bir alanı kapsamakta, aynı zamanda Aydın İnciri ile ortak Sarılop varyetesi ile tescillenmiş durumdadır (Tablo 2). Coğrafi işaretlerin dünyadaki uygulama örneklerinde de geniş alanları kapsayan örnekler bulunmakta olup, sağlayabileceği bazı avantajlar nedeniyle tercih bile edilebilmektedir. Sınırların geniş tutulmasının ürünlerin üretim miktarının artırılması ve dolayısıyla daha geniş bir tüketici kitlesine ulaştırılabilmesi açısından avantaj sağlaması mümkündür. Bununla birlikte, ürünlerde belirli bir kalite düzeyinin yakalanmasının, denetim ve pazarlama organizasyonun zorlaşması gibi sakıncaları bulunmaktadır (Demir, 2020). Ege İnciri, ülkemizin ilk coğrafi işaret başvurusu ve tescilli inciridir. Bu, ülkemiz koşulları için tesadüfi bir durum değildir ve tarihsel süreçte incirle ilgili belirli bir tanınırlığının olmasından kaynaklanmaktadır (Özbek, 1949). Diğer yandan, Aydın ili sınırlarında yetiştirilen Sarılop incirlerinin teorik olarak iki işareti kullanma imkânı bulunmaktadır. Bu tescile ilişkin özel durumun, gerçekleştirilecek etki analizi sonuçlarına göre ya da ülkemizin dış ticaretindeki menfaatleri, iç pazar koşulları, tüketicilere sağlayacağı faydalar, ürünlerin pazarlanması ve yönetim organizasyonu anlamında yeniden değerlendirilmesinin faydalı olacağı düşünülmektedir.

Başvuru aşamasındaki incirlere bakıldığında ürün için tanımlanan coğrafi alanların hepsinin ilçe ölçeğinde daha dar alanlar olduğu ve Hasankeyf Benati İnciri dışında diğerlerinin başvurularının milli çeşit listesinde kayıtlı ulusal çeşitlere dayandığı görülmektedir (Tablo 4) (TÜRKPATENT, 2025b). Bununla birlikte, tek yerel çeşitli başvuru olan Hasankeyf Benati İnciri'nin de Silopi Behnat İnciri'nin bir sinonimi ya da genetik ve morfolojik olarak çok yakın incir tipleri olabileceği akla gelmektedir. Bu ihtimalin güçlü olmasına ilişkin fazlasıyla kanıt bulunmaktadır. Nitekim coğrafi işaret Tescili almış olan Silopi Behnat İnciri'nin tescil öncesinde, "Benat" adı ile mahalli çeşit olarak özellikleri bir araştırma ile belirlenmiş ve kayıt başvurusu yapılmıştır. "Benat" ismi ile Hasankeyf'in "Benati" inciri arasındaki ses benzerliği çok yüksektir. Ayrıca, bu mahalli varyeteye ilişkin tanımlamalar ve internette paylaşılan görseller yüksek düzeyde benzerlik göstermektedir. Bununla ilgili tam bir sonuca varılabilmesi için dünyadaki diğer uygulama örneklerinde olduğu gibi DNA temelli moleküler teşhis tekniklerin kullanılması gerekmektedir (Ciarmiello ve ark., 2015; Ganopoulos ve ark., 2015). Ülkemizde de buna ilişkin laboratuvar imkânları ve yetkinlik düzeyi yüksek uzmanlar bulunmaktadır (Akin ve ark., 2021; Ergül ve ark., 2021).

Türkiye'deki coğrafi işaret tescil bilgileri incelendiğinde, ürünlerin büyük çoğunluğunun belediyeler, ticaret/ticaret-sanayi odaları, ticaret borsaları, valilik ve kaymakamlıklar gibi kamu veya yarı-kamu niteliğindeki kurumlar tarafından tescil ettirildiği görülmektedir. Benzer bir

eğilim incir özelinde de geçerlidir. Şu an için tescilli 8 incir ürününden 3'ünün tescil sahibi belediyeler, 2'sinin ticaret veya ticaret ve sanayi odaları, 2'sinin Tarım ve Orman Bakanlığı İlçe Müdürlükleri, 1'inin ki ise üretici kooperatif birliğidir. Türkiye'nin iki en bilinen coğrafi işaretli incirinden Aydın İnciri, ilin Ticaret Odası adına tescilli iken, Bursa Siyah İnciri, S.S. Bursa Bölgesi Tarım Kooperatifleri Birliği adına tescillidir (TÜRKPATENT, 2025b). Bu örnekler, ürünün ekonomik potansiyeliyle tescil sahibinin yapısı arasında bir ilişki kurulabileceğini işaret etmektedir Özellikle, üretici birliklerinin tescil sahibi olduğu coğrafi işaretlerin, üretim gücü, ürünün pazarlanması ve sağlayacağı ekonomik katkı bakımından daha işlevsel olacağı düşünülmektedir (Kan ve ark., 2019). Buna karşılık, Tarım ve Orman Bakanlığı'nın taşra teşkilatları olan ilçe müdürlüklerinin tescil sahibi olduğu durumların da olması dikkat çekicidir. Özellikle, Güneydoğu Anadolu Bölgesi'nde bu durum yaygındır. İlçe müdürlükleri, çoğu zaman mülki amirlerin desteğiyle başvuru sürecini yürütmektedir. Ticari potansiyeli ve üretim hacmi yüksek olan coğrafi işaretli incirlerde ise tescil sahibi kurumun üretici örgütü/birliği olması hem sahiplenmeyi hem de uygulama etkinliğini artıran bir unsurdur. Bu olumlu örnek, Bursa Siyah İnciri özelinde net biçimde gözlemlenmektedir.

TÜRKPATENT'in çevrimiçi veri tabanında yer alan "Faaliyet gösterenler" kısmı incelendiğinde, coğrafi işaretli incirlerin ekonomik büyüklüğü, işlerliği, üretim ve pazarlama organizasyonunun yapısı ve işleyişi hakkında önemli çıkarımlar yapmak mümkündür (TÜRKPATENT, 2025b). Örneğin, Aydın İnciri'nde pazarlamacı sıfatı ile kayıtlı 6 adet tarım satış kooperatifi, 6 adet limited şirket, 2 anonim şirket ve 2 gerçek kişi yer almaktadır. Buna karşın "üretici" sıfatı ile yalnızca 3 limited şirketin kayıtlı olduğu görülmektedir (ci.turkpatent.gov.tr, 2025f). Bu yapı, üretimin büyük ölçüde küçük üreticiler tarafından yapıldığını, daha çok yerel üretici kooperatifler ve özel şirketler aracılığıyla pazara sunulduğunu yansıtmaktadır. Bursa Siyah İnciri ile karşılaştırıldığında, Aydın İnciri'nin organizasyon yapısının daha fazla aktör içerdiği, ne var ki üretici temsiliyetinin nispeten düşük kaldığı anlaşılmaktadır. Ege İnciri örneğinde ise yalnızca bir üretici ve bir pazarlamacı anonim şirketin kayıtlı olması, sınırlı kapasite ve şirket temelli bir yapıya işaret etmektedir (ci.turkpatent.gov.tr, 2025h). Fethiye Kaya İnciri örneğinde ise üretim ve pazarlamanın, tek bir kooperatif aracılığıyla kollektif biçimde yürütüldüğü gözlemlenmektedir (ci.turkpatent.gov.tr, 2025i). Buna karşılık, Melli İnciri'nde üretim ve pazarlamanın çoğunlukla şahıslar üzerinden yürütüldüğü ve doğrudan yerel pazarlarda tüketiciye sunulduğu anlaşılmaktadır (ci.turkpatent.gov.tr, 2025k). Havran İnciri'nde ise faaliyet gösterenlere ilişkin herhangi bir bilgi bulunmamaktadır (ci.turkpatent.gov.tr, 2025j). Bu durum, işlerliğin henüz sağlanamadığını ve organizasyon yapısının tam anlamıyla fonksiyonel hale gelmediğini düşündürmektedir. Güneydoğu Anadolu Bölgesi'ne ait incirlerde ise faaliyet gösterenlere dair veri tabanında herhangi bir kayıt bulunmamaktadır (ci.turkpatent.gov.tr, 2025l; ci.turkpatent.gov.tr, 2025m). Bu konudaki eksikliğin mevcut üretim ve pazarlama şartlarını dikkate alarak giderilmesinin yerinde olacağı düşünülmektedir.

Aydın İnciri, Ege İnciri ve Bursa Siyah İnciri, diğer coğrafi işaretli incirlerden farklı olarak, 5553 Sayılı Tohumculuk Kanunu kapsamında ulusal çeşit listesine kayıtlı olan tescilli çeşitlerle (sırasıyla "Sarılop" ve "Dürdane") üretilmektedir. Bu durum, söz konusu ürünlerin coğrafi işaret tescili ve uygulama süreçleri açısından bir engel teşkil etmemektedir. Bununla birlikte, çeşitlerin resmi olarak tescillenmiş olması, bu çeşitlerin coğrafi işaret sınırları dışında, benzer ekolojik koşullara sahip farklı bölgelerde de yetiştirilebilmesine imkân tanımaktadır. Özellikle

bu çeşitlerin adları kullanılarak, coğrafi işaret alanı dışında üretilen ve fiziksel-morfolojik açıdan büyük ölçüde benzerlik gösteren ürünlerin iç piyasada dolaşıma girmesi mümkündür. Bu durum, coğrafi işaret sisteminin temel amacı olan ürünün menşeiyle bağlantılı ayrıştırma, farklılaştırma ve pazarda koruma sağlama işlevini zayıflatabilir (Gökovalı, 2007). Dolayısıyla, tescilli çeşitlerin farklı bölgelerde yetiştirilebilmesi, coğrafi işaretin ekonomik etkisini azaltabilecek ve tüketici nezdinde kafa karışıklığı yaratabilecek bir risk faktörü olarak değerlendirilmelidir.

Türkiye'deki tescilli coğrafi işarete sahip incirler ile başvuru aşamasındaki incirlerin tanımlayıcı meyve özellikleri, döllenme tipleri, tüketim uygunlukları ve öne çıkan özelliklerine ilişkin bilgiler, sırası ile Tablo 4 ve Tablo 5'te sunulmuştur. Başvurusu devam eden ve tescillenmiş incirlerimizin tamamının "Smyrna" tipi meyve verme özelliğine sahip olduğu görülmektedir. Bu tip incirlerde döllenme zorunludur ve meyveleri birçok özellik yönünden diğer tiplerden üstün özelliklere sahiptir (Çalışkan ve Bayazit, 2012; Eisikowitch ve Ghara, 2015). Bursa Siyah İnciri dışındaki tüm incirlerin taze tüketim ile birlikte kurutularak tüketilme durumu söz konusudur. Coğrafi işaret tescili yapılmış 8 incirin dayandığı varyetelerin sarı, sarı yeşil, yeşil tonlarda kabuk rengine sahip olanların daha fazla olduğu, daha koyu mor renkte (koyu mor, siyah-mor) olanların ise daha az olduğu görülebilmektedir. Meyve iç renkleri ise genellikle pembe renkte, daha az sayıdakinin de kırmızı renkte olduğu ve bazılarının pembe ve kırmızı arası geçiş renklerinde olduğu görülmektedir. Bu renk aralıkları itibarı ile incirlerin hepsinin tüketici tercihlerinde görsel cazibe ve kalite açısından olumlu karşılanabilecek özelliklere sahip olduğu söylenebilir. Nitekim iç özelliği beğenildiği için özellikle tercih edilen ve klonal olarak çoğaltılan genotipler olmasından dolayı günümüze kadar ulaşıp coğrafi işaret tesciline konu olmuşlardır. Meyve şekli bakımından incirlerin genel olarak yuvarlak ve yuvarlağa yakın basık formlarda olduğu, sadece birinin uzun oval formda olduğu görülebilmektedir. Coğrafi işaretli incirlerimizin meyve şekil tanımlamalarına bakıldığında, uluslararası incir tanımlayıcı kriterlerinde belirtilen grupların ve ölçüm şekillerinin dikkate alınmadığı görülmektedir (IPGRI, 2003).

Öte yandan, tanımlayıcı ve ayırıcı özellik olarak bahsedilen içerik bilgilerinin sınırlı ve basit analiz sonuçlarına dayalı olarak verildiği, yine benzer şekilde tat ve aroma özelliklerinin de büyük ölçüde birbirine benzeyen ve yüzeysel tanımlarla ifade edildiği görülmektedir (Tablo 4 ve 5). Bu durum, ürünün pazarlama potansiyelin ve tüketici farkındalığını sınırlandıran bir etkide bulunabilir. Dünyadaki coğrafi işaretli zeytinyağı örneklerine bakıldığında, özel içerik bilgilerinin ürünlerin kalitesini ve farklılıklarını ortaya koymak için oldukça detaylı olarak incelendiği ve bu bilgilerin ürünlerin pazarlamasında kullanıldığı görülmektedir (Inarejos-García ve ark., 2010). İncir meyveleri, insan beslenmesinde temel besin öğelerini içermesi yanında sağlığa olumlu etkilerde bulunan özel biyokimyasal bileşikler de içerdiği için fonksiyonel gıda olarak kabul edilmektedir (Caliskan, 2015). Bu nedenle, özel içerik bilgilerinin, zeytinyağı örneklerinde olduğu gibi, nitelikli kimyasal analizler yoluyla belirlenerek incirlerin kalitesiyle ilgili ayrıştırıcı ve farklılaştırıcı bilgiye dönüştürülmesi ve bu bilgilerin ürünlerin iç ve dış pazardaki kalite algısında kullanılmasına özel önem verilmelidir (Caliskan, 2015; Hosseini ve ark., 2025; Kiralan ve ark., 2023; Vinson, 1999). Özellikle aroma profillerinin daha detaylı şekilde tanımlanması, tüketici tercihlerinin yönlendirilmesi açısından büyük önem taşımaktadır. Nitekim dünyadaki diğer meyve türlerine ilişkin coğrafi işaret uygulamalarında olduğu gibi, duyusal analizler ve içerik analizleri (örneğin şeker-asit dengesi,

fenolik bileşikler, organik asitler vb.) ile desteklenen detaylı kalite profilleri oluşturmak, incir meyvelerinin özgünlüğünü daha açık biçimde ortaya koyacaktır (Aljane ve ark., 2020; Çalişkan ve Polat, 2011; Veberic ve ark., 2008). Ayrıca, yerel ürünlerin geleneksel tüketim biçimlerine ilişkin ifadeler de çoğu zaman sınırlı ve genelleyici düzeyde kalmaktadır. Oysa ürünün bölgesel kültürdeki yeri, tüketim alışkanlıkları ve bu meyveden elde edilen geleneksel gıda ürünleri (örneğin incir ezmesi, reçel, pestil gibi) dikkatle belgelenmeli ve gerekirse üretim yöntemleriyle birlikte sunulmalıdır (Günal, 1999; Kantaroğlu ve Demirbaş, 2018; Trichopoulou ve ark., 2006) .

4. SONUÇ VE ÖNERİLER

Coğrafi İşaretler, üreticilere sağladığı koruma, pazarlama olanaklarını artırması ve ekonomik ve kırsal kalkınmayı desteklemesi yönüyle önemlidirler. Bununla birlikte en önemli fonksiyonları belirli bir coğrafyada üretilmiş ürünlerin diğerlerinde üretilenlerden kalite yönüyle olumlu yönde ayrıştığını göstermesidir. Coğrafi işaret koruması (PDO) sadece ekonomik kazanç boyutu ile değil geleneksel bilgi ve üretim şekillerinin, kültürel mirasın korunmasına katkı sağlar. Aynı zamanda korunan ürünleri üreten işletmelerin ürünlerini daha yüksek fiyattan satmalarına imkân sağlayarak gelirlerini artırır. Kırsal bölgelerde turizmi ve diğer coğrafi faaliyetleri olumlu yönde etkileyerek kalkınmaya destek olur. Bununla birlikte, bu durum sadece tescil ile sağlanabilecek bir sonuç değildir. Bunun dışında, ürünlerin kaliteli biçimde üretilmesini sağlayacak organizasyon yapısının kurulması, kullanıcıların belirlenmesi, ürünlerin kalitesini denetleyecek sistemin kurumlar ve altyapı anlamında oluşturulması gerekmektedir. Ayrıca tanıtımının yapılarak, tüketicilerin bilgilendirilmesi ve ürünün piyasada tanınırlığının arttırılması gerekir (Gökovalı, 2007; WIPO, 2025).

Türkiye, incir üretiminde dünyanın en önemli ülkelerinden biridir ve bu nispette fırsatlara sahiptir (Ana ve ark., 2022; Tırkaz ve ark., 2022). Önemli fırsatlarından birisi de tarihi ve kültürel derinliğinin, genetik zenginliğinin bir yansıması olarak ortaya çıkmış coğrafi işaretli incirleridir. Son yıllarda, coğrafi işaretli ürünlerin tesciline yönelik artan ilginin bir sonucu olarak, 2016 yılından sonra, tescilli ürün sayımızda ciddi bir artış meydana gelmiş ve bu süreçte, coğrafi işaretli incirlerimizin sayısı 2'den 8'e çıkmıştır (Kan ve Kan, 2020). Ülkemizdeki coğrafi işaret tescilli incir ve başvuru sayısı incir üretim kültürünün ve incirden ürün elde etme kültürünün ne kadar önemli olduğunu göstermektedir. Mevcut durumda, iç pazar ve dış pazarlar için ayrı düzeyde öneme sahip, farklı üretim miktarları ve kalite özelliklerinde çeşitli coğrafi işaretli incirlerimiz bulunmaktadır. Aydın İnciri ve Bursa Siyah İnciri coğrafi işaretleri, üretim miktarı, ticaret hacmi ve uluslararasılaşmaları itibarı ile en önemlileridir. Düşük miktarlarda üretime sahip coğrafi işaretli incirlerin daha çok sosyo ekonomik etkileri olduğunu söylemek mümkündür. Sağlanan faydalar arasında yörenin ve yöre insanının tanınması olduğu gibi, yöredeki insanların aidiyet duygularını artması da sayılabilir. Ayrıca bölgede işbirliği düzeyinin kültürünün gelişmesine katkı sağlama gibi olumlu sosyokültürel etkiler oluşturabilirler (Demir, 2020).

Coğrafi işaret sisteminden beklenen faydaların tam olarak elde edilebilmesi, tüketici güveninin ve sürdürülebilirliğin sağlanması için yapılması gereken önemli işler bulunmaktadır. Özellikle üretim miktarı düşük olan tescilli incirlerimizde, ürün tanımlamalarındaki eksiklik ve hataların giderilmesi, ayırt edici ve ürünlerin farklılaştırmasında işe yarayacak özelliklerin bilimsel yöntemler kullanılarak geliştirilmesi yerinde olacaktır. Coğrafi işaretli incirlerde, ayırt edici

özgün özelliklerin ortaya konulmasında ülkemizin bilimsel potansiyelinden ve uzmanlarından daha fazla istifade edilmesi gerekmektedir. Bu süreçlerin etkin bir şekilde yürütülebilmesi için ilgili uzman kurum ve kuruluşlar arasındaki işbirliğinin güçlendirilmesi de kritik bir öneme sahiptir. Üniversiteler ve araştırma kuruluşları işbirliğiyle, Coğrafi İşaretli incirlerin kendine özgü tat, aroma, tekstür gibi duyusal özellikleri ile besin içerikleri detaylı olarak analiz edilmelidir. İncirlerin besin içerikleri ve kalitesini artıran özel biyokimyasal içeriklerinin detaylı bir şekilde incelenmesi ve sonuçların tüketicilerle paylaşılması ürünlerin kalite algısı ve tercih edilmeleri açısından önemlidir (Hosseini ve ark., 2025).

Ülkemizin farklı yörelerindeki diğer kıymetli yerel incir varyetelerinin de sistemli bir biçimde kayıt altına alınarak, coğrafi işaret tescil süreçlerine dahil edilmesi önemsenmelidir (Ayar, 2023; Ayar ve ark., 2021; Çalışkan ve Polat, 2012; Gündeşli, 2020). Bunun sağlayacağı çok boyutlu faydalardan birisi de genetik kaynakların korunması olacaktır. İyi özelliklere sahip incir varyetelerinin gen kaynağı olarak kullanılması ve ıslah çalışmalarında kullanılma potansiyeli vardır. Unutulmamalıdır ki Anadolu toprakları "Brown Turkey" ve "Calmyrna" incirlerinin orijinidir. Ayrıca, yeni yapılacak başvurularda, ürün karakteristikleri ile üretildiği coğrafya arasındaki bağın daha güçlü kurulmasına ve bunun bilimsel verilerle desteklenmesine dikkat edilmeli, mevcutlarda ise zaman içerisinde ilişkinin güçlendirilmesi için çabalanmalıdır. Bir başka önemli konu da mevcut ve gelecekteki coğrafi işaretli incirlerimizde ürün güvenliği ile ilgili izlenebilirlik sisteminin oluşturulmasıdır. Coğrafi İşaretlerin, Organik Tarım, GLOBALGAP, İyi Tarım Uygulamaları ve HACCP gibi çevreye duyarlı gıda üretim, kontrol ve sertifikasyon sistemleri ile yürütülmesi düşünülmelidir (Kan ve Gülçubuk, 2008). Zira bu, güvenli ürünlerin üretilmesine, doğal kaynakların korunmasına, uzun vadede müşteri memnuniyetinin oluşmasına ve her yönüyle üretimin sürdürülebilirliğine katkı sağlayacaktır.

Öte yandan, coğrafi işaret tescil belgesinin alınmasının son değil, bir başlangıç noktası olduğu unutulmamalıdır. Geliştirme yönünde çabalara devam edilmeli ve üründen elde edilecek gelirlerin artırılmasına yönelik olarak başka faaliyetlerde gerçekleştirilmelidir. Coğrafi incirlerde marka yönetimi yaklaşımı benimsenerek, pazarlama iletişimi ve halkla ilişkiler geliştirilmeli ve böylece yeni pazarların açılması sağlanmalıdır (Çiftçi, 2019). İncirden yapılan geleneksel ürünlere sahip olan ve ürün işleme potansiyeli bulunan yörelerin, bu ürünleri coğrafi işaret kapsamında pazara sunarak gelirlerini artırmaları ve ilave istihdam oluşturmaları mümkündür. Ayrıca hem uluslararası hem de ulusal tescilli coğrafi işaretli incirlerimizin turizm ve gastronomi ile birleştirilmesi için çabalar sarf edilmelidir (Armesto López ve Martin, 2006; Denk, 2025; Kan ve ark., 2012). Nitekim bunun yakın vadede incirde gerçekleşebileceğine dair göstergeler oluşmaya başlamıştır (Şahin ve Girgin, 2024). Mevcut ve gelecekteki tescil sahiplerinin, ürünlerinin yurt içi ve yurtdışı pazarların taleplerine ne kadar uyduğunu belirlemeleri yerinde bir iş olacaktır. Ayrıca ulusal tescillerini devam ettirecek olanların ve uluslararası tescile başvuracakların öncelikle kararlarını tescil maliyetlerine ve etki analizi sonuçlarına göre vermeleri yerinde olacaktır. İncir yetiştiriciliğimizdeki mevcut pozisyonumuz ve avantajlarımızla yerel incirlerimizi ve coğrafi işaretli incirlerimizi anlamlı çabalarla daha iyi noktalara taşımamız mümkün görünmektedir.

Tablo 1: Türkiye'deki Coğrafi İşaretli İncirlerin Logoları (TÜRKPATENT, 2025c).

Coğrafi İşaret Adı	Fotoğrafı	Logosu
Aydın İnciri	-	
Bursa Siyah İnciri	-	
Ege İnciri	-	
Fethiye Kaya İnciri	-	
Havran Siyah İnciri		Logosu yok
Melli İnciri		Logosu yok
Midyat İnciri		Logosu yok

Tablo 4: Coğrafi İşaretli İncirlerin Meyve Özellikleri (TÜRKPATENT, 2025b)

Coğrafi işaret adı	Kabuk rengi	İç rengi	Meyve şekli	Meyve ağırlığı (aralık ve ortalama)	Meyve verme tipi	Tüketim uygunluğu (/Yöreye özgü özel ürün ya da tüketim şekli)	İncirin kalite ve kullanım yönünden ayırıcı - öne çıkan özelliği
Aydın İnciri	Açık sarı	Pembe	Oval-basık	64,77-67,84 g	Smyrna	Taze sofralık ve kurutmalık	İçinin yoğun balı ve kıvamlı olması, aroması
Bursa Siyah İnciri	Koyu mor	Koyu kırmızı	Uzun oval	76,92- 90,90 g	Smyrna	Taze sofralık	İri meyveli olması, tat ve aroması, taze tüketime uygunluk
Ege İnciri	Yeşilimsi sarı	Pembe	Oval	67,5-68,05	Smyrna	Taze sofralık ve kurutmalık	Aroması ve kuru kalitesinin yüksek olması
Fethiye Kaya İnciri	Siyah-mor	Kırmızımsı	Oval-basık	21,66 – 31,68 g	Smyrna	Taze sofralık ve kurutmalık	Tadının çok tatlı olması, hem taze hem sofralık tüketilebilmesi
Havran Siyah İnciri	Siyah-mor	Kırmızımsı	Uzun-oval	55 gr	Smyrna	Taze sofralık ve kurutmalık	İri meyveli ve tatlı olması
Melli İnciri	Açık yeşil ile sarımtırak	Koyu pembe	Basık	38,4 gr	Smyrna	Taze sofralık ve kurutmalık	Çekirdeğinin fazla olması, ince pürtüsüz kabuğa sahip olması
Midyat İnciri	Sarı-yeşilimsi	Açık pembe	Basık	33,55 – 54,82 g	Smyrna	Taze sofralık ve kurutmalık	Kuraklığa dayanıklı olması
Silopi Behnat İnciri	Sarı	Pembemsı kırmızı	Oval-basık	33,56-52,07gr	Smyrna	Taze sofralık ve kurutmalık (Seyfi: Özel incir pestili)	Kuru incirinin (Seyfi) pestil kıvamında olması

Tablo 5: Başvuru Aşamasındaki İncirlerin Meyve Özellikleri (TÜRKPATENT, 2025b)

Coğrafi işaret adı	Kabuk rengi	İç rengi	Meyve şekli	Meyve ağırlığı / Meyve iriliği	Meyve verme tipi	Tüketim uygunluğu (/Yöreye özgü özel ürün ya da tüketim şekli)	İncirin kalite ve kullanım yönünden ayırıcı - öne çıkan özelliği
Buharkent Taze İnciri	Sarı	Pembe	Basık	66,8-67,85 gr	Smyrna	Taze sofralık ve kurutmalık	Üretim yeri itibarı ile sezon içindeki erkencilği
Dalaman İnciri	Açık yeşil	Koyu pembe	Basık	45-60 gr	Smyrna	Taze sofralık	Benzoik asit ve mevalonik lakton içeriği
Hasankeyf Benati İnciri	Sarı-yeşil alacalı	Açık pembe	Yassı-basık	33,56-52,07 gr	Smyrna	Taze sofralık ve kurutmalık	Güneşe tutulduğunda yarı saydam özelliğe sahip olması İncir cipsi üretimine uygunluk
Payamlı Bardacık İnciri	Açık yeşil-boyuna çatlak	Koyu pembe	Uzun-oval	Orta	Smyrna	Taze sofralık	Uzun boyunlu-kabuk rengi boyuna çatlak
Tekkeköy Patlıcan İnciri	Siyah-mor	Kırmızımsı	Uzun-oval	50-70 gr	Smyrna	Taze sofralık ve kurutmalık (/Ezme olarak tüketilmesi)	Tat ve aroması

ABSTRACT

Vitis vinifera L. is one of the most important species within the *Vitis* genus in terms of cultivated area, production, and economic output. Although *V. vinifera* has a broad genetic diversity, modern grapevine cultivation is carried out by grafting *V. vinifera* varieties onto American rootstocks resistant to the phylloxera (*Daktulosphaira vitifoliae*: Fitch) or hybrids derived from them. In recent years, countries such as China and Peru, alongside Mediterranean nations with traditional viticulture, have quickly expanded their modern vineyards, emerging as important actors in the global grape market. Along with the rising market competition, these developments have highlighted the importance of ensuring the sustainability of production against the environmental stress factors that restrict viticulture. In this context, the selection of rootstocks is not only based on their resistance to phylloxera and the affinity between the rootstock and scion, but also on their tolerance to biotic and abiotic stress factors, particularly drought stress, which has become a key criterion. With the effects of global climate change, drought is progressively becoming a growing threat to viticulture. Even though rootstocks adapted to different environmental conditions were developed in the past, their genetic diversity remains insufficient, as most of these rootstocks were derived from the hybridization of a small number of species. Extended dry seasons and changing rainfall patterns are resulting in yield and quality reductions in vineyards, thus requiring the development of new rootstocks with improved drought tolerance. This study focuses on the physiological, biochemical, and molecular responses of some grapevine rootstocks commonly used worldwide and in Turkey to drought stress, as discussed in the current literature, and evaluates the mechanisms of drought tolerance. The presented information will support efforts to breed new drought-resistant grapevine rootstocks and determine graft combinations that show high adaptability to dry conditions.

Keywords: *Vitis* ssp., Abiotic stress, Osmoregulation, Metabolic response, Water limitation

YAYGIN KULLANILAN ASMA ANAÇLARINDA KURAKLIĞA TOLERANS MEKANİZMASI

ÖZET

Vitis vinifera L. türü, *Vitis* cinsi içerisinde yetiştiricilik alanı, üretim miktarı ve ekonomik getirisi açısından öne çıkan bir türdür. Geniş bir genetik varyasyona sahip olmasına rağmen, modern bağcılıkta *V. vinifera* çeşitlerinin yetiştiriciliği, filoksera zararlısına (*Daktulosphaira vitifoliae*: Fitch) karşı dayanıklı Amerikan türleri ya da bu türlerden geliştirilen hibrit anaçlar üzerine aşılanarak gerçekleştirilmektedir. Günümüzde yalnızca geleneksel bağcılık yapılan Akdeniz ülkeleri değil, aynı zamanda Çin ve Peru gibi ülkeler de modern bağ alanlarını hızla genişleterek küresel üzüm pazarında önemli aktörler hâline gelmiştir. Bu gelişmeler, artan pazar rekabetiyle birlikte, bağcılığı sınırlayan çevresel stres faktörlerine karşı üretimin sürdürülebilirliğini daha da önemli hâle getirmiştir. Bu bağlamda anaç seçiminde yalnızca filokseraya dayanıklılık ve anacın kalem ile gösterdiği afinite değil; aynı zamanda biyotik ve abiyotik stres faktörlerine, özellikle de kuraklık stresine karşı tolerans düzeyi de temel bir kriter olarak ön plana çıkmaktadır. Küresel iklim değişikliğinin etkisiyle kuraklık, bağcılık açısından giderek artan bir tehdit oluşturmaktadır. Geçmişte farklı çevresel koşullara uyum sağlayabilen anaçlar geliştirilmiş olsa da bu anaçların çoğu sınırlı sayıda türün melezlenmesiyle elde edildiğinden genetik çeşitlilik açısından yeterli değildir. Uzayan kurak sezonlar ve azalan yağış rejimleri, bağlarda verim ve kalite kayıplarına yol açmakta, bu da kuraklığa daha toleranslı yeni anaçların geliştirilmesini zorunlu kılmaktadır. Bu çalışmada, dünyada ve Türkiye'de yaygın olarak kullanılan bazı asma anaçlarının kuraklık stresine karşı gösterdikleri fizyolojik, biyokimyasal ve moleküler tepkiler güncel literatür ışığında ele alınmış, kuraklık toleransına ilişkin mekanizmalar değerlendirilmiştir. Sunulan bilgiler, kuraklığa dayanıklı yeni asma anaçlarının ıslahı ile kurak koşullara yüksek adaptasyon kabiliyeti gösteren aşı kombinasyonlarının belirlenmesi yönünde yürütülen çalışmalara katkı sunacaktır.

Anahtar Kelimeler: *Vitis* ssp., Abiyotik stres, Osmoregülasyon, Metabolik tepki, Su kısıtı

1. GİRİŞ

Küresel iklim değişiminin olumsuz etkilerinin tarımsal alanlarda artması ve su kaynaklarına erişimin zorlaşması ile beraber tarımsal üretim maliyetleri de artış göstermiştir. Bu sebeple; daha ekonomik ve sürdürülebilir bir yöntem olan kuraklığa toleranslı bitkilerin ıslahına yönelik araştırmalar ve yatırımlar giderek hızlanmıştır (Ceccarelli ve ark., 2010). Bu bitkilerden biri olan asma, üretimi oldukça yaygın olan ve ürünü çok çeşitli sektörlerde ham madde olarak değerlendirilen, ticari öneme sahip bir bitki türüdür (Odabaşıoğlu ve ark., 2022). Her ne kadar bağcılık her iki yarım kürede de 10-20°C izotermlerinde yer alan ılıman iklim kuşağında yoğun olarak yapılmaktaysa da sıcak iklim bölgelerinde de azımsanmayacak bir ölçüde yetiştiriciliği sürdürülmektedir (Jackson ve Cherry, 1988). Kültüre alınmış birçok bitkinin aksine; asmanın göreceli olarak kuraklığa toleransı yüksektir. Ürün verimine olumsuz bir etkisi olmasına rağmen orta derecede kuraklığın, şarap üretiminde kullanılan üzüm çeşitlerinde tanelerin fitokimyasal bileşimini etkileyerek şarap kalitesine olumlu bir yansımasının olduğu bildirilmektedir (Savoi ve ark., 2020; Tsegay ve ark., 2014). Filoksera zararlısının (*Daktulosphaira vitifoliae*: Fitch) bağlara yayılımı ve *Vitis vinifera* L. türüne ait çeşitlere verdiği zararlar nedeniyle günümüzde bağcılık; Amerikan asma anaçları üzerine *Vitis vinifera* L. çeşitlerinin aşılanması yöntemiyle sürdürülmektedir (Gökbayrak, 2006). Bu nedenle asma fidanı üretimi dünya genelinde büyük ölçüde aşılı olarak yapılmaktadır (Smith, 2004). Filokseraya dayanımın yüksek olması Amerikan asma anaçlarında elzem bir özellik olsa da günümüzde tek başına aranan bir özellik olmaktan çıkmıştır. Son yıllarda asma anaçlarında; çeşitlerle oluşturulan aşı kombinasyonlarında yüksek afinite göstermenin, patojenlere ve diğer zararlılara karşı dayanıklı olmanın yanı sıra toprak tuzluluğu, kuraklık ve benzeri abiyotik stres faktörlerine karşı toleransın yüksek olması gibi özellikler de aranmaya başlanmıştır.

Vitis vinifera L. türüne ait üzüm çeşitlerinin yetiştiriciliğinde kullanılan Amerikan asma anaçlarının büyük bir bölümü, filokseraya toleranslı olmaları hedeflenerek ıslah edildiklerinden dolayı üç farklı *Vitis* türünden (*V. rupestris, V. berlandieri, V. riperia)* en az birinin kullanılmasıyla elde edilmiştir (Cousins, 2005; Odabaşıoğlu, 2021; Atak, 2025). *Vitis riparia* yüzlek kök sistemiyle göreceli olarak sulak alanlara iyi adapte olurken, *Vitis rupestris* ve *Vitis berlandieri* daha derine gidebilen kök sistemine sahip oldukları için kuraklığa toleransları bu türe göre daha yüksektir. Türkiye'de *Vitis vinifera* L. türüne ait çeşitlerin kendi kökleri üzerinde yetiştiriciliği; sınırlı alanlarda da olsa (filokseradan ari bazı bölgelerde) devam etmektedir.

Abiyotik stres faktörleri arasında kuraklığın (su kısıtı); doğrudan verim kaybına ve üründe kalitenin azalmasına neden olduğu bilinmektedir. Bu nedenle suyun etkin kullanımını sağlayan tarımsal sistemlerin geliştirilmesi; tarım işletmeleri için anahtar bir stratejidir. Küresel iklim değişikliği etkilerinin giderek artacağı varsayılmakta ve hatta gelecekte kuraklığın etkisinin günümüz yarı kurak-kurak alanlarında etkisini daha da göstereceği öngörülmektedir (Feng ve ark., 2014). Bu bağlamda anaçlar; su kullanımın etkinliği, potansiyel yaşam gücünün ve büyüme kapasitesinin yüksek olması ve kalemin stres koşullarına adaptasyonunu geliştirerek ürün kayıplarının sınırlandırılmasında önemli bir rol oynayabilirler (Marguerit ve ark., 2012).

İklim değişimi nedeniyle tatlı su kaynaklarına erişim giderek zorlaşmaktadır. Bu nedenle bağcılık için kuraklığa dayanımı yüksek anaçların geliştirilmesi amacı ile yapılan ıslah çalışmaları giderek hız kazanmıştır (Schachtman ve Goodger, 2008). Anaçların genetik çeşitliliği özellikle kuraklık açısından küresel iklim değişimine adaptasyonunda önemli bir rol

oynamaktadır (Vincent ve ark., 2007). Ancak anaçlar arasında kuraklığa dayanımda standart bir metodolojinin bulunmaması nedeniyle çalışmalar arasında farklılıklar bulunabilmektedir (Ollat ve ark., 2016). Nitekim Çizelge 1 incelendiğinde, farklı araştırıcıların belirli bir asma anacının kuraklığa tolerans düzeyi için farklı değerlendirmelerde bulundukları görülebilmektedir.

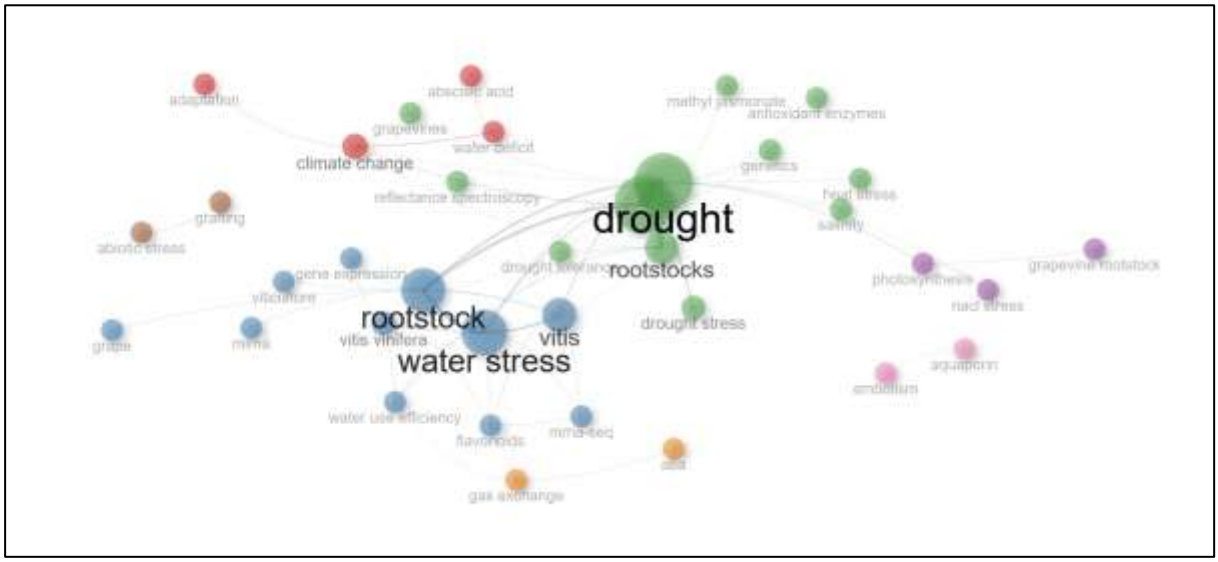
2. ANAÇLARIN KURAKLIĞA TOLERANS MEKANİZMALARI

İklim değişiminin etkileri nedeniyle, özellikle Akdeniz havzasında yoğun olarak yetiştiriciliği yapılan asma bitkisini etkileyen en önemli sorunların başında kuraklık gelmektedir. Kısmi kuraklık şarap içeriğinde istenilen bir unsur olmasına rağmen kuraklığın şiddeti ve süreci önemli verim kayıplarına ve hatta bitki ölümlerine neden olmaktadır (Gambetta ve ark., 2020). Bu nedenle araştırmacılar son dönemde, asmalarda kuraklık stresinin fizyolojisi üzerine çalışmalarını yoğunlaştırmışlardır. “Grapevine”, “drought stress” ve “rootstock” anahtar kelimeleri ile Scopus veri tabanında dizinlenen makalelerde kullanılan anahtar kelimeler ile oluşturulan ağ haritası aşağıdaki şekilde sunulmuştur (Şekil 1). Bu çalışmalar derlendiğinde 7 farklı alt kümenin oluştuğu görülmektedir. En büyük alana sahip olan yeşil kümede sadece kuraklık değil kuraklık stresi ile birlikte tuz ve yüksek sıcaklık ile kombine çalışmaların da yapıldığı görünürken ikinci büyük alana sahip olan mavi kümede ise moleküler çalışmaların

toplandığı görülmektedir. Bu da günümüzde çalışmaların bu doğrultuda yoğunlaştığını göstermektedir.



Şekil 1. Scopus veri tabanında konu ile ilgili yapılmış çalışmaların dağılımı

Bitkilerde kuraklık koşulları altında gözlemlenen dehidrasyon, kökler vasıtasıyla alınan su ile terleme yoluyla kaybedilen su arasındaki dengenin bozulduğu durumlarda ortaya çıkar (Aroca ve ark., 2012). Bu nedenle, asma (*Vitis vinifera* L.) gibi rutin olarak bir anaç üzerine aşılanarak çoğaltılan bitkilerde, stres koşullarına adaptasyon sağlamaya yönelik çalışmalar, anaçlar üzerinde yoğunlaşmaktadır. Asma anaçları, üzerlerine aşılanan üzüm çeşitlerinin eko-fizyolojik davranışını ve meyve kalitesini etkilerken, biyotik (toprak kaynaklı zararlılar vb.) ve abiyotik (tuzluluk, su veya oksijen eksikliği vb.) gibi dışsal sınırlayıcı faktörlere karşı da tolerans sağlar (Tramontini ve ark., 2013a).

Asma anaçları, kuraklık durumunda kalemlerin transpirasyonunun kontrolünde kaleme önemli katkılar sağlamaktadır (Smart ve ark., 2006). Anaçlar kuraklığa toleransta etkin bir rol oynamasına rağmen; kök fizyolojisi ve morfolojisine yönelik çalışmalar, genellikle yaprak gibi toprak üstü organlara kıyasla ikincil düzeyde kalmaktadır. Bunun başlıca nedeni, köklerin doğal ortamda doğrudan gözlemlenmesinin zor olmasıdır. Toprak altında gelişen köklerin zarar vermeyecek yöntemlerle zaman içinde izlenmesi ve örneklenmesi oldukça güçtür. Ayrıca kök dokularında hormon, gen ekspresyonu ya da metabolit düzeylerinin ölçümü için gereken örnekleme işlemleri çoğunlukla bitkiye zarar verecek şekilde olabilmektedir. Bu da zamana bağlı analizlerin güvenilirliğini sınırlandırmaktadır (Zheng ve ark., 2023). Köklerin su alım kapasitesinin stres altında değiştiğini ve bu değişimlerin zamansal olarak izlenmesinin deneysel olarak zor olduğunu vurgulamıştır. Javaux ve ark. (2013) ise kök-toprak etkileşimlerinin karmaşık yapısı ve bu ilişkinin modellenmesindeki belirsizliklerin, kök çalışmalarını daha da karmaşık hale getirdiğini belirtmiştir. Tüm bu metodolojik zorluklar, köklerin kuraklık stresine verdiği yanıtların tam olarak anlaşılmasını güçleştirmiş ve araştırma odağının çoğunlukla

yaprak fizyolojisi ve stoma yanıtları üzerine yoğunlaşmasına neden olmuştur. Oysa stresin ilk algılandığı ve sistemik yanıtların başladığı organ olarak köklerin daha fazla dikkate alınması, bitkilerin kuraklığa tolerans mekanizmalarının bütüncül olarak anlaşılması açısından büyük önem taşımaktadır.

Kök sisteminin gelişimi oldukça esnektir. Kök sisteminin yapısı; kaynaklara erişim, abiyotik-biyotik dışsal etmenlere tepkide ve değişen çevre koşullarına en iyi şekilde adapte olacak şekilde düzenlenmektedir (Zhang ve Kirkham, 1996). Aşılanmış bitkilerde anaç ve kalem arasında etkileşim vardır. Bu etkileşim ve aralarındaki iletişim halen tam olarak açıklanabilmiş değildir. Farklı anaçların kök sistemleri; hormon üretimlerinin yanı sıra bitki besin elementleri ve su alımı kapasiteleri açısından da birbirlerinden farklılık göstermektedir (Satisha ve ark., 2007; Zhang ve ark., 2016). Bu farklılığı; değişik anaçlar üzerine aşılanmış belirli bir üzüm çeşidinin aynı bölgede farklı zamanlarda tanelerini olgunlaştırması veya vejetatif gelişiminde gözle görülür değişikliklerin olması gibi ölçütleri inceleyerek tespit etmek mümkündür (Keller, 2020; Odabaşıoğlu, 2020). Bununla birlikte kuraklığa farklı tepkiler gösteren anaçlar üzerine aşılanmış üzüm çeşitlerinde; kullanılan anaca bağlı olarak büyüme ve gelişme farklılıkları, mahsuldardık değişimleri, tanelerin fitokimyasal kompozisyonlarının değişmesi vb. durumlar, kuraklığa dayanıklı anaçların önemini ortaya koymuştur (Cakir ve ark., 2022; Ezzahouani ve Williams, 1995; Köse ve ark., 2014; Zhang ve ark., 2016). Genel olarak kuraklık, kültürü yapılan üzüm çeşitlerinin büyüme, verimlilik ve ürün kalitesi vb. üzerinde olumsuz bir etkiye sahiptir (Kamiloğlu ve ark., 2014). Öte yandan asmalar, büyüme ve gelişimini devam ettirebilmek için hem yapısal hem de fizyolojik değişimler sayesinde kuraklığa adaptasyon sağlama eğilimindedir.

Stomalar, asmaların kuraklık stresine maruz kaldıkları süre boyunca su kaybının düzenlenmesinde önemli bir role sahiptir (Damour ve ark., 2010; Flexas ve ark., 2009; Tombesi ve ark., 2015). Günümüze değin, kuraklık stresi altında stomaların kontrol mekanizması üzerine pek çok çalışma yapılmıştır. Stomaların düzenlenmesi, su kullanım etkinliğini ve dolayısıyla fotosentetik aktiviteyi etkiler. Asmalar, bitki su durumunda ki azalmaya bağlı olarak stomalarının hassasiyetlerine göre isohidrik ve anisohidrik olmak üzere sınıflandırılmaktadır (Van Leeuwen ve ark., 2009). Sıkı bir stoma kontrolü sağlayanlar isohidrik olarak tanımlanmakta ve bu farklı stoma davranışlarının altında genetik kontrolün olabileceğine dair kanıtlar bulunmaktadır. (Coupel-Ledru ve ark., 2014).

Stomaların kapanmasının düzenlenmesi hidrolik, kimyasal, fiziksel ve hatta elektriksel sinyallerle ilişkilendirilmektedir (Beis ve Patakas, 2010). Kuraklık stresine karşı bitkilerde gelişen temel savunma mekanizmalarından biri, köklerin toprakta azalan su potansiyelini algılaması ve bu duruma yanıt olarak yapraklara sinyaller iletmesidir. Son araştırmalar, bu süreçte yalnızca aktif absisik asit (ABA) üretiminin değil, aynı zamanda ABA'nın biyosentetik öncü maddelerinin de önemli bir rol oynadığını ortaya koymuştur. Kuraklık koşullarında kökler, ABA'nın doğrudan kendisini üretmek yerine, xanthoxin gibi öncü bileşikleri sentezleyerek bunları ksilem yoluyla yapraklara taşır. Böylece ABA biyosentez yolunun bazı basamaklarının farklı dokularda gerçekleştiğini ve bu dağılımın bitkisel yanıtları daha esnek hale getirdiğini bildirmiştir (Seo ve Koshiba, 2002). Bu öncüller yaprak hücrelerinde ABA'ya dönüştürülerek bekçi hücrelerde sinyal iletimini başlatır ve stomaların kapanmasına neden olur. Böylece transpirasyon azalır, su kaybı kontrol altına alınır ve bitkinin kuraklık koşullarına adaptasyonu sağlanır (Davies ve Zhang, 1991). Sauter ve ark. (2001), kökten yaprağa taşınan

ABA ve öncüllerinin bitkisel dokularda farklı şekillerde metabolize edilerek uzun mesafeli sinyal iletimini sağladığını ifade etmiştir. Bu bulgular, köklerin yalnızca su eksikliğini algılamakla kalmayıp, bu bilgiye dayalı olarak sistemik kimyasal sinyal üretimiyle bitki genelinde etkili ve hedefe yönelik kuraklık yanıtlarını başlattığını ortaya koymaktadır.

Kuraklığa toleransı yüksek olan asma anaçlarının yapraklarında stoma yoğunluğunun, kuraklığa hassas olan anaçlara göre daha düşük olduğu rapor edilmiştir (Bekişli ve Gürsöz, 2016). Kara ve Özeker (1999) kuraklığa toleranslı anaçların, hassas olan anaçlara kıyasla üzerlerine aşılanan kalemlerin (çeşitlerin) yapraklarında stoma sayısını arttırma eğiliminde olduğunu bildirmiştir. Odabaşıoğlu (2020) ise kuraklığa toleransı yüksek olan asma anaçlarına aşılı olarak yetiştirilen üzüm çeşitlerinin yapraklarındaki stoma yoğunluğunun, daha kurak geçen sezonlarda arttığını saptamıştır. Bu bulgular; kurak şartlara omcanın tepkisi açısından anaçların, kalemin su durumu ve gaz değişimi üzerine etkiye sahip olduğunu gösterir niteliktedir. Anaçlar, kalemlerdeki stomaların yalnızca hareketlerini değil aynı zamanda yapraklardaki ve diğer yeşil aksamlardaki yoğunluğunu da etkileyebilmektedir. Öte yandan kuraklığa toleransı yüksek anaçların ıslahı için yapılan çalışmalar, kalemin transpirasyon ve hormon sinyal iletişiminin şekillenmesinde anaçların genetik bir katkısı olduğunu kanıtlamıştır (Richards, 1983; Soar ve ark., 2006).

Asma anaçları kuraklığa farklı derecelerde tolerans gösterebilmektedirler. Örneğin, 101-14 ve Schwarzmann daha az tolerans gösterirken, Lider 116-60, Ramsey, 140 Ruggeri, Kober 5BB ve 110R kuraklığa göreceli olarak daha toleranslıdır (Corso ve Bonghi, 2014). Bu farklılığın temelinde, anaçlar ıslah edilirken seçilen *Vitis* türlerinin kuraklığa tolerans düzeylerinin birbirlerinden farklı olması yatmaktadır (Çizelge 2). Nitekim, Lovisolo ve ark. (2008b) *Vitis berlandieri* x *Vitis rupestris* melezlerinin, *Vitis berlandieri* x *Vitis riperia* melezlerine göre kurak koşullara daha iyi adaptasyon gösterdiğini savunmuştur. Sürgün büyümesi, klorofil kapsamı ve bitkinin zararlanma semptomları dikkate alınarak yapılan bir çalışmada, *Vitis cinerea* türünün kuraklığa direnci yüksek anaçların ıslahında kullanılabilecek uygun bir genetik kaynak olabileceği bildirilmiştir (Pavlousek, 2011). Oysaki Padgett-Johnson ve ark. (2003) ve Rustioni ve ark. (2016), bu türün kuraklığa duyarlı olduğunu savunmuşlardır. Araştırmacılar, asma anaçları ıslah edilirken heterosis (melez azmanlığı) etkisinin ortaya çıkabildiğini ve bu nedenle kuraklığa tolerans düzeyi bakımından bazı melez anaçların ebeveynlerinden daha iyi performans sergilediklerini savunmuşlardır. Nitekim bu duruma verilebilecek en güzel örnekler 110R, 140Ruggeri ve 1103Paulsen anaçlarıdır. Her üç anaç da *Vitis berlandieri* x *Vitis rupestris* melezidir ve ebeveynlerine göre kuraklığa toleransları daha yüksektir.

Çizelge 2. Bazı *Vitis* türlerinin kuraklığa tolerans düzeyleri (Padgett-Johnson ve ark., 2003)

Duyarlı	Kısmen Toleranslı	Toleranslı	Çok Toleranslı
V. solonis >	*V. cordifolia* >	*V. longii* >	
V. riperia >	*V. treleasei* >	*V. girdiana* >	*V. champinii* >
V. berlandieri >	*V. monticola* >	*V. arizonica* >	*V. doaniana*
V. lincecumii >	*V. candicans* >	*V. californica* >	
V. cinerea	*V. rupestris*	*V. vinifera*	

Çeşitli bitki türlerinde kuraklık stresine toleransta, oksidatif zararın azalması ile antioksidan sistem arasında yakın bir ilişki bulunmuştur (Aganchich ve ark., 2009; Lima ve ark., 2002; Ozkur ve ark., 2009; Reddy ve ark., 2004; Sofo ve ark., 2005; Zhang ve Kirkham,1996). Kuraklık stresine karşı geliştirilen savunma tepkilerinden biri, reaktif oksijen türlerinin (ROS) neden olduğu hücresel hasarı önlemek amacıyla enzimatik antioksidan savunma sistemlerinin aktive edilmesidir (Beis ve Patakas, 2012). Kuraklık stresinin erken dönemlerinde süperoksit dismutaz (SOD), katalaz (CAT), askorbat peroksidaz (APX) ve glutatyon redüktaz (GR) gibi enzimlerin aktivitesinde anlamlı artışlar gözlemlenmiştir. Bu enzimler, ROS'un toksik etkilerini azaltarak hücre zarlarının bütünlüğünü ve metabolik dengeyi korumaya yardımcı olur. Ancak stresin şiddetinin artması ve sürenin uzaması durumunda bu enzimatik aktivitelerde bir düşüş görülmektedir. Bu azalma, bitkinin antioksidan kapasitesinin yetersiz kalması ve oksidatif hasarın kontrolsüz biçimde artmasıyla ilişkilendirilir. Weidner ve ark. (2009) kuraklık stresinin asma köklerinde bazı fenolik asitlerin (*p*-kumarik asit, ferulik asit) miktarını arttırdığını bildirmiştir. Patakas ve ark. (2002), kuraklık uygulanan asmalarda yapraklardaki SOD ve CAT aktivitelerinin başlangıçta yükseldiğini ancak uzun süreli su kesintisinde bu aktivitelerin azaldığını raporlamıştır. Benzer şekilde, Flexas ve ark. (2002), kuraklık stresine karşı fotosentetik aparatın korunmasında antioksidan sistemin önemli olduğunu, fakat uzun süren stresin bu savunma sistemini zayıflattığını ortaya koymuştur. Koç (2020) tarafından yapılan bir çalışmada ise Türkiye'ye özgü asma çeşitlerinde kuraklık stresinin başlangıcında artan APX ve CAT aktivitelerinin ilerleyen günlerde azaldığı ve bunun hücresel zar hasarıyla ilişkili olduğu bildirilmiştir. Bu bulgular, asmalarda kuraklık stresine karşı geliştirilen antioksidan savunmanın geçici ve strese bağlı olarak sınırlı etkinliğe sahip olduğunu göstermektedir.

3. KİMYASAL TEPKİLER

Anaçlar, kaleme topraktan su ve besin elementleri tedariki sağlamasının yanı sıra pek çok bitki hormonunun da bir kaynağıdır (Keller, 2020; Richards, 1983). Hormon seviyesinde ve sinyal iletimindeki değişim yoluyla anaçların, kalemin büyümesi üzerine bir etkisi olduğu açıktır. Kök-sürgün büyümesinin kontrolünde en merkezi olan hormonlar sitokinin ve oksin, bitkilerde uzun mesafe taşınan hormonlardır (El-Showk ve ark., 2013). Skene ve Antcliff (1972), farklı anaçlar üzerine aşılı Sultana üzüm çeşidinin yaş üzüm verimi ile kanama suyundaki sitokinin seviyesi arasındaki ilişkiyi incelemişler ve sitokinin seviyesi düşük olan omcaların aynı zamanda daha düşük üzüm verimi elde edilen anaç üzerine aşılı olanlar olduğunu saptamışlardır. Benzer bulgulara ulaşan Nikolaou ve ark. (2000) farklı anaçlar (420A, 110R, 99R, 41B, 5BB, 8B, 1103P, 31R ve 3309C) üzerine aşılanmış Thompson Seedless üzüm çeşidine ait omcaların büyüme parametreleri ile sitokinin içerikleri arasında pozitif korelasyon olduğunu ayrıca yüksek sitokinin içeren anaçların, ksilem eksüdatlarında ve yaprak ayasında yüksek azot içerdiğini bildirmiştir.

Kökten gelen kimyasal tepkilerin; özellikle kuraklık stresinin ilk aşaması boyunca asmaların kısa süreli adaptasyonu için önemi büyüktür (Rossdeutsch ve ark., 2016). Bu sinyaller ksilem sayesinde yapraklara kadar taşınabilmektedir. Bu sayede yaprakların büyümesi ve kalemin su kaybının düzenlenmesi sağlanmış olur. Kurak şartlar boyunca köklerden etilenin öncü maddeleri, malat, sitokinin, pH değişimi ve ABA gibi pek çoğunun kimyasal iletişimde rolleri

bulunmaktadır. Özellikle sitokininler köklerde sentezlendikleri için, besin eksikliğinde de olduğu üzere, kuraklık stresi altındaki asmalarda kökler ile kalem arasındaki iletişimde önemli bir role sahip olabilir (Schachtman ve Goodger, 2008). Bu açıdan, ksilem özsuyundaki ABA:Sitokinin oranlarının kuraklık stresinin sinyalizasyonu açısından önem bir işlevinin olması muhtemeldir (Stoll ve ark., 2000). Öte yandan asmalarda, sitokinin ve ABA arasında stomaların kapanması açısından antagonistik bir etki tanımlanmıştır (Montanaro ve ark., 2022). Sharp ve LeNoble (2002), kuraklık stresi altındaki bitkilerde kök-sürgün arasındaki sinyalizasyonda ABA-Etilen ilişkisinin önemli bir rol oynadığını bildirmişlerdir. Ayrıca köklerde yeterli düzeyde ABA sentezlenmediğinde, etilen veya etilenin öncüsü olan ACC hormonunun, köklerden sürgünlere taşındığını bildirmişlerdir. Kurak koşullara asma anaçlarının tepkileri ve adaptasyonu bakımından söz konusu ilişki ile ilgili önemli bir bulgu henüz rapor edilmemiştir.

Yeterli miktarda su bulunmayan toprak şartları altında, köklerdeki sitokinin hormon seviyesinin azalmasıyla beraber kalemlerin vejetatif gelişmesinde azalmaya neden olan, kalemde daha düşük konsantrasyon ile sonuçlanır. Kalem/anaç etkileşimi, taç yapısını ve boyutunu etkileyerek kuraklığa toleransta asmalarda su kullanımını etkileyecek önemli bir etkiye sahiptir (Whiting, 2004). Bunların yanında kimyasal sinyaller, ABA ve akuaporin ifadesi su taşınımını bitkilerde önemli şekilde etkilemektedir. Rehidre olmuş asmalarda transpirasyonal kontrolde ABA'nın önemli bir role sahip olduğu, ksilem embolizmi ve absisik asit hormonunun streslenmiş bitkilerde arttığı bildirilmiştir (Lovisolo ve ark., 2008a; 2008b).

4. HİDROLİK İLETKENLİK

Angiospermlerde ksilem aracılığıyla suyun taşınması, damar çapı, dağılımı, yoğunluğu, hidrolik iletkenlik ve ksilem ağı topolojisi gibi anatomik özellikler tarafından belirlenmektedir. Ksilem anatomisi ile anaçlardan sürgünlere su taşınım verimliliği arasında doğrudan bir ilişki bulunmaktadır (de Herralde ve ark., 2006). Bu durum, anaçların topraktan su alıp kaleme iletme kapasitelerinin birbirinden farklı olduğunu ortaya koymaktadır (Koundouras ve ark., 2008). Asmalar ise, diğer birçok bitki türüyle karşılaştırıldığında daha geniş ksilem damarlarına sahip olmaları sayesinde, su kısıtı koşullarına karşı nispeten daha toleranslı olarak değerlendirilmektedir (Comas ve ark., 2010). Ayrıca kendi organları arasında ksilem genişliği bakımından farklılıklar (kökler > gövde dokuları) mevcuttur (Lovisolo ve ark., 2008a; Serra ve ark., 2014). Hidrolik sistem sadece genetik mekanizma tarafından değil aynı zamanda ksilem dokusunun gelişimi üzerine bir etkiye sahip olan toprak tipi tarafından da etkilenmektedir (Tramontini ve ark., 2013b). Etkili bir kök sistemine sahip asma anaçlarının, topraktan aldığı su ve besin maddelerini en az kayıpla ve hızlı bir şekilde kaleme iletebilmesi üreticilerin avantajınadır.

Uygun sulama şartları altında anaçların kök hidrolik iletkenlikleri farklıdır ve kuraklık stresi ile hidrolik iletkenliklerinde azalma söz konusudur (Lovisolo ve ark., 2008b; Vandeleur ve ark., 2009). Kuraklık stresi altında iletkenlikteki bu azalmaya, muhtemelen akuaporin gen ifade ve aktivesindeki değişim katkı sağlamaktadır (Vandeleur ve ark., 2009). Ayrıca ABA, akuaporin aktivitesi ve kök hidrolik iletkenliği arasında bir ilişki bulunmaktadır (Maurel ve ark., 2010). Kök hidrolik iletkenliğindeki değişimler potansiyel olarak yaprak su potansiyelini de etkileyebilir ve bu nedenle kök hidrolik iletkenliğindeki azalma yaprak su potansiyelinde de bir

azalmaya neden olabilir (Brodribb ve Hill, 2000; Else ve ark., 1995).

Kuraklık stresi, kök hidrolik iletkenliğindeki sürekli azalmaya muhtemel katkı sağlayan bilhassa apoplast kök dokularında ki suberin tabakasının değişimi vasıtasıyla yapısal değişime de neden olabilir (Steudle, 2000). Asmalarda kılcal kök uçlarındaki olgunlaşan bölgelerde ekzodermis ve endodermis bir suberinleşme bulunabilir (Gambetta ve ark., 2013) ve kuraklık stresinin artmasıyla beraber bu suberinleşmeye daha sık rastlanılmaktadır (Lovisolo ve ark., 2010; Vandeleur ve ark., 2009). Kuraklığa 110R anacından göreceli olarak daha hassas olan 101-14MGt anacında kuraklık stresiyle birlikte daha erken ve daha büyük suberinleşme olduğu gözlemlenmiştir (Barrios-Masias ve ark., 2015). Yeni nesil dizileme yöntemi ile asmada yapılan bir çalışma da VriMYB41 transkripsiyonel faktörünün kuraklık stresi ile birlikte suberin birikiminde aktif bir rol oynadığı ortaya konmuştur (Zhang ve ark., 2020).

5. ABSİSİK ASİT (ABA)

Bitkiler kuraklık stresine karşı genellikle dört tür tepki mekanizması gösterirler: kuraklıktan kaçınma, kuraklıktan sakınma, kuraklığa tolerans ve kuraklıktan kurtulma (Fang ve Xiong, 2015). ABA, kuraklık stresine karşı bitkilerin geliştirdiği tolerans mekanizmalarında aktif rol almaktadır. Bu nedenle ABA, stres hormonu olarak da bilinmektedir. ABA, bitkilerin çevresel strese karşı tepkisi bakımından oldukça kritik bir öneme sahiptir (Dalal ve Chinnusamy, 2015). ABA, özellikle kuraklık altında sürgün fizyolojisini etkilemesi üzerine anaçların düzenlemesi için güçlü bir adaydır. Yedi farklı asma anacı üzerine aşılanmış Şiraz üzüm çeşidinin stoma davranışları ile sürgün ksilem özsuyundaki ABA konsantrasyonu arasında güçlü bir ilişki bulunmuştur (Soar ve ark., 2004).

Kurağa görece olarak toleransı yüksek olan bitkiler kuraklık stresi ile başa çıkmak için üç yol izlemektedirler. Bunlar; su tüketiminin azaltılması, su alımını arttırılması ve stres genlerinin ifadelerindeki değişimler ile stomaların kapanarak su kısıtının olumsuz etkilerinin azaltılmasıdır (Surbanovski ve Grant, 2014). ABA bu süreçlerde düzenleyici bir hormon olarak yer almaktadır. Köklerde ABA'nın üretilerek yapraklara taşınması, topraktaki su durumunun rapor edilmesi için kullanılan bitkinin ana mekanizması olarak düşünülmektedir. Bununla birlikte, köklerdeki ABA üretiminin lokasyonu tam olarak bilinmemekte ve ayrıca bu iletişim mekanizması ile etkileşebilen yapraklarda da ABA sentezinin mevcut olduğu düşünülmektedir (Rossdeutsch ve ark., 2016). Kök bölgesinde sentezlenen ABA hormonunun etilen ile antigonistik etkileşime girerek etilen üretimini sınırladığı ve kök uçlarının uzamasının devam etmesi için elzem bir rol oynadığı vurgulanmıştır (Serra ve ark., 2014). ABA'nın ana köklerin uzamasını teşvik ettiği ve lateral köklerin kuraklığa tepki olarak ortaya çıktığı, bir başka çalışma ile doğrulanmıştır (De Smet ve ark., 2006). Bu yüzden ABA kök sisteminin yapısı ve boyutları üzerine önemli bir etkiye sahiptir.

6. AKUAPORİNLER

Akuaporinler farklı fizyolojik süreçlerde yaşayan organizmaların çoğunda bulunan su kanal proteinleridir. Asma genomunda yapılan filogenetik analizler sonucu 28 adet akuaporin geni sınıflandırılmıştır (Koç ve ark., 2024). Asmalarda akuaporinler, değişen çevre şartlarında bitkilerin iyon-su dengesini devam ettirerek kuraklığa adaptasyonda temel bir rol oynarlar.

Kuraklığa daha toleranslı anaçlar, ilerlemiş ksilem gelişimi ve daha düşük damar embolizasyonu ile ilişkilendirilen daha yüksek hidrolik iletkenliğe sahiptirler (Lovisolo ve ark., 2008b). Anaçlar arasındaki bu farklılıkları açıklayabilen yaygın bir görüş; bitkilerdeki özel proteinler olan ve su kısıtında harekete geçen akuaporinlerin varlığıdır (Vandeleur ve ark., 2009). Farklı bitki türlerinde yapılan çalışmalarda kuraklık stresi uygulanmamış bitkilerde *PIP1-1* akuaporin geninin yapraklarla kıyaslandığında köklerde çok daha fazla ifade olduğu görülmüştür (Galmes ve ark., 2007; Jang ve ark., 2004; Weig ve ark., 1997).

Bazı çok yıllık bitki türlerinde, kalem gücünün değişimi ile kök sisteminin hidrolik parametrelerindeki değişimler ilişkilendirilmiştir. Kuraklık boyunca kalemlerde su kullanımının kontrolünde, asma anaçları ile bağlantılı olarak akuaporin proteinlerinin büyük bir rol oynadığını ileri sürülmüştür. Gambetta ve ark. (2012), *Vv*PIPs ifadesinin yaşam gücü yüksek anaçlarda daha yüksek ifade edildiğini saptamıştır. Dahası bir başka çalışmada, 110R anacında akuaporin geninin ifadesinde yaprak ve kökler arasında farklılık tespit edilmiştir. Araştırmacılar bu farklılığı; yapraklarda transpirasyon vasıtasıyla oluşan su kaybının azaltılması için gen ifadesinin azaldığı, kökler yoluyla suyun topraktan alımının arttırılması içinse gen ifadesinin arttığı şeklinde yorumlamışlardır (Galmes ve ark., 2007).

Akuaporinler, asmalarda köklerin (Vandeleur ve ark., 2009) ve yaprakların (Pou ve ark., 2013) hidroliğinin düzenlenmesinde önemli bir rol oynar. Akuaporinler köklerden yapraklara suyun devamlı taşınımında rol alırlar ve membran su geçirgenliğini düzenleyerek hücrenin hidrolik iletkenliğinde hızlı ve tersine değişimler meydana getirebilirler (Hayes ve ark., 2007; Surbanovski ve Grant, 2014). Akuaporinler hücreden hücreye metabolik yolda plazma membranları boyunca su hareketinin düzenlenmesinde ve ksilem embolizasyonunun düzeltilmesinde görev almaktadır (Lovisolo ve Schubert, 2006; Lovisolo ve ark., 2008a). Kuraklığa karşı toleransı yüksek olduğu söylenen 110R anacında moleküler seviyede yapılan çalışmalar sayesinde 8 adet akuaporin tanımlanmıştır (Baiges ve Schaffner, 2001). Asmalarda, yüksek yaşam gücüne sahip anaçlar daha yüksek akuaporin ifade ve aktivitesinden dolayı daha yüksek kılcal kök hidrolik iletkenliğine sahiptir. Öte yandan, farklı *Vitis vinifera* L. çeşitlerinin köklerinde topraktaki su eksikliğini tolere etme yeteneğinin ve akuaporin düzenleme yoğunluğunun, çeşitlerin adaptasyon yeteneğine göre değiştiği saptanmıştır (Vandeleur ve ark., 2009). Farklı anaçlar üzerine aşılanan Cabernet Sauvignon üzüm çeşidi ile yapılan bir çalışmada, akuaporin aktivitesinin olgun kök bölgesine kıyasla köklerin uç kısmında daha aktif olduğu vurgulanmıştır (Gambetta ve ark., 2012).

Portekiz'de yerli bir üzüm çeşidi olan Tourigo Nacional üzerinde kuraklık stresi ile ilgili yapılan çalışmada, hem kök ve hem de yapraktan alınan örneklerde farklı akuaporin (*Vv*PIP2-1; *Vv*TIP1-1; *Vv*TIP2-2 ve *Vv*SIP) ifadeleri incelenmiştir. PIP-TIP grubu akuaporinlerin stresin farklı aşamalarında köklerde ve yapraklarda farklı düzeylerde ifade olduğu, *Vv*SIP geninde herhangi bir değişim olmadığı saptanmıştır. Araştırmacılar, özellikle *Vv*TIP1-1 geninin hem kökte hem de yapraklarda vakuoller sayesinde sitoplazmanın ozmotik düzenlenmesinde önemli bir rolü olduğunu ileri sürmüşlerdir (Zarrouk ve ark., 2015).

7. OMİKS TEKNOLOJİLER

Anaç-kalem iletişiminin kuraklığa karşı nasıl bir tepki geliştirdiğinin anlaşılmasında farklı "omiks" (transkriptomik, proteomik ve metabolomik) yaklaşımların birleştirilerek çalışılması bu mekanizmasının çözülmesine katkı sağlayacaktır. Asma tür ve çeşitleri, 1970'lerden bu yana

kuraklık stresine karşı kompleks bitkilerin tepkilerinin incelendiği araştırmalarda model bitki olarak kullanılmaktadır. Moleküler çalışmalar 1990 itibariyle başlamış olmakla birlikte son yıllarda omiks teknolojiler ile ivme alarak hızla artmaya devam etmektedir (Fischer ve Efferth, 2021; Lovisolo ve ark., 2010). Transkripsiyonel çalışmalarda Northern blot tekniği ile mRNA kantitatif olarak ölçülmeye başlanmış, günümüzde mRNA teknolojisinin ilerlemesi ile qPCR, mikroarray ve Yeni Nesil dizileme gibi yöntemler geliştirilmiştir. Çok fazla gen bölgesinin incelenmesi mikroarray ve Yeni Nesil dizileme ile yapılmaktadır. Ancak mikroarray teknolojisinin çip üzerine ekilen belirli bölgelere bağlı olmasının yanı sıra tekrarlanabilirliği de düşüktür. Günümüzde Yeni Nesil Dizileme teknolojisi hazırlanan kütüphaneler ile daha spesifik bölgelerin stres ile birlikte aktivitesindeki değişiminde daha güvenilir veriler alınması nedeniyle tercih edilen bir yöntem olmaktadır (Malone ve Oliver, 2011). Genetik bilgilerin aşılama yoluyla değişimi üzerine spesifik olarak asmalarda çok fazla çalışma olmasa da diğer bitki türlerinde DNA ve/ya da RNA genetik değişiminin var olduğu ile ilgili kanıtlar vardır. Asmada mRNA moleküllerinin aşı bölgesi boyunca geçtiği saptanmıştır (Yang ve ark., 2015).

Yapılan mikroarray çalışmalarında 110R, 5BB anaçları ve Sultani Çekirdeksiz (K-7 klonu) çeşidinde kuraklık stresine karşı köklerde özellikle 110R anacında MtN3 ve LTP proteinlerine ait transkriptler diğer genotiplere göre çok yüksek seviyede ifade göstermiştir (Sucu, 2016). Kuraklık ve tuza tolerans mekanizmalarının farklılıklarını transkriptomik düzeyde belirlemek amacıyla yapılmış olan bir çalışmada, transkripsiyon faktörleri transkriptleri (NAC domain, Myb-related transcription factor), metabolit transkriptleri (1-prolin-5 –Karboksilat sintetaz, arjinin dekarboksilaz) ve hormonlarla ilgili transkriptlerin (ABA, oksin ve etilen) stresle aktivitelerinin etkilendiği ve bu transkriptlerin oranlarının stres tipine bağlı önemli farklılıklar gösterdiği belirlenmiştir (Bakır, 2012).

Üzümde yapılan proteomik bir çalışmada, Chardonnay üzüm çeşidinin Cabernet Sauvignon çeşidinden kuraklığa daha toleranslı olduğu belirlenmiştir. Ayrıca Cabernet Sauvignon çeşidinde protein metabolizmasındaki proteinler üst düzenleyici olsa da Chardonnay üzüm çeşidindeki üst düzenleyici pek çok protein ya sınıflandırılamamış ya da fonksiyonu bilinmemektedir. Araştırmacılar, geçmiş çalışmalar ile paralel olarak strese adaptasyonda PR-10, PRX ve bHLH proteinlerinin ifade edildiği vurgulanmışlar ve ilk defa NMCP1, RPL39, DEL ve PPR proteinlerinin de abiyotik stres tarafından etkilendiğini ortaya koymuşlardır (Vincent ve ark., 2007).

8. SONUÇ

Bu çalışmada, Amerikan asma anaçlarının kuraklık stresine karşı verdikleri tepkiler farklı yönleriyle değerlendirilmiştir. Kuraklık, bağcılıkta verim ve kaliteyi sınırlayan en önemli abiyotik streslerden biridir. Anaçların bu strese karşı geliştirdiği savunma mekanizmaları; su alma kapasitesi, antioksidan enzim aktivitesi ve gen ekspresyon düzeyinde farklılık göstermektedir.

Yeni Nesil Dizileme (NGS) gibi ileri düzey transkriptomik yaklaşımlar sayesinde, kuraklık stresi altında farklılaşan genetik yanıtların yüksek doğrulukla belirlenebildiği görülmüştür. Bu durum, stres toleransının moleküler düzeyde anlaşılmasına ve bu bilgilerin ıslah programlarında kullanılmasına olanak sağlamaktadır. Sonuç olarak, kuraklığa toleranslı anaçların belirlenmesi ve kullanımı, bağcılığın iklim değişikliğine karşı sürdürülebilirliğini sağlamak açısından büyük önem taşımaktadır.

ABSTRACT

This study aims to assess land degradation vulnerability (LDV) in Kırşehir Province, located in the Central Anatolia Region of Türkiye, using fuzzy logic and spatial geographic data. Variables such as land capability classification (AKK), slope-depth combination (TOK), current land use (SAK), erosion status (ERZ), and Normalized Difference Vegetation Index (NDVI) were integrated using expert knowledge-based membership functions within a Mamdani fuzzy inference system. The spatial distribution of LDV classes was determined, and planning contradictions (AKK-SAK and AKK-NDVI inconsistencies) along with spatial autocorrelation analyses (Moran's I and LISA) were performed. Results indicated that approximately 86% of the study area falls into "High" and "Very High" LDV classes. Significant risks of degradation were identified, particularly due to steep slopes, low NDVI values, and unsuitable land use. The presence of inconsistencies between AKK and SAK was evaluated as a critical indicator of unsustainable land use practices. Furthermore, Moran's I analysis revealed that LDV values exhibit significant spatial clustering rather than random distribution. The results provide valuable insights for developing sustainable land management policies and offer important decision-support mechanisms for future land use planning.

BULANIK MANTIK YAKLAŞIMI VE MEKÂNSAL COĞRAFİ VERİLERLE YARI KURAK BÖLGELERDE ARAZİ BOZULUMU HASSASİYETİNİN DEĞERLENDİRMESİ: KIRŞEHİR, TÜRKİYE ÖRNEĞİ

ÖZET

Bu çalışma, Türkiye'nin İç Anadolu Bölgesi'nde yer alan Kırşehir ilinde, bulanık mantık ve mekânsal coğrafi veriler kullanılarak arazi bozulumu hassasiyetinin değerlendirilmesini amaçlamaktadır. Çalışmada arazi kullanım kabiliyeti (AKK), eğim ve toprak derinliği kombinasyonu (TOK), mevcut arazi kullanımı (SAK), erozyon durumu (ERZ) ve Normalleştirilmiş Fark Bitki Örtüsü İndeksi (NDVI) değişkenleri kullanılmıştır. Bu parametreler uzman bilgisine dayalı üyelik fonksiyonları ile modellenmiş ve Mamdani tipi bulanık mantık çıkarım sistemiyle değerlendirilmiştir. Arazi bozulma duyarlılığı (LDV) sınıflarının mekânsal dağılımı belirlenmiş, planlama çelişkileri (AKK-SAK ve AKK-NDVI uyumsuzlukları) ile mekânsal otokorelasyon analizleri (Moran's I ve LISA) gerçekleştirilmiştir. Bulgular, çalışma alanının yaklaşık %86'sının "Yüksek" ve "Çok Yüksek" LDV sınıfında olduğunu ortaya koymuştur. Özellikle yüksek eğim, düşük NDVI değerleri ve uygunsuz arazi kullanımı nedeniyle ciddi bozulma riskleri tespit edilmiştir. AKK ve SAK arasındaki uyumsuzlukların varlığı, sürdürülebilir olmayan arazi kullanımının kritik bir göstergesi olarak değerlendirilmiştir. Ayrıca Moran's I analizi ile LDV değerlerinin rastgele olmadığı, belirgin mekânsal kümeler halinde dağıldığı kanıtlanmıştır. Elde edilen sonuçlar, sürdürülebilir arazi yönetim politikalarının geliştirilmesine katkı sağlamakta ve gelecekteki arazi kullanımı planlamaları için önemli karar destek mekanizmaları sunmaktadır.

Anahtar Kelimeler: Bulanık çıkarım sistemi, Arazi yönetimi, Mekânsal analiz, Arazi planlama çelişkisi, Erozyon riski

INTRODUCTION

Land degradation vulnerability (LDV) refers to a negative trend in land condition caused by direct or indirect human-induced processes, including climate change, that result in long-term reduction or loss of biological productivity, ecological integrity, or societal value of the land (IPCC, 2019a). This concept extends beyond biophysical drivers such as climate variability, soil erosion, and vegetation decline to encompass socioeconomic factors, urban expansion, agricultural intensification, and mining, that further exacerbate resource depletion (UNDRR, 2022; Geneva Environment Network, 2024). In the face of accelerating climate variability and mounting anthropogenic pressures, accurately characterizing LDV is indispensable for developing targeted land-management strategies and informing policy frameworks aimed at reversing degradation trends (IPCC, 2019b; UNFCCC, 2019). Although determinants vary by physiographic setting, key factors consistently include fluctuating precipitation and temperature regimes, soil deterioration processes (e.g., compaction and erosion), vegetation cover loss, and land-use changes driven by human activity (Halbac- Cotoara-Zamfir et al., 2020; Nickayin et al., 2022; Seifollahi et al., 2022).

Modern LDV assessments integrate both quantitative and qualitative methods to capture landscape sensitivity holistically. Field surveys and expert elicitation provide essential ground-truth and contextual insights into local degradation drivers (Geneva Environment Network, 2024). Remote-sensing techniques, extracting vegetation indices such as NDVI and EVI, and erosion indicators from satellite imagery, are combined with Geographic Information Systems (GIS) to produce high-resolution vulnerability maps (Dubovyk, 2017). Multi-criteria decision-making frameworks, notably the Analytic Hierarchy Process (AHP), systematically weight and rank contributing drivers (climate, soil properties, vegetation, and human pressures) via pairwise comparisons to yield composite vulnerability indices (Chatterjee, 2023; Pandey et al., 2022; Yadav et al., 2023). Advanced modeling tools, including fuzzy-logic expert systems that simulate soil-based reasoning processes (Lue et al., 2022) and process-based numerical models that project degradation trajectories over time, offer mechanistic insight into LDV dynamics across heterogeneous landscapes (IPCC, 2019b). Together, these integrated approaches enable practitioners to prioritize high-risk zones, optimize resource allocation, and develop adaptive management strategies that address both biophysical and socioeconomic dimensions of land degradation (FAO and ITPS, 2015).

Among analytical techniques, fuzzy logic stands out due to its ability to handle uncertainty, imprecision, and non-definitive data (Lu et al., 2022; Islam et al., 2024). Unlike traditional crisp-set methods, fuzzy logic assigns continuous membership values to degradation states, better reflecting transitions between varying degrees of land degradation (Lu et al., 2022). This capability is particularly advantageous when integrating quantitative inputs such as remote-sensing indices, and qualitative judgments, such as expert opinions, within a unified evaluation framework (Islam et al., 2024). Moreover, fuzzy-logic approaches yield more flexible and reliable degradation-risk maps by mimicking human reasoning and adapting to local land conditions (Lu et al., 2022). Practically, these strengths make fuzzy logic indispensable for addressing the multidimensional nature of LDV assessments, enhancing both the accuracy of susceptibility mapping and the interpretability of results for decision-makers (Yadav et al., 2022).

This study was conducted to assess the susceptibility of Kırşehir Province to land degradation. Variables such as land use capability, slope gradient, soil depth, current erosion status, land use type, and Normalized Difference Vegetation Index (NDVI) were evaluated to determine land degradation susceptibility. The sensitivity classification was performed using a fuzzy logic approach based on expert knowledge-driven membership functions and a Mamdani-type inference system, reflecting field conditions. The primary objective is to spatially identify degradation risks through the developed fuzzy logic inference system and provide decision support for sustainable land management by analyzing planning conflicts.

MATERIAL and METHODS

Study Area

Kırşehir Province (Figure 1) is located in Turkey's Central Anatolia Region and stands out for its geological and geomorphological features. Geographically, Kırşehir can be defined as a closed basin area that includes Seyfe Lake. This basin hosts significant ecosystems due to its position among the tributaries of the Kızılırmak River and its wetland characteristics. Seyfe Lake, classified as a Class-A wetland in Turkey, is a critical natural resource that enhances regional biodiversity (Çiftçi et al., 2021).

The geological structure of Kırşehir is shaped by volcanic and sedimentary rocks, which are part of the Central Anatolian Massif. This geological foundation supports fertile soil formations, contributing to agricultural productivity (Abacı Bayar et al., 2019). Geomorphologically, Kırşehir is characterized by rugged terrain (Uysal, 2015).

The region has a continental climate, with hot, dry summers and cold, snowy winters. These climatic conditions facilitate the widespread cultivation of crops such as barley, wheat, and chickpeas (Abacı Bayar et al., 2019).

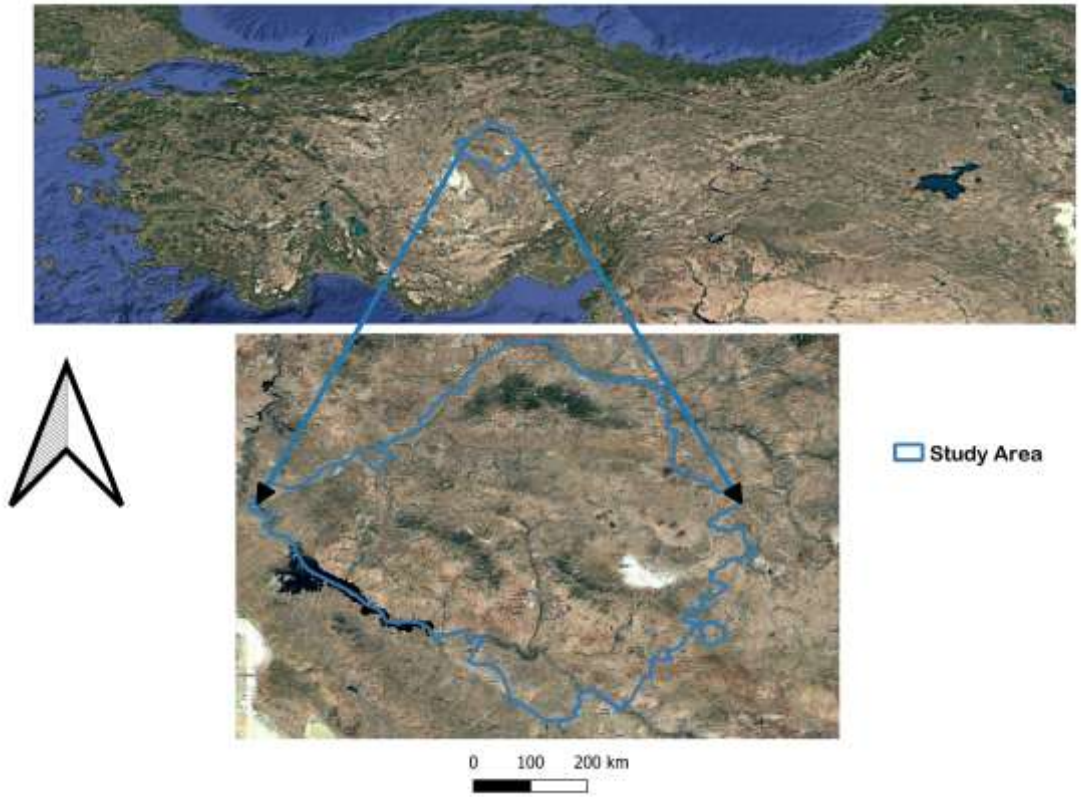

Figure 1. Location of Study Area

Data Set

In this study, both field-based attribute data and remotely sensed data were used to assess land degradation vulnerability. Data obtained from various sources were integrated within a Geographic Information Systems (GIS) environment. The variables used in this analysis include Land Capability Classes (LCC), Texture, Slope and Depth Combination (TSD), Soil Erosion Status (SER), Current Land Use (CLU), and the Normalized Difference Vegetation Index (NDVI) (Equation 1).

$NDVI = (\rho^8 - \rho^4)/(\rho^8 + \rho^4)$ (Eşitlik 1)

In Equation 1, ρ_8 represents Band 8 (Near-Infrared) and ρ_4 represents Band 4 (Red) of the Sentinel-2A optical satellite imagery.

The Land Capability Classification (LCC) system is used to categorize land based on its suitability for agricultural production, ranging from Class 1 (highly suitable) to Class 8 (very limited suitability) (Deviren Saygın & Yüksel, 2008). The TSD variable (Texture, Slope, and Depth Combination) is a composite classification comprising soil group classes, slope percentages, and effective soil depth information (Aygün et al., 2017). The Soil Erosion Status (SER) reflects physical land surface loss and is classified based on the influence of water and wind erosion (Aygün et al., 2017). Current Land Use (CLU) identifies the actual land use types in the area, such as dry farming, irrigated farming, vineyards, orchards, and pasture.

Fuzzy Logic Model and Inference System

In this study, a Mamdani-type fuzzy logic inference system was employed to predict land degradation vulnerability. This approach is widely recognized as an effective tool for modeling complex and uncertain natural systems, and it is particularly valuable in supporting expert-based decision-making in agricultural land management (Rezvani et al., 2016). The input variables used in the model were selected based on a combination of literature review and field conditions. For each variable, appropriate triangular (trimf) or trapezoidal (trapmf) membership functions were defined (Table 1).

Table 1. Classes, membership function types, and threshold values for input variables used in the fuzzy logic model

Input Variable	Class Name	Type of Function	Threshold Value
Land Use Capability	Low	trapmf	1 – 1 – 1.75 – 3
	Moderate	trimf	2.25 – 4 – 5.75
	High	trimf	4.5 – 6 – 7.25
	Very High	trapmf	6.5 – 7.25 – 8 – 8
Soil Composite Variables (Slope, Depth Combination)	Low	trapmf	1 – 1 – 8 – 11
	Moderate	trimf	10 – 14 – 18
	High	trimf	17 – 22 – 26
	Very High	trapmf	25 – 27 – 30 – 30
SER (Soil Erosion Status)	Low	trapmf	1 – 1 – 1.5 – 2
	Moderate	trimf	1.5 – 2.5 – 3.5
	High	trapmf	3 – 3.5 – 4 – 4
NDVI	Low	trapmf	-1.00 – -1.00 – 0.10 – 0.25
	Moderate	trimf	0.20 – 0.45 – 0.65
	High	trimf	0.55 – 0.75 – 0.90
	Very High	trapmf	0.85 – 0.95 – 1.00 – 1.00

For each input variable, triangular (trimf) and trapezoidal (trapmf) membership functions were defined and structured based on expert evaluation to reflect site-specific conditions and field realities.

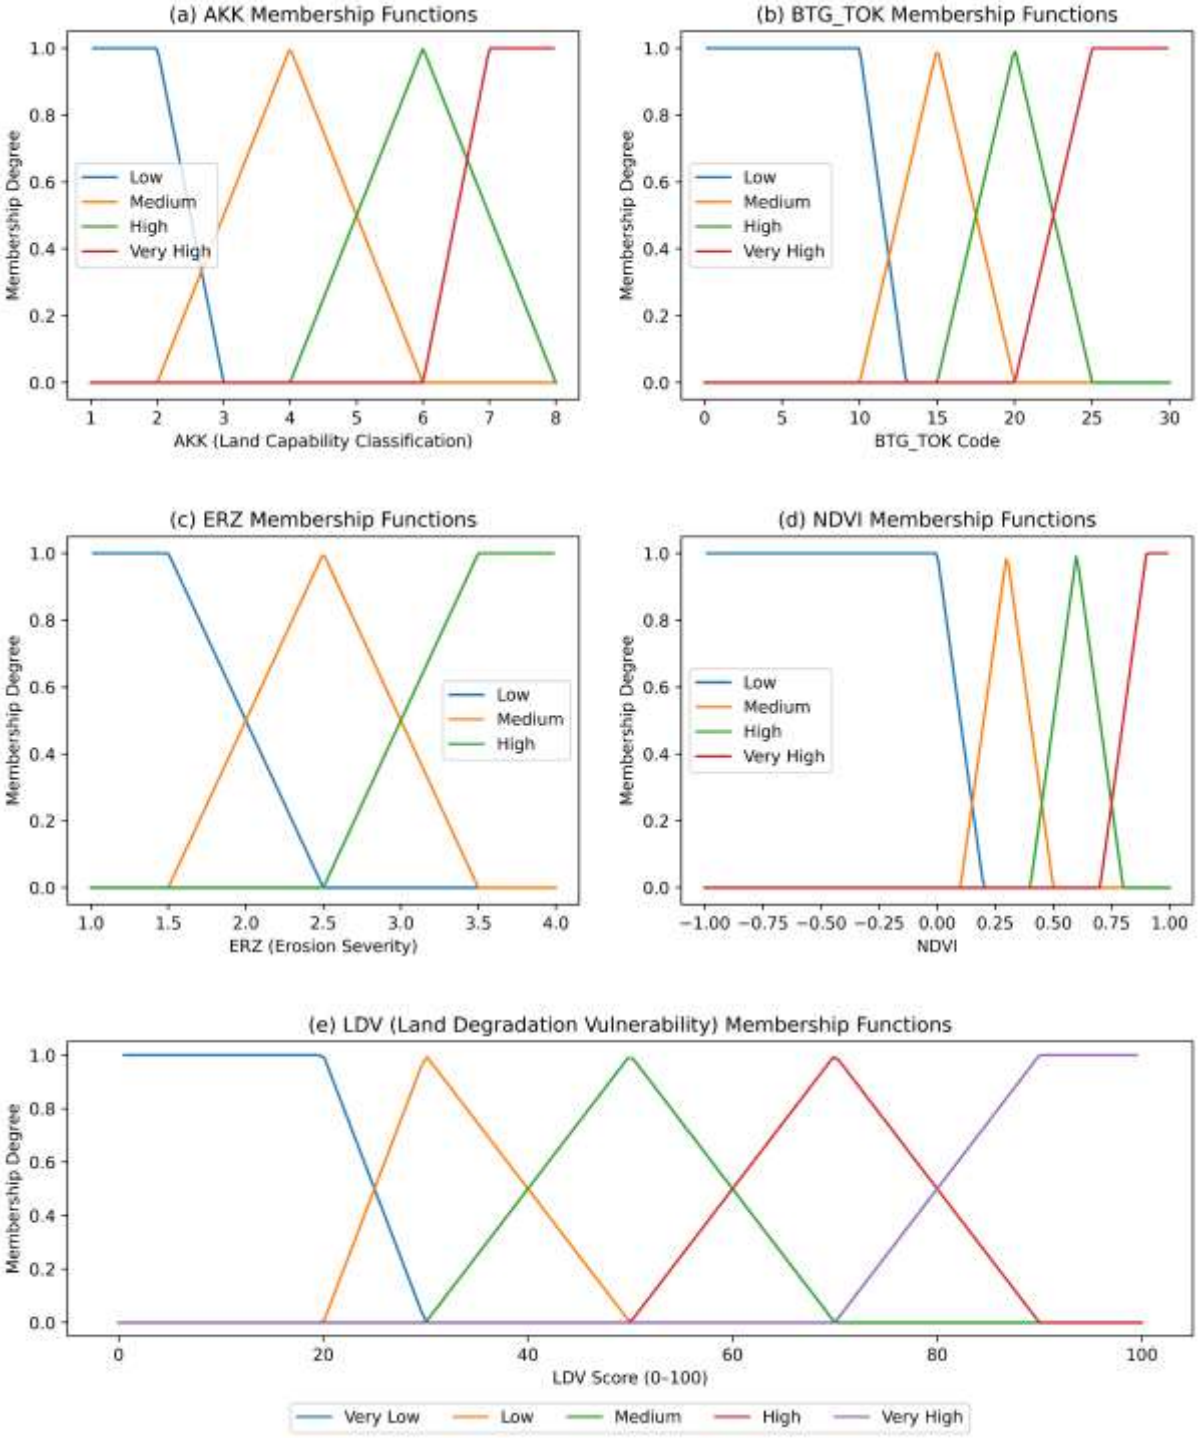

Figure 2. Membership functions for fuzzy logic classification: (a) AKK (Land Capability Classification), (b) BTG_TOK (Erosion Severity), (c) ERZ (Erosion Severity), (d) NDVI (Vegetation Index), and (e) LDV (Land Degradation Vulnerability). Each subplot depicts the degree of membership (y-axis) for linguistic variables (Low, Medium, High, Very High) across respective input ranges (x-axis).

The decision-making mechanism of the fuzzy inference system is based on a rule base composed of expert-defined "IF–THEN" rules. Each rule evaluates a combination of multiple input variables to determine the output variable, Land Degradation Vulnerability (LDV). The LDV output is categorized into four risk levels: Low, Moderate, High, and Very High. The inference rules in the rule base were designed to align with observed field conditions (Table 2). A total of 192 rules were formulated, and 15 representative rules are presented in Table 2.

An analysis of the rule combinations in Table 2 reveals that low NDVI values, which indicate weak vegetation cover, are associated with high degradation risk. High values of LCC and TSD classes reflect increasing natural limitations of the soil, which correspond to greater susceptibility to potential degradation. Similarly, in areas where the SER (erosion status) class is high, the dominant influence of both water and wind erosion contributes to elevated LDV. In this context, the rule base enables a holistic and ecologically grounded estimation of degradation vulnerability by evaluating all input variables in combination. The decision rules ensure the system operates with high accuracy and allow spatial variability in risk levels to be effectively captured in the analysis (Table 3).

Table 2. Sample Fuzzy Rule Combinations for Land Degradation Vulnerability Classification

Rule No	**LUK**	**SCC**	SER	**NDVI**	**LDV (Output)**
1	Low	Low	Low	Very High	Low
2	Moderate	Moderate	Moderate	High	Moderate
3	High	High	High	Moderate	High
4	Very High	Very High	Very High	Low	Very High
5	Moderate	High	Moderate	Low	High
6	Low	Moderate	Low	Moderate	Moderate
7	Moderate	Low	High	Low	High
8	High	Very High	Moderate	Moderate	High
9	Very High	High	Low	High	Moderate
10	Low	Low	Low	Low	Moderate
11	Low	Moderate	High	Low	High
12	Moderate	Very High	Very High	Very High	Moderate
13	Very High	Moderate	High	Low	Very High
14	Moderate	Low	Low	High	Low
15	High	Moderate	Moderate	Moderate	Moderate

Table 3. Spatial Risk Classes and Descriptions Based on Land Degradation Vulnerability

Land degradation vulnerability Classes	Score Range	Description
Very High	0 – 20	Highly vulnerable to land degradation. Characterized by steep slopes, high erosion risk, and low productivity. Requires urgent protection and rehabilitation.
High	21 – 40	High-risk areas. Vulnerable due to soil properties or land use practices. Erosion control and appropriate agricultural techniques are recommended.
Moderate	41 – 60	Areas with moderate risk. Exhibit certain limitations. Agricultural use is possible but requires careful management.
Low	61 – 80	Generally suitable areas. Low slope and erosion risk, with above-average soil quality. Sustainable use is feasible.
Very Low	81 – 100	Least vulnerable to land degradation. High potential for agriculture and other land uses. Not a priority for protection or conservation.

Spatial Consistency Analysis and Autocorrelation Assessment

Autocorrelation and Cluster Analysis (Moran's I and LISA)

Global Moran's I is a statistical measure used to assess spatial autocorrelation across an entire dataset, returning a single summary value between -1 and +1. A value close to +1 indicates strong positive spatial autocorrelation (i.e., clustering of similar values), while a value near -1 reflects negative autocorrelation (i.e., dispersed or checkerboard-like patterns). Values near 0 suggest a random spatial distribution (Fu et al., 2015; Nguyen and Nguyen, 2023). The calculation is based on spatial weights that define the relationships between neighboring observations, either by adjacency or distance (Tokarz and Novak, 2018; Zhu et al., 2018). Statistical significance is commonly determined through permutation tests, which confirm that the observed spatial patterns are not due to random chance (Bai et al., 2022).

Local Indicators of Spatial Association (LISA), developed by Luc Anselin (1995), decompose global spatial autocorrelation into localized statistics, allowing the identification of spatial clusters, such as hot spots or cold spots, at specific locations. LISA results are typically visualized through maps that highlight areas where high or low values are surrounded by similar values, thereby supporting targeted interventions. Like Global Moran's I, LISA uses spatial weights and permutation testing to assess significance; however, its localized detail helps reveal sub-regional patterns that may be masked in global statistics (Bai et al., 2022; Zhu et al., 2018).

Consistency Analysis

This analysis aims to identify conflicts between the land's potential use and its current land use conditions by evaluating inconsistencies among key input variables. The consistency status was assessed for each pixel or polygon using a binary logic approach (Figure 3):

Consistent (1): When the Land Capability Classification (LCC) aligns with parameters such as Current Land Use (CLU), NDVI, or TSD (Texture–Slope–Depth), indicating a supportive relationship.

Inconsistent (0): When there is a clear contradiction between the limitations indicated by LCC, NDVI, or TSD and the actual land use (CLU).

These matches and mismatches were spatially mapped to reveal both the geographic distribution of potential degradation risk and its underlying, resource-based causes. For instance, the occurrence of irrigated agriculture (CLU = irrigated) in areas classified as LCC 7–8, characterized by limited productive potential, signals unsustainable land use practices.

In this study, both planning inconsistency analysis and spatial autocorrelation tests were conducted to evaluate the spatial patterns of land degradation vulnerability (LDV).

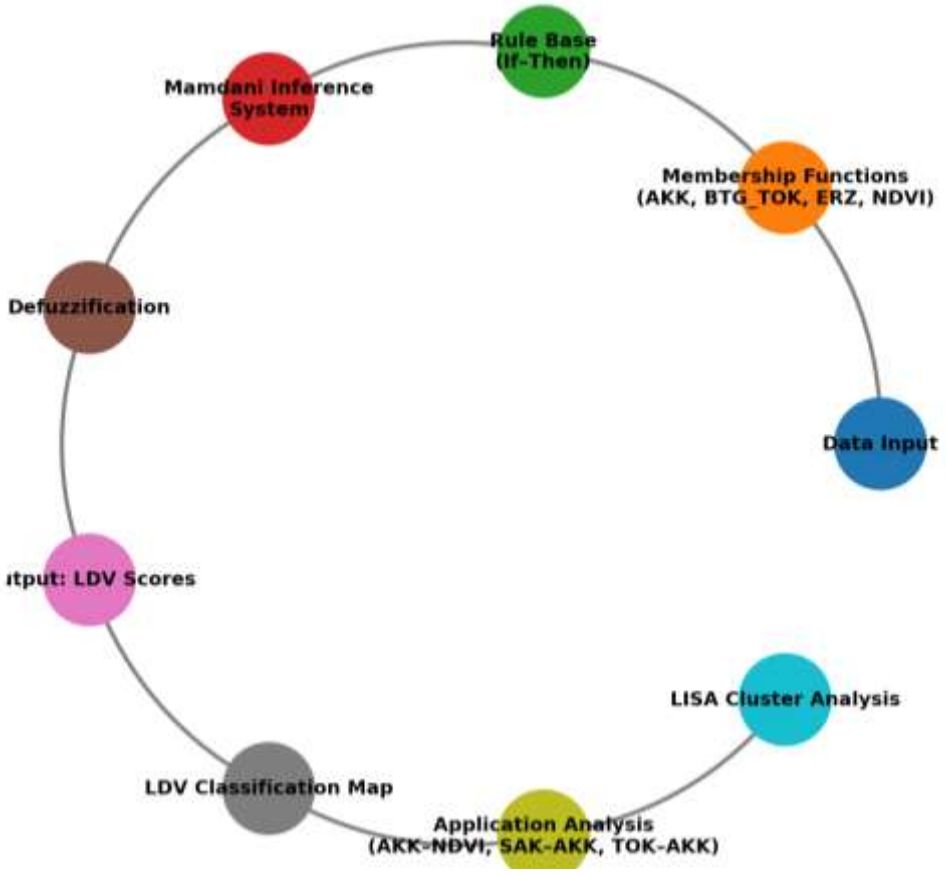

Figure 3. Modeling workflow: Sequential steps of the LDV analysis, from input variable definition to spatial outcome evaluation.

RESULTS and DISCUSSION

Spatial Distribution of LDV Classes

The fuzzy logic-based land degradation vulnerability (LDV) sensitivity analyses conducted in the study area revealed that 86% of the region (comprising 66.36% "Very High" and 19.7% "High" susceptibility classes) is at significant risk of degradation. This finding indicates that physical constraints, such as erosion, topographic limitations, low productivity, and drainage issues, are predominant across most of the land. The combined coverage of "Low" (9%) and "Moderate" (5%) classes accounts for only 14% of the area, while the "Very Low" class is nearly absent. These results underscore the region's severe degradation risk, driven by both biophysical and anthropogenic pressures.

Areas classified as "Very High" risk exhibit critical limitations, as evidenced by their mean values for soil depth (LCC: 5.40), slope gradient (SCC: 13.66), and vegetation cover (NDVI: 0.31). These metrics reflect steep slopes, shallow soils, and low land potential. The moderate NDVI values suggest ongoing agricultural activity but highlight critical degradation risks.

In the "High" susceptibility class, while LCC (3.17) and SCC (9.94) values are relatively lower, slope-related challenges and moderate productivity constraints necessitate monitoring and controlled land use. These findings align with Abuzaid et al. (2021), whose study in the Farafra Oasis similarly identified topographic factors (e.g., slope and surface drainage conditions) and physical soil constraints (e.g., shallow depth and textural imbalances) as key drivers of degradation.

The LCC and SCC values observed in the "High" LDV class further indicate moderate risks associated with soil depth and slope, underscoring the need for protective soil management and targeted monitoring strategies. This aligns with Abuzaid et al. (2021)'s model, which warns that poorly managed medium-risk areas can rapidly transition to higher-risk categories.

The "Moderate" LDV class (LCC: 2.49; SCC: 6.12; NDVI: 0.25) represents transitional zones where physical limitations have partially decreased and which possess potential for improvement. In contrast, areas in the "Low" class (LCC: 1.26; SCC: 2.17; NDVI: 0.27) offer ideal conditions for sustainable agriculture due to low slope and deep soil structure. However, the lower-than-expected NDVI suggests that these areas might be lying fallow. In the "Very Low" class (LCC: 1.00; SCC: 1.66), despite excellent land characteristics, the extremely low NDVI value of 0.18 reflects a condition that may require vegetation preservation or rehabilitation.

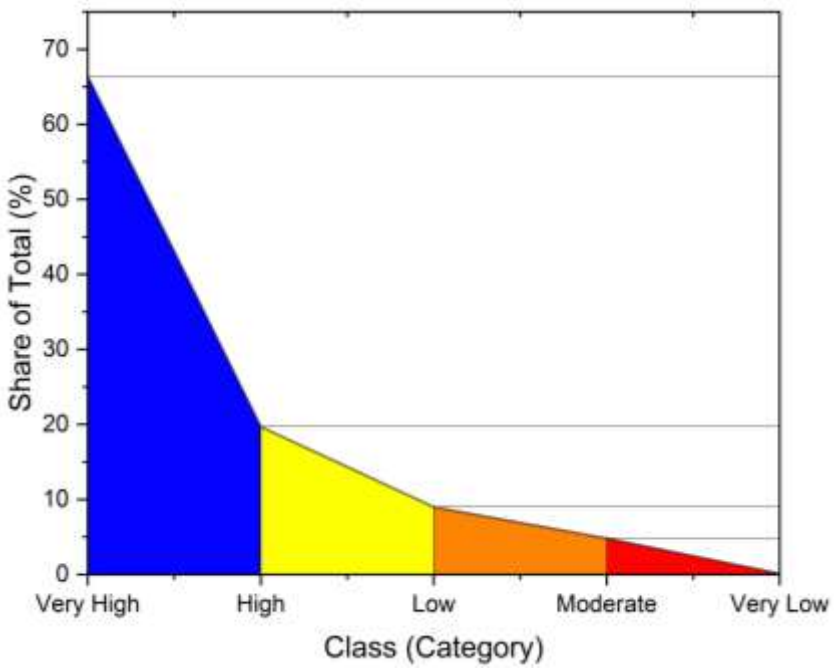

Figure 4. Proportional distribution of LDV classes.

The spatial distribution map of LDV based on GIS, created using the Mamdani fuzzy logic analysis (Figure 5), reveals a distinct geographical distribution of LDV classes across the study area. Areas belonging to the Very High LDV class (red tones) are concentrated in the southeastern, southwestern, and northeastern parts of the map. These regions are characterized by high slope values (>15%), LCC classes ranging between 6 and 8, weak vegetation cover (NDVI: 0.18–0.31), and pronounced erosion risk. In particular, areas surrounding the Kırşehir-Aksaray, Kırşehir-Kırıkkale, and Kırşehir-Yozgat road corridors face critical degradation risks due to high agricultural intensity, soil fatigue, and unplanned land use.

In a study conducted by Lu et al. (2022) in China's Loess Plateau, it was reported that slope, loss of soil organic carbon, and scarcity of vegetation cover play a decisive role in land degradation. The study found that fuzzy logic-based LDI (Land Degradation Index) values were significantly higher in areas with steep slopes and poor vegetation cover.

The High LDV class (yellow tones) is mostly distributed as transitional zones surrounding the Very High class. It is associated with moderate to high slopes (10–15%), drainage problems, and limited agricultural productivity. These areas consist of sloped lands opened to agricultural activities, typically along topographic break lines. In these regions, which require controlled use and close monitoring, LCC values are measured at 3.17 and SCC at 9.94.

The Moderate LDV class (turquoise) is represented with a homogeneous distribution in the eastern and southeastern parts of the map. In this class, moderate slope (5–10%), improved drainage conditions, and a relatively denser vegetation cover (NDVI: 0.25) are observed. The LCC value of 2.49 and SCC value of 6.12 reflect limited but manageable risk levels. These areas have rehabilitation potential when managed with sustainable land practices. This finding aligns with the study by Dutta et al. (2024) in the Subansiri Basin, where soil erosion supported

by fuzzy logic methods showed that regions with moderate slopes are open to rehabilitation under controlled management strategies.

The Low and Very Low LDV classes (green tones) are concentrated primarily in the northeast of Kırşehir, east of the Seyfe Lake Nature Reserve, and alluvial plains. The low slope (<5%), deep soil profiles (LCC: 1.00–1.26), high NDVI values (0.27–0.18), and SCC consistency (1.66–2.17) indicate that these regions are ideal for agricultural and ecological sustainability. This is also confirmed by the study of Lei et al. (2020) in Iran, which reported that low-slope and deep-soil regions present minimal land degradation risk and form optimal zones for sustainable agriculture.

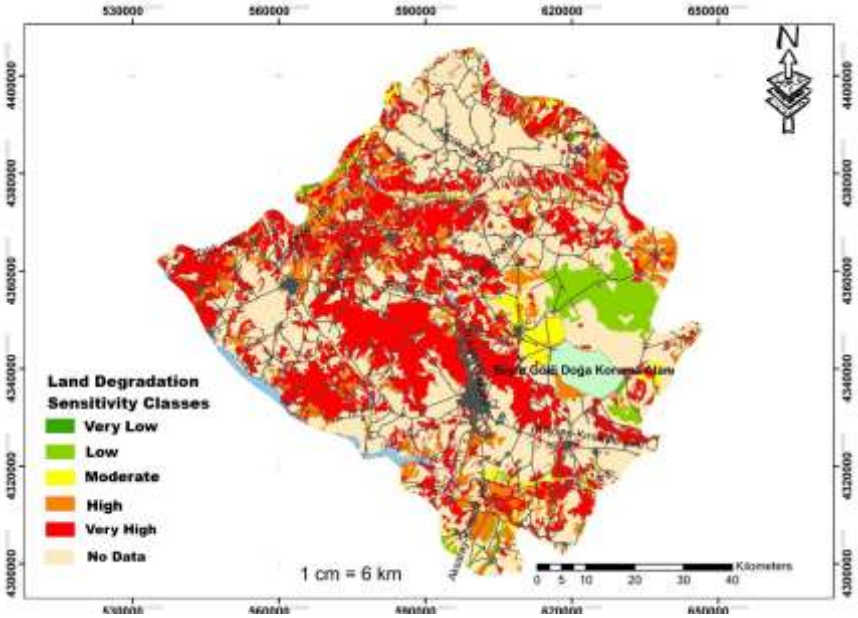

Figure 5. Spatial Distribution Map of Land Degradation Vulnerability (LDV) Classes in Kırşehir Province

Consistency Analysis Among Input Variables

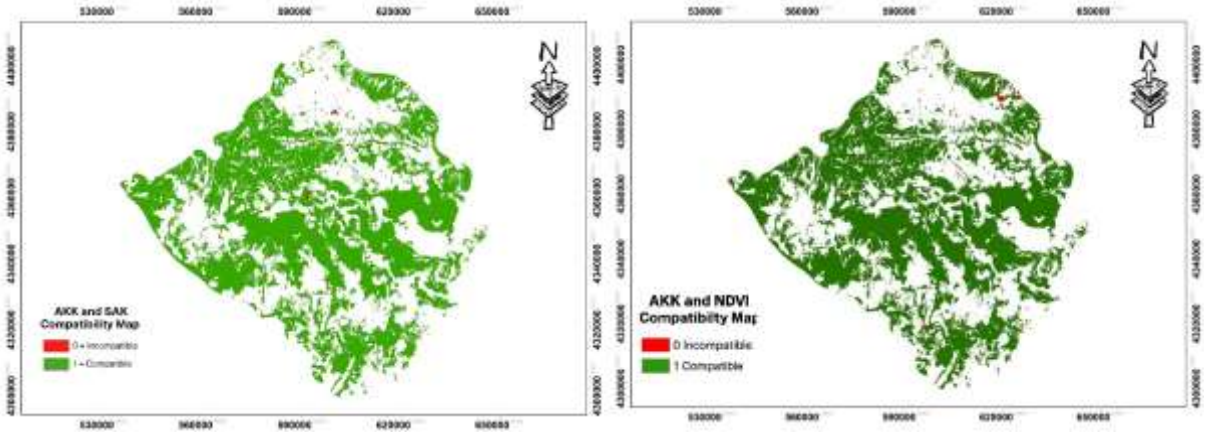
The compatibility map between Land Capability Classes (LCC) and Current Land Use Types (CLU) (Figure 6a) evaluates the degree to which actual land use aligns with the potential of the land. CLU represents how the land is currently being used, such as for irrigated agriculture, pasture, or abandoned purposes, while LCC indicates the ideal use of the land based on its physical and edaphic (soil-related) characteristics, rated on a scale from 1 to 8. The analysis revealed that a total of 3.7 km² of land shows incompatibility between current use and land potential.

Compatible areas (coded as value 1) include situations where high-potential lands (LCC 1–2) are used appropriately for agriculture or low-potential lands (LCC 7–8) are maintained in natural states, such as pasture or left fallow. These represent sustainable and ecologically sound land-use practices. In contrast, incompatible areas (coded as value 0) indicate unsustainable conditions, such as highly productive lands (LCC 1–2) being left idle or underutilized, or

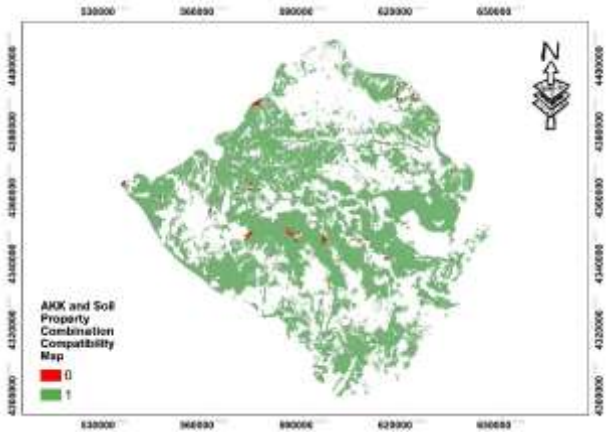
marginal lands (LCC 7–8) being subjected to intensive agricultural activities like irrigated farming. These mismatches reflect a disregard for land suitability and can contribute to degradation risks. Kılıç et al. (2023) emphasize that such discrepancies between land capability and actual land use are among the primary drivers of land degradation. Their findings underscore that both the misuse of fertile lands and the overuse of poorly suited areas lead to accelerated economic losses and environmental deterioration. In this study, specific examples of these inconsistencies include the abandonment of highly capable lands (LCC 1–2) and the intensification of agriculture on limited-capacity lands (LCC 7–8). These patterns are, as Schillaci et al. (2023), point out, direct indicators of land degradation, resulting in significant reductions in ecosystem services and long-term sustainability challenges. Verheijen et al. (2010) in their comprehensive review, also noted land-use intensity and abandonment as critical processes contributing to soil degradation across Europe. Furthermore, Oldeman et al. (1991) in the GLASOD assessment, identified inappropriate land use as a major global driver of soil degradation. The principle of aligning land use with land capability is fundamental to sustainable resource management, as highlighted by Sys et al. (1993) in their work on land evaluation.

The map examining the relationship between LCC and the NDVI (Figure 6b) analyzes the consistency between land potential and vegetation productivity. While NDVI values (ranging from 0.16 to 0.55) reflect the instantaneous condition of vegetation density, LCC represents the long-term potential and suitability of land based on its inherent physical characteristics.

The study identified significant inconsistencies across 101 km² of land. For example, low NDVI values (<0.2) in high-potential lands (LCC classes 1–2) may indicate fallow periods or stress due to water scarcity, which lead to a decline in productivity. Conversely, in low-potential lands (LCC 7–8), elevated NDVI values (>0.5) achieved through intensive artificial inputs (such as excessive irrigation or fertilization) increase the risk of soil degradation. These findings emphasize that vegetation data alone are insufficient for sustainable land assessments. Instead, integrating NDVI with LCC is essential for developing effective and sustainable land management strategies.



(a) (b)



(c)

Figure 6. Incompatibility Maps for Co-variates

The map comparing LCC with topographic constraints such as soil depth and slope (Figure 6c) investigates how accurately the classification system reflects topographic realities. The analysis revealed 1.6 km² of notable inconsistencies between land capability classifications and physical land characteristics. For instance, some areas categorized under LCC classes 1–2, which are theoretically optimal for agriculture, were found to have slopes between 12% and 20% and shallow soil depth, both of which are limiting factors for agricultural use. Similarly, areas with slopes over 30% and very shallow soils were also labeled as LCC class 2, indicating a mismatch between classification and terrain conditions. These inconsistencies suggest that current LCC classifications may overlook critical topographic factors, and that parameters such as slope and soil depth need to be more thoroughly integrated into land capability assessments to improve the accuracy of land-use planning.

Spatial Autocorrelation and Clustering Analysis

Spatial autocorrelation measures like Moran's I and local Moran's I (LISA) are increasingly used to map land degradation and vulnerability. Global Moran's I tests whether values (e.g. a vulnerability index) cluster more than random, while the local LISA identifies hotspots and outliers. LISA classifies each location into one of four spatial association types: high–high (H-H), low–low (L-L), high–low (H-L), or low–high (L-H) cluster, based on whether a location and its neighbors have similarly high or low values (Zhang et al., 2023). These classifications provide intuitive, statistically grounded representations of spatial dynamics across a landscape.

In the present study, Moran's I value of 0.3565 ($p<0.001$) indicates significant spatial autocorrelation in Land Degradation Vulnerability (LDV) values, affirming that degradation sensitivity is not randomly distributed but instead forms meaningful spatial patterns. The LISA cluster map (Figure 7) reveals several statistically significant clusters that align closely with regional environmental and agricultural features. Specifically, H–H clusters (Blue Areas), concentrated in the northeastern and eastern zones, are characterized by high fuzzy logic scores, translating into low LDV and thus low degradation vulnerability. These areas, particularly around Lake Seyfe and its surrounding plains, emerge as ecological strongholds and should be prioritized for sustainable agriculture and conservation initiatives.

Conversely, H–L clusters (Red Areas) appear primarily in the western and southwestern belts, indicating local zones of environmental stability that are bordered by more vulnerable areas. Policy-driven initiatives, economic development disparities, natural conditions, and technological dissemination are crucial factors influencing the spatial distribution of these clusters. Areas with strong policy support for specific agricultural practices, for instance, might exhibit clusters of compatible agricultural land use on suitable lands. Conversely, regions experiencing economic disparities might show clusters of incompatible land use, such as the abandonment of fertile lands due to a lack of economic incentives or the intensification of agriculture on marginal lands driven by economic necessity (Jing et al, 2024).

The L–H clusters (Purple Areas) are scattered as localized anomalies. These zones exhibit high degradation vulnerability, yet they are surrounded by areas with lower vulnerability, making them spatial outliers of concern. Lastly, L–L clusters (Turquoise Areas) are concentrated in the central, southern, and southeastern parts of the study area. These regions demonstrate high degradation risk both locally and in their surrounding context, indicating widespread environmental vulnerability that may require urgent attention.

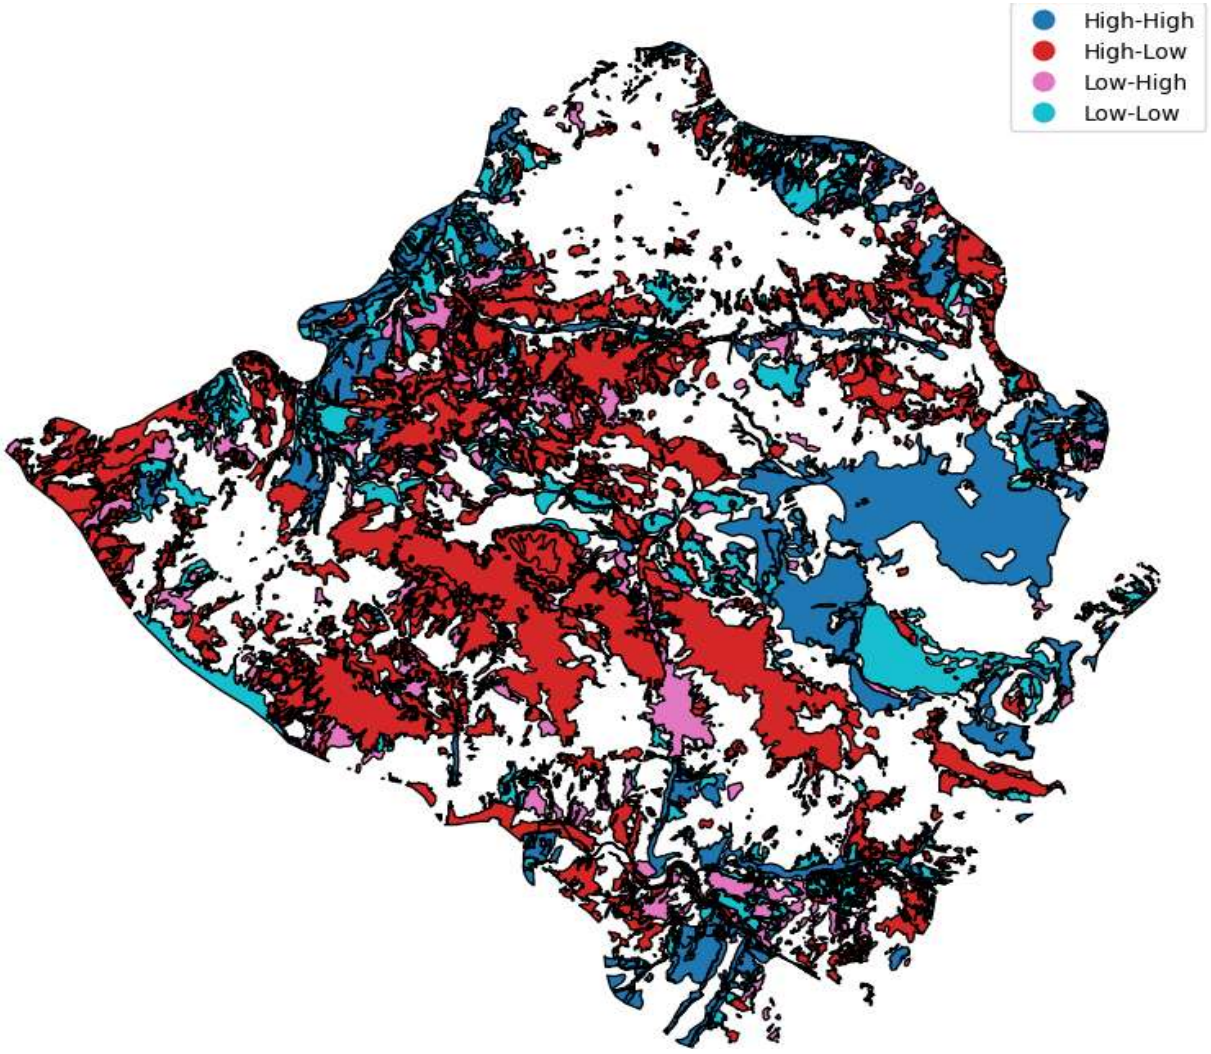


Figure 7. LISA Cluster Map

CONCLUSION

This study evaluates land degradation vulnerability (LDV) in the province of Kırşehir using a fuzzy logic model and spatial analysis, offering critical insights for sustainable land management. The results reveal that 86% of the study area falls under the "Very High" and "High" LDV classes, indicating a serious risk of degradation. This high vulnerability is primarily due to a combination of steep slopes, shallow soil depths, erosion pressure, and incompatible land use practices across the region.

The Mamdani-type fuzzy logic model, with its flexibility in modeling uncertain natural systems and its effective integration with GIS, has enabled the high-accuracy generation of risk maps. The model successfully captured complex interactions between environmental variables and provided a spatially explicit risk assessment framework. Compatibility analyses between land capability classification (LCC) and current land use (CLU) show that mismatches, particularly unplanned agricultural use in high-potential areas and intensive pressure on low-potential areas,

significantly increase degradation risks. Furthermore, inconsistencies between NDVI and LCC highlight the insufficiency of relying solely on vegetation productivity. Instead, integrated evaluations considering parameters like soil depth, slope, and land potential are essential for accurate land assessments.

Spatial autocorrelation analyses confirmed that degradation risk is not randomly distributed, but instead occurs in distinct spatial clusters. The LISA cluster maps showed that high-risk areas are concentrated in the western and southwestern regions, whereas low-risk areas are located around alluvial plains and protected zones. These findings suggest the need for urgent interventions, such as erosion control measures and regulated agricultural practices, especially in high-risk zones. Moreover, the study recommends that land capability classifications be updated to better incorporate dynamic parameters like slope and soil depth for more effective and sustainable land-use planning. A key limitation of the study is that the model was constrained by the limited set of selected variables. Future research should integrate socioeconomic factors and compare alternative modeling techniques to broaden the scope and accuracy of risk assessments.

In conclusion, this study provides a quantitative foundation for developing effective land management policies at the local scale and contributes meaningfully to climate change adaptation strategies.

ABSTRACT

This study provides an integrated assessment of global carbon market evolution, greenhouse gas mitigation practices in agriculture, and Turkey's climate policy landscape. The first section explores the structure of compliance and voluntary carbon markets, including pricing mechanisms, cap-and-trade systems, and the principle of additionality. The second section evaluates agricultural practices such as precision irrigation, no-till farming, biochar application, cover cropping, and agroforestry in relation to their potential to generate carbon credits. The role of MRV (Monitoring, Reporting, and Verification) systems is emphasized, focusing on data transparency, quality assurance, and long-term tracking. The final section discusses Turkey's efforts toward its 2053 net-zero goal, covering its preparation for a national Emissions Trading System (ETS), alignment with the EU Carbon Border Adjustment Mechanism (CBAM), and integration into the European Green Deal framework. The paper highlights Turkey's strategic potential in carbon markets and offers policy recommendations including the enhancement of MRV infrastructure, support for agricultural carbon projects, and harmonization with international carbon credit standards to ensure environmental integrity and market credibility.

Keywords: Carbon Market, Emissions Trading System, Agricultural Carbon Credits, MRV Infrastructure, Additionality

TÜRKİYE'DE KARBON PİYASALARININ GELİŞİMİ VE FIRSATLARI: MEVCUT DURUM VE GELECEĞE BAKIŞ

ÖZET

Bu çalışma, karbon piyasalarının küresel gelişimini, tarım sektöründe sera gazı emisyonlarının azaltımına yönelik uygulamalarını ve Türkiye'nin iklim politikalarını bütüncül şekilde ele almaktadır. İlk bölümde, zorunlu ve gönüllü karbon piyasalarının yapısı, fiyatlandırma mekanizmaları ve katkısallık kriteri gibi temel ilkeler incelenmiştir. İkinci bölümde, tarımsal uygulamalar kapsamında hassas sulama, toprak işlemesiz tarım, biyokömür, örtü bitkileri ve agroforestry gibi yöntemlerin karbon kredisi üretimine etkisi değerlendirilmiştir. MRV sistemlerinin (İzleme, Raporlama, Doğrulama) bu süreçteki rolü detaylandırılmış; veri bütünlüğü, kalite kontrolü ve uzun vadeli izleme önemi vurgulanmıştır. Son bölümde, Türkiye'nin 2053 net sıfır hedefi doğrultusunda ETS (Emisyon Ticaret Sistemi) hazırlıkları, CBAM uyumu ve AB ile entegrasyon süreci ele alınmıştır. Çalışma, Türkiye'nin karbon piyasalarındaki potansiyelini ortaya koymakta; MRV altyapısının güçlendirilmesi, tarımda karbon projelerinin yaygınlaştırılması ve uluslararası standartlara uyumun artırılması yönünde öneriler sunmaktadır.

Anahtar Kelimeler: Karbon Piyasası; Emisyon Ticaret Sistemi, Tarımda Karbon Kredisi, MRV Sistemi, Katkısallık

1. KÜRESEL ISINMA VE EMİSYON GERÇEKLİĞİ

Yirmi birinci yüzyılın en ciddi çevresel tehditlerinden biri haline gelen küresel ısınma, insan faaliyetleri kaynaklı sera gazı salımlarının hızla artması sonucu, iklim sisteminde geri döndürülemez değişikliklere neden olmuştur. IPCC'nin 2023 raporuna göre, mevcut emisyon eğilimleri devam ederse, 2100 yılına kadar sıcaklık artışının 3.1-3.7 °C aralığında gerçekleşeceği öngörülmektedir. Bu durum dünya nüfusunun yaklaşık 3.6 milyarını doğrudan etkileme riski taşımaktadır. Sanayi Devrimi sonrası ortaya çıkan karbon yoğunluklu büyüme modelinin artık sürdürülebilir olmadığı açıktır. Paris Anlaşması ise bu tehdidi azaltmak amacıyla, 1.5 °C hedefini koruyarak, 2050'ye kadar net sıfır emisyon hedefi koymuştur.

2. KARBON PİYASALARI VE FİYATLANDIRMA MEKANİZMALARI

Artan sera gazı emisyonunun azaltılması ve atmosfere biriken gazların miktarının azaltılması amacı ile geliştirilen karbon piyasaları, çevresel maliyetlerin içselleştirilmesini hedefleyen piyasa-temelli mekanizmalardır (Solarin, 2025). Türkiye gibi gelişmekte olan ülkeler için bu piyasalar, hem uluslararası yükümlülükleri yerine getirme hem de ekonomik fırsatlar yaratma açısından stratejik önem taşımaktadır. Karbon fiyatlandırma, karbon vergisi ve emisyon ticaret sistemleri (ETS) gibi araçlarla, firmaların karbon salımlarına bir maliyet yüklenmesini sağlar. Böylece firmalar, düşük karbon teknolojilerine geçmeye teşvik edilir (Delbeke, 2024). Cap-and-trade sistemleri, emisyon izinleri vererek firmaların bu izinleri birbirleriyle ticaret yapmasına olanak tanır (Battocletti et al., 2024). Ancak etkin bir karbon piyasası için fiyat istikrarı, sertifikasyon süreçlerinin güvenilirliği ve katkısallık ilkesi büyük önem taşır.

Karbon fiyatlandırması, iklim değişikliğiyle mücadelede giderek daha merkezi bir politika aracı olarak öne çıkmaktadır ve arazi kullanımı sektörünü de etkileme potansiyeline sahiptir. Dünya Bankası'nın (2023) verilerine göre, karbon vergileri ve ETS'ler, küresel sera gazı emisyonlarının önemli bir kısmını (%23) fiyatlandırmaktadır (World Bank, 2023). Bu mekanizmalar, emisyonları olan faaliyetlere maliyet getirerek ekonomik teşvikler yaratır ve arazi sahiplerini ile yöneticilerini daha sürdürülebilir uygulamalara yönlendirebilir. Örneğin, ETS ve karbon vergileri, tarım ve ormancılık gibi sektörlerde sera gazı emisyonlarını azaltma veya karbonu tutma yönündeki çabaları ekonomik olarak destekleyebilir. Bu durum, orman restorasyonu, tarımsal ormancılık veya azaltılmış toprak işleme gibi karbonu toprakta veya biyokütlede depolayan arazi kullanım şekillerinin yaygınlaşmasına katkıda bulunabilir. Avrupa Birliği'nin ETS reformları ve Çin'in ulusal ETS'si gibi uygulamalar, karbon fiyatlamanın etkin bir politika aracı olabileceğini göstermekle birlikte, düşük fiyat seviyeleri ve kapsam dışı sektörler gibi devam eden zorluklar, bu mekanizmaların arazi kullanımı üzerindeki tam potansiyelini henüz ortaya koymamaktadır. Yine de, karbon fiyatlandırmasının, arazi kullanımının sürdürülebilirlik hedefleriyle uyumlu hale getirilmesinde önemli bir rol oynaması beklenmektedir.

2.1. KARBON KREDİLERİ: KATKISALLIK VE GREENWASHING SORUNU

Karbon kredileri, bir ton CO_2 eşdeğeri azaltan veya tutan projelere yatırım yapılarak oluşturulan ve alınıp satılabilen dijital veya kağıt tabanlı sertifikalardır. Bu mekanizma, özellikle gelişmekte olan bölgelerde yenilenebilir enerji, orman koruma ve toprak yönetimi gibi faaliyetleri finanse

etmeyi hedeflemektedir. Krediler, gönüllü veya zorunlu (düzenlenmiş) piyasalarda işlem görebilir; gönüllü piyasalar esnekliği, düzenlenmiş piyasalar ise zorunluluğu ön plana çıkarır (Seymour ve Langer, 2021).

Bir projenin yalnızca karbon piyasasından elde edilen gelirle mümkün olması beklenir, buna "katkısallık" ilkesi denir. Başka kaynaklarla finanse edilseydi hayata geçmeyecek projeler "ek" sayılır. Bu kriter, piyasanın çevresel bütünlüğünü koruyabilmesi için Core Carbon Principles tarafından zorunlu kılınmıştır (Integrity Council, 2025). Katkısallık değerlendirmesi, finansal fizibilite analizleri, alternatif finansman opsiyonlarının incelenmesi ve şirket içi strateji dokümanlarının analizi yoluyla yapılır. Calyx Global'e göre, kredinin gelirinin proje kararlarında belirleyici rol oynaması, katkısallığın temel göstergesidir (Calyx Global, 2024).

Verra'nın VM0042 metodolojisi kapsamında katkısallık üç temel test üzerinden değerlendirilmektedir: regülasyon fazlası, yaygın uygulama analizi ve engel analizi. Regülasyon fazlası testi, projede uygulanacak faaliyetlerin mevcut yasa ya da yönetmeliklerle zorunlu kılınmadığını göstermeyi hedefler. Örneğin, Hindistan'ın Pencap eyaletinde anız yakma yasaklanmış olduğundan, bu faaliyetten kaçınmak katkısal sayılmamaktadır (Cariappa ve ark., 2024).

İkinci test olan yaygın uygulama analizi, hedeflenen faaliyetlerin uygulama öncesi alanda %20'nin altında bir yaygınlığa sahip olması gerektiğini belirtmektedir. Bu eşik, BM Temiz Kalkınma Mekanizması'nın "yaygın uygulama" metodolojisinden türetilmiştir. Bu sınırın amacı, teknolojilerin veya uygulamaların henüz erken benimsenme aşamasında olduğunu ve dış destek (örneğin karbon geliri) olmadan daha fazla yaygınlaşamayacağını varsaymaktır (Michaelowa ve ark., 2019; Cariappa ve ark., 2024).

Üçüncü test olan engel analizi ise, söz konusu projenin karşılaştığı kurumsal, ekonomik ya da teknik engelleri ortaya koymaktadır. Bu bağlamda, katkısallığın sağlanabilmesi için yalnızca düzenlemelere aykırı olmamak yeterli değildir; aynı zamanda uygulamanın karşılaştığı pratik zorluklar da belgelenmelidir. Örneğin, bazı bölgelerde sıfır toprak işleme gibi uygulamalar için gerekli ekipman erişimi, bilgi eksikliği ve risk algısı önemli engeller olarak değerlendirilmiştir (Cariappa ve ark., 2024).

Aksi takdirde, bu tür krediler "greenwashing" riski taşımaktadır. Örneğin, hâlihazırda ekonomik getirisi olan yenilenebilir enerji projelerine verilen karbon kredileri, çevresel değil finansal araçlar haline gelmektedir. Bu durum, şirketlerin gerçek karbon azaltımı yapmak yerine yalnızca dışsal faaliyetleri finanse ederek çevreye duyarlı göründükleri bir sistem yaratır. Bu tür uygulamalar, karbon denkleştirme mekanizmasının algılanan değerine dayalı olarak şirketlerin sürdürülebilirlik stratejilerinde yüzeysel davranmalarına neden olabilmektedir (Abadie ve ark., 2024).

Yapılan deneysel çalışmalara göre, karbon kredisi satın alma istekliliği yüksek olan firmaların genellikle çevresel performansı düşük, ancak yeşil iletişim faaliyetleri yüksek olmaktadır. Bu durum, dışsal karbon kredisi alımının içsel çevresel dönüşümün yerine geçtiğini ve böylece "greenwashing" davranışlarını beslediğini göstermektedir. Aynı araştırmada, yüksek karbon kredi fiyatlarının firmaları daha güçlü çevresel niyetler sergilemeye teşvik edebileceği bulunmuş, ancak bu niyetin çoğu zaman iletişim stratejileri ile sınırlı kaldığı, somut içsel değişimlerin ise gözlemlenmediği belirtilmiştir. Böylece şirketler, gerçek çevresel dönüşüm yerine, yüksek ödeme gücü sayesinde itibar kazanımı peşinde koşmaktadır (Szabo ve Webster,

2021). Örneğin, Shell'in karbon kredisi satın alımlarını gerçek emisyon azaltımından çok iletişim stratejisi olarak kullanması, bu eleştirilerin somut örneklerinden biridir (Civillini, 2024).

Dolayısıyla, karbon kredisi kullanımı sadece dışsal dengeleme aracı olarak değil, aynı zamanda içsel sürdürülebilirlik çabalarının tamamlayıcısı olarak kurgulanmalıdır. Aksi takdirde karbon piyasaları, çevresel bütünlüğü sağlamak yerine yalnızca itibar kazanımı amacı güden birer araç haline gelir.

2.2. KAÇAK EMİSYON (LEAKAGE) VE ÇİFTE SAYIM RİSKİ

Karbon dengeleme projeleri, sera gazı (GHG) emisyonlarını azaltma ve doğal yutakları artırma amacıyla geliştirilen piyasa-temelli araçlardır. Ancak bu projeler, uygulama sürecinde çeşitli yapısal sorunlarla karşı karşıya kalmaktadır. Bu sorunların başında kaçak emisyon (leakage) gelmektedir. Kaçak emisyon, bir bölgede emisyon azaltımına yönelik alınan önlemlerin, başka bir bölgede emisyonların artmasına neden olmasıdır. Özellikle tarım ve orman tabanlı projelerde bu risk yüksektir. Çünkü bu projelerde arazi kullanımı değişiklikleri ve ekonomik faaliyetlerin yer değiştirmesi sık görülür (Khurana ve ark., 2024).

Örneğin, Hindistan'daki agri-karbon projelerinde çiftçilerin anlık ekonomik ihtiyaçlarını karşılamak için ormansızlaştırma riskini artıran arazi değişimlerine yöneldiği, bunun da toplam emisyon faydasını düşürdüğü gözlemlenmiştir (Khurana ve ark., 2024). Benzer şekilde, bir bölgede uygulanan düşük karbonlu tarım uygulamaları, yüksek emisyonlu tarım faaliyetlerinin başka bölgelere kaymasına yol açarak iklim açısından küresel net faydayı azaltabilmektedir (West ve ark., 2020). Bu nedenle, projelerin ekolojik bütünlük ve mekânsal sürdürülebilirlik açısından dikkatle tasarlanması gerekir.

İkinci önemli sorun ise çifte sayım (double counting) olgusudur. Bu sorun, aynı emisyon azaltımının birden fazla iklim politikası veya aktör tarafından raporlanmasıyla ortaya çıkar. Örneğin bir ülke, Paris Anlaşması kapsamındaki Ulusal Katkı Beyanı (NDC) içinde bir emisyon azaltımını raporlarken; aynı proje gönüllü karbon piyasasında özel bir şirket tarafından da karbon kredisi olarak kullanılıyorsa, aynı azaltım iki kez "sayılmış" olur (Gehring ve Phillips, 2016). Bu tür çifte muhasebe, karbon piyasasının güvenilirliğini zedelerken, aynı zamanda iklim politikalarında yapay başarı algısı yaratabilir.

Khurana ve ark. (2024), tarım sektörüne yönelik karbon kredilendirme sistemlerinin, düzenleyici çerçeve ve doğrulama standartları yetersiz kaldığında bu iki soruna oldukça açık hale geldiğini belirtmektedir. Özellikle VERRA ve Gold Standard gibi sertifikasyon mekanizmalarının bu riskleri azaltmak amacıyla "ek katkısallık," "kalıcılık (permanence)," "sızıntı kontrolü" gibi kalite kriterlerini sıkılaştırması gerektiği ifade edilmiştir. Bu bağlamda, Yüksek Nitelikli Karbon Kredi İlkeleri (Core Carbon Principles) gibi küresel çerçeveler ve hükümet destekli uyum protokolleri, bu sorunların önüne geçilmesinde önemli rol oynamaktadır (Alexander, 2023).

Küresel anlamda bu tür sorunları çözebilmek için uluslararası koordinasyon gerekmektedir. Aksi halde, gelişmiş ülkelerde karbon nötrlüğü hedeflenirken, emisyonlar gelişmekte olan ülkelere kaydırılarak sadece mekânsal bir yer değişikliği yaşanır ve iklim krizi derinleşir

(Bohringer ve ark., 2017; Kawasaki, 2023). Bu nedenle karbon piyasalarında etkili MRV (ölçme, raporlama, doğrulama) altyapısı ve şeffaf veri paylaşımı şarttır.

2.3. GÖNÜLLÜ VE ZORUNLU PİYASALARIN KARŞILAŞTIRMASI

Karbon piyasaları, gönüllü ve zorunlu olmak üzere iki ana kategoriye ayrılır. Gönüllü karbon piyasaları, bireysel ve kurumsal aktörlerin emisyonlarını gönüllü olarak telafi etme çabalarına dayanır. Bu piyasaların temelinde, karbon emisyonlarını azaltıcı veya giderici projeler aracılığıyla üretilen karbon kredilerinin satışı yer alır. Ancak Battocletti ve ark. (2024)'nın belirttiği gibi, gönüllü piyasalar bir dizi yapısal zayıflıktan muzdariptir: Özellikle şeffaflık eksikliği, denetim ve doğrulama süreçlerinin zayıflığı, katkısallık kriterlerinin karşılanmasındaki belirsizlik ve kalite standardı eksikliği, bu piyasanın iklim değişikliğiyle mücadelede potansiyel etkinliğini sınırlandırmaktadır (Battocletti ve ark., 2024).

Proje geliştiriciler, doğrulayıcı kuruluşlar ve standart belirleyici kurumlar (örneğin Verra, Gold Standard) arasında oluşan mali teşvik yapısı, karbon ofsetlerinin gerçekte olduğundan daha fazla emisyon azaltımı sağladığı yönünde sistematik bir "ofset şişirmesi" problemi yaratmaktadır. Bu çıkar birliği, piyasada karbon kredisi arzının niteliksel olarak zayıflamasına ve piyasada güven erozyonuna yol açmaktadır. Dahası, bilgi asimetrisi nedeniyle alıcıların kaliteli ve katkısallığı yüksek ofsetleri diğerlerinden ayırması neredeyse imkânsız hale gelmekte, bu da piyasayı düşük kaliteli, etkisiz karbon kredileriyle doldurmaktadır (Battocletti ve ark., 2024).

Öte yandan, zorunlu karbon piyasaları hükümetler tarafından düzenlenen ve yasal yükümlülüklere dayanan sistemlerdir. Bu piyasalar, genellikle emisyon ticaret sistemleri (ETS), karbon vergileri veya hibrit mekanizmalar gibi araçlarla yürütülür. Dao et al. (2024), zorunlu piyasa araçlarının karbon nötrlüğü hedefleri için kritik olduğunu ve emisyon kapsama oranlarının ve karbon fiyat seviyelerinin belirleyici faktörler olduğunu vurgulamaktadır. Emisyon ticareti sistemleri, belli bir toplam emisyon kotası belirleyerek şirketlere sınırlı sayıda emisyon izni tahsis eder. Bu izinlerin alınıp satılabilir olması, piyasada bir karbon fiyatı oluşmasını sağlar. Karbon vergileri ise sabit bir fiyat aracılığıyla her bir ton emisyon için maliyet yükleyerek emisyonları azaltmayı hedefler (Dao ve ark, 2024).

Bu araçlar arasında temel farklar mevcuttur: Emisyon ticaret sistemleri emisyon miktarını sabitlerken fiyatı değişken bırakır; karbon vergileri ise fiyatı sabitler ancak emisyon miktarı belirsizdir. Bu durum, politika yapıcıların önceliklerine göre tercih ettikleri mekanizmaları şekillendirir. Örneğin AB Emisyon Ticaret Sistemi (EU ETS), piyasaya esneklik ve maliyet etkinliği sağlarken, fiyat oynaklığı gibi sorunlar yaratabilmektedir (Dao ve ark., 2024). Buna karşın karbon vergileri daha öngörülebilir bir maliyet yapısına sahiptir ancak emisyon hedeflerine ulaşma konusunda belirsizlik taşırlar.

Zorunlu sistemlerin bir diğer üstünlüğü, daha geniş sektörel kapsama ve daha sıkı izleme-doğrulama sistemlerine sahip olmalarıdır. Dao ve ark. (2024)'nın analizine göre, 2023 itibarıyla ETS programları dünya çapında 38 örnekle temsil edilirken, karbon vergileri 37 farklı yargı alanında uygulanmaktadır. Ancak sadece %23 oranında küresel emisyon, bu sistemlerle gerçekten kapsanabilmektedir. Emisyonların yalnızca %5.4'ü karbon vergileriyle, %17.6'sı ise

ETS ile regüle edilmektedir (Dao ve ark., 2024). Üstelik bu kapsama oranı; serbest tahsisatlar, istisnalar ve muafiyetler nedeniyle daha da düşmektedir.

Emisyon fiyatlandırması açısından, zorunlu piyasalardaki karbon fiyatları çoğu zaman yeterli düzeyin altında kalmaktadır. Stern ve Stiglitz (2017) tarafından belirlenen hedeflere göre 2030 yılına kadar karbon fiyatlarının \$50–\$100/tCO_2e arasında olması gerekirken, mevcut sistemlerin %90'ı \$25/tCO_2e'nin altında kalmaktadır. Örneğin İsviçre ETS'si nominalde \$95/tCO_2e fiyatlandırma yapsa da yalnızca %12 emisyonu kapsadığı ve %87'si serbest tahsis edildiği için etkin fiyat çok daha düşüktür (Dao ve ark., 2024).

Gönüllü piyasaların etkinliğini artırmak adına, standart belirleyici kurumların teşvik yapısının yeniden tasarlanması, doğrulayıcı kuruluşların hesap verebilirliğinin artırılması ve şeffaflık düzeyinin yükseltilmesi gibi reformlara ihtiyaç duyulmaktadır. Aksi halde, gönüllü karbon piyasalarının iklim hedeflerine katkısı sınırlı kalacaktır.

2.4. İZLEME, RAPORLAMA VE DOĞRULAMA (MRV) SİSTEMİ

Karbon piyasalarının etkinliği yalnızca fiyatlandırma mekanizmalarına değil, aynı zamanda güçlü bir düzenleyici ve teknik altyapıya, özellikle de İzleme, Raporlama ve Doğrulama (Monitoring, Reporting and Verification – MRV) sistemlerinin varlığına bağlıdır. MRV sistemleri, karbon piyasalarının çevresel bütünlüğünü ve piyasa güvenilirliğini sağlamak adına kritik öneme sahiptir. Bu sistemler sayesinde emisyon verilerinin doğruluğu teyit edilmekte, piyasa aktörleri arasında şeffaflık ve hesap verebilirlik artmaktadır (Dominioni ve Efthymiou, 2025).

MRV altyapıları tipik olarak üç temel aşamadan oluşur: (1) İzleme, yani tesis seviyesinde sera gazı emisyonlarının metodolojik olarak ölçülmesi ve kayıt altına alınması aşamasıdır. (2) Raporlama, bu emisyon verilerinin düzenli periyotlarla yetkili otoritelere bildirilmesidir. Avrupa Birliği'nin CRCF düzenlemesi, sertifikalı karbon giderme birimlerini kaydetmek için bir AB kayıt sistemi oluşturuyor. (3) Doğrulama, bildirimlerin bağımsız üçüncü taraf kuruluşlar tarafından incelenerek teyit edilmesi aşamasıdır. Örneğin ISO 14064-2 ve ISO 14065 standartları, proje doğrulaması için küresel kılavuzlar sunmaktadır. Avrupa Birliği Emisyon Ticaret Sistemi bu konuda kapsamlı bir yasal ve teknik çerçeve sunmakta ve diğer ülkeler için örnek teşkil etmektedir (Bencini ve ark., 2025).

Türkiye'de yürürlükte olan MRV sistemi, AB ETS ile yüksek oranda uyumludur. Çevre, Şehircilik ve İklim Değişikliği Bakanlığı tarafından yürütülen sistem kapsamında yaklaşık 770 tesisten elde edilen yıllık emisyon verileri, akredite üçüncü taraf doğrulayıcı kuruluşlar aracılığıyla denetlenmekte ve Bakanlığa raporlanmaktadır. Türkiye'nin 2012 yılından bu yana uyguladığı Sera Gazı Emisyonlarının Takibi Hakkında Yönetmelik, özellikle izleme metodolojilerinde IPCC ve AB yönergelerine dayalı yaklaşımı benimseyerek teknik bütünlük sağlamaktadır.

Ancak literatür MRV sistemlerinin yalnızca teknik kapasiteyle değil, aynı zamanda kurumsal uyum, cezai yaptırımlar, dijital veri yönetimi altyapısı ve düzenleyici bağımsızlık gibi yönleriyle de değerlendirilmesi gerektiğine dikkat çekmektedir (Dominioni ve Efthymiou, 2025). Örneğin AB sisteminde, emisyon verileri merkezi bir dijital platformda saklanmakta, doğrulayıcı kuruluşların lisansları düzenli olarak gözden geçirilmekte ve hatalı beyanlar ciddi

yaptırımlara tabi tutulmaktadır. Türkiye'de ise MRV uygulamaları henüz piyasa bazlı karbon fiyatlandırma mekanizmasıyla bütünleşmiş değildir, ancak ETS'ye hazırlık sürecinde bu altyapının çok kritik olduğu açıktır.

Çin gibi gelişmekte olan ekonomilerde ise MRV teknolojisinin karbon piyasalarını desteklemede oynadığı rol giderek artmaktadır. Çin'in ulusal ETS sistemine geçiş sürecinde demiryolu taşımacılığı gibi yeni sektörlerin dahil edilmesiyle birlikte MRV teknolojisinin dijitalleştiği, uzaktan izleme ve otomatik veri analitiği gibi çözümlerin geliştirildiği bildirilmektedir (Wei ve Wang, 2025). Bu örnekler, Türkiye gibi geçiş aşamasındaki ülkeler için MRV sistemlerinin yalnızca bir veri raporlama aracı değil, aynı zamanda piyasa güvenliğini sağlayan temel bir yapı taşı olduğunu göstermektedir.

Karbon piyasalarının adil, etkin ve çevresel bütünlüğe sahip bir şekilde işlemesi için MRV sistemlerinin sadece teknik doğruluk değil, aynı zamanda kurumsal kapasite, bağımsızlık, dijitalleşme ve düzenleyici uyum boyutlarıyla geliştirilmesi gerekmektedir. Türkiye'nin AB ile uyumlu MRV altyapısını ETS uygulamalarına entegre etmesi, piyasanın güvenilirliğini artıracak ve uzun vadeli iklim hedeflerinin gerçekleştirilmesine katkı sağlayacaktır.

3. TARIM VE HAYVANCILIK SEKTÖRÜNDE KARBON DENGELEME POTANSİYELİ

Tarım sektörü, iklim değişikliği ile mücadelede hem önemli bir sera gazı (GHG) kaynağı hem de yüksek karbon yutak kapasitesine sahip stratejik bir alandır. Küresel düzeyde tarımsal faaliyetlerin, özellikle arazi kullanımı değişikliği dâhil olmak üzere, %14 ila %24 arasında sera gazı salımından sorumlu olduğu tahmin edilmektedir (Shukla ve ark., 2020). Özellikle metan (CH_4) ve azot oksit (N_2O) gibi tarıma özgü gazlar, toplam emisyonlarda belirgin paya sahiptir (Richards ve ark., 2015). Ancak tarım arazileri aynı zamanda büyük bir karbon yutağı olup, atmosferik CO_2'nin %30'a kadarını absorbe etme potansiyeline sahiptir (Shukla ve ark., 2020).

Bu çift yönlü yapı, tarımı hem sorunun hem de çözümün bir parçası haline getirmektedir. Nitekim Acampora ve ark. (2023), tarım sektörünün karbon nötrlüğüne geçişte diğer sektörlere kıyasla daha yüksek bir teknik azaltım potansiyeline sahip olduğunu vurgulamaktadır. OECD (2019) raporuna göre, 2030 yılına kadar tarım sektörünün teknik sera gazı azaltım potansiyeli 5500–6000 $MtCO_2eq$/yıl seviyesindedir. Bu miktar, karbon kredisi piyasasında ciddi bir finansal değer yaratabilecek düzeydedir.

Karbon kredisi üretimi açısından, tarım sektöründe uygulanabilecek çeşitli stratejiler mevcuttur. Toprak işlemesinin azaltılması, hassas gübre ve sulama tekniklerinin kullanılması, hayvansal yem formülasyonlarının değiştirilmesi ve biyogaz sistemlerinin yaygınlaştırılması gibi uygulamalar, hem doğrudan emisyon azaltımı sağlar hem de toprakta karbon depolamasını artırır (Acampora et al., 2023). Özellikle entansif hayvancılıkta metan salımı önemli bir sorun olup, yem içerikleri ve sindirim süreçlerini düzenleyici tekniklerle bu salımlar azaltılabilir.

Ancak bu süreçlerin başarılı olabilmesi için belirli kurumsal altyapılar gereklidir. İlk olarak, MRV (Measure-Report-Verify) sistemlerinin tarım özelinde geliştirilmesi gerekir. Acampora ve ark. (2023), mevcut karbon muhasebesi yaklaşımlarının tarımda karmaşık üretim zincirleri nedeniyle eksik ve karşılaştırılamaz olduğuna dikkat çekmiştir. Özellikle "scope 3" yani tedarik zincirine dayalı emisyonların ölçülmesi ve raporlanması hâlen ciddi metodolojik sorunlar

barındırmaktadır. Ayrıca, küçük ölçekli çiftçilerin karbon piyasasına dahil edilmesini engelleyen yüksek proje geliştirme maliyetleri ve sertifikasyon ücretleri de önemli bir engel olarak ortaya çıkmaktadır (Klaaßen ve Stoll, 2021).

Buna ek olarak, üreticilerin bu tür projelere katılımı için sadece ekonomik teşvik değil, aynı zamanda teknik destek ve kapasite geliştirme desteği sağlanması elzemdir. Acampora ve ark. (2023), yaptıkları saha çalışmasında, agri-food firmalarının karbon nötrlüğüne geçiş sürecinde en çok ihtiyaç duydukları araçların başında sübvansiyonlu sertifikasyon, teknik danışmanlık ve tedarik zinciri düzeyinde destek paketleri olduğunu ortaya koymuştur.

3.1. TARIMSAL KARBON AZALTICI/TUTUCU UYGULAMALAR

Tarımda karbon piyasasına konu olabilecek başlıca faaliyetler, sera gazı emisyonlarını azaltan veya karbon depolanmasını artıran yöntemlerdir. Bunların birçoğu aynı zamanda "iklim akıllı tarım" uygulamaları olarak çiftçinin verimliliğine ve arazinin sağlığına katkı sağlar.

3.1.1. ORGANİK MADDE MİKTARININ ARTTIRILMASI

Tarım topraklarında organik madde miktarını artırmak, hem toprak verimliliğini hem de uzun dönemde karbon tutulumunu destekleyen en etkili yöntemlerden biridir. Meta-analizlere göre, çiftlik gübrelerinin uygulanmasıyla toprak organik karbon stoklarında ortalama %35,4 artış ve 10,7 Mg C ha^{-1}'lik kazanç sağlandığı gösterilmiştir (Gross ve Glaser, 2021) . Benzer biçimde, toprakta yüksek nem koşullarında kompost karıştırmanın organik maddenin ayrışma hızını yavaşlatarak korunmasını artırdığı ve böylece karbon havuzunu genişlettiği tespit edilmiştir (Dijkstra ve Keitel, 2024).

Kompostlama ve gübrelemede temel uygulamalar; hayvan gübresinin olgunlaştırılarak kompost haline getirilmesi, hasat artığı bitki materyalinin sahada parçalanıp toprağa karıştırılması ve organik atık biyokütlelerin düzenli olarak toprak yüzeyine verilmesidir. FAO'nun "Soil Organic Carbon – The Hidden Potential" raporunda, bu tür organik girişlerin hem serbest organik madde hem de mikrobiyal biyokütleyi artırarak topraktaki karbon bakımını optimize ettiği vurgulanmıştır (FAO GSP, 2015)

Kompost ve gübre uygulamalarının saha ölçeğinde en somut örneklerinden biri, Kenya Tarımsal Karbon Projesi'dir. Batı Kenya'daki yaklaşık 60.000 küçük çiftçi; tarlalarında kompost, ahır gübresi ve diğer Sürdürülebilir Arazi Yönetimi (SALM) tekniklerini uygulayarak toprak organik maddesini önemli ölçüde artırmıştır (Tennigkeit ve ark., 2019). Bu proje, organik madde artışı sayesinde 2014 yılında VCS standardı altında 24.788 ton CO_2e azaltımına karşılık gelen ilk toprak kaynaklı gönüllü karbon kredilerinin ihraç edilmesini sağlamıştır (World Bank, 2014).

Toprak organik maddesinin artırılması yalnızca karbon tutulumunu değil, toprak sağlığını ve tarımsal verimliliği de destekler. Kompostla zenginleştirilen tarlalarda su tutma kapasitesi yükselir, besin maddeleri daha dengeli dolaşıma girer ve toprağın fizikokimyasal özellikleri iyileşir. Bu sayede bitki kök gelişimi desteklenir ve verim artışları elde edilir (Pustian ve ark., 2019). Karbon piyasalarında organik madde artışı projeleri, MRV süreçleriyle desteklenir. Saha sensörleri, portatif gaz analizörleri ve uydu tabanlı izleme yöntemleri kullanılarak karbon

azaltım etkileri hesaplanır ve bağımsız kuruluşlarca sertifikalandırılır. Bu sayede çiftçiler hem iklim değişikliğiyle mücadeleye katkıda bulunur hem de gönüllü karbon piyasalarında güvenilir krediler oluşturarak uzun vadeli ekonomik sürdürülebilirlik sağlarlar (Verra, 2014)

3.1.2. BİYOKÖMÜR KULLANIMI

Biyokömür, organik atık biyokütlenin oksijensiz ortamda yüksek sıcaklıkta ısıtılması (piroliz) sonucu elde edilen, karbon açısından zengin ve biyolojik olarak dayanıklı bir maddedir. Toprağa uygulandığında, yüzlerce hatta binlerce yıl boyunca bozulmadan kalabilen bir karbon havuzu oluşturarak atmosferdeki CO_2'nin uzun vadeli depolanmasını sağlar .

Örneğin, pirinç sapları, fındık kabukları ve ağaç dalları gibi tarımsal atıkların yakılması yerine biyokömüre dönüştürülmesi, bu atıkların karbon içeriğinin toprağa gömülerek kalıcı karbon depolama imkânı sunar. Ayrıca, biyokömür toprağın su tutma kapasitesini artırır, besin maddelerini daha iyi korur ve mikrobiyal aktiviteyi destekleyerek tarımsal verimliliği yükseltir.

Gönüllü karbon piyasalarında biyokömür projeleri, karbonun kalıcı olarak depolandığı miktarların hesaplanıp doğrulanmasıyla karbon kredileri oluşturmakta ve bu krediler satılabilmektedir. Örneğin, Kenya'da yürütülen Kenya Tarımsal Karbon Projesi, 60.000 çiftçinin 45.000 hektarlık alanda sürdürülebilir tarım uygulamalarıyla hem verimi artırmalarını hem de karbon kredisi elde etmelerini sağlamıştır (World Bank, 2014). Küresel ölçekte, biyokömür uygulamalarının yıllık 0,44 ila 2,62 gigaton CO_2'yi atmosferden uzaklaştırma potansiyeline sahip olduğu tahmin edilmektedir (Moya, 2023).

3.1.3. TOPRAK İŞLEME

Toprak işleme yöntemlerinin değiştirilmesi, tarımsal faaliyetlerin karbon ayak izini azaltmada kritik bir rol oynamaktadır. Anızın toprakta bırakılması, minimum toprak işleme veya doğrudan ekim gibi uygulamalar, toprağın karbondioksit salımını azaltır ve organik karbon birikimini teşvik eder. Geleneksel sürüm yerine toprağı mümkün olduğunca az rahatsız eden ekim teknikleri, bitki kalıntılarının toprakta kalarak çürümesini sağlar; bu da karbonun toprağa hapsolması anlamına gelir. Ayrıca, bu yöntemler yakıt kullanımını azaltarak fosil kaynaklı emisyonların düşmesine katkıda bulunur. Örneğin, ABD Tarım Bakanlığı'nın tahminlerine göre, sıfır toprak işlemeli tarım uygulayan çiftçiler yılda yaklaşık 588 milyon galon dizel yakıttan tasarruf etmektedir. Bu miktar, 720.000'den fazla evin bir yıllık enerji ihtiyacına eşdeğerdir. Ayrıca, sıfır toprak işleme ile yapılan tarım, toprağın su tutma kapasitesini artırır, erozyonu azaltır ve toprak sağlığını iyileştirerek tarımsal verimliliği destekler (Bertrand ve ark., 2022).

Tarımsal üretimde nitroz oksit (N_2O) emisyonlarının azaltılması, toprak yönetim uygulamalarının iklim değişikliğiyle mücadeledeki en kritik bileşenlerinden biridir. FAO tarafından hazırlanan “Recarbonizing Global Soils” kılavuzunda, hem organik hem de sentetik gübrelerin bitki ihtiyaçlarına göre optimize edilmesiyle toprak kaynaklı N_2O salımında %20–50’ye varan düşüşlerin sağlanabileceği vurgulanmıştır (FAO and ITPS, 2021). Aynı rehber, kapalı havza ikliminden tropik koşullara kadar farklı tarım sistemlerinde en iyi toprak yönetimi uygulamalarının karbon tutulumunu artırdığını göstermektedir.

3.1.4. GÜBRE UYGULAMALARI

"Doğru Kaynak, Doğru Oran, Doğru Zaman ve Doğru Yer" ilkeleri, gübre yönetiminde yaygın kabul gören bir çerçeve sunmaktadır. 4R uygulamalarıyla, üretilen birim mahsul başına çıkan N_2O emisyonlarında %50'ye yakın azalmalar kaydedilmiştir (Canadian 4R Research Network, 2015). Özellikle azot bazlı gübrelerin uygun derinliğe yerleştirilmesi ve zamanlamanın bitki büyüme fazlarına göre ayarlanması, amonyak volatilizasyonunu ve nitroz oksit oluşumunu önemli ölçüde engellemektedir (Venterea ve ark., 2016).

Emisyon azaltımlarının güvenilir biçimde ölçülmesi, izlenmesi ve doğrulanması ise ACR VM0022 metodolojisi gibi uluslararası standartlarla gerçekleştirilir. Verra tarafından yayımlanan VM0022, tarla düzeyinde farklı toprak ve bitki koşullarına göre N_2O salım değerlerinin saha sensörleri ve portatif gaz analizörleriyle ölçülmesini öngörmektedir. Böylece elde edilen veriler, bağımsız üçüncü taraf sertifikasyon kuruluşları tarafından onaylanarak karbon kredisi üretimine temel oluşturur (Verra, 2023).

3.1.5. TARIMSAL SULAMA

Sulama yönetiminde ise damla sulama, geleneksel oluklu veya yağmurlama sistemlerine kıyasla N_2O emisyonlarında sırasıyla ortalama %32 ve %46 oranında azalma sağlar. Toprağın nem profilini stabilize eden damla sulama; aşırı su birikimini engelleyerek nitrifikasyon–denitrifikasyon döngülerini düzenler ve azot kayıplarını düşürür (Kuang ve ark., 2021).

Türkiye'nin Konya Kapalı Havzası'nda Netafim ve Virridy iş birliğiyle başlatılan karbon kredisi programı, 1.000 ha'dan fazla alanda damla sulama ve hassas gübre yönetimini entegre ederek yıllık en az 3,5 ton CO_2e/ha azaltım sağlamayı hedefler (Virridy, 2024; PR Newswire, 2025). Çiftçilere dijital toprak nem sensörleri ve otomasyonlu kontrol sistemleri kurulmakta; böylece hem verim artışı hem de su ve azot kullanım verimliliği yükselmektedir. Bu bütüncül yaklaşımlar, hem çevresel hem de ekonomik faydalar doğurmakta; tarımsal üretimde sürdürülebilirliği artırırken, gönüllü karbon piyasalarında satılan karbon kredileri çiftçilere ek gelir imkânı sunmaktadır (Virridy, 2024). Ayrıca, saha verilerinin anlık izlenmesi ve bağımsız doğrulama süreçleri, projelerin şeffaflığını ve güvenilirliğini pekiştirmektedir (Verra, 2023).

3.1.5. ÖRTÜ BİTKİLERİ KULLANIMI

Örtü bitkileri, ana ürün ekiminden sonra ya da kış döneminde tarlayı örterek erozyonu önler, toprağa organik madde kazandırır ve toprağın biyolojik çeşitliliğini destekler (SARE, 2023). Bu bitkiler; baklagiller (fiğ, yem bezelyesi), tahıllar (yulaf, çavdar) ya da karışım halinde ekildiğinde hem kök yapılarıyla toprağı havalandırır hem de yüzey örtüsüyle nem kaybını azaltır (Bertrand ve ark., 2021). Dünya genelinde 8,1 milyon ha örtü bitkisi alanı, yılda yaklaşık 60 milyon ton CO_2-e oranında karbonun toprağa bağlanmasına olanak tanımaktadır (SARE, 2023).

Örtü bitkilerinin karbon tutulum potansiyeli, yapılan meta-analizlere göre yılda ortalama 0,88 Mg C ha^{-1} $yıl^{-1}$ (yaklaşık 3,2 Mg CO_2 ha^{-1} $yıl^{-1}$) olarak hesaplanmıştır (Joshi ve ark., 2023). Çift tür cover crop uygulamaları—bir baklagil ve bir tahıl karışımı—ise 1,20 Mg C ha^{-1} $yıl^{-1}$'e kadar yükselmektedir (Villat ve Nicholas, 2024). Modern tarımda yer altı sensörleri ve uzaktan

algılama ile gerçek zamanlı izleme imkânı, bu tutulum değerlerinin güvenilir biçimde ölçülmesini ve sahaya özgü uygulama optimizasyonunu sağlar (Opoku ve ark., 2024).

Baklagil türü örtü bitkileri, atmosferik N_2 fiksasyonu yaparak toprağın azot içeriğini zenginleştirir; böylece sonraki ürün için sentetik gübre ihtiyacını azaltır. Amerika Tarım Bakanlığı Araştırma Servisi'nin kışlık çavdar uygulamalarında, nitrat kayıpları azalırken nitrifikasyon–denitrifikasyon dengesi sağlanmış, buna bağlı olarak N_2O emisyonlarında düşüş gözlenmiştir (USDA ARS, 2023). Bu dolaylı etki, örtü bitkilerinin hem karbon hem de diğer sera gazı dengelemelerinde çift fayda yaratmasını mümkün kılar.

Karbon kredisi piyasalarında, örtü bitkisi uygulamaları Indigo Ag ve Nori gibi platformlar üzerinden ticarileştirilmektedir. Indigo Ag'in standart programında, karbon kredisi gelirinin %75'i çiftçiye geri dönerken (Indigo Ag, 2024), Nori pazarında 2024 itibarıyla 125.000'den fazla toprak karbon kredisi listeye eklenmiştir (Bayer, 2024). Bu modeller, dört yıllık geriye dönük uygulama takibi ve hem saha ölçümleri hem de modellemeye dayalı doğrulama süreçleriyle çalışmaktadır.

3.1.6. TARIMSAL ORMANCILIK

Agroforestry, tarım arazilerinde veya meralarda tarımsal ürünlerle ağaçların uyumlu biçimde bir arada yetiştirildiği sistemleri ifade eder. Bu sistemler; tarlaların kenarına rüzgâr kıran olarak ağaç sıraları dikmeyi, hızlı büyüyen azot bağlayıcı türleri ekim nöbetine dahil etmeyi ya da kahve ve kakao gibi ürünleri, gölge ağaçları altında yetiştirmeyi kapsamaktadır (Montagnini ve Nair, 2004). Agroforestry uygulamaları, yalnızca karbon yakalamakla kalmaz; tarımsal verim artışı, toprak erozyonunun engellenmesi, biyolojik çeşitliliğin korunması ve mikroiklim düzenlemesi gibi çok sayıda yarar sunar (Hance, 2025).

Ağaçlar, büyümeleri sırasında atmosferden CO_2'yi fotosentezle alarak odun dokusunda uzun süreli karbon depolar. Kök sistemleri aracılığıyla toprağa organik karbona katkı sağlar ve toprağın toplam karbon havuzunu büyütür. Karışık ağaç türlerine sahip agroforestry sistemleri, tek tür orman veya monokültür ağaç plantasyonlarına göre %70'e varan oranda daha fazla karbon tutma kapasitesi gösterebilmektedir (Warner ve ark., 2023).

3.2. TARIM SEKTÖRÜNDE MRV

MRV sistemleri yalnızca bir teknik raporlama aracı değil, aynı zamanda piyasa şeffaflığını sağlayan, teşvik sistemlerini yönlendiren, çevresel faydaları güvence altına alan çok katmanlı bir yapı olarak karşımıza çıkmaktadır. Brummitt ve ark. (2024) tarafından yayımlanan kapsamlı bir çalışma, MRV sistemlerinin bilimsel temellerini ve uygulamadaki karşılıklarını gözler önüne sermektedir. ABD'de 553.743 hektar genişliğindeki tarım arazilerinde uygulanan "CAR1459" kodlu karbon kredilendirme sistemi, toprak karbon kredilendirmesine dayalı izleme sistemlerinin nasıl yapılandırılması gerektiğine dair önemli ipuçları sunmaktadır. Çalışmada kullanılan MRV yaklaşımı, klasik veri toplama yöntemlerinin ötesine geçerek, sahadan alınan gözlemleri uzaktan algılama teknolojileri, tarla ekipmanlarından gelen dijital kayıtlar, iklim ve toprak verileriyle entegre eden çok kaynaklı bir veri altyapısına dayanmaktadır. Bu veriler, DayCent-CR isimli biyogeo-kimyasal bir model aracılığıyla analiz

edilmiş; böylece arazi bazında karbon tutumundaki değişiklikler yıl bazında tahmin edilebilmiştir. Bu ileri düzey modelleme, MRV sistemlerinin sadece nicel değil, aynı zamanda çevresel olarak anlamlı çıktılar üretmesini sağlamıştır.

Karbon piyasalarında kredilerin güvenilirliği, ne kadar emisyonun azaltıldığı kadar, bu azaltımın ne ölçüde "ilave" olduğuna da bağlıdır. Brummitt ve ark. (2024), bu ilavelik ilkesini sağlamak amacıyla kredileri %70 güven düzeyine göre hesaplamış; böylece oluşturulan karbon kredilerinin çoğunlukla gerçek etkiden daha düşük olmasını sağlayarak piyasaya muhafazakâr ve güvenilir bir arz sunmuştur. Bu yaklaşım, emisyon azaltımına ilişkin iddiaların temkinli biçimde yönetilmesini ve piyasa güvenliğinin artmasını sağlamaktadır. Çalışmanın dikkat çeken bir diğer yönü ise, karbon tutumunun zamanla değişen doğasının MRV sistemlerine entegre edilmesidir. Özellikle toprak işlemesiz tarım gibi uygulamaların beş ila on yıl boyunca artan karbon tutumu sağladığı bulgusu, izleme sistemlerinin yalnızca kısa vadeli değil, uzun vadeli izlemeyi de kapsaması gerektiğini ortaya koymaktadır. Bu, karbon piyasalarında geçici değil, kalıcı çevresel faydaların teşvik edilmesini sağlamaktadır.

MRV sistemleri yalnızca izleme işlevi görmemekte, aynı zamanda teşvik mekanizmalarının yönünü de belirlemektedir. "Pay-for-outcome" (sonuç temelli ödeme) modeli bu bağlamda dikkat çeken bir uygulamadır. Bu modelde, çiftçilere ya da uygulayıcılara yalnızca uygulamayı gerçekleştirdikleri için değil, uygulamanın çevresel sonuçları doğrultusunda ödeme yapılmaktadır. Bu teşvik yapısı, çevresel çıktıyı merkeze alan, daha etkin bir karbon yönetimi anlayışına işaret etmektedir.

Son olarak, çalışmada belirsizliklerin şeffaf biçimde yönetilmesi de MRV sistemlerinin ayrılmaz bir parçası olarak ele alınmıştır. Veri eksiklikleri, modelleme hataları ya da uygulayıcı davranışlarındaki değişkenlik gibi unsurlar nicel biçimde hesaplanmakta ve sistem içinde belirsizlik tamponu aracılığıyla dengelenmektedir. Böylece, fazla kredi verilmesinin önüne geçilmekte ve karbon piyasalarının bütünlüğü korunmaktadır.

4. TÜRKİYE'NİN 2053 NET SIFIR HEDEFİ, NDC GÜNCELLEMESİ VE ETS GEREKLİLİĞİ

Türkiye, 2021 yılında ilan ettiği 2053 Net Sıfır emisyon hedefi ile iklim politikasında köklü bir dönüşüm sürecine girmiştir. Bu hedef doğrultusunda, 2023 yılında Birleşmiş Milletler İklim Değişikliği Çerçeve Sözleşmesi'ne sunulan güncellenmiş Ulusal Katkı Beyanı (NDC) kapsamında, 2030 yılına kadar referans senaryoya göre emisyon azaltım hedefi %21'den %41'e çıkarılmıştır (Tümer ve van Zeben, 2024). Bu artış, Türkiye'nin iklim taahhütlerini güçlendirme yönündeki niyetini ortaya koymakla birlikte, uygulama kapasitesi ve altyapı gereksinimleri açısından önemli zorluklar da barındırmaktadır.

Bu hedefler, yalnızca iç politikalar bağlamında değil, aynı zamanda Avrupa Birliği'nin 2026'da uygulamaya koyacağı Sınırda Karbon Düzenleme Mekanizması (CBAM) çerçevesinde dış ticaret ilişkileri açısından da kritik önemdedir. CBAM, demir-çelik, çimento, alüminyum, gübre ve elektrik gibi karbon yoğun sektörlerden AB'ye yapılan ihracatlar için karbon fiyatlandırması yükümlülüğü getirmektedir. Bu da, Türkiye gibi AB ile derin ticaret entegrasyonuna sahip ülkeler için karbon maliyetlerini hesaba katan sanayi politikaları geliştirmeyi zorunlu kılmaktadır (Tümer ve van Zeben, 2024; Ediger ve ark., 2024).

Türkiye'nin ihracatının yaklaşık %40'ının AB ülkelerine yönelik olduğu dikkate alındığında, CBAM'ın etkileri hem makroekonomik düzeyde hem de sektör bazında hissedilecektir. Örneğin, demir-çelik sektörü, CBAM kapsamında ilk etkilenecek alanlardan biri olarak öne çıkmaktadır (Ediger ve ark., 2024). Bu durum, Türkiye'nin üretim yapısını karbon yoğun olmaktan çıkarmasını, yani "karbon verimliliği yüksek" teknolojilere geçmesini gerektirmektedir.

Bu bağlamda, ulusal bir karbon fiyatlandırma mekanizması, özellikle de ETS kurulması, Türkiye için yalnızca çevresel değil, aynı zamanda ekonomik ve ticari bir zorunluluk haline gelmiştir. Hâlihazırda Türkiye, ETS'ye geçiş süreci için teknik hazırlıklar yürütmekte olup, Dünya Bankası'nın PMR programı kapsamında pilot çalışmalar gerçekleştirilmiştir. Ayrıca Türkiye'nin MRV altyapısı da AB standartlarıyla uyumlu hale getirilmiştir, bu da ETS altyapısı için kritik bir ön koşuldur (Bencini ve ark., 2025).

Ancak politika belgeleri ve analizler, Türkiye'nin mevcut güncellenmiş NDC hedeflerinin hala Paris Anlaşması'nın 1.5°C hedefiyle uyumlu olmadığını göstermektedir (Tümer ve van Zeben, 2024). Bu da, ETS'nin etkili bir şekilde devreye alınması, karbon fiyatının yeterli düzeye ulaşması ve sanayide düşük karbon teknolojilerine hızlı geçiş yapılmasını gerektirmektedir.

Sonuç olarak, Türkiye'nin 2053 net sıfır hedefiyle uyumlu hareket edebilmesi için, karbon maliyetlerinin içselleştirildiği, piyasaya dayalı ve şeffaf bir ETS mekanizması kurması kaçınılmazdır. Bu mekanizma, hem AB ile ticari uyumu sağlar hem de yeşil dönüşüm hedeflerine ulaşmada temel araç işlevi görür.

5. TÜRKİYE'NİN EMİSYON PROFİLİ

Türkiye'nin 2023 yılı toplam sera gazı emisyonu, bir önceki yıla göre %6,9 oranında artarak 598,9 milyon ton CO_2 eşdeğeri ($MtCO_2e$) düzeyine ulaşmıştır. Bu emisyonların sektörel dağılımı, gelecekte uygulanacak karbon fiyatlandırma mekanizmaları ve ETS açısından öncelik verilecek alanları da doğrudan şekillendirmektedir. Resmi TÜİK verilerine göre, enerji sektörü 2023 yılında toplam emisyonların %73,8'ini oluşturarak açık ara en büyük paya sahip olmuştur. Bu oran, fosil yakıt kullanımına dayalı enerji üretiminin ve sanayi ile ulaşım sektörlerindeki enerji tüketiminin Türkiye'nin emisyon profilindeki belirleyici rolünü teyit etmektedir (TUIK, 2024).

Tarım sektörü, toplam emisyonların %12'sini oluşturarak ikinci sırada gelmektedir. Bu oran, metan (CH_4) ve diazot monoksit (N_2O) gibi yüksek küresel ısınma potansiyeline sahip gazların, özellikle gübreleme, pirinç üretimi, hayvancılık ve toprak işleme gibi faaliyetlerden kaynaklandığını göstermektedir. Tarımsal emisyonlar doğrudan enerji tüketiminden çok biyolojik süreçlerden kaynaklandığı için, MRV sistemlerinin bu sektöre özel olarak tasarlanması önemlidir. Ayrıca, düşük karbonlu tarım uygulamaları ile tarım sektörü, yalnızca emisyon kaynağı olmakla kalmayıp aynı zamanda karbon yutağına dönüşme potansiyeli de taşımaktadır.

Endüstriyel işlemler ve ürün kullanımı sektörü ise toplam emisyonların %11,8'ini oluşturarak üçüncü sırada yer almaktadır. Bu alandaki emisyonlar genellikle çimento, kimya ve metalürji gibi enerji yoğun sanayi kollarından kaynaklanmakta ve doğrudan üretim süreçlerinden ortaya

çıkmaktadır. Bu sektörü, izlenebilir ve ölçülebilir nitelikteki emisyonları sayesinde karbon piyasalarına entegrasyon için oldukça elverişlidir.

Atık sektörü ise emisyonların yalnızca %2,3'ünü oluşturmaktadır. Bu emisyonlar, katı atık depolama sahaları, atık su arıtma sistemleri ve biyolojik ayrışma süreçlerinden kaynaklanmakta olup, sektördeki düzenleyici reformlar ve teknolojik yatırımlar sayesinde uzun vadede azaltılabilir niteliktedir. Bu dağılım, Türkiye'de karbon piyasalarının hangi sektörleri öncelemesi gerektiğini açık biçimde ortaya koymaktadır. Enerji sektörü, hem toplam emisyon yükünün büyüklüğü hem de alt sektörleri kapsayan yapısı nedeniyle emisyon ticaret sistemi kapsamında öncelikli olarak düzenlenmelidir. Tarım sektörü ise her ne kadar ikinci sırada yer alsa da emisyon kaynaklarının doğası gereği, gönüllü piyasa mekanizmaları, sonuç temelli teşvik sistemleri ve tarımsal karbon kredilendirme programlarıyla desteklenmelidir. Endüstriyel süreçler ise doğrudan kapsama alınabilecek teknik yeterliliğe sahip sektörler arasında yer almaktadır.

6. SONUÇLAR VE ÖNERİLER

Küresel iklim hedeflerine uyum sağlamak ve Avrupa Yeşil Mutabakatı gibi dış ticaret düzenlemelerine entegrasyonu güçlendirmek adına, Türkiye'nin emisyon azaltımını piyasaya dayalı araçlarla desteklemesi kaçınılmaz hale gelmiştir. Emisyon Ticaret Sistemi (ETS), bu süreçte temel bir politika aracı olarak ön plana çıkmakta; enerji, sanayi ve tarım gibi yüksek emisyon potansiyeline sahip sektörlerde emisyonları azaltmayı hedeflemektedir. Türkiye, MRV (İzleme-Raporlama-Doğrulama) altyapısını AB standartlarına uyumlu hale getirmiştir ve bu durum ETS'nin hayata geçirilmesi için güçlü bir temel oluşturmaktadır.

Tarım ve doğa temelli çözümler, gönüllü karbon piyasalarında potansiyel arz etmektedir. Ancak katkısallık, kalıcılık, sızıntı ve çifte sayım gibi risklerin dikkatle yönetilmesi gerekmektedir. Özellikle katkısallık ilkesinin net biçimde karşılanmadığı projeler, karbon kredilerinin "greenwashing" amacıyla kullanılmasına neden olabilir. Bu risklerin bertarafı için Verra ve Gold Standard gibi doğrulayıcı kurumların metodolojileri sıkılaştırılmalı; kamu denetimi ve veri şeffaflığı artırılmalıdır.

Etkin bir karbon piyasası, yalnızca fiyatlandırma sistemine değil; aynı zamanda güçlü ve bütünleşik bir MRV altyapısına dayanır. Tarımda toprak karbonu, metan ve azot oksit emisyonlarının izlenmesi; sahadan gelen verilerin modelleme yazılımlarıyla birleştirilmesi; sonuç odaklı ödeme sistemleri ile teşvik yapılarının kurulması önerilmektedir. Türkiye'nin MRV altyapısını dijitalleştirmesi, uzaktan algılama ve sensör teknolojilerini kullanması, piyasanın şeffaflığını ve yatırım güvenliğini artıracaktır.

Toprak işleme azaltımı, örtü bitkileri, biyokömür, hassas sulama ve gübre yönetimi gibi yöntemler; hem çiftçiye ek gelir hem de uzun vadeli karbon faydası sağlar. Türkiye'nin tarım politikaları bu tür uygulamaları destekleyecek şekilde yeniden yapılandırılmalıdır. Özellikle küçük çiftçilerin karbon piyasasına girişini kolaylaştırmak için sübvansiyonlu sertifikasyon sistemleri, teknik rehberlik ve kamu-özel ortaklıkları oluşturulmalıdır.

Yüksek kaliteli karbon kredisi arzı ve etkin karbon fiyatlaması, sadece çevresel fayda değil aynı zamanda sanayinin dönüşümünü teşvik eder. Türkiye, karbon fiyatlarını sürdürülebilir seviyelere çekerek düşük karbon teknolojilerine geçişi hızlandırmalı; serbest tahsisat oranlarını

kademeli olarak düşürmelidir. Ayrıca CBAM'a hazırlık kapsamında, ihracat yapan firmalar için karbon hesaplama ve raporlama zorunlulukları getirilmelidir.

Dünya Bankası, VCMI, Integrity Council gibi uluslararası kurumlarla teknik ve finansal iş birlikleri artırılmalı; karbon projelerinin kredilendirilmesi ve pazarlanması süreçleri için küresel standartlara uyum sağlanmalıdır. Özel sektörün karbon piyasasına aktif katılımı, yalnızca kurumsal sorumluluk değil aynı zamanda rekabetçilik açısından da önem taşımaktadır.

Türkiye'nin net sıfır hedeflerine ulaşabilmesi için, tarım, sanayi, enerji ve atık sektörlerinde uygulanan politikaların karbon piyasalarıyla uyumlu hale getirilmesi gereklidir. Ayrıca, NDC hedeflerinin Paris Anlaşması'nın 1.5°C sınırına uygun şekilde revize edilmesi, yatırımcı ve proje geliştiriciler için yön gösterici olacaktır.

ABSTRACT

In recent years, nanoparticles have become a preferred alternative to traditional products in agricultural production due to their compact size, ease of transport, long shelf life, and high efficiency. This has increased the significance of the role of nanoparticles in agriculture for achieving environmental sustainability.

In this study, the effects of Indole-3-butyric acid (IBA) and iron oxide (Fe_3O_4) nanoparticles on shoot growth and rooting parameters of hardwood cuttings of Jumbo blackberry grown at the Agricultural Practice and Research Center of Bilecik Şeyh Edebali University were investigated. Along with the control group, treatments included 4000 ppm IBA, 1 ppm Fe_3O_4, and a combination of 1 ppm Fe_3O_4 + 4000 ppm IBA. The cuttings were planted on rooting benches containing perlite medium with bottom heating (22±2 °C).

After 90 days in the rooting environment, the following parameters were measured: rooting percentage (%), callus formation rate (%), number of roots per cutting, root length (cm), root diameter (mm), and shoot length (cm). At the end of the experiment, it was determined that Fe_3O_4 nanoparticles had a positive effect on rooting. As a result, it is suggested that nanoparticles may be used to enhance rooting in difficult-to-root fruit species, and further research is needed in this area.

Keywords: Iron oxide nanoparticle, rooting, shoot development, propagation, Indole-3-butyric acid (IBA)

DEMİR OKSİT (Fe_3O_4) NANOPARTİKÜLÜNÜN BÖĞÜRTLEN (*Rubus fructicosus* L.) ÇELİKLERİNİN KÖKLENMESİ ÜZERİNE ETKİSİ

ÖZET

Nanopartiküller, kompakt boyutları, kolay taşınabilirlikleri, uzun raf ömürleri ve yüksek verimlilikleri sayesinde son yıllarda tarımsal üretimde geleneksel ürünlere kıyasla daha fazla tercih edilmeye başlanmıştır. Bu durum, sürdürülebilir bir çevre hedefi doğrultusunda tarımda nanopartiküllerin rolüne olan ilgiyi artırmıştır.

Bu çalışmada Bilecik Şeyh Edebali Üniversitesi Tarım Uygulama ve Araştırma Merkezi'nde bulunan Jumbo böğürtlen odun çeliklerinde Indol-3 bütirik asit (IBA) ve demir oksit (Fe_3O_4) nanopartikülünün sürgün büyümesi ve köklenme parametreleri üzerine etkisi incelenmiştir. Kontrol grubu ile birlikte, 4000 ppm IBA, 1 ppm Fe_3O_4 ve 1 ppm Fe_3O_4 +4000 ppm IBA kombinasyon uygulamaları yapılmıştır. Çelikler alttan ısıtmalı (22±2 °C) perlit ortamından oluşan köklendirme masalarına dikilmiştir.

Köklendirme ortamından 90 gün sonra çıkarılan çeliklerde; köklenme oranı (%), kallus oluşum oranı (%), kök sayısı (çelik başına), kök uzunluğu (cm), kök çapı (mm) ve sürgün uzunlukları (cm) belirlenmiştir. Deneme sonunda, köklenme üzerine Fe_3O_4 nanopartikülün olumlu etkisi belirlenmiştir. Sonuç olarak çeliklerin köklenmesi üzerine nanopartiküllerin kullanılabileceği zor köklenen meyve türleri üzerine de daha fazla araştırmaya ihtiyaç duyulabileceği düşünülmektedir.

Anahtar Kelimeler: demir nanopartikülü, köklenme, sürgün, çoğaltım, Indol-3 bütirik asit

1. GİRİŞ

Rosaceae familyasına ait olan *Rubus* cinsi, Asya, Avrupa, Kuzey ve Güney Amerika'daki çeşitli çevre koşullarına adapte olmuş 700'den fazla türü kapsamaktadır. Bu adaptasyon yeteneği, *Rubus*'u tarımsal açıdan önemli bir cins haline getirmiştir (Lee ve ark 2016). *Rubus* cinsi içerisinde yer alan böğürtlen (*Rubus fructicosus*), Kuzey Amerika ve Avrupa'nın ılıman bölgelerinde önemli üretim gerçekleştirilmiştir (Ladyzhenskaya ve ark., 2023; Varzaru ve ark., 2023).

Böğürtlen meyvesi, taze olarak tüketiminin yanında reçel, jöle, şarap, çay, dondurma ve tatlı gibi çeşitli ürünlere işlenebildiği için yüksek ticari değere sahiptir (Kaume ve ark., 2011). Meyvelere ek olarak, bitkinin diğer kısımlarından da yararlanılmaktadır. Genç sürgünler sıklıkla salatalarda tüketilmekte ve kökler yiyecek olarak pişirilmektedir. Bu durum böğürtlenlerin hem kültürel önemini hem de besin potansiyelini vurgulamaktadır. Bunun yanında böğürtlenler, esas olarak yüksek antioksidan kapasitelerinden sorumlu olan antosiyaninler, flavonoidler ve ellagitanninler dahil olmak üzere fenolik bileşikler açısından özellikle zengindir (Kaume ve ark., 2011).

Böğürtlenler birçok vejetatif çoğaltma yöntemi ile çoğaltılmaktadır. Böğürtlen genellikle yaz aylarında yaprak tomurcuğu çeliklerinden ve yaz sonlarında uç katmanlar primocanes'lerinden çoğaltılır (Hartmann ve ark., 2011; Takeda ve Soria, 2011). Böğürtlen çeliklerinde köklenme başlangıcı, kullanılan yöntemlere (çelik materyali, toplama zamanı ve oksin uygulaması) göre de değişmektedir. Bunun yanında böğürtlen çeliklerinin köklenmesini iyileştirme amacıyla İndol-3-bütirik asit (IBA) uygulamasının böğürtlen çeliklerinde köklenmeyi iyileştirdiği gösterilmiştir, ancak bazı araştırmalar farklı çeşitler arasında sonuçların tutarsız olabileceğini göstermektedir (Takeda ve ark., 2011; Debner ve ark., 2019).

Tarımda yenilikçi nanoteknoloji uygulaması, ürün veriminde önemli artışlar elde etmek için umut verici yaklaşımlardan biri olarak kabul edilmektedir (Liu ve ark., 2015; Farooqui ve ark., 2016). Çeşitli tipteki nanopartiküllerin (NP) bitki büyümesi ve gelişimi üzerindeki etkileri üzerine yapılan birçok çalışma mevcuttur (Huang ve ark., 2015; Farooqui ve ark., 2016; Siddiqi ve ark., 2016). Bu çalışmalar, NP'lerin tohum çimlenmesi, fotosentetik aktivite, proteinler de dahil olmak üzere çeşitli metabolitlerin sentezi ve azot içeren metabolitler dahil olmak üzere farklı fizyolojik süreçleri geliştirerek ürün verimini artırabileceğini göstermektedir (Huang ve ark., 2015; Rui ve ark., 2016). Çelikle köklenme çalışmalarında literatürde nanopartikül uygulamasına rastlanmamıştır. Bu nedenle, bu çalışmada Jumbo böğürtlen çeşidinin köklenme üzerine IBA ile demir oksit nanopartikülünün karşılaştırılması amaçlanmıştır.

2. MATERYAL VE METOT

Çalışma Bilecik Şeyh Edebali Üniversitesi Tarımsal Uygulama ve Araştırma Merkezinde yüksek tünel içerisinde yer alan köklendirme sisteminde yürütülmüştür. Kullanılan materyal araştırma merkezinde bulunan Jumbo böğürtlen çeşidinden elde edilmiştir. Jumbo böğürtlen çeşiti, kesin orijini bilinmemekle birlikte 1920 yılından bu yana Amerika'da yetiştiriciliği yapılmakta olup, ülkemizde yapılan adaptasyon çalışmalarında iyi sonuçlar verdiği bilinmektedir (Akbulut ve ark., 2003; Cangi ve İslam, 2003; Gerçekcioğlu ve ark., 2003). Çalışmada kullanılan Fe_3O_4 NP kaynağı olarak, Sigma firmasına ait (cas: 1317-61-9) taramalı

elektron mikroskobu (sem) cihazı ile partikül boyutu belirlenmiş (50-100 nm) ticari ürün kullanılmıştır. Bu çalışmada kullanılan IBA dozu, Edizer (2011) tarafından en uygun doz olarak bildirilen 4000 ppm düzeyinde uygulanmıştır.

Çalışmada 1 yaşlı dallardan kesilen 15-20 cm'lik böğürtlen odun çeliklerine %0.3 fungisit (Benlate) püskürtülerek, yaklaşık on dakika kurumaya bırakılmıştır. Aşağıda verilen uygulamalara çelikler 5 sn hızlı bandırma işlemine bırakıldıktan sonra köklendirme ünitesine dikilmiştir.

- **U1**: Kontrol
- **U2**: 4000 ppm IBA
- **U3**: 1 ppm Fe_3O_4
- **U4**: 4000 ppm IBA + 1 ppm Fe_3O_4

Böğürtlen çelikleri perlit içeren köklendirme masalarında 90 gün süreyle tutulmuştur. Çalışmanın tamamlanmasının ardından çelikler çıkarılarak; köklenme oranı (%), kallus oluşum oranı (%), kök sayısı (çelik başına), kök uzunluğu (cm), kök kalınlığı (mm), sürgün uzunluğu (cm) belirlenmiştir. Deneme, 3 tekerrürlü, tesadüf parselleri deneme desenine göre yürütülmüş olup, her tekrarlamada 15 adet çelik kullanılmıştır. Varyans analizinin ardından, uygulamalarının ortalamaları Duncan Çoklu Aralık Testi (DMRT), SPSS 23.0 yazılımı kullanılarak $p < 0,05$ düzeyindeki ortalama değerleri karşılaştırmak için kullanıldı.

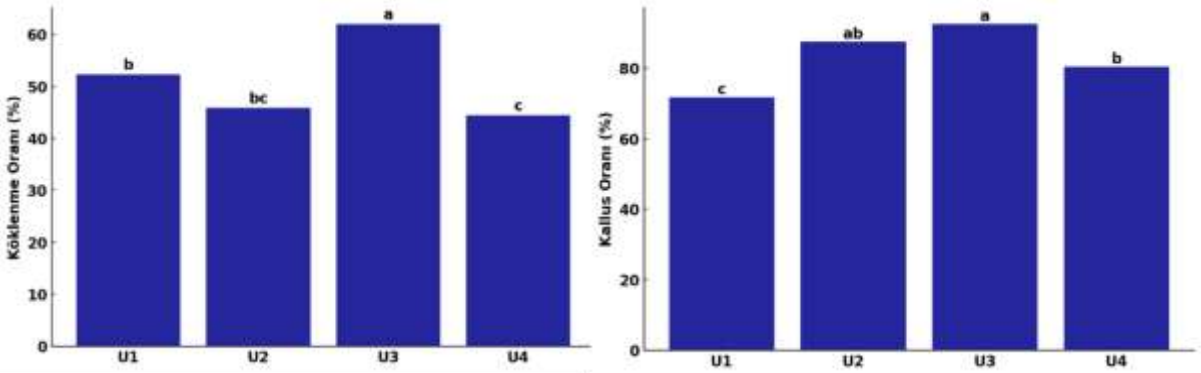
3. BULGULAR VE TARTIŞMA

Deneme sonucunda elde edilen veriler değerlendirdiğinde, böğürtlen çeliklerinde kök çapı hariç diğer özelliklerde istatistiksel olarak önemli farklılıklar tespit edilmiştir. En yüksek köklenme oranı %62 ile 1 ppm Fe_3O_4 uygulamasından elde edilmiştir. Demir, fotosentez, solunum ve azot fiksasyonu gibi çeşitli bitki fizyolojik süreçlerinde görev alan ve kök oluşumu ile kök sağlığını etkileyen temel bir mikro besin elementi olarak önemli bir rol oynamaktadır (Rui ve ark., 2016; Hat ve ark., 2021). Nanopartikül olarak uygulanan Fe_3O_4 fitohormon aktivitesini teşvik ederek bazı türlerde kök uzunluğunu ve genel bitki biyokütlesini artırabileceği düşünülmektedir. Hat ve ark. (2021), düşük konsantrasyonlarda demir oksit nanopartiküllerinin baklagillerde kök kılı gelişiminin artmasına ve daha iyi besin alımına yol açtığını ve kök büyümesine olumlu katkıda bulunduğunu göstermiştir. Bu durum da besin alımı için etkili yüzey alanını artırarak, köklerdeki metabolik aktiviteyi geliştirerek ve muhtemelen oksinler gibi kök gelişimini düzenleyen bitki hormonlarıyla etkileşime girerek böğürtlen çeliklerinde köklenmeyi uyarabileceğini düşündürmektedir (Overvoorde ve ark., 2010).

Kallus oranı bakımından en yüksek oran sırasıyla Fe_30_4 (%92.5) ve IBA (%87.5) uygulamasından elde edilmiştir (Şekil 1). Nanopartiküller bitki büyümesini artırmakta, kallus oluşumunu ve bitki rejenerasyonu için daha elverişli bir ortam sağladığını göstermiştir (Moradiasl ve ark.,2025). Fe_3O_4 nanopartikülleri potansiyel olarak temel mikro besinleri serbest bırakarak, gelişmiş kallus büyümesine yol açan metabolik yolları uyardığı bilinmektedir (Rui ve ark., 2016). Chang ve ark. (2023), tarafından yapılan bir çalışmada, kesim yüzeylerinin

kallus oluşumu da dahil olmak üzere rejeneratif yetenekleri önemli ölçüde artırabileceğini göstermektedir. Bu durum bizim çalışmamızdaki bulgularla uyumludur.

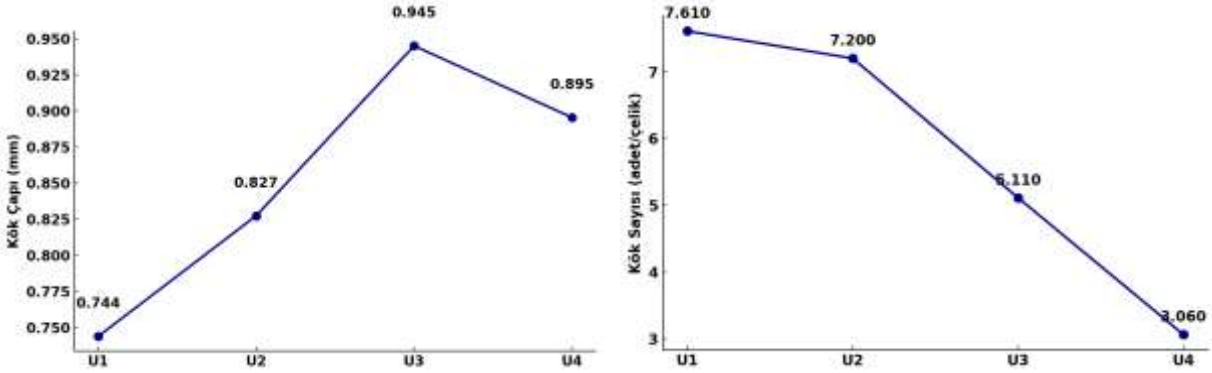
Şekil 1. Demir Oksit Nanopartikülünün Böğürtlen (*Rubus Fructicosus* L.) çeliklerinin köklenme oranı (%) ve kallus oranı (%) üzerine etkisi



Demir oksit nanopartikülünün böğürtlen çeliklerinin kök çapı üzerine etkisi istatistiki olarak önemsiz bulunmuştur. Kök çap değerlerinin 0.74 mm-0.94 mm arasında değiştiği belirlenmiştir (Şekil 2). Kök çap değerleri üzerine demir nanopartiküllerinin etkisi sınırlı olarak görülse de bu sonuç nanopartikül ile bitki fizyolojisi arasındaki hem yararlı hem de zararlı etkileri kapsayan çok yönlü etkileşimlerin daha derinlemesine araştırılmasını gerektirmektedir. Demir oksit nanopartiküllerinin özellikle besin alımını kolaylaştırarak ve bitkilerde oksidatif stresi azaltarak kök gelişimini destekleyebileceğini öne sürmektedir (Saeedi ve ark., 2016; Oijagbe ve ark., 2021).

Çalışma sonucunda, kök sayısı bakımından en yüksek sayıya 7.6 adet/çelik ile kontrol grubundan ve 7.2 adet/çelik ile 4000 ppm IBA uygulamasında belirlenmiştir. Kök sayısı, bitki çoğaltımında büyüme artırma etkinliğini değerlendirmede önemli bir ölçüt olarak bilinmektedir. Çeşitli türlerin IBA'ya farklı tepkiler göstermesine rağmen, daha yüksek konsantrasyonların daha iyi köklenme sonuçlarıyla ilişkili olmadığını vurgulamaktadır. Shabala ve ark. (2010), aşırı oksin konsantrasyonlarının potansiyel toksisiteye veya stres tepkilerinin ortaya çıkmasının kök büyümesi inhibisyonuna yol açabileceğini bildirmiştir. Buna karşılık, 1 ppm Fe_3O_4 ve 4000 ppm IBA içeren ve çelik başına ortalama 5.4 ile en düşük kök sayısını veren kombinasyon uygulaması, demir oksit nanopartikülleri ile yüksek IBA seviyeleri arasındaki etkileşimlerin olumsuz bir şekilde etkilendiğini göstermektedir. Gözlemlenen zararlı etkinin birçok faktörden kaynaklanıyor olabileceği düşünülmektedir.

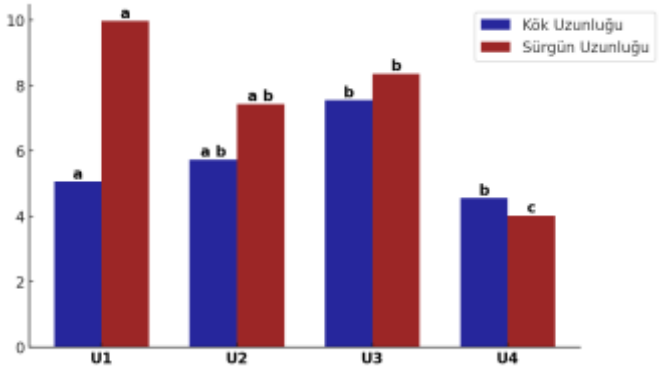
Şekil 2. Demir oksit nanopartikülünün böğürtlen (*Rubus Fructicosus* L.) çeliklerinin kök çapları (mm) ve kallus oranı (%) üzerine etkisi



Şekil 3'de verilen kök uzunlukları istatistiki olarak önemli bulunmuştur. En uzun kök uzunluğuna 1 ppm Fe_3O_4 (7.55 cm) ve 4000 ppm IBA (5.73 cm) uygulamasından elde edilmiştir. Bu sonuçlar hem demir nanopartiküllerinin hem de büyüme düzenleyicilerinin uygulanmasının bitki kök gelişimini sinerjik olarak iyileştirebileceğini öne süren artan kanıtlarla uyumludur. 1 ppm gibi düşük konsantrasyonlarda demir oksit nanopartiküllerinin çeşitli bitki türlerinde olumlu fizyolojik tepkiler uyandırdığı gösterilmiştir. Win ve ark. (2021), Fe_3O_4 nanopartiküllerinin uygulanmasının bitki büyümesini uyarabileceğini ve hem büyüme iyileştirebileceğini göstermiştir. Aynı şekilde, IBA uygulamasının köklenmeyi desteklemede genellikle köklenme üzerine olumlu sonuçlar verdiği belirlenmiştir (Rautela ve ark., 2018).

Çalışma sonuçlarımıza göre en yüksek sürgün uzunluğuna kontrol (9.97 cm) ile 1 ppm Fe_3O_4 (8.35 cm) uygulamalarından elde edilmiştir. Demir nanopartiküllerinin bitkiler üzerindeki etkisi, besin emilimi ve iyileştirilmiş bitki morfolojisi gibi büyümeyi teşvik etme konusunda faydaları olmasına rağmen, nanopartiküllerin her zaman tüm büyüme parametreleri için optimum sonuç veremeyeceği bilinmektedir. Podlasova ve Лебедев (2022), buğday üzerine uygulanan nanopartikül uygulamasının artan büyüme gösterdiği ancak 1 ppm gibi daha düşük konsantrasyonların tek uygulamalarındaki etkileşim etkileri tam olarak bilinmemektedir. Nanopartikül konsantrasyonlarının etkilere göre değiştiği ilgili çalışmalarda görüldüğü gibi, demirin bitki sistemine entegre edilmesi için optimum bir konsantrasyon olmayabileceğini göstermektedir (Raiesi-Ardali ve ark., 2022). Bu nedenle her bitki türüne hatta çeşidine göre konstrasyonu miktarları değişmekle birlikte bundan sonraki çalışmalarda önerilmektedir.

Şekil 3. Demir oksit nanopartikülünün böğürtlen çeliklerinin kök uzunluğu (cm) ve sürgün uzunluğu (cm) üzerine etkisi



4. SONUÇ

Nanopartiküller tarım her alanında kullanılarak bitki üzerine birçok fayda sağlamaktadır. Çalışma, demir nanopartikülünün odun çeliklerin köklenmesi için kullanılabileceğini göstermektedir. Köklenme üzerine bir avantaj tespit edilmiştir. Nanopartikül türüne, bitki türü hatta çeşidine göre değiştiği düşünülmektedir. Bu nedenle her çeşit için ayrı araştırmalar ve nanopartiküller için ayrı araştırmalar gerekmektedir.

ABSTRACT

Fuel in Nigeria is an inelastic product both at the demand and supply sides. Therefore, it is challenging for consumers to find substitutes daily. The focus of this study was to examine the effects of fuel subsidy removal on the price trend of major staple food crops in Kaduna Municipal, Nigeria. Primary data was collected from 90 respondents with structured questionnaires and interview schedules in the 2023 market survey. The T-test results show a significant difference between the prices of rice, sorghum and maize before and after fuel subsidy removal. The coefficient of distance to purchase food commodity (2.110), statistically significant at 1% level of probability. This indicates that a unit increase in distance will lead to a ₦2.11 increase in the cost of transportation. The results indicate that the price trend of three staple food crops from 2019 to 2023 has been fluctuating but tilting more towards a persistent increase. The upsurge in prices of staple food items during these periods has been linked majorly to fuel subsidy removal, which culminates in an increase in farm inputs as seeds, fertilizer and herbicides. Findings also show that insecurity, import bans, intervention of speculators, and institutional investors in the commodity markets have also been brought into play to explain the recent behaviour of commodity prices' fluctuations. The results established that the cost of food items is greatly affected by the cost of transportation and the distance covered in purchasing the produce. The government should give more attention to refining its petroleum products locally and invest in building new refineries.

Keywords: Staple food crop, fuel, subsidy, transportation, refinery.

Introduction

The removal of fuel subsidies has been a longstanding and contentious issue in Nigeria, given the country's heavy reliance on petroleum products for both revenue generation and meeting domestic fuel demands. Fuel prices in Nigeria, as an essential input across sectors, are intricately linked to transport costs, which, in turn, have far-reaching implications for the cost structure of goods and services (Meludu *et al.*, 2023). As such, changes in fuel pricing have a significant impact on broader economic indicators, particularly in developing economies, where fuel is inelastic in both demand and supply. In Nigeria, fuel is indispensable for daily life and economic activities such as transportation and electrification or power provision, making any alterations to the fuel subsidy policy particularly sensitive (Abdulkadir *et al.*, 2023).

The Nigerian government's decision to remove the fuel subsidy in May 2023 under President Bola Ahmed Tinubu marked a pivotal moment in the nation's economic policy. Historically, fuel subsidies have been implemented to alleviate the burden of fuel costs on ordinary citizens (Ani *et al.* 2021), but such subsidies have come at a significant fiscal cost. Between 2011 and 2020, fuel subsidy spending accounted for nearly 30% of government expenditure, diverting resources from critical sectors such as education, health, and infrastructure (Umeji *et al*., 2021). The International Monetary Fund (IMF) and other international institutions have long advocated for the removal of fuel subsidies, citing inefficiencies in resource allocation, price distortions, and corruption risks that stem from the subsidized system (Okwanya, Ogbu, & Pristine, 2015). Despite these critiques, fuel subsidies have remained a vital mechanism for maintaining socio-economic stability, particularly in the face of Nigeria's rising population and the country's heavy dependence on oil.

In May 2023, with the removal of the subsidy, the Nigerian government implemented a substantial increase in fuel prices, moving from ₦240 to ₦960 per liter to correct the long-standing market distortions and promote economic reform. This policy shift was met with widespread protests and criticism as Nigerians feared the potential adverse effects on living costs, particularly for essential items like food. Given that transport costs play a crucial role in determining the prices of goods, including agricultural products, the rise in fuel prices was expected to exacerbate the cost of living and further strain food security, particularly in impoverished regions of the country (Houeland, 2021).

This study seeks to examine the immediate effects of fuel subsidy removal on food prices, specifically focusing on three staple agricultural products, viz., maize, sorghum, and rice, in Zaria, Nigeria. Zaria, located in the northern region of Nigeria, is a key commercial and agricultural hub, making it an ideal location to investigate the broader implications of fuel price changes on the food supply chain. The research will analyze the price trends of these food items before and after the subsidy removal, with a particular emphasis on the socio-economic impact on both producers and consumers in the region.

Understanding the multifaceted effects of fuel subsidy removal on food prices is critical for policymakers, businesses, and consumers alike. While the government argues that the removal of the subsidy will enhance long-term economic growth, reduce fuel smuggling, and eliminate

market inefficiencies, the immediate effects on food prices and the living standards of vulnerable populations must not be overlooked. By investigating these dynamics, this study aims to contribute valuable insights into the socio-economic consequences of subsidy removal and provide evidence to guide future policy decisions in Nigeria and similar economies.

RESEARCH METHODOLOGY

Description of the Study Area

This study was conducted in the Sabon Gari Local Government Area (LGA) of Kaduna State, Nigeria. Sabon Gari LGA is situated in the northern plains of the state, geographically located between latitude 11°7'25" N and longitude 7°43'52" E (NPC, 2022). With an estimated population of approximately 200,000 people, the area is predominantly rural, although it contains several towns and villages. Sabon Gari is widely recognized for its vibrant economic activities, particularly in trade and commerce. The LGA serves as a key commercial hub within Kaduna State, attracting merchants, traders, and business owners from both local and regional areas. The area is characterized by its bustling markets, where a diverse range of food items are bought and sold, making it an important center for food trade.

Given its status as a commercial epicenter, Sabon Gari is an ideal location to examine the effects of fuel subsidy removal. The region is heavily influenced by changes in fuel prices, which significantly impact transportation costs and the logistical aspects of food distribution. As transportation costs increase or decrease, they directly affect the pricing and availability of food in the local markets. Additionally, Sabon Gari is home to a substantial number of fuel retailers whose operations are also impacted by fuel price fluctuations, providing a unique opportunity to explore the broader economic implications of the fuel subsidy removal policy in the region. The proximity of Sabon Gari to major trade routes and its central role in local commerce makes it a critical area for studying the cascading effects of fuel price changes on local economies, particularly in terms of food pricing, market dynamics, and the livelihoods of traders and consumers alike.

Sampling and sample size determination

A purposive sampling technique was adopted in selecting the markets based on the predominance of grain marketers in the Samaru market, Sabon Gari market, Tudun Wada market, and Dan – Magaji markets, respectively. The second stage involves the random selection of grain marketers from the list of marketers drawn from the sample frame of 117. The third stage involves the selection of 90 respondents as the sample size using Slovin's formula adopted by Umar (2021.

$$n = \frac{N}{1 + N\,(e)^2} \qquad (1)$$

Table 1: Population and Sample size of marketers

LGA	Selected Market	Sample Frame	Sample Size

Sabon Gari	Samaru	36	30
	Sabon Gari	29	25
	Tudun Wada	24	15
	Dan Magaji	28	20
Total	**4**	**117**	**90**

Source: Kaduna state ADP

Method of Data Collection

The data was obtained from primary sources only. The primary data were collected with the aid of well-structured questionnaires administered to the respondents. Data were collected based on the socio–economic variables such as gender, age, trading experiences, educational status, household size and income level of the respondents. Also, data were collected for the prices of food crops before and after the subsidy removal.

Analytical Techniques

The tools that were used for the study are: Descriptive statistics, Regression, T-Test and E-View.

Descriptive Statistics

Descriptive statistics was used, which involves the use of percentages, means and frequency distributions to describe the socio-economic characteristics of the respondents in the area.

Multiple Regression Model

Multiple regression is a statistical analysis that uses several explanatory variables to predict the outcome of a response variable. It compares the relationship of two or more factors or trends to determine the correlation between the variables. The relationship between transportation, distance and prices of food was analyzed using the regression model. This study used the multiple regression model to determine the relationship between the dependent and independent variables, which estimates the extent to which food prices are affected by transportation and distance.

To examine the effect of subsidy removal on selected food item prices in the study area, the Cobb Douglas production function was used. This function can be expressed in a logarithm form as

$$LogY = Loga + b1Logx1 + b2Logx2 + b3Logx3 + b4Logx4 + Log\ U \ldots\ldots (2)$$

Where

Y= Output (Cost of transportation before the subsidy removal)

b_1= Price of Rice, b_2= Price of Sorghum, b_3= Price of Maize, b_4= Distance from the point of purchase to the market, U= Random Error term

This function can further be expressed below

$$l_n\gamma = \beta_0 + \beta_1 lnX_1 + \beta_2 lnX_2 + \beta_3 lnX_3 + \beta_4 lnX_4 + \beta_5 lnX_5 + \vartheta i - \mu i \quad (3)$$

T-Test (two samples assuming unequal variance)

A T-test is a statistical test that is used to compare the means of two groups. It is often used in hypothesis testing to determine whether a process or treatment affects the population of interest or whether two groups are different from one another. This was used to analyse the impact of subsidy removal on the price of maize, sorghum and rice.

E-View

EViews is a software used to analyse the price trends in selected food prices before and after the subsidy removal for over five years.

RESULT AND DISCUSSION

Socio-Economic Characteristics of Food Traders

Age of Traders

Analysis of the age distribution of the traders in the study area is presented in Table 2. Age of food marketers could, to a certain degree, affect their marketing ability as it involves interaction with different classes of actors in and outside markets. The result revealed that the mean age of the traders involved in trading in the study area was 37. The result further revealed that most of the traders were between the ages of 31 and 40 years, representing 47.8%. This implies that they are economically active and are in their prime stage, young and agile with enough vigor and innovative ideas to pursue the marketing activities. Ogeto, Cheruiyot, Mshenga, and Onyari (2013) opined that the active ages of 30-39 years are more active in life in terms of enterprise development and management, which may have a positive influence.

Distribution of Traders based on gender

The distribution of the traders in respect of gender revealed that 94.4% of males were involved in trading. The results indicated that only 5.6% of the traders involved in food trading were females. Additionally, outdoor marketing is tedious and involves mingling with males of different backgrounds and characters, a situation that is seen as strange in Northern Nigeria due to religious and socio-cultural settings. This corroborates the statement of Olagunju *et al*. (2020) that the religious beliefs and cultural background of the people in northern Nigeria restrict women from participating in some economic activities.

Marital Status of the Traders

Analysis of the marital status of the traders in the study area revealed that 97.8% were married, while only 1.1 single and 1.1 widowed were involved in trading in the study area. Being married increases the socio-economic responsibility of traders, which could improve their decision-making abilities. (Abdulaziz *et al*., 2018), Stated that marital responsibility could make farmers/traders make more rational decisions with high accuracy on their own, which could, in turn, increase their efficiency.

Household size of the Traders

The size of the household of the traders shows that 7.8% of the traders had less than 5 members per household, while 75.6% of the traders had between 5-10 members per household. The average household size of the traders was 7.4. This result shows that most traders in the study area have relatively large households. This is in line with the findings of Ichsan *et al.* (2022 and Christopher *et al. (*2021), who reported that the average household size of marketers in northern Nigeria is 7, which implies that the marketers may utilize members of the household as labour for some activities relating to marketing. This may reduce some transaction costs that may be incurred, thereby increasing the net income of the marketers.

Table 2: Socio-Economic Characteristics of Food Traders

Variables	Frequency	Percentage	Mean
Age			
21-30 years	3	3.3	37
31-40 years	43	47.8	
41-50 years	36	40	
>50 years	8	8.9	
Total	**90**	**100**	
Gender			
Male	85	94.4	
Female	5	5.6	
Marital status

Source: Field Survey, 2023

Educational Status of the Traders

The distribution of food traders according to educational attainment is presented in Table 2. The result revealed that 15.6% of the traders in the study area attained at least a tertiary level of education while 74.4% attained SSCE (Senior Secondary School Certificate Examination). Education is very important in every human endeavor as an avenue through which technology is conveyed. Marketers with formal education have a greater ability to adopt innovations, ideas, information and marketing strategies to increase the volume of sales. It is expected that the level of education will significantly influence the decision-making of marketers. Furthermore, Fikire *et al. (*2022 and Esiobu *et al. (*2014) opined that exposure to high levels of education is an added advantage in terms of achieving a higher volume of sales, huge profit and efficient marketing.

Trading Experience of the Traders

The distribution of the years of trading by the traders showed that 3.3% of the traders had 1-5 years' experience while 68.9% of the traders had 6-10 years' experience. This finding implies that the traders in the study area were experienced. Years of experience have a profound influence on managerial ability and decision-making in the marketing of agricultural commodities. (Christopher *et al.*, 2021). opined that long years of involvement in marketing expose the marketers to marketing ideas that will help them to overcome marketing intricacies.

Method of Shop Acquisition

The results of the distribution of traders according to the source of shop acquisition show that about 68.9% of the traders in the study area acquired their shop through rent, 22.2% obtained

theirs through inheritance, and 8.9% purchased theirs. This indicates that the predominant source of shop acquisition in the study area is Lease.

Income Distribution

Analysis of the income distribution of the traders in the study area revealed that 47.8% gain below N45, 000 monthly while 37.8% gain above 45, 000 monthly. According to economic theory, the level of consumption of an individual depends largely on his level of current income, as propounded by Keynes. This is in line with Abdulkadir Baba Mohammed *et al. (*2020), who opined that the higher the individual's level of income, the higher his consumption level.

Impact of subsidy removal on prices of maize, sorghum and rice from 2019-2023.

The result of the T-test in table 3.1, 3.2, 3.3, 3.4 and 3.5 shows a significant difference between the prices of Rice, Sorghum and Maize. The mean prices of Rice, Sorghum and Maize after the subsidy removal are 90255.5, 53855.5, 53966.6 which are higher than the mean prices between 2019 to 2022, (34677.7, 9794.4, 9961.1), (40688.8, 12644.4, 12822.2), (48555.5, 15766.6, 15911.1), (58388.8, 21444.4, 21844.4)}, which implies that after the subsidy removal, we realized higher increase in prices of Rice, Sorghum and Maize and it is significant at 10% level of probability. This implies that there is a significant difference between the prices of rice, sorghum and maize after the subsidy removal. This suggests that subsidy removal contributes to the high price of Rice, Sorghum and Maize, as affirmed by Omotosho (2020).

Table 3.1: T-test Analysis revealing the effect of subsidy removal on selected food item prices in 2019.

Crop	Mean	Variance	T-stat
Rice	34677.7	8243320.8	1.975

Computed from field survey data 2019, 2021, 2022 and 2023

Effects of subsidy removal on food items

A Multiple A regression model was used to analyze the effect of subsidy removal on food items. Table 4 shows the effect of subsidy removal on prices of rice, sorghum and maize. The result of the regression in the table reveals an F-Value of 22.39322, which is highly significant, indicating that the model is well-fitted for the regression. The R-square was 0.513097304, which indicates that about 50% variation of the dependent variable is explained by the independent variable. From the result, out of four variables, only one variable was found to be significant at a 1% level of significance. The variable is the distance.

The model result indicated that distance had a positive coefficient of 2.109853 and was significant at a 10% level of significance. This indicates that a unit increase in distance will lead to a 2.109853 increase in the cost of transportation. This conforms with a priori expectation because an increase in distance will lead to an increase in the cost of transportation. This is because of the subsidy removal, which led to an increase in the price of fuel, which is the main source of transportation, as confirmed by Raji *et al.* (2018).

Table 4: Regression analysis revealing the effect of subsidy removal on prices of rice, sorghum and maize.

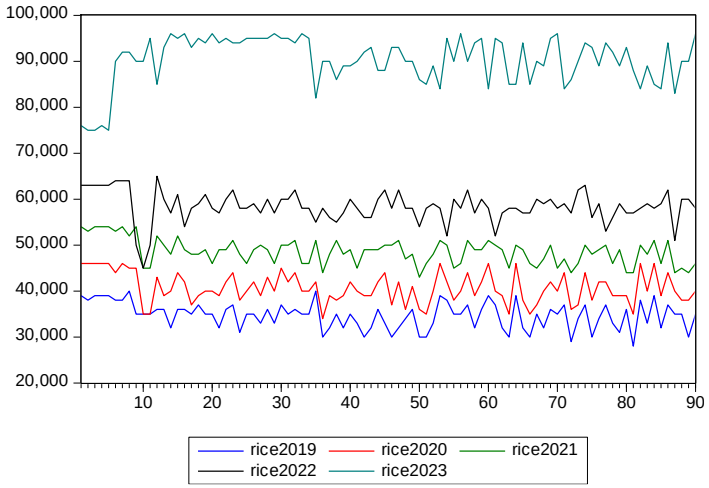
Price Trends of Selected Food Prices

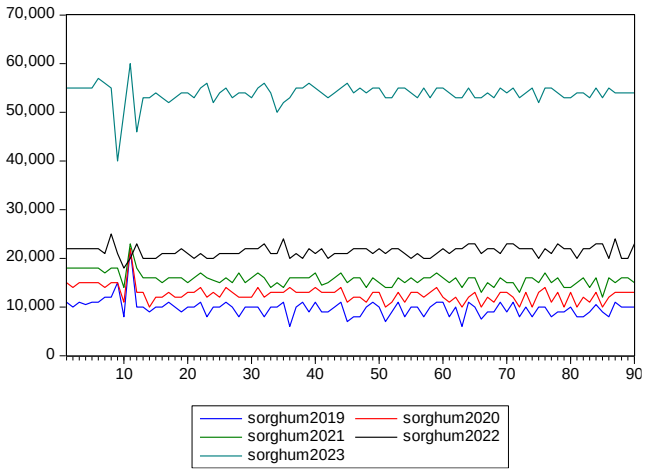
The graphs in figure 1 show the price trend of Rice, Sorghum and Maize from 2019 to 2023. From the graph below, it was observed that an upsurge in prices occurred from the beginning of 2022 to 2023. However, between 2019 and 2022, the index showed a persistent decline. The upsurge in the price of food items between 2022 and 2023 has been linked to some economic forces such as an increase in farm inputs as seeds, fertilizer and herbicides. The world has now entered a period of sustained high prices, particularly in the case of food. However, apart from economic dynamics, the geopolitical stress, intervention of speculators, hedged funds and institutional investors in the commodity markets, the behavior of monetary policy and the weakness of dollar have also been brought into play to explain the recent behavior of commodity prices (Ocampo and Parra, 2008).

Fig 1 Price Trend of Rice from 2019 – 2023



The graph in Fig 2 shows the price trend of Rice from 2019 to 2023. In 2019, the price of rice was relatively stable, and then there was an increase and decline in price. And a continuous rise and fall, i.e. fluctuation in prices. In 2020, the price was stable, and then there was a decline in the price followed by an increase and a continuous rise and fall in the price. The main cause of disparity in prices between 2022 and 2023 was linked to the fuel subsidy removal, which led to an increase in the cost of transportation of the rice from the farm to the market. Other factors include rising insecurity in the country, import bans, and activities of speculative middlemen who take advantage of price fluctuations in the market by hoarding the rice during the on-season when there is availability and bringing them out when market is scarce at high prices Soile, Tsaku, & Musa-Yar'Adua, 2014).

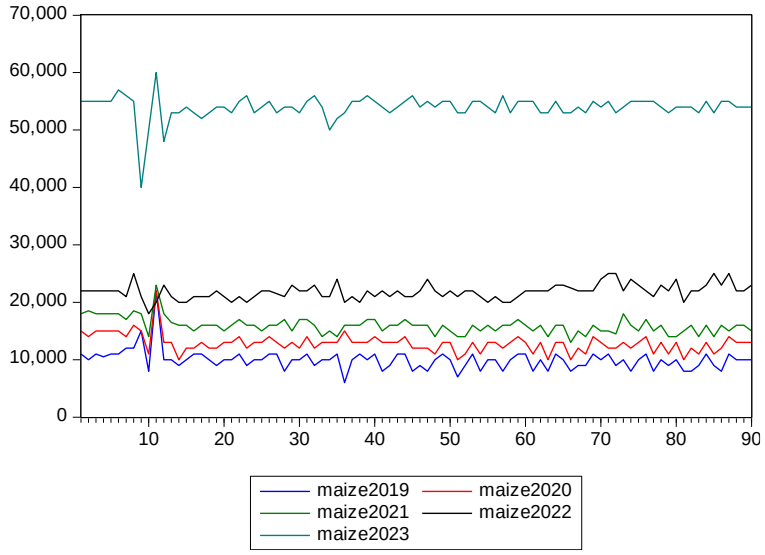
Fig 2 Price Trend of Sorghum from 2019 – 2020



The graph in Fig 3 shows the price trend of Sorghum from 2019 to 2023. Between 2019 and 2022, the price of sorghum was relatively stable with consistent rise and fall, i.e. fluctuation in prices. The main cause of disparity in prices between 2022 and 2023 was linked to the fuel subsidy removal, which led to an increase in the cost of transportation of the sorghum from the

farm to the market. Other factors include weather conditions and natural disasters such as floods, Scarcity of rainfall, and higher increases in demand for the crop.

Fig 3 Price trend of Maize from 2019 - 2023



The above graph shows the price trend of maize from 2019 to 2023. Between 2019 and 2022, the price of sorghum was relatively stable with consistent rise and fall, i.e. fluctuation in prices. The main cause of disparity in prices between 2022 and 2023 was linked to the fuel subsidy removal, which led to an increase in the cost of transportation of the maize from the farm to the market. Other factors include the cost of inputs used in production such as seeds, fertilizers and labour.

Conclusion

From the findings of the study, it was concluded that the cost of food items is highly affected by the cost of transportation, which is also affected by the distance covered. The major factor that led to the increase in food price is as a result of the fuel subsidy removal which led to the increase in fuel price which is the main source of transportation. Other factors include rising insecurity in the country, import bans, and activities of speculative middlemen who take advantage of price fluctuations in the market by hoarding commodities during the on-season when there is availability and bringing them out when market is scarce at high prices.

Recommendations

Efforts to curtail extreme spikes in the price of cereals can substantially enhance food security and the overall economic welfare of households. If policy actions which curtail excessive increases in fuel prices are complemented with food distribution and sensitively guided welfare-related gender interventions, more improvements for livelihoods can be achieved. Effectiveness of complementary efforts can be enhanced through proper appraisal of local context and by investing in sectors by supplying farm inputs where the poor benefits the most, and by proper identification of socially deserving people in order to better allocate resources for poverty alleviation, food insecurity and/or malnutrition reduction programs.

i. It is recommended that government give more attention on refining her petroleum here in Nigeria by fixing her refineries and possibly build new ones and also deregulate the downstream sector of the petroleum industry.
ii. Traders should form a cooperative union where they can pick representatives to purchase the goods from the markets to reduce the cost of transportation.
iii. Traders should purchase goods from nearby markets as distance also affects the cost of transportation which in turn affects the prices of food.
iv. Revitalize the railway system to enable the transportation of agricultural commodities across the country.

ABSTRACT

Cattle breeding, which is carried out by small and medium-sized family farms in rural areas of Turkiye, makes a significant contribution to economic growth and employment. Kırşehir province is one of the regions that stands out in this respect and where cattle breeding is practiced intensively. In Kırşehir, one of the most important centres of agriculture and livestock farming in Central Anatolia, livestock farming is one of the most important sources of income for the rural population. The aim of the study is to evaluate the sustainability level and development potentials of livestock farms in Kırşehir province and to propose solutions for local agricultural policies and animal husbandry strategies. The data obtained will be analyzed to show the impact of socio-economic factors on business performance. It is expected that this data will enable concrete proposals for the development of the agricultural and livestock sector in the region.

Keywords: Livestock Policies, Beef Cattle Farming, Kırşehir Province, Türkiye.

BESİ SIĞIRCILIĞI FAALİYETLERİNİN GELİŞİM TRENDİNİN DEĞERLENDİRİLMESİ: KIRŞEHİR İLİ ÖRNEĞİ

ÖZET

Türkiye'nin kırsal bölgelerinde küçük ve orta ölçekli aile işletmeleri tarafından gerçekleştirilen besi sığırcılığı, ekonomik büyüme ve istihdam açısından önemli katkılar sağlamaktadır. Kırşehir ili, bu açıdan öne çıkan ve hayvancılığın yoğun olarak yapıldığı bölgelerden biridir. Orta Anadolu'nun önemli tarım ve hayvancılık merkezlerinden biri olan Kırşehir'de, besi sığırcılığı, kırsal nüfus için temel geçim kaynaklarından biridir. Çalışmanın kapsamı, Kırşehir ilindeki besi sığırcılığı işletmelerinin sürdürülebilirlik düzeylerini ve kalkınma potansiyellerini değerlendirerek, yerel tarım politikaları ve hayvancılık stratejileri için çözüm önerileri sunmaktır. Elde edilen veriler, sosyo-ekonomik faktörlerin işletme performansına etkisini ortaya koyacak şekilde analiz edilecek ve bu veriler, bölgedeki tarım ve hayvancılık sektörünün gelişimine yönelik somut önerilerde bulunulmasına olanak sağlaması beklenmektedir.

Anahtar Kelimeler: Hayvancılık Politikaları, Besi Sığırcılığı, Kırşehir, Türkiye.

1.INTRODUCTION

Livestock breeding is the rearing of animals in stables or on pastures, regardless of their sex, breed and age, and the rearing for meat production through refinement and weight gain in a way that increases profitability over a certain period of time. Livestock breeding is one of the most important branches of modern livestock farming and involves special feeding and breeding methods aimed at increasing meat production. The rapid increase in the human population and the growing demand for protein have made livestock production a strategic sector. Especially in recent years, as the consumption of red meat has increased worldwide, the demand for livestock farming has also accelerated. The efficient use of agricultural land is a priority for the country's development. As an important branch of the livestock industry, cattle breeding helps to reduce hidden unemployment, prevent migration from the countryside to the cities and utilize plant and animal waste. It also contributes to a balanced diet for the growing population. (Karakaş, 2002). While animal husbandry has the largest share in the agricultural sector in developed countries with over 50%, this share is 25-30% in Turkiye. (Yılmaz and Köknaroğlu, 2007; Hozman and Akçay, 2016). While in industrialized countries animal husbandry has priority in agricultural production, crop production is more dominant in Turkiye. Government subsidies and projects are also largely geared towards plant production. However, it can be observed that incentives for the development of animal husbandry have increased in recent years and new projects have been implemented in this area. (Ören and Bahadır, 2005).

While dietary habits in industrialised countries are mainly based on animal protein, in developing countries such as Turkiye, plant-based foods, especially cereals, are among the basic sources of nutrition. However, it is said that for a healthy and balanced diet, half of the proteins should come from plant sources and the other half from animal sources. (DPT, 2001). Although Turkiye occupies an important position in the world in terms of animal abundance, it lags behind developed countries in terms of animal productivity. The main reasons for this are that most of the livestock consists of low-yielding breeds and that the environmental conditions are inadequate. In addition, the low slaughter weight achieved per animal prevents the desired level of meat production. (Ayyıldız, 2001).

1.1 Araştırmanın Önemi

Animal husbandry, one of the fundamental dynamics of the agricultural economy in developed countries, is of great importance in two respects. On the one hand, it can create jobs at low cost, and on the other, it transforms feed that is not suitable for human consumption into food with high nutritional value. While many countries are promoting the livestock sector and conducting development studies, the desired success cannot be achieved in Turkiye. The problems that occur especially in the areas of productivity and production have a negative impact on the sector. Although Turkiye ranks second in Europe and sixth in the world in terms of the number of animals, it cannot maintain this rank and its livestock population is gradually decreasing. (Kutlu et al 2003). Livestock farming makes a significant contribution to the country's economy and can create high added value per unit area at low cost. Generally, high investment is required to establish a new business line in industry, but only 20% of the cost is sufficient to establish the same business line in animal husbandry. This situation shows that an investment in the industrial sector can create 5 times more jobs if it is made in the livestock sector. However, the livestock sector was not given enough importance and although there were suitable conditions

for livestock farming in Turkiye, this potential was not utilized. As a result, the sector deteriorated even further (Peşmen and Yardımcı, 2008).

The main objective in cattle breeding, as in all other sectors, is to make a profit. First of all, meat is obtained from fattening cattle, and after slaughter, by-products are also obtained, which are used as raw materials in many sectors such as the food, clothing, medicine, cosmetics and animal feed industries. In order to achieve efficiency and profit in cattle breeding, it is necessary to understand the cost structure of the business well, to control the cost elements and to master the various factors that directly affect profitability. (Çiçek and Sakarya, 2003; Çiçek, 2005). In cattle breeding, all expenses such as the supply of feed and raw materials, personnel, electricity, water, veterinary services as well as taxes, interest and insurance must be covered during the fattening period. These expenses can only be covered by the producers at the end of the fattening period, as fattening farms do not have a daily income like dairy farms. It is very difficult for small farms to make a profit from fattening cattle. Small farms with 5-10 people can be run as subsistence family farms and cannot benefit from economies of scale. Such farms usually work with family labor and can only cover their own expenses. To make a profit, a cattle farm must produce roughage and other feed on its own land, have a farm with at least 50-100 animals and be able to market its livestock products at affordable prices. One of the biggest obstacles to livestock farming is the lack of capital. The continuous increase in basic input costs, especially for feed, and inflation further increase the capital requirements of breeders. However, the fact that meat prices are rising more slowly compared to the increase in input costs is having a negative impact on breeders' profitability. One of the main reasons for this situation is the illegal import of cheaper live animals and meat from neighboring countries. In addition, the increase in imports of animal products puts the domestic livestock sector in a difficult situation and reduces the competitiveness of producers. (Anonymous 1996).

One of the biggest problems in cattle breeding in Turkiye is the difficulties in marketing and pricing. The producer organization plays an important role in solving these problems. An effective organization can help eliminate structural deficiencies in the sector, use the resources used in the production process more efficiently and avoid waste. The organizational model to be chosen should be suitable for the social and economic structure of Türkiye. Such an organization should aim to support the economic development of rural enterprises and increase the social and economic welfare of producers. (Aral, 1974; Aral and Cevger, 1998; Aral and Cevger, 2000; Çiçek, 2005).

It is of great importance to provide financial resources to cover input costs and increase investment in livestock production. However, the economic crises and high inflation rates that our country has experienced in recent years have significantly increased the interest rates on loans, which has had a negative impact on the livestock sector. The high interest rates have made it difficult for producers to access the necessary credit and have led to an increase in financial liabilities. This situation has prevented livestock farmers from making new investments and expanding their existing farms. (SPO, 2001). In this context, it has become urgent to reduce lending rates and create more suitable financing options to increase the sustainability and competitiveness of the livestock sector. The desired progress in livestock production, increasing productivity and ensuring profitability depends on other important factors such as high quality breeding stock, suitable environmental conditions, veterinary health services, product evaluation and marketing, and high quality roughage production. Since feed

expenditure accounts for 60-70% of livestock farm expenditure, solving the feed problem in this sector can increase income by about 30. (Kabukçu, 1985). The most important element that accounts for a large part of the costs in livestock enterprises is feed. In order to reduce costs in livestock production and ensure efficient and profitable operations, the need for roughage and concentrates must be met in large quantities, in high quality and at affordable prices. The way to achieve this goal is to give the necessary importance to the production of forage crops. (Aral and Cevger, 1998).

Profitability in cattle breeding is based on the animal yielding the expected live weight gain in an economical manner. Fattening performance is evaluated in terms of daily live weight gain and the amount of feed used to achieve this gain and is a phenotypic trait shaped by the effects of genetic and environmental factors. Regardless of how high the genetic capacity of an animal is, the provision of suitable environmental conditions is essential to achieve the desired level of productivity. (Akcan et al., 1991). In addition, barns for cattle, regardless of type, should be clean, odor-free, sufficiently bright and healthy. Although closed barns are generally built in our country and region, it is said that fixed investments should be kept as low as possible in order to increase the profitability of fattening and that cattle can show efficient fattening performance even at temperatures as low as -17°C. (Ateş, 2004).

1.2. Purpose of the Research

In this research, the development of cattle breeding in Kırşehir province is examined from a macro perspective and the sector is evaluated. The results of this research will provide a scientific basis for the development of strategic planning for the sector by showing the economic sustainability of cattle farms in Kırşehir and their impact on regional development.

2. MATERIAL AND METHOD

The main research material consists of data from electronic data sources such as FAO and TUIK. In addition, studies, dissertations and reports on the topic were consulted to evaluate the research in relation to the literature. The study has a general evaluation concept and the data scope was evaluated as the last 10 years.

3. FINDINGS

3.1. Cattle Presence in the World

Tablo 1.1. Cattle Presence by Country

Ülke	Sığır Varlığı
Brazil	238.626.442,0
India	194.478.229,0
United States	88.841.000,0
China	73.718.307,0
Ethiopia	70.904.004,0
Pakistan	55.450.000,0
Argentina	54.242.595,0
Tanzania	37.913.129,0
Chad	37.647.402,0
Mexico	36.619.592,0

Reference: FAO, (2023)

The countries with the largest cattle populations in the world are listed in detail in Table 1.1. The country with the largest cattle population in the world is Brazil with 238 million animals, followed by India with 194 million animals (FAO 2023). These countries account for a large share of global cattle production. The reason for the high cattle population in Brazil is the large agricultural areas, the climatic conditions suitable for animal husbandry and a large meat and dairy production industry. India is one of the leading countries in the world in terms of milk production, but its share of beef production is lower because cattle are considered sacred in Hinduism and meat consumption is low. The United States ranks third with 88 million cattle, although its meat production and processing capacity is quite high. The fact that the meat industry has a large export market can also explain this figure. Turkiye's 21st place with 16.8 million cattle reflects the size and potential of the country's livestock sector. Turkiye is an important producer, especially in milk production. However, there is still room for improvement in meat production and productivity per head of cattle. In general, the presence of cattle varies from country to country around the world and these differences are directly related to the livestock policies, geographical conditions and consumption habits of each country. Turkiye's place in the ranking shows that the country has a strong livestock sector, but has not yet fully realized its potential in this area.

2024	8 213 136	7 669 922	941 150	16 824 208

Reference: TURKSTAT, (2024)

The development of the cattle population in Turkiye over the years is shown in detail in Table 1.2. Looking at Table 1.2, the number of breeding cattle in Turkiye was 6,385,343 in 1995, while this number reached 8,213,136 in 2024. There is no continuous and regular increase in the number of breeding cattle. The number of bred cattle continued to increase from 2015 to 2020, and a decrease in this number was observed from 2021 to 2023. The decline in the number of bred cattle gave way to an increase in 2024. While the number of crossbred cattle bred in 2015 was 5,733,803, it reached 7,669,922 in 2024. During the reporting period, the number of crossbred cattle bred continued to increase until 2021. The number of crossbred cattle followed an upward and downward trend. The number of cattle, which had been declining since 2022, has shown an upward trend since 2024. While the number of domestic cattle was 1,874,925 in 2015, it fell to 941,150 by 2024. The number of domestic cattle is continuously decreasing. (TUİK, 2024). The main reasons for this decline in the number of domestic cattle are the low meat and milk yield of domestic cattle breeds, the increasing use of modern methods in large breeding farms instead of traditional methods, the decline in grazing areas and climate change, as domestic cattle breeds are usually bred on the basis of grazing methods that make it difficult to raise these animals. In addition, the majority of government support is provided for breeding breeds that produce higher yields. When the incentives for native breeds are not sufficient, breeders turn to breeding breeds. In order to increase the productivity of native cattle breeds, crossbreeding with cultivated breeds is carried out. In this case, the number of cattle of native breeds has decreased and the number of cattle from cross-breeds has increased. While the total number of cattle in 2015 was 13,994,071, it was set at 16,824,208 for 2024. While an increase in the total number of cattle was observed until 2021, it has been declining since 2022. The total number of cattle reached its highest level in 2020 (TUİK, 2024). The main reason for the decline in the total number of cattle in Turkiye in recent years is the rising production costs and

economic difficulties. In particular, the increase in expenses for feed, energy, veterinary services and care has made livestock farming increasingly costly. In recent years, high feed prices have become a major problem for livestock producers. The fact that feed prices in Turkiye are largely dependent on foreign sources and exchange rate fluctuations have led to an increase in costs that has put producers in a difficult position. As a result, many breeders have had to send their animals to slaughter earlier, which has accelerated the decline in cattle numbers. In addition, the import policy is also having a negative impact on domestic producers. The increasing demand for live animal and meat imports has weakened the competitiveness of domestic producers and caused many producers to withdraw from the sector. In addition, the decline in profit margins has prompted small and medium-sized enterprises to abandon livestock farming, which has accelerated the decline in cattle numbers. Another important factor is the gradual decline in grazing land. The shrinking of agricultural land due to industrialization and urbanization has made it difficult for animals to graze in natural environments, which has had a negative impact on the sustainability of livestock farming. When all these factors are taken into account, the reasons for the decline in cattle numbers in Turkiye become clearer.

3.3. Cattle Presence in Kirsehir Province

Tablo 1.3. Cattle Breeds (Kırşehir)

Year	Culture	Hybrid	Native	Total
2015	63 442	60 372	16 038	139 852
2016	101 548	56 529	15 851	173 928
2017	112 432	69 608	16 076	198 116
2018	136 605	89 960	18 756	245 321
2019	141 132	91 024	18 525	250 681
2020	172 892	109 401	17 911	300 204
2021	152 057	100 200	10 110	262 367
2022	164 960	115 849	9 080	289 889
2023	163 024	112 950	8 950	284 924
2024	171 569	143 034	997	315 600

Referece: Kirsehir Provincial Directorate of Agriculture (2024)

The change in the cattle population in the province of Kırşehir over the years is shown in detail in Table 1.3. The number of breeding cattle in Kırşehir province was 63,442 in 2015 and increased continuously to reach 171,569 cattle in 2024. The number of hybrid cattle was 60,372 in 2015 and showed a continuous increase to 143,034 in 2024. The number of local breed cattle was determined as 16,038 in 2015. In 2016 and 2017, the number of local breed cattle decreased, and although there was an increase in 2018 and 2019, a rapid decline has been observed since 2020. While the total number of cattle in Kırşehir was 139,928 in 2015, it was determined to be 315,600 in 2024. The total number of cattle continued to increase until 2020 and followed a fluctuating trend in 2021 (TUİK, 2024). When this fluctuation was compared

with Turkiye as a whole, it was found to follow the same trend. When the number of wild cattle was compared with Turkiye as a whole, it was found that it did not show the same trend. While the number of native breeds in Turkiye is continuously decreasing, it can be observed that the decrease in Kırşehir province increased after 2020.

Tablo 1.4. Cattle Breeds (Türkiye) Annual Change Rates

Year	Culture	Hybrid	Native	Total
2015	-	-	-	-
2016	3,18	0,43	-7,55	0,62
2017	18,46	13,51	-7,52	13,23
2018	7,88	7,56	-0,62	6,89
2019	1,67	7,46	-1,21	3,79
2020	3,26	0,52	-2,59	1,57
2021	-0,16	0,62	-9,67	-0,64
2022	-5,99	-4,14	-11,08	-5,59
2023	-2,72	-0,29	-14,93	-2,56
2024	1,77	5,01	-10,15	2,45
Mean	3,04	3,41	-7,26	2,20

Tablo 1.5. Cattle Breeds (Kırşehir) Annual Change Rates

Year	Culture	Hybrid	Native	Total
2015	-	-	-	-
2016	60,06	-6,37	-1,17	24,37
2017	10,72	23,14	1,42	13,91
2018	21,50	29,24	16,67	23,83
2019	3,31	1,18	-1,23	2,18
2020	22,50	20,19	-3,31	19,76
2021	-12,05	-8,41	-43,55	-12,60
2022	8,49	15,62	-10,19	10,49
2023	-1,17	-2,50	-1,43	-1,71
2024	5,24	26,63	-88,86	10,77
Mean	13,17	10,96	-14,62	10,10

(Reference: Authors' own calculations)

Looking at Table 1.4 and Table 1.5, an absolute decline can be observed for all breeds in the years in question, both in Turkiye and in the province of Kırşehir. The downward trend, especially after 2021, is due to the inflationary market and supply chain disruptions that occurred after COVID-19. However, the direction of the distribution across animal breeds during the reporting period indicates that producers are trending towards the more productive breeds.

4. CONCLUSION AND RECOMMENDATIONS

In this study, the development process of cattle breeding in Kırşehir province was analyzed on a macro level. In line with the findings, the changing trends of the cattle population over the years in both Turkiye and Kırşehir were evaluated; an increase in the number of breeding and crossbred cattle and a significant decrease in local breeds were observed. This situation shows that producers tend to turn to genotypes that can achieve higher productivity. In addition, based on the literature results, it would be correct to state that the reduction in production costs generally seen in Turkiye can be achieved by ensuring feed supply (the need for agricultural production in the dry climatic conditions of Kırşehir province is a major handicap in terms of feed crops), activating marketing processes and strengthening the producer organization. Especially considering the high share of feed costs in total expenditures, the need to increase feed production and the restructuring of feed policies are important dynamics observed in this area.

ABSTRACT

The demand for agricultural land outside the agricultural sector means that it is being used for purposes other than its intended use. With rapid population growth and increasing migration from the countryside to the cities, it becomes apparent that urban settlement areas cannot meet demand and are gradually growing. This growth is generally shifting to agricultural land, which is located near the cities and is cheaper than land in the city centers. This form of urban sprawl can be referred to as urban sprawl. When the rapidly growing population and the demand for land required in this context are combined with the phenomenon of urban renting, it becomes apparent that fertile agricultural land is being diverted from its intended purpose to meet current needs, with agricultural land around cities being targeted. In addition, expectations of high rents and leases for non-agricultural uses mean that agricultural land is negatively impacted by urban sprawl. This research discusses the relationship between urban sprawl and the agricultural sector at a conceptual level. By discussing the potential impact of urban sprawl on the agricultural sector and the extent to which the agricultural sector is affected, a scientific approach is provided to the arguments that agricultural land is decreasing, which has been a particular concern of public opinion in recent years.

Keywords: Urban Sprawl, Agricultural Sector, Agricultural Land, Türkiye

KENTSEL SAÇAKLANMA VE TARIM SEKTÖRÜ İLİŞKİSİ: KAVRAMSAL BİR DEĞERLENDİRME

ÖZET

Tarımsal sektör dışında tarımsal arazileri için oluşan talep, arazilerinde amacı dışında kullanılmalarına neden olur. Hızlı yaşanan nüfus artışı ve kırsal kesimden kentlere olan göçlerin artması ile birlikte kentlerdeki yerleşim alanlarının oluşan ihtiyaçlara cevap veremediği ve giderek büyüdükleri görülmektedir. Bu büyümenin genellikle kentlere yakın mesafede yer alan, kentlerin merkezindeki arsalara göre daha ucuz olan tarımsal alanlara doğru kaydığı görülmektedir. Kentlerin dışına doğru oluşan bu yayılma şekli saçaklanma olarak ifade edilebilir. Hızlı bir artış gösteren nufüs ve bağlamda ihtiyaç duyulan arazi talebi kentsel rant olgusuyla birleşince, ağırlıklı olarak kentlerin çevresindeki tarım alanlarını hedef alarak verimli tarım arazileri günümüz ihtiyaçlarının karşılanması amacıyla amacı dışında kullanıldığı görülmektedir. Ayrıca tarım dışı kullanımlara yönelik yüksek kira ve rant elde etme beklentisi beklentileri, tarımsal alanların kentsel saçaklanmalardan olumsuz etkilenmesine sebep olmaktadır. Bu araştırmada, kentsel saçaklanma ve tarım sektörü ilişkisi kavramsal boyutta ele alınacaktır. Kentsel saçaklanmanın tarım sektörüne olası etkileri ve tarım sektöründen etkilenme boyutunun tartışılmasıyla özellikle son yıllarda kamuoyunu meşgul eden tarım arazilerinin azaldığı yönündeki argümanlara bilimsel bir yaklaşım oluşturacaktır.

Anahtar Kelimeler: Kentsel Saçaklanma, Tarım Sektörü, Tarım Arazileri, Türkiye

1.INTRODUCTION

Although the culture of urbanization dates back to antiquity, the modern urbanization process developed primarily in the 20th and 21st centuries. It developed in the 19th century. In the early period, cities, which were mostly founded in areas unsuitable for agriculture, expanded over time under the influence of dynamics such as population growth, industrialization and economic growth; during this expansion process, they generally changed the functions of these areas by covering the fertile agricultural land around them. As a result, the use of agricultural land for urbanization purposes has become widespread due to its lower cost and ease of implementation.

Urban sprawl is the spread of irregular, low-density settlements from urban centers to remote rural areas. This process is generally characterized by low population density, inadequate transport infrastructure and weak social capital.

The unplanned and uncontrolled expansion of urban areas through urban sprawl leads to the destruction of agricultural land and ecologically sensitive areas on the one hand, and threatens the sustainability of open and green areas at regional level on the other. If this process is not brought under control, serious environmental damage and loss of ecosystem services are inevitable in the long term. This study discusses a conceptual assessment of urban sprawl, which has accelerated urban life and caused complex problems in the sociological strata of society and food security in recent years.

2. MATERIAL AND METHOD

In this research, evaluations were made by using scientific literature and studies on the subject and suggestions were made for the results obtained.

3. CONCEPTUAL FRAMEWORK

3.1.The Concept of Urban Sprawl

Since the industrial revolution at the beginning of the 20th century in the industrialized countries and after the Second World War in the developing countries, economic development efforts and industrial policy have accelerated the migration of the population from rural areas to the cities.

Under the pressure of rapid urbanization, rural areas surrounding cities have gradually been transformed into urban areas, and new formations known as urban sprawl have emerged in these areas. Urban sprawl generally refers to the physical expansion of urban areas; it is an area that is squeezed between urban and rural areas and has neither urban nor rural characteristics. The uncontrolled and rapid change taking place in these areas has resulted in unplanned, irregular settlements as these areas are subject to rapid and uncontrolled change.

The area between the populated area and the rural area of the cities is the urban sprawl area. Urban sprawl is the result of the expansion and dispersion of cities and can be seen as the boundary between rural and urban areas. It can be defined as the urban area that attracts population from the center and surrounding settlements of cities and where the element of development and growth is most pronounced in developed countries (Özçevik, 1999). Although

the terms urban sprawl and urban sprawl are similar in meaning and are sometimes used synonymously, they have different characteristics in the literature. Urban sprawl, which is defined as the expansion of cities into their surrounding areas, is mainly observed in developing countries. This type of growth is a type of growth that expresses development at the same density without gaps instead of leapfrog development (Wei & Ewing, 2018). The term fringe areas refers to the areas around cities, on the boundary between rural areas and urban areas. (Mukherjee J, 2018).

The theory of urban sprawl encompasses not only a part of urban development policy, but also a settlement area outside the city. As the density and continuity of these areas will increase over time during the urban growth process, the cluster element and proximity dimension will also increase over time (Glaeser & Kahn, 2003).

Urban sprawl has some basic characteristics and can be simply defined as the migration from cities to rural areas that occurs spontaneously or for political reasons (Morris, 2005). The National Trust for Historic Preservation, which was established to protect historic preservation areas, defines sprawl as dispersion. According to another definition, it is the development that results from land use and the dominance of the automobile (Karagülle, 2011). Another definition of sprawl states that the city center spreads like an oil slick and the city center grows towards the areas formed outside the city. (Barnett, 1995). Staley, on the other hand, defines the phenomenon of urban sprawl as the areas in transition between rural areas and urban areas (Staley, 1999).

3.1.1. Causes of Urban Sprawl

The factors that pave the way for urban sprawl, especially as a result of the rapid development of large cities, are manifold. There are various examples of urban sprawl from the past to the present. The first urban sprawl occurred in developed European countries in the early 19th century and took place in suburbs where professional and social groups working in mining and heavy industry lived. In the 20th century, urban sprawl was mainly caused by the relocation of industrial centers. Today, while the industrial sector is still influential in the choice of where to produce, it is clear that the choice of where to live is also influential as a result of rapid population growth and class changes in social structures. The economic improvements that occurred with the end of the Second World War have strengthened the middle class, and thus the need of this class to escape the urban centers has paved the way for the formation of land rental markets around the cities, which in turn has paved the way for the formation of urban sprawl on the periphery of the cities. In addition, the desire for a second home also plays a role in these processes (Kaygalak, 2006). The main reasons for urban sprawl are urban land use decisions, the expansion of the transportation network, social and economic development and urban growth.

Urban sprawl from the center to the periphery is also due to the dense population and industry in cities, increasing air pollution, rising crime rates, increasing noise levels and insufficient open spaces in city centers, limited land in city centers and the formation of exorbitant prices in these areas, new technologies in housing construction and developments in mass housing, rapid population growth, the relocation of high-income residential areas to the outskirts of cities and the idea of having larger houses.

In a 2006 report by the European Environment Agency, the reasons cited for urban sprawl include economic and demographic reasons, changes in transportation and communication technologies, and urban sprawl. (Sezgin, 2010). Although the reasons for urban sprawl vary from region to region, the main reasons are the effects of globalization, technological development, population growth and industrialization on cities. (Hayrullahoğlu et al., 2021). There are many reasons for urban sprawl, the most important of which are the change in people's lifestyles and the increasing demand for low-density and independent areas, low land prices on the outskirts of cities, developed transportation systems, high costs in city centers, developed communication systems, increasing wealth levels with rising income levels, and governments' planning efforts to determine the direction of urban growth (Wu. J, 2006).

3.1.2 Effects of urban sprawl

The rapid increase in urban population has created a demand for urban areas. As the demand for urban areas increases, cities grow rapidly and spread out spatially. Urban growth and urban sprawl is one of the problems that many cities in the world have been struggling with since the 1960s. It can be seen that urbanization is losing control due to the effects of many factors such as increasing population growth, legal and administrative changes, planning processes and the variables associated with these factors.

Urban expansion has led to rapid changes in the surrounding areas of cities, but it has also created some problems. Today, many cities face numerous problems, such as housing, transportation networks, infrastructure systems and environmental factors, because they are growing too fast to be controlled. As can be seen from the high growth rate of the urban population, this situation will become an even greater problem in the coming years. The policies of developing countries have caused cities to grow continuously and uncontrollably, and the living environment and economic structures have become inefficient.

The problems caused by rapid population growth, which are also mentioned in the report "Our Common Future" prepared by the United Nations World Commission on Environment and Development in 1987, are discussed under the name of urbanization, and it can be seen that this paves the way for a reduction in the quality of life, causes excessive consumption of environmental resources and brings to the fore the problems associated with the uncontrolled expansion of cities. (Author, 2006). It can be seen that increasing development in rural areas consumes water resources, degrades water quality and leads to land warming. and warms the soil. Urban expansion also has a significant impact on natural thresholds. The unplanned and haphazard growth of cities threatens forest areas, valleys and watersheds and leads to overconsumption of natural resources (Türkten, 2015). Scientists who have studied this issue emphasize that urban sprawl will have negative consequences and point out that the social costs of this will be high. In their studies, they have calculated in detail the monetary equivalents of the costs that these negative effects will entail. While this form of growth has been criticized, it has also been argued that these processes should be accepted as natural, that they are difficult to prevent and that the negative effects are exaggerated [Özdemir, 1993]. In the Bruntland Report published by the World Commission on Environment and Development and at the United Nations Environment and Development Agency Conference in 1992, the concept of urban sprawl was seen as a problem. It was mentioned that it was necessary to take precautionary measures by reaching a consensus against the negative effects of urban sprawl

and it was decided to develop strategies to eliminate the negative effects of urban sprawl. (Yenigül and Çamur, 2009).

3.2. Relationship between Urban Sprawl and Agricultural Areas

The decreasing of agricultural lands, especially due to urbanization and industrialization, has become a significant problem today. Food is the most basic need for societies to continue their lives, therefore, sufficient measures must be taken to protect food. In this context, the protection of agricultural lands is especially important. While the type of land is not important in meeting the need for shelter, the type of land suitable for agriculture is important in meeting the need for food. In other words, housing etc. can be built on every type of soil, but agricultural activities cannot be carried out on every land. The decrease in agricultural activity, i.e. production, can endanger the lives of millions of people who have to fight hunger and the increasing population. Throughout history, cities have expanded towards their surroundings as people have needed more space to live and work. In a period when land was abundant, urban expansion was made possible by farmers moving to new plots. However, today, urban expansion threatens agricultural lands due to the fact that many cities are built on agricultural lands (Gardner, 1997). While efforts are being made to meet the shelter and security needs of the rapidly increasing world population due to the misuse of agricultural lands, it is seen that physiological needs such as food that are necessary for people to survive are also being ignored. As in all parts of the world, cities and rural areas in Türkiye have undergone rapid changes in the development process (Sertkaya Doğan and Gökburun 2019). In the 1960s, it is estimated that Türkiye lost at least 25,000 hectares of agricultural land per year due to urbanization and industrialization requirements. A study conducted by the Chamber of Architects stated that approximately 10,000 hectares of agricultural land were added to urban areas every year between 1965 and 1985. According to Çepel (2003), Turkey lost 326,000 hectares of agricultural land as of 1991 due to urbanization and related infrastructure developments. As can be seen from all these data, especially the residential areas and industrial facilities around Türkiye's big cities continue to put serious pressure on fertile agricultural lands (Akseki, 2011).

When the rapidly increasing population and the demand for land in this context are combined with the phenomenon of urban rent, it is seen that fertile agricultural lands are being used for purposes other than their intended purpose in order to meet today's needs, mainly targeting agricultural lands around cities. (Sezgin, 2010). In addition, high rents and expectations of rent for non-agricultural uses cause agricultural lands to be negatively affected by urban sprawl.

The effects of urban expansion and urban sprawl on agricultural lands can be evaluated from different perspectives. Sprawling cities cause agricultural lands to be fragmented, land prices to increase, and taxes in these areas to increase, making agricultural production unsustainable. (Nas, 2016).

The most important reason for the misuse of agricultural lands around cities is urbanization and urban sprawl. In this context, sprawl cities pose a threat to agricultural lands in these areas and businesses operating in these areas are negatively affected by this. Urban sprawl, the effects of which are strongly felt, not only destroys agricultural lands, but also causes the destruction of already scarce natural resources and negatively affects the use of open spaces in these areas (Brueckner, 2001).

4. CONCLUSIONS AND SUGGESTIONS

This study evaluates the phenomenon of urban sprawl, which has arisen as a result of the rapid urbanization process, and its impact on agricultural land within a conceptual framework. Urban sprawl, as an irregular structure and form of settlement spreading from the city center to the periphery, poses a significant threat to both the natural environment and agricultural production.

Reasons for urban sprawl include population growth, changing lifestyles, demand for cheap land, advanced transportation systems and high costs for the city center. The combination of these factors means that fertile agricultural land around the city is rapidly being released for development and the sustainability of agricultural production is at risk.

The decline in agricultural land not only has a negative impact on food production, but also on food security and rural development. This situation can lead to serious difficulties in meeting the basic needs of the world's growing population in the future. In addition, the environmental impact of urban sprawl leads to far-reaching environmental problems such as the pollution of water resources, the destruction of natural areas and the disruption of the climatic balance.

Therefore, planned urbanization, legislation to protect agricultural land and strategic policies to guide urban growth should be implemented. Deterrent measures should be taken against the misuse of agricultural land and the balance between agriculture and urbanization should be maintained in accordance with the principles of sustainable development.

ABSTRACT

Products derived from genetically modified plants and animals using modern biotechnological methods are referred to as genetically modified organisms (GMOs). These technologies aim to increase agricultural productivity, reduce environmental impacts, and provide resistance to pests, but consumer perceptions and evaluations of the potential benefits of GMOs can vary. While some consumers have safety concerns regarding GMOs, others express worries about health and ethics. This situation negatively affects how consumers perceive these products and hinders the realization of their potential benefits.

The purpose of this study is to determine the attitudes of young consumers towards GMO products, to examine their approaches, opinions, and levels of knowledge about these products. Additionally, the study aims to investigate the level of trust young consumers have in GMO products, their expectations regarding product labeling, the sources of information they rely on, and the impact of these factors on their attitudes and behaviors. In the research, the survey method was preferred, and data were collected from 248 participants. The results indicate that young consumers lack sufficient information about GMO products and exhibit a general mistrust towards them. It was found that young people are concerned about the potential health effects of GMOs and believe that labeling of these products should be mandatory. Labeling is seen as an important factor for ensuring transparency and building trust. Furthermore, there is a need for more research on the potential benefits and risks of GMOs. These studies would contribute significantly to reducing consumer mistrust towards GMOs and establishing more solid scientific foundations for informed decision-making. In conclusion, the attitudes of young consumers towards GMOs highlight the need for transparency, trust, and the flow of information for these products to be accepted in society.

GENÇ TÜKETİCİLERİN GENETİĞİ DEĞİŞTİRİLMİŞ ORGANİZMALI (GDO) ÜRÜNLERE YÖNELİK TUTUM VE DAVRANIŞLARINI ETKİLEYEN FAKTÖRLERİN BELİRLENMESİ: KIRŞEHİR AHİ EVRAN ÜNİVERSİTESİ ÖRNEĞİ

ÖZET

Modern biyoteknoloji yöntemleri kullanılarak, genetik yapısı değiştirilmiş bitki ve hayvanlardan elde edilen ürünler genetiği değiştirilmiş organizmalar (GDO) olarak adlandırılmaktadır. Bu teknolojiler, tarımsal üretimde verimliliği arttırmayı, çevresel etkileri azaltmayı ve zararlılara karşı direnç sağlamayı amaçlamasıyla birlikte, GDO'ların potansiyel faydalarıyla ilgili tüketicilerin algılamaları ve değerlendirmeleri farklılaşabilmektedir. Kimi tüketicilerin GDO'ya karşı güvenlik endişesi yaşarken, kimisi de sağlık ve etik noktasında kaygılar taşıdıkları gözlenmektedir. Bu durum tüketicilerin nezdinde bu ürünleri algılamalarını olumsuz etkilerken ve potansiyel faydalarının önüne geçmektedir.

Yürütülen bu çalışmanın amacı genç tüketicilerin GDO'lu ürünlere yönelik tutumlarını belirlemek, bu ürünlere yaklaşımları ve görüşleri ile bilgi düzeylerini ortaya koymaktır. Ayrıca genç tüketicilerin GDO'lu ürünlere karşı duymuş oldukları güven düzeyini, ürün etiketlemesine yönelik beklentilerini ve bu ürünlere yönelik bilgi kaynaklarının neler olduğunu tespit etmek ve bu faktörlerin genç tüketicilerin tutum ve davranışları üzerindeki etkisini belirlemekte amaçlanmaktadır. Araştırmada, anket yönteminin kullanılması tercih edilmiş ve 248 katılımcıdan veri toplanılmıştır. Elde edilen sonuçlara göre, genç tüketicilerin GDO'lu ürünler hakkında yeterli bilgiye sahip olmadıkları ve bu ürünlere yönelik genel bir güvensizlik olduğunu ortaya koymuştur. GDO'lu ürünlerin sağlık üzerindeki potansiyel etkileri konusunda gençlerin endişe duydukları belirlenmiş ve bu ürünlerin etiketlenmesinin zorunlu olması gerektiği, şeffaflığın sağlanılması ve güven ortamının oluşturulması açısından önemli bir faktör olduğu görülmüştür. Ayrıca GDO'lu ürünlerin potansiyel faydaları ve riskleri hakkında daha fazla araştırma yapılması gerekliliği ortaya çıkmıştır. Bu araştırmalar, tüketicilerin GDO'lara karşı duyduğu güvensizliklerin azaltılması ve bilinçli kararlar verebilmeleri için daha sağlam bilimsel temellerin oluşturulması açısından önemli katkı sağlayacaktır. Sonuç olarak, genç tüketicilerin GDO'lara yönelik tutumları, bu ürünlerin toplumda kabul görmesi için gerekli olan şeffaflık, güven ve bilgi akışının sağlanması gerektiğini göstermektedir.

Anahtar Kelimeler: Tarımsal Pazarlama, Genetiği Değiştirilmiş Organizma, Biyoteknoloji, Tüketici Davranışı

1. GİRİŞ

Kentleşme ve sanayileşmedeki artış, tarıma uygun alanların azalmasına yol açmıştır. Bir taraftan artan dünya nüfusu ve değişen iklim koşulları, sınırlı tarımsal kaynakların gıda talebini karşılamada yetersiz kalmasına neden olmuştur. Bu durum, gıda üretiminde verimliliği artırmayı ve birim başına elde edilen ürün miktarını yükseltmeyi zorunlu hale getirmiştir.

Bu ihtiyaç doğrultusunda, 20. yüzyılın başlarında genetik biliminde kaydedilen ilerlemeler, bitki ve hayvan yetiştiriciliğinde yeni bir dönemin başlamasına öncülük etmiştir. Genetik bilginin yetiştirme çalışmalarına entegre edilmesi sayesinde, daha yüksek verimli bitki çeşitleri ve hayvan ırkları geliştirilmiştir. Bu gelişmelerin bir sonucu olarak, genetiği değiştirilmiş organizmalar (GDO'lar), daha dayanıklı ve verimli ürünler elde etme potansiyeliyle modern tarımın temel unsurlarından biri haline gelmiştir.

Ancak GDO'lar yalnızca biyoteknolojik bir yenilik olarak görülmemekte, aynı zamanda etik, çevresel ve sağlık açısından çeşitli tartışmaları da beraberinde getirmektedir. Bu noktada, özellikle genç tüketiciler, geleceğin karar vericileri ve bilinçli bireyleri olarak, GDO'lara karşı tutum ve davranışlarıyla önemli bir toplumsal kesimi temsil etmektedir. Gençlerin GDO'lara ilişkin bilgi düzeyleri, algıları ve tutumları, yalnızca kendi bireysel gıda tercihlerini değil, toplumun genel bilinç düzeyini ve gelecekteki politika geliştirme süreçlerini de etkileme gücüne sahiptir. GDO'lara yönelik tutumlar ise bireylerin eğitim aldıkları alan, yaşadıkları coğrafi bölge, bilgiye erişim olanakları ve sosyal çevre gibi çeşitli faktörlerin etkisiyle şekillenmektedir.

Genç tüketicilerin GDO ile ilgili algı ve farkındalık düzeylerini incelemek, günümüzde tarım ve gıda sektöründeki önemli bir konudur. GDO'ların sağlığa, çevreye ve genel olarak toplumsal yapıya olan etkileri üzerine süregeldiği tartışmalar, bu ürünlerin kabulü ve reddi konusunda toplumsal ve akademik tartışmaların temelini oluşturmaktadır.

2. Kavramsal Çerçeve

2.1. Biyoteknoloji ve GDO

Biyoteknoloji, özel bir kullanıma yönelik olarak ürün ya da işlemleri dönüştürmek ya da oluşturmak için biyolojik sistem, canlı organizmalar ve bunların türevlerini kullanan teknolojik uygulamalar olarak tanımlanmaktadır. Modern biyoteknoloji ise rekombinant DNA'nın hücre ya da organellere doğrudan enjeksiyonu ya da farklı taksonomik gruplar arasında uygulanan hücre füzyonu gibi doğal çoğalma ve rekombinasyon engellerini ortadan kaldıran ve klâsik ıslah ile seleksiyon yöntemlerince kullanılmayan in vitro nükleik asit tekniklerinin tamamı" olarak tanımlanmaktadır. Bir türe başka türden gen aktarılarak doğal yapının değiştirilmesiyle yeni genetik özellikler kazandırılmasını sağlayan bu modern biyoteknoloji tekniklerine "gen teknolojisi", gen teknolojisi kullanılarak doğal doğal olarak elde edilmesi mümkün olmayan yeni özellikler kazandırılmış organizmalara da "Genetik Yapıları Değiştirilmiş Organizma (GDO) adı verilmiştir.

Rekombinant DNA'nın hücrelere doğrudan enjeksiyonu ya da farklı taksonomik gruplar arasında uygulanan hücre füzyonu gibi, doğal çoğalma ve rekombinasyon engellerini ortadan kaldıran in vitro tekniklerin tamamı olarak tanımlanan bitkisel biyoteknoloji ve onun ürünü

olan transgenik çeşitlerden; herbisitlere, zararlılara ve hastalıklara dayanıklılık; vitamin ve protein kalitesini artırma ve döllenme sistemlerinin kontrolu gibi konularda yararlanılmaktadır (Özgen vd., 2005). Sağlık, çevre, agronomi, ekonomi, üretici ve tüketici hakları açısından önemli risklerinin olması nedeniyle, başta Avrupa Birliği ülkeleri olmak üzere, birçok ülkede transgenik çeşitlerin kullanılması son derece kısıtlıdır. Bununla birlikte, günümüzde, ABD, Kanada ve Arjantin gibi ülkelerde, özellikle transgenik soya, mısır, pamuk ve kolzada ekim alanı 70 milyon hektarı aşmıştır.

Dünyada başta transgenik bitkiler olmak üzere, biyoteknolojik ürünlerin üretilmesi ve kullanılmasına ilişkin gelişmeler uluslararası düzeyde izlenmekte, hedefler ülke ekonomisine katkısı dikkate alınarak belirlenmekte ve uluslararası iş birliği olanakları araştırılmaktadır. Son yıllarda, biyoteknoloji politikalarının oluşturulmasında gelişmiş ülkelerde önemli ilerlemeler sağlanmıştır. Geri dönüşü olmayan zarar verme olasılığı nedeniyle biyoteknolojik ürünlerin kullanımına yasal düzenlemelerle sınırlamalar getirilmektedir. Biyoteknoloji ile ilgili yasalar, AB ülkelerinde olduğu gibi ya özel olarak çıkarılmakta ya da ABD ve Japonya'da olduğu gibi yürürlükteki yasalara ek yapılarak oluşturulmaktadır.

Türkiye'de modern biyoteknoloji ve bu kapsamda yer alan bitkisel biyoteknoloji çalışmaları başlangıç aşamasında olup, yasal olarak transgenik bitkilerin ticari olarak üretilmeleri söz konusu değildir. Yani çiftçilerin GDO'lu ürünleri ekimleri yasaktır (Hayırlıdağ, Arslan ve Büken, 2016).. Ancak hayvan yeminde bazı GDO'lu mısır ve soya ürünlerinin kullanılmasına Biyogüvenlik kurulu kontrolünde izin verilmektedir. Birçok kurumda temel biyoteknoloji çalışmaları yapılmakla birlikte, agronomik öneme sahip izole edilmiş uygun genler bulunmadığından transgenik çeşit geliştirme aşamasına gelinememiştir. Bu nedenle, Türkiye'nin durumu transgenik bitki geliştiren değil, geliştirilmiş transgenik çeşitleri satın alıp kullanma potansiyeli olan ülke olarak ele alınmalıdır. Ülkemizde transgenik çeşitlerin ekimi, Tarım ve Orman Bakanlığı kontrolunda "Alan Denemeleri Yönetmeliği" kapsamında patates, mısır ve pamuk için Tarımsal Araştırma Enstitüleri'nde yapılmaktadır (Özgen vd.., 2005). Bu denemelerin amacı; çeşit özelliklerinin gözlenmesi, flora ve faunaya olan etkilerinin belirlenmesi olarak açıklanmakla birlikte, bu çalışmaların ne kadar bilimsel ve geçerli oldukları tartışma konusudur. Çevreye zarar vermemesi açısından alan denemelerinin çiçek tozu izolasyon koşullarına uyularak yapılması zorunludur. İzolasyon koşullarında yapılan denemelerde ise çevreye olan etkinin belirlenmesi mümkün değildir. Bu nedenle, alan denemelerinden bilimsel ya da uygulamaya yönelik önemi olan sağlıklı verilerin alınması beklenmemelidir.

Transgenik çeşitlerin ticaretinde alıcı ülke konumunda olan Türkiye, bu çeşitleri yetiştirmeye başlaması durumunda ekonomisini olumsuz etkileyecek durumlarla karşılaşabilecektir. Örneğin, en büyük dışsatım pazarı olan AB ülkeleri transgenik ürünler konusunda son derece duyarlı düzenlemelere sahip olduklarından, transgenik çeşitleri üretmemiz halinde, bulaşma riski nedeniyle klâsik çeşitlere ilişkin ürünlerin alımında da büyük zorluklar çıkarabilecektir. Özellikle son yıllarda önem kazanmaya başlayan organik tarım ürünlerinin dışsatımında da olumsuz gelişmeler söz konusu olabilecektir.

Türkiye'de tüm ürünlerin dışalımı Tarım ve Orman Bakanlığı'ndan kontrol belgesi alınması koşuluyla serbesttir. Türkiye, ABD ve Arjantin'den gıda ve yem amaçlı kullanılmak üzere önemli miktarda mısır ve soya fasulyesi ithalatı yapmaktadır (Büyüközer, 2009). 2024 yılında

soya dışalımı yaklaşık 3.7 milyon ton civarında iken mısır dışalımının parasal değeri 1 milyar TL'nin üzerindedir. Türkiye'de bu iki bitkiye ilişkin alım değerlerinin son yıllarda önemli düzeyde arttığı görülmektedir. Öte yandan, dış ticaret verilerinde başta mısır ve soya olmak üzere, transgenik ürünlerin dış alımına ilişkin herhangi bir bilgi bulunmamaktadır. Ancak, bu ürünlerin alındığı ülkelerde transgenik bitki üretiminin çok yaygın olması, dışalımı yapılan bu ürünlerin de transgenik olabileceğini akla getirmektedir. Ülkemizde transgenik ürün analizi yapabilecek laboratuvarların bulunmaması ve dışalımın tamamen satan ülkenin bildirimine göre yapılması, özellikle mısır ve soya başta olmak üzere bazı ürünler hakkında kuşkulu bir ortam oluşturmaktadır (Yılmaz, 2014).

Modern biyoteknolojinin özellikle transgenik bitkiler ve genetik olarak değiştirilmiş organizmalar (GDO) üzerinden sağladığı yenilikler, tarım ve sağlık gibi sektörlerde önemli değişimler yaratmaktadır. Bu bağlamda pazarlama, yeni ürün geliştirme ve ürün karma elemanlarında belirleyici bir rol oynamaktadır. Yeni teknolojiler ve biyoteknolojik ürünlerin, özellikle genetik yapıları değiştirilmiş ürünlerin pazara sunulması, firmaların ürün geliştirme süreçlerinde daha geniş bir stratejik bakış açısı gerektirmektedir. Yeni ürünlerin tüketiciye sunulmadan önce yapılan detaylı araştırmalar, inovasyonun pazarlama stratejileri ile uyumlu olmasını sağlamaktadır. Ayrıca, tüketicinin biyoteknolojik ürünlere olan ilgisi ve bu ürünlere karşı duyduğu güven, pazarlama çabalarını doğrudan etkilemektedir. Bu durum, ürün karma stratejisinde de önemli bir yer tutmakta; firmalar, farklı ürün seçenekleri ve tüketici taleplerine göre pazara sundukları ürünleri çeşitlendirmek zorundadır.

Bu noktada, biyoteknolojik ürünlerin pazara girişi ve tüketicilerin bu ürünlere yaklaşımı, tüketici davranışlarıyla doğrudan ilişkilidir. Tüketicilerin bu yenilikçi ürünleri nasıl algıladıkları ve hangi faktörlerin kararlarını etkilediği, pazarlama stratejilerinin başarısını belirleyen temel faktörlerden biri olacaktır. O nedenle, biyoteknolojik ürünlerin pazarlanması, yalnızca teknik özelliklere bağlı değildir. Tüketici davranışı bilinmesi, tüketicilerin algısı ve etik kaygılar çerçevesinde şekillenmektedir. Bu nedenle, GDO'lu ürünlerin pazar kabulünü anlamak için tüketici davranışları disiplininden yararlanmak gerekir. Özellikle, risk algısı, yenilikçilik eğilimi ve sosyo-kültürel normlar gibi faktörler, pazarlama iletişimi stratejilerinin kurgulanmasında önemli faktörler olarak görülmektedir.

2.2. Tüketici Davranışları

Tüketici davranışları, bireylerin ihtiyaçlarını ve isteklerini karşılamak için ürün veya hizmetleri nasıl seçtikleri, kullandıkları ve tükettikleri ile ilgili psikolojik, sosyal, ekonomik ve kültürel faktörlerin birleşiminden meydana gelen bir alandır (Durmaz ve Bahar, 2011). Tüketicinin ne istediği, genellikle bir içsel ihtiyaç veya dışsal bir etken tarafından tetiklenmektedir. İhtiyaçlar, fizyolojik gereksinimler (yemek, su, barınma) veya psikolojik gereksinimler (açıklık, aidiyet, prestij) olabilirken, istekler daha çok sosyal ve kültürel etmenler tarafından şekillenmektedir. Tüketiciler, yaşam tarzlarına, değerlerine ve çevrelerindeki insanlardan aldıkları etkilere göre farklı tercihler yapabilirler. Bir ürün ya da hizmet, tüketicinin kendisine katacağı değere ve karşılaşmış olduğu soruna yönelik çözüme ulaşma potansiyeline göre tüketici tarafından tercih edilmektedir.

Tüketici karar verme süreci, karmaşık bir dizi adımdan oluşmaktadır. İlk olarak, tüketici bir ihtiyacı fark eder ve ardından bu ihtiyacı karşılayacak seçenekleri araştırmaya başlar. Bu araştırma süreci, çeşitli kaynaklardan (arkadaşlar, aile, medya, internet) bilgi toplamakla devam

eder. Tüketici, farklı alternatifleri karşılaştırarak ve her birinin sağladığı faydaları değerlendirerek en uygun seçeneği belirlemeye çalışır. Karar verme aşamasında, fiyat, kalite, marka güvenilirliği, ürünün sunduğu faydalar ve hatta sosyal kabul gibi faktörler etkili olabilir. Tüketici bir satın alma kararı verir ve bu karar, bireysel tercihler, geçmiş deneyimler ve çevresel etkenlere dayalı olarak şekillenir.

Bir tüketicinin kararlarını etkileyen birçok faktör vardır. Bunlar arasında psikolojik faktörler (kişisel değerler, algılar, öğrenme ve motivasyon), sosyo-kültürel faktörler (aile, arkadaşlar, sosyal çevre), ekonomik faktörler (bütçe, fiyat duyarlılığı), çevresel faktörler (mevsimsel değişiklikler, kültürel eğilimler) ve pazarlama faktörleri (reklamlar, promosyonlar) sayılabilir. Bu faktörler, tüketicinin bir ürünü seçme, kullanma veya ondan vazgeçme kararlarını doğrudan etkileme potansiyeline sahiptir. Tüketiciler istekleri, tutumları, davranış şekilleri, demografik özellikleri gibi birçok bakımdan farklı olmaları, haliyle pazar içerisinde heterojenliğe neden olmaktadır (Altuntaş vd., 2015). Ayrıca, bireysel özellikler de bu süreci yönlendiren önemli bir faktördür; örneğin, yaş, cinsiyet, eğitim seviyesi ve gelir durumu, bir tüketicinin alışveriş alışkanlıkları üzerinde belirleyici olabilir.

Tüketici davranışlarının karmaşıklığı, biyoteknolojik ürünlere yönelik pazarlama stratejilerinin oluşturulmasında nicel araştırma yöntemlerini gerekli kılmaktadır.

3. MATERYAL VE METOT

Bu bölümde araştırmanın amacı ve önemi, araştırmanın kısıtları ile veri analizi açıklanmaktadır. İstatistiksel analizlerin neler olduğu yine bu bölümde açıklanmaktadır.

3.1. Araştırmanın Amacı ve Önemi

Genetiği değiştirilmiş organizmalar (GDO), tarım ve gıda üretimi alanında devrim niteliğinde yenilikler sunarken, biyoteknolojik gelişmelerin sosyal, ekonomik ve etik boyutları da giderek daha fazla tartışılmaktadır. GDO'lar, özellikle çevresel sürdürülebilirlik, gıda güvenliği ve sağlık üzerindeki potansiyel etkileriyle dikkat çekmektedir. Ancak, bu organizmaların kullanımı toplumun farklı kesimlerinde farklı bakış açıları oluşturmakta ve özellikle genç kuşaklar arasında bu konuda önemli bir farklılık gözlemlenmektedir. Gençlerin, GDO'lar konusundaki tutum ve davranışları, çevresel kaygılar, sağlık endişeleri ve etik değerlere dayalı olarak şekillenmektedir.

Bu çalışmanın amacı, genç tüketicilerin GDO'lara yönelik tutum ve davranışlarının geliştirilmesinde etkili olabilecek faktörleri belirmektir. Bir diğer amaç ise demografik değişkenler doğrultusunda GDO'lara yönelik tutum ve davranışlarını etkileyen faktörler yönünden anlamlı farklılıklar olup olmadığını incelemektir. Çalışma, GDO'ların sağlık, çevre ve güvenlik üzerindeki potansiyel etkileri hakkındaki endişeleri ile bu ürünlere yönelik duyulan güvensizliğin ardında yatan psikolojik ve sosyal dinamikleri anlamayı hedeflemektedir.

Genç tüketicilerin GDO'lara yönelik tutum ve davranışlarını incelemek, yalnızca mevcut tüketim eğilimlerini anlamaya değil, aynı zamanda gelecekteki gıda politikalarının, etik tartışmaların ve pazarlama stratejilerinin şekillenmesinde temel rol oynayacak dinamikleri belirlemesi açısından da önem arz etmektedir. Dolaysıyla yürütülen bu çalışmanın önemi de gençlerin GDO'lu ürünlere yönelik yaklaşımlarının ortaya konulması ile gerek tarım

politikalarının gerekse de pazarlama stratejilerinin belirlenmesi ve geliştirilmesine katkı sağlamasıdır.

Çalışmanın özgün değeri, GDO'ların yalnızca biyoteknolojik ve tarımsal boyutlarıyla değil, aynı zamanda tüketici psikolojisi ve davranışları açısından da incelenmesinden kaynaklanmaktadır. Tüketicilerin bu ürünlere karşı nasıl bir risk algılayışı geliştirdiği, ne tür koruyucu davranışlar sergilediği ve bu davranışların arkasındaki motivasyonları anlamak, GDO'ların pazarlanması ve tüketici davranışları üzerine önemli stratejik öngörüler sağlayacaktır.

Bu çalışma, GDO'lara yönelik genç tüketicilerin algısını anlamakta daha farklı boyutlarıyla ele alan bir anlayış geliştirilmesine olanak tanımayı ve özellikle biyoteknoloji, tarım ve gıda endüstrilerinde faaliyet gösteren şirketler için değerli bilgiler sunmayı hedeflemektedir. Çalışma bu alanda yapılacak olası yasal düzenlemeler ve pazarlama stratejilerinin şekillendirilmesinde etkili olabilecek, bilimsel ve toplumsal perspektiflerin bir araya getirilmesine temel oluşturabilme potansiyeli taşımaktadır. GDO'lar gibi tartışmalı teknolojilerin toplumda daha geniş bir kabul görmesi için, tüketicilerin bu ürünlere yönelik algı ve tutumlarının anlaşılması büyük önem taşımaktadır.

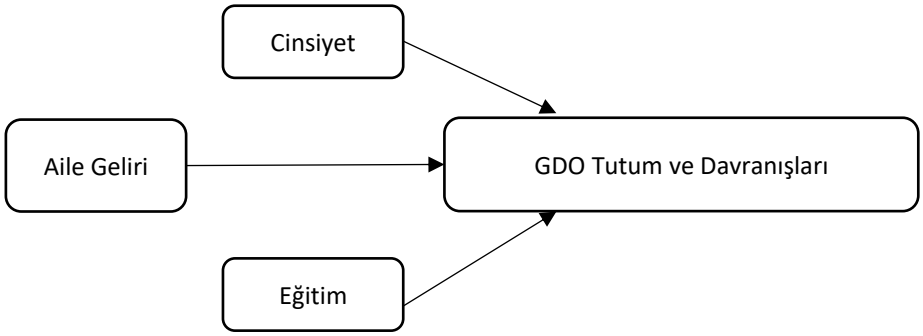
3.2. ARAŞTIRMANIN KAPSAMI VE SINIRLILIKLARI

Araştırma her ne kadar genç tüketicilerin tutum ve davranışlarını anlamaya yönelik olarak geliştirilmiş olsa dahi Kırşehir Ahi Evran Üniversitesi öğrencilerine yönelik yürütülmektedir. Üniversite öğrencilerinin homojen bir özellik göstermesine rağmen kapsamı coğrafi olarak sınırlandırılmış durumdadır. Bu çalışma GDO'lu ürünlere yönelik genç tüketicilerin algı düzeylerini, tutumlarını ve davranışlarını inceleme ile sınırlıdır. Yine çalışmanın kapsamı TÜİK'e göre genç olarak nitelendirilen 18-24 yaş grubunu kapsamaktadır. Ayrıca bu çalışma 2025 yılında yürütülmüş ve belirli bir dönem içerisinde tüketicilerin davranışını anlamaya yöneliktir. Tüketici davranışını birçok faktör tarafından etkileniyor olması ve bugünün bulgularının yarının durumlarında geçerli olabilmesi beklenmemelidir. O nedenle bu çalışmanın bir zaman kısıtı olduğunu belirtmek gerekmektedir. Son olarak çalışmada tutum ve davranış başta olmak üzere bilgi ve algı düzeyi, etik kaygılar, iletişim kaynakları ve sağlık endişesi boyutları ile ele alınmaktadır. Bunlar dışında GDO'lu ürünlere yönelik tutum ve davranışı etkileyebilecek faktörlerin olabileceği göz önünde bulundurulmalıdır.

3.3. Araştırma Modeli ve Hipotezleri

Genç tüketicilerin demografik özelliklerinin GDO'lu ürünlere yönelik algı, tutum ve davranışları üzerinde etkili olduğunu gösterebilmek amacıyla teorik evrende model kurgulanmıştır. Genç tüketicilerin yaş, eğitim gördükleri bölüm, cinsiyet ve gelir değişkenlerine göre GDO'lu ürün algılamalarında ilişki olabileceği bu model ile ortaya konulmaktadır. Araştırmanın modeli Şekil 1.'de ayrıntılı olarak gösterilmektedir.

Şekil 1. Araştırma Modeli



Bu model doğrultusunda test edilecek hipotezler şu şekildedir:

H1: Genç tüketicilerin cinsiyetleri ile GDO'lu ürün algılamaları arasında farklılık vardır.

H2: Genç tüketicilerin aile geliri ile GDO'lu ürün algılamaları arasında farklılık vardır.

H3: Genç tüketicilerin eğitim gördükleri bölüm ile GDO'lu ürün algılamaları arasında farklılık vardır.

3.4. Örneklem, Anket Tasarımı ve Saha Çalışması

Genç tüketicilerin GDO'lu ürünlere yönelik farkındalık ve bu ürünlere yönelik tutumlarını etkileyen faktörleri belirleyebilmek için yürütülen çalışmanın ana kütlesini "genç tüketiciler" oluşturmaktadır. Türkiye İstatistik Kurumu (TÜİK) 2024 yılı verilerine göre genç nüfus olarak nitelendirilen 15-24 yaş grubu toplam nüfusun %15,1'ini oluşturmaktadır ki bu rakam 12 milyon 872 bin 39 kişidir (TÜİK, 2024). Basit tesadüfi örnekleme yöntemine göre örnek hacmi belirlenmiştir. Örnek büyüklüğünü hesaplamada Krejcie ve Morgan (1970) çalışmasında ortaya koymuş olduğu formül kullanılmıştır, buna göre:

$$n = \frac{Z^2 . p . (1 - p)}{E^2}$$

n= Örneklem büyüklüğü; Z= %95 güven düzeyine göre Z-değeri; p=popülasyondaki başarı oranı (%50); E=hata payı; N=toplam popülasyon

Yapılan hesaplamalar neticesinde örneğe 384 katılımcının alınmasının yeterli olacağı belirlenmiştir. Anket uygulaması üniversite kampüsü içerisinde kolayda örnekleme yöntemiyle gerçekleştirilmiştir. Kampüs içerisinde rastgele öğrencilere ulaşılarak, gönüllük temelinde ankete katılımları sağlanmış, öğrencilerin özgür iradeleri doğrultusunda anketlere katıldıkları bir süreç izlenmiştir. Saha çalışmasında olası yanlış ya da eksik doldurma gibi geçersiz anketler olma olasılığına karşı ihtiyatlı davranılmış, hesaplanan örnek hacminin üzerinde anket uygulanmasına karar verilmiştir. Ayrıca demografik alt gruplara göre karşılaştırmalar yapılacağından daha anlamlı sonuçların elde edilmesi açısından da önemli olarak görüldüğünden %20 daha fazla anket uygulanmasına karar verilmiş ve 460 anket uygulanmıştır.

Ancak verilerin dijitalleştirilmesinde fark edilen ve analize uygun olmayan 24 anket veri analize dahil edilmemiş, böylelikle veri analizi 436 anket ile gerçekleştirilmiştir.

Saha çalışmasında veri hem yüz yüze anket yöntemiyle hem de dijital anket formları aracılığıyla toplanılmıştır. Anket formu iki bölümden oluşmaktadır. Birinci bölümü katılımcıların demografik bilgilerini belirlemeye yöneliktir. Bu bağlamda yaş, cinsiyet, ortalama gelir, eğitim bölümü ve ikamet ettiği il bilgilerinden oluşmaktadır. İkinci bölümde ise katılımcıların GDO'lu ürünlere yönelik tutum ve davranışlarını belirlemeye yönelik ifadeler yer almaktadır. 34 ifadenin yer aldığı bu bölümde ifadelerin değerlendirilmesi 1-kesinlikle katılmıyorum ile 5-kesinlikle katılıyorum şeklinde 5'li Likert Tipi ölçek kullanılmıştır. Ankette kullanılan ifadeler literatürde yer alan daha önceki çalışmalardan elde edilmiş ve çalışmanın amacına uygun biçimde uyarlaması yapılmıştır. Ankette kullanılan ölçek ifadelerinin oluşturulmasında çeşitli bilimsel çalışmalardan (Chen vd., 2010; Plotnikoff vd., 2010; Macdonell vd., 2013; Wang vd., 2019; Brooks ve Bubela, 2020; Yıldız vd., 2022) faydalanılmıştır.

Veri Analizinde SPSS 27 paket programı kullanılmıştır. Açıklayıcı araştırma türü olan bu çalışmada, özelden genele doğru tümevarım bir yaklaşım benimsenmiş ve hipotezler sınanmıştır.

4. BULGULAR

Ankete katılan 436 kişiyle ilgili özellikler aşağıda yer alan Tablo 1.'de ayrıntılı olarak sunulmuştur. Buna göre araştırmaya katılanların yaş ortalaması 21 olarak hesap edilmiştir. Bu yaş grubu araştırmanın amacını için hedeflemiş olduğu yaş grubudur. Araştırmaya katılanların %57,8'i kadın, %42,2'si ise erkektir. Katılımcıların %47,7'si aylık 55 – 100 bin TL arası aile gelirine sahip bir gruptan oluştururken, %27,5'i 55 bin TL altında ücret düzeyinde geliri bulunmaktadır. Ankete katılan gençlerin eğitim alanlarına göre yapılan sınıflandırmaları neticesinde ortaya çıkan dağılımları ise en fazla katılımcının %23,39 ile Ziraat Fakültesi'nden olduğu hemen ardından %17,89 ile Eğitim Fakültesi öğrencilerinin katılım sağladığı görülmektedir. Ardından sırasıyla İİBF (%16,51), Sosyal Bilimler MYO (%15,60), Fen Edebiyat Fakültesi 41 kişi, Sağlık Hizmetleri MYO 3 kişi ve Fizik Tedavi ve Rehabilitasyon Yüksekokulundan ise 36 kişi ankete katılım sağlamıştır.

Tablo 1. Katılımcıların Özellikleri

		Frekans	**Ortalama**	**Standart Sapma**
Yaş		436	21,21	1,885
		Frekans	**Yüzde**	**Kümülatif Yüzde**
Cinsiyet	Kadın	252	57,8	57,8
	Erkek	184	42,2	100,0
	Toplam	**436**	**100**	
Ailenizin ortalama aylık geliri	0-55.000 TL	120	27,5	27,5
	55.001-100.000 TL	208	47,7	52,3
	100.000 TL üstü	108	24,8	100,0
	Toplam	**436**	**100**	
Bölüm	Ziraat Fakültesi	102	23,39	26,6
	Eğitim Fakültesi	78	17,89	37,6
	İİBF	72	16,51	46,8
	Sosyal Bilimler M.	68	15,60	62,4
	Fen Edebiyat	41	9,41	72,5
	Sağlık Hizmetler M.	39	8,95	89,9
	Fizik Tedavi	36	8,25	100,0
	Toplam	**436**	**100**	

Veri analizine geçilmeden önce hangi istatistik yöntemlerin kullanılacağına karar vermek amacıyla veri setinin çarpıklık ve basıklık değerleri hesaplanmıştır. Bu değerlerin-1.5 ile +1.5 olduğu zaman normal dağılım olduğu kabul edilmektedir (Tabachnick ve Fidell, 2013). Yapılan analizler neticesinde değişkenlerin çarpıklık ve basıklık değerlerinin -0,559 ile 0,298 arasında değiştiği belirlenmiş ve verinin normal dağılım gösterdiğini tespit edilmiştir. O nedenle veri analizinde parametrik testler kullanılmıştır.

Araştırmada kullanılan ölçeğin güvenilirlik analizi için Cronbach's Alpha değerine bakılmıştır. Güvenilirlik düzeyi 0,784 olarak hesap edilmiştir. Güvenilirlik düzeyi yüksek olan veri setine faktör analizi uygulanmasına karar verilmiştir. Çünkü faktör analizi değişkenler arası ilişkilerden hareket ederek verilerin daha anlamlı ve özet biçimde sunulmasını sağlayan bir analiz türüdür. Bu analiz ile çok sayıda değişkenden oluşan ifade setini, korelasyonları yüksek olan gruplara ayırarak ortaya bir faktörün belirlenmesini sağlamakta ve toplam varyansın büyük bir kısmını ortaya çıkan bu az sayıdaki faktörler ile açıklayabilmektedir.

Bu araştırmada 34 ifadeden oluşan ölçek kullanılarak keşifsel faktör analizi gerçekleştirilmiştir. Öz değeri (eigenvalue) 1'den büyük olan ifadeleri gruplandırılması istenilmiştir. Örneklem büyüklüğüne ilişkin Kaiser-Meyer-Olkin (KMO) ve Barlett Küresellik değerleri öncelikli olarak kontrol edilmiştir. KMO testi 0,749 ve Barlett Küresellik Testi ise $X^2(561)=8719,834$, $p<0.001$ olarak hesaplanmış ve örneklem büyüklüğünün faktör analizi için uygun olduğu ortaya konulmuştur.

Principal Component ve rotasyon konverjansı 50 olarak belirlenmiş, rotasyon direct oblimim tercih edilmiştir. Çünkü bu rotasyon metodu faktörler arası korelasyona izin vermektedir. Bu doğrultuda yapılan faktör analizi sonucuna göre toplam varyansın %69,546'sını açıklayan toplam 7 faktörün genç tüketicilerin GDO ürünlere yönelik tutum ve davranışlarını etkilediği ya da belirleyen faktörler olduğu tespit edilmiştir. Bu faktörlerle ilgili incelenen desen matrisindeki ifadeler isimlendirilmiştir. Buna göre toplam varyansın %23,480'ini açıklayan, 6 ifadenin birleşimden oluşan ilk faktör ***"risk ve endişe algısı"*** olarak isimlendirilmiştir. İkinci bileşende 7 ifadenin bir faktörü oluşturduğu ve toplam varyansın %13,463'ünü açıklayan ***"olumlu tutum ve kabul"*** faktörü olarak isimlendirilmiştir. Toplam varyansın %7,847'sini açıklayan ve 4 ifadeden oluşan faktör ***"bilgi düzeyi ve dış etkiler".*** Genç tüketicilerin davranışlarını açıklamak için toplam varyansın %7,704'ünü açıklayan ve 7 ifade bileşeninden oluşan faktör ise ***"kaçınma davranışı"*** olarak isimlendirilmiştir. Toplam varyansın %4,451'ini açıklayan ve 3 ifadeden oluşan faktör ise ***"bilgi eksikliği ve eğitim ihtiyacı"*** faktörüdür. %3,511 varyansı açıklayan ve 3 ifadeden oluşan diğer faktör ise ***"sosyal etkileşim***" ve son olarak toplam varyansın %3,258'ini açıklayan 3 ifadeden oluşan faktör ise ***"etik sorumluluk"*** faktörü olarak isimlendirilmiştir. Bu faktörler ve faktörlere yüklenen ifadelerin içeriğini gösteren Tablo 2. Aşağıda verilmiştir.

Tablo 2. Faktör İfadeleri İçeriği ve Faktörlerin Tematik İsimleri

Faktör	Faktöre Yüklenen İfadelerin İçeriği	Faktör İsmi
1	GDO'ların sağlık ve çevresel risklere dair endişeler, uzun vadeli etkiler, güven eksikliği	Risk ve Endişe Algısı
2	GDO'ların faydaları, tarımsal verimlilik, olumlu tutum ve politik destek	Olumlu Tutum ve Kabul
3	GDO'lara ilişkin bilgi sahibi olma, medyanın etkisi ve etiketlemeye yönelik beklentiler	Bilgi Düzeyi ve Dış Etkiler
4	GDO'lu ürün tüketiminden kaçınma, sağlık ve çevre endişeleri, alternatif arayışları	Kaçınma Davranışı
5	Bilgi eksikliği, kamu eğitimi ihtiyacı, karar verme sürecinde ortaya çıkan belirsizlikler	Bilgi Eksikliği ve Eğitim İhtiyacı
6	Sosyal çevrenin etkisi, aile ve arkadaşlar ile görüş alışverişinde bulunma isteği	Sosyal Etkileşim
7	Akademik çalışmalara güven, sağlıkla ilgili etiksel kaygılar, hükümetin GDO'lu ürünler ile ilgili düzenleyicilik rolü	Etik Sorumluluk

Araştırmanın bu bölümünde katılımcıların demografik özelliklerine göre aile geliri, cinsiyet ve eğitim alanı değişkenlerine göre GDO'lu ürünlere yönelik ortaya çıkan faktörlere göre anlamlı farklılıkların olup olmadığına bakılmıştır.

Cinsiyet değişkenine göre GDO'lu ürünlere yönelik tutum ve davranışlarında farklılığı tespit etmek amacıyla ***bağımsız örneklem t-testi*** uygulanmıştır. Test sonuçlarına göre risk ve endişe algısı, bilgi düzeyi ve dış etkiler, kaçınma davranışı, bilgi eksikliği ve eğitim ihtiyacı, sosyal etkileşim ve etik sorumluluk faktörlerine göre Kadın ve Erkek katılımcılar arasında herhangi bir tutum ve davranış farklılığı görülmemiştir. Ancak olumlu tutum ve kabul faktöründe gruplar arası farklılık olduğu görülmüştür. Varyans homojenliğinin sağlanıldığı Levene testine (p> .01) göre belirlenmiştir. Tablonun çift kuyruk anlamlılık değerinin 0,028, p<0,05 olduğu görülmüştür. Kadın katılımcıların olumlu tutum ve kabul ortalamalarının (2,7404) erkek katılımcılarının oranından (3,0807) daha düşük olduğu belirlenmiştir. Cohen's d etki büyüklüğü testi sonucu ise .876 gibi büyük ve güçlü bir etkinin olduğu ve bu iki grup arasında fark edilebilecek düzeyde bir farklılık olduğunu göstermiştir.

Ailenin ortalama geliri ile GDO'lu ürünlere yönelik tutum ve davranışlarında farklılık olup olmadığını belirlemek için ***tek yönlü varyans (ANOVA)*** testi uygulanmıştır. Ailenin ortalama geliri ile GDO'lu ürünlere yönelik tutum ve davranışlarındaki risk ve endişe algısı, [F(2, 433) = 2.36, p=.095], kaçınma davranışı [F(2, 433) =2.00, p=.136] ve sosyal etkileşim [F(2, 433) =1.33, p=.265] faktörlerine göre gruplar arasında anlamlı bir farklılık bulunmamıştır.

Olumlu tutum ve kabul F(2, 433) = 8.83, p < .001; bilgi düzeyi ve dış etkiler F(2, 433) = 4.93, p = .008; bilgi eksikliği ve eğitim ihtiyacı F(2, 433) = 10.70, p < .001 ile etik sorumluluk F(2, 433) = 3.97, p = .020 faktörlerine göre gruplar arasında anlamlı farklılık olduğu tespit edilmiştir.

Levene test sonuçlarına göre varyansların homojenliğinin sağlanamadığı durum için post-hoc olarak Games Howell; varyans homojenliğinin sağlandığı durum için ise post-hoc test olarak Tukey testi tercih edilmiştir.

Aylık gelir düzeyi yüksek olarak kabul edilen 100.000 TL ve üzeri gelir grubu diğer gelir gruplarına göre daha düşük düzeyde olumlu tutum ve kabul göstermektedir. Aynı şekilde bilgi düzeyi ve dış etki faktörüne göre de diğer gruplara göre daha düşük düzeydedir. Bilgi eksikliği ve eğitim ihtiyacı düşük gelir grubunda yer alan (0-55.000 TL) genç tüketicilerin anlamlı derecede daha yüksek olduğu belirlenmiştir. Düşük gelir grubunda yer alan bireylerin etik sorumluluk algısı, yüksek gelir grubundaki bireylere göre daha düşüktür.

Genç tüketicilerin eğitim aldıkları bölüm ile GDO'lu ürünlere yönelik tutum ve davranışları arasındaki farklılığı tespit etmek için ***tek yönlü varyans (ANOVA)*** analizi uygulanmıştır. Değişkenler arasında istatistiki olarak anlamlı bir farklılık bulunmamıştır. Her ne kadar p>0.05 olsa da ortalama değerlere bakıldığında bazı fakülteler arasında belirgin eğilim farklılıkları gözlenmektedir. Özellikle Sağlık Bilimleri Meslek Yüksekokulu ve Ziraat Fakültesi öğrencilerinin, *olumlu tutum ve kabul (OTK)* ile *bilgi eksikliği ve eğitim ihtiyacı (BEEI)* boyutlarında diğer fakültelere kıyasla daha yüksek ortalamalara sahip olduğu görülmektedir. Bu durum, sağlık alanında eğitim alan bireylerin GDO'lu ürünlere ilişkin konulara daha duyarlı veya bilinçli yaklaşabileceğini düşündürmektedir. Diğer yandan, İktisadi ve İdari Bilimler Fakültesi öğrencilerinin birçok boyutta daha düşük ortalamalara sahip olması, bu gruptaki bireylerin GDO konusuna daha mesafeli ya da eleştirel bir tutum sergilemiş olabileceğini düşündürmektedir. Bu bulgular, GDO'lu ürünler konusundaki tutumların sadece bireysel

faktörlerle değil, aynı zamanda eğitimin alanına ve içeriğine bağlı olarak da şekillenebileceğini ortaya koymaktadır.

5. SONUÇLAR

Bu çalışma genç tüketici olarak kategorize edilen 18-24 yaş grubu bireyleri Genetiği Değiştirilmiş Organizmalara (GDO) yönelik tutum ve davranışını belirlemeye yönelik gerçekleştirilmiş, keşifsel bir çalışmadır. Genç tüketiciler geleceği tüketimi şekillendirmesi açısından önemli bir pazar bölümüdür. Gençler henüz kariyerlerinin başından, büyük çoğunlukta aile kurmamış bireylerdir. Bu durum gençlerin tüketim alışkanlıklarının nasıl ve ne yönde olabileceğine dair önemli bilgiler vermektedir. Gençlerin tercihleri, alışkanlıkları, bilgi düzeyleri ve tutumları gelecekteki pazar trendlerini belirlemede önemli değişkenlerdir. Bu nedenle gençlerin davranışlarını incelemek gelecekteki pazarlama stratejilerinin belirlenmesinde ve şekillendirilmesinde kritik rol oynamaktadır. Çalışmanın neticesinde elde edilen bulgular doğrultusunda oldukça dikkat çekici sonuçlar elde edilmiştir. Bu sonuçların GDO'lu ürünlere yönelik politikaların geliştirilmesinde, yasal mevzuatın düzenlenmesinde ve tüketiciler ile kurgulanacak iletişim stratejilerinin belirlenmesinde ve yön verilmesine etki edebilecek düzeydedir.

Araştırmada sahadan toplanan veriye uygulanan keşifsel faktör analizi sonucunda, GDO'lu ürünlere yönelik genç tüketicilerin tutum ve davranışını etkileyen ve belirleyen 7 faktör ortaya çıkmıştır. Faktör yükleri ve bu faktörlere yüklenen ifadelerin içerikleri incelenmiş ve tematik olarak adlandırılmıştır.

Genç tüketicilerin *risk ve endişe algısı* faktörüne göre bu ürünlerin başta sağlık olmak üzere, çevreye olası etkileri ile uzun vadedeki belirsizlikleri ve bilinmezlikleri konusunda bu tüketici kitlesinin endişelerini ortaya koymaktadır. O nedenle bu tüketicilerin GDO'ya karşı daha temkinli bir yaklaşım benimsemesine etki ettiği söylenebilir. Bu durum karşısında bakanlıklar düzeyinde (Sağlık ve Tarım Orman Bakanlıkları) eğitim yayım faaliyetleri çerçevesinde ve hatta üniversitelerin de dahil olabileceği oluşumlar ile bilgilendirme ve iletişim kampanyalarının yapılması bu tüketicilerin endişeleri bertaraf etmede faydalı olabilecektir. Bir diğer faktör olan bilgi düzeyi ve dış etkiler faktörüne göre genç tüketiciler kendilerinde bilgi eksikliği hissettiklerini göstermektedir. Bu kitle medya başta olmak üzere ürün etiketlemelerinden de etkilenmektedir. O nedenle bu kitlenin tutum ve davranışını GDO'lu ürün lehine etkileyebilmek için medyanın güçlü bir araç olarak kullanılır hale getirilmesi, tarafsız dijital bilgi platformları ile bu gençlere ulaşılması faaliyetlerinde bulunmak faydalı olabilecektir.

Çalışma sonuçlarına göre çıkan önemli bir faktörde GDO'lu ürünlerin bilinçli olarak tercih edilmemesini içeren *kaçınma davranışı* faktörüdür. Buna göre genç tüketiciler etiketleri incelemekte, alternatif ürün arayışına girmektedir. Genç tüketicilerin davranışlarında risk algısının doğrudan etkisinin olduğunu ortaya koymaktadır. O nedenle gençlerin risk olarak görmüş oldukları durumların (sağlık, çevre riski gibi) ortadan kaldırılması bu tüketici kitlesinin olumlu yönde ikna edilmesine etki edeceği öngörülebilir.

Genç tüketiciler *bilgi eksikliğinin* tutum ve davranış gelişimi üzerinde olumsuz etkisinin olduğunu belirtmektedirler. O nedenle bu kitleye neden GDO'lu ürün tercih edilebileceği?

Risklerinin neler olduğu? gibi konularda daha şeffaf ve akılcı yöntemler ile bilgi sağlanması gerekmektedir.

GDO'lu ürünler ilgili kararların sosyal çevreden ve aileden etkilendiğine dair bir başka faktörün varlığı söz konusudur. Gençlerin GDO'ya karşı tutum ve davranışlarının gelişmesinde sosyal çevrenin etkisinin olduğu görülmektedir.

Son bir faktör olarak ise GDO'lu ürünlerle ilgili düzenlemelerin, bilimsel denetimin ve etik sorumlulukların yeterliliği sorgulanmaktadır. O nedenle etik kurul raporlarının kamuya açık hale getirilmesi, tarım ve gıda politikaları konularında sivil toplum örgütleriyle iş birliklerinin geliştirilmesinin konunun geniş kitlelerce kabulü noktasında önemli etkileri olabilecektir.

Genç tüketiciler, GDO'lu ürünlerin faydalarını gören akılcı ve yenilikçi bir bakış açısı içermesi nedeniyle olumlu tutum ve kabul davranışı sergileyebilme potansiyeli olan ve bilinçli olduğu görülen bir tüketici kitlesi olarak görülmelidir.

Araştırmada elde edilen bir diğer önemli sonuç ise kadınların, erkek katılımcılara göre olumlu tutum ve kabul davranışı gösterme durumlarının daha düşük olduğudur. Bu durum kadınların daha rasyonel ve daha fazla koruyucu güdüsü içerisinde olma özellikleri ile anlaşılabilir. O nedenle GDO'lu ürünlerin kullanılması ya da tüketilmesinde daha temkinli olduklarını göstermektedir.

Ailenin ortalama gelirine göre değerlendirildiğinde yüksek gelir grubu (100.000 TL ve üzeri) katılımcıların diğer gelir gruplarına göre GDO'lu ürünlere karşı olumlu tutum ve kabul davranışı daha düşük düzeydedir. Yüksek gelir düzeyinde aile geliri olan katılımcıların tüketim konusunda daha çok bildikleri ve güvendikleri ürün grubunu tercih ettiği, henüz bilmediği, risklerini öngöremediği ürünlere karşı daha temkinli olduğu sonucuna ulaşabiliriz. Yine aynı gelir grubu aile mensubu katılımcıların bilgi düzeyi ve dış etkiler konusunda da diğer gruplara göre daha düşük düzeyde olduğu görülmektedir. Bu katılımcıların GDO'lu ürünlere karşı çevresel etkilere daha az duyarlı olduğunu ve GDO'lu ürünleri kabulünü sınırlandırdığı düşünülmektedir.

Düşük gelirli aile bireylerinin GDO'lu ürünlere yönelik tutum ve davranışlarının gelişmesinde bilgi eksikliği yaşadıkları ve eğitim ihtiyaçlarının diğer gelir grubundaki bireylere göre daha fazla olduğu sonucuna ulaşılmıştır. Yüksek gelirli aile bireylerinin, etik sorumluluk bilincinin daha yüksek olduğu, bu gruptaki bireylerin çevresel ve toplumsal etkiler konusunda daha bilinçli olduklarını göstermektedir. O nedenle düşük gelir grubundaki kişilerin daha fazla bilgilendirilmesine yönelik çaba ve faaliyetlere girilmesinin gerekliliği ortaya çıkmaktadır. Çalışmanın üniversite öğrencileriyle birlikte yapılmış olması, homojen bir örnek oluşturması nedeniyle, tanımlayıcı istatistiklerde de görüldüğü üzere katılımcıların büyük bir kısmı (%75,2) düşük ve orta gelirli aile bireyleri olması nedeniyle, bahsi geçen bilinçlendirme faaliyetlerin önemi daha fazla ortaya çıkmaktadır.

GDO'lu ürünlere yönelik tutumların fakültelere göre farklılaştığını, ancak bu farklılığın istatistiksel olarak anlamlı olmasa da belirli bir eğilim oluşturduğu belirlenmiştir. Özellikle sağlık ve ziraat ile ilgili alanlarda eğitim alan öğrencilerin daha bilinçli ve olumlu tutumlar sergilemesi, bu alanlarda verilen eğitimin bilgi düzeyini ve tutumları etkileyebileceğini ortaya koymaktadır. Buna karşın sosyal bilimler ve idari bilimler alanlarında daha düşük tutum ortalamalarının gözlemlenmesi, bu alanlarda konunun yeterince işlenmediğini

düşündürmektedir. Bu doğrultuda, GDO'lu ürünler gibi toplum sağlığını, çevreyi ve etik değerleri doğrudan etkileyen konuların fakülteler arası ortak derslerle veya müfredat içi entegre modüllerle daha kapsayıcı bir şekilde ele alınması bu alanlarda eğitim alan bireyler açısından fayda sağlayacaktır. Ayrıca, üniversitelerde düzenlenecek bilgilendirici seminerler, çalıştaylar ve paneller ile öğrencilerin konu hakkında daha fazla bilgi edinmesi ve bilinçli tutum geliştirmesi teşvik edilmelidir. Böylece öğrenciler GDO konusunda daha bütüncül ve bilinçli bir şekilde yaklaşabilecek ve değerlendirebileceklerdir.

Yapılan araştırmalar (Konar vd., 2014) genç tüketicilerin GDO'lara yönelik tutumlarının, demografik değişkenlerle ilişkili olarak anlamlı farklılıklar gösterip göstermediğini doğrulamakta ve bu durum, tüketici davranışlarının anlaşılmasında önemli bir katkı sunmaktadır. Yürütülen bu çalışmanın sonuçları da bu paralelde olup, demografik değişkenlere göre farklılıklar söz konusu olmaktadır.

Gelecekte bu alanda yapılacak çalışmalarının gerek hedef kitle seçimi gerekse de farklı değişkenler modele eklenerek kapsamının genişletilmesi farklı sonuçların elde edilmesine katkı sağlayabilecektir. GDO konusunun çok farklı disiplinler ile iç içe bir konu olması nedeniyle, farklı alanlarda ortaklaşa yürütülecek çalışmalara ihtiyaç duyulduğu görülmektedir. Ayrıca GDO konusu yerli literatürde daha fazla işlenmesi gereken bir konu olarak görülmektedir. Bu durum ankete katılanların bilgi eksikliği ve eğitim ihtiyacı faktöründen de belli olmaktadır. O nedenle akademik camianın bu alana daha fazla yoğunlaşması bilimsel bilgi açısından önem arz etmektedir.

Sonuç olarak, yürütülen bu araştırma GDO konusunda tüketici algısının yalnızca bilimsel olmadığı aynı zamanda psikolojik, sosyolojik ve etik boyutları da içerdiği ortaya konulmuştur. Bu nedenle karar vericilerin belirleyeceği stratejilerin çok yönlü, katılımcı ve en önemlisi güven inşa eden bir yapıda olması gerekmektedir.
