ABSTRACT

In this study, the antifungal activity of methanol and hexane extracts obtained from the aerial parts of *Pteridium aquilinum* (bracken fern) was evaluated against the major plant pathogen *Monilinia fructigena*. The plant extracts were applied at concentrations of 0 (control), 0.5, 1, and 2 mg/mL. A negative control and a commercial fungicide containing 80% Thiram were used as reference treatments to assess the effectiveness of the extracts.

According to the results, the methanol extract inhibited the mycelial growth of *M. fructigena* by 19.40%, 26.16%, and 50.85% at doses of 0.5, 1, and 2 mg/mL, respectively. The hexane extract, on the other hand, inhibited fungal growth by 12.89%, 19.05%, and 28.68% at the same concentrations. These findings indicate that the methanol extract exhibited stronger antifungal activity compared to the hexane extract.

In conclusion, plant-derived natural antifungal compounds show promise as eco-friendly and cost-effective alternatives for the control of plant pathogens and could contribute to the development of biopesticides in sustainable agriculture.

Key words: Antifungal activity, Plant extracts, *Pteridium aquilinum, Monilinia fructigena*

1. INTRODUCTION

With the rapid increase in global population, the need to obtain higher yields and better-quality products from limited agricultural land has intensified. To meet this demand, various strategies have been developed to combat harmful organisms, among which chemical control remains the most widely adopted and effective approach. However, cultural and biological control methods are also considered important alternatives (Türküsay & Onoğur, 1996). In recent years, concerns about environmental pollution and disruptions to ecological balance have been increasingly associated with the excessive and improper use of synthetic pesticides.

The antifungal properties of plants are primarily attributed to the volatile oils and phenolic compounds naturally present in their structures. A significant relationship has been established between the chemical composition of these volatile oils and their antifungal efficacy (Cooner & Beuchat, 1984). Plant-derived pesticides are suggested to be more economical than synthetic ones, as they can be cultivated and applied by growers themselves and are considered environmentally friendly, making them suitable for use in integrated pest management programs (Lovang & Wildt-Persson, 1998).

Among the major fungal pathogens affecting fruit production worldwide are species of *Monilinia*, which are well-known for causing brown rot. Of particular importance are *Monilinia fructigena*, *M. fructicola*, and *M. laxa*, which are responsible for blossom blight, twig blight, and brown fruit rot in fruit trees and ornamental plants (Petróczy et al., 2012). *Monilinia fructigena* specifically leads to considerable losses in fruit yield and quality. While chemical fungicides are commonly used for the control of this pathogen, the adverse effects of synthetic chemicals on human health and the environment have prompted the search for alternative and more sustainable control methods. One such method involves the use of plant extracts.

Pteridium aquilinum (bracken fern) is a perennial plant with a wide global distribution. It is a non-flowering species commonly found along the coastal regions of Anatolia and in forest clearings (Özkara et al., 2003; Eslava-Silva et al., 2023). This plant contains various phenolic acids and exhibits antimicrobial activity against several important plant pathogens, including *Fusarium oxysporum* f.sp. *lycopersici*, *Sclerotinia sclerotiorum*, *Botrytis cinerea*, *Rhizoctonia solani*, *Pythium* spp., *Corynebacterium* spp., and *Erwinia* spp. (Francisco & Cooper-Driver, 1984; Yılar et al., 2019). Moreover, aqueous leaf extracts of bracken fern have been reported to inhibit seed germination, hypocotyl elongation, and root growth in several vegetable species (Wang et al., 2011).

The aim of this study is to evaluate the contact antifungal activity of methanol and hexane extracts derived from the aerial parts of *Pteridium aquilinum* against *Monilinia fructigena*, a major pathogen responsible for significant yield and quality losses in fruit production.

2. MATERIALS AND METHODS

Plant Material

The plant material used in this study, *Pteridium aquilinum*, was collected from Tokat (Turkey) during its vegetative growth period. The harvested plant samples were dried in a shaded

environment and subsequently ground into a fine powder. The powdered plant material was stored in airtight containers until extraction.

Preparation of Plant Extracts

A total of 100 grams of powdered plant material was placed into separate 1-liter Erlenmeyer flasks. Methanol was added to each flask in sufficient quantity to cover the plant material completely. The mixtures were shaken on an orbital shaker at 120 rpm for 72 hours at room temperature. The resulting solutions were filtered through Whatman filter paper, and the methanol solvent was evaporated using a rotary evaporator at 40 °C. The residual dry extracts were dissolved in 50% aqueous acetone and adjusted to final concentrations of 0.5, 1, and 2 mg/mL for further bioassay applications.

In Vitro Antifungal Activity Assay

Potato Dextrose Agar (PDA) was prepared and sterilized by autoclaving, then cooled to 40 °C. The prepared plant extracts were incorporated into the sterile PDA to yield final concentrations of 0.5, 1, and 2 mg/mL. The medium was poured into 60 mm diameter Petri dishes to a uniform depth of approximately 10 mm. Mycelial discs (5 mm in diameter), excised from 7-day-old cultures of the test fungus (Monilinia fructigena), were placed at the center of each plate. The inoculated plates were incubated at 25 ± 2 °C for 7 days. Fungal growth was measured daily, and mycelial diameters were recorded for each treatment . The percentage inhibition of mycelial growth was calculated using the formula described by Pandey et al. (1982):

$I = 100 \times (dc - dt) / dc$

I = Percentage inhibition of mycelial growth

dc = Mycelial growth in control

dt = Mycelial growth in treatment

A commercial fungicide containing 80% Thiram was used as a positive control. The experiment was conducted using a completely randomized design with three replications and two repetitions per treatment.

3. RESULTS AND DISCUSSION

In this study, the antifungal effects of methanol and hexane extracts of *Pteridium aquilinum* against *Monilinia fructigena* were evaluated under in vitro conditions, and the results are presented in Table 1. A significant correlation was observed between the applied concentrations and the inhibition rates of mycelial growth. The data indicate that both extracts inhibited the mycelial growth of *M. fructigena* in a dose-dependent manner. The methanol extract exhibited inhibition rates of 12.89%, 19.05%, and 28.68% at concentrations of 0.5, 1, and 2 mg/mL, respectively. In comparison, the hexane extract demonstrated a stronger antifungal activity, resulting in inhibition rates of 19.40%, 26.16%, and 50.85% at the same concentrations.

Table 1. Inhibition rates (%) of *Pteridium aquilinum* methanol and hexane extracts on *Monilinia fructigena* mycelial growth

Concentration (mg/mL)	Hexane Extract (%)	Methanol Extract (%)
C− (Negative Control)	0.00 ± 0.00^{e}	0.00 ± 0.00^{d}
C+ (Positive Control, 80% Thiram)	100.00 ± 0.00^{a}	100.00 ± 0.00^{a}
0.5	19.40 ± 1.55^{d}	12.89 ± 2.81^{cd}
1.0	26.16 ± 0.46^{c}	19.05 ± 2.04^{bc}
2.0	50.85 ± 1.01^{b}	28.68 ± 2.15^{b}

Values followed by different letters within the same column indicate statistically significant differences ($p < 0.05$).

These findings suggest that while both extracts possess antifungal activity against *M. fructigena*, the hexane extract is notably more effective, especially at higher concentrations. This may be attributed to the differential solubility and extraction of bioactive compounds in non-polar versus polar solvents, with hexane possibly extracting more potent lipophilic antifungal compounds from *P. aquilinum*. These results highlight the potential of plant-based extracts, particularly from ferns such as *P. aquilinum*, as environmentally friendly alternatives to synthetic fungicides in the management of brown rot in fruit production systems.

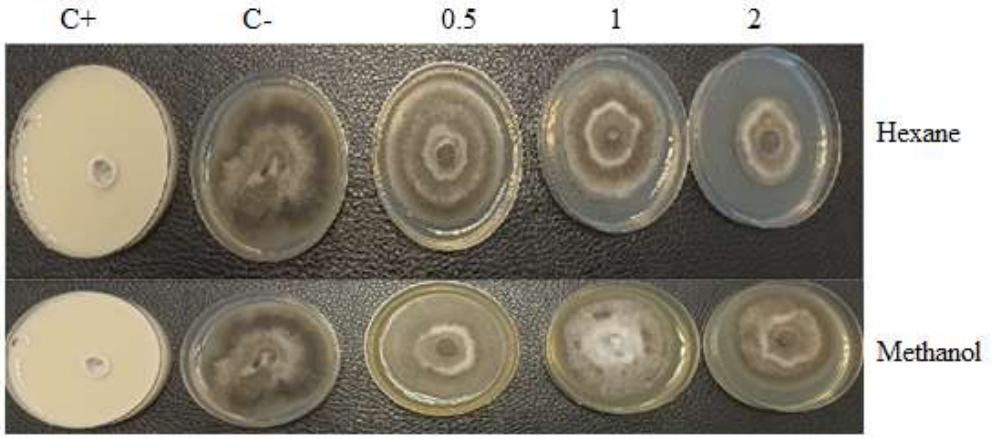

Figure 1. Effect of *Pteridium aquilinum* methanol and hexane extracts on *Monilinia fructigena* mycelial growth

The results demonstrated that the hexane extract exhibited significantly higher antifungal activity compared to the methanol extract, with nearly twice the inhibitory effect at the 2 mg/mL

concentration. This suggests that the non-polar compounds present in the hexane extract are more effective in suppressing *M. fructigena* mycelial development.

The antifungal activity observed in *P. aquilinum* extracts is likely attributed to the presence of secondary metabolites, particularly phenolic compounds known for their antimicrobial properties. These bioactive constituents, including phenolics, flavonoids, and other phytochemicals, play a critical role in the plant's defense mechanisms against pathogens. Furthermore, the plant also exerts allelopathic effects by inhibiting seed germination and the growth of neighboring plant species, thereby playing a significant ecological role (Glassman & Muller, 1978; Francisco & Cooper-Driver, 1984).

P. aquilinum has been shown to exert strong inhibitory effects on other crops, which are believed to be associated with allelochemicals such as selligueain (Jatoba et al., 2016). Previous research has reported that hexane, chloroform, and aqueous extracts of *P. aquilinum* variably inhibited the mycelial growth of *Puccinia arachidis* and *Phaeoisariopsis personata* (Sahayaraj et al., 2009). Additionally, methanol and hexane extracts of *P. aquilinum* have demonstrated antifungal activity against *Fusarium oxysporum* f.sp. *lycopersici* and *Sclerotinia sclerotiorum*, with inhibition rates ranging between 64.22% and 79.48% for *S. sclerotiorum*. For *F. oxysporum* f.sp. *lycopersici*, methanol and hexane extracts inhibited mycelial growth by 73.58% and 83.92%, respectively (Yılar et al., 2019).

In light of these findings, the hexane extract of *Pteridium aquilinum* represents a promising natural source of bioactive antifungal agents against plant pathogens. Considering the growing demand for environmentally friendly and cost-effective alternatives to synthetic pesticides, the integration of such natural compounds in biopesticide development efforts is strongly recommended.

ABSTRACT

This study aimed to evaluate the antifungal effects of methanol extracts obtained from the leaves, seeds, and flowers of *Vitex agnus-castus* against important plant pathogens: *Fusarium oxysporum* f. sp. *melonis* (Fom), *F. oxysporum* f. sp. *cucumerinum* (Foc), and *F. oxysporum* f. sp. *lycopersici* (Fol). The plant extracts were applied at concentrations of 0.5, 1, and 2 mg/mL, and their effects were compared with a negative control and a commercial fungicide containing 80% Thiram as a positive control.

According to the findings, the seed extract exhibited the highest antifungal activity across all tested pathogens. It inhibited mycelial growth of Foc, Fol, and Fom by 59.27%, 59.80%, and 62.81%, respectively. The leaf extract showed moderate antifungal activity, suppressing the mycelial development of Foc, Fol, and Fom by 36.28%, 50.95%, and 39.06%, respectively. The flower extract also demonstrated notable inhibition rates: 50.61% for Foc, 38.14% for Fom, and 52.98% for Fol.

Overall, the results indicate that antifungal activity increased in a dose-dependent manner, with the seed extract being the most effective among the plant parts tested. These findings suggest

that *V. agnus-castus* contains bioactive compounds with antifungal potential and could serve as a promising source of eco-friendly and sustainable biopesticides for the management of plant diseases.

Keywords: *Vitex agnus-castus*, *Fusarium oxysporum* spp. Antifungal activity, Plant extracts

VİTEX AGNUS-CASTUS'UN YAPRAK, ÇİÇEK VE TOHUM EKSTRAKTLARININ *FUSARİUM OXYSPORUM* TÜRLERİNE KARŞI ANTİFUNGAL AKTİVİTE AÇISINDAN KARŞILAŞTIRMALI DEĞERLENDİRİLMESİ

ÖZET

Bu çalışma, *Vitex agnus-castus* bitkisinin yaprak, tohum ve çiçek organlarından elde edilen metanol ekstraktlarının önemli bitki patojenlerinden *Fusarium oxysporum* f. sp. *melonis* (Fom), *F. oxysporum* f. sp. *cucumerinum* (Foc) ve *F. oxysporum* f. sp. *lycopersici* (Fol) üzerindeki antifungal etkilerini belirlemeyi amaçlamaktadır. Bitki ekstraktları, 0.5, 1 ve 2 mg/mL konsantrasyonlarında uygulanmış; değerlendirmelerde negatif kontrol ve %80 Thiram içeren ticari bir fungisit pozitif kontrol olarak kullanılmıştır.

Araştırma bulgularına göre, tohum ekstraktı tüm patojen türlerine karşı en yüksek antifungal etkiyi göstermiştir. Foc, Fol ve Fom'un miselyum gelişimi tohum ekstraktı ile sırasıyla %59,27, %59,80 ve %62,81 oranlarında inhibe edilmiştir. Yaprak ekstraktı ise orta düzeyde etki göstererek Foc, Fol ve Fom'un miselyal gelişimini sırasıyla %36,28, %50,95 ve %39,06 oranlarında baskılamıştır. Çiçek ekstraktı da dikkate değer bir antifungal etki sergilemiş; bu etki Foc için %50,61, Fom için %38,14 ve Fol için %52,98 olarak ölçülmüştür.

Elde edilen veriler, antifungal etkinin uygulanan doza bağlı olarak arttığını ve özellikle tohum ekstraktının *Fusarium oxysporum* patojenlerine karşı diğer bitki kısımlarından elde edilen ekstraktlara kıyasla daha güçlü bir inhibitör etki gösterdiğini ortaya koymuştur. Bu sonuçlar, *V. agnus-castus* bitkisinin doğal antifungal bileşikler bakımından zengin bir kaynak olabileceğini ve bitki hastalıklarıyla mücadelede çevre dostu biyopestisitlerin geliştirilmesinde potansiyel bir aday olduğunu göstermektedir.

Anahtar Kelimeler: *Vitex agnus-castus, Fusarium oxysporum* spp. Antifungal aktivite, Bitki ekstraktı

1.GİRİŞ

Tarımsal alanlarda ürünleri bozan hastalıklar, zararlılar ve yabani otlar önemli kayıplara neden olmaktadır. Patojenik mantarlar, bitkilerde hasat sonrası da dahil olmak üzere gelişim aşamalarında değişikliklere neden olan ana enfeksiyon etkenleridir. Meyve ve sebzelerde, görünüş, besin değeri, organoleptik özellikler ve sınırlı raf ömrü ile ilgili kalite sorunlarına neden olan çok çeşitli mantar cinsleri vardır (Agrios, 2004). Buna ek olarak, bazı durumlarda mantarlar mikotoksin veya alerjen üretimi nedeniyle tüketiciler arasında alerjik veya toksik bozukluklardan dolaylı olarak sorumludur. Genellikle fitopatojen funguslar sentetik fungisitlerle kontrol edilmektedir (Harris, vd., 2001). Ancak bugüne kadar yapılan çalışmalar, artan pestisit kullanımının çeşitli sorunlara neden olduğunu ortaya koymuştur. Pestisitlerin insan sağlığı ve çevre üzerindeki zararlı etkileri nedeniyle bunların kullanımı giderek kısıtlanmaktadır (Harris, vd., 2001). Bunun yanında; artan üretim talebi ve tarımsal kimyasalların kullanımına ilişkin düzenlemeler ve kullanılan kimyasallara dirençli patojenlerin ortaya çıkması, yeni aktif moleküllerin ve yeni kontrol stratejilerinin araştırılmasını ve uygulanmasını gerekli kılmaktadır. Antik çağlardan bu yana, bitkiler alemi analjezikler, anti-enflamatuarlar, astım ilaçları ve diğerleri gibi bilinen terapötik özelliklere sahip çeşitli bileşikler sağlamıştır. Son yıllarda, bitki özlerinin antimikrobiyal özellikleri dünyanın farklı bölgelerinden artan sıklıkta rapor edilmektedir (Cowan, 1999). Bitki metabolitleri ve bitki bazlı ilaçların sentetik pestisitlere kıyasla insan sağlığına ve çevreye daha az zararlı olduğu düşünülmekte ve bu yönde çalışmalar yapılmaktadır (Kordali ve ark., 2007). Bu nedenle çeşitli bitki ekstraktlarının ve uçucu yağların bitki hastalıkları üzerindeki etkileri üzerine yapılan çalışmalar ön plana çıkmıştır. Türkiye coğrafi konumuna bağlı olarak Akdeniz, İran-Turan ve Avrupa-Sibirya bölgesi olmak üzere 3 temel fitocoğrafik bölgeye ayrılır (Doğan ve Mert, 1998). Bu nedenle bitki çeşitliliği ve endemizm açısından oldukça zengindir. Akdeniz lemur vejetasyonunun tipik bir elemanı olan Vitex agnus-castus L, Verbenaceae familyasından çok yıllık bir bitkidir (Anonim, 2015). Ancak son sınıflandırmada Lamiaceae familyasına dahil edilmiştir (Asdadi ve ark., 2014). Hayıt, acı ayıt, hayıd, beş parmak otu gibi çeşitli isimlerle anılan Vitex agnus-castus, kıyılarda ve kayalık arazilerde yetişen çalı, nadiren küçük ağaç formunda bitkilerdir (Anonim, 2015). Vitex agnus-castus bitkisinin tıpta yaraların ve basurların iyileştirilmesinde kullanıldığına dair bilgilerin geçmişi en az yıllar öncesine kadar uzanmasına rağmen (Chantaranothai, 2011), günümüzde farklı kısımları adet söktürücü, spazmodik dismenore, menopasual durumlar, yetersiz emzirme ve akne gibi bazı rahatsızlıkların iyileştirilmesinde kullanılmaktadır (Maltaş ve ark., 2010). Ayrıca, Vitex agnus-castus'un uçucu yağ ve bitki ekstraktlarının antioksidan, antimikrobiyal ve antifungal aktiviteleri bildirilmiştir. Ayrıca Vitex agnus-castus tohumlarından elde edilen uçucu yağın Candida türleri üzerinde güçlü bir antifungal aktivite gösterdiği (Asdadi vd., 2014) ve yedi bakteri türünü içeren Vitex agnus-castus metanol ekstraktlarının Candida albicans mantarına karşı antimikrobiyal etkiye sahip olduğu bildirilmiştir (Maltaş vd., 2010). Bitki methanol ekstraktının önemli bitki patojeni funguslar olan *Alternaria. solani, Rhizoctonia solani, Sclerotinia sclerotiorum* türleri üzerine antifungal aktiviteleri rapor edilmiştir (Yılar ve ark., 2015). Bu çalışma ile Türkiye'de normal olarak yetişen Vitex agnus-castus bitkisinin metanol ekstraktlarının, tarımsal üretimde önemli kayıplara yol açan Foc, Fom ve Fol bitki patojenleri üzerindeki antifungal aktivitesi ortaya konmuştur.

2. MATERYAL VE METOD

2.1. Bitki Materyali

Denemelerde kullanılan *Vitex agnus-castus* bitki materyali Antalya ilinden toplanmıştır. Toplanan bitkiler Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi, Bitki Koruma Bölümü Laboratuvarında oda sıcaklığında kurutulmuş ve elektrikli değirmende öğütülmüşlerdir. Öğütülen bitki materyalleri denemeler kuruluncaya kadar oda sıcaklığında gölgede kağıt torbalar içerisinde muhafaza edilmişlerdir.

2.2. Bitki methanol ekstraktının Hazırlanması

100 g öğütülmüş bitki materyali 1L Erlenmeyere konmuş ve üzerine 600 mL metanol ilave edilmiştir. Bu çözeltiler oda sıcaklığında 24 saat boyunca orbital çalkalayıcıda tutulmuştur. Bu süre sonunda filtre kağıdından süzülen ekstrakt katı hale gelene kadar 32°C'de evaporatör methanol uzaklaştırılmıştır. Kalan katı madde DMSO çözeltisi ile çözülerek farklı konsantrasyonda dozlar elde edilmiştir (Kadıoğlu ve Yanar, 2004).

2.3. Fungus kültürlerinin hazırlanması

Bitki patojeni funguslar, Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi, Bitki Koruma Bölümü Fitopatoloji laboratuvarında bulunan stoklardan elde edilmiştir. Bu stok kültürlerden elde edilen funguslar 7 gün boyunca 25±2ºC'de, 90 mm'lik petri kaplarında geliştirilmiştir. Denemelerde bu son gelişen taze kültürler kullanılmıştır.

2.4. İn vitro koşullarda bitki methanol ekstraktının antifungal aktivitesi: Methanol ekstraktından elde edilen özüt DMSO-su karışımıyla çözülerek elde edilen stok çözeltiler son konsantrasyon 100, 200 ve 400 ppm olacak şekilde 45-50 ºC'ye kadar soğutulan PDA ortamlarına ilave edilmiştir (Onaran and Yılar, 2012). Kontrol olarak, funguslar sadece PDA içeren petri kaplarına ekimi yapılmıştır. Ayrıca denemelerde pozitif kontrol olarak Thiram etkili maddeli bir fungusit kullanılmıştır. Farklı dozlardaki bu PDA ortamları 60 mm çaplı petri kaplarına 10 ml olacak şekilde dökülmüştür. Denemelerden 7-10 günlük önce geliştirilmiş bitki patojeni kültürlerinde alınan 5 mm çaplı miselyum diskleri ekstrakt ilaveli PDA ortamı içeren petri kaplarına ekimi yapılmıştır. Fungus kültürleri inokulasyondan sonra gelişme kabininde 25±1ºC'de7 gün boyunca inkubasyona bırakılmıştır (Yılar ve ark., 2020, Yılar ve ark., 2023). Bu çalışma 4 tekerrürlü olarak 2 defa tekrarlanmıştır. Petri kaplarındaki gelişen miselyum çapları digital Caliper aleti ile ölçülmüştür. Ekstraktların miselyum gelişmesi engelleme yüzdesi aşağıdaki formüle göre hesaplanmıştır:

I:100x(dc-dt)/dc

I:Yüzde miselyum gelişimi engelleme oranı

dc: Kontroldeki miselyum gelişimi

dt: Uygulamadaki miselyum gelişimi(Pandey et al., 1982)

3. BULGULAR ve TARTIŞMA

Vitex agnus-castus bitki methanol ekstraktının önemli bitki patojeni *Fusarium* türleri üzerine antifungal aktivite sonuçları Çizelge ve grafiklerle verilmiştir. Buna göre bitki methanol ekstraktları uygulanan doza, bitki kısmına ve *Fusarium* türlerine bağlı olarak değişen oranlarda antifungal aktivite sergilemiştir. Bitki çiçek methanol ekstraktı en yüksek konsantrasyonda(400ppm) ey yüksek engelleyici etkiyi Fol miselyum gelişimi üzerine göstermiş olup, bunu Foc ve Fom izlemiştir (Çizelge 1, Grafik 1). Benzer sonuçlar Bitki yaprak ve tohum ekstraktlarında da görülmüştür. Nitekim, bitki yaprak ekstraktı kontrole kıyasla %50,95 engelleme oranı ile en yüksek etkiyi Fol üzerine göstermiş, bunu Fom ve Foc takip etmiştir (Çizelge 2, Grafik 2). Bitki tohum ekstraktı diğer ekstraktlara göre fungusların miselyum gelişimi üzerine daha etkili olduğu belirlenmiştir. Buna göre tohum ekstraktı %62,81 engelleme ile en yüksek etkiyi Fom üzerine göstermiş, bunu %59,80 ile Fol ve %59,27 engelleme oranı ile Foc izlemiştir (Çizelge 3, Grafik 3).

Çizelge 1. *Vitex agnus-castus* çiçek methanol ekstraktının *Fusarium* türlerinin miselyum gelişimi üzerine engelleme oranı (%)

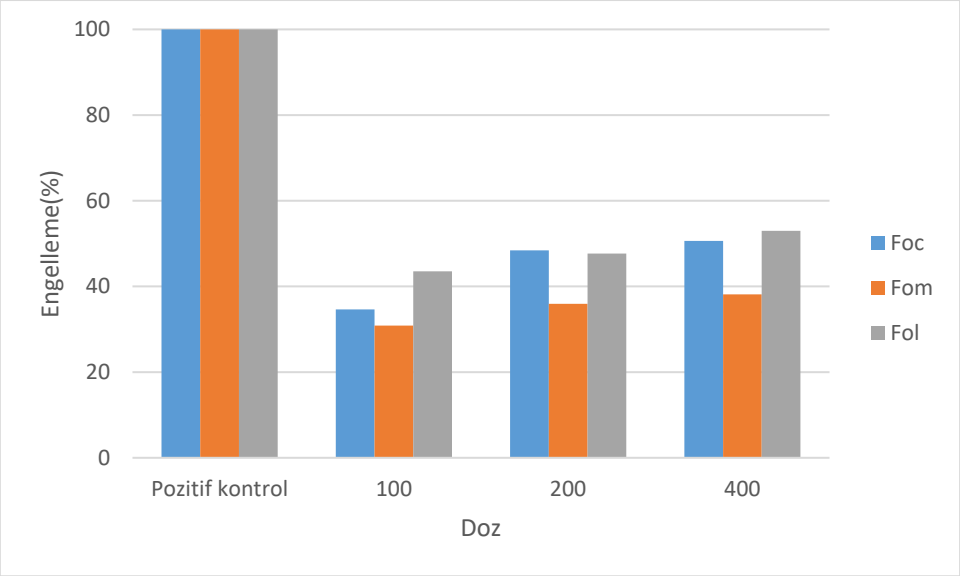
Doz	Foc	Fom	Fol
Pozitif kontrol	100,0a±0,0	100,0a±0,0	100,0a±0,0
Kontrol	0,0 d±0,0	0,0d±0,0	0,0d±0,0
100	34,62c±0,2	30,87c±0,6	43,53c±0,9
200	48,42b±0,3	35,96b±1,0	47,67c±2,2
400	50,61b±1,5	38,14b±2,2	52,98b±1,7

Çizelge 2. *Vitex agnus-castus* yaprak methanol ekstraktının *Fusarium* türlerinin miselyum gelişimi üzerine engelleme oranı (%)

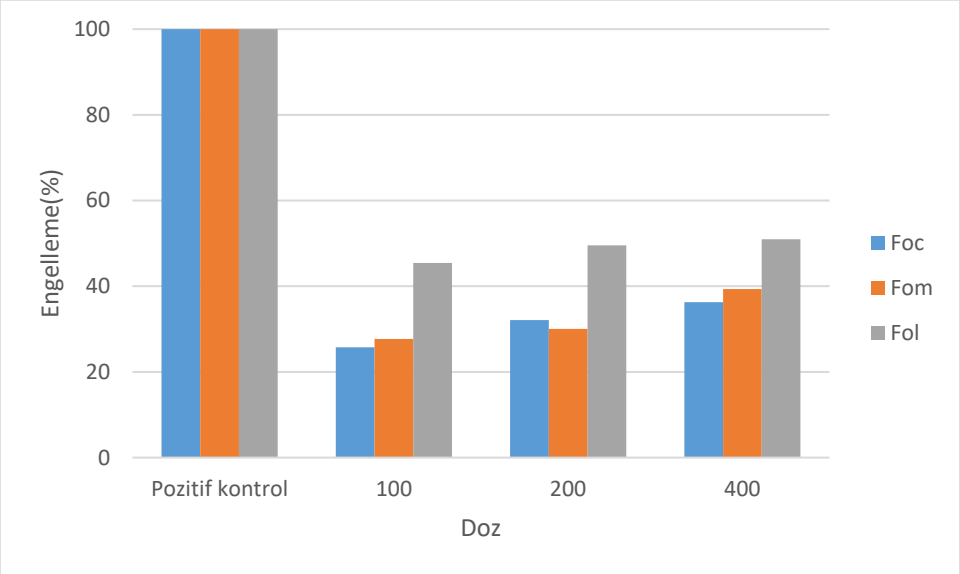
Doz	Foc	Fom	Fol
Pozitif kontrol	100,0a±0,0	100,0a±0,0	100,0a±0,0
Kontrol	0,0e±0,0	0,0e±0,0	0,0d±0,0,0
100	25,73d±0,5	27,69d±0,7	45,45c±0,5
200	32,08c±0,7	30,03c±0,1	49,55c±0,4
400	36,28b±0,5	39,35b±1,0	50,95b±0,4

Çizelge 3. *Vitex agnus-castus* tohum methanol ekstraktının *Fusarium* türlerinin miselyum gelişimi üzerine engelleme oranı (%)

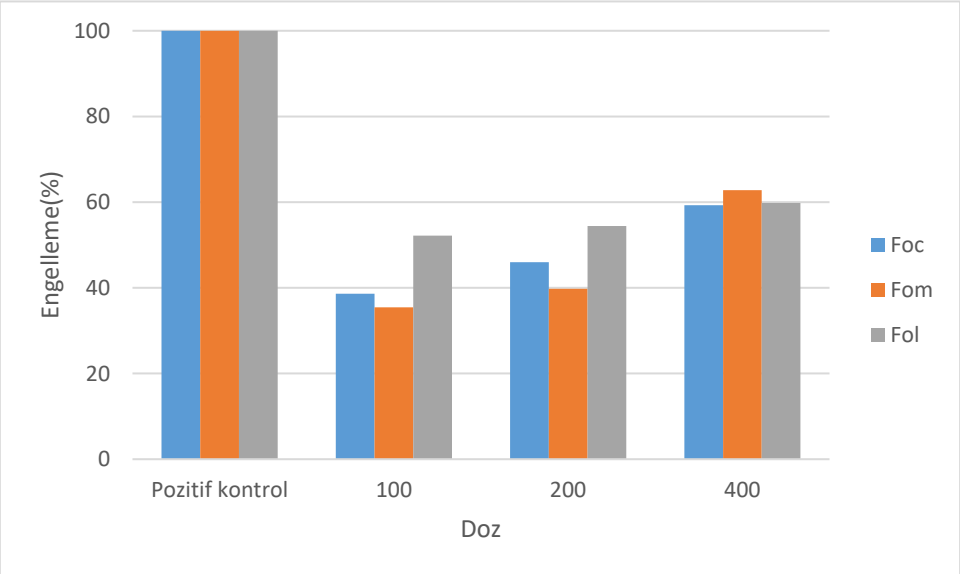
Doz	Foc	Fom	Fol
Pozitif kontrol	100,0a±0,0	100,0a±0,0	100,0a±0,0
Kontrol	0,0e±0,0	0,0d±0,0	0,0d±0,0
100	38,62d±0,3	35,45c±0,6	52,19c±0,6
200	46,00c±0,4	39,78c±0,7	54,41c±1,0
400	59,27b±3,4	62,81b±1,5	59,80b±2,3



Grafik 1. *Vitex agnus-castus* çiçek methanol ekstraktının *Fusarium* türlerinin miselyum gelişimi üzerine engelleme oranı (%)



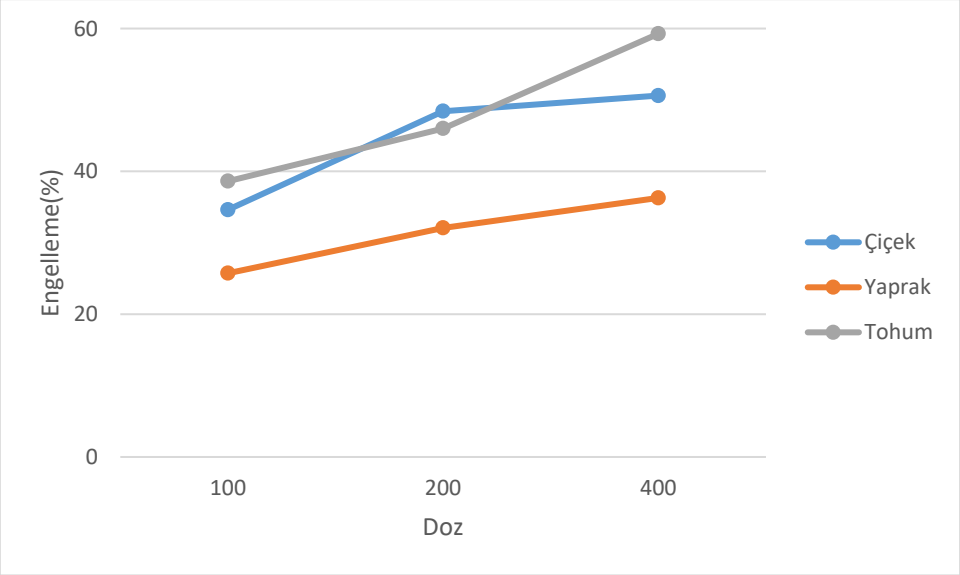
Grafik 2.*Vitex agnus-castus* yaprak methanol ekstraktının *Fusarium* türlerinin miselyum gelişimi üzerine engelleme oranı (%)



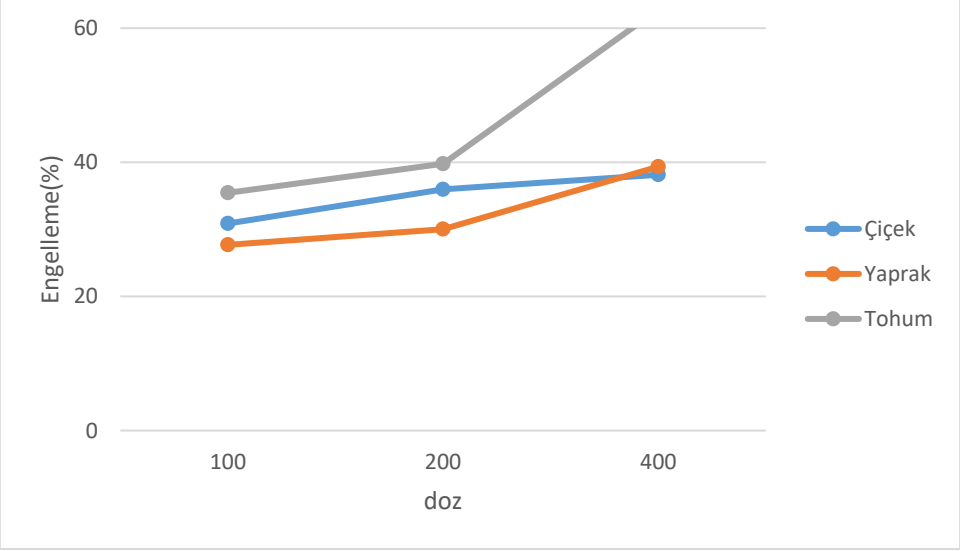
Grafik 3. *Vitex agnus-castus* tohum methanol ekstraktının *Fusarium* türlerinin miselyum gelişimi üzerine engelleme oranı (%)

Hastalık etmeni üzerinden bir değerlendirme yapılacak olursa; Foc miselyum gelişimi üzerine tohum ekstraktı en yüksek engelleme etkisi göstermiştir. Tohum ekstraktının 400 ppm dozu Foc miselyum gelişimini kontrole kıyasla %59,27 inhibe etmiştir. Bunu %50,61 ile çiçek ve %36,28 ile yaprak ekstraktı takip etmiştir (Grafik 4). Diğer *Fusarium* türleri üzerine

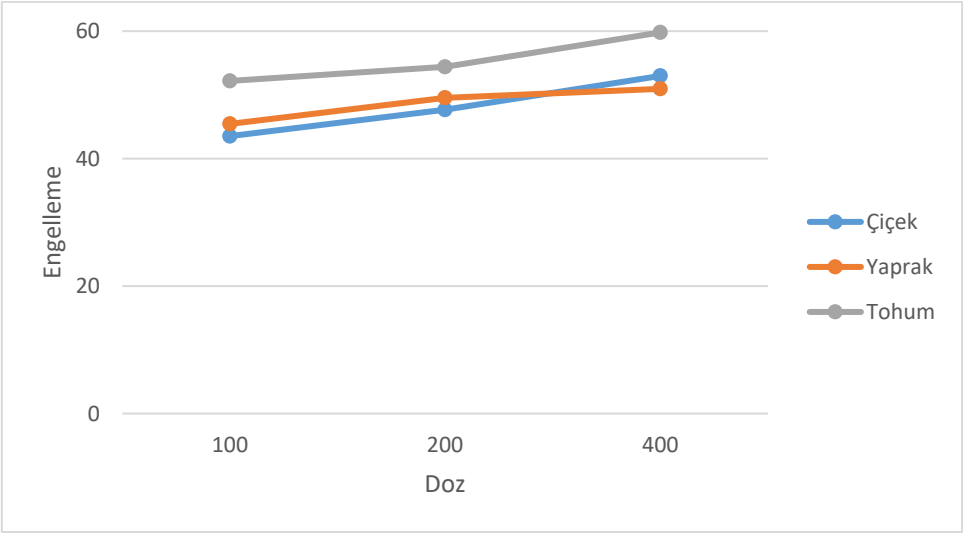
ekstraktların 400ppm dozunda; engelleme oranlarında farklılık olmakla beraber yine tohum ekstraktı en yüksek engelleyici etkiyi sergilemiştir (Grafik 5, Grafik 6).



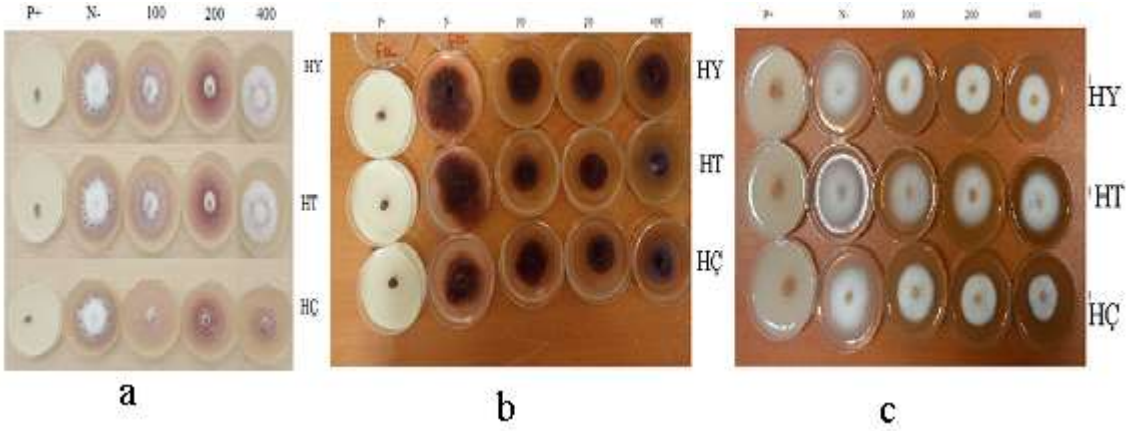
Grafik 4. *Vitex agnus-castus* bitki methanol ekstraktının Foc miselyum gelişimi üzerine engelleme oranı (%)



Grafik 5. *Vitex agnus-castus* bitki methanol ekstraktının Fom miselyum gelişimi üzerine engelleme oranı (%)



Grafik 5. *Vitex agnus-castus* bitki methanol ekstraktının Fol miselyum gelişimi üzerine engelleme oranı (%)



Şekil 1. *Vitex agnus-castus* bitki methanol ekstraktının Fom(a), Fol(b) ve Foc(c) patojeni fungusların miselyum gelişim üzerine etkisi

V. agnus-castus yaprak, çiçek ve meyveleri fenolik asitler ve türevleri, flavonoidler, tanenler, iridoitler, diterpenoidler ve uçucu yağ bileşimi bakımından zengindir (Sağlam vd., 2007; Hajdú vd., 2007; Proestos vd., 2006; Cabral vd., 2008; Stojković vd., 2011; Latovi vd., 2012; Fakir vd., 2014). Başka bir çalışmada, V. agnus castus'un yaprak ve meyvelerinin önemli düzeyde vitexin bileşiği içerdiği belirlenmiştir. Vitexin, antioksidan, antimikrobiyal, anti-inflamatuar, hepatoprotektif, spazmolitik, antiviral, antitiroid ve antiglikasyon gibi birçok biyolojik özelliğe sahip olduğu bildirilmiştir (Gökbulut ve ark., 2010; Peng ve ark., 2008; Zielińska ve Zieliński, 2011). Bu nedenledir ki *Vitex agnus-castus* bitkisinin farklı kısımlarımdan elde edilen ekstrakt ve uçucu yağlarının biyolojik aktivitesi üzerine çalışmalar yürütülmüş ve yürütülmeyede devam

etmektedir. Bitki tohumlarından elde edilen uçucu yağın *Candida* türleri üzerinde güçlü bir antifungal aktivite sergilediği (Asdadi vd., 2014) rapor edilmiştir. Önceki çalışmalarda, bazı *Vitex* türleri Gram-pozitif bakterilere (0.02-8.00 mg ml^{-1}) karşı iyi büyüme inhibisyonu gösterirken, Gram-negatif bakterilere ve mayalara (0.50-8.00 mg ml^{-1}) karşı daha düşük aktivite göstermiştir (Nyiligira ve ark., 2008). Vitex trifolia yapraklarının antimikrobiyal aktivitesi daha önce araştırılmıştır. Tüm ekstraktlar gram-pozitif ve gram-negatif türlerin büyümesini inhibe etmiştir. Sadece DCM yaprak ekstresi 5 mg ml-1 dozunda *Candida albicans*'a karşı inhibisyona neden olmuştur (Hernandez ve ark., 1999). Disk difüzyon deneyi, *Vitex trifolia*'nın petrol ekstresi ve eta-nolik ekstresi ile gerçekleştirilmiştir. Petrol eteri fraksiyonunun etanolik olandan daha aktif olduğu bulunmuştur (Hossain ve ark., 2001). Maltaş ve ark.(2010) yürüttükleri çalışmada *Vitex agnus castus*'un sadece metanolik ekstresinin antifungal aktivite gösterdiği belirtilmektedir. Başka bir çalışmada; antioksidant aktivite testlerinde, EtOAc ekstraktının özellikle DPPH-serbest radikal testinde (IC50 = 15.68 ± 1.51 µg/mL) dikkate değer bir etkiye sahip olduğunu, enzimatik analizlerde de diklorometan ekstraktının bütirilkolinesterazı orta derecede inhibe ettiği rapor edilmiştir (IC50 = 133,54 ± 1,45 µg/mL)(Bramki ve ark., 2025). Bitki methanol ve su ekstraktları *C. Albicans* klinik izolasyonlarına karşı antifungal aktivite sergilemiştir (Keikha ve ark., 2018). Vitex ekstraktı disk füzyon yöntemi kullanılarak yürütülen çalışmada, 50 mm'lik büyüme inhibisyon zonu ile Staphylococcus aureus'a karşı antifungal etki göstermiştir (Ghannadi ve ark., 2012). Vitex agnus castus'tan izole edilen agnusid maddesinin E. floccosum (31.25 µg/ml), T. simii (62.5 µg/ml), C. lunata (250 µg/ml), T. rubrum (62.5µg/ml), C. albicans (125 µg/ml) ve Scopulariopsis sp'ye (500 µg/ml) karşı güçlü antifungal aktivite aktivite göstermiştir (Mohandass ve ark., 2010).

Mevcut çalışmada ise *Vitex agnus-castus* methanol ekstraktının önemli toprak patojeni olan Fusarium türler üzerine antifungal etkiye sahip olduğu ortaya konmuştur.

ABSTRACT

Sitophilus granarius L. (Coleoptera: Curculionidae) is a widespread pest of stored cereals, causing substantial quantitative and qualitative losses, particularly in wheat, barley, oats, and rye. In this study, the essential oils (EOs) of *Lavandula angustifolia* Mil. (Lamiaceae) and *Eucalyptus globulus* Labill. (Myrtaceae) EOs were evaluated under laboratory conditions for their contact toxicity, repellency, and fumigant effects against *S. granarius*. Chemical compositions of the oils were identified using gas chromatography-mass spectrometry (GC-MS) and gas chromatography-flame ionization detection (GC-FID). Jaccard similarity analysis was used to assess compositional similarity, while t-SNE Clustering Analysis classified compounds based on structural relationships. In contact toxicity assays, the highest mortality (92.6%) was observed at 35% *L. angustifolia* oil concentration on day two. The most potent effect (97.9% mortality) was achieved with a mixture of 20% *L. angustifolia* and 50% *E. globulus* oil. Maximum repellency occurred at 0.25% (class IV) and 1% (class V) *L. angustifolia* concentrations, and the strongest fumigation effect was observed at 1.5 µl/ml air concentration. Major compounds identified were linalool, linalyl acetate, and 1,8-cineole in *L. angustifolia*, and 1,8-cineole, cymene, and alpha-pinene in *E. globulus*. The oils showed 30.7% overall compositional similarity; linalool and linalyl acetate had the highest pairwise similarity (52%). t-SNE analysis revealed three molecular clusters, separating the oils based on their dominant compounds. These results suggest that both essential oils, due to their multi-modal actions and eco-friendly nature, hold promise as alternative or complementary agents in integrated pest management (IPM) strategies for stored grain protection.

Keywords: Botanical fumigation, chemical composition, environmentally friendly control, principle component analysis

SITOPHILUS GRANARIUS L. (COLEOPTERA: CURCULIONIDAE) ÜZERİNDE İKİ UÇUCU YAĞIN BİYOETKİNLİĞİ VE KİMYASAL PROFİLLEMESİ

ÖZET

Sitophilus granarius L. (Coleoptera: Curculionidae) depolanmış tahıllarda yaygın bir zararlı olup, özellikle buğday, arpa, yulaf ve çavdarda önemli nicel ve nitel kayıplara neden olmaktadır. Bu çalışmada, *Lavandula angustifolia* Mil. (Lamiaceae) ve *Eucalyptus globulus* Labill. (Myrtaceae) uçucu yağları, *S. granarius*'a karşı temas toksisitesi, kovuculuk ve fumigant etkileri açısından laboratuvar koşullarında değerlendirilmiştir. Yağların kimyasal bileşimleri gaz kromatografisi-kütle spektrometresi (GC-MS) ve gaz kromatografisi-alev iyonizasyon tespiti (GC-FID) kullanılarak tanımlanmıştır. Bileşimsel benzerliği değerlendirmek için Jaccard benzerlik analizi kullanılırken, t-SNE Kümeleme Analizi yapısal ilişkilere dayalı olarak bileşikleri sınıflandırmıştır. Temas toksisitesi deneylerinde, en yüksek ölüm oranı (%92.6) ikinci günde %35 *L. angustifolia* yağı konsantrasyonunda gözlenmiştir. En güçlü etki (%97.9 ölüm) %20 *L. angustifolia* ve %50 *E. globulus* yağı karışımı ile elde edilmiştir. Maksimum kovuculuk %0.25 (sınıf IV) ve %1 (sınıf V) *L. angustifolia* konsantrasyonlarında meydana gelmiş ve en güçlü fümigasyon etkisi 1.5 µl/ml hava konsantrasyonunda gözlenmiştir. Tanımlanan başlıca bileşikler *L. angustifolia*'da linalool, linalil asetat ve 1,8-cineole, *E. globulus*'ta ise 1,8-cineole, cymene ve alpha-pinene olmuştur. Yağlar %30.7 genel bileşimsel benzerlik göstermiştir; linalool ve linalil asetat en yüksek ikili benzerliğe (%52) sahiptir. t-SNE analizi, yağları baskın bileşiklerine göre ayıran üç moleküler küme ortaya çıkarmıştır. Bu sonuçlar, çok modlu etkileri ve çevre dostu doğaları nedeniyle her iki uçucu yağın da depolanmış tahılların korunmasına yönelik entegre zararlı yönetimi (IPM) stratejilerinde alternatif veya tamamlayıcı maddeler olarak umut vaat ettiğini göstermektedir.

Anahtar Kelimeler: Bitkisel fümigasyon, kimyasal bileşim, çevre dostu mücadele, temel bileşen analizi

1. INTRODUCTION

The granary weevil, *Sitophilus granarius* L., 1758 (Coleoptera: Curculionidae), is widely distributed throughout Türkiye and causes significant damage and economic losses by feeding on various stored grains (Bağcı et al., 2014; Koçak et al., 2018). For decades, control of this pest has relied primarily on synthetic insecticides. However, repeated applications have led to the development of resistance in pest populations, necessitating the use of higher doses. This, in turn, increases risks to human and environmental health and raises concerns regarding pesticide residues in food products (Alpkent et al., 2023).

As a result of these drawbacks, there has been a growing demand for natural compounds that rapidly degrade into harmless metabolites. Among these, essential oils (EOs) have attracted attention as environmentally benign alternatives that can be integrated into pest management programs. Notably, biopesticides are considered safe for human health (Generally Recognized as Safe, GRAS) and offer substantial benefits due to their minimal residue potential and low impact on non-target organisms (Essiedu et al., 2020; Alpkent et al., 2024).

The biological activity of EOs can vary significantly depending on the plant's chemical profile, cultivation conditions, and harvest timing (Verma et al., 2010). *Lavandula angustifolia* essential oil, rich in monoterpenes such as linalool and linalyl acetate, has been shown to possess antimicrobial, antioxidant, and anti-inflammatory properties. Moreover, it exhibits promising insecticidal activity, including both direct toxicity and repellent effects on agricultural pests. In addition to these, larvicidal and ovicidal properties have also been reported (Prusinowska & Śmigielski, 2014; Chiffelle et al., 2019; Valizadeh et al., 2021). Some studies have further suggested that Eos of *L. angustifolia*, when used in combination with conventional synthetic insecticides, can enhance their toxic effects through synergistic interactions (Faraone et al., 2015). Such synergy may reduce the likelihood of resistance development and strengthen environmentally friendly integrated pest management (IPM) strategies.

Similarly, *E. globulus* represents another promising natural alternative for pest control in agriculture. Its essential oil, particularly rich in the active component 1,8-cineole, has demonstrated strong insecticidal properties against various insect species (Aziz et al., 2019). Research has shown that *E. globulus* exhibits repellent effects, especially against pests like *S. zeamais*, providing effective protection against infestation (Mossi et al., 2010). Additionally, the plant's inherent disease resistance and its positive contribution to ecosystem health further support its integration into sustainable plant protection approaches. The use of *Eucalyptus* species in crop protection is increasingly recognized as a valuable component of IPM programs (Puig et al., 2018).

Essential oils are considered effective and environmentally sound alternatives to synthetic insecticides due to their rich chemical composition and diverse biological activities. Their integration into sustainable agriculture and pest management practices holds great promise for reducing reliance on synthetic chemicals (Chiffelle et al., 2019; Faraone et al., 2015). Therefore, this study aims to investigate the insecticidal activity of *L. angustifolia* and *E. globulus* EOs against *S. granarius*.

2. MATERIALS AND METHODS

Insect Rearing

Sitophilus granarius adults used in this study were obtained from stock cultures maintained at Ankara University, Faculty of Agriculture, Department of Plant Protection. Rearing conditions were maintained at 25 ± 1 °C and 55 ± 5% relative humidity (RH) in climate-controlled chambers. Clean wheat grains, previously stored at low temperatures, were conditioned 24 hours before use. Adult insects (500–1000 individuals, mixed sexes) were introduced into 1 L glass jars containing 300–500 g of wheat. Adults were transferred to new containers every three days via sieving. As begin to appear dates of new adults were recorded, and individuals aged 7–14 days were selected for bioassays.

Plant Material and Chemical Composition Analysis

Essential oils of *L. angustifolia* and *E. globulus* were supplied by Biomesi Ar-Ge company (Türkiye). These oils were obtained via cold-press extraction and distillation methods. Their chemical compositions were determined using Gas Chromatography-Mass Spectrometry (GC-MS) and Gas Chromatography-Flame Ionization Detection (GC-FID), following the analytical protocol described by Özek et al. (2010).

Briefly, samples were diluted at a 1:100 ratio using hexane and analyzed using a GC-MS/FID system (Agilent 7890A GC, Agilent 5975C MS detector), equipped with an HP InnowaxCapillary column. Helium was used as the carrier gas at a constant flow rate of 0.8 mL/min. A 1 µL aliquot of each sample was injected in split mode (40:1). The injector temperature was set at 250 °C. The oven temperature program was as follows: initial hold at 60 °C, ramped to 220 °C at 4 °C/min, followed by a 10-minute hold at 220 °C. The total run time was 60 minutes. Mass spectra were recorded in the 35–450 m/z range using electron impact ionization at 70 eV. Compound identification was conducted by comparison with WILEY7 and OIL ADAMS spectral libraries.

Contact Toxicity Bioassay

Lavandula angustifolia essential oil was diluted to different concentrations of 10 - 35%, using a buffer solution consisting of 1% dimethyl sulfoxide (DMSO) and 0.02% Triton X-100 in double-distilled water. Each treatment group consisted of 30 insects and placed in 90 mm Petri dishes. The control group received only the DMSO/Tx-100 buffer. For the evaluation of the potential effects of increasing the insecticidal mortality rate, diluted *E. globulus* essential oil (50%) was applied in combination with varying concentrations of *L. angustifolia* oil. Treated insects were placed in Petri dishes containing 1 g of wheat and incubated in dark chambers at 25 ± 1 °C and 55 ± 5% RH. Mortality was assessed at 24, 48, and 72 hours post-treatment. Insects were considered dead if unresponsive to soft forceps or warm air stimulation. Individuals showing movement were further observed for 24 hours to confirm survival. A completely randomized design (CRD) were conducted for the experiments. Five concentrations were chosen, except for the control. All concentrations were established in four replicates.

Repellency Bioassay

Five sub-lethal concentrations of *L. angustifolia* essential oil were tested for repellency at five different times. For this purpose, 90 mm Whatman No. 1 filter paper was used. One half was treated with the test solution (essential oil + buffer), while the other half received the control solution (1% DMSO + 0.02% Tx-100). Solutions were applied at a defined volume per surface area (µL/cm²) using a micropipette. Papers were air-dried under a fume hood for 15 minutes. Twenty mixed-sex adult *S. granarius* were placed in the center of each the Petri dish. The dishes were sealed with Parafilm and incubated at 25 ± 1 °C and 55 ± 5% RH. Each treatment was replicated four times in a completely randomized design (CRD). At predetermined time intervals, the number of insects on each half of the paper was recorded.

Repellency percentage (PR) was calculated using the formula: $PR = \frac{N_c - N_t}{N_c + N_t} \times 100$

Where; N_c is the number of insects on the control side, and N_t is the number on the treated side (McDonald et al., 1970). Repellency classes were defined according to Juliana and Su (1983):

Class 1 = 0.1–20%, **Class 2** = 20.1–40%, **Class 3** = 40.1–60%, **Class 4** = 60.1–80%, **Class 5** = 80.1–100%.

Fumigant Activity Bioassay

Fumigant toxicity of *L. angustifolia* (70%) oil was assessed using 230 cc airtight glass jars. A small amount of wheat was placed in 20 cc pin- punctured PVC containers containing 30 adult beetles.. These cups were fixed inside the larger jars. Essential oils were applied onto Whatman No. 1 filter paper strips using micropipettes, and the jars were immediately sealed. Experiments were incubated at 25 ± 1 °C and 55 ± 5% RH. Mortality was assessed at 24, 48, and 72 hours. Suspected dead insects were transferred to clean Petri dishes and observed for 24 hours. Individuals that failed to respond to gentle brushing were recorded as dead. Each treatment included four replicates, and the experiment followed a CRD.

Molecular Similarity and Dimensionality Reduction

To evaluate molecular similarity between the components of *L. angustifolia* and *E. globulus* oils, SMILES (Simplified Molecular Input Line Entry System) strings were converted into Morgan fingerprints using the RDKit toolkit (Landrum, 2013). Pairwise molecular similarity was quantified using the Tanimoto coefficient. A two-dimensional projection of the high-dimensional (Principal component analysis) fingerprint data was generated using t-Distributed Stochastic Neighbor Embedding (t-SNE) for visualization of molecular clusters and patterns. The resulting similarity matrix was displayed as a heatmap, with individual cell values representing Tanimoto coefficients (Babicki et al., 2016; Wilkinson and Friendly, 2009).

Statistical Analysis

Mortality data from contact and fumigant toxicity assays were arcsine transformed prior to analysis. One-way Analysis of Variance (ANOVA) was performed, and means were separated using Tukey's HSD test. Statistical significance was considered at $\alpha = 0.05$. Analyses were performed using MINITAB 18 (Release 18.1). The efficacy of each essential oil was evaluated across different concentrations and time intervals.

3. RESULTS

Chemical Composition of Essential Oils

Gas chromatographic analysis identified a total of 19 constituents in *L. angustifolia* essential oil and 8 constituents in *E. globulus* oil. The dominant components of *L. angustifolia* oil were linalool (42.55%) and linalyl acetate (31.47%), whereas *E. globulus* oil was primarily composed of 1,8-cineole (82.23%) and limonene (7.79%) (Table 1).

Contact Toxicity

The contact toxicity of varying concentrations of *L. angustifolia* essential oil against *S. granarius* adults, as well as its binary mixtures with a constant 50% concentration of *E. globulus* oil, was assessed (Tables 2 and 3). *Lavandula angustifolia* alone at 10% and 17.5% concentrations exhibited the lowest mortality rates across three time points, with no significant time-dependent differences ($F = 0.03$; df = 2, 11; $P > 0.05$; $F = 0.01$; df = 2, 11; $P > 0.05$). At 35% concentration, mortality reached 87–92.64% but remained statistically unchanged over time ($F = 0.4$; df = 2, 11; $P > 0.05$). Daily evaluation of mortality across concentrations revealed significant differences, ranging from 1.69% to 87% ($F = 48.59$; df = 5, 23; $P < 0.05$). However, third-day results did not differ significantly from day one ($F = 35.47$; df = 5, 23; $P < 0.05$).

In mixture treatments, the addition of 50% *E. globulus* oil enhanced mortality at all *L. angustifolia* concentrations (Table 3). For instance, the 5% + 50% mixture showed no significant day-to-day variation, though mortality began at 17% on day one ($F = 0.01$; df = 2, 11; $P > 0.05$). The highest mortality was observed in the 20% + 50% mixture, with 88% mortality on day one and 99.78% on day three ($F = 6.9$; df = 2, 11; $P < 0.05$). Across days, mortality rates in both 5% + 50% and 20% + 50% mixtures ranged from 18% to 98.78%, showing significant variation ($F = 67.13$; df = 5, 23; $P < 0.05$).

Repellency Activity

Lavandula angustifolia essential oil exhibited concentration- and time-dependent repellency against *S. granarius* (Table 4). Two hours after application, repellency rates for 0.25%, 0.5%, 1%, 2%, and 5% concentrations were 65%, 45%, 75%, 90%, and 100%, respectively. At 48 hours, 2% oil maintained a repellency of 95%. Notably, even at 1% concentration, repellency reached the highest rating (Class 5: 80.1–100%) by the end of 48 hours, indicating sustained repellent activity.

Table 4. Repellent activity of lavender essential oil against *Sitophilus granarius*

Fumigant Toxicity

Varying doses of 70% *L. angustifolia* essential oil were evaluated for fumigant activity (Table 5). After one day, the lowest dose (1 µL/mL air) resulted in 9.74% mortality ($F = 2.56$; $df = 2, 11$; $P > 0.05$), while the highest mortality (97%) was observed at 1.625 µL/mL ($F = 1.82$; $df = 2, 11$; $P > 0.05$). A dose of 1.5 µL/mL achieved >90% mortality in the shortest time.

Daily comparisons revealed a dose-dependent linear increase in mortality. However, no statistically significant difference was observed between the results on the second and third days, indicating a plateau in fumigant activity.

Molecular Similarity Analysis

Molecular similarity analysis using the Jaccard Similarity Index indicated an overall similarity of 30.7% between the complete molecular profiles of *L. angustifolia* and *E. globulus* oils (Niwattanakul et al., 2013). At the individual component level, the main constituents of *L. angustifolia*—linalool and linalyl acetate—shared a high similarity score of 52%. In contrast, 1,8-cineole showed negligible similarity (0.05%) with the major lavender constituents, suggesting distinct molecular structures. Within *E. globulus*, 1,8-cineole showed 20% similarity with cymene and alpha-pinene (Figure 1, Figure 2).

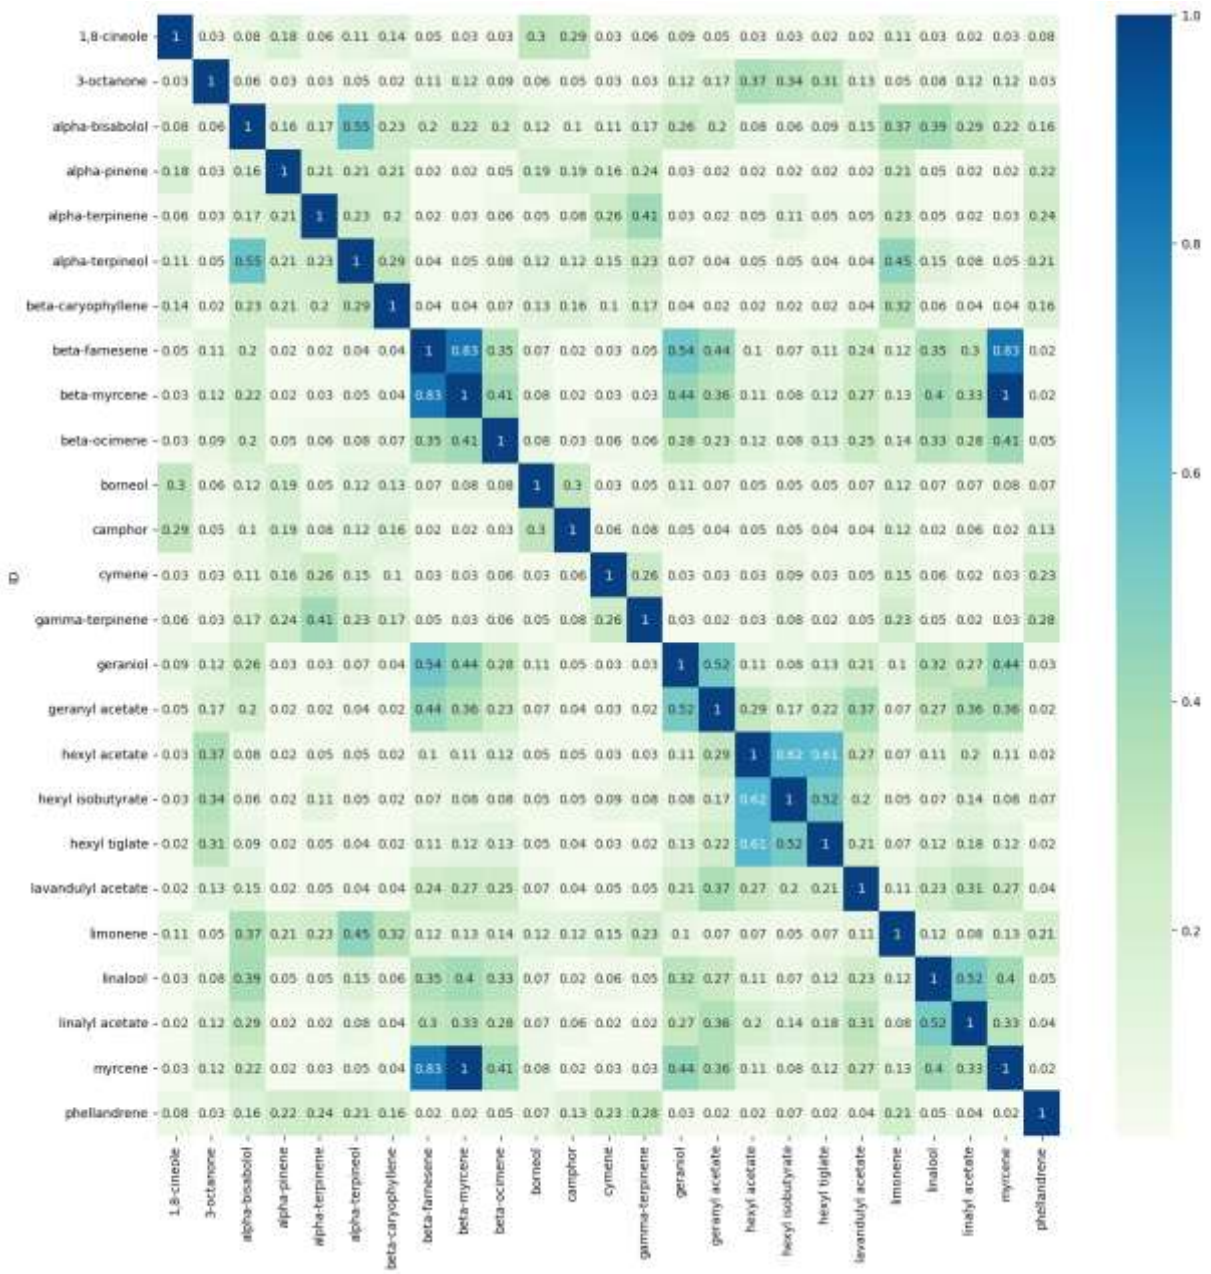

Fig. 1. Molecular clustering analysis. The SMILES strings of each molecule were converted to Morgan fingerprints using RDKit. Similarity between molecules was quantified using the Tanimoto coefficient. Similarity matrix was visualized as a heatmap, with each cell displaying the Tanimoto coefficient.

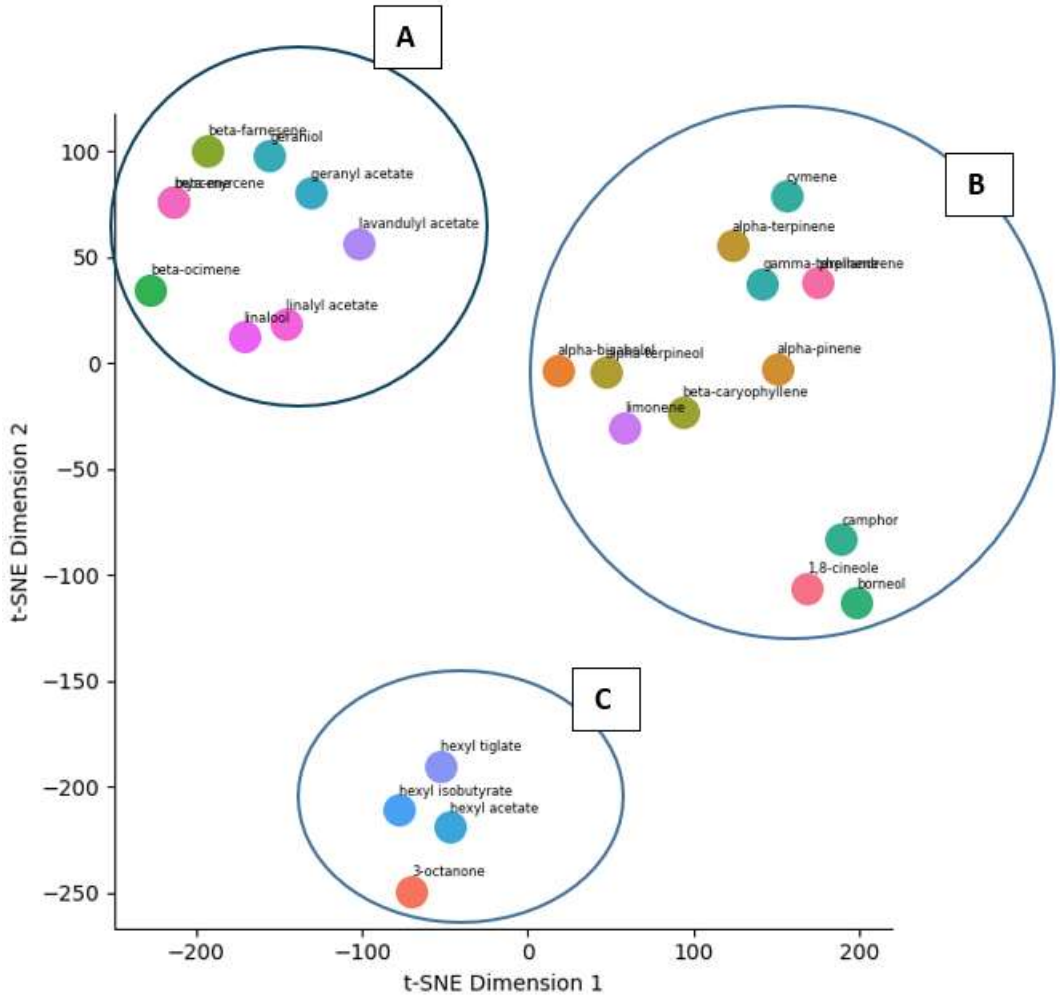

Fig. 2. T-distributed stochastic neighbor embedding (t-SNE) was used to visualize fingerprint similarities in a scatter plot, where each dot represents a unique hit compound.

According to the t-SNE analysis, three distinct molecular clusters were observed (Fig. 2), indicating major structural divergence between key active compounds. The principal compounds in *L. angustifolia* (linalool 42.55% and linalyl acetate 31.47%) grouped within cluster A, while the dominant components of *E. globulus* (1,8-cineole 82.23%, cymene 3.99%, and alpha-pinene 3.11%) were placed in cluster B.

4. DISCUSSION

Present study provides detailed insights into the insecticidal efficacy and chemical profiles of *L. angustifolia* and *E. globulus* EOs against the stored-product pest *Sitophilus granarius* under controlled laboratory conditions. These findings not only align with previously documented

insecticidal effects of these EOs but also offer novel contributions, particularly regarding their binary combinations and molecular similarity analysis.

Chemical profiling through GC-MS and GC-FID revealed that *L. angustifolia* EO consisted primarily of linalool (42.55%) and linalyl acetate (31.47%), while *E. globulus* EO was dominated by 1,8-cineole (82.23%) and limonene (7.79%). These results corroborate earlier findings on the phytochemical composition of these oils (Prusinowska & Śmigielski, 2014; Batish et al., 2008; Soković et al., 2010). The presence of linalool and 1,8-cineole as major constituents is particularly relevant, given their well-established insecticidal and repellent properties against various Coleopteran pests (Alkan et al., 2021; Isman & Grieneisen, 2014; Nerio et al., 2009).

One of the distinctive aspects of this study lies in the integration of chemical similarity analysis using Jaccard similarity coefficients and Tanimoto-based molecular clustering. The two oils shared an overall compositional similarity of 30.7%, with linalool and linalyl acetate showing the highest individual similarity (52%). Based on these preliminary results, it is possible that the results not only highlight the structural difference between the two oils but also provide an intermolecular rationale for the bioactivities of the essential oils, which may account for their increased mortality at low concentration on the pest when used in combination. The low structural similarity between 1,8-cineole and lavender constituents (e.g., similarity score of 0.05) supports the hypothesis that their insecticidal mechanisms or mode of action may involve complementary or non-overlapping modes of action, increasing the probability of synergism (Cherkasov et al., 2014). According to the t-SNE analysis, three distinct molecular clusters were observed (Fig. 2), indicating major structural divergence between key active compounds. The principal compounds in *L. angustifolia* (linalool 42.55% and linalyl acetate 31.47%) grouped within cluster A, while the dominant components of *E. globulus* (1,8-cineole 82.23%, cymene 3.99%, and alpha-pinene 3.11%) were placed in cluster B. These clustering results underscore the molecular dissimilarity between linalool and 1,8-cineole, suggesting they interact with different physiological targets within the pest organism. This supports the notion that distinct bioactivity mechanisms may be at play. Previous studies have shown that the major constituents of EOs often mirror their overall biophysical and biological properties (Ipek et al., 2005), although the effects may vary depending on concentration or whether compounds are applied individually or as part of a complex mixture. As such, synergistic interactions among multiple constituents in an essential oil may yield effects that cannot be explained by the activity of the dominant compounds alone. Additionally, the activity of major components may be modulated by minor ones (Hoet et al., 2006; Bakkali et al., 2008). Therefore, for biological applications, examining the entire oil composition is more informative than focusing solely on selected constituents, as the concept of synergy becomes more meaningful in a whole-oil context.

The contact toxicity assays demonstrated that *L. angustifolia* alone at 35% concentration caused high mortality (92.6%) in *S. granarius* adults by the second day, comparable to prior research on lavender EO effects against *S. oryzae* and *T. castaneum* (Benelli et al., 2018; Pavela, 2015). However, the combined application of *L. angustifolia* (20%) with *E. globulus* (50%) significantly enhanced efficacy, achieving 99.78% mortality within three days. This synergy highlights the potential of EO blends to overcome the moderate efficacy observed at lower individual concentrations and to potentially delay resistance development, as suggested in

earlier studies (Faraone et al., 2015). The increased mortality observed in the binary treatments also supports the hypothesis that structurally divergent yet bioactive constituents may exert multi-target toxic effects on insects, possibly affecting the nervous system, respiratory activity, or cellular membranes concurrently (Regnault-Roger et al., 2012).

Repellency results indicated that *L. angustifolia* EO exhibited strong and persistent deterrent activity against *S. granarius*, with concentrations as low as 1% resulting in repellency rates over 80% for up to 48 hours. These findings echo those of Nerio et al. (2009), who reported high repellent activity of monoterpene-rich EOs against storage pests. The results also demonstrate time- and dose-dependent repellency, consistent with the volatization and diffusion characteristics of EO components (Pavela & Benelli, 2016). The high repellency observed even at low doses makes *L. angustifolia* a promising candidate for push-pull strategies or for integration into packaging materials for stored grain protection.

Fumigant assays showed that *L. angustifolia* EO had potent vapor-phase toxicity, with over 90% mortality at 1.5 µL/mL air concentration. The maximum effect (100% mortality) was achieved at 1.625 µL/mL. These results are consistent with the fumigant activity of lavender and other monoterpene-rich oils documented in the literature (Lee et al., 2003; Tripathi et al., 2009). The dose-dependent mortality trend, followed by a plateau between days two and three, suggests rapid action followed by saturation of the toxic effect, a phenomenon also reported by Huang et al. (2021) for other volatile bioinsecticides.

Overall, the findings strongly support the potential of both *L. angustifolia* and *E. globulus* EOs as components of an eco-friendly Integrated Pest Management (IPM) framework targeting stored-product pests. The observed synergistic effects of the binary EO treatments are particularly noteworthy, indicating a promising approach for enhancing efficacy while potentially lowering the required concentrations. The additional use of cheminformatics tools to analyze molecular similarity and clustering adds a mechanistic dimension to EO-based pest management research, opening new avenues for rational EO formulation based on chemical complementarity.

5. CONCLUSION

This study comprehensively demonstrated the bioefficacy of *L. angustifolia* and *E. globulus* EOs against *S. granarius* through contact toxicity, repellency, and fumigant assays. The results highlighted that both oils exhibit substantial insecticidal activity, with *L. angustifolia* at 35% concentration achieving over 90% mortality, and the binary mixture of 20% *L. angustifolia* + 50% *E. globulus* yielding nearly complete mortality. Furthermore, strong repellency was achieved at relatively low concentrations, indicating these oils' potential for use as both lethal and behavioral control agents in pest management systems.

The GC-MS and GC-FID analyses revealed distinct yet partially overlapping chemical profiles, with linalool and linalyl acetate dominating *L. angustifolia*, and 1,8-cineole being the main compound in *E. globulus*. The limited structural similarity (30.7%) between the two oils, combined with the pronounced enhancement of efficacy in binary treatments, points toward complementary modes of action. The integration of molecular similarity analyses and clustering

using cheminformatics tools provides a mechanistic rationale for their synergism and offers a data-driven foundation for future EO blend formulations.

Taken together, these findings support the incorporation of both essential oils—either individually or in synergistic combinations—into eco-friendly Integrated Pest Management (IPM) frameworks for stored grain protection. Their rapid action, sustained efficacy, and low environmental footprint make them promising alternatives or adjuncts to conventional synthetic insecticides. Future studies should focus on field validation, formulation stability, and potential impacts on non-target organisms to further facilitate their adoption in sustainable agricultural practices.

ABSTRACT

The study was conducted to evaluate the effects of insect nets on the air exchange coefficient in a block greenhouse covered with polyethylene cover material with a base area of 1000 m^2 (2x500 m^2), which is widely used in Kırşehir province. For this purpose, calculations were made for the long-term wind speeds of the province and six different ventilation openings (10%, 15%, 20%, 25%, 30%, 35%). In the calculations, firstly, the air exchange numbers that will occur in the greenhouse in case of using insect net without insect net and using insect net with 3 different porosity coefficients (0.50, 0.40 and 0.25) in the ventilation opening were calculated. Then, depending on the number of air changes, the internal and external temperature differences reached in the greenhouse interior were calculated when the shading net was used and not used. According to the results obtained, it was determined by the calculation that there was no good ventilation opportunity in the greenhouse with the applications in case the ventilation opening was 10%, 15% and 20%. According to the average wind speeds in the province, for good ventilation, insect nets should not be used in the ventilation opening and the ventilation opening ratio should be at least 25%. It has been determined that in the use of insect nets, the ventilation opening should be 30% and insect nets with a porosity of 0.50 should be used. In addition, while the $\Delta T_{(in-out)}$ temperature difference in the greenhouse where shading nets were used at 25% ventilation opening between March and September varied between 0.7-1.9 °C, the $\Delta T_{(in-out)}$ temperature difference in the greenhouse where shading nets were not used varied between 1.5-3.8 °C. It has been shown that insect nets stretched over ventilation openings in greenhouses reduce the number of air exchanges and increase the indoor-outdoor temperature difference due to decreasing porosity coefficients. For this reason, it has been determined that paying attention to the planning of ventilation openings in greenhouses where insect nets are used is important for proper ventilation.

Keywords: Greenhouse, air exchange number, porosity coefficient, shading net

SERALARDA HAVALANDIRMA AÇIKLIKLARINDA KULLANILAN BÖCEK TÜLLERİNİN HAVALANDIRMA ÜZERİNDEKİ ETKİLERİNİN DEĞERLENDİRİLMESİ

ÖZET

Çalışma, Kırşehir ilinde yaygın olarak kullanılan taban alanı 1008 m^2 (2x504 m^2) olan polietilen örtü malzemesi ile kaplı blok serada böcek tüllerinin hava değişim katsayısı üzerindeki etkilerinin değerlendirilmesi amacıyla yürütülmüştür. Bu amaçla, ili ait uzun yıllık rüzgar hızları ve altı farklı havalandırma açıklıkları (%10, %15, %20, %25, %30, %35) için hesaplamalar yapılmıştır. Hesaplamalarda ilk olarak böcek tülü kullanılmayan ve havalandırma açıklığında 3 farklı porozite katsayısına sahip (0.50, 0.40 ve 0.25) böcek tülü kullanılması durumunda serada ortaya çıkacak hava değişim sayıları hesaplanmıştır. Daha sonra hava değişim sayısına bağlı olarak gölgeleme tülü kullanılması ve kullanılmaması durumunda sera iç ortamında ulaşılan iç ve dış sıcaklık farklılıkları hesaplanmıştır. Elde edilen sonuçlara göre, havalandırma açıklığının %10, %15 ve %20 olması durumunda uygulamalar ile serada iyi bir havalandırma imkanı olmadığı yapılan hesaplama ile belirlenmiştir. İlde ortalama rüzgar hızlarına göre iyi bir havalandırma için havalandırma açıklığında böcek tülü kullanılmaması ve havalandırma açıklık oranın en az %25 olması gerekmektedir. Böcek tülü kullanımında ise havalandırma açıklığının %30 olması ve porozitesi 0.50 olan böcek tülü kullanılması gerektiği belirlenmiştir. Ayrıca, Mart-Eylül ayları arasında %25 havalandırma açıklığında gölgeleme tülü kullanılan serada $\Delta T_{(iç-dış)}$ sıcaklık farkı 0.7-1.9 °C arasında değişirken gölgeleme tülü kullanılmayan serada $\Delta T_{(iç-dış)}$ sıcaklık farkı 1.5-3.8 °C arasında değişmektedir. Seralarda havalandırma açıklıklarına gerilen böcek tülleri azalan porozite katsayılarına bağlı olarak hava değişim sayısını azalttığı ve iç-dış sıcaklık farkını arttırdığı ortaya konulmuştur. Bu nedenle böcek tüllerinin kullanıldığı seralarda havalandırma açıklıklarının planlanmasına dikkat edilmesinin uygun bir havalandırma için önemli olduğu belirlenmiştir.

Anahtar Kelimeler: Sera, hava değişim sayisi, porozite katsayisi, gölgeleme tülü

1. GİRİŞ

Havalandırma, sera iklimini kontrol etmek için en önemli araçlardan biridir. Bir seranın içi ve dışı arasındaki hava değişimi, ürünün gelişimini ve üretimini etkileyen sıcaklık, nem ve karbondioksit konsantrasyonu gibi çevresel koşulları etkiler. Kış aylarında yapılan havalandırma, iç ortamda artan yüksek nemi gidermeli ve seranın içinde iyi bir atmosfer sağlamalıdır. Yaz aylarında yapılan havalandırma ise iç koşullara bağlı olarak soğutma sağlamalı ve nemi gidermelidir. Bu nedenle, iç çevre koşullarının iyi bir şekilde kontrol edilmesi ve yüksek kaliteli üründen oluşan iyi bir ürün verimi sağlamak için bir seranın havalandırma özelliklerini bilmek gerekir (Baptista ve ark., 1999).

Akdeniz ülkelerinin çoğunda sera soğutması genellikle rüzgar ve sıcaklık etkisiyle doğal havalandırma ile gerçekleştirilir. Genellikle çok basit ve düşük verimlilikle çalışan bu sistemler iç ortam iklimini bitki yetiştiriciliğine uygun hale getirmekte yetersiz kalabilmektedir (Baille, 2001; Luo ve ark, 2005). Ayrıca, bu seraların çoğunun düşük yükseklik ve hacim, düz çatı ve küçük havalandırma yüzey alanı ile karakterize edilen yapısı ve şekli bölgelenin iklim koşullarına göre tasarlanmadığını göstermektedir. Bu nedenle iç ortamda gerekli soğutmayı sağlamaz. Sonuç olarak, ortaya çıkan mikro iklim yılın büyük bir bölümünde ürün büyümesi için yeterli olmaktan uzaktır (Castilla ve Lopez Galvez, 1994). Perez Parra ve ark. (2004) herhangi bir rüzgar hızında en yüksek havalandırma oranının hem çatı hem de yan açıklıkların aynı anda açıldığında elde edildiğini bildirmişlerdir. Araştırmacılar iyi bir havalandırma için seralarda havalandırma açıklığı alanının taban alanına oranını %20-%25 olması gerektiğini bildirmişlerdir (Nicolaus 1990; Baytorun ve ark., 1994). Ayrıca, seralarda iyi bir havalandırma için hava değişim katsayısının 30 1/h olması durumunda iyi ve 50 1/h olması durumunda ise çok iyi havalandırma olarak sınıflandırılmıştır (Baytorun, 1986). Son yıllarda, sera zararlılarının pestisitlere karşı direnç geliştirmesi, pestisit kullanımına bağlı çevresel sorunları azaltma zorunluluğu ve tüketicilerin kalıntı bırakmayan ürünlere olan talepleri, havalandırma açıklıklarına böcek tüllerinin kullanımını arttırmıştır (Teitel ve ark., 2005). Tüller, böceklerin bitkilere ulaşmasını önleyen mekanik bir bariyer görevi görür ve böylece doğrudan ürün hasarı ve böcek yoluyla bulaşan virüs hastalıklarının görülme sıklığını azalması neticesinde pestisit uygulamasına olan ihtiyaç azalır (Teitel ve ark., 2007). Aslında Akdeniz havzasındaki pek çok yetiştirici, bitkileri aşırı sıcaktan korumaktan ziyade böceklerden korumayı daha önemli görür. Ancak, böcek tülleri hava hareketine karşı ekstra bir bariyer görevi gördüklerinden havalandırma oranını önemli ölçüde azaltabilir ve Akdeniz seralarında sıklıkla görülen yetersiz havalandırmadan kaynaklanan yüksek iç hava sıcaklıkları sorununu daha da kötü hale getirir (Soni ve ark., 2005).

Yapılan bu çalışmada Kırşehir ilinin uzun yıllık ortalama rüzgar hızlarında, farklı havalandırma açıklığı ve farklı poroziteye sahip böcek tülü kullanılması durumunda serada ortaya çıkacak hava değişim sayılarının belirlenmesi ve belirlenen hava değişim sayılarına bağlı olarak gölgeleme tülü kullanılması ve kullanılmaması durumunda ulaşılan sıcaklık farkının hesaplanması amaçlanmıştır.

2. MATERYAL VE METOT

Çalışmada hesaplamalar Kırşehir ilinde yaygın olarak kullanılan taban alanı 1008 m^2 olan seralar için yapılmıştır. Hesaplama yapılan seranın boyutsal özellikleri Çizelge 1'de, Kırşehir iline ait aylık ortalama rüzgar hızı değerleri ise Çizelge 2'de verilmiştir.

Çizelge 1. Hesaplama yapılan seraya ait boyutsal özellikler

Parametreler	Boyutlar	Parametreler	Boyutlar
Bölme sayısı	2 adet	Çatı yüksekliği	2.10 m
Bölme uzunluğu	63.0 m	Çatı eğim açısı	35°
Bölme genişliği	8 m	Taban alanı	1008 m^2
Yan duvar yüksekliği	3.5 m	Sera hacmi	4939.2 m^3

Çizelge 2. Kırşehir iline ait aylık ortalama rüzgar hızı

Rasat süresi (yıl)	Ocak	Şubat	Mart	Nisan	Mayıs	Haziran	Temmuz	Ağustos	Eylül	Ekim	Kasım	Aralık
92	1.8	2.1	2.3	2.3	2.1	2.5	3.3	3.1	2.5	1.9	1.7	1.7

Seralarda enerji dengesi yöntemine göre istenen sıcaklık farkına bağlı gereksinilen hava değişim sayısı Eşitlik 1'de verilmiştir (Bailey, 1998; ANSI/ASAE EP 406.4, 2003; Boulard, 2006; Von Zabeltitz, 2011).

$$V_A = \frac{\tau . I_o . (1 - E . f)}{cp . \rho . \Delta T} - \frac{U . A_C}{cp . \rho . A_G} \quad (1)$$

Eşitlikte; τ= Kullanılan örtü malzemesinin geçirgenliği (-), I_o= Güneş ışınımı şiddeti (W/m^2), cp= Havanın özgül ısısı (Wh/kg°C), ρ= Havanın yoğunluğu (kg/m^3), ΔT= İç ve dış sıcaklık farkı (°C), U= Örtü malzemesine ait ısı iletim katsayısı (W/m^2°C), A_C= Örtü yüzey alanı (m^2), E= Seraya ulaşan güneş ışınımının buharlaşmada kullanılan oranı (bitkiyle tamamen kaplı serada için 0.9 alınmıştır), f= Bitki örtü faktörü (toprakta doğrudan üretimin yapıldığı sera için 0.8 alınmıştır).

Seranın havalandırmasında ortaya çıkan hava akış debisi Eşitlik 2'de verilmiştir.

$$V_V = \frac{A_V}{2} . C_d . v_w . \sqrt{C_w} \quad (2)$$

Eşitlikte; V_v= Hava akış debisi (m^3/s) A_V= Havalandırma açıklık alanı (m^2), C_w= Rüzgar basınç katsayısı (-),Vw= Rüzgar hızı (m/s), Cd= Deşarj katsayısı (-).

Havalandırma açıklıklarında böcek tülünün kullanılması durumunda tülün porozite katsayısına bağlı olarak ortaya çıkan hava akış debisi Eşitlik 3'te verilmiştir.

$$V_{VS} = V_V.\left(\varepsilon.(2-\varepsilon)\right) \quad (3)$$

Eşitlikte; ε= Böcek tülünün porozite katsayısı

Serada birim alan için hava değişim sayısı (V_A) Eşitlik 4'te gerekli olan deşarj katsayısı Eşitlik 5'te verilmiştir.

$$V_A = \frac{A_V}{2.A_G}.C_d.vw.\sqrt{C_w}.(\varepsilon.(2-\varepsilon)) \quad (4)$$

$$C_d = \frac{1}{\sqrt{1.9+0.7exp[-L_o/(32.5.H_o.Sin\alpha)]}} \quad (5)$$

Eşitlikte; A_G= Sera taban alanı (m^2), L_o= Havalandırma açıklığının uzunluğu (m), H_o= Havalandırma açıklığının genişliği (m), α= Havalandırma kapaklarının açıklık açısı

3. BULGULAR VE TARTIŞMA

Çalışmada, Kırşehir iline ait uzun yıllık ortalama rüzgar hızlarında aylara bağlı ortaya çıkan hava değişim sayıları Çizelge 3'te verilmiştir.

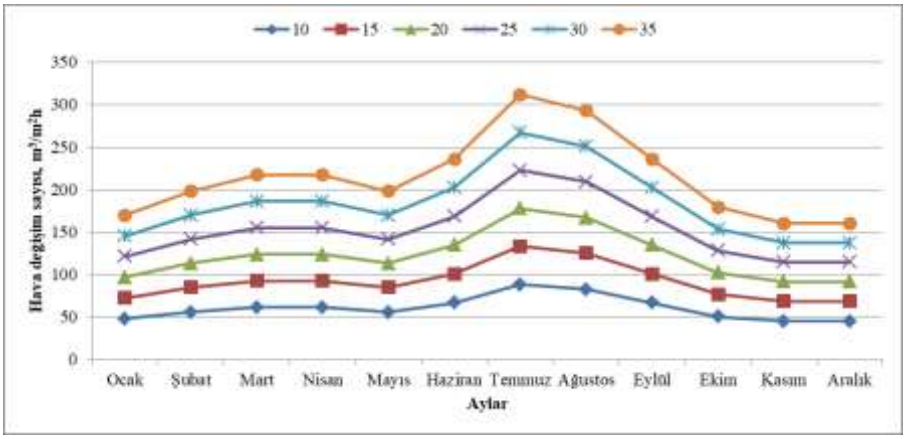
Çizelge 3. Serada farklı havalandırma açıklığında ortaya çıkan hava değişim sayıları

Rüzgar hızı,	**Havalandırma açıklık oranı, %**					
m/s	**10**	**15**	**20**	**25**	**30**	**35**
Ocak	48.3	73.0	97.3	121.6	145.9	170.3
Şubat	56.3	85.1	113.5	141.9	170.3	198.6
Mart	61.7	93.2	124.3	155.4	186.5	217.6
Nisan	61.7	93.2	124.3	155.4	186.5	217.6
Mayıs	56.3	85.1	113.5	141.9	170.3	198.6
Haziran	67.0	101.3	135.1	168.9	202.7	236.5
Temmuz	88.5	133.8	178.4	223.0	267.6	312.2
Ağustos	83.1	125.7	167.6	209.5	251.3	293.2
Eylül	67.0	101.3	135.1	168.9	202.7	236.5
Ekim	50.9	77.0	102.7	128.4	154.1	179.7
Kasım	45.6	68.9	91.9	114.9	137.8	160.8
Aralık	45.6	68.9	91.9	114.9	137.8	160.8

Serada aylara bağlı olarak ortaya çıkabilecek hava değişim sayıları en düşük %10 havalandırma açıklık oranında Kasım ve Aralık ayında 45.6 m^3/m^2h iken en yüksek hava değişim sayısı %35 havalandırma açıklığında Temmuz ayında 312.2 m^3/m^2h olarak hesaplanmıştır (Çizelge 3). Kırşehir ilinde Temmuz ayında ortaya çıkan 3.3 m/s lik ortalama rüzgar hızı değeri nedeniyle serada hava değişim sayısı hesaplanan tüm hava oranlarında en yüksek değerlere sahip

olmuştur. Ancak seralarda sıcaklıkların yükselmeye başladığı Temmuz ve Ağustos aylarında ortaya çıkan 3 m/s ve daha yüksek hızlarda esen rüzgâr iç ortamın soğutulmasına katkı sağlarken, özellikle PE örtülü seralar için meydana gelebilecek şişme ve yırtılmalar bakımından bir dezavantaj oluşturabileceği bildirilmiştir (Boyacı, 2018).

Uzun yıllık ortalama rüzgâr hızına bağlı olarak serada hesaplanan hava değişim sayılarının grafiksel gösterimi Şekil 1'de verilmiştir.



Şekil 1. Serada aylara bağlı rüzgâr hızlarında ortaya çıkan hava değişim sayıları

Şekil 1'de görüldüğü üzere hava değişim sayısı aylara göre değişen hava hızlarında farklılıklar göstermiştir. Buna göre artan hava hızları ve havalandırma açıklık oranlarında hava değişim sayısı artış göstermiştir. Bu nedenle doğal havalandırma açıklıklarının belirlenmesinde bölgeye uygun seraların tasarlanması ve esen rüzgarın yönü ile hızlarının dikkate alınması doğal havalandırmanın etkili çalışması bakımından önemlidir.

Serada aylara bağlı olarak farklı havalandırma açıklığı oranı ve poroziteye sahip böcek tüllerinin kullanılması durumunda, ulaşılacak hava değişim sayısı ve hava değişim katsayısı değerleri Çizelge 4'te verilmiştir.

Çizelge 4. Farklı havalandırma oranları ve porozitenin hava değişim sayısına etkisi

Çizelgeye bakıldığında seralarda böcek tüllerinin kullanılmaması durumunda hava değişim sayısı ve katsayısı değerlerinin havalandırma açıklık oranlarının artışı ile arttığı görülmektedir. Bunun yanında azalan porozite katsayılarında ise hava değişim sayıları ve katsayıları azalmıştır. Araştırmacıların yapmış oldukları çalışmalarında, Baytorun, (1986) seralarda iyi bir havalandırma için hava değişim katsayısının 30 1/h ve 50 1/h olması durumunda ise çok iyi havalandırma olarak sınıflandırılmıştır. Öztürk ve Başçetinçelik, (2002) ise hava değişim sayısının dakikada 0.75 olması durumunda, sera iç ortamında sıcaklık artışı yaklaşık 6 ºC, dakikada 1 olması durumunda ise yaklaşık 5 ºC olacağını belirtmişlerdir. Ayrıca, Soni ve ark., (2005) ise böcek tüllerinin hava hareketine karşı ekstra bir bariyer görevi görmesi nedeniyle havalandırma oranını önemli ölçüde azaltabileceğini ve bu durumda yetersiz havalandırmadan kaynaklanan yüksek iç hava sıcaklıklarının artacağını belirtmişlerdir. Buna göre çalışmada %25

havalandırma açıklık oranında böcek tülü kullanılmaması durumunda iyi bir havalandırma etkinliği sağlanırken bu aylarda rüzgar hızı ve böcek tülü porozitelerine bağlı olaraktan iyi bir havalandırma etkinliği sağlanamayacağı belirlenmiştir. Havalandırma açıklık oranının %30 ve %35 olması durumunda ise böcek tülü kullanılmadığı takdirde iyi bir havalandırma etkinliği sağlanabilecektir. Ancak bu havalandırma açıklık oranlarında böcek tülü kullanılması durumunda ise en fazla porozitesi Ɛ= 0.50 olan böcek tülleri kullanılmalıdır. Havalandırma açıklık oranı %35 olan ve Ɛ= 0.40 poroziteye sahip böcek tüllerinin kullanılması durumunda Haziran-Eylül ayları arasında iyi bir havalandırma mümkün olmaktadır. Ancak karasal iklime sahip bölgelerde soğuk dönemlerde ortaya çıkan düşük sıcaklık değerleri ve havalandırma açıklıklarındaki infiltrasyon kayıpları düşünüldüğünde bu açıklık alanlarının artırılması yanında bu açıklıklarda mümkün olan en iyi şekilde açıklıkların azaltılmasının önemli olduğu da dikkate alınmalıdır.

Çalışmada, dış ortamdaki ışınımın 900 W/m^2 olması ve porozite katsayıları farklı böcek tülünün kullanılması durumunda %50 gölgeleme tülü kullanılan ve kullanılmayan serada Mart- Eylül ayları arasında ulaşılan hava değişim sayısı, hava değişim katsayısı ve iç-dış sıcaklık farkı Çizelge 5'te verilmiştir.

		Ɛ= 0.25	97.5	19.9	1.4	2.8
	Ağustos	Böcek tülü yok	209.5	42.7	0.8	1.5
		Ɛ=0.5	157.1	32.1	1.0	1.9
		Ɛ= 0.4	134.1	27.4	1.1	2.2
		Ɛ= 0.25	91.6	18.7	1.5	2.9
	Eylül	Böcek tülü yok	168.9	34.5	0.9	1.8
		Ɛ=0.5	126.7	25.9	1.2	2.3
		Ɛ= 0.4	108.1	22.1	1.3	2.6
		Ɛ= 0.25	73.9	15.1	1.7	3.4

Çizelge 5 te görüldüğü üzere Mart ve Nisan aylarında havalandırma açıklıklarında böcek tülü kullanılmaması durumunda havalandırma katsayısı değerleri serada iyi bir havalandırma için yeterli olurken bu aylarda düşük rüzgar hızları ve porozite katsayılarının artması nedeniyle havalandırma sayısı azalmıştır. Mayıs ayında düşük rüzgar hızları nedeniyle ise iyi bir havalandırma oluşmayacağı görülmektedir. Bunun yanında Haziran ve Eylül ayları arasında havalandırma açıklıklarında böcek tülü kullanılmaması durumunda iyi bir havalandırma yapılabilecek iken Temmuz ve Ağustos aylarında ise Ɛ= 0.50 porozitede de iyi bir havalandırma yapabilme imkanı ortaya çıkmaktadır. Porozite katsayılarının azalması ise iyi bir havalandırmaya engel olmuştur. Ayrıca azalan havalandırma katsayılarının iç ortam sıcaklıklarını arttırdığı belirlenmiştir. Bu aylarda seraya ulaşan güneş radyasyonun azaltılması amacıyla yaygın olarak kullanılan gölgeleme tüllerinin iç ortama etkisi incelendiğinde, serada havalandırma açıklık oranın %25 olması durumunda Mart–Eylül ayları arasında havalandırma açıklıklarında böcek tülü kullanılmaması ve kullanılması durumunda serada gölgeleme tülü kullanılarak gelen radyasyonun %50 sinin azaltılması ile ulaşılan iç-dış sıcaklık farkı 0.7–1.9 °C arasında ortalama 1.3 °C arasında olarak hesaplanmıştır. Aynı durumda gölgeleme tülü kullanılmaması durumunda ise bu değerler 1.5–3.8 °C arasında ortalama 2.5°C olarak hesaplanmıştır. Fatnassi ve ark. (2003) tarafından yapılan çalışmada, anti-trips (Ɛ= 0.19) ve anti-afit (Ɛ= 0.56) tüllerinin havalandırma açıklıklarına konulmasıyla sıcaklık ve nemde önemli artışlar olduğunu belirtmişlerdir. Serada havalandırma açıklıklarında böcek tüllerinin kullanılmaması durumunda iç ve dış sıcaklık farkı 3.58 °C iken tüllerin kullanımı ile sera içi (kanopi yüksekliğinde) ve dışı arasındaki sıcaklık farkı sırasıyla 18.0 °C ve 12.8 °C'lik maksimum sıcaklık farklarına neden olmuştur. Ayrıca, tül olmadan havanın maksimum nem

oranı değeri yaklaşık 3.5 g/kg iken anti-trips ve anti-afit tüllerinin kullanılmasıyla sırasıyla 29 ve 19 g/kg'a yükselmiştir. Boyacı ve Başpınar (2022) iç ortamda yüksek sıcaklıkların azaltılabilmesi için doğal havalandırma ile birlikte hava sirkülasyonunu engellemeyecek şekilde gölgeleme tüllerinin kullanılması serada iç ve dış sıcaklık farkının azaltılmasına katkı sağlayacağını bildirmişlerdir. Çalışmada'da araştırmacıların belirttiği gibi böcek tülleri havalandırma açıklıklarında bariyer görevi gördüğünden iç sıcaklıkları arttırmıştır. Bu sıcaklıkların azaltılmasına katkı sağlaması için gölgeleme tüllerinin kullanılması ise iç ortama ulaşan radyasyon değerlerini azaltması nedeniyle ulaşılan iç ve dış sıcaklık farkını azaltmıştır.

4. SONUÇ VE ÖNERİLER

Seralarda havalandırma açıklıklarında kullanılan böcek tüllerinin havalandırma üzerindeki etkilerinin değerlendirildiği çalışma sonucunda,

- Sera tasarımının bölge iklimine uygun olması ve havalandırma açıklık oranlarının bölgenin iklim özelliklerine göre planlanmasının doğal havalandırma yönteminden daha yüksek verimin alınmasını sağlayacaktır.

- Havalandırma açıklıklarında kullanılan böcek tüllerinin bariyer etkisi yapması nedeniyle serada hava değişim sayısını azalttığı ve bunun iç ortam sıcaklık değerlerini arttıracağı belirlenmiştir.

- Sera iç ortam sıcaklıklarının azaltılması amacıyla kullanılan gölgeleme tülleri ise gölgeleme oranına bağlı olarak iç ortama ulaşan radyasyon değerlerini azaltarak sıcaklıkların azaltılmasına katkı sağlayacaktır.

Çalışma sonucunda, seralarda kullanılan böcek tüllerinin porozite katsayının azaltılması seraya giren böceklerin azaltılmasına katkı sağlarken havalandırmayı azaltacağı ve bunun bitki yetiştiriciliğine olumsuz etkide bulunacağı belirlenmiştir. Buna göre havalandırma açıklık oranlarının bölgenin iklim özellikleri dikkate alınarak planlanması doğal havalandırmanın daha etkin kullanılması bakımından önemli olacaktır.

EVALUATION OF THE EFFECT OF NATURAL VENTILATION AND COOLING APPLICATIONS ON INDOOR CLIMATE IN A HIGH TUNNEL GREENHOUSE

Prof. Dr. Sedat BOYACI
Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi, Biyosistem Mühendisliği Bölümü, Kırşehir, Türkiye
sedat.boyaci@ahievran.edu.tr, ORCID NO: 0000-0001-9356-1736

ABSTRACT

In order to make the indoor temperature, which increases due to the solar radiation reaching the greenhouse during periods of increasing temperatures, suitable for plant cultivation, greenhouses need to be air-conditioned. For this purpose, it was aimed to determine the effect of natural ventilation and cooling applications on the indoor climate in the high tunnel greenhouse. In the study, four different applications (natural ventilation, natural ventilation+external shading net, commercial cellulose pad, commercial cellulose pad+external shading net) were applied in the high tunnel greenhouse in order to make the indoor climate parameters suitable for plant cultivation. According to the results obtained, in natural ventilation and natural ventilation+external shading net applications, the temperature measured in the interior environment was 10.4 °C and 9.3 °C higher than the exterior environment, and the relative humidity values were 14% and 11% lower than the exterior environment, respectively. In cooling applications, the cooling effect measured in front of the pad in commercial cellulose pad and commercial cellulose pad+external shading net applications was determined as 5.2 °C and 7.2 °C lower than the external environment, and the relative humidity values were determined as 31.7% and 34.8% higher than the external environment, respectively. The cooling efficiencies of the applications were calculated as 49.0% and 58.6%, cooling capacities were 2.5 kW and 3.4 kW, and the system coefficient of performance values were 9.9 and 13.5, respectively. Water consumption values were measured as 3.4 L/h and 3.5 L/h, respectively. As a result of the study, commercial pads made positive contributions in reducing indoor temperatures and increasing relative humidity values during periods when temperatures increased. However, it was concluded that it is important to pay attention to the amount of water consumed in businesses with water restrictions and electricity consumed in the use of cooling applications.

Keywords: High tunnel greenhouse, temperature, relative humidity, cooling efficiency, cooling capacity

YÜKSEK TÜNEL SERADA DOĞAL HAVALANDIRMA VE SERİNLETME UYGULAMALARININ İÇ ORTAM İKLİMİ ÜZERİNDEKİ ETKİSİNİN DEĞERLENDİRİLMESİ

ÖZET

Sıcaklıkların arttığı dönemlerde seraya ulaşan güneş ışınımına bağlı olarak artan iç ortam sıcaklığın bitki yetiştiriciliğine uygun hale getirilebilmesi için seraların iklimlendirilmesi gereklidir. Bu amaçla yüksek tünel serada doğal havalandırma ve serinletme uygulamalarının iç ortam iklimi üzerindeki etkisinin belirlenmesi amaçlanmıştır. Çalışmada, iç ortam iklim parametrelerinin bitki yetiştiriciliğine uygun hale getirilebilmesi amacıyla yüksek tünel serada dört farklı uygulama (doğal havalandırma, doğal havalandırma+dıştan gölgeleme tülü, ticari selüloz ped, ticari selüloz ped+dıştan gölgeleme tülü) yapılmıştır. Elde edilen sonuçlara göre doğal havalandırma ve doğal havalandırma+dıştan gölgeleme tülü uygulamalarında iç ortamda ölçülen sıcaklık dış ortamdan sırasıyla 10.4 °C ve 9.3 °C daha yüksek, oransal nem değerleri ise dış ortamdan sırasıyla %14 ve %11 daha düşük olarak ölçülmüştür. Serinletme uygulamalarında ise ticari selüloz ped ve ticari selüloz ped+dıştan gölgeleme tülü uygulamalarında soğutma etkisi dış ortamdan sırasıyla 5.2 °C ve 7.2 °C düşük, oransal nem değerleri ise dış ortamdan sırasıyla %31.7, %34.8 yüksek olarak belirlenmiştir. Uygulamaların soğutma verimleri sırasıyla %49.0 ve %58.6, soğutma kapasiteleri 2.5 kW ve 3.4 kW ve sistemin performans katsayısı değerleri ise 9.9 ve 13.5 olarak hesaplanmıştır. Saatlik olarak tüketilen su miktarı sırasıyla 3.4 L/h ve 3.5 L/h olarak ölçülmüştür. Çalışma sonucunda sıcaklıkların arttığı dönemlerde ticari pedler iç ortam sıcaklıkların azaltılması ve oransal nem değerlerinin arttırılmasında olumlu katkılar sağlamıştır. Ancak serinletme uygulamalarının kullanımında tüketilen elektrik enerjisi ve su kısıtı bulunan işletmelerde tüketilen su miktarına dikkat edilmesinin önemli olduğu sonucuna varılmıştır.

Anahtar Kelimeler: Sera, sıcaklık, oransal nem, serinletme etkinliği, soğutma kapasitesi

1. GİRİŞ

Seralar, içerisinde yetiştirilen ürünleri olumsuz hava koşullarından korumak ve ürün kalitesini artırmak için inşa edilen yapılardır (Debhi ve ark., 2017). Sıcak iklimlerde, seralar yılın soğuk ve ılıman dönemlerinde tarımsal üretime özel olarak tasarlanmıştır. Ancak, yüksek yaz sıcaklıkları yetiştirilen ürünlerin gelişimini olumsuz etkiler (Callejón-Ferre ve ark., 2009). Kurak ve yarı kurak bölgelerde, yaz sıcaklıkları, gündüzleri 40 °C'yi aşabilen sıcaklıklar ve %30'un altındaki bağıl nem seviyeleri ile karakterize edilir (Al-Helal ve ark., 2004). Bu nedenle, yılın en sıcak zamanları için seranın içindeki hava sıcaklığını düşürmeyi amaçlayan stratejiler geliştirilmiştir (Cámara-Zapata ve ark., 2020).

Yarı kurak iklimlerdeki seralarda, düşük ekonomik maliyetleri nedeniyle en yaygın kullanılan soğutma sistemleri doğal havalandırma ve gölgelemedir (Muñoz ve ark., 1999; Kittas ve ark., 2002). İlk yatırım maliyetlerinin daha ucuz ve işletilmesinin daha kolay olması nedeniyle doğal havalandırma uygulaması yaygın olarak kullanılsa da bu yöntem çoğu zaman güneşli yaz günlerinde içerideki aşırı enerjinin dışarı atılmasında yeterli olamamaktadır (Baille, 1999). Gölgeleme tülleri ise seranın içine kurulurlarsa havalandırma oranlarını düşürür sera dışına kurulması durumunda ise hareketli gölgeleme tüllerinin kurulumu için ortaya çıkan yüksek maliyet ve sera yapısının üzerindeki artan yükler gibi dezavantajları vardır (González-Real ve ark., 2006; Montero ve ark., 2013).

Bu sorunların üstesinden gelmek için, aralarında buharlaştırıcı soğutma tekniklerinin de bulunduğu çok sayıda soğutma sistemi tasarlanmıştır. Doğrudan buharlaştırıcı soğutma grubu, fan-ped ve sisleme sistemlerini içerir (Misra ve Ghosh, 2018). Bu sistemler havadaki duyulur ısıyı gizli ısıya dönüştürerek ısı yükünü azaltır ve bitki gelişimi için uygun sera içi ortamı sağlar (Mutwiwa ve ark., 2007). Fan-ped sistemi, daha iyi hava doygunluk verimliliği nedeniyle daha fazla sıcaklık düşüşüne izin verir (López ve ark., 2012; Misra ve Ghosh, 2018). Bu sistemlerdeki temel sorunlar, daha fazla ekonomik yatırım gerektiren ve daha yüksek kalitede su gerektiren su ve enerji tüketimidir (sisleme sisteminde daha yüksektir) (Rabbi ve ark., 2019). Fan-ped sisteminin çalışmasını optimize etmek için yapılan uygulamalar arasında gölgelendirme perdeleriyle kullanılması iç ortam sıcaklıklarını azaltmak için iyi sonuçlar vermiştir (Ghosal ve ark., 2003). Farklı soğutma sistemlerinin (buharlaştırıcı soğutma, doğal havalandırma ve gölgeleme) birleştirilmesi sera enerjisi gereksinimlerini azaltabilir ve sıcak iklimlerde örtü altında bitki üretimi için optimum koşulları sağlayabilir (Xu ve ark., 2015; Ghoulem ve ark., 2019). Bu nedenle, bir fan-ped sistemini saha koşullarında karakterize etmek, diğer sistemlerin pedin çalışma parametreleri üzerindeki etkisini analiz etmeyi ve kombinasyonlarının ve/veya uyumsuzlukların varlığını belirlemeyi gerektirir (Cámara-Zapata ve ark., 2020). Sethi ve Sharma (2007), mevcut teknolojilerin hiçbirinin mükemmel olarak kabul edilemeyeceği sonucuna vardı, çünkü hiçbiri seraların ve iç mekan bitkilerinin tüm soğutma gereksinimlerini karşılamıyor. Bir soğutma sisteminin seçimi ve işletimi, iklim türü, yetiştirilecek bitki, maliyet, bakım, işletim kolaylığı, güvenilirlik, sistemin ömrü, elektriğe bağımlılık vb. gibi çeşitli parametrelere dayanmaktadır. Bu nedenle, sera soğutması için en uygun teknolojinin, çiftçinin maksimum getiri elde etmek için sezon dışı bitkileri yetiştirmek için istediği koşulların çoğunu karşılayan teknoloji olduğu söylenebilir.

Bu amaçla çalışmada, sıcaklıkların bitki yetiştiriciliğine olanak tanımadığı dönemlerde iç ortam sıcaklıkların azaltılması için farklı soğutma uygulamalarının bazı performans parametreleri ve iç ortam iklimine etkisini araştırmaktır.

2. MATERYAL VE METOT

Doğal havalandırma ve soğutma uygulamaları yapılan yüksek tünel seranın boyutları 3x5 m olup taban alanı 15 m^2 dir. Havalandırma açıklığı olarak ön cephe duvarındaki kapı boyutları 180 cm x 80 cm ve arka cephe duvarından bulunan pencere boyutları 50 cm x 50 cm olup havalandırma açıklık alanının taban alanına oranı %11.3'tür. Örtü malzemesi ise 36 aylık UV+IR katkılı PE plastik ile örtülüdür.

Yüksek tünel serada kullanılan doğrudan evaporatif soğutucunun havalandırma debisi 1500 m^3/h ve akan su miktarı saatte 216 L'dir. Evaporatif soğutucu içerisinde yaygın olarak kullanılan ticari selüloz ped kullanılmış ve ped kalınlığı 3 cm dir. Sistem günlük olarak 09:00-18:00 saatleri arasında çalıştırılmış ve tüketilen saatlik enerji miktarı 0.250 W'tir. Sistemin çalıştığı saatler arasında ortalama elektrik tüketimi 2.25 kWh'tir.

Çalışmada iç ve dış ortamda ölçülen iklim verileri Onset HOBO U12 sıcaklık ve oransal nem ölçer ile kayıt altına alınmıştır. Veri kaydediciler 30 dakikalık aralıklar ile verileri kayıt altına alınmıştır. Evaporatif soğutucunun elektrik tüketimi TT Technic PMG-1 ile kayıt altına alınarak ölçülmüştür.

Yüksek tünel serada, (1) Doğal havalandırma (DH), (2) Doğal havalandırma + dıştan gölgeleme tülü (DH+DGT), (3) ticari selüloz ped (CP) ve (4) Selüloz ped + dıştan gölgeleme tülü (CP+DGT) olmak üzere dört farklı uygulama yapılmıştır.

Evaporatif soğutma sisteminin performansının belirlenmesi amacıyla hesaplamalarda kullanılan eşitlikler aşağıda verilmiştir. Uygulamalarda, iç ve dış sıcaklık farkı olan uygulamaların soğutma etkisi Eşitlik 1 yardımıyla hesaplanmıştır (Almaneea ve ark., 2022).

$$\Delta T = T_i - T_d \qquad (1)$$

Eşitlikte; ΔT= uygulamaların soğutma etkisi (°C), Ti= İç ortam hava sıcaklığı (°C), Td= Dış ortam hava sıcaklığı (°C).

Evaporatif sistemin serinletme etkinliği Eşitlik 2 ile hesaplanmıştır (Maurya ve ark., 2014).

$$\eta = \frac{[td - ti]}{[td - twb]} x100 \qquad (2)$$

Eşitlikte; η= Soğutma sisteminin etkinliği (%), td= Dış ortam hava sıcaklığı (°C), ti= İç ortam hava sıcaklığı (°C), twb= Dış havanın ıslak termometre sıcaklığı (°C), dır.

Evaporatif serinletme pedinin soğutma kapasitesi Eşitlik 3 ile hesaplanmıştır (Maurya ve ark., 2014).

$$Qc = Ma \times Cpa \times [td - ti] \times 3.6 \quad (3)$$

Eşitlikte; Qc= Soğutma kapasitesi (kJ/h), Ma=Havanın kütlesel akış hızı (kg/s), Cpa= Havanın özgül ısısı (J/kg°C)

Su tüketim oranı Eşitlik 4 ile hesaplanmıştır (Maurya ve ark., 2014).

$$Q\omega = Ma\ [\omega o - \omega i]\ x\ 3600 \quad (4)$$

Eşitlikte; Qω= Su tüketim oranı (kg/sa), ωi= Dış ortam havasının pede girmeden önceki özgül nemi (kg/kg), ωo= Dış ortam havasının pedden çıktıktan sonraki özgül nemi (kg/kg)

Soğutma sisteminin performans katsayısı Eşitlik 5 ile hesaplanmıştır (Abohorlu Doğramacı ve ark., 2019).

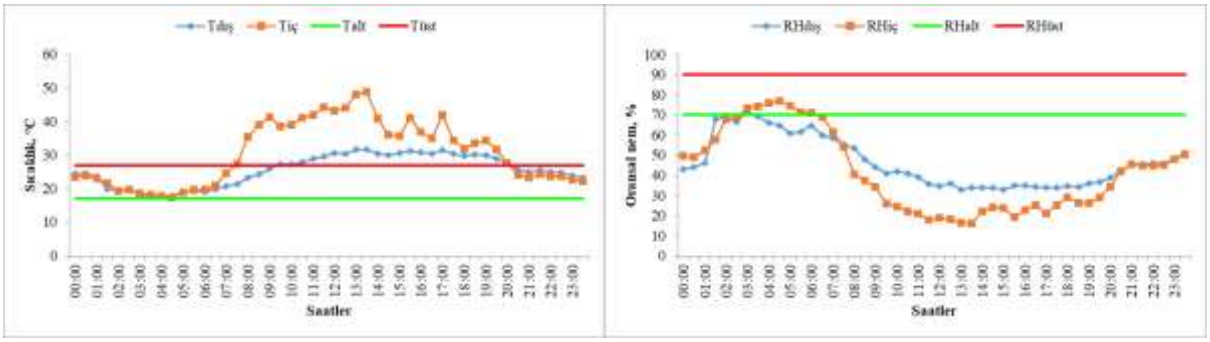
$$COP = \frac{Q_C}{W_{fan}+W_{pompa}} \quad (5)$$

Eşitlikte; Wfan ve Wpompa= soğutma sisteminde kullanılan fan ve pompanın elektrik tüketimi (kWh)

3. BULGULAR VE TARTIŞMA

3.1. Doğal Havalandırma Uygulamaları

İlk yatırım ve işletim maliyetlerinin düşük olması nedeniyle yaygın olarak kullanılan doğal havalandırma (DH) uygulamalarında ölçülen iç ve dış ortam sıcaklık ve oransal nem değerlerinin zamana bağlı değişimleri Şekil 1'de verilmiştir.

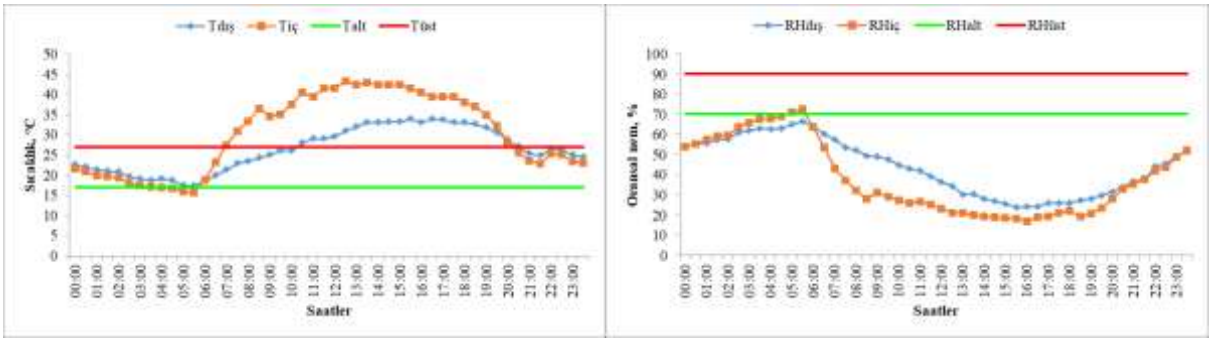


Şekil 1. DH uygulamasında ölçülen sıcaklık ve oransal nem değerlerinin zamana bağlı değişimleri

Gün içerisinde dış ortamda artan sıcaklık değerleri, iç ortamda sıcaklıkların artmasına neden olmuştur. Ayrıca artan sıcaklık değerlerinin etkisi ile iç ortamda bağıl nem değerleri azalmıştır. Doğal havalandırma uygulaması yapılan günde dış ortam sıcaklık değerleri 26.1-31.7 °C ve oransal nemin %33.0-44.0 arasında değişim göstermiştir. İç ortamda ölçülen sıcaklık 32.0-49.0 °C ve oransal nem %16.0-34.2 arasında ölçülmüştür. Yüksek tünel dışında ölçülen sıcaklık ve oransal neminin ortalama 29.8 °C ve %36.2 ölçüldüğü günde iç ortamda ölçülen sıcaklık ve oransal nem değerleri 40.3 °C ve %22.4 olarak belirlenmiştir. Bu durumda iç ortam sıcaklığı dış ortamdan 10.5 °C yüksek, oransal nem ise %13.8 daha düşük olduğu belirlenmiştir. DH uygulamasında örtü malzemesi nedeniyle iç ortama ulaşan güneş radyasyonu %30 azalmıştır. Artan güneş radyasyonuna bağlı olarak iç ortam sıcaklık değerlerinin arttığı bu dönemlerde yüksek tünel sera içine ulaşan yüksek radyasyon değerlerinin azaltılması amacıyla örtü altı yetiştiriciliğine yaygın olarak kullanılan dıştan gölgeleme tülü uygulaması doğal havalandırmaya katkı sağlayacaktır.

3.2. Doğal Havalandırma ve Dıştan Gölgeleme Tülü Uygulamaları

Güneş radyasyon değerlerinin yüksek yoğunluğuna sahip olduğu bölgelerde, yüksek havalandırma oranları her zaman sera iç ortam sıcaklıklarını azaltmada yeterli olamamaktadır. Bu durumda yüksek güneş yoğunluğu bitkilerde ısı stresine neden olur. Bunu azaltmak içinse seralarda gölgeleme tülü kullanılır (Holcman ve Sentelhas, 2012). Doğal havalandırma + Dıştan gölgeleme tülü (DH+DGT) uygulamasında ölçülen iç ve dış ortam sıcaklık ve oransal nem değerlerinin zamana bağlı değişimleri Şekil 2'de verilmiştir.



Şekil 2. DH +DGT uygulamasında sıcaklık ve oransal nem değerlerinin değişimi

Çalışmada DH+DGT uygulamasına benzer olarak dış ortamda artan sıcaklık değerleri iç ortam sıcaklıklarını arttırması oransal nem değerlerini ise azaltmıştır (Şekil 2). Gün içerisinde dış ortamda ölçülen sıcaklık 25.0-34.0 °C ve oransal nem %23.8-49.0 arasında değişmiştir. İç ortamda ise ölçülen sıcaklık 34.6-43.3 °C ve oransal nem %16.9-31.2 arasında ölçülmüştür. Dış ortamda ölçülen sıcaklık ve oransal nemin ortalama 31.0 °C ve %33.0 olduğu günde iç ortam sıcaklık ve oransal nem değeri 40.3 °C ve %22.2 olarak belirlenmiştir. Bu durumda iç ortam sıcaklığı dış ortamdan 9.3 °C yüksek, oransal nem ise %10.8 düşük ölçülmüştür. DH+DGT uygulamasında dış ortama göre iç ortama ulaşan güneş radyasyonu %55 azalmıştır.

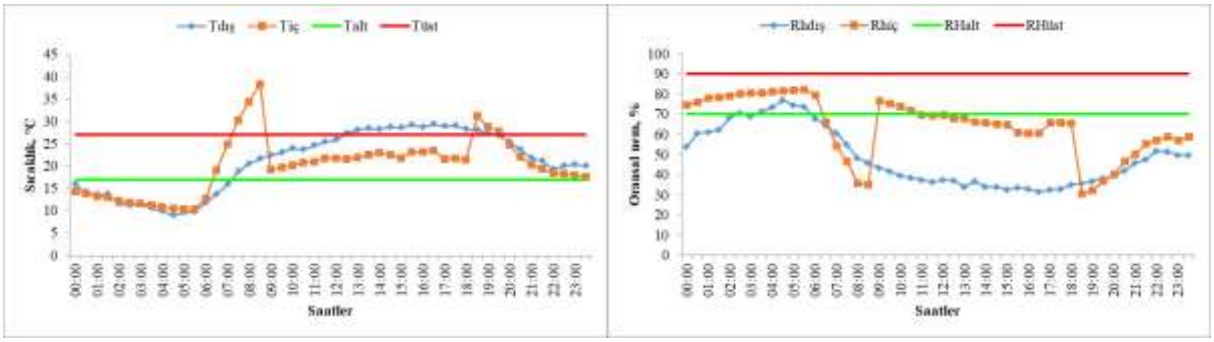
Serada yetiştiriciliği yapılan bitkiler için iç ortam sıcaklık değerlerinin 17–27 °C ve oransal nem değerlerinin %80 düzeyinde olması istenir (von Zabeltitz, 1994). Yapılan ölçümlerde DH uygulamasında (40.3 °C ve %22.4) bitki yetiştiriciliği bakımından yüksek sıcaklık, düşük oransal nem değerlerindedir. İç ortam sıcaklıklarını azaltmak ve oransal nem değerlerini yükseltmek için dıştan gölgeleme tülü uygulaması ile sera iç ortamına ulaşan güneş radyasyonu değerlerini azaltıp iç ortam iklimini bitki yetiştiriciliğine uygun hale getirmek iyi bir yöntem olabilmektedir. Fakat DH+DGT uygulamasında da (40.3 °C ve %22.2) ölçülen yüksek iç ortam sıcaklığı ve düşük oransal nem değerleri göstermiştir ki yaz aylarında gölgeleme tülü uygulaması da DH uygulamasına benzer olarak iç ortam iklimini bitki yetiştiriciliğine uygun hale getirmekten uzak olduğu görülmüştür (Şekil 1 ve Şekil 2).

Seralarda kullanılan doğal havalandırma uygulamasının etkinliği düşük dış hava hızlarında sınırlı olmaktadır. Kullanılan gölgeleme tülleri kullanılan tekniğe ve gelen güneş radyasyonunu azaltma oranına bağlı olarak serada yapılan üretimi ve yetiştiriciliği yapılan ürünün kalite özelliklerini olumsuz etkileyebilir (Aroca-Delgado ve ark., 2018; McCartney ve ark., 2018). Abbouda ve Almuhanna (2012) serada 200 µm kalınlığında UV katkılı polietilen örtü malzemesi ve %60 oranında gölgeleme tülü kullanılması durumunda, sera dış ve iç ortamında ölçülen solar radyasyon değerini sırasıyla 555.7 W/m^2 ve 298.7 W/m^2 olarak ölçülmüş ve örtü malzemesinin etkin geçirgenliğini ortalama %53.8 olduğunu bildirmişlerdir. Yürütülen çalışmada kullanılan örtü malzemesinin yansıtma özelliği ve dıştan kullanılan gölgeleme tülünün etkisiyle iç ortama ulaşan güneş radyasyonu DH uygulamasında %30, DH+DGT uygulamasında %55 oranında azalmıştır.

Yapılan çalışmada, DH uygulaması yapılan bir gündeki benzer sıcaklık değerlerine göre iç ortamda 1.5 °C lik bir sıcaklık farkı oluşmuştur. Gölgeleme tülü nedeniyle her nekadar iç ortama ulaşan güneş radyasyonu değeri azalsa da sıcaklıkları 40°C ve üzerine çıktığı günlerde iç ortamda biriken ısı enerjisinin dış ortama atılması mümkün olmamıştır. Bunun neticesinde yapılan her iki uygulamadan da iç ortam sıcaklık ve oransal nem değerleri iç ortam iklimini bitki yetiştiriciliği için gerekli olan optimum değerlere getirememiştir. Bu durumda birim alandan daha fazla verim alınmasına olanak sağlayan seralarda yüksek sıcaklık ve düşük oransal nem değerleri bitkilerin çiçek bağlaması, gelişim ve verim parametrelerini olumsuz etkileyecektir. Dış ortam sıcaklık değerlerinin yükseldiği bu dönemlerde yetiştiricilik için iç ortam sıcaklık değerini düşüren ve oransal nem değerlerini yükselten evaporatif serinletme uygulamalarının gerekliliği ortaya çıkmaktadır.

3.3. Selüloz ped uygulaması

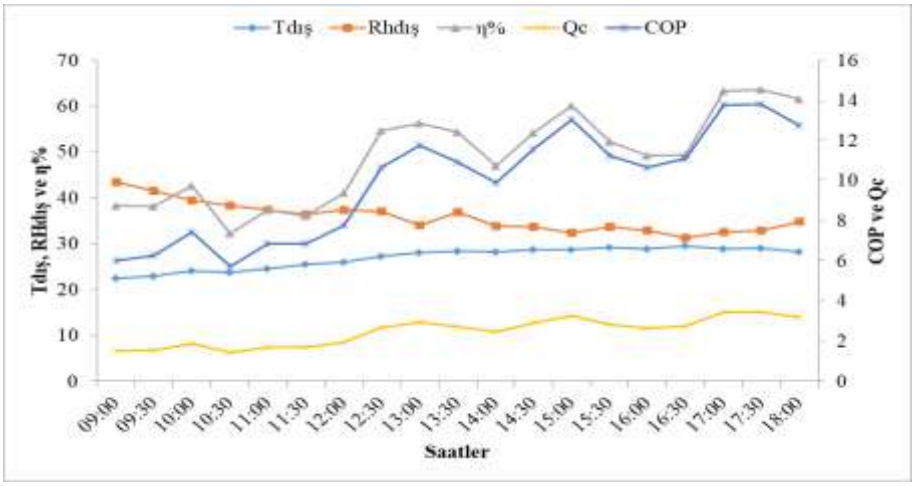
Çalışmada, CP uygulamasında ölçülen sıcaklık ve oransal nem değerlerinin zamana bağlı değişimleri Şekil 3' te verilmiştir.



Şekil 3. CP uygulamasında ölçülen sıcaklık ve oransal nem değerleri

CP uygulamasında sistemin çalışmadığı gece saatlerinde iç sıcaklıklarının düşük olmasına karşın güneşin doğuşu ile birlikte güneş radyasyonu etkisini göstererek iç ortam sıcaklıklarını arttırmıştır. İç ortamda artan sıcaklık değerleri ise oransal nem değerlerini azaltmıştır (Şekil 3). Soğutma sisteminin çalıştığı 09:00-18:00 saatleri arasında ölçülen dış sıcaklık değerleri 22.4 °C - 29.4 °C arasında ortalama 27 °C ölçülmüştür. Bu saatler arasında iç ortam sıcaklıkları 19.3 °C - 23.5 °C arasında ortalama 21.7 °C ölçülmüştür. Buna göre soğutma etkisi 3 °C - 7.4 °C arasında ortalama 5.2 °C olarak hesaplanmıştır. Dış bağıl nem değerleri ise %31.3 - %43.4 arasında ortalama %35.8 olarak ölçülmüştür. İç ortam bağıl nem değerleri ise %60.5 - %76.6 arasında ortalama %67.5 olarak ölçülmüştür. Buharlaştırmalı soğutma sistemi ile iç ortamda oransal nem dış ortama göre %31.7 artmıştır.

CP uygulamasında ölçülen ve hesaplanan performans parametrelerinin zamana bağlı değişimi Şekil 4'te verilmiştir.

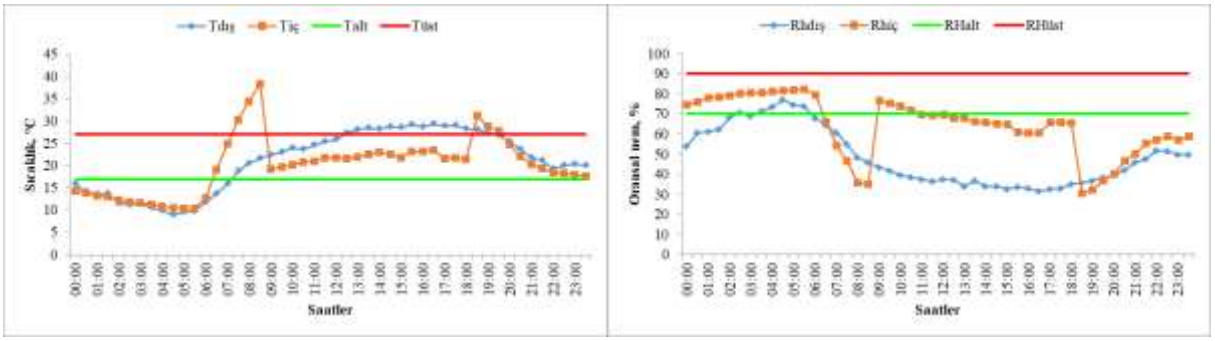


Şekil 4. CP uygulamasında performans parametrelerinin zamana bağlı değişimleri

Çalışmada CP uygulamasında soğutma verimi %32.3 - %63.6 arasında ortalama %49 olarak hesaplanmıştır. Sistemin soğutma kapasitesi 1.4 kW - 3.5 kW arasında ortalama 2.5 kW, COP değeri 5.7 - 13.8 arasında ortalama 9.9 olarak hesaplanmıştır (Şekil 4). Su tüketimi 1.6 L/h - 5.3 L/h arasında ortalama 3.4 L/h ve günlük su tüketimi ortalama 63.9 L olarak hesaplanmıştır.

3.4. Selüloz ped ve Dıştan gölgeleme uygulaması

Çalışmada, ticari selüloz ped+ dıştan gölgeleme tülü uygulamasında ölçülen sıcaklık ve oransal nem değerlerinin değişimi Şekil 5' te verilmiştir.

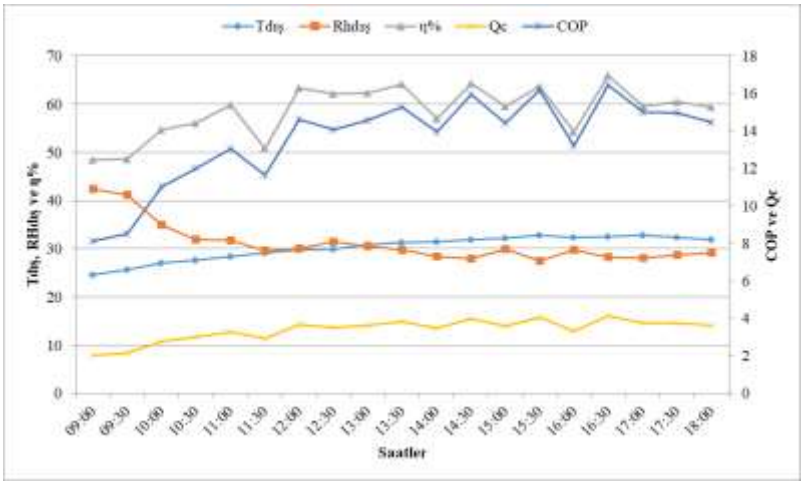


Şekil 5. CP+DGT uygulamasında ölçülen sıcaklık ve oransal nem değerleri

Çalışmada, CP+DGT uygulamasında CP uygulamasına benzer olarak günün erken saatlerinde artan iç ortam sıcaklıkları oransal nem değerlerini azaltmıştır. Soğutma sisteminin çalıştığı 09:00-18:00 saatleri arasında ölçülen dış sıcaklık değerleri 24.6 °C - 32.7 °C arasında ortalama 30.2 °C ölçülmüştür. Bu saatler arasında iç ortam sıcaklıkları 20.3 °C - 25.2 °C arasında

ortalama 23 °C olarak ölçülmüştür. Yüksek tünel serada ölçüm yapılan saatler arasında soğutma etkisi 4.3 °C - 8.9 °C arasında ortalama 7.2 °C olarak hesaplanmıştır. Dış bağıl nem değerleri ise %27.4 - %42.3 arasında ortalama %31.1 olarak ölçülmüştür. İç ortam bağıl nem değerleri ise %60-%74.2 arasında %65.9 olarak ölçülmüştür. Buna göre buharlaştırmalı soğutma sistemi ile iç ortamda oransal nem %34.8 artmıştır.

CP+DGT uygulamasında ölçülen ve hesaplanan performans parametrelerinin zamana bağlı değişimi Şekil 6'da verilmiştir.



Şekil 6. CP+DGT uygulamasında performans parametrelerinin zamana bağlı değişimleri

CP+DGT uygulamasında soğutma verimi %48.4 - %65.9 arasında ortalama %58.6 olarak hesaplanmıştır. Sistemin soğutma kapasitesi 2 kW - 4.1 kW arasında ortalama 3.4 kW, COP değeri 8.1 - 16.4 arasında ortalama 13.5, su tüketimi 2.6 L/h - 5.4 L/h arasında ortalama 3.5 L/h ve günlük su tüketimi ortalama 65.8 L olarak hesaplanmıştır.

Çalışmada, soğutma etkisi değerlerine bakıldığında iç ortamda ölçülen sıcaklıklar dış ortamdan CP uygulamasında 5.2 °C ve CP+DGT uygulamasında 7.2 °C daha düşük olarak hesaplanmıştır. Araştırmacıların evaporatif uygulamalar üzerine yapmış oldukları çalışmalarda soğutma etkisini, Jakubowski ve ark. (2024) tarafından CP ve CP+DGT uygulamasında sırasıyla 5.5 °C ve 6.6 °C, Gunhan ve ark. (2007) CP uygulamasında farklı hava hızları için 3.91- 4.97 °C arasında ve Shivpuje ve ark. (2018) CP uygulamasında pede giren ve ped den çıkan sıcaklıkları arasındaki farkın 5-7 °C arasında olduğunu belirlemişlerdir. Bu sonuçlar araştırmacıların çalışmaları ile uyumlu bulunmuştur. Çalışmada elde edilen sonuçlara gör CP ve CP+DGT uygulamalarının her iki uygulamada iç ortamdaki sıcaklık değerlerini bitki yetiştiriciliğine uygun koşullara getirilebilecektir. Evaporatif sistem ile duyulur ısı gizli ısıya dönüştürülerek iç ortamdaki sıcaklık değerlerini azaltıp oransal nem değerlerini arttırması nedeniyle bu sistemlerin soğutma etkisi DH ve DH+DGT uygulamalarına göre oldukça yüksek olmuştur. Aynı zamanda, CP+DGT uygulamasında kullanılan dıştan gölgeleme tülünün iç

ortama ulaşan güneş radyasyonu azaltılması nedeniyle soğutma etkisi CP uygulamasından fazla olduğu belirlenmiştir.

Yüksek tünel sera içerisinde ölçülen oransal nem değerleri dış ortama göre CP uygulamasında yaklaşık %31.7 ve CP+DGT uygulamasında %34.8 daha yüksek ölçülmüştür. Gunhan ve ark. (2007) CP uygulamasında farklı hava hızları için bağıl nem değerlerini %27.4-%37.2 arasında ve Shivpuje ve ark. (2018) pede giren havanın ortalama bağıl neminin %23.3-%26.6 arasında arttığını bildirmişlerdir. Çalışmada elde edilen sonuçlar araştırmacıların çalışmaları ile benzer özellikler göstermiştir. Dış ortamda artan sıcaklık değerleri oransal nem değerlerini azaltmıştır. Böylece, dış ortamdan soğutma pedinin içine giren kuru hava daha fazla nem almış ve iç ortamdaki bağıl nem değerlerinin artmasını sağlamıştır. Her iki uygulamada da iç ortam iklim koşulları bitki yetiştiriciliğine uygun hale getirilse de CP+DGT uygulamasında dıştan gölgeleme tülü kullanılması iç ortamı CP uygulamasına göre daha uygun hale getirmiştir.

Soğutma verimliliği bakımından CP uygulaması ortalama %49.0, CP+DGT uygulaması ortalama %58.6 olarak hesaplanmıştır. Çalışmada kullanılan dıştan gölgeleme tülü soğutma verimliliğini olumlu yönde etkilemiştir. Gunhan ve ark. (2007) CP uygulaması için soğutma verimliliğini %46.1, ve Vala ve ark. (2016) CP uygulamasında %57.14–%90.70 belirlemişlerdir. Elde edilen sonuçlar araştırmacıların yapmış oldukları çalışmalar ile farklılıklar göstermiştir. Bu farklılıklar uygulamalarda kullanılan ped kalınlığına ve dış ortam kuru havasına bağlı olarak değişim göstermiştir.

Soğutma kapasitesi CP uygulaması için ortalama 2.5 kW ve COP değeri 9.9 iken CP+DGT uygulaması için ortalama 3.4 kW ve COP değeri 13.5 olarak hesaplanmıştır. Çalışmada CP+DGT uygulamasının CP uygulamasına göre soğutma etkisinin fazla olması soğutma kapasitesini (Qc) ve COP'u arttırmıştır (Şekil 4 ve Şekil 6). Chaomuang ve ark. (2023) CP için soğutma kapasitesinin 0.3-0.6 kW ve COP değerinin yaklaşık 2.2–4.5 arasında ve soğutma kapasitesinin sadece sıcaklık düşüşüyle değil bunun yanında su akış hızıyla da ilişkili olduğunu bildirmişlerdir. Çalışmada, soğutma sisteminin 2 m/s lik yüksek hava akış hızında olması sistemin soğutma kapasitesi ve COP değerlerini arttırmıştır.

Çalışmada, tüketilen su tüketimi karşılaştırıldığında SP uygulamasında 63.9 L/gün iken SP+DGT uygulamasında 65.8 L/gün olarak hesaplanmıştır. Dış ortamdaki düşük oransal nem, evaporatif soğutucuya giren kuru havanın daha fazla nem almasına ve dolayısıyla daha fazla su tüketilmesine neden olur. Nikolaou ve ark. (2018) hıyar yetiştirilen bir serada fan-ped sistemi için sera birim taban alanına 3 L/m^2' suyun tüketildiğini bildirmişlerdir. Franco ve ark. (2014) CP için tüketilen suyun 1.8–2.62 L/h arasında değiştiğini belirtmişlerdir. Yürütülen çalışmada, birim alan için tüketilen su miktarı CP uygulamasında 4.3 L/m^2, CP+DGT uygulamasında 4.4 L/m^2 su tüketilmiştir. Birim alan için su tüketimindeki farklılıklar iklim koşulları, ped kalınlıkları gibi farklılıklardan kaynaklanmıştır. İklim değişikliği ve yağış rejimlerindeki düzensizlikler nedeniyle su kullanımının öneminin her geçen gün arttığı günümüzde seraların soğutulması kadar soğutma amaçlı kullanılan su miktarının bilinmesinin de önemli olduğu görülmektedir. Çünkü su kısıtının olduğu bölgelerde evaporatif (buharlaştırmalı) soğutma uygulamalarında tüketilen su miktarının fazlalığı sistemin uygulanabilirliğini de etkileyecektir.

Soğutma sisteminin elektrik tüketimine bakıldığında saatlik enerji tüketimi 0.250 W ölçülmüştür. Gün içerisinde sistemin çalıştığı saatler arasında toplam tüketim ortalama 2.25

kWh olarak ölçülmüştür. Sıcaklıkların yükseldiği Haziran-Ağustos ayları arasında soğutma yapılacak saatler ve yetiştiricilik süreside dikkate alınarak elektrik tüketimi için yapılan harcamalara dikkat edilmesi gerekmektedir. Çünkü bu aylarda açık tarla koşullarında yetiştirilen ürünlerin piyasa çıkması da soğutma için karar vermede önemli bir kriter olarak ortaya çıkmaktadır.

4. SONUÇ VE ÖNERİLER

Yüksek tünel serada doğal havalandırma ve serinletme uygulamalarının iç ortam iklimi üzerindeki etkisinin değerlendirildiği çalışmada,

Yüksek sıcaklıkların bitki yetiştiriciliğine imkan vermediği veya yetiştiriciliği sınırlandırdığı koşullar altında doğal havalandırma ve doğal havalandırma+dıştan gölgeleme tülü uygulamalarının iç ortam sıcaklığını bitki yetiştiriciliğine uygun hale getiremediği bu yöntemlerin daha çok ilkbahar ve sonbahar mevsimlerinde kullanılmasının uygun olduğu belirlenmiştir. Bu dönemlerde yetiştiricilik yapılabilmesi için evaporatif soğutma sistemlerinin kullanımı yetiştiricilikte bitki gelişim ve verim parametreleri üzerinde etkili olacaktır.

Bu amaçla kullanılan fan-ped sisteminin verimliliği dış ortamda artan hava sıcaklığı ve azalan oransal nem ile birlikte arttığından sistemin kullanıldığı bölgenin iklimine dikkat edilmesi gerekmektedir. Aynı zamanda elde edilen sonuçlar, fan-ped sistemi çalışmasının gölgelendirme ile birleştirildiğinde daha uygun iç ortam iklimi sağladığı belirlenmiştir.

Fan ped sistemi için kullanılan su miktarı ve elektrik enerjisinin fiyatlarının üretim maliyetleri içindeki payının belirlenmesi ve ürün satış fiyatı arasındaki ekonomik dengenin işletmeler tarafından belirlenmesi karlı bir üretim açısından önemlidir.

KNOWLEDGE AND ATTITUDE LEVELS OF FEMALE CONSUMERS IN NEVŞEHİR PROVINCE ABOUT THE STORAGE OF BEE PRODUCTS

Fatih ÇALIŞKAN[1]
Doç. Dr. Halil Özcan ÖZDEMİR[2]
Doç. Dr. Başar ALTUNTAŞ[3]

ABSTRACT

This study aims to measure the knowledge, attitudes and behaviors of bee product consumers in Nevşehir province regarding the preservation of bee products. Bee products are natural products known for their many health benefits, primarily honey, propolis, royal jelly, pollen and bee venom. They have an important place in child nutrition, especially due to their immune system-supporting effects. However, there is not enough scientific data on how much mothers know about these products, their usage habits and the storage conditions for these products. In this context, a survey was conducted among women living in Nevşehir. The survey aims to measure the level of knowledge of mothers about the preservation of bee products. The findings of the study will help determine the level of awareness in society about the preservation methods of bee products. In line with the data obtained, training programs and informative campaigns can be organized to raise awareness of mothers. When the age of the participants in the study is examined, it was determined that 41.5% (111 people) were women between the ages of 36-45, 46% (122 people) of the participants had a bachelor's degree and 58.2% (153 people) were public personnel. According to the results of the research, the rate of those who store honey in closed containers outside was 77.5% (207 people), and the rate of those who store pollen and perga in a dry and cool place was 32.4% (85 people). Finally, it was determined that 51.3% (135 people) of the participants had no information about the storage of royal jelly. As a result, this research aims to contribute to the widespread use of bee products and the development of more conscious consumption habits. It is expected that the data obtained will shed light on public health policies and nutritional guidelines.

Keywords: Apitherapy, mother, child.

NEVŞEHİR İLİNDEKİ KADIN TÜKETİCİLERİN ARI ÜRÜNLERİNİN MUHAFAZASI KONUSUNDAKİ BİLGİ VE TUTUM DÜZEYLERİ

ÖZET

Bu çalışma, Nevşehir ilindeki arı ürünleri tüketicilerinin arı ürünlerinin muhafazası konusundaki bilgi, tutum ve davranışlarını ölçmeyi amaçlamaktadır. Arı ürünleri, başta bal, propolis, arı sütü, polen ve arı zehri olmak üzere birçok sağlık yararı ile bilinen doğal ürünlerdir. Özellikle bağışıklık sistemini destekleyici etkileri nedeniyle çocuk beslenmesinde önemli bir yere sahiptir. Ancak annelerin bu ürünler hakkında ne kadar bilgi sahibi olduğu, kullanım alışkanlıkları ve bu ürünlere yönelik muhafaza şartları konusunda yeterli bilimsel veri bulunmamaktadır. Bu kapsamda, Nevşehir'de yaşayan kadınlara anket çalışması yapılmıştır. Anket ile annelerin arı ürünlerinin muhafazası hakkındaki bilgi düzeylerini ölçmek amaçlanmaktadır. Çalışmanın bulguları, toplumda arı ürünlerinin muhafaza yöntemleri hakkındaki bilinç düzeylerini belirlemeye yardımcı olacaktır. Elde edilen veriler doğrultusunda, annelerin bilinçlendirilmesine yönelik eğitim programları ve bilgilendirici kampanyalar düzenlenebilir. Araştırmaya katılanların yaşlarına bakıldığında en çok 36-45 yaş aralığındaki kadınlardan oluştuğu %41,5 (111 kişi), katılımcıların %46'sinin (122 kişi) lisans düzeyinde eğitime sahip oldukları, %58,2'sinin (153 kişi) kamu personeli olduğu belirlenmiştir. Araştırma sonuçlarına göre balı kapalı kapta dışarıda muhafaza edenlerin oranı % 77,5 (207 kişi), polen ve pergayı kuru ve serin yerde muhafaza edenlerin oranı % 32,4 (85 kişi) olarak gerçekleşmiştir. Son olarak arı sütünün muhafazası ile ilgili ise katılımcıların %51,3'ünün (135 kişi) hiçbir bilgilerinin olmadığı belirlenmiştir. Sonuç olarak, bu araştırma, arı ürünleri kullanımının yaygınlaştırılması ve daha bilinçli tüketim alışkanlıklarının geliştirilmesine katkı sağlamayı amaçlamaktadır. Elde edilen verilerin, halk sağlığı politikalarına ve beslenme rehberlerine ışık tutması beklenmektedir.

Anahtar kelimeler: Apiterapi, anne, çocuk.

GİRİŞ

Arı ürünleri, insanlık tarihi boyunca beslenme ve sağlık alanında önemli bir role sahip olmuştur. Bal, propolis, arı sütü, polen ve arı zehri gibi ürünler, zengin besin içerikleri ve terapötik özellikleri nedeniyle giderek artan bir ilgi görmektedir (Pasupuleti vd., 2017). Bu ürünlerin bağışıklık sistemini güçlendirme, antioksidan etki gösterme ve antimikrobiyal özellikler sergileme gibi çeşitli sağlık yararları bilimsel çalışmalarla desteklenmektedir (Eteraf-Oskouei ve Najafi, 2013). Özellikle çocuk beslenmesinde önemli bir yere sahip olan arı ürünlerinin etkinliği, büyük ölçüde doğru muhafaza edilmelerine bağlıdır (Bogdanov vd., 2008). Ancak, tüketicilerin bu ürünlerin uygun saklama koşulları hakkındaki bilgi düzeyleri ve uygulamaları konusunda sınırlı veri bulunmaktadır. Bu bağlamda, özellikle annelerin arı ürünlerinin muhafazası konusundaki bilgi, tutum ve davranışlarının incelenmesi, halk sağlığı açısından kritik öneme sahiptir. Bu çalışma, Nevşehir ilindeki kadın tüketicilerin arı ürünlerinin muhafazası konusundaki bilgi düzeylerini, tutumlarını ve uygulamalarını değerlendirmeyi amaçlamaktadır. Elde edilecek bulgular, toplumda arı ürünlerinin doğru kullanımı ve saklanması konusundaki bilinç düzeyinin artırılmasına yönelik stratejilerin geliştirilmesine katkı sağlayacaktır. Apiterapi ürünleri, arı ve arı ürünlerinin sağlık amaçlı kullanımını içeren doğal tedavi yöntemlerinde kullanılan ürünlerdir. Başlıca apiterapi ürünleri şunlardır:

1. **Bal:**

Bal, nektar ve bitki salgılarının arılar tarafından toplanıp, vücutlarında değişikliğe uğratılarak petek gözlerine depo edilmesi sonucu oluşan tatlı bir gıdadır. Antibakteriyel, antioksidan ve anti-inflamatuar özelliklere sahiptir. Yapılan çalışmalar, balın yara iyileşmesini hızlandırdığını, üst solunum yolu enfeksiyonlarında semptomları hafiflettiğini ve sindirim sistemi rahatsızlıklarında faydalı olabileceğini göstermiştir (Eteraf-Oskouei & Najafi, 2013).

2. **Polen:**

Polen, çiçekli bitkilerin erkek üreme hücrelerini içeren tozlardır. Arılar tarafından toplanıp, nektar ve tükürük salgılarıyla karıştırılarak oluşturulur. Yüksek protein, vitamin ve mineral içeriğiyle besleyici bir gıda takviyesidir. Araştırmalar, polenin bağışıklık sistemini güçlendirdiğini, antioksidan etkiye sahip olduğunu ve prostat sorunlarında faydalı olabileceğini göstermiştir (Komosinska-Vassev et al., 2015).

3. **Propolis:**

Propolis, arıların bitki tomurcukları ve reçinelerinden topladığı, kovan içinde dezenfektan ve yapı malzemesi olarak kullandığı bir maddedir. Güçlü antimikrobiyal, antioksidan ve anti-inflamatuar özelliklere sahiptir. Bilimsel çalışmalar, propolisin ağız ve diş sağlığını korumada, yara iyileşmesinde ve bazı kanser türlerine karşı koruyucu etkisinin olabileceğini göstermiştir (Sforcin, 2016).

4. **ArıSütü:**

Arı sütü, işçi arıların hypopharyngeal ve mandibular bezlerinden salgılanan, kraliçe arı ve larvaların beslenmesinde kullanılan besin değeri yüksek bir maddedir. İçerdiği proteinler, vitaminler ve mineraller sayesinde bağışıklık sistemini güçlendirici ve yaşlanma karşıtı etkilere sahiptir. Yapılan araştırmalar, arı sütünün kolesterol düzeylerini düşürmede, menopoz semptomlarını hafifletmede ve cilt sağlığını iyileştirmede etkili olabileceğini göstermiştir (Ramadan & Al-Ghamdi, 2012).

5. ArıZehri:

Arı zehri, bal arılarının savunma mekanizması olarak kullandıkları, iğnelerinden salgılanan bir maddedir. Anti-inflamatuar ve analjezik özelliklere sahiptir. Klinik çalışmalar, arı zehrinin romatoid artrit, multiple skleroz ve kronik ağrı gibi rahatsızlıklarda semptomları hafifletmede etkili olabileceğini göstermiştir. Ancak alerjik reaksiyon riski nedeniyle kullanımı dikkat gerektirir (Lee et al., 2005).

6. Balmumu:

Balmumu, işçi arıların karın bölgelerindeki bezlerden salgıladıkları, petek yapımında kullandıkları bir maddedir. Kozmetik ve tıbbi ürünlerde yaygın olarak kullanılır. Araştırmalar, balmumunun cilt bakımında nemlendirici ve koruyucu etkilerinin yanı sıra, bazı cilt rahatsızlıklarının tedavisinde de faydalı olabileceğini göstermiştir (Fratini et al., 2016).

Materyal ve Yöntem

Bu araştırma, Nevşehir ilinde yaşayan kadın tüketicilerin arı ürünlerinin muhafazası konusundaki bilgi ve tutum düzeylerini belirlemek amacıyla yapılmıştır. Araştırmanın evrenini Nevşehir ilinde yaşayan 18 yaş ve üzeri kadın tüketiciler oluşturmaktadır. Örneklem seçiminde basit tesadüfi örnekleme yöntemi kullanılmış ve toplam 269 kadın tüketici araştırmaya dahil edilmiştir. Veriler, yüz yüze görüşme tekniği kullanılarak toplanmıştır. Veri toplama süreci Kasım-Aralık 2024 tarihleri arasında gerçekleştirilmiştir. Elde edilen veriler, SPSS 25.0 istatistik programı kullanılarak analiz edilmiştir. Verilerin analizinde tanımlayıcı istatistiklerden frekans, yüzde yöntemi kullanılmıştır.

BULGULAR

Tablo 1. Katılımcıların yaş düzeyleri

Yaş Aralığı	% Oranı	Kişi Sayısı
45 Üzeri	28,5	76
36 - 45	41,5	111
26 - 35	22,3	59
18 - 25	7,5	20

Bu çalışmaya katılan 266 kişiden %7,5'i (20 kişi) 18-25 yaş aralığında, %22,3'i (59 kişi) 26-35 yaş aralığında, %41,5'i (111 kişi) 36-45 yaş aralığında , %28,5'i (76 kişi) ise 46 yaş ve üzeri yaşta olduğunu belirtmiştir.

Tablo 2. Katılımcıların eğitim düzeyleri

Eğitim Kategorileri	% Oranı	Kişi Sayısı
Lisans Üstü	14,3	38
Lisans	46	122
Ön lisans	17,4	46
Ortaöğretim	14,3	38
İlköğretim	7,9	21

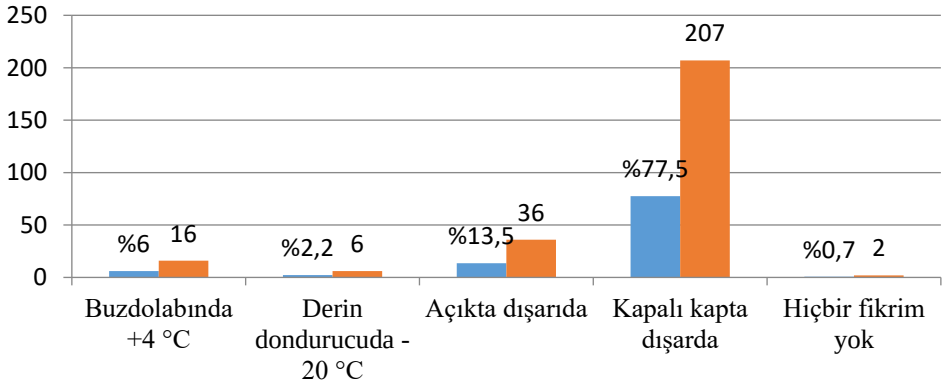
Katılımcıların eğitim durumuna bakıldığında %7,9'unun (21 kişi) ilköğretim düzeyinde, %14,3'ünün (38 kişi) ortaöğretim düzeyinde, % 17,4'ünün (46 kişi) önlisans düzeyinde, % 46'sının (122 kişi) lisans düzeyinde, son olarak %14,3'ünün ise; (38 kişi) ise lisansüstü eğitim aldığı görülmüştür.

Tablo 3. Katılımcıların meslek grupları

Meslek Grupları	% Oran	Kişi Sayısı
Ev Hanımı	16	42
Serbest	13,7	36
İşçi	12,2	32
Memur	58,2	153

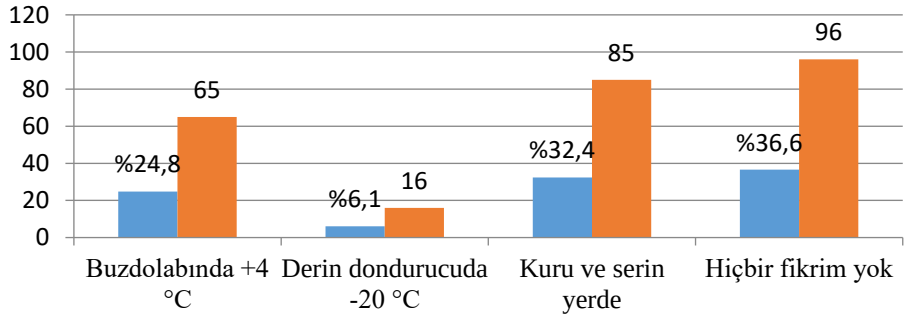
Ankete katılan kadınların iş hayatı ve çalışma durumunlarına bakıldığında ise %58,2'sinin (153 kişi) memur, %12,2'sinin (32 kişi) işçi, %13,7'sinin (36 kişi) serbest ve %16'sının (42 kişi) ise ev hanımı olduğu görülmüştür.

Tablo 4. Katılımcıların balı nasıl muhafaza ettikleri



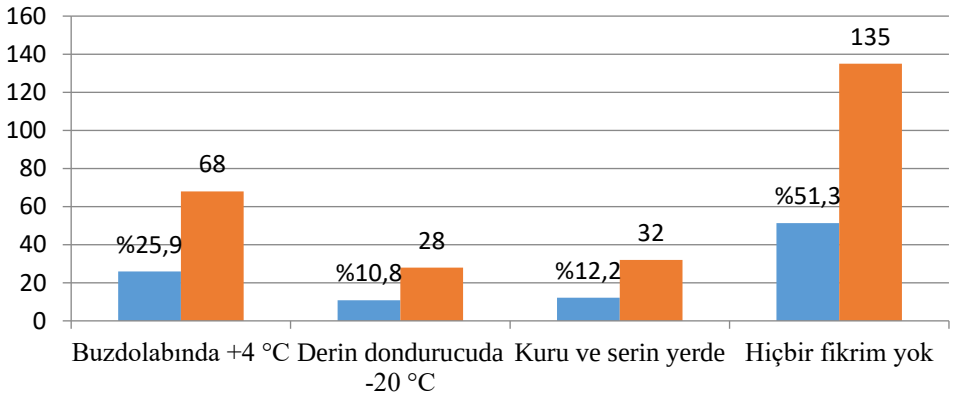
Katılımcılara balı nasıl muhafaza ettikleri sorulmuş; % 6'sının (16 kişi) buzdolabında (+4 °C) muhafaza ettikleri, % 2,2'sinin (6 kişi) derin dondurucuda (-20 °C) muhafaza ettikleri, % 13,5'inin (36 kişi) açıkta dışarıda muhafaza ettikleri, % 77,5'inin (207 kişi) kapalı kapta dışarıda muhafaza ettikleri belirlenmiştir. Araştırmaya katılanların % 0,7'sinin (2 kişi) ise hiç bir fikirlerinin olmadığını belirlenmiştir.

Tablo 5. Katılımcıların polen ve pergayı nasıl muhafaza ettikleri



Polen ve perga'nın saklanması hakkında katılımcıların % 24,8'i (65 kişi) buzdolabında (+4 °C), % 6,1'i (16 kişi) derin dondurucuda (-20 °C), % 32,4'ü (85 kişi) kuru ve serin yerde muhafaza ederim derken; % 36,6'sı ise (96 kişi) hiçbir fikirlerinin olmadığını belirtmiştir.

Tablo 6. Katılımcıların arı sütünü nasıl muhafaza ettikleri



Arı sütünün nasıl saklanacağı konusunda katılımcıların % 25,9'unun (68 kişi) buzdolabında (+4 °C), %10,6'sının (28 kişi) derin dondurucuda (-20 °C), %12,2'sinin (32 kişi) kuru ve serin yerde muhafaza ettikleri belirlenmiştir. Katılımcıların yarısından fazlası olan %51,3'ünün ise; (135 kişi) arı sütünü nasıl muhafaza edecekleri hakkında hiç bir fikirlerinin olmadığını belirlenmiştir.

SONUÇ VE ÖNERİLER

Bu çalışma, Nevşehir ilindeki kadın tüketicilerin arı ürünlerinin muhafazası konusundaki bilgi, tutum ve davranışlarına ışık tutmuştur. Araştırma sonuçları, katılımcıların özellikle bal muhafazası konusunda nispeten iyi bir bilgi düzeyine sahip olduklarını göstermiştir; %77,5'i balı kapalı kapta dışarıda muhafaza ettiğini belirtmiştir. Ancak, diğer arı ürünlerinin muhafazası konusunda bilgi eksikliği olduğu gözlemlenmiştir. Örneğin, polen ve perganın doğru muhafazası konusunda yalnızca %32,4'ünün bilgi sahibi olduğu, arı sütünün muhafazası konusunda ise katılımcıların yarısından fazlasının (%51,3) hiçbir bilgiye sahip olmadığı tespit edilmiştir. Bu bulgular, arı ürünlerinin muhafazası konusunda toplumda genel bir bilgi eksikliği olduğunu ve özellikle bal dışındaki ürünler için farkındalık artırıcı çalışmalara ihtiyaç duyulduğunu göstermektedir. Katılımcıların demografik özellikleri göz önüne alındığında, eğitim düzeyi yüksek ve çoğunlukla kamu personeli olan bir örneklem grubunda bile bu bilgi eksikliğinin gözlemlenmesi, konunun önemini vurgulamaktadır. Bu doğrultuda, arı ürünlerinin doğru muhafazası konusunda kapsamlı eğitim programları düzenlenmesi, bilgilendirici kampanyalar yürütülmesi ve özellikle annelere yönelik bilinçlendirme çalışmaları yapılması önerilmektedir. Ayrıca, arı ürünlerinin etiketlerinde muhafaza koşullarına dair daha detaylı bilgilerin yer alması, tüketicilerin bu konudaki farkındalığını artırabilir. Gelecekte yapılacak çalışmalarda, farklı bölgelerdeki tüketicilerin bilgi düzeylerinin karşılaştırılması ve arı ürünlerinin muhafazası ile sağlık etkileri arasındaki ilişkinin incelenmesi, konuya daha geniş bir perspektif kazandırabilir. Sonuç olarak, bu araştırma, arı ürünlerinin daha bilinçli tüketimi ve doğru muhafazası konusunda toplumsal farkındalığın artırılması gerekliliğini ortaya koymuştur. Elde edilen bulgular, halk sağlığı politikalarının geliştirilmesine ve beslenme rehberlerinin güncellenmesine katkı sağlayabilir. Bu öneriler doğrultusunda yapılacak çalışmaların, Nevşehir ilindeki kadın tüketicilerin arı ürünlerinin muhafazası konusundaki bilgi ve tutum düzeylerini artıracağı ve dolayısıyla arı ürünlerinden elde edilecek faydayı maksimize edeceği düşünülmektedir. Bu apiterapi ürünleri, geleneksel ve tamamlayıcı tıp uygulamalarında giderek daha fazla ilgi görmektedir. Ancak, her doğal ürün gibi, bu ürünlerin de potansiyel yan etkileri ve etkileşimleri olabileceği unutulmamalı ve kullanımları konusunda bir sağlık profesyoneline danışılmalıdır. Benzer şekilde Özdemir (2025) de yaptığı çalışmada tıbbi aromatik bitkilerin de aynı apiterapi ürünlerinde olduğu gibi sağlık profesyonellerince önerilen dozda kullanılması gerektiğine vurgu yapmıştır. Bu sonuçlar Nevşehir ili örnekleminde yapılmış kesitsel bir çalışmadır. Farklı örneklem grubunda farklı tarihlerde yapılacak çalışmada farklı sonuçlar elde edilebilir.

ABSTRACT

The optimum temperatures for cotton are between 20 and 30 °C. Cotton yield and quality are significantly reduced, especially when daily maximum temperatures are above 35 ºC. Heat stress causes an increase in the production of hydrogen peroxide, superoxide radical, and hydroxyl radical reactive oxygen species. Photosynthesis is suppressed while respiration increases and, as a result, the quantity and distribution of assimilates that support boll development are disturbed. The suppression of assimilate synthesis reduces root depth and volume. Although cotton is sensitive to temperature during the growing period, the anthesis period following flowering is particularly sensitive to high temperatures. The formation of male and female gametes in the flower and the viscosity of the stigma are disrupted. As a result, the square, flower, and especially the young bolls may fall off and the number of seeds in the boll may decrease. Fiber length may be reduced, while fibers may coarsen. The negative effects are exacerbated when high temperatures are combined with water stress.

Keywords: Boll Retention, Fiber Quality, Heat Stress, Photosynthesis, Yield

PAMUKTA YÜKSEK SICAKLIK STRESİ

ÖZET

Pamuk için optimum sıcaklıklar 20 ila 30 °C arasındadır. Pamukta verim ve kalite özellikle günlük maksimum sıcaklıklar 35 ºC'nin üzerinde gerçekleştiğinde önemli ölçüde azalmaktadır. Yüksek sıcaklık stresi hidrojen peroksit, süper oksit radikal ve hidroksil radikal gibi reaktif oksijen türlerinin üretiminde artışa neden olmaktadır. Verim ve kalitenin azalışında fotosentezin yavaşlaması buna karşı solunumun artması sonucu koza gelişimini destekleyen asimilatların miktarının ve paylaşımının bozulması etkilidir. Asimilat sentezinin baskılanması kök derinliği ve hacmini azaltmaktadır. Pamuk, gelişme periyodunda sıcaklığa karşı hassas olmasına karşın çiçeklenmeyi izleyen anthesis dönemi yüksek sıcaklığa özellikle duyarlıdır. Çiçekte erkek ve dişi gamet oluşumu ve dişicik tepesi vizkozitesi bozulmaktadır. Sonuçta tarak, çiçek ve özellikle genç kozaların dökülmesi ve kozada tohum sayısının azalması görülebilir. Lif uzunluğu azabilir buna karşın lifler kabalaşabilir. Yüksek sıcaklıklar su stresi ile birleştiğinde olumsuz etkiler daha da ağırlaşmaktadır.

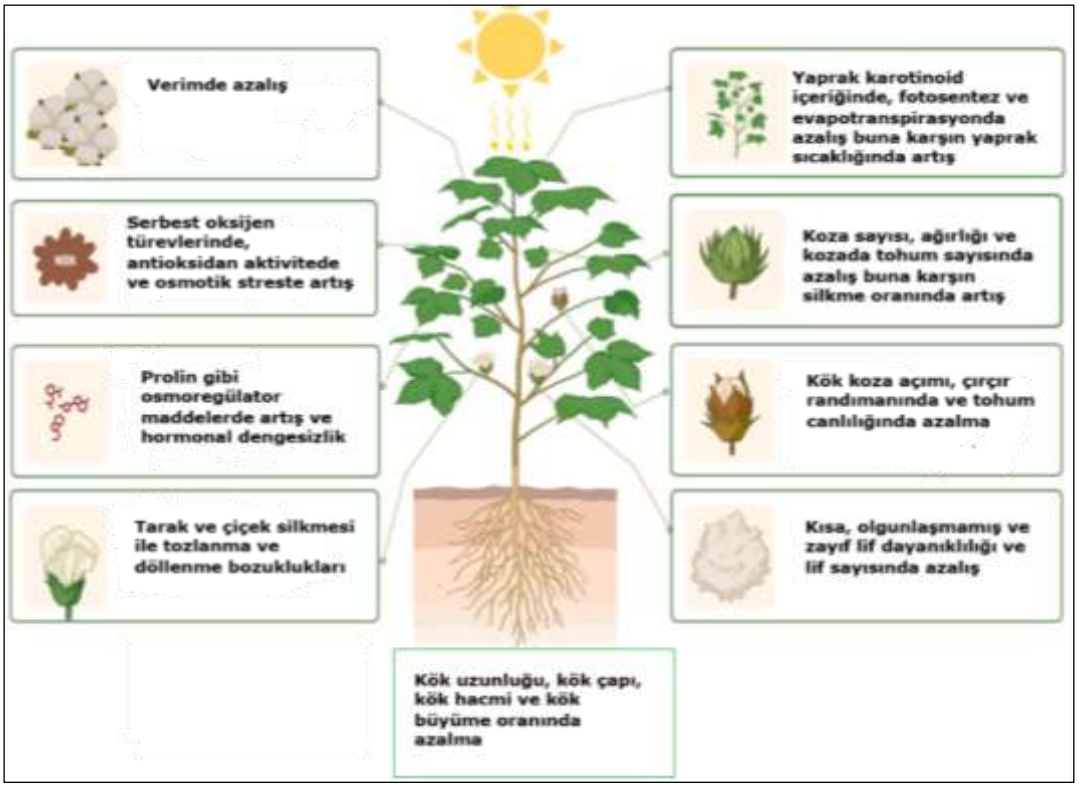
Anahtar Kelimeler: Fotosentez, Koza Bağlama, Lif Kalitesi, Yüksek Sıcaklık Stresi, Verim

1. GİRİŞ

Küresel iklim değişikliğinin bir sonucu olarak sıcaklıklar arttıkça yüksek sıcaklık stresi (HS) oluşumlarının sıklığı, süresi ve yoğunluğu artmaktadır (Iqbal vd., 2023). Fotoperiyoda duyarlı olamayan pamuk çiçeklenme periyodunda sıcaklığa karşı oldukça hassastır (Ünay ve Başal, 2005). Pamukta verim yönünden görülen farklılık %70 oranda sıcaklık dalgalanmalarından kaynaklanmakta ve yüksek sıcaklık çoğu kez kuraklık ile etkileşim halindedir (Rahman, 2006; Farooq vd., 2015; Luo vd., 2014; Nasim vd., 2016; Rahman vd., 2017). Pamukta maksimum büyüme ve gelişme 33 °C'de gerçekleşse de 36 °C'nin üzerinde silkme nedeniyle koza tutumunda önemli bir düşüşler meydana gelmektedir (Luo, 2011; Nasim vd., 2016; Singh vd., 2007).

Erken büyüme aşamaları, çiçeklenme ve koza gelişimi özellikle tozlanma ve döllenme aşamalarında yüksek sıcaklığın yol açtığı olumsuzluklar görülmektedir (Li vd., 2018). Şekil 1'de görüldüğü gibi fotosentez kapasitesi, oksidatif denge, protein sentezi, stoma davranışları, membran bütünlüğü, lipit oksidasyonu ve karbonhidrat üretimi gibi çeşitli biyokimyasal ve fizyolojik reaksiyonlar HS'ye oldukça hassastır (Karumannil vd., 2023; Yang vd., 2022). Pamukta yüksek sıcaklık ile birlikte reaktif oksijen türevlerinde ve beraberinde süperoksit dismutaz (SOD), katalaz (CAT), peroksidaz (POX) ve askorbat peroksidaz (APX) gibi enzimatik antioksidanların aktivitesinde de önemli artışlar gerçekleşmektedir (Sekmen vd., 2014; Sarwar vd., 2018).

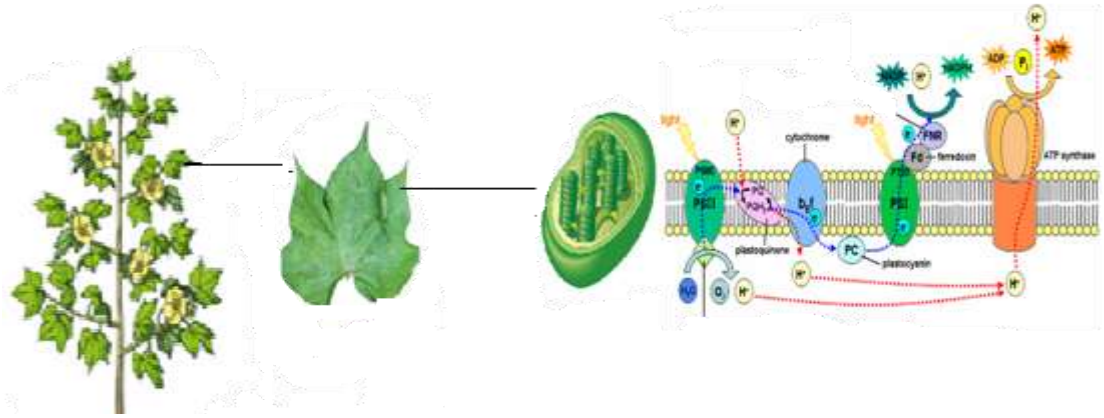
Gece/gündüz şeklinde 32/40 °C'nin üzerindeki sıcaklık, köklerin dağılımını ve büyümesini bozduğu için daha kısa ve bodur kökler görülmektedir (Reddy vd., 1997). Bununla birlikte HS tohum, kök ve yaprak hücrelerinde membranlardaki yağ asidi bileşimini etkilemekte ve hücre işlevlerini olumsuz yönde etkilemektedir (Tsvetkova vd., 2002).



Şekil 1. Pamuk yüksek sıcaklık stresinin etkileri (Dev vd., 2024'den değiştirilerek)

2. FOTOSENTEZ ÜZERİNE ETKİSİ

Pamukta HS artışı ile birlikte yaprak alanı (Abro vd., 2023) ve klorofil sentezinin engellenmesi (Tewari ve Tripathy, 1998) ile birlikte klorofil içeriği (Reddy vd., 2004, Hejnák vd., 2015) azaltmaktadır. Son olarak ise klorofil parçalayıcı enzimlerin aktivitesinde artış görülmektedir (Wang vd., 2018; Hu vd., 2020). Klorofil a klorofil b ye göre olumsuzluklardan daha fazla etkilenmektedir (Thompson vd., 2022). HS sünger mezofil ve palisat tabakası ile birlikte yaprak kalınlığını, hemiselülozik fraksiyonları ve hücre sertliğini artırmaktadır (Muñoz vd., 1993). Şekil 2'de özetlendiği gibi, kloroplastlarda yüksek sıcaklığa en duyarlı bölüm ışık reaksiyonunun gerçekleştiği tilakoid membranlardır (Berry ve Bjorkman, 1980; Demirel, 2008) ve tilakoid membranda düzensizlik ve bozulmalar görülmektedir (Havaux vd., 1996, Sharkey, 2005, Ristic vd., 2007, Herritt ve Fritschi 2020). Kloroplastta yer alan ısı şoku proteini fotosistem II deki elektron taşınma olaylarını korumaktadır (Heckathorn, 1998). Ayrıca, HS mezofil kloroplastlarında grana boyutunu artırmakta, tilakoid membranları bozmakta ve amiloplast birikimini artırmaktadır (Anderson vd., 2021; Zhang vd., 2022). Tilakoid membranlardaki düzensizlik öncelikle fotosistem II'yi etkilemektedir ve fotosentetik fosforilizasyonun engellenmesi ile ATP ve NADPH sentezi azalmaktadır (Haque vd., 2014). RubisCO'nun karboksilasyon yerine oksilasyon kapasitesinin artışı ile birlikte fotorespirasyon artmakta ve net fotosentez azalmaktadır.

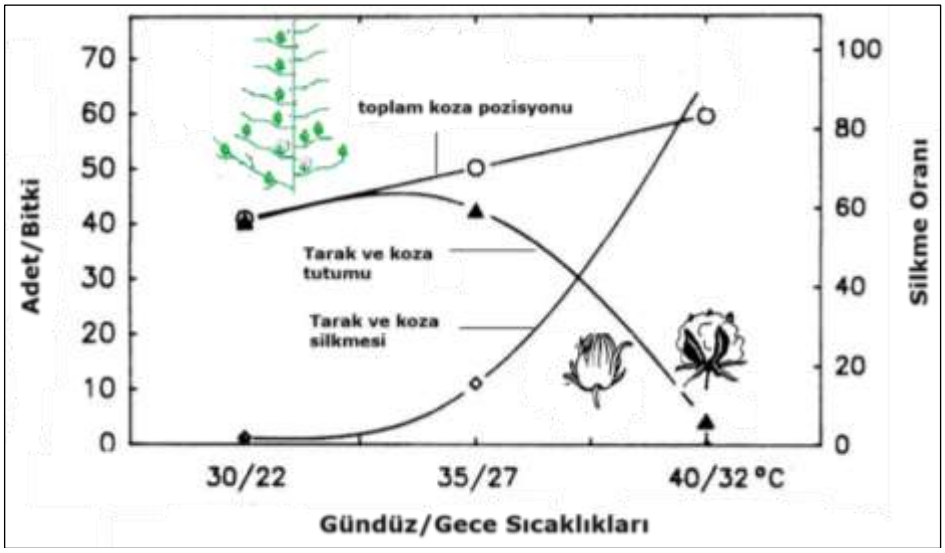


Yaprak alanı	-	Fotosentez	-	Fotosistem II	-
Yaprak dökülmesi	+	Solunum	+	Tilakoid akışkanlığı	+
		Fotorespirasyon	+	Rubisko	-
				Şok proteini	+

Şekil 2. Bitki, yaprak ve kloroplastlarda olan değişimler

3. ÇİÇEKLENME, TOZLANMA-DÖLLENME VE KOZA OLUŞUMUNA ETKİSİ

Döllenmenin gerçekleşmesi için tüm üreme sürecinde senkronizasyon gereklidir. Erkek ve dişi gamet oluşumu, polen çimlenmesi ve polen tüpü gelişimi içerisinde yüksek sıcaklık stresine en duyarlı süreç tozlanma ve döllenmeyi sınırlandırmaktadır (Hedhly vd., 2009; Zinn vd., 2010; Masoomi-Aladizgeh vd., 2022). Polen çimlenmesi optimum değeri 28 °C'dir (Burke vd., 2004), buna karşın 28 °C üzerindeki sıcaklıklarda azalır ve 37 °C'nin üzerindeki sıcaklıklarda ani bir şekilde düşme göstermektedir. Şekil 3'den izlenebildiği gibi, 30 °C'den 40 °C'ye sıcaklık artışı koza pozisyon sayısını artırsa da çiçeklenme aşamasındaki 30 °C'yi aşan yüksek sıcaklıklar tarak ve çiçek silkmesine neden olur (Hemberger vd., 2023) ve 35 °C'de koza tutumu önemli ölçüde azalır ve sıcaklıklar 40 °C'yi aştığında neredeyse durmaktadır (Ahmad vd., 2020).



Şekil 3. Farklı gündüz/gece sıcaklıklarının koza tutumu ve silkme oranlarına etkisi (Hodges vd., 1993'den değiştirilerek).

4. VERİME ETKİSİ

Gece ve gündüz sıcaklıkları, pamuk verim potansiyelinin belirlenmesinde önemli bir rol oynasa da yüksek gece sıcaklığının verimi azaltıcı etkisi daha yüksektir (Khan vd., 2020). Pamukta verim kapasitesinin artması için güçlü bir fide gelişimini takip eden hızlı bir vejetatif gelişme istenmektedir. Optimum sıcaklıkların 2-3 °C üzerindeki sıcaklıklarda biyokütlede %10'luk bir azalış beraberinde %40'lık bir verim azalışı (Majeed vd., 2021) veya her 1 °C sıcaklık artışında 11 kg da^{-1} verim azalışı bildirilmiştir (Singh vd., 2007). Vejetatif büyüme sırasında yüksek sıcaklıklar bodurlaşmaya ve beraberinde koza sayısında azalmaya neden olmaktadır (Schuster ve Monson, 1990). Yüksek sıcaklığın etkisi ile küçük, biçimsiz kozalar (Şekil 4) ve daha az lif miktarı görülmektedir (Khan vd., 2024). Solunum artışına eşlik eden aşırı karbonhidrat kullanımı nedeniyle koza sayısı ve ağırlığındaki azalışa paralel bir şekilde verim düşmektedir (Salman vd., 2019; Xu vd., 2020; Li vd., 2020; Yousaf vd., 2023).

Şekil 4. Yüksek sıcaklıklar nedeniyle kozada meydana gelen şekil bozuklukları (Dodds, 2018)

5. LİF KALİTESİ ÜZERİNE ETKİSİ

Pamukta en önemli lif kalite özellikleri lif inceliği, uzunluğu ve dayanıklılığıdır. Solunumu artıran ve böylelikle karbonhidrat kapasitesini azaltan özellikle gece sıcaklıklarındaki artış koza ve tohumda lif sayısının azalmasına neden olmaktadır (Soliz vd., 2008; Loka and Oosterhuis, 2010). Yüksek sıcaklıklar fotosentetik aktiviteyi, selüloz birikimini, fosfor ve çözünür protein sentezini engellediği için lif uzunluğu ve dayanıklılığı olumsuz etkilenir (Li vd., 2020; Jamil vd., 2020; Aluko vd., 2021). Öte yandan yüksek sıcaklığın en önemli etkilerinden birisi kaba lif oluşumudur (van der Sluijs ve Roth, 2021; Correia vd., 2020). Bazı araştırıcılar ise yüksek sıcaklık ile ortaya çıkan kaba lifliliğin olgun ve daha dayanıklı liflere neden olduğunu belirtmiştir (Ahmad vd., 2020). Aşırı sıcaklıklar kuraklık ile birleştiğinde özellikle lif uzunluğunu olumsuz yönde etkilemektedir (Gao vd., 2021).

6. SONUÇ VE HEDEFLER

Pamuk gelişme dönemlerinin her evresinde yüksek sıcaklıkların olumsuz etkisi görülse de en hassas dönem çiçeklenme ve koza tutumu dönemleridir. Özellikle erkek ve dişi gamet oluşumu, tozlanma ve döllenme fizyolojisinin bozulması kozada tohum sayısı başta olmak üzere tüm koza komponentlerini etkilemektedir. Bu dönemde yapılacak hormon, amino asit ve bitki besin maddelerinin yapraktan uygulanması zararı hafifletebilir. Temmuz ve Ağustos aşırı sıcaklıklarından kaçmak için mümkün olduğunca erken ekim tercih edilmelidir. Yüksek sıcaklıklara toleranslı çeşit geliştirmek için germplazmın değerlendirilmesi ve yabani akrabaların anaç olarak kullanılabilmesi bir ön koşuldur. Bunun için kontrollü koşullarda veya ekim zamanı değişikliği önemli test yöntemleridir. Diploid türlerden tetraploid türlere gen aktarımı çok sayıda sorunla karşılaşsa da ileri ıslah teknikleri bu sorunu çözme konusunda olanak sağlamaktadır. Yabani türler içerisinde *Gossypium robinsonii* buna karşın kültürü yapılan türler içerisinde *Gossypium barbadense* melezleri ümitvar sonuçlar vermiştir.

ABSTRACT

Wind energy, recognized as one of the most vital sources of renewable energy, has emerged as a significant alternative to meet the growing global demand for power. However, the rapid expansion of wind farms has raised ecological concerns due to their potential negative impacts on pollinators-particularly bees. Unlike most existing studies that primarily focus on the behavioral effects of wind farms on bees, this research adopts a novel approach by investigating the relationship between the presence of wind farms and honey production, utilizing data collected from six provinces in Turkey's Aegean Region. The primary objective of this study is to identify and quantify the key factors influencing honey production by employing advanced machine learning techniques, which have gained increasing prominence in recent years. Comparative analyses, including t-tests, reveal that multiple factors significantly affect honey yields. Furthermore, this research integrates traditional statistical methods with cutting-edge machine learning (ML) approaches to conduct a comprehensive evaluation of the impact of wind farms on honey production. The findings indicate that beekeepers operating near wind farms produce, on average, 866 kg more honey per season compared to those in areas without wind farms. Furthermore, higher levels of honey production are significantly associated with beekeepers who are younger, possess lower levels of formal education, learned the profession through family tradition, own a vehicle, are registered farmers, and are members of cooperatives. Other positively correlated factors include practicing migratory beekeeping, holding agricultural insurance, regularly feeding hives (weekly), owning a greater number of hives, having more experience, and receiving government support. Supporting apicultural activities around wind farms is of great significance for both economic development and environmental sustainability. This research highlights the potential for synergistic collaborations between the wind energy and beekeeping sectors, aiming to enhance both

ecological and economic benefits. Additionally, incorporating bee-friendly vegetation into wind farm projects emerges as an effective strategy for maximizing the ecological and economic advantages of apiculture in these areas.

YEŞİL ENERJİ, TATLI SONUÇLAR: RÜZGÂR ÇİFTLİKLERİNİN BAL ÜRETİMİNE ETKİSİ

ÖZET

1. Yeşil enerji kaynakları arasında kritik bir öneme sahip olan rüzgâr enerjisi, küresel ölçekte artan enerji taleplerini karşılamak amacıyla enerji üretiminde önemli bir alternatif olarak dikkat çekmektedir. Ancak, rüzgâr enerjisinin hızla yayılması, polinatörler üzerinde, özellikle de arılar üzerinde oluşturabileceği olumsuz etkiler nedeniyle ekolojik endişelere yol açmıştır. Çoğunlukla rüzgâr çiftlikleri ile arı davranışları üzerine yapılan araştırmaların aksine, bu çalışma, Türkiye'nin Ege Bölgesi'ndeki altı ilde toplanan 300 veri kullanılarak, rüzgâr çiftlikleri ile bal üretimi arasındaki ilişkiyi ilk defa incelemektedir. Bu çalışmanın amacı, son yıllarda önem düzeyi artan makine öğrenim teknikleri kullanarak bal üretim miktarında etkili olan faktörlerin önem derecelerini belirlemektir. Yapılan karşılaştırmalar sonucunda, t-testi analizine göre birden fazla faktörün bal üretimini etkilediği tespit edilmiştir. Ayrıca bu çalışma, rüzgâr çiftliklerinin bal üretim miktarı üzerindeki etkilerini kapsamlı bir şekilde analiz etmek amacıyla geleneksel istatistiksel yöntemler ile son teknoloji makine öğrenimi (ML) tekniklerinin birleşimini kullanmaktadır. Elde edilen bulgulara göre rüzgâr çiftliği bölgesinde arıcılık yapan bir arıcının rüzgâr çiftliği olmayan bölgelere göre bir sezonda ortalama 866 kg daha fazla bal üretmektedir. Ayrıca, genç yaşta, düşük eğitim seviyesine sahip, mesleği aileden öğrenmiş, araca sahip, çiftlik kaydı bulunan ve kooperatif üyesi olan; göçebe arıcılık yapan, tarım sigortası bulunan, kovanlarını düzenli olarak (haftalık) besleyen, daha fazla kovana sahip, deneyimli ve devlet desteğinden yararlanan arıcıların bal üretim düzeylerinin anlamlı biçimde daha yüksek olduğu tespit edilmiştir. Rüzgâr çiftlikleri çevresinde gerçekleştirilen arıcılık faaliyetlerinin desteklenmesi hem ekonomik hem de çevresel sürdürülebilirlik açısından büyük önem arz etmektedir. Bu araştırma, rüzgâr enerjisi ile arıcılık sektörleri arasında ekonomik ve çevresel faydaları artırabilecek potansiyel iş birliklerinin keşfedilmesine olanak tanımaktadır. Ayrıca, rüzgâr çiftliği projelerinde arı dostu bitki örtüsünün desteklenmesi, arıcılığın hem ekolojik hem de ekonomik avantajlarını somut bir şekilde artırabilecek etkili bir yaklaşım olarak dikkat çekmektedir.

Anahtar Kelimeler: Arıcılık, Bal Üretimi, Enerji, Makine Öğrenimi, Rüzgar Santralleri, Türkiye

1. GİRİŞ

Enerji, temel insan ihtiyaçlarını karşılamanın yanı sıra gıda zincirinden çeşitli ekonomik faaliyetlerin yürütülmesine kadar geniş bir yelpazede kritik bir faktör olarak öne çıkmaktadır. Nüfus artışındaki hızlı yükseliş, ekonomik ve teknolojik gelişmeler, kentleşme dinamikleri ve iklim değişikliği gibi unsurlar, küresel enerji talebinde dikkate değer bir artışa yol açmaktadır (IEA, 2010). Uluslararası Enerji Ajansı'nın (IEA) 2010 yılı raporuna göre, dünya genelinde enerji talebinin 2035 yılına kadar %50 oranında artması öngörülmektedir (IEA, 2010). Bu artan enerji talebi, günlük yaşamın neredeyse her alanında yaygın olarak kullanılan ve tükenme riski taşıyan kömür, petrol ve doğal gaz gibi geleneksel fosil yakıtlardan karşılanmaktadır (Shi vd., 2021). Ancak, enerji ve elektrik üretiminde yenilenemeyen fosil kaynakların kullanımı, çevresel kirliliğe sebep olmakta ve bu durum insan sağlığı üzerinde ciddi olumsuz etkiler doğurmaktadır (Bridges vd., 2015; Hirschberg vd., 2016; Kim vd., 2020). Bunun yanısıra yeşilenerji olarak ta nitelendirilen yenilebilir enerji kaynakları tükenme riski taşımadığı gibi, temiz enerji üreterek kirliliği ve iklim değişikliğine neden olan sera gazı emisyonlarını azaltır; bu durum düşük emisyon seviyeleri sayesinde kirlilik ve buna bağlı sağlık sorunlarının azalmasına katkı sağlar (Silva vd., 2021; Olabi ve Abdelkareem, 2022; Olabi vd., 2022). Bu nedenle, birçok gelişmiş ve gelişmekte olan ülkeler, fosil yakıtların yerine geçebilecek ve çevre dostu olan yenilenebilir enerji kaynaklarına yönelmektedir (Ahmad ve Zhang, 2020; Opeyemi, 2021**).** Yenilenebilir enerji kaynakları içerisinde yer alan rüzgar enerjisi, modern teknolojisi, güvenilir altyapısı ve düşük maliyeti sayesinde diğer yenilenebilir enerji kaynaklarına kıyasla avantaj sağlamaktadır (Barra vd., 2021). Bu yönüyle rüzgâr enerjisi, dünyada yenilenebilir enerji kaynakları arasında en hızlı büyüyen, en yaygın kullanılan ve en fazla yatırım yapılan enerji türü olarak öne çıkmaktadır (Ahmad ve Zhang, 2020; Simla ve Stanek, 2020). Elektrik sektöründe yenilenebilir enerji payının 2023'te %30 seviyesindeyken, 2030 yılına gelindiğinde %46'ya ulaşması öngörülmektedir. Bu da büyük ölçüde güneş ve rüzgâr enerjisinden kaynaklanması beklenmektedir. On yılın sonunda ise rüzgâr enerjisinin, hidroelektrik enerjisini geride bırakarak güneş enerjisinin ardından küresel yenilenebilir elektrik üretiminde ikinci en büyük kaynak olması öngörülmektedir (IEA, 2024).

Rüzgâr enerjisi, elektrik üretimi sırasında çevreye zarar vermediği ve kirlilik yaratmadığı için sürdürülebilir ve çevre dostu bir enerji kaynağıdır (Olabi vd., 2023). Aynı zamanda yenilenebilir enerjinin temel bir unsuru olup düşük maliyetli ve güvenilir olmasıyla da öne çıkmaktadır (Sadorsky, 2021). Elektrik üretiminde kullanımı, diğer enerji santrallerine kıyasla daha az çevresel etkiye sebep olmaktadır (Sayed vd., 2021; Sadorsky, 2021). Yakıt yakılmadığı için rüzgâr çiftlikleri (RÇ) hava ve su kirliliğine neden olmaz (Gomaa vd., 2019; Ghenai vd., 2020). Atmosfere sera gazı salmadığı için temiz bir enerji kaynağı olan rüzgâr enerjisi, enerji güvenliğini artırırken emisyonları da azaltır (Mendecka ve Lombardi, 2019; Olabi vd., 2023). Ayrıca, istihdama ve ekonomik büyümeye katkıda bulunmasının yanı sıra, diğer enerji kaynaklarına kıyasla daha ekonomik ve sürdürülebilir olması nedeniyle de uygun yenilenebilir enerji seçeneklerinden biri olarak değerlendirilmektedir (Chien vd., 2021; Olabi vd., 2023). Bu nedenle, dünya genelindeki birçok ülke, fosil yakıtların yerini almayı ve ulusal enerji şebekelerine daha fazla temiz enerji entegre etmeyi hedefleyerek rüzgâr enerjisi santralleri inşa etmektedir (Nguyen vd., 2021). Rüzgâr çiftliklerinin birçok avantajı bulunmasına rağmen, planlama aşamalarına özen gösterilmeden yapılan kurulumlar, bazı olumsuz sonuçlara yol

açabilmektedir (Leroux vd., 2022). Örneğin, göçmen kuşlar, yarasalar ve arı kolonileri gibi hayvanlar üzerinde olumsuz etkilere yol açarak doğal dengeyi bozmakta; ayrıca orman kaybı, arazi erozyonu ve bitki örtüsüne zarar gibi çevresel sorunlara neden olmaktadır (Smallwood, 2013; Hayes, 2013; Marques vd., 2014; Nazir vd., 2020; Gürbüz vd., 2021; Guest vd., 2022; Leroux vd., 2022). Buna ek olarak, gölgeleme, ışık yansıması, çarpışmalar ve türbin kanatlarının titreşimlerinin arıların yön bulmasını zorlaştırabileceği, ayrıca kanat sesleri ve kaçak voltajın arılar üzerinde başka olumsuz etkilere yol açabileceği konusunda endişeler mevcuttur (Voigt, 2021; Guest vd., 2022; Leroux vd., 2022; Fourrier vd., 2023). Bu kapsamda rüzgar elektrik santrallerinin arıcılık üzerine olan olası negatif etkilerinin belirlenmesi için yapılan bu çalışma, arı kovanlarının uygun uzaklıklara yerleştirilmesi, bu uzaklığın bal üretimine olan etkisi, alanda kısıtlı olan bilgilerin derinleştirilmesi ve arıcılığın sürdürülebilirliği açısından büyük önem arzettiği düşünülmektedir.

Bu çalışma, makine öğrenimi metotunu kullanarak rüzgâr santrallerinin diğer önemli faktörlerle birlikte arı kolonileri ve özellikle bal üretim tahminini nasıl şekillendirdiği araştırılmıştır. Bulgular, rüzgâr santrallerine yakın bölgelerdeki arıcıların, daha uzak bölgelerdeki meslektaşlarına göre belirgin şekilde daha fazla bal elde ettiğini göstermektedir. Araştırma, yenilenebilir enerji ile tarım arasındaki etkileşimlere dikkat çekmektedir. Rüzgâr çiftlikleri ve arıların davranışları üzerine yapılan önceki çalışmalardan (Pustkowiak vd., 2018; Marques vd., 2020; Voigt, 2021; Guest vd., 2022; Leroux vd., 2022; Fourrier vd., 2023) farklı olarak, bu araştırma, diğer temel belirleyicilerle birlikte rüzgâr çiftliklerinin bal üretim miktarıyla olan ilişkisini ilk kez incelenmesi açısından oldukça önemlidir. Çalışmada, Türkiye'nin Ege Bölgesi'nde bulunan altı ilden (Çanakkale, İzmir, Muğla, Balıkesir, Aydın, Manisa) toplanan veriler kullanılmıştır. Bu çalışmanın amacı, makine öğrenimini kullanarak bal üretim miktarında etkili olan faktörlerin önem derecelerini belirlemektir. Yapılan karşılaştırmalar sonucunda, t-testi analizine göre birden fazla faktörün bal üretimini etkilediği tespit edilmiştir. Ayrıca bu çalışma, rüzgâr çiftliklerinin bal üretim miktarı üzerindeki etkilerini kapsamlı bir şekilde analiz etmek amacıyla geleneksel istatistiksel yöntemler ile son teknoloji makine öğrenimi (ML) tekniklerinin birleşimini kullanılmıştır. XGBoost gibi algoritmalar, özellik seçimini kolaylaştırmakla kalmayıp geleneksel yöntemlerin zorluklarını aşarak sağlam ve güvenilir sonuçlar sunmaktadır. Makine öğrenimi, sağlık, sosyal bilimler, ekonomi ve çevre gibi alanlarda önemli bir araç haline gelmiştir. Değişkenlerin önemini otomatik değerlendirme ve karmaşık etkileşimleri yakalama yeteneği, tahminleyebilir (prediktif) modellemeyi yeniden şekillendirmiştir. Boruta ve SHAP gibi yöntemler, etkili yordayıcıları belirlerken model şeffaflığını korur ve hassasiyet ile yorumlanabilirlik arasında denge sağlamaktadır. Bu çalışma, makine öğrenimi yöntemi ile elde edilen veriler ışığında, rüzgâr enerjisi ile arıcılık sektörleri arasında ekonomik ve çevresel faydaları artırabilecek potansiyel iş birliklerinin keşfedilmesine olanak tanımaktadır. Ayrıca, rüzgâr çiftliği projelerinde arı dostu bitki örtüsünün desteklenmesi, arıcılığın hem ekolojik hem de ekonomik avantajlarını somut bir şekilde artırabilecek etkili bir yaklaşım olarak dikkat çekmektedir.

2. MATERYAL VE METOT

2.1. Materyal

Bu çalışmaya ait veriler, Türkiye'nin Ege Bölgesi'nde yürütülen kapsamlı bir anket çalışmasına dayanmaktadır. Bölge, ülkenin toplam rüzgâr enerjisi üretim kapasitesinin yaklaşık %55'ini ve arıcılık faaliyetlerinin yaklaşık %20'sini barındırması açısından stratejik öneme sahiptir. Araştırma kapsamında yer alan Aydın, Balıkesir, Manisa, Çanakkale, İzmir ve Muğla illerindeki arıcılık işletmeleri incelenmiştir. Öncelikle tabakalı örnekleme yöntemi kullanılmak istenmiş, ancak Türkiye İstatistik Kurumu (TÜİK) ve Tarım ve Orman Bakanlığı'nın yalnızca illere ait toplam kovan sayılarını sağlamaması nedeniyle işletme düzeyinde yeterli veri elde edilememiştir. Bu nedenle, örnekleme sürecinde orantılı örnekleme yöntemi tercih edilmiştir. %10'luk bir hata payı gözetilerek örnek hacmi yaklaşık 150 olarak belirlenmiş ve bu sayı iller arasında eşit olarak dağıtılmıştır. Anketler, rüzgâr enerjisi santrallerine (RES) 10 km mesafede faaliyet gösteren sabit arıcılara uygulanmıştır. Aynı işletmenin eş zamanlı olarak hem RES etkisindeki hem de dışında kalan bölgelerde faaliyet göstermesinin mümkün olmaması nedeniyle, karşılaştırmalı analizlerde benzer yapısal özelliklere sahip ancak RES etkisinden uzak konumlanan arıcılık işletmeleri de araştırmaya dâhil edilmiştir. Literatürde (Baidya vd., 2004; Trieb, 2018; Danook vd., 2019) rüzgâr santrallerinin etkili olduğu alan genellikle 10–20 km yarıçap içinde tanımlandığından, bu çalışmada 10 km yarıçaplı bölge "RES bölgesi" olarak kabul edilmiştir. Bu çerçevede, her ilde RES içi ve dışı bölgelerden 25'er anket olmak üzere toplamda 300 anket gerçekleştirilmiştir. Veri toplama süreci, bal hasadının yoğunlaştığı Eylül ve Ekim aylarını kapsamaktadır.

2.2. Metot

Bu çalışmada, denetimli makine öğrenmesi algoritmalarından biri olan Extreme Gradient Boosting (XGBoost) modeli kullanılmıştır. XGBoost, karmaşık veri yapılarında değişkenler arasındaki doğrusal olmayan ilişkileri yüksek hassasiyetle modelleyebilmesiyle öne çıkmaktadır. Bu sayede hem sınıflandırma hem de regresyon problemlerinde yaygın olarak tercih edilir ve değişken önem analizlerinde etkili sonuçlar sunmaktadır. Modelin esnek yapısı, farklı türdeki değişkenlerin birlikte analiz edilmesine ve etkileşimlerin hiyerarşik olarak incelenebilmesine olanak tanımaktadır. Bu özellikleri nedeniyle, çok boyutlu ve heterojen bir yapıya sahip olan arıcılık sektöründe üretim çıktılarının belirleyicilerini analiz etmek için ideal bir yöntem olarak benimsenmiştir.

Araştırmada hedef değişken olarak bal üretim düzeyi belirlenmiştir. Bu değişken, arıcılık faaliyetlerinin nihai sonucunu nicel olarak yansıtmaktadır. Bağımsız değişkenler ise arıcılıkla doğrudan veya dolaylı bağlantılı biyofiziksel, ekonomik, sosyodemografik ve davranışsal göstergelerden oluşmaktadır. Bu göstergeler, arıcıların fiziksel özelliklerinden ekipman kullanım oranına, üretim ölçeğinden coğrafi konuma kadar geniş bir yelpazeyi kapsamaktadır. Veri seti, nicel ve nitel verilerin entegre edilmesiyle çok katmanlı bir yapıda tasarlanmıştır. Bu kapsamda, arıcılara uygulanan yapılandırılmış anketlerden elde edilen bireysel ve işletme düzeyindeki bilgiler ile bölgesel çevresel ve mekânsal veriler bir araya getirilmiştir. Anket verileri, arıcıların demografik özelliklerini, üretim pratiklerini, yönetim

stratejilerini ve bilgi kaynaklarını içerirken; çevresel veriler ise flora çeşitliliği, iklim koşulları, arazi kullanımı ve ulaşım altyapısı gibi dışsal faktörleri yansıtmaktadır. Model eğitildikten sonra, değişken önem analizi yapılarak bal üretimini en çok etkileyen ilk 10 değişken detaylıca incelenmiş ve tartışılmıştır. Bu analiz, yalnızca hangi faktörlerin üretim üzerinde daha belirleyici olduğunu göstermekle kalmamış, aynı zamanda arıcılığın çok boyutlu doğasını ortaya koyan yapısal ilişkileri de açığa çıkarmıştır. Elde edilen bulgular, üretim performansının sadece biyofiziksel koşullara değil, sosyoekonomik ve davranışsal faktörlere de bağlı olduğunu kanıtlayarak, arıcılık politikalarının bütüncül bir yaklaşımla geliştirilmesi gerektiğini desteklemektedir.

3. BULGULAR VE TARTIŞMA

Tablo 1, araştırmada kullanılan bağımlı ve bağımsız değişkenlerin ortalamalarını göstermektedir. Çalışma kapsamında, İzmir, Aydın, Muğla, Manisa, Balıkesir ve Çanakkale illerinden eşit sayıda katılımcı yer almakta olup, her il toplam katılımcıların %16,7'sini temsil etmektedir. Bir sezonda bir arıcılık işletmesi ortalama olarak yaklaşık 3680 kg bal elde etmiştir. Katılımcı arıcıların demografik profili incelendiğinde, %31,7'sinin 1965 yılı öncesinde, %62,3'ünün 1965-1980 yılları arasında ve %6'sının ise 1980 sonrası doğduğu görülmektedir. Eğitim düzeyine bakıldığında, katılımcıların %51,3'ü ilkokul mezunu iken, %16,3'ü yükseköğrenim düzeyine sahiptir. Sosyoekonomik göstergelere göre, arıcıların %91,3'ü evli, %83'ünün kişisel aracı bulunmaktadır. Ayrıca, %41,7'si Çiftçi Kayıt Sistemi'ne (ÇKS) kayıtlıyken, %94,3'ü bir arıcılık kooperatifine üyedir. Arıcıların %77,7'si arıcılığın yanı sıra başka bir mesleği de sürdürmektedir. Katılımcıların %49,3'ü arıcılıkla birlikte bitkisel ve hayvansal üretimle de ilgilenmektedir. %85,3'ü göçebe arıcılık yaparken, %85,7'si bal dışında farklı arıcılık ürünleri de üretmektedir. Ayrıca, %48'i arıcılığı temel geçim kaynağı olarak belirtmiş ve %43'ü arılarını tarımsal sigorta ile güvence altına almıştır.

Tablo 1. Bağımlı ve bağımsız değişkenlerin betimleyici istatistikleri

Değişkenler	İngilizce değişken isimleri	Tanımlayıcı	Ortalama	VİF
Bağımlı Değişkenler	**Dependent variable**			
Bal Üretimi	Honey production	Bir sezonda elde edilen bal miktarı (kg)	3679,82	-
Kukla değişkenler	**Dummy variables**			
İzmir	Izmir	İzmir'de arıcılık yapılıyorsa 1, yapılmıyorsa 0	0.167	2.363
Aydın	Aydin	Aydın'da arıcılık yapılıyorsa 1, yapılmıyorsa 0	0.167	2.372
Muğla	Mugla	Muğla'da arıcılık yapılıyorsa 1, yapılmıyorsa 0	0.167	2.877
Manisa	Manisa	Manisa'da arıcılık yapılıyorsa 1, yapılmıyorsa 0	0.167	2.354
Balıkesir	Balikesir	Balıkesir'de arıcılık yapılıyorsa 1, yapılmıyorsa 0 (referans grubu)	0.167	-
Çanakkale		Çanakkale'de arıcılık yapılıyorsa 1,yapılmıyorsa 0	0.167	2.052

Hiç	Never Married	Birey hiç evlenmemişse 1, değilse 0	0.047	2.532
Başkaları tarafından öğrenme	Learning by others	Arıcılık başka yöntemlerle öğreniliyorsa 1, aksi takdirde 0 (referans)	0.240	

Babadan öğrenme	Learning by father	Arıcılık babadan miras kaldıysa 1, değilse 0	0.490	2.039
Kurslar aracılığıyla öğrenme	Learning by courses	Arıcılık kurslar aracılığıyla öğrenildiyse 1, değilse 0	0.270	1.757
Araba	Car	Kişinin arabası varsa 1, değilse 0	0.830	1.172
Özel kayıt	Private registration	Arıcılık işletmesine ilişkin faaliyetlere kayıtlı ise 1, kayıtlı değilse 0	0.223	1.253
Çiftlik kaydı	Farm registration	İşletme çiftçi kayıt sistemine dahil ise 1, değilse 0	0.417	1.646
Kooperatif üyesi	Cooperative member	Arıcılık faaliyeti ile ilgili kooperatif/birlik üyeliği varsa 1, değilse 0	0.943	1.389
Arıcılık dışı işi	Out of beekeeping job	İşletmecinin arıcılık dışında bir işi varsa 1, yoksa 0	0.777	1.622
Bitkisel ve hayvansal üretim	Plant & animal production	Arıcılık dışında bitkisel ve hayvansal üretimle ilgili bir faaliyet varsa 1, yoksa 0	0.493	1.895
Göçebe	Nomad	Eğer birey göçebe ise 1, değilse 0	0.853	1.892
Sigorta	Insurance	Arılara yönelik tarım sigortası varsa 1, yoksa 0	0.430	1.617
Kredi bazlı borç	Credit-based debt	Tarımsal krediye dayalı borç varsa 1, değilse 0	0.377	1.516
Diğer arı ürünleri üretimi	Other bee production	Bal üretimi dışında arıcılık ürünleri üretimi varsa 1, yoksa 0	0.857	1.218
Geçim kaynağı	Livelihood	Arıcılık geçim kaynağıysa 1, değilse 0	0.480	2.212
Diğer kraliçe ırkı	Other queen breed	Kraliçe ırkı Kafkas, Karniyol, İtalyan veya Muğla dışındaysa 1, değilse 0	0.360	2.146
Diğer çalışan ırk	Other working breed	İşçi ve damızlık arı ırkı Kafkas, Karniyol, İtalyan veya Muğla ırklarından farklıysa 1, değilse 0	0.440	2.383
Kraliçe değişimi	Queen replacement	Kolonilerde ana arı değişimi yapılıyorsa 1, aksi takdirde 0	0.107	1.119
Haftalık besleme	Weekly feeding	Koloniler haftalık olarak beslenirse 1, aksi halde 0	0.423	1.351
Beslenme	Nutrition	Koloniler hem kek hem de şekerle besleniyorsa 1, aksi takdirde 0	0.777	1.210
Rüzgar çiftliği bölgesi	Wind farm region	Kovanların rüzgar çiftliği bölgesinde ise 1 , aksi taktirde 0	0.50	1.206
Sürekli değişkenler	**Continuous variables**			

Vücut kitle indeksi	Body mass index	Arıcının vücut kitle indeksi (ağırlığın boyun karesine bölümü)	26.710	1.212
Mesafe	Distance	Kovanların bulunduğu yerin ana yola uzaklığı (km)	2.910	1.227
Deneyim oranı	Experience proportion	Girişimcinin deneyim yaşının oranı	0.393	1.647
Çalışma oranı	Working proportion	Ailede çalışan birey sayısının toplam aile büyüklüğüne oranı	0.452	1.159
Sübvansiyon miktarı	Subsidy amount	Yıl boyunca arıcılık faaliyetleri için devlet destek miktarı (Türk Lirası)/10.000	6.971	11.268
Kovan sayısı	Hive count	Arıcının sahip olduğı kovan sayısı	232	12.744
Malzeme oranı	Materials proportion	İşletmede kovan başına kullanılan toplam malzeme sayısı	0.127	2.446
Sağım numarası	Milking number	Bir yıldaki toplam sağım sayısı	2.477	1.638
Toplam gözlem sayısı			300	

Önemli bir bulgu olarak, arıcılıkla uğraşan katılımcıların %49'u bu mesleği babalarından öğrenmiş, %27'si arıcılıkla ilgili kurslara katılarak bilgi edinmiş, kalan %24'ü ise çeşitli diğer yollarla arıcılığı öğrenmiştir. Koloni bakım uygulamalarına bakıldığında ise, arıcıların %42,3'ü kovanlarını haftalık olarak beslemektedir. Besleme yöntemlerinde ise %77,7'si hem arı keki hem de şeker kullanarak kolonilerini desteklemektedir. Diğer değişkenlerin istatistiksel değerleri Tablo 1'de detaylı olarak sunulmuştur.

Tablo 2, modele dâhil edilen ikili ve çok düzeyli kategorik değişkenler için ortalama bal üretim miktarı ve ortalama bal üretim farkını ve ilgili istatistikleri ele almaktadır. Eğer kategorik değişken iki düzeyden yüksek ise bir düzeyini referans alıp diğer değişkenlerin bal üretim miktarını bu referans düzeyin sahip olduğu bal üretim miktarı ile karşılaştırılmış ve ilgili istatistikler bu verilerden türetilmiştir. Ayrıca eğer değişkenler sürekli bir yapıda ise bu değişkenlerle bölgedeki bal üretim miktarı ile olan ikili korelasyon katsayılarını istatistiki düzeyi ile birlikte hesaplanıp Tablo 2'de sunulmuştur. İllere göre yapılan değerlendirmelerde, sezonluk ortalama bal üretimi bakımından en yüksek verime sahip ilin Muğla olduğu belirlenmiştir. Muğla ilinde faaliyet gösteren arıcılar, bir sezonda ortalama 5.258 kg bal üretmekte olup, bu değer diğer illerle kıyaslandığında oldukça yüksek bir seviyededir. Muğla'yı sırasıyla 4.098 kg ile Manisa ve 4.063 kg ile İzmir illeri takip etmektedir. Buna karşılık, Balıkesir ili, 2.356 kg ile arıcı başına sezonluk ortalama bal üretiminin en düşük olduğu il konumundadır. Veriler incelendiğinde, Muğla'daki bir arıcının, Balıkesir'deki bir arıcıya göre sezonda ortalama 2.902 kg daha fazla bal ürettiği görülmektedir. Bu fark istatistiksel olarak anlamlı bulunmuş olup ($p < 0.05$), iller arasında bal üretim kapasitesine etki eden belirgin farklılıkların varlığını göstermektedir. Balıkesir ili ile yapılan karşılaştırmalarda, Çanakkale hariç diğer dört ilin tamamında istatistiksel olarak anlamlı üretim farkları saptanmıştır. Bu durum, bal üretimindeki farklılıkların yalnızca bireysel ya da işletmeye özgü değişkenlerden

değil; aynı zamanda coğrafi yapı, iklim özellikleri, flora zenginliği ve bitki örtüsündeki çeşitlilik gibi çevresel faktörlerden de kaynaklandığını düşündürmektedir. Özellikle Muğla'nın yüksek üretim kapasitesi, ilin zengin bitki örtüsü, uzun bal üretim sezonu ve uygun iklim koşullarıyla ilişkilendirilebilir. Buna karşın Balıkesir'deki görece düşük üretim miktarı, bölgedeki floristik çeşitliliğin sınırlı olması ya da iklimin arıcılık faaliyetlerine elverişliliğinin düşük olmasından kaynaklanıyor olabilir. Bu bağlamda, arıcılık faaliyetlerinin planlanmasında ve bölgesel desteklerin düzenlenmesinde, söz konusu çevresel faktörlerin dikkate alınması önem arz etmektedir.

Tablo 2. Her kategorik değişken için ortalama bal üretimi ve istatistiksel test

Yaş gruplarına göre yapılan analizler, bal üretim miktarının yaşla birlikte değişkenlik gösterdiğini ortaya koymaktadır. 1980 sonrası doğan genç arıcılar, bir sezonda ortalama 5.167 kg bal üretimiyle en yüksek verime sahip grup olarak öne çıkmaktadır. Bu grubu, sezonda ortalama 3.982 kg bal üreten 1965–1980 doğumlu orta yaş grubundaki arıcılar takip etmekte; 1965 yılı öncesinde doğan yaşlı arıcılar ise ortalama 2.803 kg ile en düşük üretim düzeyine sahip grubu oluşturmaktadır. Veriler, orta yaş grubundaki arıcıların yaşlı arıcılara kıyasla sezonda ortalama 1.179 kg daha fazla bal ürettiğini göstermektedir. Öte yandan, genç ve yaşlı arıcılar arasındaki üretim farkı daha belirgin olmasına rağmen, bu fark istatistiksel olarak anlamlı bulunmamıştır. Bu durum, genç arıcılar grubunda gözlenen yüksek iç grup varyansı ve buna bağlı olarak yüksek standart sapma ile açıklanmaktadır. Genç arıcılardan bazıları oldukça yüksek üretim rakamlarına ulaşırken, bazı bireylerin düşük üretim seviyelerinde kalması, ortalamanın istatistiksel anlamlılığını gölgede bırakmıştır. Bu bulgular, yaş faktörünün deneyimle birlikte üretime etkili olabileceği kadar, fiziksel kapasite, yeniliklere açıklık ve teknolojiyi kullanma becerileri gibi etkenlerle de ilişkili olabileceğini düşündürtmektedir. Özellikle genç arıcıların daha modern yöntemleri benimsemeye yatkın olmaları, verimlilikteki artışa katkı sağlıyor olabilir. Buna karşılık, yaşlı arıcıların daha geleneksel yöntemlerle üretim yapmaları ve fiziksel sınırlılıkların etkisiyle üretimde düşük seviyelerde kalmaları muhtemeldir. Sonuç olarak, yaş grupları arasında gözlemlenen üretim farklılıkları yalnızca deneyim süresiyle değil, çağdaş tarım teknolojilerinin benimsenme düzeyi ve fiziksel iş gücü kapasitesi gibi çok boyutlu faktörlerle birlikte değerlendirilmelidir.

Eğitim düzeyine göre yapılan karşılaştırmalarda, ilkokul mezunu arıcıların sezonluk bal üretiminin diğer gruplara kıyasla daha yüksek olduğu gözlemlenmiştir. Buna göre, ilkokul mezunu bir arıcı bir sezonda ortalama 4.198 kg bal üretirken, üniversite mezunu bir arıcının ortalama üretimi 2.176 kg ile sınırlı kalmaktadır. Bu sonuçlara göre, üniversite mezunu bir arıcının, ilkokul mezunu bir arıcıya kıyasla sezonda ortalama 2.022 kg daha az bal ürettiği anlaşılmaktadır. Ayrıca lise mezunu bir arıcının da ilkokul mezunu bir arıcıya göre ortalama 1.042 kg daha az üretmektedir. Bulgularımızla paralel olarak, Uzundumlu vd. (2011), ilköğretim mezunu arıcıların daha yüksek eğitim düzeyine sahip meslektaşlarına kıyasla daha fazla bal ürettikleri rapor edilmiştir. Öte yandan, Tadesse vd. (2021), elde ettiğimiz sonuçların aksine, eğitim seviyesi arttıkça bal üretiminin de arttığını belirlemişlerdir. Bu farklılık, çalışma yapılan bölgelerdeki üretim pratikleri, teknoloji kullanımı ve bilgiye erişim düzeylerindeki değişikliklerden kaynaklanıyor olabilir.

Benzer şekilde, arıcılık mesleğinin edinilme yöntemi de bal üretim miktarı üzerinde belirleyici bir faktör olarak öne çıkmaktadır. Arıcılık becerilerini informal yollarla edinen arıcılar, formal eğitim ve öğretim yoluyla mesleği edinenlere kıyasla daha yüksek seviyede bal üretimi gerçekleştirmektedir. Özellikle mesleği babasından öğrenen arıcılar, sezonda ortalama 4.649 kg bal üretimiyle diğer gruplardan belirgin şekilde istatistiksel önemli düzeyde ayrılmaktadır ($p < 0.05$). Bu grubun, referans grubuna kıyasla ortalama 1.501 kg daha fazla bal ürettiği tespit edilmiştir. Bu durum, deneyime dayalı uygulamalı öğrenmenin ve kuşaktan kuşağa aktarılan bilgi birikiminin, arıcılık faaliyetlerinde daha verimli üretim süreçleri geliştirilmesine olanak sağlamasından kaynaklanmaktadır. Geleneksel bilgi aktarımı, arıcılıkta çevresel koşullara uyum sağlama, sorunlara pratik çözümler üretme ve üretim süreçlerini daha etkin yönetme konusunda önemli avantajlar sunmaktadır.

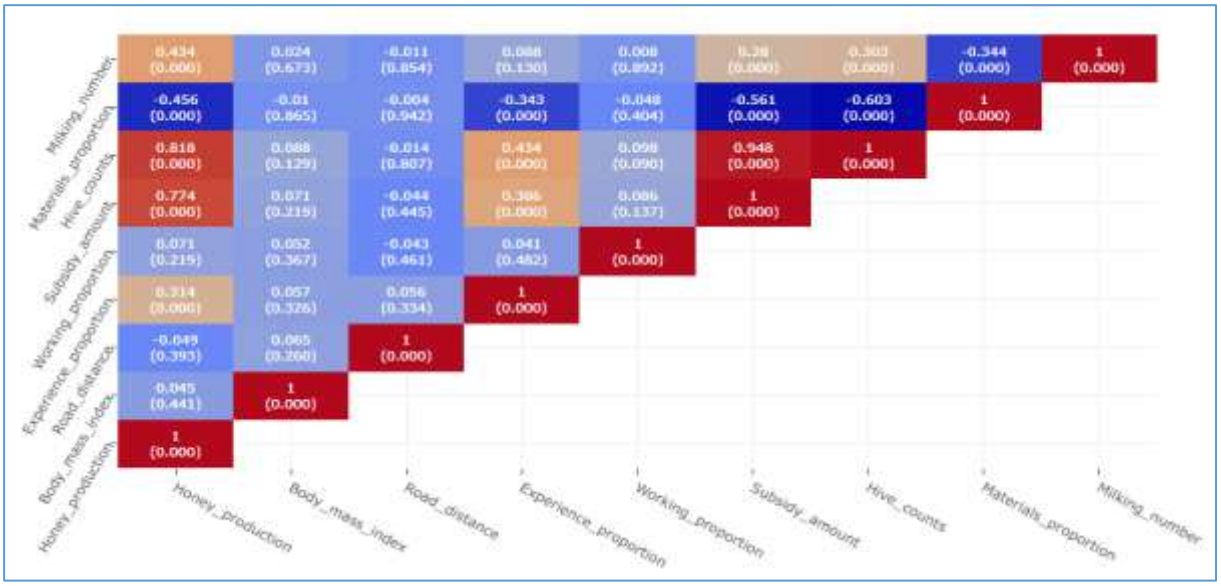
Bal üretim miktarı ile kukla değişkeni arasındaki ilişkiler incelenmiş ve bu analiz sonucunda istatistiki açıdan önemli bulgular elde edilmiştir. Örneğin araba sahibi olan bir arıcının araba sahibi olmayan bir arıcıya kıyasla sezonda ortalama 1.106 kg daha fazla bal üretmektedir. Aynı şekilde arıcıların çiftçi kayıt sistemine kayıtlı olması ve bir arıcılık kooperatifine üye bulunmaları, bal üretim düzeyine anlamlı ve olumlu katkılar sağlamaktadır. Örneğin, çiftlik kaydı bulunan arıcıların yıllık ortalama bal üretimi 4.478 kg iken, kaydı olmayan arıcıların üretimi ortalama 3.109 kg düzeyindedir. Bu fark, çiftlik kaydı bulunan bir arıcının yılda ortalama 1.369 kg daha fazla bal ürettiğini göstermektedir. Benzer şekilde, bir kooperatife üye olan arıcılar da üretim açısından avantajlı konumdadır. Kooperatif üyeleri, üye olmayanlara kıyasla yıllık ortalama 1.759 kg daha fazla bal üretmektedir. Bu bulgular, kurumsal destek mekanizmalarına erişimin ve örgütlü yapılar içinde yer almanın, arıcılık faaliyetlerinin verimliliğini artırıcı bir etkiye sahip olduğunu ortaya koymaktadır. Kooperatife üye olmanın bal verimine pozitif etki olduğu gözlenmiştir (Uzundumlu vd., 2011).

Öte yandan, arıcılık dışında başka bir işle meşgul olan arıcıların bal üretim düzeyleri, yalnızca arıcılıkla uğraşanlara kıyasla daha düşük kalmaktadır. Verilere göre, ek bir işle uğraşan arıcılar, sadece arıcılık yapan arıcılara göre sezonda ortalama 855 kg daha az bal üretmektedir. Bu durum, arıcılığa ayrılan zaman, emek ve kaynakların bölünmesinin, üretim miktarı üzerinde olumsuz bir etki yarattığını göstermektedir. Dolayısıyla, tam zamanlı arıcılık yapan üreticiler, faaliyetlerini daha verimli bir şekilde yürüterek daha yüksek üretim düzeylerine ulaşabilmektedir. Arıcılık faaliyetlerinin yanı sıra bitkisel ve hayvansal üretimle de uğraşan arıcılar, bu faaliyetlerde bulunmayanlara kıyasla sezonda ortalama 1.339 kg daha fazla bal üretmektedir. Bu durum, tarımsal faaliyetlerin birbirini desteklemesi ve arıcılık için uygun çevresel koşulların sağlanmasına katkıda bulunmasından kaynaklanabilir. Göçebe arıcılık yapan arıcılar, sabit arıcılık yapanlara göre sezonda ortalama 3.472 kg daha fazla bal üretmektedir. Bu fark, göçebe arıcılığın bitki örtüsü zengin bölgelerde nektar akımına göre hareket etme olanağı sunmasından ileri gelebilmektedir. Arıcılar, bal üretimini artırmak amacıyla daha kapsamlı göçebe arıcılık uygulamalarına yönelme eğilimi göstermektedir (Grillot, 2020). Arıcının göçebe olması bal verimini pozitif yönde etkilemektedir (Uzundumlu vd., 2011). Ayrıca Tarım sigortası yaptıran, tarımsal kredi kullanan ve arıcılığı ana geçim kaynağı olarak benimseyen arıcılar, sırasıyla ortalama 1.702 kg, 1.765 kg ve 3.332 kg daha fazla bal üretmektedir. Bu durum, söz konusu grupların riski azaltarak üretime daha fazla yatırım yapmaları ve arıcılığa daha fazla kaynak ayırmalarıyla açıklanabilir.

Ege Bölgesi'nde gerçekleştirilen çalışmada, kullanılan kraliçe arı ırkının bal verimi üzerindeki etkisi dikkat çekici düzeyde ortaya konmuştur. Özellikle Kafkas, Karniyol, İtalyan ve Muğla ırkı kraliçe arılarla çalışan arıcıların, diğer ırkları tercih edenlere kıyasla anlamlı düzeyde daha yüksek bal üretimi gerçekleştirdiği belirlenmiştir. Bu bulgu, arı ırkının genetik yapısı ve fizyolojik özelliklerinin, üretim verimliliği üzerinde kritik bir rol oynadığını göstermektedir. Bal üretimini etkileyen temel faktörler arasında yalnızca arı ırkı değil; aynı zamanda iklim koşulları, parazit ve hastalık baskısı, arıcılıkta uygulanan yönetim stratejileri ve çevresel flora çeşitliliği de önemli yer tutmaktadır (Karadaş ve Birinci, 2018; Çelik ve Yılmaz, 2019). Özellikle koloni yönetiminde besleme sıklığı öne çıkan bir değişkendir. Araştırma bulgularına göre, kovanlarını haftalık olarak besleyen arıcılar, daha seyrek besleme yapanlara kıyasla

sezonda ortalama 1.386 kg daha fazla bal üretmektedir. Bu fark, düzenli beslemenin koloni gelişimini hızlandırarak arı sağlığını desteklemesiyle açıklanabilir.

Dikkat çeken bir diğer sonuç ise, kovanların konumlandırıldığı çevresel koşulların bal verimi üzerindeki etkisidir. Rüzgar enerji santrali (RES) bölgelerinde faaliyet gösteren arıcıların, RES dışı bölgelerdeki meslektaşlarına kıyasla sezonda ortalama 866 kg daha fazla bal ürettiği belirlenmiştir ve bu fark istatistiksel olarak anlamlı bulunmuştur ($p < 0.05$). Bu durum, RES bölgelerinde kimyasal tarım ilaçlamalarının daha sınırlı olması, çevresel stres faktörlerinin düşük düzeyde seyretmesi ya da flora çeşitliliğinin daha iyi korunmuş olmasıyla ilişkilendirilebilir. Bu bulgular, bal üretimini artırmaya yönelik stratejilerin yalnızca biyolojik faktörlerle değil; aynı zamanda yönetsel ve çevresel unsurlarla bütüncül bir şekilde ele alınması gerektiğini göstermektedir. Arı ırkı seçimi, besleme sıklığı ve kovan yerleşimi gibi kararlar, üretim verimliliğinde belirleyici olmaktadır ve bu nedenle arıcılık faaliyetlerinde bilimsel temelli uygulamaların önemi giderek artmaktadır.



Şekil 1. Bal üretim miktarı ile sürekli değişkenler arasındaki korelasyon analizi

Model kapsamında gerçekleştirilen korelasyon analizi (Şekil 1), sürekli değişkenler ile bal üretimi arasındaki ilişkileri ortaya koyarak bazı dikkat çekici sonuçlar sunmaktadır. Analiz sonuçlarına göre, bal üretim miktarı ile kovan sayısı ve sübvansiyon miktarı arasında yüksek düzeyde pozitif korelasyon tespit edilmiş ve bu ilişki düzeyi istatistiksel olarak önemli bulunmuştur. Bu bulgular, özellikle üretim kapasitesini doğrudan etkileyen kovan sayısının ve sağlanan ekonomik desteklerin bal üretimi üzerinde belirleyici bir rol oynadığını göstermektedir. Kovan sayısı, doğal olarak üretim potansiyelini yansıtan bir unsur olarak öne çıkmakta; sübvansiyon desteği ise arıcının üretim faaliyetlerini genişletmesine, ekipman yatırımlarını artırmasına veya koloni sağlığını iyileştirmesine olanak tanımaktadır. Bal üretimi ile sağım sayısı arasında ise pozitif önemli ($p < 0.05$) istatistiksel bir ilişki bulunmuştur. Bu

durum, yıl içerisinde daha fazla sağım yapan arıcıların sezonda daha yüksek üretim elde ettiklerini ve kolonilerini daha etkin yönettiklerini göstermektedir.

Arıcılık deneyimi ile bal üretimi arasında zayıf düzeyde pozitif önemli ($p < 0.05$) istatistiksel bir ilişki gözlenmiştir Bu sonuç, deneyimin üretim sürecine belirli katkılar sağladığını, ancak tek başına üretkenliği artıran yeterli bir unsur olmadığını göstermektedir. Öte yandan, bal üretimi ile malzeme oranı arasında negatif bir ilişki saptanmıştır. Bu bulgu, üretime kıyasla daha fazla girdi kullanımının verimlilik üzerinde olumsuz bir etki yarattığını düşündürmektedir. Aşırı malzeme kullanımı, kaynakların etkin olmayan biçimde tüketildiğini göstermektedir. Bu durum aynı zamanda yüksek girdi maliyetlerinin üretim artışını sınırlayabileceğine işaret etmektedir. Sonuç olarak, model bulguları, bal üretimini artırmaya yönelik stratejiler geliştirilirken özellikle üretim kapasitesine yönelik değişkenler (kovan sayısı) ve ekonomik destek mekanizmalarının (sübvansiyonlar) öncelikli olarak ele alınması gerektiğini göstermektedir. Bunun yanında, sağım sıklığı gibi yönetimsel faktörlerin ve girdi kullanımındaki etkinliğin de üretkenlik açısından kritik olduğu anlaşılmaktadır.

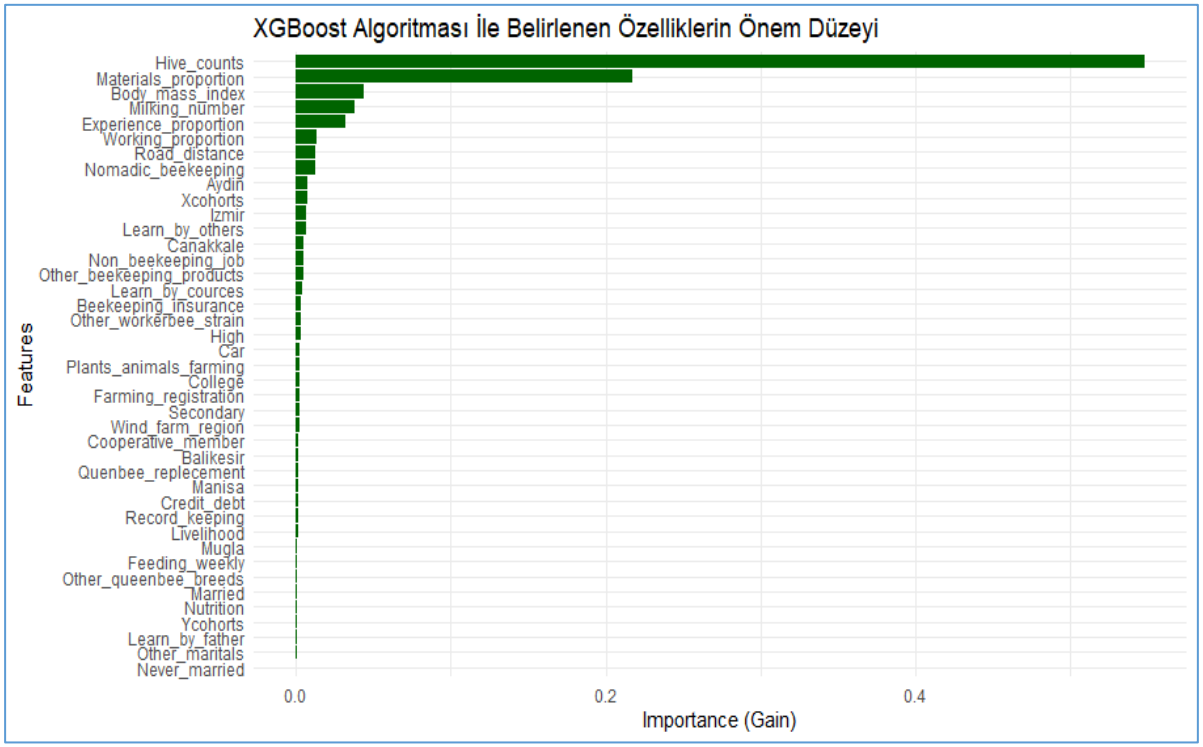
XGBoost modeli kullanılarak gerçekleştirilen analiz sonucunda, arıcılıkta bal üretim düzeyini etkileyen faktörlerin yalnızca biyofiziksel unsurlarla sınırlı olmadığını, aynı zamanda ekonomik, sosyodemografik ve davranışsal dinamiklerin de belirleyici bir rol oynadığını ortaya koymaktadır (Şekil 2-3). Model çıktıları, bal üretim düzeyinin şekillenmesinde çok boyutlu bir etkileşim ağının varlığını açıkça göstermektedir. Bu analiz, arıcılık sektörünün sürdürülebilir büyümesi için hangi faktörlere odaklanılması gerektiğini aydınlatmakta ve politika yapıcılara çok yönlü müdahale stratejileri geliştirme konusunda yol göstermektedir.

Modelin çıktılarına göre, bal üretim düzeyi üzerinde en yüksek etkiye sahip değişken, kovan sayısıdır. Bu, üretim hacminin en temel belirleyicisinin arıcının sahip olduğu kovan miktarı olduğunu göstermektedir. Kovan sayısı yalnızca bir niceliksel kapasite göstergesi değil, aynı zamanda üretim ölçeğini ve potansiyel girdi kullanım düzeyini de temsil etmektedir. İkinci sırada yer alan değişken bal üretim sürecinde kullanılan malzeme oranıdır. Bu bulgu, üretim ölçeği arttıkça daha sistemli ve donanımlı ekipman kullanımına ihtiyaç duyulduğunu göstermektedir. Malzeme kullanımındaki artış, aynı zamanda üretim kapasitesine paralel bir teknik altyapı ihtiyacını yansıtmaktadır. Bu nedenle, arıcıların daha verimli malzeme yönetimi konusunda desteklenmesi önem arz etmektedir.

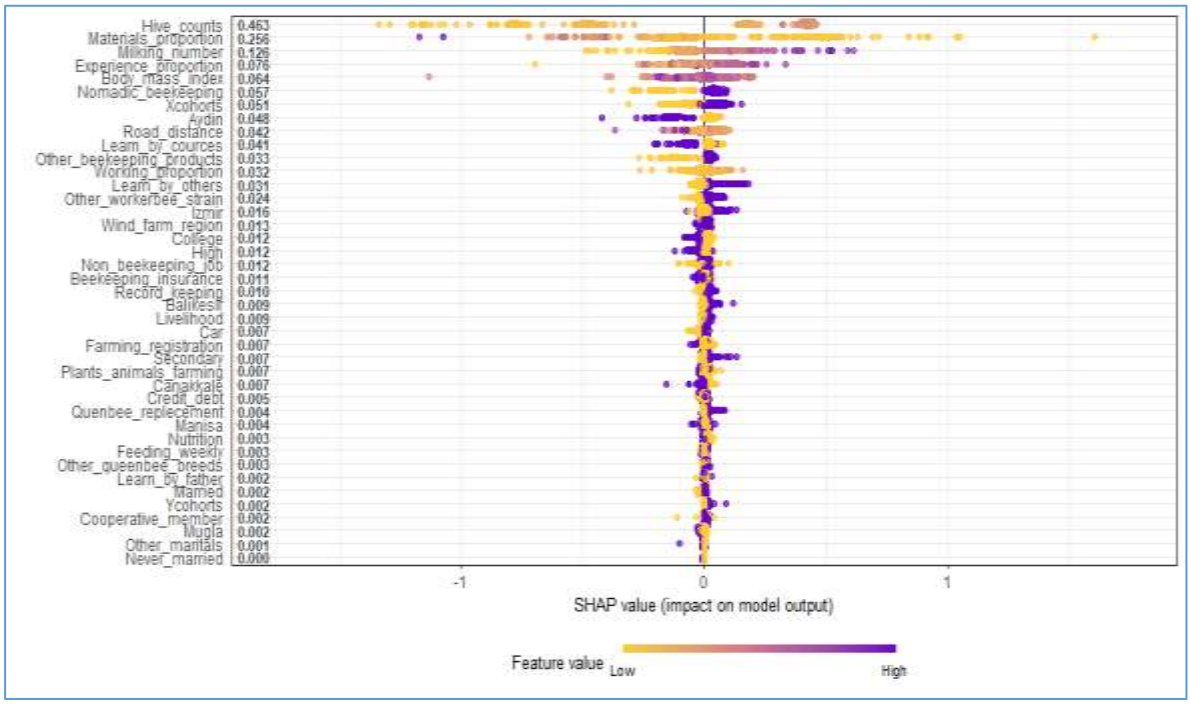
Üçüncü sıradaki vücut kitle indeksi (VKİ), arıcının fiziksel uygunluğunun dolaylı yoldan üretim verimliliği üzerinde etkili olduğunu göstermektedir. Fiziksel kapasite, özellikle üretim sürecinde hareketlilik gerektiren işlerde performansı belirleyici bir unsur haline gelmektedir. Bu durum, sektörde ergonomik çalışma koşullarının geliştirilmesi ve sağlık destek programlarının yaygınlaştırılması gereğini ortaya koymaktadır. Dördüncü sırada yer alan sağım sayısı, doğrudan arıcılık faaliyetiyle ile ilişkili olup çevresel koşullar, flora çeşitliliği ve göç rotaları gibi etmenlerle bağlıdır. Sağım sayısındaki farklılıklar, bal verimini dolaylı olarak etkileyebilecek mekânsal ve çevresel faktörlere işaret etmektedir. Bu bağlamda, arıcılık bölgelerinde ekolojik dengeyi koruyacak politikalar geliştirilmesi önem kazanmaktadır. Beşinci sıradaki deneyim oranı, arıcının bilgi ve tecrübe düzeyinin üretim sürecine olan katkısını ortaya koymaktadır. Daha deneyimli arıcıların teknik yeterlilikleri ve kriz yönetim becerileri daha gelişmiş olup, bu da üretim düzeyine doğrudan yansımaktadır. Ancak, deneyim

faktörü tek başına yeterli olmayıp, diğer değişkenlerle etkileşim içinde değerlendirildiğinde daha anlamlı hale gelmektedir. Altıncı sırada bulunan çalışma oranı, arıcılığın tam zamanlı bir meslek olarak icra edilip edilmediğini göstermektedir. Profesyonel düzeyde yapılan arıcılık faaliyetlerinin üretim düzeyine olumlu katkı sunduğu gözlemlenmektedir. Tam zamanlı çalışan arıcılar, zaman ve kaynaklarını daha etkili biçimde yönetebilmekte, dolayısıyla üretim kapasitesini artırabilmektedir. Yerleşim yerinin merkezî yollara uzaklığı, yedinci sırada yer almakta ve mekânsal erişilebilirliğin üretim kapasitesine olan etkisini yansıtmaktadır. Uzak bölgelerde faaliyet gösteren arıcıların, doğaya yakınlık ve düşük rekabet gibi avantajlara sahip olduğu; bu nedenle üretim düzeylerinin daha yüksek olabileceği anlaşılmaktadır. Bu durum, kırsal altyapının planlanmasında dikkate alınması gereken önemli bir faktördür. Sekizinci sıradaki göçebe arıcılık, farklı flora kaynaklarından faydalanma olanağı sunduğu için daha esnek ve verimli üretim biçimleri ile ilişkilidir. Göçebe üretim modeli, özellikle iklimsel ve çevresel çeşitliliğin yüksek olduğu bölgelerde bal verimliliğini artırıcı etki göstermektedir. Dokuzuncu sıradaki orta kuşak arıcılar, arıcılığı bir hobi değil geçim kaynağı olarak gören bir grup olarak, üretim düzeyine hem beşeri hem de fiziksel sermaye yoluyla katkı sağlamaktadır. Bu kuşakta yer alan bireylerin, daha fazla yatırım yapmaya ve verimliliği artırmaya istekli oldukları görülmektedir. Son olarak, başkalarından öğrenme değişkeni, geleneksel bilgi aktarım yollarının üretim performansına olan olumlu etkilerini ortaya koymaktadır. Aileden öğrenme, usta-çırak ilişkileri ve yöresel bilgi birikimi, modern tekniklerle entegre edildiğinde sektörel büyümeyi destekleyici bir potansiyel taşımaktadır.

Elde edilen tüm bu bulgular, arıcılık sektöründe üretim düzeyini etkileyen faktörlerin çok boyutlu ve iç içe geçmiş bir yapıya sahip olduğunu göstermektedir. Biyofiziksel kapasitenin (kovan sayısı, malzeme oranı) yanı sıra, bireysel özellikler (VKİ, deneyim, çalışma oranı), çevresel koşullar (yerleşim yeri, sağım sayısı) ve sosyo-kültürel etmenler (göçebe arıcılık, başkalarından öğrenme) üretim kapasitesi üzerinde belirleyici rol oynamaktadır. Bu bulgular, arıcılığa yönelik müdahalelerin yalnızca tarımsal üretim araçlarına değil, aynı zamanda eğitim, sağlık, çevre ve kırsal kalkınma gibi alanlara da yayılması gerektiğini göstermektedir. Genel olarak, XGBoost modelinin belirlediği bu ilk on değişken, arıcılıkta bal üretim düzeyini şekillendiren dinamiklerin biyolojik, ekonomik, çevresel ve sosyokültürel unsurlardan oluşan karmaşık bir yapıda olduğunu ortaya koymaktadır. Bu bulgular, arıcılığın sürdürülebilir gelişimi için çok boyutlu politika araçlarına ihtiyaç duyulduğunu göstermektedir.



Şekil 2. Bal üretim düzeyini belirleyen değişkenlerin önem düzeyine göre sıralanışı



Şekil 3. SHAP değerlerinin bal üretim düzeyi üzerindeki etkisi

4. SONUÇ VE ÖNERİLER

Rüzgâr enerjisi, çevreye duyarlı yapısı ve sürdürülebilir kalkınmaya katkısıyla, yenilenebilir enerji kaynakları arasında en hızlı büyüyen ve en fazla yatırım çeken alternatif olarak öne çıkmaktadır. Enerji üretiminde sunduğu avantajlara rağmen, rüzgâr çiftliklerinin plansız ve bilinçsiz şekilde kurulması, doğal habitatlar, ekosistem dengesi ve insan faaliyetleri üzerinde olumsuz etkiler yaratabilmektedir. Literatürde çoğunlukla rüzgâr türbinlerinin arıların yön bulma kabiliyetleri üzerindeki etkileri ve ekosistemlerdeki değişim incelenmiş olsa da, rüzgâr enerjisi altyapısının özellikle bal üretimi gibi tarımsal çıktılar üzerindeki doğrudan etkilerine ilişkin çalışmalar sınırlı kalmıştır. Bu çalışma, Türkiye'nin Ege Bölgesi'nde yer alan altı ili kapsayan kapsamlı bir saha araştırmasına dayanarak, arıcılık üretimi ile rüzgâr enerjisi santrallerine (RES) yakınlık arasındaki ilişkiyi incelemekte ve bu alandaki bilgi boşluğunu doldurmayı amaçlamaktadır. Araştırma bulgularına göre, kovanlarını RES bölgelerinde konumlandıran arıcılar, RES dışı bölgelerde faaliyet gösterenlere kıyasla sezonda ortalama 866 kg daha fazla bal üretmektedir. İl bazında değerlendirildiğinde ise, Muğla ilindeki arıcıların sezonda ortalama 5.258 kg, Balıkesir'dekilerin ise ortalama 2.356 kg bal ürettiği görülmektedir. Ayrıca, genç yaşta, düşük eğitim seviyesine sahip, mesleği aileden öğrenmiş, araca sahip, çiftlik kaydı bulunan ve kooperatif üyesi olan, göçebe arıcılık yapan, tarım sigortası bulunan, kovanlarını düzenli olarak (haftalık) besleyen, daha fazla kovana sahip, deneyimli ve devlet desteğinden yararlanan arıcıların bal üretim miktarlarının daha yüksek olduğu tespit edilmiştir. Bu doğrultuda bal üretimini artırmak amacıyla, deneyimli ve fazla sayıda kovana sahip arıcıların desteklenmesi, devlet desteklerine erişimin kolaylaştırılması, göçebe arıcılık faaliyetlerinin teşvik edilmesi, araç sahibi olmanın sağladığı lojistik avantajların artırılması, çiftlik kaydı ve kooperatif üyeliğinin yaygınlaştırılması, tarım sigortası kapsamının genişletilmesi ve düzenli koloni besleme uygulamalarına yönelik teşviklerin güçlendirilmesi gerekmektedir.

Rüzgâr çiftliklerinin çevresinde yapılan arıcılık faaliyetleri, bu alanlardaki zengin biyoçeşitlilik ve nektar kaynakları sayesinde bal üretimini artırmakta ve çevresel sürdürülebilirliğe katkı sağlamaktadır. Arıcılığı yaşam biçimi haline getiren ve deneyim kazanan üreticiler, verimliliklerini daha da artırmaktadır. Bu bulgular, yenilenebilir enerji projeleri ile tarımsal üretimin uyum içinde yürütülebileceğini göstermektedir. Bu doğrultuda, türbin çevresinde arı dostu bitkilerin teşviki ve rüzgâr santrallerinin arıcılık açısından yüksek potansiyelli alanlar olarak değerlendirilmesi, ekolojik ve ekonomik fayda sağlayabilir. Bu kapsamda önerilen "arıcılık uygunluk haritası", kırsal kalkınma politikalarının şekillendirilmesine katkı sunabilir. Bal üretimi ile rüzgâr santrallerine yakınlık arasında tespit edilen pozitif ilişki, tarımsal üretim, çevresel sürdürülebilirlik ve yenilenebilir enerji arasında uyumlu ve karşılıklı faydaya dayalı bir etkileşimin mümkün olduğunu göstermektedir. Bu durum, enerji, gıda ve ekosistem hizmetlerini birlikte ele alan bütüncül yaklaşımların önemini ortaya koymakta olup, rüzgâr enerjisi ile arıcılığın entegrasyonu, sürdürülebilir kalkınma hedeflerine katkı sağlayacak güçlü bir model olarak öne çıkmaktadır.

XGBoost modeliyle elde edilen bulgular, arıcılık sektörünün sürdürülebilir gelişimi için yalnızca üretim odaklı değil, aynı zamanda sosyal, çevresel ve kurumsal boyutları kapsayan çok boyutlu politika yaklaşımlarının gerekliliğini ortaya koymaktadır. Bu kapsamda, üretim sürecinde ihtiyaç duyulan donanım ve ekipmanlara erişimi kolaylaştırmak amacıyla

kooperatifleşme teşvik edilmeli, toplu alımlar yoluyla maliyetler azaltılmalıdır. Arıcıların fiziksel uygunluklarının üretim performansına olan etkisi dikkate alınarak, sağlık taramaları, ergonomi eğitimleri ve destekleyici sağlık programları hayata geçirilmelidir. Çevresel sürdürülebilirliği gözeten bir yaklaşımla, flora çeşitliliğini koruyacak projeler desteklenmeli, özellikle sağım faaliyetlerinin yoğunlaştığı alanlarda doğal dengeyi koruyucu önlemler güçlendirilmelidir. Bilgi aktarımında geleneksel sistemlerin hâlen önemli bir rol oynadığı arıcılıkta, bu bilgiyi modern tekniklerle harmanlayan hibrit eğitim modelleri geliştirilmeli ve yeni arıcıların deneyimli üreticilerle mentorluk ilişkileri kurmaları sağlanmalıdır. Kırsal bölgelerde üretimin pazara entegrasyonunu kolaylaştırmak amacıyla ulaşım, enerji ve iletişim altyapıları iyileştirilmeli; göçebe arıcılığın taşıdığı potansiyel göz önüne alınarak bu üretim biçimine yönelik geçici kamp alanları ve mevzuat kolaylıkları sunulmalıdır. Tüm bu bütüncül stratejiler, arıcılığın hem ekonomik kalkınmaya hem de ekolojik dengeye katkısını artırarak, sektörü daha dirençli ve sürdürülebilir bir yapıya kavuşturacaktır.

Çalışma, kapsam açısından yalnızca Ege Bölgesi ile sınırlı kalmış olup, bu durum bulguların genellenebilirliğini kısıtlayabilecek bir faktör olarak öne çıkmaktadır. Gelecek araştırmalarda, Türkiye'nin farklı arıcılık bölgelerini kapsayan daha geniş ölçekli çalışmalar yürütülerek bölgesel çeşitliliklerin ve dinamiklerin derinlemesine anlaşılması büyük önem taşımaktadır. Bu doğrultuda, coğrafi bilgi sistemleri (CBS) ve uzaktan algılama sistemleri (UAS) gibi ileri teknolojilerin kullanımı, RES gibi arıcılıkla bağlantılı çevresel, sosyoekonomik ve mekânsal faktörlerin çok boyutlu ve karşılaştırmalı bir şekilde analiz edilmesini mümkün kılacaktır. Söz konusu bütüncül yaklaşımlar, arıcılık sektörüne özgü, yerel koşullara duyarlı ve daha etkili politika önerilerinin geliştirilmesine değerli katkılar sunabilir.

ABSTRACT

Grass pea, which is used in many areas around the world and mostly grown as a fodder plant in our country, is not cultivated much, although it has the opportunity to grow in every region. Considering the possible climate change scenarios and drought factors that may arise in the future, the importance of the plant becomes more important. When we consider the roughage costs in animal husbandry, the high nutritional value of the plant makes it advantageous again. It is also an important plant in terms of improving the soil and preventing unnecessary fertilizer use by being used as green fertilizer thanks to bacteria that can bind nitrogen in the air specific to legumes. Each plant has its own bacterial strain for effective nitrogen fixation and adequate nodule formation. In this study, the effects of different bacterial strains on the grass pea plant were examined to determine the most effective strain, and since it is desired to have a small amount of nitrogen in the environment for the bacteria to work better, the experiment was carried out using different doses of DAP fertilizer, which also contains phosphorus, as a nitrogen source. was carried out to investigate the effects of isolated rhizobium bacteria on grass pea and also to determine the most appropriate dose of DAP fertilizer. In the study conducted as a pot experiment, control (samples without bacterial inoculation), alfalfa, vetch, soybean and pea bacterial strains inoculated with grass pea seeds; 0, 4 and 10 kg/da DAP fertilizer doses were applied and sown in the medium. Above-ground nitrogen and protein values and below-ground nitrogen and protein values were measured at 50% flowering. According to the results of analysis of variance, for above-ground nitrogen and protein values, bacteria application was found significant at 1% level, while fertilizer doses application was found significant at 5% level. For below-soil nitrogen and protein values, both treatments were found to be significant at 1% level. Above-ground nitrogen values ranged between 3.75-5.91% and protein values ranged between 23.45-36.95%. Subsoil nitrogen values varied between 0.14-2.17% and protein values varied between 0.87-13.58%. The highest results for above-ground plant nitrogen and protein values were obtained in the control group and 4 kg/da DAP fertilizer dose, while the lowest results were determined at 4 and 10 kg/da doses of soybean bacterial strain. For below-ground nitrogen and protein values, the highest values were obtained from soybean bacterial strain and 10 kg/da DAP fertilizer dose, while the lowest values were obtained from alfalfa bacterial strain and 0 kg/da fertilizer dose in the control group. When the results were evaluated,

it was observed that increasing fertilizer doses had positive effects on subsoil nitrogen and protein values, while they did not have much effect on above-soil nitrogen and protein values. It was observed that the bacterial strains used gave better results on above-ground nitrogen and protein values than the uninoculated groups. It is thought that the measurement time may also have a significant effect on the values and it would be appropriate to conduct field trials at different measurement times.

Keywords: Grass pea, Rhizobium, Nitrogen, Protein,

MÜRDÜMÜKTE GÜBRE VE BAKTERİ UYGULAMALARININ AZOT VE PROTEİN ORANLARI ÜZERİNE ETKİSİ

ÖZET

Dünya genelinde birçok alanda kullanılan, ülkemizde çoğunlukla yem bitkisi olarak yetiştirilen mürdümük, her bölgede yetişme imkânı olmasına rağmen tarımı fazla yapılmamaktadır. Gelecekte karşılaşılabilecek olası iklim değişikliği senaryoları ve ortaya çıkacak kuraklık etmenleri göz önüne alındığında bitkinin önemi daha fazla ortaya çıkmaktadır. Hayvancılıktaki kaba yem maliyetlerini düşündüğümüzde de besin değerlerinin yüksek olması bitkiyi yine avantajlı konuma getirmektedir. Baklagillere özgü havada bulunan azotu toprağa bağlayabilen bakteriler sayesinde yeşil gübre olarak kullanılıp, toprağı iyileştirmesi ve gereksiz gübre kullanımının önüne geçilmesi yönünden de önemli bir bitkidir. Azot fiksasyonunun etkili olabilmesi ve yeterli nodül oluşumu için her bitkinin kendine özgü bakteri suşu bulunmaktadır. Çalışmada farklı bakteri suşlarının mürdümük bitkisinde etkileri incelenerek en etkili suşu belirlemek, ayrıca bakterilerin daha iyi çalışabilmesi için ortamda az miktarda da olsa azot bulunması istendiğinden, azot kaynağı olarak, içeriğinde fosfor da bulunan DAP gübresin farklı dozları kullanılarak deneme yürütülmüştür. izole edilen rhizobium bakterilerinin mürdümük üzerinde etkilerini araştırmak ve ayrıca en uygun DAP gübre dozunu ortaya koymak amacıyla gerçekleştirilmiştir. Saksı denemesi şeklinde gerçekleştirilen çalışmada kontrol (bakteri aşılaması yapılmayan örnekler), yonca, fiğ, soya ve bezelye bakteri suşları ile aşılanan mürdümük tohumları; 0, 4 ve 10 kg/da DAP gübre dozlarının uygulandığı ortama ekilerek denemeye alınmıştır. %50 çiçeklenme döneminde yapılan ölçümlerde toprak üstü azot ve protein değerleri ile toprak altı azot ve protein değerleri ölçülmüştür. Varyans analizi sonuçlarına göre toprak üstü azot ve protein değerleri için bakteri uygulaması %1 seviyesinde önemli bulunurken, gübre dozları uygulaması %5 seviyesinde önemli bulunmuştur. Toprak altı azot ve protein değerlerinde ise her iki uyulama da %1 seviyesinde önemli olduğu saptanmıştır. Toprak üstü azot değerleri %3.75-5.91, protein değerleri %23.45-36.95 aralığında değişmiştir. Toprak altı azot değerlerinin %0.14-2.17, protein değerlerinin ise %0.87-13.58 aralığında değiştiği görülmüştür. Elde edilen bulgular incelendiğinde toprak üstü bitki azot ve protein değerleri için en yüksek sonuçlar kontrol grubu ve 4 kg/da DAP gübre dozunda elde edilirken, en düşük sonuçlar soya bakteri suşunun 4 ve 10 kg/da dozlarında tespit edilmiştir. Toprak altı azot ve protein değerleri için ise en yüksek veriler soya bakteri suşu ve 10 kg/da DAP gübre dozundan elde edilirken, en düşük değerler yonca bakteri susu ile kontrol grubunda 0 kg/da gübre dozunda elde edilmiştir. Ortaya çıkan sonuçlar değerlendirildiğinde artan gübre dozlarının toprak altı azot ve protein değerlerine olumlu etkileri gözlenirken, toprak üstü azot ve protein değerlerine fazla etkisi görülmemiştir. Kullanılan bakteri suşlarının toprak üstü azot ve protein değerleri üzerine aşısız gruplardan daha iyi sonuçlar verdiği görülmüştür. Ölçüm zamanının da değerler üzerinde önemli bir etkisinin olabileceği ve farklı ölçüm zamanlarında tarla denemesi de yapılmasının uygun olacağı düşünülmektedir.

Anahtar Kelimeler: Mürdümük, Rhizobium, Azot, Protein,

1.GİRİŞ

Artan dünya nüfusu ile birlikte besin ihtiyacı da paralel olarak artış göstermektedir. Hayvanların kaba yem ihtiyacının karşılanamaması elde edilen verimin azalmasına neden olmakta, bunun sonucunda ise insanların hayvansal protein yönünden eksik kaldığı görülmektedir (Arslan ve Çakmakçı 2011). Baklagiller de insan beslemesinde doğrudan ve dolaylı olarak büyük bir öneme sahiptir. Dünya genelinde özellikle insanların protein ihtiyacının karşılanabilmesi için yüksek protein içerikli bitkilerin yetiştirilmesi öncelikler altına alınmış olup, yapılan çalışmalarla bu bitkilerdeki verimliliğin de üst seviyeye çıkarılması amaçlanmaktadır (Eşiyok, 2016). Ancak üretimi arttırmak için kullanılan gübreler toprağa zarar vermekte ve maliyet açısından sorun oluşturmaktadır. Özellikle münavebe kültürünün yaygınlaşmaması ve aynı ürünlerin yıllar boyunca ekilmesinden dolayı topraklarda belli elementler azalarak, verimin düşmesine sebep olmaktadır. Verimi arttırmak için uygulanan kimyasal gübreler hem maliyetli olmakta hem de insan ve hayvan sağlığı için tehdit oluşturmaktadır (Açıkgöz, 2001). Bunun yanında toprak ıslahında da ön plana çıkan baklagiller toprağın iyileştirilmesinde ve sürdürülebilirliğinde etkin rol oynamaktadır.

Baklagil türleri arasında mürdümük hastalık ve zararlılara olan direnci ile ön plana çıkmaktadır (Vaz Patto vd. 2006). Mürdümük ülkemizin neredeyse her bölgesinde yetiştirilebilme olanağına sahip olan bir baklagil yem bitkisidir. Gelişmiş kök sistemi ile kuraklığa karşı dayanıklı olmasıyla birlikte, yetişme ortamına bakıldığında birçok toprak tipinde başarılı sonuçlar elde edilebilmektedir (Rybinski, 2003). Bu durumlar da tercih edilme sebepleri arasında yer almaktadır. Mürdümük bitkisi kullanım alanları incelendiğinde, insan ve hayvan beslenmesi yanında, toprak ıslahı amacıyla yeşil gübrelemede kullanıldığı da görülmektedir (Karadağ, 2009). Ülkemizde mürdümüğün daha çok hayvan beslemesinde ön plana çıktığı bilinmektedir. Mürdümük bitkisi, kendinden sonra tarımı yapılacak farklı bitkilere de fayda sağlamakta, toprağı azot yönünden iyileştirmektedir (Kumar vd. 2011).

Bakteri aşılaması ile baklagillerin köklerinde nodül oluşumu sağlanarak, havadaki azot bağlanır ve azot ihtiyacı karşılanır. Toprakta doğal olarak bulunan bakteriler az miktarda olduğundan ya da etkileri zayıf olduğundan aşılama işlemi yapılmadığında istenilen nodül oluşumu yeterli düzeyde sağlanamaz (Gök ve Onaç, 1995). Rhizobium bakterilerinin sağladığı azot fiksasyonu ile köklerde oluşacak nodüller vasıtasıyla bitkinin ihtiyacı olan azot karşılanabilir böylece aşırı gübrelemeye ihtiyaç kalmaz. Kimyasal gübrelerin kullanımının sınırlandırılması ile ekonomik olarak avantaj sağlacak olup, ayrıca toprakta oluşabilecek verimsizliğin önüne geçilmesine de sağlayacaktır (Kılıç, 2014). Özellikle baklagillerde bulunan rhizobium bakterileri sayesinde köklerde bağlanan azot daha temiz içerikli bir azot kaynağı olup, bitkisel aksamları da yeşil gübreleme ile toprağa faydalı olmaktadır.

DAP gübresi içeriğinde azot ve fosfor bulunduran bir gübredir. Yağış yüksek olduğunda ya da fazla sulama yapıldığında topraktan hemen yıkanmaz. Bitkiler için en etkili olduğu dönem özellikle ilk gelişme dönemleridir. Bu dönemde fosfor kökün gelişebilmesi için önem arz etmektedir. Baklagillerde sıklıkla kullanılıp, taban gübresi olarak değerlendirilmektedir.

Farklı bitkilerden izole edilmiş Rhizobium bakterilerinin aşılaması ve bünyesinde azot ile fosfor bulunan DAP gübre dozlarının mürdümük bitkisinin toprak altı ve toprak üstü aksamındaki azot ve protein oranlarını belirlemek, bitki gelişimine katkı sağlayarak kullanılabilirliğini arttırmak

ve kullanım alanlarını genişletmek, yeşil gübrelemeye uygunluğunu tespit ve teşvik ederek gübre zararlarını azaltmak projemizin amaçları arasında yer almaktadır.

2.MATERYAL VE METOT

2.1. Materyal

Kocaeli ilinde sera koşullarında saksı denemesi şeklinde yürütülen çalışmada materyal olarak; piyasadan temin edilen DAP gübresi, Toprak, Gübre ve Su Kaynakları Merkez Araştırma Enstitüsü Müdürlüğü'nden temin edilen farklı bitkilerden izole edilmiş bakteri suşları ve Batı Akdeniz Tarımsal Araştırma Enstitüsü Müdürlüğünden temin edilen mürdümük tohumları kullanılmıştır.

2.2. Metot

Denemede kullanılan tohumlar dezenfeksiyon edilmek amacıyla %3 lük Sodyum Hipoklorit çözeltisinde 5 dakika bekletilmiş, ardından yıkanmış ve kurutularak işleme uygun hale getirilmiştir (Baltepe ve Mert, 1972). Toprak ise otoklavda 121 ºC de 1 saat süre ile sterilize edilerek kullanılmıştır (Alef ve Nannipleri, 1995). Çalışma 3 tekerrürlü olacak şekilde planlanmıştır. Çalışmada kullanılan toprak karışımı 2/4 tarla toprağı, 1/4 kum ve 1/4 torf şeklindedir. Saksıların derinliği 13 cm, genişliği ise 15 cm'dir. DAP gübresinin (0, 4, 10 kg/da) farklı dozları ortama ilave edilmiş olup, tohumlar ekim öncesi yonca, fiğ, bezelye ve soya bitkilerinden izole edilen bakteri suşu ile muamele edilerek ekilmiştir. Kontrol grubunda hiçbir suş kullanılmamıştır. Saksılara ekilen tohumlardan çıkış sonrası her saksıda 3 adet bitki kalacak şekilde seyreltme yapılmıştır.

Tablo 1. Çalışmada kullanılan toprak karışımının fiziksel ve kimyasal özellikleri

pH	Ec (mS/cm)	Tekstür	Kireç (%)	Organik madde (%)	Azot (%)
7.31	0.193	Kumlu Balçık	5.78	2.46	0.0822

Tablo 1. incelendiğinde çalışmada kullanılan toprak karışımının hafif alkali, tuzsuz, orta kireçli, organik madde içeriği yüksek ve azot içeriği düşük olduğu görülmektedir.

2.3. Analiz Yöntemleri

Toprak üstü bitki azot ve protein içeriğinin tespiti için bitki gövde kısmından alınan örnekler Kjhelldal yöntemine göre analiz edilmiş, ve azot değerleri elde edilmiştir (Kacar, 1972). Elde edilen azot değerlerinin 6,25 katsayısı ile çarpımı neticesinde ise protein değerleri tespit edilmiştir (Bremner, 1965). Toprak altı azot ve protein içeriği tespiti için aynı işlemler uygulanmış ve kök kısmından alınan örnekler kullanılmıştır.

Çalışmada elde edilen veriler JMP istatistik paket programı kullanılarak değerlendirilmiş, yapılan varyans analizi sonucunda ortalamalar arasındaki farklar LSD testi ile gruplandırılmıştır (Düzgüneş ve diğ, 1987).

3.BULGULAR VE TARTIŞMA

3.1. Mürdümükte Toprak Üstü Azot ve Protein İçerikleri

Yapılan ölçümler sonucunda elde edilen toprak üstü azot ve protein değerlerinin varyans analiz sonuçları Tablo 2. de verilmiştir. Değerler incelendiğinde Bakteri türü ve Bakteri türü*Gübre dozu interaksiyonu %1 düzeyinde önemli bulunurken, Gübre dozu %5 düzeyinde istatistiki açıdan önemli bulunmuştur.

Tablo 2. Araştırmada elde edilen toprak üstü bitki azot ve protein değerlerine ait varyans analiz tablosu

Varyasyon Kaynakları	SD	HKT	F
Bakteri türü	4	6.5141867	6.4319**
Gübre (DAP) dozu	2	1.9858800	3.9216*

CV (%)		10,56	10.56
LSD		1,12	7.06
Önem		**	**

Çalışmada elde edilen veriler değerlendirildiğinde; en yüksek toprak üstü bitki azot (%5,91) ve protein (%36,95) değerlerinin kontrol grubunda 4 kg/da gübre dozunda elde edildiği belirlenmiştir. En düşük toprak altı azot değerleri soya bakteri suşuyla aşılanmış grupta 4 ve 10 kg/da gübre dozlarında sırasıyla %3.80 ve %3.75 olarak tespit edilmiştir. Protein değerleri ise %23.79 ve %23.45 olarak belirlenmiştir. Bakteri türü açısından kontrol edildiğinde Şekil 1. de görüldüğü gibi aşısız grup en yüksek ortalama değerleri vermiş olup, en yakın ortalama değerler fiğ grubuna ait bakteri suşundan elde edilmiştir. Soya bakteri suşu en düşük ortalamaların olduğu grup olarak görülmektedir. Tablo 3 de belirtilen ortalama değerler tablosu incelendiğinde kullanılan gübre dozları ile farklı bakteri suşlarının etkilerinin değiştiği belirlenmiştir. Toprak üstü azot ve protein değerleri yüksek gübre dozları ile bakteri suşu aşılı suşlarda pozitif yönde artış göstermemiştir.

Yağmur ve Engin (2005) yapmış oldukları aşılama çalışmasında nohut bitkisinde toprak üstü bitki aksamında protein oranlarının değişmediğini belirlemişlerdir. Doğan ve diğ. (2007) çalışmalarında farklı demir dozları ile bakteri aşılmasını denedikleri yerfıstığında protein değerlerinin istatistiki açıdan değişmediğini belirlemişlerdir. Karadağ ve diğ. (2008) farklı illerde yürütmüş oldukları çalışmalarında ekimle birlikte azot ve fosfor gübreleri kullanmış

mürdümükte protein değerlerini % 17.89-26.70 oranlarında belirlemişlerdir. Sarıoğlu (2017) yürütmüş olduğu çalışmada soyada aşılama yapılmayan örneklerde daha yüksek azot değerleri olduğunu belirtmiştir. İşler ve Coşkan (2019) değişik bakteri aşılama yöntemleri ile soya bitkisi üzerinde yürttükleri çalışmalarında aşısız gruplarda azot değerlerinin daha yüksek olduğunu belirtmişlerdir. Tufan (2019) Mürdümük bitkisi ile yaptığı çalışmasında ortalama protein içeriklerini %23.93-27.23 değer aralığında belirlemiştir. Deniz (2020) Çalışmasında mürdümük bitkisinde ortalama toprak üstü protein oranlarını %12.52-16.28 aralığında tespit etmiştir. Deniz ve diğ. (2020) yapmış oldukları çalışmada mürdümük bitkisine ekimle birlikte azot uygulaması yapmış ve toprak üstü protein değerlerini % 11.90-20.23 olarak belirlemişlerdir. Güleç Şen (2021) mürdümükte tuzluluk oranlarının yükseldikçe toprak üstü protein değerlerinin de artış gösterdiğini bildirmiştir. Küçükkaya (2022) mürdümük bitkisi ile yürütmüş olduğu çalışmasında yozgat ilinde toprak üstü protein içeriklerini %27.71-28.88 aralığında belirlemiştir. Sezer (2024) Bilecik ilinde iki yıl süreyle devam ettiği çalışmasında mürdümükte protein değerlerini 2022 yılında ortalama %18.13, 2023 de ise %19.70 olarak belirlemiştir.

İncelenen kaynaklarda aşılama çalışmalarının etkisiz olduğu aşısız grupların daha yüksek ortalamalar verdiği tespit edilmiş, çalışmada da aynı sonuçlar elde edilmiştir. Ancak çalışmada gübre dozu*bakteri suşu interaksiyonunun da önemli olduğu tespit edilmiş ve uygun dozlarda uygun bakteri suşu kullanımında farklı değerler elde edilebileceği düşünülmektedir. Ayrıca incelenen kaynaklarda toprak üstü azot ve protein değerlerinin çalışmada eld edilen değerlerden genel olarak daha düşük olduğu tespit edilmiştir. Bu durumun varyans analiz tablosunda gübre dozu interaksiyonunun önemli bulunmasıyla bağlantılı olarak farklı gübre dozları kullanımı, yağış ve sulamada farklılıklar yada farklı çeşit ve popülasyonlarda bitki kullanımından kaynaklabileceği düşünülmektedir.

3.2. Mürdümükte Toprak Altı Azot ve Protein İçerikleri

Mürdümük bitkisi ile yapılan farklı DAP gübre dozları ve bakteri aşılama işlemi ile elde edilen toprak altı azot ve protein değerlerine ait varyans analiz sonuçları Tablo 4. de verilmiştir. Elde edilen değerler incelendiğinde Bakteri türü, Gübre dozu ve Bakteri türü*Gübre (DAP) dozu interaksiyonlarının %1 düzeyinde istatistiki olarak önemli tespit edilmiştir.

Tablo 4. Araştırmada elde edilen toprak altı bitki azot ve protein değerlerine ait varyans analiz tablosu

Varyasyon Kaynakları	SD	HKT	F
Bakteri türü	4	146.13837	60.7855**

	10	1.91b	11.97b
CV (%)		14,16	14.16
LSD		0,27	1.74
Önem		**	**

Çalışmada elde edilen ortalama değerler incelendiğinde, en yüksek toprak altı azot ve protein değerleri soya bakteri suşunda 10 kg/da gübre dozunda %2.17 ve %13.58 olarak tespit edilmiştir. En düşük ortalama toprak altı azot ve protein değerleri aşısız grupta ve yonca bakteri suşu ile aşılanmış grupta, 0 kg/da gübre (DAP) dozunda elde edilmiştir. Bu değerler aşısız grupta %0.16 azot ve %1.00 protein, yonca bakteri aşılı grupta ise azot %0.14 ve protein %0.87 olarak tespit edilmiştir. Gübre dozu*bakteri türü interaksiyonu önemli çıkan çalışmada, gübre dozlarının bakteri suşlarına etkisi Tablo 5 de görüldüğü gibi en fazla 10 kg/da ortaya çıkmıştır. Ayrıca yüksek gübre dozlarında bakteri suşu aşılamanın azot ve protein değerleri üzerindeki önemi görülmüştür.

Doğan ve diğ. (2007) bakteri aşılaması yaptıkları çalışmalarında kök azot içeriklerini kontrol etmiş ve anlamlı farklılıklar olduğunu belirtmişlerdir. Coşkan ve diğ. (2009) farklı bakteri suşları ve gübre kullanarak yürüttükleri çalışmalarında soya kök azot değerlerinde farklılıkların olmadığını tespit etmişlerdir. İşler ve Coşkan (2009) soyada kök azot içeriklerini %2.18-2.87 değer aralığında belirlemiş ve en düşük ortalamaların aşısız grupta olduğunu tespit etmişlerdir.

Akkurt (2010) Bakteri aşılaması yapılan fasulye örneklerinde aşısız gruplara göre daha yüksek değerlerin tespit edildiğini bildirmiştir. Sarıoğlu (2017) soya bitkisiyle yapmış olduğu çalışmasında bakteri aşılaması yapılan topraklarda aşısız olanlara göre daha yüksek değerler tespit etmiştir. İncekara (2023) Çalışmasında farklı baklagillerde bakteri aşısız örneklerde düşük değerler elde ederken en iyi ortalamaları rhizobium*azotobakter kombine aşılama yönteminde tespit etmiştir. Literatürde incelenen kaynaklarda yapılan incelemede, çalışmamızda elde edilen sonuçların benzerlik gösterdiği tespit edilmiş ve bakteri aşısı yapılan çalışmaların yüksek değerler verdiği görülmüştür. Bununla birlikte farklı sonuçlar elde edilen çalışmaların da bulunduğu, bu durumun çalışmada elde edilen bakteri suşu*gübre dozu interaksiyonunun istatistiki olarak önemli olması ile bağlantılı olarak çalışmalarda kullanılan farklı dozlarda gübre miktarından ve toprak özelliklerinin farklılığından kaynaklandığı düşünülmektedir. Ayrıca kullanılan bakteri suşlarının farklı olmasından kaynaklı bu durumun ortaya çıkabileceği düşünülmektedir.

4.SONUÇ

Toprak üstü azot ve protein değerleri incelendiğinde yapılan çalışmalarla paralellik gösterdiği ve aşısız denemelerin daha iyi sonuçlar verdiği görülmüştür. DAP gübre dozu açısından ise gübresiz ortalamaların daha yüksek değerler verdiği tespit edilmiştir. Ancak çalışmada gübre dozu*bakteri suşu interaksiyonu %1 düzeyinde önemli bulunmuş kullanılan bakteri suşlarıyla uygulanan gübre dozlarının değerler üzerindeki etkisi görülmüş, bazı bakteri suşlarının farklı dozlardaki gübrelerde kontrol ve gübresiz ortalamalara göre daha yüksek değerler verdiği tespit edilmiştir. Örneğin aşısız grupta 4 kg/da gübre dozunda en yüksek değer elde edilirken yonca ve fiğ bakteri suşu ile aşılı grupların 0 kg/da gübre dozunda da sonraki yüksek değerlerin ortaya çıktığı tespit edilmiştir. Bunun sebebi ise toprakta yeterli miktarda azot ve fosfor bulunmasından kaynaklanabileceği düşünülmektedir. Bununla birlikte çalışmada elde edilen değerlerin literatürde belirtilen çalışmalardan daha yüksek olduğu görülmüştür. Bu durumun çalışmaların yapıldığı ekolojik koşullardan, kullanılan gübre miktarlarından, yağış yada sulama değerlerinin farklılıklarından, tohum genotiplerinin farklılıklarından yada vejetasyon döneminden kaynaklanabileceği düşünülmektedir. Toprak altı azot ve protein değerleri incelendiğinde yapılan çalışmaların büyük çoğunluğu ile benzerlik gösterdiği ve bakteri aşılamanın etkili olduğu görülmüş, aşısız denemeler daha düşük değerler vermiştir. Bu durumun bakterilerin fikse ettiği azotun köklere bağlanmasıyla bağlantılı olabileceği düşünülmektedir. DAP gübre dozları incelendiğinde ise en yüksek değerlerin 10 kg/da gübre dozunda elde edildiği ve bu durumun da artan azot ve fosfor oranlarının bakteri etkinliği üzerindeki etkisinden kaynaklandığı düşünülmektedir. Çalışmada gübre dozu*bakteri suşu interaksiyonu toprak altı azot ve protein değerleri içinde önemli bulunmuş gübre dozlarının farklı bakteri suşları ile etkileşiminin olduğu tespit edilmiştir. Örneğin en yüksek ortalama değer soya bakteri suşunun 10 kg/da gübre dozunda elde edilmiş olmasına rağmen gübre dozlarının tamamına göre en yüksek ortalamalar yonca ve bezelye bakteri suşunda tespit edilmiş, soya bakteri suşunun 0 ve 4 kg/da gübre dozları düşük değerler vermiştir. Genel olarak sonuçlar değerlendirildiğinde kullanılacak gübre miktarının ve bakteri türünün incelenen özelliklerde farklılık gösterdiği ve uygun dozda uygun bakteri suşunun etkili olabileceği, ayrıca

tarla denemesi olarak farklı ekim zamanlarında, hasat zamanı ölçümlerin ve birkaç yıllık denemelerin sonuçlarının incelenmesinin uygun olabileceği düşünülmektedir.

Bu çalışmanın maddi açıdan desteklenmesine olanak sağlayan, Sakarya Uygulamalı Bilimler Üniversitesi Bilimsel Araştırma Projeleri (BAP) Komisyon Başkanlığına (Proje No: 205-2024) teşekkür ederiz.

PLANT PROTEIN REVOLUTION FOR SUSTAINABLE AGRICULTURE AND RURAL DEVELOPMENT: OPPORTUNITIES AND CHALLENGES

Doç. Dr. Sena ÖZBAY
Kırşehir Ahi Evran Üniversitesi Kaman Meslek Yüksekokulu
sena_ozbay@hotmail.com
ORCID NO: 0000-0001-6024-0805

ABSTRACT

The growing global population and changing dietary habits are placing significant pressure on food systems worldwide. While this pressure sometimes promotes the production of fairer and healthier products, it can also lead to an increase in fast, cheap, and unhealthy production methods. The widespread consumption of fast food has increased the demand for animal food and therefore its production. However, traditional animal protein production has recently faced criticism for its environmental impact, including greenhouse gas emissions, land use issues, water consumption, and biodiversity loss. In this context, the production and adoption of plant-based proteins and foods have been gaining traction.

The aim of this study is to examine the global demand for plant-based proteins and their potential impacts on sustainable agricultural practices and rural development. The "plant-based protein revolution" offers significant opportunities such as enhancing environmental sustainability, ensuring food security, and revitalizing rural economies. However, it also faces various challenges, including productivity, infrastructure, market access, and consumer acceptance. This study will investigate these opportunities and challenges based on data obtained through an extensive literature review. Additionally, the benefits and possible processes of this transformative change in the global food system will be explored.

The plant-based protein revolution presents valuable opportunities to transform agriculture, promote rural development, and build a more sustainable and equitable food system. However, the development of these new protein production models will only be possible through investments in these models, as well as the establishment of policies and collaborations that promote sustainable practices.

The plant-based protein revolution is not merely a dietary trend; it represents a fundamental shift in how we produce and consume food. It is driven by a range of factors, including increasing awareness of the environmental and health impacts of food choices, advancements in food technology, and evolving consumer preferences. While the transition to a plant-based food system offers significant benefits, recognizing and addressing the associated challenges will further improve the process.

This transition is crucial for ensuring food security, mitigating climate change, conserving natural resources, and improving human health. Current food production trends suggest that the future will witness an increase in plant-based food production and consumption. Embracing the plant-based protein revolution is essential for developing innovative foods and constructing more sustainable production processes.

Keywords: Plant-based protein, sustainability, climate

SÜRDÜRÜLEBİLİR TARIM VE KIRSAL KALKINMA İÇİN BİTKİSEL PROTEİN DEVRİMİ: FIRSATLAR VE ZORLUKLAR

ÖZET

Büyüyen küresel nüfus ve değişen beslenme alışkanlıkları, dünya çapındaki gıda sistemleri üzerinde önemli bir baskı oluşturmaktadır. Bu baskı zaman zaman daha adil ve sağlıklı ürünlerin üretimini desteklerken bazen de hızlı, ucuz ve sağlıksız üretimi arttırmaktadır. Fast-food gıda tüketiminin yaygınlaşması ile artan gıda talebi özellikle hayvansal gıda üretimini arttırmıştır. Ancak geleneksel hayvansal protein üretimi, son günlerde sera gazı emisyonları, arazi problemleri, su tüketimi ve biyoçeşitlilik kaybı gibi çevresel sorunlar açısından da ele alınmaktadır. Bu bağlamda bitki bazlı protein üretimi ve bitki bazlı gıdaların yaygınlaştığı da görülmektedir.

Bu çalışmada amaç bitkisel proteinlere yönelik oluşan küresel talebi ve bu talebin sürdürülebilir tarım uygulamaları ve kırsal kalkınma üzerindeki potansiyel etkilerini incelemektir. "Bitkisel protein devrimi", çevresel sürdürülebilirliği artırma, gıda güvenliğini sağlama ve kırsal ekonomileri canlandırma gibi önemli fırsatlar sunmaktadır. Ancak, verimlilik, altyapı, pazar erişimi ve tüketici kabulü gibi çeşitli zorluklarla da karşı karşıyadır. Bu etmenler açısından derin literatür taraması ile elde edilen verilere dayanarak bu fırsatlar ve zorluklar araştırılacaktır. Aynı zamanda küresel gıda sistemindeki bu dönüşümsel değişimin faydaları ve olası süreçleri incelenecektir. Bitkisel protein devrimi, tarımı dönüştürmek, kırsal kalkınmayı teşvik etmek ve daha sürdürülebilir ve adil bir gıda sistemi inşa etmek için önemli fırsatlar sunmaktadır. Ancak bu yeni protein üretim modellerinin gelişimi, modellere yatırım yaparak, sürdürülebilir uygulamaları teşvik eden politikalar ve işbirlikleri geliştirmek ile mümkün olabilecektir.

Bitkisel protein devrimi, yalnızca bir beslenme trendi değil; gıda üretme ve tüketme şeklimizde temel bir değişimdir. Gıda seçimlerinin çevresel ve sağlık etkileri hakkında artan farkındalık, gıda teknolojisindeki gelişmeler ve gelişen tüketici tercihleri dâhil olmak üzere bir dizi faktör tarafından yönlendirilmektedir. Bitkisel merkezli bir gıda sistemine geçiş önemli faydalar sunarken, ilgili zorlukları kabul etmek ve ele almak da süreci iyileştirecektir.

Bu geçiş, gıda güvenliğini sağlamak, iklim değişikliğini azaltmak, doğal kaynakları korumak ve insan sağlığını iyileştirmek için de önem taşımaktadır. Mevcut gıda üretim trendleri, gelecekte daha fazla bitkisel bazlı gıda üretimi/tüketimi yaşanacağını düşündürmektedir. Bitkisel protein devrimini benimsemek, yenilikçi gıdaları üretmek ve daha sürdürülebilir üretim süreçleri inşa etmek için de önem teşkil etmektedir.

Anahtar Kelimeler: bitki bazlı protein, sürdürülebilirlik, iklim

1. INTRODUCTION

Global food systems are under increasing pressure at the intersection of growing world population and changing dietary habits. This situation causes hunger to emerge as a critical and urgent issue worldwide. Indeed, increasing population and consumption patterns create an unprecedented demand load on already limited agricultural and natural resources. One of the harsh realities we face today is that while approximately one billion people struggle with chronic malnutrition, our current agricultural systems simultaneously deplete soil and water resources, threaten biodiversity, and disrupt the climate on a global scale (Foley et al., 2011). In this complex picture, meat consumption, a significant component of the diet, is considered one of the main drivers of global environmental change due to its multifaceted dimensions such as greenhouse gas emissions, land and water use, animal welfare concerns, impacts on human health, and modern farming practices (van der Weele et al., 2019).

In addition to this significant harm caused by human activities to nature, the problem of hunger also maintains its place on the global agenda. The FAO (2020) report reveals that the number of people affected by hunger in the world has shown an alarming slow upward trend in recent years. According to the report, factors such as food insecurity exacerbated by climate change and increasing conflicts worldwide lie behind this increase. The same data paints a grim picture, forecasting that the number of globally undernourished people will exceed 840 million by 2030 (FAO, 2020).

From a nutritional habits perspective, the proliferation of diets high in animal and processed foods is seen to have played a significant role in the increase of non-communicable diseases and deepened the negative environmental health impacts of food production (Blanco-Gutierrez et al., 2020). However, contrasting this general trend, a different awareness is also developing in many countries. There is a not insignificant and growing consumer base that consciously reduces or completely abandons animal product consumption and orients towards more traditional dietary patterns (Derbyshire, 2016; Serra-Majem et al., 2004). Specifically, among consumers adopting models like the flexitarian and Mediterranean diets, factors such as health, ethical values, environmental concerns, and animal welfare come to the fore. With these motivations, it is observed that consumers are reducing meat consumption and increasingly turning towards plant-based options (Derbyshire, 2016). Parallel to this consumer trend, a significant transformation is also taking place in the industrial sphere; industrial efforts to develop healthier and sustainable alternatives to animal products continue unabated (van der Weele et al., 2019).

As a concrete indicator of this transformation, the demand for plant-based proteins in Europe has reached remarkable levels. In the 2016/2017 period, this demand reached approximately 27 million tons of crude protein, and it has been reported that the European Union imports approximately 17 million tons of crude protein annually, a significant portion of which (13 million tons) is soy-based (Commission, 2018). Market data also confirms this rising trend. According to the Vegan Food Market reports prepared by Antriksh (2023), the global market, the global vegan food market is growing rapidly (Antriksh, 2023). Consequently, this increase in plant-based food production is recognized not just as a consumer preference but as an important alternative for transitioning to a more sustainable and ethical production model

(Broad, 2019). In this context, this study aims to comprehensively examine the opportunities presented by, and the challenges faced by, the rapidly growing plant-based food market, driven by increasing consumer interest and diversifying production alternatives.

2. OPPORTUNITIES AND CHALLENGES

This growing interest in plant-based proteins and the consequent developments in production trigger a significant transformation that can be described as a "plant-based protein revolution," and this process brings both considerable opportunities and challenges that need to be overcome.

2.1. Opportunities

The proliferation of the plant-based protein revolution offers significant opportunities, particularly for sustainable agriculture, rural development, and the future of the overall food system. These opportunities can be summarized under the following headings:

1. **Environmental Sustainability:** The first and most prominent opportunity lies in environmental sustainability. Current scientific data consistently show that plant-based diets support both human health and the health of our planet. Reducing large-scale animal food production can offer considerable environmental benefits by significantly reducing greenhouse gas emissions caused by the entire livestock value chain, land-use change and degradation, and the use of water resources, especially those at risk of scarcity (Espinosa-Marrón et al., 2022). Indeed, studies show that high consumption of animal foods creates greater pressure on the environment, whereas high consumption of plant-based foods is associated with lower environmental impact. Significant evidence in this area indicates that plant-based nutrition requires less land use and can mitigate biodiversity loss. Generally evaluated, the current scientific evidence strongly supports the transition to plant-based diets to reduce the environmental footprint of human dietary practices, confirming that this transition will also provide significant benefits for human health (Carey et al., 2023).

2. **Environment and Human Health Interaction:** In addition to environmental benefits, strong health motivations also underlie the shift towards plant-based diets. It is clearly observed that consumers adopting models like flexitarian and Mediterranean diets are increasingly reducing meat consumption and turning more towards plant-based diets due to heightened awareness of issues such as health, ethical values, environmental sensitivity, and animal welfare (Derbyshire, 2016). In fact, plant-based foods offer a significant contribution by providing a wide spectrum of phytochemicals that play critical regulatory roles in human health (Briskin, 2000). Of course, nutrition is complex; while some human nutrient requirements can be met more effectively from plant sources, animal foods might be an easier source for others. This situation suggests

that plant-based and animal-based foods might have a complementary, even symbiotic interaction in terms of their potential to improve human health (van Vliet et al., 2020). However, one of the most dominant motivations for consumers turning to plant-based foods is the desire to protect environmental health. Indeed, the environmental burden of today's food and agricultural system is substantial; the system causes 17.3 billion metric tons of carbon dioxide emissions annually, and a large portion of this massive total, 57%, originates directly from animal food production (Suri & Ray, 2023). From the perspective of consumer perception, health benefits stand out among the main advantages associated with plant-based diets; factors such as reduced saturated fat intake (79% agreement), increased fiber intake (76%), and helping prevent various diseases (70%) are frequently mentioned. However, it has been observed that demographic differences such as age, gender, and education also play a role in the perception of these benefits, although gender differences might be more pronounced than other factors (Lea et al., 2006). From the viewpoint of food industry stakeholders, current market conditions and the global macro-environment are considered to offer a highly favorable ground for investing in plant-based food and protein trends, both now and in the foreseeable future (Aschemann-Witzel et al., 2021).

3. **Market Trends and Consumer Preferences:** This positive health and environmental perception is clearly reflected in concrete market trends. As previously mentioned, Antriksh (2023) reports project the global Vegan Food Market to grow from its USD 28.42 billion value in 2023 to USD 63.23 billion by 2031, showing a strong annual growth rate (CAGR) of 10.53% during this period. A key factor underlying this remarkable growth is the increasing health consciousness among consumers. As people become more aware of the strong link between nutrition and overall health, their preference for plant-based foods, accepted as healthier alternatives compared to animal products, naturally increases (Antriksh, 2023). This trend also serves the goal of sustainable food systems. A sustainable food system aims to provide sufficient and nutritious food for everyone within the framework of limited natural resources, and the food sector, among both consumers and producers, is increasingly focusing on these sustainability issues. At this point, plant-based foods and proteins are considered a new and rapidly growing trend aiming to make a significant contribution to this global challenge (Aschemann-Witzel et al., 2021). Comparative studies on consumer acceptance offer interesting findings. For example, compared to the US, countries like India and China have been found to have significantly higher acceptance of "clean" (lab-grown/cultured) meat and plant-based meat. However, the same study found that food neophobia (reluctance towards new foods) is higher in India and China compared to the US, while attachment to meat is lower. These findings highlight the significant impact of demographic factors and established cultural beliefs on consumer acceptance; notably, a higher level of familiarity has been linked to greater acceptance of plant-based and clean meat in all countries. These results underscore the importance for alternative protein producers to explore new markets and approach them with the right strategies, especially in developing countries where meat consumption continues to rise

(Bryant et al., 2019). Therefore, it is predicted that the PBM (plant-based meat) market will grow with increased awareness, familiarity, and knowledge in the coming period. It is critically important for companies aiming for success in this market to focus on potential benefit categories (health, environment, ethics, etc.) that will help consumers adopt PBM alternatives to win over their target audiences (Safdar et al., 2022).

4. **Revitalization of Rural Economies:** Market growth opens new doors not only for urban consumers and the food industry but also for rural economies. The production of plant-based foods holds the potential to be a significant stakeholder in the rural economy. Specifically, the cultivation of necessary raw materials (e.g., protein crops) for plant-based meat alternatives, the opportunity to transition to new, value-added sectors in agricultural production, and the creation of new market opportunities for these alternative products are considered potential contributions to the rural economy (Newton & Blaustein-Rejto, 2021). Although it is noted that net margins and profitability at the farm level may, in some cases, be lower compared to traditional animal production equivalents, the situation can differ at the processing stage. At this stage, it is stated that plant-based products may provide socio-economic gains, such as the potential to create lower unemployment rates (Varela-Ortega et al., 2021).

In summary, when these factors converge – namely, increasing societal awareness, the desire to protect the planet, efforts to prevent non-communicable diseases, the goal of enhancing food security, the aim of ensuring nutritional adequacy, and the drive to develop sustainable food production practices – they strengthen the call for a holistic food system transformation. It is an undeniable fact that plant-based foods possess immense future potential due to requiring fewer natural resources and causing less harm to the environment (Suri & Ray, 2023). Ultimately, considering the current limited agricultural land, water, and energy resources, plant-based meat and other alternatives offer a promising solution path for sustainably feeding the growing global population.

2.2. Challenges

However, realizing the full potential benefits offered by this plant-based protein revolution faces several serious challenges that must be overcome:

1. **Policy and Regulatory Hurdles:** Firstly, uncertainties in the legal and regulatory framework pose a significant obstacle. Both in Turkey and globally, specific legal regulations and codex work related to plant-based foods are still in development, and the lack of clearly defined, internationally accepted standards in this area creates market uncertainty. This uncertainty complicates the commercialization of plant-based foods in various aspects. The lack of sufficient and standardized information regarding the relative advantages and disadvantages of different plant-derived ingredients and production processes, potential safety concerns (e.g., allergenicity risks), varying regulatory approaches across countries, and supply chain management issues hinder

companies' entry into and growth in this market. Therefore, providing more scientific data and clarity on these issues will help companies enter the plant-based food market more safely and successfully (McClements & Grossmann, 2021). On the other hand, government interventions such as taxation policies, incentive mechanisms, and public education programs could facilitate consumers' shift towards more plant-based diets. However, the effective design and implementation of such policies require more comprehensive and reliable information about the multifaceted social, economic, environmental, and health impacts of replacing animal products with plant-based alternatives.

2. **Infrastructure, Processing, and Industrial Adaptation:** In addition to legislative and policy uncertainties, production infrastructure and processing technologies also present significant challenges. Currently, the plant-based meat industry may face challenges and competition from the established traditional meat industry, particularly concerning legal and regulatory classification issues (Li, 2020). This situation also brings threats such as potential income loss concerns for farmers engaged in traditional agriculture and animal husbandry, barriers preventing these actors from transitioning to alternative meat sectors, and the risk of exclusion from these new sectors (Newton & Blaustein-Rejto, 2021). From a technical standpoint, the successful production of plant-based foods is constrained by difficulties in sourcing adequate quantities of suitable plant-derived ingredients, especially high-quality proteins, in a sustainable manner, and the lack of efficient, large-scale production processes to convert these ingredients into the desired final products (meat, milk, cheese analogues, etc.) sought by consumers. Particularly, creating plant-based analogues of products with complex structural and sensory attributes, such as whole muscle meat, fish, yogurt, and cheese, remains technically challenging with current technology. Therefore, there is a strong need for more fundamental and applied research to understand more deeply the complex relationship between the structural and functional properties of plant-based ingredients and the ability to produce high-quality animal product analogues that consumers wish to consume (McClements & Grossmann, 2021). These technical challenges are coupled with consumer-side barriers. For business opportunities to materialize on a larger scale, technological advancements alone are not sufficient; there must also be a positive shift in consumer beliefs, perceptions, and general understanding. Additionally, a significant contradiction arises from consumers expecting health benefits and "clean labels" (few and understandable ingredients) on one hand, while harboring general skepticism towards processed foods on the other. Overcoming this contradiction requires the development of innovative plant-based foods that can meet both consumer expectations – for instance, having simple and understandable ingredient lists, not containing excessive amounts of ingredients perceived as unhealthy like sugar and salt, and avoiding artificial ingredients unfamiliar or viewed skeptically by consumers (Aschemann-Witzel et al., 2021).

3. **Consumer Acceptance and Dietary Habits:** Finally, perhaps one of the most fundamental challenges is the difficulty in achieving consumer acceptance and changing established dietary habits. It is observed that consumers' awareness level regarding the environmental impacts of meat production is surprisingly low, and this applies to consumers in various European countries as well. Parallel to this, the willingness of people to change their meat consumption behavior (i.e., reduce or substitute – e.g., eating insects or meat substitutes) is generally observed to be low. Unfortunately, insufficient research has yet been conducted on how to more effectively motivate people to reduce meat consumption. Specifically, there is an urgent need for further research focusing on strategies that can help promote pro-environmental meat consumption behavior (e.g., behavioral interventions known as 'nudging'), given the lack of experimental studies that could trigger behavior change. Furthermore, studies representing the general population are scarce, and there is a need for more in-depth and comprehensive research on the underlying factors that increase people's willingness to reduce or substitute meat consumption (Hartmann & Siegrist, 2017). At this point, greater effort is needed to educate consumers accurately and understandably about the potential benefits and possible disadvantages of consuming plant-based foods; only then can consumers make informed and knowledge-based choices (McClements & Grossmann, 2021). An important finding emerging from research is that the main perceived barrier to adopting a plant-based diet is the lack of information about these diets (42% agreement). Moreover, demographic factors such as gender, age, and education have been observed to play a role in the perception of this barrier. For example, non-university graduates and older individuals appear less willing to change their current eating patterns compared to university graduates and younger participants (Lea et al., 2006). As a general trend, it is also noted that consumers' personal benefits (such as health, taste, cost) often take precedence when the environmental impact of food is concerned, and this situation can lead to environmental motivations being overshadowed by other consumption motives (Siegrist et al., 2024).

3. CONCLUSION

This study examined the rapidly growing plant-based food market within the context of pressures on global food systems and changing consumer trends, identifying the significant opportunities it presents and the key challenges it faces. Based on the analyzed data and literature, the following main conclusions have been reached:

- **A High-Potential Environmental and Health Alternative:** Plant-based diets and foods possess the potential to play a critical role in the transition to a sustainable food system by offering environmental advantages such as lower greenhouse gas emissions, land, and water use compared to traditional animal production. Concurrently, driven by increasing health consciousness, they are a significant source of consumer motivation due to potential health benefits like reducing saturated fat intake, increasing fiber intake, and preventing certain diseases.

- **Strong Market Growth and Economic Opportunities:** The global plant-based food market exhibits double-digit growth rates, supported by increasing consumer awareness, health, and ethical concerns. This situation creates a significant area for innovation and investment for the food industry, while also offering new revitalization opportunities for rural economies through the production and processing of plant-based protein raw materials.
- **Importance of Policy and Regulatory Framework:** For the healthy and reliable development of the market, there is an urgent need for clear, harmonized legal regulations and standards at national and international levels. Supportive public policies such as taxation, incentives, and education programs can play a key role in accelerating this transition, but a better understanding of the social, economic, and environmental impacts of these policies is necessary.
- **Need for Technological and Infrastructural Development:** Technological innovation and the development of production infrastructure are needed for plant-based products to successfully mimic the taste, texture, and nutritional value of animal products, particularly meat, milk, and cheese. Strengthening raw material supply chains and scaling up processing technologies are critical for market growth.
- **Challenge of Consumer Acceptance and Behavior Change:** Low consumer awareness of the environmental impacts of meat consumption, established dietary habits, potential reservations about new foods (neophobia), and the lack of information about plant-based products are among the most significant barriers to market expansion. Educating consumers and ensuring products meet sensory expectations are fundamental requirements for increasing acceptance rates.

Ultimately, the full realization of the potential offered by the plant-based food revolution depends on capitalizing on these opportunities and overcoming the challenges. A strong collaboration and coordination established among policymakers, industry players, researchers, and consumers will be decisive in progressing towards a more sustainable, healthy, and ethical global food system.

ABSTRACT

Although the world's climates have seemed stable throughout human history, the findings from the past to the present show that this is not the case and that they have undergone some changes, albeit slightly. While climates may change due to natural causes, there may also be some changes resulting from human-made effects. The pollutants released with the world's population growth and industrialization are at the forefront of the effects that cause global warming and are created by humans. These pollutants directly and indirectly negatively affect the world's atmosphere, as well as the seas, soil and living creatures on earth. The agricultural sector that is most affected by these negativities is the livestock sector, which uses 45% of the world's land area ((Sejian, Gaughan et al. 2015). These effects can be in the form of extreme temperatures, storms and excessive rainfall, which directly affect the welfare and productivity of animals, as well as in the form of a decrease in the production of plant products used in their nutrition and the vegetation cover in pastures, which are their natural feeding areas. In both cases, animal production causes an increase in prices in parallel with the increase in costs along with the decrease in productivity, and therefore a decrease in people's purchasing power. The poultry industry, where most of the production is carried out in closed shelters, is also negatively affected by global warming and climate change. Feed costs, which constitute a large part of production costs, increase feed raw material prices due to the decrease in plant production efficiency, which is one of the negative results of global warming and climate change, as well as increasing the amount of energy required to keep shelter conditions at appropriate levels, and also increases the feed conversion rate of animals. In order to be able to cope heat stress caused by global warming, it is inevitable to develop different strategies in the livestock sector while water use strategies and drought-resistant varieties are being developed in plant production.

Keywords: Global warming, poultry industry, animal welfare.

KÜRESEL ISINMA VE İKLİM DEĞİŞİKLİĞİNİN KANATLI SEKTÖRÜNE ETKİSİ

ÖZET

İnsanlık tarihi boyunca dünya iklimleri her ne kadar durağan gibi görünse de geçmişten günümüze dek elde edilen bulgular bunun böyle olmadığını, az da olsa bir değişime maruz kaldığını göstermektedir. İklimler doğal nedenlerle değişeceği gibi insanlar tarafından oluşturulan etkilerden kaynaklanan bazı değişimler de olabilmektedir. Küresel ısınmaya sebep olan ve insanlar tarafından oluşturulan etkilerin en başında, dünya nüfus artışı ve sanayileşme ile birlikte açığa çıkan kirleticiler yer almaktadır. Bu kirleticiler, dünya atmosferi ile birlikte denizleri, toprağı ve dünyada yaşayan canlıları da doğrudan ve dolaylı olumsuz olarak etkilemektedir. Bu olumsuzlukların en fazla etkilediği tarımsal sektörlerin başında dünya kara alanlarının %45'ini kullanan hayvancılık sektörü gelmektedir((Sejian, Gaughan et al. 2015). Bu etkiler aşırı sıcaklık, fırtınalar ve aşırı yağışlar şeklinde doğrudan hayvanlar üzerinde onların refah ve verimini olumsuz etkileyen durumlar oluşturduğu gibi, onların beslenmesinde kullanılan bitkisel ürünlerin üretiminin ve doğal beslenme alanları olan meralardaki bitki örtüsünün azalması şeklinde de olabilmektedir. Her iki durumda da hayvansal üretim de verim düşüklüğü ile birlikte maliyetlerin artmasına paralel olarak fiyatların artmasına ve dolayısı ile insanların alım güçlerinin düşmesine sebep olmaktadır. Üretimin büyük kısmının kapalı barınaklarda yapıldığı kanatlı sektörü de küresel ısınma ve iklim değişikliğinden olumsuz olarak etkilenmektedir. Üretim masraflarının büyük kısmını oluşturan yem masrafı küresel ısınma ve iklim değişikliğinin olumsuz sonuçlarından biri olan bitkisel üretim verim düşüklüğünden kaynaklı yem hammadde fiyatlarının artmasının yanında barınak şartlarının uygun seviyelerde tutulması için gereken enerji miktarını da arttırmakta, hayvanların yem dönüşüm oranını da yükseltmektedir. Küresel ısınmanın sebep olduğu sıcaklık stresi ile mücadele edebilmek amacı ile bitkisel üretimde su kullanım stratejileri, kuraklığa dayanıklı çeşitler geliştirilirken hayvancılık sektöründe de farklı stratejiler geliştirilmesi kaçınılmazdır.

Anahtar Kelimeler: Küresel ısınma, kanatlı sektörü, hayvan refahı,

1. GİRİŞ

İnsanlık tarihi boyunca dünya iklimleri her ne kadar durağan gibi görünse de geçmişten günümüze dek elde edilen bulgular bunun böyle olmadığını, az da olsa bir değişime maruz kaldığını göstermektedir. İklimler doğal nedenlerle değişeceği gibi, insanlar tarafından oluşturulan etkiler de bu değişimlere katkıda bulunabilmektedir. Küresel ısınmaya sebep olan ve insanlar tarafından oluşturulan etkilerin en başında, dünya nüfus artışı ve sanayileşme ile birlikte açığa çıkan kirleticiler yer almaktadır. Bu kirleticiler, dünya atmosferi ile birlikte denizleri, toprağı ve dünyada yaşayan canlıları da doğrudan ve dolaylı olumsuz olarak etkilemektedir. Bu olumsuzlukların en fazla etkilediği tarımsal sektörlerin başında dünya kara alanlarının %45'ini kullanan hayvancılık sektörü gelmektedir (Sejian, Gaughan et al. 2015). Bu etkiler aşırı sıcaklık, fırtınalar ve aşırı yağışlar şeklinde doğrudan hayvanlar üzerinde onların refah ve verimini olumsuz etkileyen durumlar oluşturduğu gibi, onların beslenmesinde kullanılan bitkisel ürünlerin üretiminin ve doğal beslenme alanları olan meralardaki bitki örtüsünün azalması şeklinde de olabilmektedir. Her iki durumda da hayvansal üretim de verim düşüklüğü ile birlikte maliyetlerin artmasına paralel olarak fiyatların artmasına ve dolayısı ile insanların alım güçlerinin düşmesine sebep olmaktadır. Üretimin büyük kısmının kapalı barınaklarda yapıldığı kanatlı sektörü de küresel ısınma ve iklim değişikliğinden olumsuz olarak etkilenmektedir. Üretim masraflarının büyük kısmını oluşturan yem masrafı küresel ısınma ve iklim değişikliğinin olumsuz sonuçlarından biri olan bitkisel üretim verim düşüklüğünden kaynaklı yem hammadde fiyatlarının artmasının yanında barınak şartlarının uygun seviyelerde tutulması için gereken enerji miktarını da arttırmakta, hayvanların yem dönüşüm oranını da yükseltmektedir. Küresel ısınmanın sebep olduğu sıcaklık stresi ile mücadele edebilmek amacı ile bitkisel üretimde su kullanım stratejileri, kuraklığa dayanıklı çeşitler geliştirilirken hayvancılık sektöründe de farklı stratejiler geliştirilmesi kaçınılmazdır.

2. KÜRESEL ISINMA

Yeryüzünde yaşayan tüm canlılar için vazgeçilmez olan atmosfer birçok gazın karışımından oluşmuştur. Atmosferi meydana getiren bu gazların her birinin ayrı fiziksel ve kimyasal özellikleri bulunmaktadır. Atmosferin bileşenleri durağan olmayıp, bazı zamanlarda bölgeden bölgeye küçük değişiklikler gösterebilir. Ancak bu bileşenler belirli standartlardaki miktarlarını korumak zorundadır, aksi halde atmosfer içerisindeki tüm canlı ve yapılar için tehlikeli bir durum oluşturur. Genel olarak dünya güneşten gelen ışınlardan çok dünya üzerine düşen güneş ışınlarının yansımasıyla ısınmaktadır. Başta karbondioksit, metan ve su buharı olmak üzere, bu ışınlar atmosferdeki gazlar tarafından tutularak dünya ısınmaktadır. Güneşten yeryüzüne gelip atmosfere doğru yansıyan güneş ışınlarından bilhassa enerji yüklü olan kızılötesi ışınların uzaya geri dönmesinin atmosferdeki gazlar tarafından engellenmesine sera etkisi adı verilmektedir. Sera gazlarının atmosferdeki miktarı arttıkça bunların sera etkisi de artmaktadır. Sera etkisi normalde doğal bir süreç olup, dünyada yaşamın sağlanabilmesi için gereken sıcaklığı sağlamaktadır. Atmosferin ısıyı tutma özelliği sayesinde yeryüzündeki suların sıcaklığı dengede kalarak, okyanus ve nehirlerin donması engellenmiş olur. Sera gazı oluşumunun iki farklı sebebi vardır. Bunlardan birincisi bitki ve hayvanların solunumu ile doğal yollardan oluşan gazlar, ikincisi ise insan aktiviteleri sonucu oluşan gazlardır. İnsanlardan kaynaklanan

gazlar büyük oranda, fosil yakıtların yakılması, orman alanlarının azalması, yoğun hayvansal üretim, sentetik gübre kullanımı ve endüstriyel süreçlerdir (Sejian, et al. 2015). Sanayi Devrimi ile artan insan aktivitesi, gelişen teknolojinin hızla yaygınlaşması ve yaşam standardının yükseltilmesi çabaları atmosferde sera etkisi yapan gazların miktarında gereğinden fazla artmaya neden olmuştur (Mikhaylov, et al. 2020).

Küresel ısınma, insan faaliyetleri, özellikle fosil yakıt yakımı nedeniyle, dünya atmosferindeki ısıyı hapseden sera gazı seviyelerini artıran, 1850 yılı sanayi öncesi dönemden bu yana dünya yüzeyinin uzun vadeli ısınmasıdır. Sanayi öncesi dönemden bu yana, insan faaliyetlerinin dünya'nın küresel ortalama sıcaklığını yaklaşık 1 santigrat derece artırdığı tahmin edilmektedir ve şu anda her on yılda 0,2 santigrat dereceden fazla artmaktadır. Mevcut ısınma eğilimi, 1950'lerden bu yana insan faaliyetlerinin açık bir sonucudur ve binlerce yıldır benzeri görülmemiş bir hızla ilerlemektedir.

Ortalama sıcaklıktaki artışa ek olarak, sıcak günlerin sayısı ve sıcak hava dalgalarının sayısı gibi aşırı olayların sıklığında da bir artış vardır. Sıcak hava dalgaları, hava sıcaklığının süresi ve yoğunluğunun birleşimidir ve insan faaliyetlerinin yanı sıra çiftlik hayvanlarının sağlığını ve üretkenliğini de güçlü bir şekilde etkileyebilir (Bernabucci, 2019).

3. TARIMSAL ÜRETİMDE SERA GAZI SALIMI

Tarımla ilişkili sera gazları üç çeşit olup, bunlar; Karbondioksit (CO2), metan (CH4) ve nitröz oksittir (N2O). Diğer önemli sera gazları arasında su buharı ve birçok halokarbon bileşiği bulunur, ancak bunların emisyonlarının tarımdan etkilendiği düşünülmemektedir. Nitröz oksit (N2O) ve metan (CH4) konsantrasyonlarının artması özellikle tehlikelidir çünkü her ikisi de diğerlerinden çok daha yüksek oksidasyona sahiptir (Podkówka etal, 2015). Metan gazı karbondioksitten 23 kat, azotoksit ise 296 kat daha fazla sera etkisine sahiptir. Fosil yakıt kullanımının insan kaynaklı CO2 emisyonlarının %75'inden fazlasından sorumlu olduğu düşünülmektedir. Başta ormansızlaştırma olmak üzere arazi kullanım değişikliği geri kalanından sorumludur. İnsan faaliyetlerinin son 25 yılda CH4 emisyon oranını iki katından fazla artırdığı düşünülmektedir (Synder ve diğerleri, 2009). Tarımla ilişkili üç sera gazı olan karbondioksit, metan ve azotoksitin (CO2, CH4 ve N2O) ısıyı hapsetme etkinlikleri ve atmosferdeki devir oranları bakımından farklılık göstermektedir. Bitkisel üretim faaliyetlerinde karbondioksit, metan ve azotoksit ile kıyaslandığında daha fazla üretilir. Bitkiler, fotosentez yoluyla büyük miktarlarda karbondioksit tüketmelerine karşın, bu bitkisel ürünler sonunda diğer canlılar tarafından tüketildiklerinde veya ayrıştıklarında tekrar karbondioksite dönüşürler. Tarımsal kaynaklı net karbondioksit salınımı, toplam karbondioksit salınımına kıyasla azdır ve çoğunlukla işletmelerde, tarımsal ürünlerin üretimi ve taşınmasında kullanılan enerjiden kaynaklanır. Metan gazı en çok, pirinç üretiminden ve geviş getiren hayvanlardan salınır. Sular altında kalan pirinç tarlalarındaki organik materyalin anaerobik ayrışması, büyüme mevsimi boyunca öncelikle pirinç bitkileri aracılığıyla difüzyonla atmosfere yayılan metan (CH4) üretir. Hayvan gübresi, dünya genelinde yaklaşık yedi milyar ton tarımda kullanılmaktadır. Hayvan gübresinin tarımsal toprakta organik gübre olarak kullanılması, yalnızca toprak sağlığını ve tarımsal verimliliği artırmakla kalmaz, aynı zamanda sera gazı emisyonları üzerinde de önemli bir etkiye sahiptir. Hayvansal gübredeki metan üretimi, anaerobik koşullar ve parçalanabilir

organik gübrenin birleşiminden kaynaklanır. Hayvan gübresi, toplam insan kaynaklı metan emisyonlarının yaklaşık % 6'sını oluşturur (Chataut etal, 2023). Azot oksit oluşumu toprak mikro organizmaları tarafından nitrifikasyon ve denitrifikasyon ile oluşur. Toprağa uygulanan azotlu gübreler azot oksit oluşumunun ana sebebidir. Oluşan azot oksit miktarı; kullanılan gübrenin türü, uygulama oranı, uygulama tekniği, uygulama zamanı, toprak işleme sistemi, diğer kimyasalların kullanımı, topraktaki mikroorganizma sayısı gibi pek çok faktörden etkilenebilir.

Ruminant hayvanlar çevreye, tek mideli hayvanlardan önemli ölçüde daha fazla miktarda gaz salarlar. Ruminantların sindirim sistemleri, selülolitik ve metanojenik mikroorganizmaların aktivitesi ile fermantasyon yoluyla yapısal karbonhidratları kullanmak üzere adapte olmuştur. Sindirim sürecinde, düşük molekül ağırlıklı uçucu yağ asitleri olarak sınıflandırılan metan ve metan olmayan uçucu organik bileşikler üretirler (Brade ve diğerleri, 2008) Metan ve metan olmayan uçucu organik bileşikler yalnızca sindirim sisteminde üretilmez. Gübre ve hayvanların vücutları, bunların önemli bir miktarını ve ek olarak azotlu maddeleri devamlı üretir. Dışkı ve idrarda bulunan sindirilmemiş organik madde ve su, metan üreten bakteriler için mükemmel bir kaynaktır; bunlar yüksek miktarda metan, metan olmayan uçucu bileşikler, amonyak ve diğer azot bileşikleri üretirler (Podkówka ve diğerleri, 2015). Tek mideli çiftlik hayvanları ve kanatlı hayvanlar da gerek sindirim sistemi gerekse dışkıları ile belirli miktarlarda sera gazı oluşumuna katkıda bulunurlar. Dünyada domuz ve kümes hayvanlarının hayvansal kaynaklı sera gazı üretimine katkısı sırasıyla %9 ve %8 civarında olduğu belirtilmektedir (Gerber etal, 2013). Kümes hayvanı üretiminden kaynaklanan sera gazı emisyonlarına en büyük katkı yem üretimidir. Çiftlikteki kümes hayvanı faaliyetlerinden kaynaklanan en yüksek emisyonlar enerji kullanımı ve gübre yönetimi için gereken yakıt kullanımından kaynaklanır. Etlik piliç üretiminde çiftlik kapısı sonrası emisyonlar tüm emisyonların yarısından fazlasını oluştururken, yumurtacı işletmelerden kaynaklanan çiftlik kapısı sonrası emisyonlar toplam emisyonların dörtte birinden daha azını oluşturur (Dunkley and Dunkley, 2013).

4. KÜRESEL ISINMA VE İKLİM DEĞİŞİKLİĞİNİN BİTKİSEL ÜRETİM ÜZERİNE OLAN ETKİLERİ

Küresel ısınmanın, tarım üzerindeki temel olumsuz etkileri; Sıcaklık ve yağışların ortalama uzun vadeli değerlerden sapmaları ve verimde azalmaya neden olan bazı diğer olumsuz hidrometeorolojik olaylardır. İklim değişikliği; tarım, orman ve bitki örtüsü, temiz su kaynakları, deniz seviyesi, enerji, insan sağlığı ve biyolojik çeşitliliği doğrudan veya dolaylı olarak çeşitli şekillerde etkileyebilmektedir. Tüm bunların yanında, iklim değişikliği sosyal ve ekonomik sorunsallara neden olarak tarım üzerinde baskı oluşturabilmektedir. İklim değişikliği nedeniyle toprak ve su rejimleri değişime uğramakta, tarımsal üretim azalmakta ve gıda güvenliği tehlikeye girmektedir. İklim değişikliğinin uzun dönemde; su ve diğer kaynaklar üzerinde stres oluşturması, toprakları verimsizleştirmesi, tarım alanlarının durumlarını kötüleştirmesi, geniş çapta çölleşmelere neden olması, tarım mahsullerinde zararlı ve hastalıkların çoğalmasına sebep olması ve deniz seviyesini yükselterek kıyı ekosistemlerini tahrip etmesi beklenmektedir. Afrika, en az sera gazı salmasına rağmen, iklim değişikliğinin tahmin edilen etkilerinden en çok etkilenen kıtadır. Afrika da 2050'ye kadar 1,5–3,0 °C'lik,

önümüzdeki 100 yıl içinde 2–6°C'lik bir artış beklenmektedir ve bu diğer bölgelerden daha şiddetlidir.

5. KÜRESEL ISINMA VE İKLİM DEĞİŞİKLİĞİNİN HAYVANCILIK SEKTÖRÜNE ETKİLERİ

Hayvancılık sektöründe hayvanların termal konforuyla ilgili artan endişe yalnızca tropikal bölgelerdeki ülkeler için değil, aynı zamanda yüksek ortam sıcaklıklarının sorun olmaya başladığı ılıman bölgelerdeki ülkeler için de problem oluşturmaktadır. Son çeyrek yüzyılda, hayvancılık sektörü büyük oranda yüksek verimli hayvanlar geliştirmeye, çevreyi değiştirmeye ve beslenme yönetimini iyileştirmeye odaklanmış, hayvanların stresle baş edebilme kapasiteleri pek dikkate alınmamıştı. Bu yaklaşım çiftlik hayvanlarında verimi önemli ölçüde artırmakla birlikte sıcak ortamlara karşı duyarlılıklarını da artırarak termal esnekliklerini azaltmıştır. Hayvanların çevrelerindeki değişikliklere tepki verdiği süreçler onların hayatta kalmaları için kritik öneme sahipken, genellikle hayvancılık sistemlerinin verimliliğini ve karlılığını olumsuz etkiler (Bernabucci, 2019). Yoğunluğuna ve süresine bağlı olarak, ısı stresi hayvanlarda metabolik değişikliklere, oksidatif strese, bağışıklık baskılanmasına ve ölümlere neden olarak onların sağlığını olumsuz etkileyebilir. İklim değişikliğinin dolaylı etkileri, hayvanların değişen iklim koşullarına adaptasyonu olumsuz etkileyen yem ve su kıtlığı, beslenme kaynaklı hastalıklar, bulaşıcı konukçuların direnci, vektör kaynaklı hastalıkların yayılması şeklinde de ortaya çıkabilir. Yüksek sıcaklıklar patojen veya parazitlerin gelişimini destekleyebilir, rüzgarlardaki değişimler ise bazı patojen ve hastalık taşıyıcıların daha geniş bir alana yayılmasına yol açarak, hastalıkların yayılımında değişimler oluşturabilir (Petrovica ve ark., 2015). Sıcakkanlı hayvanlar yüksek sıcaklıklarda vücut sıcaklığının artmasını önlemek için ısı kaybını artırarak ve ısı üretimini azaltarak tepki verirler (hipertermi). Bu tür tepkiler arasında solunum ve terleme oranlarında artış ve yem tüketiminde azalma bulunur. Isı stresi, süt ve et ineklerinde topallamalara sebep olabilir (Shearer, 1999).

Küresel ısınmanın neden olduğu çölleşme süreci, yem bitkisi ekili alanlar da verim kayıplarına sebep olduğundan, üretim maliyetlerinin artmasına da sebep olmaktadır. Küresel ısınmanın, hayvansal üretimin yoğun olarak yapıldığı ülkelerde doğrudan etkilerinin yanı sıra su kıtlığı, kaba/kesif yem üretiminde azalma ve patojenler gibi dolaylı etkiler ile de hayvansal üretimi çok daha olumsuz etkileyebilmektedir (Koyuncu, 2017).

6. KÜRESEL ISINMA VE İKLİM DEĞİŞİKLİĞİNİN KANATLI HAYVANLAR VE SEKTÖRE ETKİLERİ

İklim değişikliği ve küresel ısınmanın kanatlı sektörü üzerinde doğrudan ve dolaylı etkileri olmaktadır. Yüksek sıcaklık, sel, kuraklık ve su kıtlığı gibi İklim değişiklikleri kanatlı hayvanların homeostazileri üzerinde stres oluşturarak onları olumsuz yönde etkiler. İklim değişikliğinin en yaygın olan etkisi yüksek sıcaklıklar olup, yem tüketiminde azalma, canlı ağırlık artışında düşüş, yem değerlendirme oranında artış, metabolizma hızının azalması, lipid peroksidasyonu, hormonal bozukluklar, bağışıklık sisteminin baskılanması ve bağırsak mikrobiyal simbiyozunda bozulmalara sebep olabilmektedir (Biswal vd. 2020; Vandana vd.

2021). Yumurtacı tavuk ve etlik piliçlerde optimum sıcaklık aralığı yaklaşık 18-22 °C arasındadır. Ortam sıcaklıkları bu sıcaklıkların üzerine çıkmaya başladığında ısı kaybetme mekanizmaları devreye girer. Tavuklarda ter bezi yoktur. Fazla ısıyı vücuttan uzaklaştırmak için solunum hızını arttırarak buharlaşma yoluyla ısı kaybetmeye çalışırlar. Aynı zamanda kanatlarını açarak tüylerin az olduğu kanat altı kısımlarından ısı kaybetmeye çalışırlar. Vücutlarını daha soğuk zeminlere temas ettirerek ısı kaybetmeye çalışırlar. Kanatlı hayvanlar belirli sıcaklıklara kadar uyum sağlayabilirler, ancak yüksek sıcaklıklarda, metabolik ısı üretimini sınırlamak için yem tüketimini azaltarak, kas gelişimi ve ya yumurta üretimi için gereken besin maddelerini ısı kaybı mekanizmaları için harcarlar. Sindirim sistemi faaliyetleri azalarak bağırsaklardaki besin maddesi sindirimi ve emilimi düşer. Yapılan çalışmalar sıcaklık stresinin bağırsak epitel hücrelerini etkilediğini ortaya koymuştur (Santos et al, 2015). Yumurtacı tavuklarda yumurta sayısı ve boyutunda düşüşlere sebep olmakla birlikte, yumurta iç ve dış kalite özelliklerinde de düşüşlere sebep olmaktadır. Damızlık tavukçulukta yumurta verimi, kalitesi, kuluçka randımanı ve civciv kalitesinde de düşüşlere sebep olabilmektedir (Ayo et al, 2011). İklim değişikliği üreme hormonları üzerinde de etkiye sahiptir. FSH, LH, progesteron, östrojen, testesteron salınımı üzerinde etkili olarak, erkeklerde spermatogenez ve dişilerde gametogenez üzerinde etkili olabilmektedir (Abioja ve Abiona, 2021). Isı stresi altındaki horozlar düşük sperm konsantrasyonu ve kalitesine sahip semen üretir. Tavukların bağışıklığı sıcaklık stresi koşulları altında düşer (Calefi ve ark. 2017). Sıcaklığın nem ile yakından ilişkili olmasından dolayı nemle birlikte sıcaklık artışlarının daha fazla olumsuz etkileri olmaktadır. Daha hızlı büyüme performansı sergileyen etlik piliçler yumurtacı tavuklara nazaran yüksek sıcaklığa daha hassastırlar.

İklim değişikliği ve küresel ısınmanın doğrudan etkilerinin yanında dolaylı olarak da hayvanlar ve sektör üzerinde etkileri olmaktadır. Kanatlı hayvanları beslemek için yem hammaddesi üretiminde ve tedarikinde, yeterli ve kaliteli su temininde de sorunlara yol açabilmektedir. Yağışların azalması veya aşırı yağışlar yem hammaddeleri üretimi üzerinde etkilidir ve her ikisi de verimi olumsuz olarak etkilemektedir. Bazı hastalıkların görülme sıklığında artış görülebilirken hayvanların düşmüş olan bağışıklık sistemleri onları daha savunmasız duruma getirebilecektir. Bütün bunlar sağlık için yapılan harcamalarda artışa sebep olacaktır. Bu etkiler özellikle güney yarım kürede Afrika kıtasında daha bariz görülebilmektedir.

7. YÜKSEK SICAKLIK STRESİNE KARŞI ALINABİLECEK ÖNLEMLER

Tamamen kapalı ve ısı yalıtımı iyi olan kümeslerde serinletme pedleri, sisleme, fanlar gibi ekipmanlarla sıcaklığı düşürmek tropik ve sıcak ve gelişmekte olan ülkelerde yaygın olan yarı açık kümeslerden kısmen daha kolaydır. Yarı açık kümeslerde havalandırmayı etkin hale getirecek önlemler alınmalı, kümeslerin etrafı hava akımını engelleyecek şekilde kapatılmamalı, etkili rüzgar yönü hesaba katılarak kümesler planlanmalı, kümes etrafına ağaç dikilmesi gölgelik ve serinlik sağlayabilir, özellikle sac çatı malzemeleri güneşte kızıp, ısıyı kümes içerisine yansıtacağından tercih edilmemelidir. Tel ızgaralı zeminler derin altlıklı sistemlere nazaran tavukların vücudundan daha fazla ısı kaybını sağlayıp avantaj oluşturabilir.

Yüksek sıcaklıklar tavuklarda yem alımının düşmesine sebep olduğundan verim kayıplarına sebep olur. Yem alımı azalacağından özellikle lisin ve metionin alımı azalabileceğinden

bunların ayarlanması gerekir. Yemlere enerji kaynağı olarak nişasta yerine yağ katılması yağların metabolizması sırasında karbonhidratlardan daha az ısı oluşturduğundan dolayı avantaj sağlar. Proteinlerin metabolik parçalanması en yüksek ısı oluşumuna sebep olduğundan düşük proteinli yemler sıcaklık stresi ile mücadelede avantaj sağlayabilir. Yemlere A, C ve E vitamini ve bitki ekstraktları gibi antioksidanların katılması ısı stresinde etkili olabilir. Sıcaklık stresi koşullarında ıslak yem ile beslemenin su alımını arttırdığından, klasik yemlere göre avantaj sağlayabileceği ile ilgili çalışmalar vardır (Syafvan et al, (2011). Yemleme zamanının günün en serin zamanlarında yapılması metabolik ısı artışının yüksek sıcaklık ile çakışmasını engelleyerek etkili olabilir. Yüksek sıcaklıklarda tavuklara sürekli, temiz ve serin su temini çok önemlidir. Yüksek sıcaklıklarda solunum sayısı ve hızı artacağından, buharlaşma ile su kaybı artar. Tavuklar ılık suyu içmekten pek hoşlanmazlar, sıcaklık stresinde özellikle serin su verilmesi oldukça etkilidir. Çıplak boyunlu tavuklar daha fazla ısı kaybı yaşayacaklarından, sıcak bölgelerde avantaj sağlayabilir. Yerleşim sıklığı yoğun olduğu durumlarda tavukların ısı kaybı azalır, sıcaklık stresi durumunda yerleşim sıklığının düşürülmesi etkili olmaktadır. Epigenetik adaptasyon uygulamalarının sıcaklık stresi ile baş etmede etkili olabileceği çalışmalar mevcuttur (Zulkifli ve ark. 2000; Liew ve ark. 2003).

8. SONUÇ

Küresel ısınma ve iklim değişikliğinin etkilerinin artarak devam edeceği öngörülmektedir. Doğa ve çevresel şartlarla direkt bağlantılı olan hayvancılık sektörünün bundan çok fazla etkileneceği açıktır. Isınmanın dolaylı etkileri ile birlikte, kanatlı sektöründe hayvanların çok büyük oranda kapalı barınak şartlarında yetiştirilmesi, onların stresli ortamlardan uzaklaşabilmelerini imkansız kılmaktadır. Kanatlı yetiştiriciliğinde sıcaklık stresini kontrol edebilecek barınakların planlanması başta olmak üzere yukarıda açıklamaya çalıştığımız önlemlerin alınması hem hayvan sağlığı ve refahı yönünden hem de karlılık açısından uygun olacaktır.

POTENTIAL USE OF PROBIOTIC SPORE-FORMING BACTERIA IN DAIRY TECHNOLOGY

Öğretim Görevlisi Dr. Sinan AKBAL
Pamukkale Üniversitesi, Acıpayam MYO, Gıda İşleme Bölümü, Denizli
sakbal@pau.edu.tr, ORCID NO: 0000-0001-5928-1917

ABSTRACT

In dairy technology, many species belonging to different genera such as *Lactobacillus*, *Bifidobacterium*, and *Lactococcus* are currently used as probiotics due to their immune system support and digestive system benefits. However, there has been an increasing interest in the probiotic properties of spore-forming bacteria in recent years.

Although probiotic microorganisms mostly have characteristics such as growth in different salt concentrations and resistance to pH changes, they do not show viability for a relatively long time when used in foods. Bacterial spores are more resistant to extreme environmental conditions such as high heat treatment, low pH, antimicrobial compounds, etc. than their vegetative forms. Due to the high viability of spores during storage at different temperatures depending on the product characteristics, it is important to evaluate them as probiotics in foods. In addition, due to the high acidity content in foods such as yogurt and cheese, it is generally not possible for spores to germinate. In this way, there are no significant changes in the sensory properties of the food and it is possible to remain a high level of vitality until consumption. It is also very important for spores to be able to show high viability in environments such as stomach acidity and bile salts in the gastrointestinal system of humans and animals.

Probiotic spore-forming microorganisms are currently commercially available and are being evaluated in the fields of medicine and veterinary. Therefore, its use in foods is expected to become widespread. The best-known spore-forming bacteria in dairy technology belong to the *Bacillus* and *Clostridium* genera. Although it is known that there are many harmful types of these microorganisms in terms of technology and health, when we look at the latest research, it is understood that some types can be evaluated as probiotics. *Bacillus coagulans*, *B. clausii*, *B. pumilus*, *B. subtilis*, and *Clostridium butyricum* are important spore-forming probiotic bacteria.

In this review, the properties of spore-forming bacteria, known for the problems they cause in dairy technology for many years, the metabolites they produce, their technological use and their effects on health are discussed.

Keywords: Probiotic, Spore forming bacteria, Dairy products, *Bacillus*, *Clostridium*

SÜT TEKNOLOJİSİNDE PROBİYOTİK SPOR OLUŞTURAN BAKTERİLERİN POTANSİYEL KULLANIMI

ÖZET

Bağışıklık sistemini destekleyici ve sindirim sistemi için önemli faydalarından dolayı süt teknolojisinde *Lactobacillus, Bifidobacterium* ve *Lactococcus* gibi farklı cinslere ait birçok tür probiyotik olarak hali hazırda kullanımı mevcuttur. Fakat son yıllarda spor oluşturan bakterilerin de probiyotik özellikleri üzerine artan bir ilgi gözlenmektedir.

Probiyotik mikroorganizmalar çoğunlukla farklı tuz konsantrasyonlarında gelişim, pH değişimlerine dayanıklılık gibi özelliklere sahip olmasına rağmen gıdalarda kullanıldıklarında nispeten çok uzun bir süre canlılık göstermemektedir. Bakteri sporları ise yüksek ısıl işlem, düşük pH, antimikrobiyal bileşikler vb. gibi zor çevre şartlarına vejetatif formlarına göre daha dayanıklı olmaktadır. Sporların ürün özelliklerine bağlı olarak farklı sıcaklıklardaki depolama süresince yüksek canlılık göstermeleri nedeniyle gıdalarda probiyotik olarak değerlendirilmeleri önem kazanmaktadır. Ayrıca yoğurt, peynir gibi gıdalarda yüksek asitlik içeriğinden dolayı sporlarının çimlenmesine genel olarak mümkün olmamaktadır. Bu sayede gıdanın duyusal özelliklerinde önemli değişiklikler meydana gelmemekte ve tüketime kadar yüksek canlılık seviyesinde kalabilmesi mümkün olmaktadır. İnsan ve hayvanlarda gastroinstenstinal sisteminde mide asitliği, safra tuzu gibi ortamlarda sporların yüksek canlılık gösterebilmesi de oldukça önemlidir.

Probiyotik spor oluşturan mikroorganizmalar hali hazırda ticari olarak ulaşılabilmekte tıp ve veterinerlik alanlarında değerlendirilmektedir. Bu nedenle gıdalarda kullanımınında yaygınlaşması beklenmektedir. Süt teknolojisinde bilinen en iyi spor oluşturan bakteriler *Bacillus* ve *Clostridium* cinsleri aittir. Bu mikroorganizmaların teknolojik ve sağlık açısından birçok zararlı türünün olduğu bilinsede yapılan son araştırmalara bakıldığında bazı türlerinin de probiyotik olarak değerlendirilmelerinin mümkün olduğu anlaşılmaktadır. *Bacillus coagulans, B. clausii, B. pumilus, B. subtilis* ve *Clostridium butyricum* spor oluşturan önemli probiyotik bakterilerdir.

Bu derleme makalede uzun yıllardır süt teknolojisinde neden oldukları olumsuzluklarla bilinen spor oluşturan bakterilerin özellikleri ve oluşturdukları metabolitler ile birlikte teknolojik olarak kullanım durumları ve sağlık üzerine etkileri tartışılmıştır.

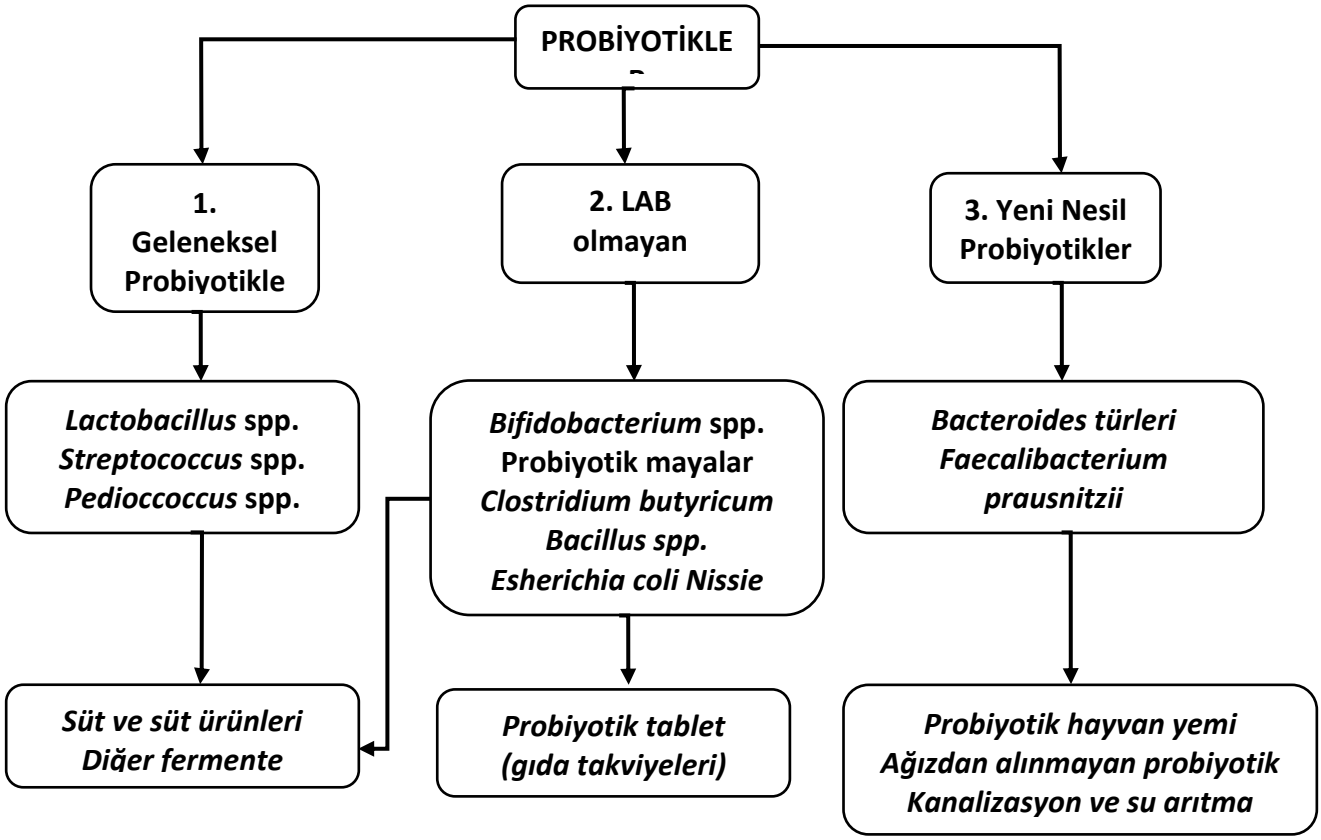
Anahtar Kelimeler: Probiyotik, Spor-oluşturan bakteriler, Süt ürünleri, *Bacillus, Clostridium*

1. GİRİŞ

Probiyotikler, "yeterli miktarlarda uygulandığında konak sağlığı üzerinde yararlı bir etki sağlayan canlı mikroorganizmalar" olarak tanımlanmaktadır (Hill ve ark., 2014). Bu mikroorganizmalar, işlevsel özellikleri ve besinsel değerleri nedeniyle ilgi görmekte ve insan vücudundaki etki mekanizmalarını aydınlatmak için çeşitli çalışmalar yapılmaktadır (Marzorati ve ark., 2021; Xavier-Santos ve ark., 2019; Soares ve ark.,2023).

Probiyotiklerin, işlevsel bileşenler olarak antikanserojen, antijenotoksik, profilaktik, antioksidan, antiinflamatuar, antiosteoporotik, antihipertansif ve antidiyabetik potansiyele sahiptir. Probiyotiklerin uyku, ruh hali ve bilişsel tepkilerin düzenlenmesi yoluyla psikolojik refah üzerinde olumlu etkisi olduğuna dair kesin kanıtların olduğu da bildirilmiştir. (Marotta ve ark., 2019; Gao ve ark., 2021).

Probiyotikler, LAB tabanlı geleneksel probiyotikler, LAB olmayan probiyotikler ve yeni nesil probiyotikler (NGP'ler) olarak sınıflandırılır (Şekil 1). Tüm bu probiyotik türleri probiyotik gıda ürünlerinde, hayvan yemlerinde, probiyotik farmasötik ürünlerde, oral olmayan probiyotik formülasyonlarında ve kanalizasyon ve atık su arıtımında kullanılmaktadır. Faydalı etkilere ulaşmak için gereken minimum probiyotik miktarı, insan veya hayvan çalışmalarından elde edilen bilimsel kanıtlarla, ürünün son kullanma tarihinin sonunda ve kullanım, dağıtım ve depolama koşullarında belirlenmelidir. Bir gıda ürününde sağlık etkilerini garanti edebilecek bir probiyotik suşunun hücre sayısı düzeyi yoktur; ancak, 10^6 ila 10^8 kob/g, probiyotik faydalarından yararlanmak için yeterli bir sayı olarak algılanmaktadır (Champagne ve ark., 2011; Gao ve ark., 2021).



Şekil 1. Probiyotiklerin sınıflandırılması (Gao ve ark., 2021)

Probiyotik mikroorganizmaların gıda üretiminden tüketiciler tarafından tüketilmesine ve gastrointestinal sistemden (GIT) geçişine kadar metabolik aktivitesini ve canlılığını sürdürmelidir. Birçok araştırma probiyotik olarak *Lactobacillus* spp. ve *Bifidobacterium* spp. üzerine yoğunlaşmıştır. Endüstriyel uygulamalarda, terapötik özellikler ve biyogüvenlik gibi çeşitli yönleri araştırarak bu probiyotik türlerine odaklanmıştır (Forssten ve ark., 2011; Kanmani ve ark.,2013). Bu mikroorganizmalar mide asitliği ve safra tuzları gibi fizyolojik koşullara duyarlıdır. Ayrıca bu bakterilerin biyoyararlanımı çeşitli üretim, depolama ve taşıma koşullarından etkilenmektedir (Graff ve ark., 2008; Cutting, 2011; Adibpour ve ark., 2019) Probiyotiklerin canlılık süresini artırmak için mikrokapsülleme ve soğuk zincir uygulaması gibi yöntemler kullanılmaktadır, ancak bu uygulamalarda üretici ve tüketici için ek bir harcama oluşturmaktadır.

Mikroorganizmaların yıllardır gıda teknolojisinde faydalarından ve kullanımlarından dolayı farklı mikrobiyal türlerin/suşların probiyotik özellikleri halen araştırılmakta ve uygulanmaktadır. Bu amaçla umut vadeden bir alternatif, spor oluşturan probiyotiklerdir. Bakteriyel sporlar, vejetatif hücrelere kıyasla termal öldürücü etkilere, kurumaya, donmaya, toksik kimyasallara ve radyasyona karşı daha fazla direnç gösterir (Sanders ve ark.,2003;

Elshaghabee ve ark., 2017; Adibpour ve ark., 2019). Ayrıca düşük pH'a ve yüksek basınca karşı direnci, iyi stabilite ve hızlı çimlenme gibi özellikleri düşünüldüğünde çeşitli probiyotik gıdaların formülasyonunda kullanımları dikkat çekici bir duruma gelmektedir (Folign´e ve ark., 2012; Permpoonpattana ve ark., 2012; Zhao ve ark., 2021). Spor oluşturan probiyotikler günümüzde insan tüketimi için takviyeler (kapsüller) olarak yaygın bir şekilde pazarlanmakta ve kullanılmaktadır. Tavuk, domuz ve su ürünleri yetiştiriciliği için hayvan yemlerinde uygulamaları mevcuttur (Mohammed ve ark., 2021; Mun ve ark., 2021; Rodigues ve ark., 2021). Spor oluşturan probiyotik mikroorganizmalar arasında en önemlileri *Bacillus, Clostridium, Sporolactobacillus* ve *Brevibacillus* cinsine ait olanlardır.

Bu derlemede, uzun yıllardır süt teknolojisinde saprofit ve patojenik özellikleri ile bilinen sporlu mikroorganizmaların probiyotik olarak değerlendirilmesi ele alınmıştır.

2. PROBİYOTİK *BACİLLUS* TÜRLERİ

Bacillus türleri çoğunlukla gram pozitif, çubuk şeklinde, spor oluşturan, hareketli ve aerobik bakterilerdir. Bu mikroorganizmaların sporlarının ana yaşam alanları toprak ve bitki örtüsüdür ve bu nedenle doğada yaygın olarak dağılmışlardır (Bergey & Holt, 1994).

Memeli bağırsağı anaerobik bir ortam olduğundan bağırsakta sporların çimlenmesi ve vejetatif hücrelerin gelişmesinin zor olduğu görünmektedir. *Bacillus* suşlarının potansiyel bir probiyotik adayı olabilmesi için iyi bir tutunma ve biyoterapötik özelliklere sahip olmanın yanı sıra gastroinstentinal (GIT) sistemdeki stres toleransının yüksek olması gerekmektedir (Thakur ve ark., 2016).

Basiller normalde toprak organizmaları olarak kabul edilmesine rağmen *B. subtilis* ve diğer *Bacillus* türleri gönüllü bireylerin dışkılarında ve ileal biyopsilerinde bulunduğu bildirilmiştir (Fakhry ve ark., 2008). Bu bağlamda Hong ve ark. (2009)'ın, *B subtilis* ve muhtemelen diğer türlerin insan GIT'inde yaşama adapte olduğu, biyofilm oluşturma, anaerobik sporlanma ve antimikrobiyal üretme yeteneklerine sahip olduğu ve yalnızca toprak mikroorganizmaları olmaktan ziyade bağırsak kommensalleri olarak kabul edilmesi gerektiği yönünde görüşleri de bulunmaktadır.

Bacillus türleri farklı besin kaynaklarında yetiştirilmesi kolaydır ve çoğu FDA tarafından genel olarak güvenli (GRAS) olarak kabul edilir; bu nedenle kendileri ve ürettikleri metabolitler insan tüketiminde kullanılabilir (Mercado ve ark., 2022). *Bacillus* türlerinin gıda ürünlerinde kullanımı 50 yıldan uzun süredir belgelenmiştir. Bu mikroorganizmalar, ilk olarak 1958'de İtalya'da Avrupa pazarlarına Enterogermina® firması aracılığıyla tıbbi bir takviye olarak tanıtılmış ve tescil edilmiştir (Hong ve ark., 2008; Cutting, 2011). Spor oluşturan *Bacillus*'un en kapsamlı araştırılan türleri arasında *B. licheniformis, B. clausii, B. coagulans, B. cereus* ve *B. subtilis* bulunmaktadır (Shahcheraghi ve ark., 2015). Günümüzde ticari probiyotik *Bacillus* türlerinin kullanıldığı bazı gıda takviyeleri tablo 1'de verilmiştir.

Tablo 1. Probiyotik *Bacillus* türleri içeren bazı ticari gıda takviyeleri

Ticari ürün	**İçerik**
Enterogermina®	*B. clausii*
BioPlus 2B®	*B. subtilis* CH201/DSM5749/ *B. licheniformis* CH200/DSM5749

2.1. *Bacillus coagulans*

B. coagulans hareketli, termofilik, asit toleranslı ve katalaz pozitif özellik gösteren bir mikroorganizmadır. Fermente edilmiş yiyecek ve içecekler için sertifikalı bir probiyotiktir. GRAS olarak adlandırılmıştır. Yüksek sıcaklıklara, asidik koşullara ve tuzluluğa sahip ortamlara dayanabilir ve bu da onu termal olarak işlenmiş ürünlerde kullanım için uygun bir aday haline getirmektedir (Poshadri ve ark., 2022). 15 ile 60 °C ve pH 4–5 aralığında gelişim gösterebilmektedir. *B. coagulans*, laktik asit, 2,3-bütandiol, asetoin, asetik asit ve etanol üreterek glikozu fermente eder ve ayrıca asidik gıdalarda çoğalabilmekte ve ayrıca süt ürünlerini pıhtılaştırabilmektedir. Morfolojik olarak, mikroorganizma 1 µm'den daha küçük bir çapa sahip bir basildir. Sporları küresel ve subterminal olarak bulunur. %5 tuz (NaCl) konsantrasyonunda inhibe olmaktadır (Soares ve ark.,2023).

B. coagulans, laktik asit, γ-aminobütirik asit (GABA), mannitol ve diğer aktif maddeleri üretebilir. Hayvancılıkta *B. coagulans*'ın kullanımı besin metabolizmasını teşvik etme, antibakteriyel/antioksidan etki ve ağır metal toksisitesini azaltma gibi birçok önemli etki göstermiştir (Zhang ve ark., 2021). Bu mikrooganizmayı içeren probiyotik preparatların düzenli uygulanmasının insanlarda laktoz intoleransını ve huzursuz bağırsak sendromunu (IBS) hafiflettiği, ishali önlediği, oksidatif stresi ortadan kaldırdığı ve bağırsak iltihabını iyileştirdiği bildirilmiştir (Sen ve ark., 2010; Sudha ve ark., 2018; Du ve ark., 2018; Madempudi ve ark., 2019; Zhao ve ark., 2023). Ayrıca, *B. coagulans*'ın immünomodülatör özellikler ve hipokolesterolemik etki sergilediği de bildirilmiştir (Kumar, 1989; Mohan ve ark., 1990; Baron, 2009; Babar ve ark., 2012). Çeşitli çalışmalar, probiyotik olan bu mikrooganizmanın rotavirüs

ishalinin önlenmesi ve süresinin kısaltılmasında da önemli olduğunu vurgulamıştır (Chandra, 2002). Ayrıca Crohn Hastalığı Aktivite İndeksi ve dışkı sıklığında azalma olduğu ortaya bildirilmiştir (Keller ve ark., 2010). Bunların dışında *B. coagulans* çeşitli antibakteriyel özelliklere sahip bakteriyosin olan 'coagulin' üretmektedir. *B. coagulans* bakteriyosinlerden başka peptitler, kısa zincirli yağ asitleri, riboflavin ve hidrojen peroksit üretimi de dahil olmak üzere başka önemli metabolitlerde üretmektedir (Poshadri ve ark., 2022).

2.2. *Bacillus clausii*

B. clausii toprakta bulunan gram pozitif bir mikroorganizmadır; çubuk şeklindedir ve pH 7.0-10.5'te 15 ve 50 °C arasında gelişim gösterir. Endosporlar üreten aerobik, alkali toleranslı, patojenik olmayan bir bakteridir (Schallmey ve ark., 2004). İnsan bağırsağı da dahil olmak üzere çeşitli bir ekosistemde gelişim gösterebilmektedir (Troeger ve ark., 2020). Ürettikleri sporlar genellikle besin azlığı, kuraklık, alkalinite, UV radyasyonu, yüksek sıcaklık ve aşırı fiziksel/kimyasal etkilere karşı iyi direnç göstermektedir (Cutting & Ricca, 2014). Vejetatif hücrelerine göre safra tuzunun veya gastrik HCl'nin asitliğine daha iyi dayanabilirler (Hong ve ark., 2005; Cutting & Ricca, 2014; Elshaghabee ve ark., 2017).

İtalya'da 1958'den beri *B. clausii* sporlarının süspansiyonu, insan tüketimi için spor bazlı bir probiyotiğin parçası olarak mevcuttur. 2001'den beri, *B.clausii* kişisel bakım endüstrisi tarafından çeşitli faydalı preparatlarda yaygın olarak pazarlanmaktadır (Senesi ve ark., 2001; Todorov ve ark., 2022). *B. clausii*'nin fizyolojik faydaları arasında, çalışmalar bakterinin bağırsaktaki kusurlu zarları iyileştirme veya antibiyotikler/kemoterapik ajanların neden olduğu bağırsaktaki vitamin eksikliklerini giderme yeteneğine sahip olduğunu göstermektedir. *B. clausii*'in en dikkat çekici probiyotik özelliğinden birisi de antibiyotik dirençleridir. Eritromisin de dahil olmak üzere çok sayıda antibiyotiğe dirençlidir. *B. clausii*, antibiyotik alımı kaynaklı bazı ishaller sonucu tetiklenen akut bağırsak enfeksiyonunun önlenmesinde veya tedavisinde önemli bir role sahip olduğu ifade edilmiştir (Abbrescia ve ark., 2014; De Castro ve ark., 2020 ; Sadrimovahed& Ulusoy, 2024).

2.3. *Bacillus subtilis*

B. subtilis, topraktan ve sudan sıklıkla izole edilen, spor oluşturan ve patojenik olmayan saprofit bir bakteridir. *B. subtilis*, 5–55 °C'de, pH'ı 5,5 ile 8,5 arasında, glikoz içeren ortamda gelişim göstermektedir. Ayrıca karbon ve azot kaynakları olarak sırasıyla sitrat ve amonyak kullanmaktadır. Mikroorganizmanın çeşitli suşları antimikrobiyal aktiviteye sahip peptitler üretir ve hızlı kazein sindirimini destekleme yeteneğine sahiptir. Bu mikroorganizma, antifungal ve antimikrobiyal aktiviteye sahip metabolitlerin üretimi için en önemli türlerden biri olduğu bilinmektedir (Bergey & Holt, 1994; Gomes, 2013).

Probiyotik *B. subtilis* suşlarının anti *H. pylori* aktivitesi de rapor edilmiştir; bu durum, 'aninocoumacin A' antibiyotiğinin salgılanması ile ilişkilendirilmiştir (Pinchuk ve ark., 2001). Ayrıca *B. subtilis* önemli bakteriosin üreticisidir. Örneğin, bu mikroorganizmaya ait farklı suşların subtilin, erisin S, erisin A, sublansin 168, mersasidin gibi bakteriyosinler ürettiği bildirilmiştir (Basi-Chipalu ve ark., 2022).

2.4. *Bacillus licheniformis*

B. licheniformis, toprakta ve bitkide yaygın olarak bulunan, 15-55 °C aralığında gelişim gösteren termofilik bir bakteridir. Morfolojik olarak, çapı 1 µm'den küçük bir basildir. Mikroorganizma, hücreyi deforme etmeyen merkezi veya terminal, küresel veya oval sporlar oluşturabilmektedir. Bağırsakta çoğalabilmek için oksijeni tüketir ve bağırsakta hızla düşük oksijenli bir ortam yaratabilir. Bu durum istenilen bağırsak florasının (*Bifidobacterium* ve *Lactobacillus* gibi) gelişimini destekleyebileceği düşünülmektedir (Kaewtapee ve ark., 2017; Song ve ark., 2014; Zhao ve ark., 2023).

B. licheniformis çeşitli antimikrobiyal aktif maddeler (likenin vb.) üretebilmekte ve antibiyofilm aktivitesi oluşumunu önleyerek ve bozarak *Staphylococcus aureus* ve *Candida albicans* gibi patojenik bakterileri inhibe edebilmektedir (Dalvand ve ark., 2018; Muras ve ark., 2021). Bu nedenle bakteri ve mantarların neden olduğu akut ve kronik enterit ve ishallerde etkili olduğu düşünülmektedir (Zhao ve ark., 2023). *B. subtilis* ve *B. licheniformis* suşlarını içeren BiosporinVR (Biofarm, Ukrayna), *Heliobacter pylori*'ye karşı tedavide klinik uygulama için probiyotik takviyesi olarak kullanılmıştır (Pinchuk ve ark. 2001).

2.5. *Bacillus pumilus*

B. pumilus, geniş bir sıcaklık aralığında 5–50 °C gelişim gösteren aerop ve termofilik bir bakteridir. Bazı suşlar gelişimleri için biyotine ihtiyaç duyar. Bazı *B. pumilus* türleri taksonomik olarak *B. subtilis* ile ilişkilidir (Bergey & Holt, 1994). Yarı saydam ve opak olmak üzere iki koloni formunda bulunur. Mikroorganizma, çapı 1 µm'den küçük bir basildir. Hücreyi deforme etmeyen, küresel veya oval, merkezi veya terminal sporlar oluşturmaktadır. Mikroorganizma %7 w/v NaCl çözeltisinin varlığında gelişebilmektedir (Gomes, 2013).

Vücuda faydalı olan birçok biyoaktif maddeyi sentezleme yeteneğine sahiptir. Farklı hidrolitik enzimler (proteaz, lipaz, α-amilaz), vitaminler, amino asitler üretebilmektedir. Ayrıca lizozim etkinliği olarak belirli bakterileri (*Escherichia coli, Aspergillus, Staphylococcus*, vb.) doğrudan lize etme kapasitesine sahiptir. Bu mikroorganizma bağırsakta biyolojik oksijen yakalama işlemini gerçekleştirebilir, yararlı anaerobik mikroorganizmaların büyümesini ve üremesini teşvik edebileceği ifade edilmektedir (Zhao ve ark., 2023).

3. PROBİYOTİK *CLOSTRİDİUM* TÜRLERİ

Clostridium spp. gram pozitif, çubuk şeklinde, fermentatif, spor oluşturan ve anaerobik bir bakteridir. *Clostridium* spp. yaygın olarak toprakta, suda, tozda, çamurda, insan ve hayvanların bağırsaklarında, ayrıca çiftlik ortamlarında ve süt/süt ürünlerinden izole edilebilmektedir (Storari ve ark., 2016; Khomeiri ve ark., 2023; Akbal & Öner, 2025)

Clostridia, erken kolonize olmuş bakterilerin üyelerinden biridir ve doğumdan sonraki ilk hafta içinde dışkıda tespit edilebilirler. Bu türler çoğunlukla *C. paraputrifikum C. difficile* ve *C. butyricum* 'dur (Guo ve ark. 2020).

Clostridium spp. probiyotik olarak önemli bir potansiyele sahiptir. Bulaşıcı hastalıklarda rol oynayan birkaç *Clostridium* türünün patojenik olduğu, esasen insanlarda ve diğer hayvanlarda yaşamı tehdit eden hastalıklardan sorumlu olan güçlü toksinler ürettiği bilinmektedir. Toksin üreterek önemli gıda zehirlenmelerine neden olabilmektedir. Fakat, toksinleri güçlü bir tedavi aracı olabilmekte ve kozmetik ürünlerinde kullanılabilmektedir. Önemli olarak süt ürünleriyle ilişkili *Clostridium* türlerinin çoğu insanlar için patojenik değildir. Ayrıca bazı suşlar organik çözücüler, organik asitler ve enzimlerin üretimi için yaygın olarak kullanılmıştır (Khomeiri ve ark., 2023).

3.1. *Clostridium butyricum*

Bilinen en önemli probiyotik *Clostridium* türü *C. butyricum*'dur. Bu mikroorganizma yüksek miktarda bütirik asit üretme kapasitesi nedeniyle adlandırılan, mutlak anaerobik, Gram pozitif, spor oluşturan bir basildir. İlk olarak 1880'de Prazmowski tarafından domuz bağırsaklarından izole edilmiştir. O zamandan beri, çeşitli ortamlarda *C. butyricum*'un birkaç suşu tanımlanmış ve bunlar yaygın insan/hayvan bağırsak kommensal bakterileridir.

C. butyricum onlarca yıldır güvenli bir probiyotik olarak kullanılmaktadır. Japonya ve Kore gibi bazı Doğu Asya ülkelerinde, *C. butyricum*'un belirli bir suşu ticari olarak probiyotik bir bakteri olarak üretilmektedir. İnsan bağırsağında, *C. butyricum* sindirilmemiş diyet liflerini tüketebilmekte ve kısa zincirli yağ asitleri, özellikle bütirat ve asetat üretebilmektedir. Asetat ve bütiratın bağırsak bariyerinin fizyolojisini etkilediği birçok yol vardır. Ayrıca, iltihabı hafifletme ve bağırsak düzenleme konusunda önemli etkileri bulunmaktadır. Ayrıca *C. butyricum*'un bağırsak mikrobiyomunun bileşimini düzenleyerek *Bifidobacterium ve Lactobacillus* gibi özel yararlı bakteri türlerini artırabileceği öne sürülmektedir (Courvalin, 2006; Guo ve ark. 2020; Stoeva ve ark., 2021, Khomeiri ve ark., 2023).

C. butyricum patojenik bakterileri antagonize ve bağırsaktaki yararlı bakterilerin çoğalmasını teşvik etmektedir (Li ve ark., 2016; Li ve ark., 2019). Bu nedenle, insan bağışıklığını iyileştirmek ve bağırsak fora dengesizliğini tedavi etmek için kullanılabilir. Hayvancılıkta *C. butyricum*, hayvan sağlığı koruma özelliği nedeniyle antibiyotik yerine umut vadeden bir pazar beklentisine sahiptir (Yi ve ark., 2020).

C. butyricum ve *B. coagulans*, *H. pylori*'yi birkaç farklı yolla etkili bir şekilde inhibe edebileceği bildirilmiş (Zhang ve ark. 2020) ve alternatif bir anti-*H. pylori* ilacı olarak kullanılabileceği düşünülmektedir. Ayrıca akut enterit ve bağırsak mikrobiyolojik bozukluklarının klinik tedavisinde de kullanılmıştır (Li ve ark., 2022). Shin & Eom (2020), *C. butyricum* hücresiz üst sıvılarının (süpernatant) *Acinetobacter baumannii*'ye karşı antimikrobiyal ve antibiyofilm aktivitesini incelemiş ve *C. butyricum* süpernatantının *A. baumannii* hücre gelişimini engellediğini göstermiştir. Ayrıca *C. butyricum* süpernatantının hücrelerin metabolik aktivitesini baskılayarak anti-biyofilm aktivitesi gösterdiği görülmüştür. *C. butyricum* MIYAIRI 588'in (CBM 588) probiyotik etkileri ve güvenliği 20 yıldan uzun süredir araştırılmaktadır. Suşun probiyotik etkileri kemirgenlerde, bazı üretim hayvanlarında ve insanlarda incelenmiştir. Suş günümüzde takviye olarak ticari şekilde şatışı bulunmaktadır. Bu suşun deney hayvanlarında enfeksiyonu önlediği, bağışıklık sistemini güçlendirdiği, kolite

karşı ve yağlı karaciğer hastalığına karşı koruyucu olduğu ortaya konmuştur. Ayrıca bu suşun çocukları antibiyotikle ilişkili ishalden koruduğu ifade edilmiştir (Saarela, 2019).

4. SPORLU PROBİYOTİK BAKTERİLERİN SÜT ÜRÜNLERİNDE OLASI KULLANIMI

Geleneksel olarak, küresel düzeydeki tüketiciler arasında süt ürünleri, iyi kabul görmeleri ve fermantasyon teknolojisinin kullanımından dolayı probiyotik kültürlerin eklenmesi için önde gelen/en popüler gıda sınıfıdır (Cruz ve ark., 2007; Zhao ve ark., 2021; Granato ve ark., 2010; Soares ve ark.,2023).

Spor oluşturan probiyotiklerin gıdalara eklenmesi son zamanlardaki bir gelişmedir. Spor oluşturan probiyotikler, uygun koşulların varlığında gıdayı bozabilecekleri için gıda matrisinde çimlenmemelidir. Bu nedenle, gıda matrisi seçimi probiyotik olarak kullanılan türe veya suşa bağlıdır (Ranadheera ve ark., 2010).

Yoğurt, tadı, kokusu ve dokusu kullanılan kültür ve meyve aromalarıyla olumlu şekilde değişebilen fermente bir süt ürünüdür. Süt endüstrisinde, *B. coagulans*-70'in eklenmesi yoğurt ürünlerinin görünümü ve dokusu üzerinde olumlu bir etkiye sahip olduğu ve ayrıca 2-heptanon, 2-nonanon, pentanol ve 2-hidroksi-3-pentanon seviyelerini artırarak daha fonksiyonel bir süt ürününün geliştirilmesi için uygun bir suş haline getirebileceği ifade edilmiştir (Ma ve ark., 2021). *B. coagulans*'ın yoğurtta starter olarak kullanımı ile gerçekleştirilen bir başka çalışmada, *Streptococcus thermophilus* ve *Lactobacillus delbrueckii* subsp. *bulgaricus*'un geleneksel uygulamasıyla ve bu mikroorganizmaların kombinasyonuyla karşılaştırılarak değerlendirilmiştir. Kombinasyon daha iyi lezzet, daha yüksek titre edilebilir asitlik, kohesiflik ve daha iyi bir uçucu bileşik profili sergilemiş ve *B. coagulans*'ın geleneksel yoğurt kültürüyle birlikte kullanımının probiyotik yoğurtların duyusal profilini iyileştirmek için iyi olabileceği ifade edilmiştir (Zhao ve ark., 2021).

B. clausii ile üretilen yoğurtta yapılan çalışmada, *B. clausii*'nin 150 günlük depolama süresince fenolik içeriği, DPPH ve FRAP gibi antioksidan aktivite değerleri üzerinde çok düşük bir etkisi olmuştur. pH değerlerine bakıldığında *B. clausii* etkilemiş yoğurt kontrole göre daha düşük bir asitlik göstermiştir. 150 günlük depolama boyunca probiyotik *B. clausii* sayısı 4,1 x 10^8 kob/g'lık seviyesinde canlılık göstermiştir (Ramos ve ark., 2019).

S. thermophilus ve *B. coagulans* MTCC 5856 ile üretilen fermente süt ürünlerinde yapılan bir çalışmada, protein ilavesi ürünün reolojik özelliklerini iyileştirmiştir. Ayrıca *B. coagulans* ve *S. thermophilus*, 60 gün içinde ürünün depolanması sırasında önemli ölçüde canlılığını korumuş ve antioksidan aktiviteyi de iyileştirdiği tespit edilmiştir (Elshaghabee ve ark., 2017). *B. indicus* HU36, probiyotik bir takviye olarak güvenliği ve karotenoid üretmedeki yüksek kapasitesi nedeniyle özel ilgi görmektedir. *B. indicus* HU36'nın vejetatif formdaki canlılığı, set tipi rekombinasyonlu yağsız yoğurttaki yoğurt kültürleriyle birlikte 4 °C'de depolanan üründe yapılan çalışmada kalite üzerindeki etkiler belirlenmiştir. Yoğurttaki *B. indicus* HU36 hücrelerinin sayısı 14 gün sonra yaklaşık 5 log kob/ml olarak kalırken, 21 gün sonra 3,5 log kob/ml'e düşmüştür. Bakteri sarılığın artmasına neden olmuş ancak yoğurdun reolojik özelliklerini etkilememiştir. Araştırmacılar, yoğurdun duyusal özellikleri ticari probiyotik

yoğurtla karşılaştırıldığında kabul edilebilir düzeyde olduğu ve *B. indicus* HU36'nın yoğurt üretiminde probiyotik kültür olarak kullanılabileceğinin düşünüldüğü ifade edilmiştir.

Bacillus'ların spor oluşturma yeteneği, diğer önemli bir süt ürünü olan peynirde kullanımınında iyi sonuçlar verebileceği düşünülmektedir. Çünkü geleneksel olarak üretilen birçok peynirin uzun olgunlaştırma süresine ihtiyacı vardır ve bu süreçte peynir matrisinde serbest su azalır ve mikroorganizmalar için yarayışlı su oranı da düşmüş olur. Dolayısıyla zor çevre koşullarına dayanıklı suşlara ihtiyaç olabilmekte ve en iyi alternatifinde spor oluşturan türler olduğu görülmektedir. Ayrıca telemesi haşlanan birçok peynirde probiyotik özellik gösteren geleneksel suşlar inaktif olabilmekte ve spor oluşturan kültürlerin bu peynirlerde kullanımı daha cazip hale gelebilmektedir. İran işlenmiş peynirinde yapılan bir çalışmada, 60 günlük depolama süresince *Bacillus* sporları içeren peynirlerin kontrole kıyasla daha yüksek titre edilebilir asitliğe ve daha düşük pH değerlerine sahip olduğu bildirilmiştir. Depolama sırasında bakteri popülasyonu azalsa da 10^6 kob/g'ın üzerinde kalmıştır. Probiyotik peynirlerin duyusal değerlendirmesi, bu örneklerin kontrol peynirlerine kıyasla daha düşük lezzet ve genel kabul gördüğünü ifade edilmiştir. Probiyotik *Bacillus* suşlarının (*Bacillus flexus HK1, B. subtilis PB6, B. subtilis PXN 21, B. coagulans GBI-30 6086, B. coagulans MTCC 5856*) Brezilya'da "requeijao ˜ cremoso" işlenmiş peynirinde üretim aşamalarında ve depolama süresinde (6 C'de 45 gün) hayatta kalmasının değerlendirildiği bir başka çalışmada, *B. coagulans* GBI-30 6086'nın üretim aşamalarında en dirençli suş olduğu ve peynir raf ömrü boyunca yüksek popülasyonlarını koruduğu belirtilmiştir.

Bacillus türlerinin son 20 yılda farklı gıdalarda probiyotik olarak kullanımı ile ilgili araştırma sayısı az olsada arttığı görülmektedir. Fakat diğer bir spor oluşturan bakteri cinsi *Clostridium*'lara ait çalışmalar özellikle güvenlik endişeleri nedeniyle henüz gıdalarda kullanım noktasına gelememiştir.

5. SONUÇ VE ÖNERİLER

Bacillus ve *Clostridium* türlerine ait bakterilerin sporları yüksek asit içeriğine sahip yoğurt ve peynir gibi ürünlerde çimlenmesi zordur. Bu nedenle ürünün duyusal özelliklerini bozmadan probiyotik özelliği yüksek bir ürün geliştirilmesi mümkün olduğu görünmektedir. Ayrıca süt ürünlerinde zor çevre sartlarına sporlar daha dayanıklı oldukları için LAB'e ait probiyotik türlerden daha uzun süre canlılık gösterebilmektedir.

Probiyotiklerin sıcaklığa karşı toleransları da oldukça önemlidir. Bu bağlamda dünya genelinde telemesi haşlanan birçok peynir üretilmektedir. Termofilik karakterde kültür kullanımı bu ürünler için önemlidir. Spor oluşturan probiyotik kültür kullanımı bu ürünler için kolaylık olabilir. Ayrıca yüksek tuz içeren ortamlara dirençli olduklarından salamurada olgunlaştırılan peynirlerde kültür olarak kullanılabilir.

B. coagulans ve *B. clausii* gibi GRAS kabul edilen türlerin gıdalarda kullanımında literatürde önemli bir boşluk bulunmaktadır. Bu nedenle sporlu probiyotikler ile ilgili ürün geliştirme araştırmalarının yapılması önerilmektedir. Ayrıca sporlu bakterilerin olası yararlı etkileri ile birlikte ishal-kabızlık gibi bağırsak rahatsızlıkları, karaciğer rahatsızlıkları, toksin ve kansorejen madde üretimine neden olabileceğinden kullanımına oldukça dikkat edilmelidir.

ABSTRACT

Greenhouse farming not only enables higher yield and quality per unit area but also offers the opportunity for early harvest, creating a high-profit margin. Due to these advantages, the use of pesticides in greenhouse farming often becomes inevitable in the fight against diseases and pests. Many pesticides have toxic properties and can cause serious health problems if used incorrectly. This review discusses the effects of pesticides used in greenhouse farming on the environment and human health, their pathways into the food chain, and their significance in terms of public health.

Keywords: Pesticide, Greenhouse, Residue

ÖRTÜ ALTI TARIMINDA PESTİSİT UYGULAMALARI VE KALINTI PROBLEMLERİ

ÖZET

Örtü altı tarımı, hem birim alandan daha yüksek verim ve kalite elde edilmesini sağlamakta hem de erken hasat imkânı sunarak yüksek kâr marjı oluşturmaktadır. Bu avantajları nedeniyle, örtü altı tarımında hastalık ve zararlılarla mücadelede pestisit kullanımı genellikle kaçınılmaz hale gelmektedir. Birçok pestisit toksik özelliklere sahiptir ve yanlış kullanıldıklarında ciddi sağlık sorunlarına yol açabilirler. Bu derlemede, örtü altı tarımında kullanılan pestisitlerin çevre ve insan sağlığı üzerindeki etkileri, gıda zincirine bulaşma yolları ve halk sağlığı açısından önemi ele alınmıştır.

1. GİRİŞ

1.1. ÖRTÜ ALTI NEDİR

Sebze yetiştiriciliğinde, cam veya plastik örtüler kullanılarak yapılan yetiştirme yöntemine "örtü altı yetiştiricilik" denir. Özellikle vejetasyon süresi kısa olan bölgelerde, uygun yer ve yöneyin yanı sıra plastik örtüler de kullanılarak sebzeler donlardan ve iklimin diğer olumsuz şartlarından korunur. Bu sayede, ürün alma süresi erkene çekilebilir veya uzatılarak turfanda sebzecilik yapılabilir (Anonim, 2015).

Sera, iklimle ilgili çevre koşullarına tamamen veya kısmen bağımlı olmadan, gerektiğinde sıcaklık, nem, ışık ve havalandırma gibi faktörler kontrol edilerek, yıl boyunca çeşitli kültür bitkileri, tohumlar, fideler ve fidanların üretildiği, saklandığı ve sergilendiği bir yapıdır. Seralar, genellikle cam, plastik gibi ışık geçirebilen maddelerle kaplanarak inşa edilir ve yüksek sistemde bir örtü altı yetiştiriciliği yapısına örnek oluşturur (Öneş, 1986; Yüksel 1990).

Ülkemizde örtüaltı alanı 2008 ve 2018 yılları arasında %42.4 oranında artmıştır (Tarım ve Orman Bakanlığı, 2019a). Ülkemizdeki örtüaltı alanlarının %84'ü Akdeniz bölgesinde bulunmaktadır.

Antalya, 28,828.3 hektar ile bu alanın en önde gelen merkezidir ve bu ili sırasıyla 19,655.5 hektar ile Mersin ve 15,072.9 hektar ile Adana takip etmektedir. Adana ve Hatay (1,109.6 hektar), özellikle alçak plastik tünel alanlarının yoğun olduğu bölgelerdir.

Akdeniz ve Ege Bölgeleri arasında bir geçit konumunda olan Muğla, 3,904.9 hektar ile bu illeri izlemektedir. İzmir ve Aydın ise sırasıyla 1,572.6 ve 1,501.8 hektar örtüaltı alanına sahiptir (Tarım ve Orman Bakanlığı, 2019b). Örtüaltı tarım alanı dağılımı incelendiğinde Orta Karadeniz Bölgesinde yeralan Amasya 10. Sırada yeralmaktadır (Tablo 1).

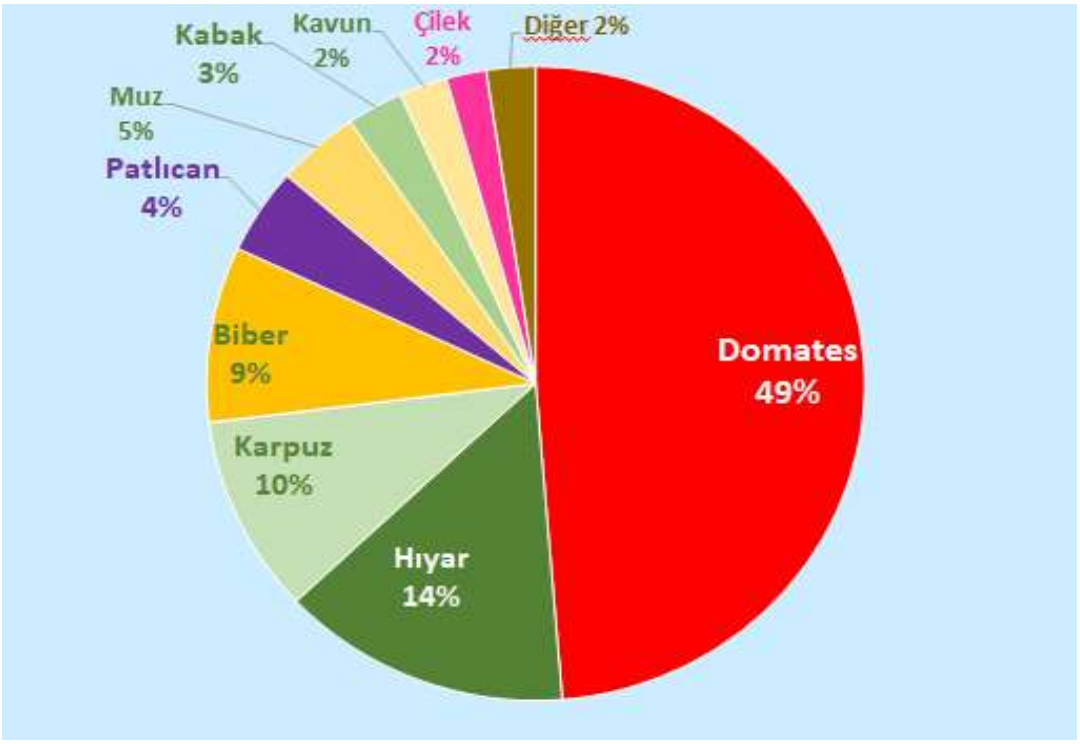
Tablo 1. İllere göre örtü altı tarım alanları

İller		Örtü altı Tarım Alanı (da)
1	Antalya	286.522
2	Mersin	201.060
3	Adana	160.493
4	Muğla	39.048
5	İzmir	14.016
6	Aydın	12.717
7	Hatay	11.456
8	Burdur	9.843
9	Isparta	4.942
10	**Amasya**	4.881

Kaynak: Tarım ve Orman Bakanlığı, 2019b

1.2 NEDEN ÖRTÜ ALTI TARIMI

Seracılık, açık tarla yetiştiriciliğine kıyasla 2-5 kat daha fazla ürün ve 5-10 kat daha fazla gelir elde edilmesine olanak tanımaktadır. Örtü altı tarımı, birim alandan daha yüksek verim ve kalite sunarken, erkencilik sayesinde yüksek kâr marjı sağlar. Yıl içerisindeki yetiştirme dönemi uzatılarak, aynı araziden yılda 2-3 kez ürün alınabilir. Bu durum, özellikle küçük arazi sahipleri için işgücü istihdamı ve işgücünün yıl boyu eşit dağılımını sağlamaktadır (Doğaka, 2015; Anonim, 2025a). Şekil 1 de görüldüğü gibi Türkiye örtü altında üretilen ürünlerin dağılımı verilmiştir.



Şekil 1. Örtü altında üretilen ürünker Kaynak: Tarım ve Orman Bakanlığı, 2023

Seracılık, işletme sahiplerine sürekli gelir sağlayan ve pazarda sürekli taze meyve, sebze ve çiçek bulunmasını sağlayan önemli bir sektördür. Sera ürünleri, daha kararlı ve cazip fiyatlarla hem yurt içinde hem de yurt dışında kolayca pazarlanabilmektedir. Ayrıca, sera tesislerinde kullanılan malzemeler, sera imalat sanayiinin kurulmasına ve gelişmesine katkı sağlar (Doğaka, 2015).

Örtü altında kültür bitkilerinde olduğu gibi bitki koruma problemleri görülmektedir. Bunların başında ise sırasıyla; Kırmızı örümcekler [*Tetranychus urticae* Koch.], Domates pasakarı [*Aculops lycopersici*, Domates güvesi [*Tuta absoluta* (Meyrick)], Danaburnu [*Gryllotalpa gryllotalpa* (L.)], Kök ur nematodları *(Meloidogyne spp.,* Goeldi*),* Tütün beyazsineği [*Bemisia tabaci* (Genn.)] (Şekil 2) ve Hıyar mozaik virüsü *(Cucumber mosaic virus),* Kabakgillerde

Mildiyö (*Pseudoperonospora cubensis* Berk. and Curt.), Kurşuni Küf *(Botrytis cinerea* Pers.), *Domates lekeli solgunluk virüsü (*Tomato spotted wilt virus) Şekil 3.

Şekil 2. Örtüaltında sorun olan başlıca zararlılar

Şekil 3. Örtüaltında sorun olan başlıca hastalıklar

Örtü altı tarımı, yüksek verim ve kalite elde etmek amacıyla yoğun olarak pestisit kullanımını gerektirir. Ancak, pestisitlerin toksik özellikleri nedeniyle bilinçsiz ve kontrolsüz kullanımları, doğada ve gıdalarda kalıntıya neden olurken aynı zamanda, ciddi sağlık sorunlarına yol açabilir ve çevresel dengenin bozulmasına sebep olabilir. Ayrıca; Pestisitlerin yanlış ve yoğun kullanımı, bitkilerde fitotoksisiteye neden olur ve hedef dışı organizmalara zarar vererek, doğal dengeyi bozar. Peki o halde;

2.PESTİSİT NEDİR

Pestisitler, tarım ürünlerini korumak ve insan sağlığını tehdit eden zararlıları kontrol altına almak amacıyla kullanılan kimyasal maddelerdir. Bu maddeler, böcekler, yabani otlar, mantarlar ve diğer zararlı organizmaları hedef alarak, onları yok eder veya büyümelerini engeller. Böylece, tarım ürünlerinin verimliliği ve kalitesi korunmuş olur (Garud et al., 2024) Biyolojik Hedeflere Göre sınıflandırılması;

1. İnsektisitler (böcek öldürücü ilaçlar)
2. Akarisitler (kırmızı örümcek öldürücü ilaçlar)
3. Fumigantlar
4. Nematisitler (nematot öldürücüler)
5. Rodentisitler (kemirgen öldürücüler)
6. Mollusitler (salyangoz öldürücüler)
7. Fungusitler (mantar öldürücü ilaçlar)
8. Bakterisitler (bakteri öldürücü ilaçlar)
9. Herbisitler (yabancı ot öldürücüler)
10. Afisitler (yaprakbiti öldürücüler)
11. Repellentler (kaçırıcılar)

Zirai mücadele ilaçları, tarımda kolay uygulanabilirliği ve hızlı sonuç alınabilirliği nedeniyle dünya genelinde vazgeçilmez maddeler olarak kabul edilmektedir (Yıldırım, 2000). Bu kimyasal maddeler, bitki koruma amacıyla yaygın olarak kullanılmakta ve zararlılarla etkin bir mücadele sağlamaktadır. Türkiye'de 2022 yılında toplam pestisit kullanım miktarı, 2021 yılına göre 4,5% artarak 55.374 ton'a yükselmiştir. Tarım ilacı kullanım miktarları gruplar bazında incelendiğinde Dünyada olduğu gibi Ülkemizde de en büyük grubu fungusitler (mantar öldürücü) oluşturmuştur (Anonim, 2022). Ancak, verim artışında büyük rol oynayan zirai mücadele ilaçlarının bilinçsiz ve kontrolsüz kullanımı, bazı bitki koruma sorunlarına yol açmaktadır. Kimyasal mücadelede pestisitlerin bilinçsiz ve kontrolsüz kullanımı, hedef organizma gruplarında pestisitlere karşı direnç gelişimine sebep olmaktadır. Ayrıca, yoğun pestisit kullanımı, ürünlerde kalıntı sorunlarına, çevreye ve insan sağlığına olumsuz etkiler doğurmaktadır. Kontrollü olmayan yoğun kimyasal uygulamalar doğal dengeyi bozabilir ve bitkilerde fitotoksiteye neden olabilir (Delen, 2005; Yıldırım, 2000).

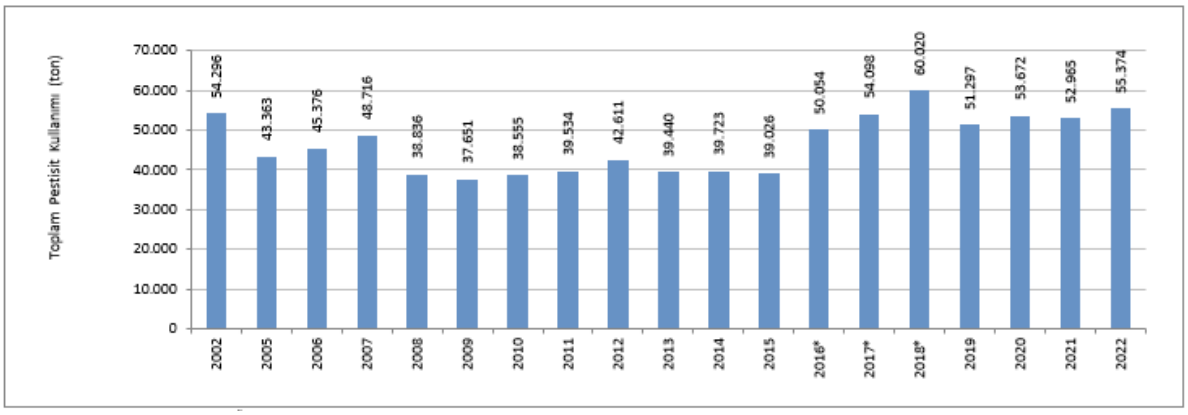
2.1 TÜRKİYE'DE PESTİSİT KULLANIM MİKTARLARI

Tarım ilaçlarının gruplar bazında kullanım miktarlarına bakıldığında, en büyük grubun fungusitler (mantar öldürücüler) olduğu görülmektedir. 2022 yılında toplam tarım ilacı

kullanımının %35,1'ini fungusitler, %26,3'ünü herbisitler (yabancı ot öldürücüler), %22,0'sini insektisitler (böcek öldürücüler), %4,5'ini akarisitler (akar öldürücüler), %0,5'sini rodentisitler (kemirgen öldürücüler) ve %11,6'sını diğerleri (bitki aktivatörü, bitki gelişim düzenleyici, böcek cezbedici, fumigant, nematosit, kükürt, madeni yağlar) oluşturmuştur (Anonim, 2022).

Yıllara göre pestisit kullanımına bakıldığında 2022'de yaklaşık 55 bin ton oldu görülmektedir (Tablo 2).

Tablo 2. Yıllara göre toplam pestisit kullanım miktarları *(Tarım ve Orman Bakanlığı, 2023)*



2.2 KALINTI NEDİR

Yoğun pestisit kullanımı sonucu bu maddeler gıda, toprak, su ve havada kalıntı olarak birikebilir. Pestisit kalıntıları hedef dışındaki organizmalar ve insanlara zarar verebilir. 1948 ve 1951 yıllarında insan vücudunda organik klorlu pestisit kalıntıları bulunduğundan beri pestisitlerin önemi anlaşılmıştır (Anonim,2025b).

Gıdalar, pestisit kalıntılarının başlıca kaynağıdır. FAO ve WHO, 1960 yılında "Pestisit Kalıntıları Kodeks Komitesi"ni kurarak gıdalarda izin verilen maksimum kalıntı seviyelerini belirlemiştir. Türkiye'de de tarımsal ürünlerdeki pestisitlerin limitleri Tarım Bakanlığı tarafından belirlenmiş olup, bu bilgiler bakanlığın web sitesinde mevcuttur (Yücel, 2006).

2.3 PESTİSİTLERİN İNSAN VE ÇEVRE ÜZERİNE ETKİLERİ NEDİR?

Pestisitlerin İnsanlar Üzerine Etkileri

Pestisitler, dünya pazarları için yeterli gıda üretiminin sağlanmasında ve modern gıda üretiminde önemli bir rol oynamaktadır. Artan dünya nüfusuyla birlikte gıda ihtiyacını karşılamak amacıyla günümüzde pestisit kullanımı birçok alanda yer almaktadır (Shaw ve Chadwick, 2002).

Pestisitlerin insanlarda belirli miktarlarda toksik olmaları nedeniyle savaşımda çalışan herkesin bunların kullanımı sırasında meydana gelebilecek potansiyel zarardan sakınmaları gerekir. Pestisitlerin kalıntı yoluyla kronik toksisiteleri yanında bazılarının insanlarda mutajenik, teratojenik ve kanserojen etkilerinin de olduğu son yıllarda yapılan çalışmalarla saptanmıştır. İnsanların pestisitlere maruz kalması mesleki zehirlenmeler veya kaza ile meydana gelebilmektedi (Gül, 2017).

Her iki tür zehirlenmenin ana nedenleri:

1. Halkın bu konuda yetersiz eğitime sahip olması ve pestisitlerin toksisite potansiyellerinin bilinmemesi,

2. Uygun olmayan koşullarda depolama,

3. Kaza ile saçılma sonucu gıdaların kontamine olması,

4. Dikkatsiz yükleme ve taşıma,

5. Yıkanmamış pestisit kaplarının kullanımı,

6. Genel bakım ve atık değerlendirme işlemleri

Mesleki zehirlenmeler:

Üretim, formülasyon hazırlama, taşıma, yükleme ve uygulama sırasında deri ve solunum yoluyla maruz kalma (akut zehirlenme) olarak tanımlanabilir. Daha çok organik fosforlular ve karbamatlılar bu tip zehirlenmeye neden olurlar. Bunlar vücutta kolinesteraz enzimini inhibe ederek asetil kolin birikimine yol açarlar (Gül, 2017).

Kaza ile meydana gelen zehirlenmeler:

Pestisitlerin yaprak ve topraktaki kalıntıları veya onların toksik dönüşüm ürünleriyle temas sonucu hastalıklar meydana gelebilmektedir. Aşırı dozlarda alınmadıkça organik klorlu pestisitlerin insanlara akut zehirlilikleri enderdir. Bu bileşikler daha çok kronik zehirlenmeler meydana getirmektedir. Sinir sistemini etkiler ve karaciğere zarar verirler (Anonim, 2025c). Son yıllarda ilaçların besin maddelerindeki kalıntılarının insanlar için kronik toksisitesi iki şekilde ele alınmaktadır:

1. Kabul edilebilir günlük alım (Acceptable Daily Intake-ADI): Bir kişinin bir günde alabileceği kabul edilebilir günlük ilaç miktarını mg/kg olarak ifade eden değerdir.

2. Maksimum kalıntı limitleri (Maximum Residue Limits-MRL): Gıda maddelerinde bulunmasına izin verilen en fazla ilaç miktarını (ppm) ifade eden değerdir.

“Codex Alimentarius”, USEPA (United States Environmental Protection Agency) gibi kuruluşların bu değerleri içeren listeleri mevcuttur. Bu miktarlar tarımsal ürünlerin dış pazarlaması bakımından da önemlidir. Zira tolerans miktarını aşan değerlerde pestisit kalıntısı tespit edilen tarımsal ürünler alıcı ülkeler tarafından geri çevrilmektedir.

Çevre Üzerine Etkileri

Pestisitler tarımsal alanlar, ormanlar veya bahçelere uygulandığında havaya, suya ve toprağa geçmekte ve bu ortamlarda yaşayan diğer canlılara ulaşmaktadır. Bir pestisitin çevredeki hareketleri kimyasal yapısı, fiziksel özellikleri, formülasyon tipi, uygulama şekli, iklim ve tarımsal koşullar gibi faktörler tarafından belirlenmektedir (Yıldırım, 2008).

Pestisitlerin püskürtülerek uygulanması sırasında, bir kısmı buharlaşma ve yayılma nedeniyle kaybolmakta; diğer kısmı ise bitki üzerinde ve toprak yüzeyinde kalmaktadır. Atmosfere karışan pestisitler rüzgarlarla taşınabilir ve yağmur, sis veya kar yağışı ile tekrar yeryüzüne dönebilir. Bu şekilde hedef dışındaki organizma ve bitkilere ulaşan pestisitler, bu canlılarda kalıntı ve toksisiteye yol açabilir (Öğüt ve Seçilmiş, 2009).

Hedef Olmayan Organizmalar Üzerine Etkisi

Hemen bütün insektisitler spesifik olmadıkları için sadece hedef organizmaları öldürmez, omurgalı ve omurgasız diğer organizmaları da etkilerler. Zararlı etkilerin şiddeti, insektisitin ve formülasyonun tipine, uygulama şekline ve tarımsal arazinin tipine bağlı olarak değişmektedir (Tiryaki, Canhilal ve Horuz, 2010). En genel yan etkiler şunlardır:

1. Arılar, kuşlar ve balıklar, mikroorganizmalar ve omurgasızlar gibi hedef olmayan organizmalarda ölümler,

2. Kuş, balık ve diğer organizmalarda üreme potansiyelinin azalması,

3. Hedef olamayan organizmalarda dayanıklılık oluşması sonucu insanlara hastalık taşıyan böcek ve parazitlerin kontrolden çıkması,

4. Ekosistemin yapısının ve türlerinin sayılarının değişmesi gibi uzun dönemli etkiler.

Pestisitler, toprak ve bitki uygulamalarından sonra yağmur suları ile yüzey akışı veya toprak içerisinde yıkanarak taban suyu ve diğer su kaynaklarına ulaşabilir. Bu pestisitler, balık ve diğer su organizmalarının ölümüne yol açabilir; ayrıca insanların gıda zincirine girerek kronik toksisiteye neden olabilir (Yücel, 2007).

Toprağa geçen pestisitler fotokimyasal, biyolojik ve kimyasal degradasyona uğrayabilir; ayrıca emilip salınabilir. Kapiller su aracılığıyla yüzeye taşınan pestisitler havaya karışabilir. Pestisitlerin hareketi ve dönüşümü, toprağın yapısı, pH seviyesi ve mikroorganizma türlerine bağlıdır. Pestisitlerin toksik özelliklerini yitirmesi veya daha zehirli metabolitlere dönüşmesi çevre açısından önemlidir. Bu nedenle, pestisitlerin toprak içindeki davranışları incelenmelidir (Sarıoğlu ve Taş, 2023).

2.4 PESTİSİT KALINTILARIYLA İLE İLGİLİ YAPILAN BAZI ÇALIŞMALAR

Balkan ve Kenan (2019) Tokat ilinde tüketime sunulan domateslerde neonikotinoid grubu insektisitlerin kalıntı düzeylerinin belirlenmesi üzerinde araştırmalar yapmışlardır. Toplam 30 domates örneğinden 16 örneğin her birinde en az bir neonikotinoid kalıntısına rastlanmış ve bu örnekler toplam numunenin %53,33'ünü temsil etmiştir. Ayrıca, bir örnekte Türk Gıda Kodeksi

(TGK) ve Avrupa Birliği (AB) Maksimum Kalıntı Limitleri (MRLs)'nin üzerinde pestisit kalıntısı tespit edilmiştir1. Bu sonuçlar, domates ürünlerinde pestisit kalıntılarının yaygın olduğunu ve bazı örneklerde güvenlik limitlerinin aşılmasını göstermektedir. Bu nedenle, domates yetiştiriciliğinde pestisit kullanımının dikkatli yapılması ve kalıntı limitlerinin dikkate alınması önemlidir.

Hepsağ (32) Akdeniz Bölgesi'nde domates numunelerinin %26'sında pestisit (dimethoate, chlorpyrifos, endosülfan, methomyl ve acetamiprid) kalıntısı bulmuş olup ancak bunların hiçbiri MRL değerinin üzerinde değildir.

Altındağ ve Özgökçe (2006) Van ilinde örtü altında yetiştirilen hıyar üzerinde Dichlorvos ve Dicofol pestisitlerinin parçalanma süreleri araştırılmıştır. Pestisitlerin kalıntı miktarları, ilaçlamadan önce ve ilaçlamadan sonra 1, 3, 5, 9 ve 13 gün geçtikten sonra alınan örneklerde gaz kromatografisi cihazı kullanılarak analiz edilmiştir. Sonuçlar, Dichlorvos kalıntısının 5. gününde tolerans düzeyinin altına düşmesine ve Dicofol kalıntısının 9. gününde tolerans değerinin üzerinde tespit edilmesine göz atıyor. 13. gününde ise Dicofol kalıntısı tolerans düzeyinin altına düşmüştür.

Burcak ve ark. (1998) tarafından sera domateslerinde bazı fungisitlerin kalıntı düzeylerini araştırmıştır. Çalışmada, rnetiram kompleks, iprodione ve vinclozoline'in son ilaçlama ile hasat arasındaki süreleri tespit etmeye yönelik parçalanma seyirleri ortaya koymuştur. Bekleme süresinin metiram kompleks için 8 gün, iprodione için 6 gün ve vinclizolin için ise 1 gün olması gerektiğini bildirmişlerdir.

Zengin ve Karaca (2017) Uşak ilinde 2015 ve 2016 yıllarında örtü altı sera alanlarından topladıkları 60 adet domates örneklerinde LC/MS/MS (Sıvı Kromatografi/Kütle Spektrometresi) ve GC/MS (Gaz Kromatografi/Kütle Spektrometresi) cihazları ile 249 etken maddesi analizi yapmışlar. Elde edilen sonuçlar, domates örneklerinin büyük çoğunluğunda çeşitli pestisit kalıntılarının bulunduğunu göstermiştir. Özellikle bazı örneklerde, pestisit kalıntı seviyelerinin Türk Gıda Kodeksi ve Avrupa Birliği Maksimum Kalıntı Limitlerinin üzerinde olduğu belirlenmiştir.

Polat ve Tiryaki (2018) Çanakkale ilinde açık alanda yetiştirilen domateslerdeki pestisit kalıntılarını tespit etmek amacıyla gerçekleştirilmiştir. Araştırmada, pestisit kalıntılarının belirlenmesinde QuEChERS yöntemi kullanılmıştır. Bu yöntem, pestisit kalıntılarının hızlı ve etkin bir şekilde analiz edilmesine olanak tanımaktadır. Çalışma kapsamında, açık alanda yetiştirilen domates örnekleri toplanmış ve laboratuvar analizlerine tabi tutulmuştur. Elde edilen sonuçlar, incelenen domates örneklerinin önemli bir kısmında çeşitli pestisit kalıntılarının bulunduğunu göstermiştir. Özellikle bazı örneklerde, kalıntı seviyelerinin güvenlik sınırlarını aştığı belirlenmiştir.

3.SONUÇ VE ÖNERİLER

Örtü altı tarımı, yüksek verim ve kalite elde etmek amacıyla yoğun olarak pestisit kullanımını gerektirir. Ancak, pestisitlerin toksik özellikleri nedeniyle bilinçsiz ve kontrolsüz kullanımları ciddi sağlık sorunlarına yol açabilir ve çevresel dengenin bozulmasına sebep olabilir.

Pestisitlerin yanlış ve yoğun kullanımı, bitkilerde fitotoksisiteye ve hedef dışı organizmalara zarar vererek, doğal dengeyi bozabilir.

Çiftçilerin pestisit kullanımı konusunda bilinçlendirilmesi ve eğitim verilmesi gerekmektedir. Pestisitlerin doğru dozajda ve uygun zamanlarda kullanılması, kalıntı problemlerinin önlenmesine yardımcı olacaktır. Ayrıca, biyolojik mücadele yöntemlerinin ve entegre zararlı yönetimi tekniklerinin teşvik edilmesi, pestisit kullanımının azaltılmasına katkı sağlayabilir.

Pestisit kullanımı ve kalıntı seviyelerinin denetimi için etkili kontrol mekanizmalarının oluşturulması gereklidir. Tarım Bakanlığı ve ilgili kuruluşlar, pestisitlerin doğru kullanımı ve denetimi konusunda sıkı tedbirler almalıdır. Bunun yansıra gıda ürünlerinde düzenli pestisit kalıntı analizleri yapılmalı ve sonuçlar kamuoyuyla paylaşılmalıdır.

Organik tarım, biyolojik mücadele ve entegre zararlı yönetimi gibi alternatif tarım yöntemlerinin teşvik edilmesi, yeni ve daha güvenli pestisit formülasyonlarının geliştirilmesi ve alternatif mücadele yöntemlerinin etkinliğinin araştırılması da oldukça önemlidir. Bu şekilde, pestisit kullanımını azaltarak hem çevresel etkileri minimize eder hem de insan sağlığını korur.

Sürdürülebilir tarım, çevre ve insan sağlığı için tüketicilerin pestisit kalıntıları konusunda bilinçlendirilmesi ve organik ürünlere yönlendirilmesi, pestisit kalıntılarının insan sağlığı üzerindeki olumsuz etkileri hakkında bilgilendirme kampanyaları düzenlenmesi ve tüketicilere sağlıklı gıda seçenekleri sunulması çerçevesinde ele alınarak kimyasalların olumsuz etkilerinin azaltılmasında şüphesiz fayda sağlayacaktır.

Örtü altı tarımında yoğun kimyasal kullanımı nedeniyle ortaya çıkacak pestisit kalıntı problemleri hem çevre hem de insan sağlığı açısından büyük önem taşımaktadır. Pestisitlerin bilinçli ve kontrollü kullanımı, verimliliği artırırken olumsuz etkileri minimize etmek için kritiktir. Bu nedenle, pestisit kullanımının etkin bir şekilde yönetilmesi ve denetlenmesi, gıda güvenliğinin sağlanması ve çevrenin korunması açısından hayati öneme sahiptir.

EVALUATION OF STABILITY FOR SOME YIELD COMPONENTS OF TRITICALE (X *Triticosecale* Wittmack) ELITE LINES

Arş. Gör. Dr. Damla BALABAN GÖÇMEN
Tekirdağ Namık Kemal Üniversitesi, Ziraat Fakültesi, Tarla Bitkileri Bölümü, Tekirdağ, dgocmen@nku.edu.tr, ORCID ID: 0000-0002-3980-3906.

Prof. Dr. İsmet BAŞER
Tekirdağ Namık Kemal Üniversitesi, Ziraat Fakültesi, Tarla Bitkileri Bölümü, Tekirdağ, ibaser@nku.edu.tr, ORCID ID: 0000-0002-5770-0118.

ABSTRACT

The study was carried out with a total of 25 triticale genotypes, including 17 triticale elite lines developed through selection by the Department of Field Crops, Faculty of Agriculture, Tekirdağ Namık Kemal University and 8 triticale varieties (Focus, Mikham 2002, GK Maros, Tatlıcak 97, Presto 2000, Karma 2000, Truva and GK Szemes) in 2019 and 2020, in 4 locations (Tekirdağ-Süleymanpaşa, Edirne-Merkez (Sarayakpınar), Tekirdağ-Hayrabolu and Kırklareli-Lüleburgaz) according to the randomized block design with 4 replications. It was aimed to determine suitable triticale genotypes for the conditions of the Thrace Region. As it is difficult to understand and reliably determine the complex genotype × environment interaction (GEI) with variance analysis, graphical method GGE-biplot analyse was used to explain GEI. Plant height, harvest index, plant weight and spike weight traits of triticale genotypes were examined, and genotype × environment interactions were found statistically significant at 1% level in all traits except harvest index. In the study, the plant height value in 2019 was 6.05 cm shorter than in 2020, and the harvest index, plant weight and spike weight traits showed similar values in both years. The NZFT 11, Tatlıcak 97 and Presto 2000 genotypes with high plant height and high stability were found to be suitable for green grass production, while the NZFT 7, NZFT 13 and NZFT 17 elite lines with short height and high stability were found to be suitable for grain production. In addition, in terms of harvest index, NZFT 13 and NZFT 17 elite lines and GK Szemes variety, in terms of plant weight, Mikham 2002, Tatlıcak 97 and Focus varieties, in terms of spike weight, NZFT 17 and NZFT 13 elite lines and GK Szemes variety were determined as suitable genotypes. When all characteristics are considered, NZFT 13, NZFT 17 elite lines with Tatlıcak 97 and GK Szemes varieties were the most suitable genotypes.

Keywords: Plant Height, Genotype × Environment Interaction, Stability, Triticale.

TRİTİKALE (X *Triticosecale* Wittmack) İLERİ HATLARINDA BAZI VERİM UNSURLARI İÇİN STABİLİTE DEĞERLENDİRMESİ

ÖZET

Çalışma, Tekirdağ Namık Kemal Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü öğretim üyeleri tarafından seleksiyon yoluyla geliştirilen 17 adet tritikale ileri hattı ile standart olarak 8 adet tritikale çeşidi (Focus, Mikham 2002, GK Maros, Tatlıcak 97, Presto 2000, Karma 2000, Truva ve GK Szemes) olmak üzere toplam 25 tritikale genotipi ile 2019 ve 2020 yıllarında 4 lokasyonda (Tekirdağ-Süleymanpaşa, Edirne-Merkez (Sarayakpınar), Tekirdağ-Hayrabolu ve Kırklareli-Lüleburgaz) tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Karmaşık olan genotip × çevre interaksiyonunu (GEI) genel varyans analizi ile anlamak ve güvenilir bir şekilde belirlemek zor olduğundan Trakya Bölgesi koşulları için uygun tritikale genotiplerinin belirlenmesinde grafiksel yöntem olan GGE-biplot analizi kullanılmıştır. Tritikale genotiplerinin bitki boyu, bitki ağırlığı, başak ağırlığı ve hasat indeksi özellikleri incelenmiş, hasat indeksi hariç tüm özelliklerde genotip × çevre interaksiyonları istatistiki olarak % 1 düzeyinde önemli bulunmuştur. Çalışmada, 2019 yılı ortalama bitki boyu değeri, 2020 yılına göre 6,05 cm daha kısa, bitki ağırlığı, başak ağırlığı ve hasat indeksi özellikleri her iki yılda da yakın değer göstermiştir. Bitki boyu bakımından stabilitesi yüksek olan NZFT 11, Tatlıcak 97 ve Presto 2000 genotipleri uzun boyları ile yeşil ot üretimi, yüksek stabilite gösteren kısa boylu NZFT 7, NZFT 13 ve NZFT 17 ileri hatları ise tane üretimi açısından uygun bulunmuştur. Ayrıca hasat indeksi yönünden NZFT 13 ve NZFT 17 ileri hatları ile GK Szemes çeşidi, bitki ağırlığı yönünden Mikham 2002, Tatlıcak 97 ve Focus çeşitleri, başak ağırlığı yönünden NZFT 17 ve NZFT 13 ileri hatları ile GK Szemes çeşidi, tüm özellikler göz önüne alındığında NZFT 13, NZFT 17 ileri hatları ile Tatlıcak 97 ve GK Szemes çeşitleri en uygun genotipler olarak belirlenmiştir.

Anahtar Kelimeler: Bitki Boyu, Genotip × Çevre İnteraksiyonu, Stabilite, Tritikale.

1. GİRİŞ

Son yıllarda artan küresel iklim değişikliği etkilerinin belirginliği, daha çok kurak alanlarda tarımı yapılan buğday, arpa, yulaf, çavdar gibi serin iklim tahıllarının üretim miktarlarında beklenen artışın olamayabileceğini göstermektedir. Araştırıcılar küresel iklim değişiminin bitkisel üretimi olumsuz yönde etkileyeceğini ve gıda güvenliğinin sağlanması için ele alınması gereken önemli bir konu olduğunu belirtmişlerdir (Tripathi ve ark., 2016; Howden ve ark., 2007). Buğday özellikle abiyotik ve biyotik stres faktörlerinden bazı yıllar oldukça etkilenmekte ve üretimde önemli azalmalar görülmektedir. Küresel iklim değişiminin sonucu olarak sıcaklığın 1 derece artması buğday veriminde % 3-10 arasında azalmaya neden olabilecektir. Bu nedenle bitki ıslahçıları stres faktörlerinden daha az etkilenen türler ve cinsler üzerine çalışmalarını yoğunlaştırmışlardır. Buğdayın verim ve kalite özellikleri ile çavdarın biyotik ve abiyotik stres şartlarına tolerans ve/veya dayanıklılık özellikleri bir araya getirilerek gelecek vadeden yeni bir tür olarak tritikale elde edilmiştir.

Tritikale; ana ebeveyni buğday, baba ebeveyni ise çavdar olan bir melezdir (Müntzing, 1989; Dodge, 1989). Elde edilen melezlerin kromozom sayısının iki katına çıkarılmasıyla fertil bitkiler elde edilmiştir. Bu yeni bitkiye Triticum ve Secale isimlerinden oluşan Tritikale adı verilmiştir. Tritikale, kendine döllenen bitki olarak kabul edilse de çeşitli araştırıcılar tarafından % 10.1 - 47.5 arasında yabancı döllenme oranı saptanmıştır (Demir ve ark., 1978). Ebeveynlerinin poliploidi düzeylerine göre tetraploid, hekzaploid ya da oktoploid olabilmektedir. Tarımsal üretimde yer alan tritikale çeşitlerinin çoğu hekzaploid'dir (Lukaszewski ve Gustafson, 1987). Soğuk, kurak ve marjinal toprak koşullarına dayanıklı, çoğu hastalık ve zararlıdan etkilenmeyen bir bitki olan tritikale, hayvan yemi olarak yaygın şekilde kullanılmasının yanında ABD, Polonya, Kanada ve Meksika gibi birçok ülkede uzun süre devam eden ıslah çalışmaları sonucu marjinal, fakir tarım alanlarından dekardan alınan verimi arttırarak, hızla artan Dünya nüfusunun gıda ihtiyacını da karşılamak amacıyla geliştirilmiştir. Ülkemizde de marjinal alanların değerlendirilmesi ve hayvancılığa katkı sağlanması açısından tritikale üretiminin yaygınlaştırılması ve farklı bölgelere uygun tritikale çeşitlerinin geliştirilmesi büyük önem taşımaktadır (Şentürk ve Akgün, 2014).

Dünyada ve ülkemizde kontrolsüz koşullarda yapılan bitkisel üretimlerde abiyotik ve biyotik streslere dayanıklı, stabilitesi yüksek türlerin ve genotiplerin belirlenmesi gün geçtikçe önem kazanmaktadır. Islah çalışmalarının esas amacı, verim yönünden stabil ve kaliteli, abiyotik ve biyotik streslere dayanıklı çeşitlerin geliştirilmesidir. Günümüzde buğday ve arpa üretiminde kullanılacak çeşitlerin farklı agroekolojik bölgelerdeki stabilitesinin ortaya konmasına yönelik çok sayıda çalışma olmasına rağmen, tritikale gibi son yıllarda giderek önemi ve üretimi artan genotiplerin stabilitesine yönelik çalışmalar hala yeterli düzeyde değildir. Verim ve kalite, genetik faktörler ile çevresel faktörlerin ortak bir kombinasyonu olarak ortaya çıkmaktadır. Çevresel faktörlere en iyi uyumu sağlayan genetik faktörlerin (genotip) belirlenmesi için birden fazla çevrede genotiplerin performasının belirlenmesi gerekmektedir. Farklı ekolojilere uygun çeşitlerin bulunması için yürütülen çalışmalarda çeşit, çevre ve interaksiyon faktörlerinin her biri ayrı öneme sahiptir. Özellikle interaksiyon farklı çevrelerde genotiplerin performansı hakkında bilgi vermekte ve ıslah programlarında verim stabilitesinin belirlenmesinde önemli rol oynamaktadır (Kılıç ve ark., 2005). Tritikalede stabiliteye yönelik yapılan çalışmalarda,

genotip, çevre ve genotip x çevre interaksiyonunun (genotiplerin farklı çevrelerde gösterdikleri farklı tepkiler) tane verimini büyük oranda etkilediği görülmektedir (McGoverin ve ark., 2011).

İstatistiki olarak genotip × çevre interaksiyonunun önemli olduğu durumlarda, genotiplerin performans stabilitelerini belirleyen farklı stabilite analiz yöntemleri geliştirilerek yaygın olarak kullanılmaktadır. Birçok özellik bakımından iyi performans gösteren ve stabil olan genotipleri belirlemek oldukça zordur. Bu amaçla GGE-biplot yöntemi yaygın olarak kullanılmaktadır. GGE-biplot analiz yönteminin hem iki yönlü (genotip ve çevre etkisinin PC1ve PC2 ile gösterilmesi) veri yapısını sunması hem de ıslahçıların genetik potansiyeli ve genotip üzerindeki çevresel etkileri tahmin etmesini mümkün kılan ana etkiler ve çarpımsal interaksiyonları içeren kompleks birer model olması, stabiliteyi belirlemede kullanılmasını uygun hale getirmektedir (Kılıç ve ark., 2014; Kendal ve Tekdal, 2016; Sayar ve ark., 2016). Birçok araştırıcı bu model ile farklı çevrelerde ileri kademedeki tescil adayı hatların test edilerek, performanslarının ve stabilitelerinin tahmin edilmesinin mümkün olduğunu dile getirmiştir (Hagos ve Abay, 2013; Rad ve ark., 2013; Kendal ve Şener, 2015). Son yıllarda farklı genotiplerle, farklı çevrelerde veya yıllarda yürütülen araştırmalarda kullanılan GGE-Biplot analiz yöntemi, birçok özelliği aynı anda görsel açıdan değerlendirme fırsatını sağladığı ve seleksiyonda başarıyı etkilediği için bitki ıslahında uygulanan yenilikçi bir yöntem olarak kabul edilmiştir (Yan ve Tinker, 2006).

Çalışmada, Tekirdağ-Süleymanpaşa, Edirne-Merkez (Sarayakpınar köyü), Tekirdağ-Hayrabolu ve Kırklareli-Lüleburgaz lokasyonlarında tritikale ileri hatlarının bitki boyu, bitki ağırlığı, başak ağırlığı ve hasat indeksi özelliklerinin genotip, çevre ve genotip × çevre interaksiyonları açısından grafiksel yöntemlerle değerlendirilerek stabilitesi yüksek, çevreden en az ya da fazla etkilenen, çevresel iyileşmelere karşı tepkileri olumlu yönde yüksek olan ve her bir özel çevre için en iyi genotiplerin belirlenmesi amaçlanmıştır.

2. MATERYAL VE YÖNTEM

Çalışmada; 17 adet tritikale ileri hattı (Çizelge 1) ile standart olarak 8 adet tritikale çeşidi (Focus, Mikham 2002, GK Maros, Tatlıcak 97, Presto 2000, Karma 2000, Truva ve GK Szemes) olmak üzere toplam 25 tritikale genotipi materyal olarak kullanılmıştır. Kullanılan tüm genotipler hekzaploid formda ve 2n=42 kromozomludur. Denemeler iki yıl (2019 ve 2020) boyunca Süleymanpaşa (Tekirdağ), Hayrabolu (Tekirdağ), Lüleburgaz (Kırklareli) ve Edirne lokasyonlarında yürütülmüştür. Deneme alanlarının coğrafi açıklamaları da Çizelge 2'de verilmiştir.

Dört lokasyon ve iki yılda kurulan denemeler tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Deneme parsellerinin ekimleri ekim sırasında tüm lokasyonlarda 8,16 m^2, hasat sırasında hasat alanı 7,5 m^2 olan parsellere metre kareye 500 adet tohum hesabı ile sıra arası 17 cm olan 6 sıralı özel deneme mibzeri ile gerçekleştirilmiştir. Denemelerde, ekim ile birlikte 4 kg/da saf azot ve 4 kg/da saf fosfor olacak şekilde 20.20.0 kompoze gübresi, kardeşlenme döneminde 9,2 kg/da saf azot olacak şekilde üre gübresi (%46 azot) ve sapa kalkma döneminde 3,9 kg/da saf azot olacak şekilde kalsiyum amonyum nitrat gübresi (% 26 azot) uygulanmıştır. Deneme alanında görülen yabancı otlara karşı kimyasal ilaçlama yapılmıştır. Denemeler parsel biçerdöveri ile hasat edilmiştir.

Çizelge 2. Deneme alanlarının coğrafi bilgileri

Toprak Sınıflandırma Sistemi (Ülgen ve Yurtsever, 1995).

Denemelerden elde edilen bitki boyu, bitki ağırlığı, başak ağırlığı ve hasat indeksi özelliklerine ilişkin verilerin birleştirilmiş varyans analizleri için JMP Pro 17 paket programı, genotiplerin toplam sekiz çevrede stabilitelerini (genotip × çevre interaksiyonlarını (GEI)) belirlemek için BAFR paket programı (Kahrıman, 2020) kullanılmıştır. Genotip ortalamaları arasındaki farklılıkların önemlilik grupları $Tukey_{HSD}$ testi ile kontrol edilmiştir.

Yirmi beş tritikale genotipi ile 8 farklı çevrede yürütülen çalışmadan elde edilen veriler öncelikli olarak varyans analizine tabi tutulmuş, sonuçların yorumlanmasında GGE-biplot analiz yöntemi kullanılmıştır. GGE-biplot grafikleri genotip, çevre ve genotip × çevre interaksiyonlarının değerlendirilmesinde çevrelerin etkisini daha net göstermektedir. GGE-biplot analizinde yıllara göre çevre, karakterler ve genotip arasındaki farklılıklar daha fazla açıklanabilmektedir. İncelenen her karakter için genotip odaklı oluşturulan GGE-biplot grafikleri kullanılarak görsel olarak genotip × çevre interaksiyonları değerlendirilmiştir.

3. BULGULAR VE TARTIŞMA

Araştırmada incelenen özellikler için gerçekleştirilen varyans analiz sonuçlarına göre bitki boyu, bitki ağırlığı ve başak ağırlığı için genotip, çevre ve genotip × çevre interaksiyon ortalamaları arasında farklılıklar % 1 düzeyinde önemli iken hasat indeksi için genotip ve çevre ortalamaları arasındaki farklılıklar % 1 düzeyinde önemli, genotip × çevre interaksiyon ortalamaları arasında farklılıklar istatistiki olarak önemsiz bulunmuştur. Sekiz çevreden (iki yıl ve dört lokasyon) elde edilen genotip ve çevre ortalama değerleri ile genotip etkisi, çevre etkisi ve önemlilik testi sonuçları Çizelge 3'te verilmiştir.

Çizelge 3. Tritikale genotiplerinin ortalama değerleri ile genotip ve çevre etkisi

Genotip	Bitki Boyu (cm)		Bitki Ağırlığı (g)		Başak Ağırlığı (g)		Hasat İndeksi (%)

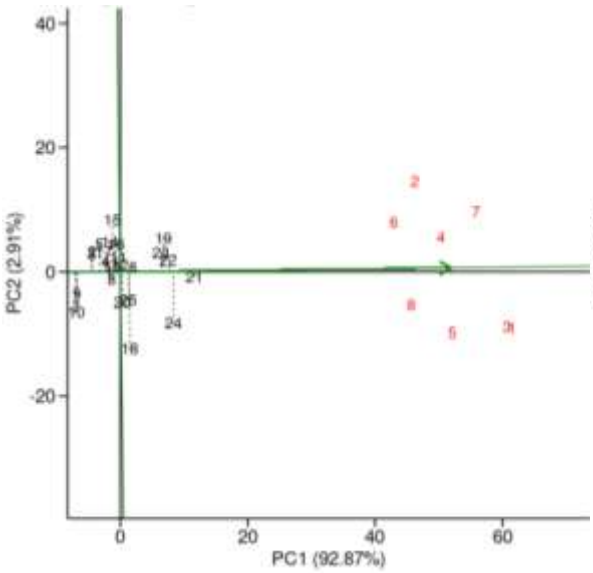
3.1. Bitki Boyu (cm)

Çizelge 3'de görüldüğü gibi tritikale genotiplerinde ortalama bitki boyu değerleri 90,29-130,71 cm arasında değişmiştir. Farklı araştırıcılar tarafından yürütülen çalışmalarda bitki boyunun 44-173 cm arasında değiştiği belirlenmiştir (Gill ve ark., 1990; Ünver, 1999; Mut ve Erbaş Köse, 2018; Dolgun ve Aydoğan Çifçi, 2019). Bitki boyu yönünden en yüksek değer Tatlıcak 97 standart çeşidinden elde edilirken, bunu 123,46 cm ile Truva, 121,83 cm ile Presto 2000, 120,28 cm ile Mikham 2002 ve 119,62 cm ile Karma 2000 genotipleri izlemiştir. Genel ortalama (105,46 cm)'ya göre ileri hatlar değerlendirildiğinde tüm ileri hatların genel ortalamadan daha düşük bitki boyuna sahip olduğu görülmekle birlikte NZFT 17 (105,15 cm), NZFT 19 (105,28 cm) genotipleri genel ortalamaya en yakın genotipler olmuştur. Standart çeşitler değerlendirildiğinde ise tüm çeşitlerin genel ortalamadan daha yüksek bitki boyuna sahip olduğu görülmektedir. Tane üretimi için genel ortalamanın altında değer veren NZFT 14 ve NZFT 15 ileri hatları uygun olurken, yeşil ot verimi yönünden ileri hatlar arasında en uzun bitki boyuna sahip olan NZFT 11, NZFT 17 ve NZFT 19 ileri hatları uygun genotipler olarak belirlenmiştir.

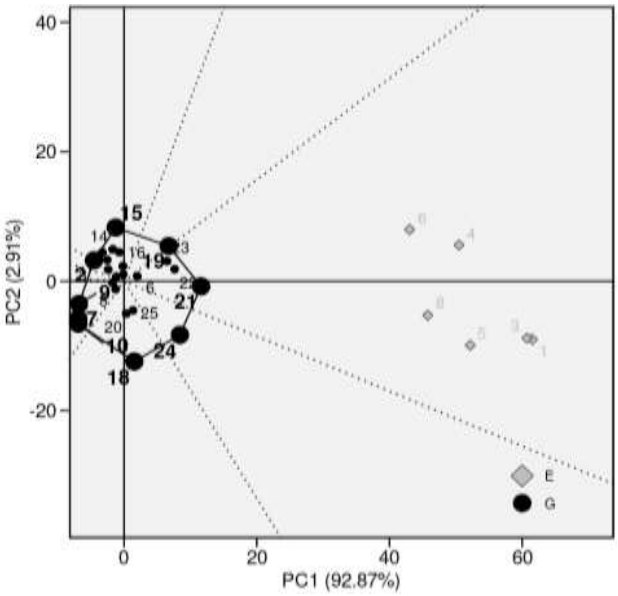
Çalışmada çevre ortalamalarına göre tritikale genotiplerinin bitki boyu değerleri 94,85-119,71 cm arasında değişmiştir. En yüksek bitki boyu 2020 yılında Tekirdağ-Hayrabolu lokasyonundan (E7) elde edilmiş, bunu 112,54 cm ile 2019 yılında Tekirdağ-Süleymanpaşa lokasyonu (E1) izlemiştir.

Sekiz farklı çevreden elde edilen ortalama bitki boyu genotipik etkileri incelendiğinde NZFT 11 ileri hattı dışındaki tüm ileri hatların negatif genotipik etkiye sahip olduğu, tüm standart çeşitlerin ise pozitif genotipik etkiye sahip olduğu görülmüştür. Ortalama bitki boyu çevre etkileri incelendiğinde ise E7, E1, E4 ve E3 pozitif etkiye sahip olurken diğer çevreler negatif etkiye sahip olmuştur.

Bitki Boyu Değerlerine İlişkin GGE-Biplot Analizi



Şekil 1. Genel ortalama ve stabilite grafiği



Şekil 2. Hangi genotip nerede kazandı grafiği

Bitki boyu değerlerine ilişkin genel ortalama ve stabilite grafiği (Şekil 1) incelendiğinde 6, 4, 8, 12, 21 ve 22 numaralı genotiplerin iz düşüm çizgileri en kısa olan genotipler oldukları görülmektedir. Bu genotiplerden genel ortalamanın üzerinde bitki boyu değeri veren 21, 22 ve 6 numaralı genotipler yeşil ot üretimi açısından yüksek stabilite gösterirken, 4, 8 ve 11 numaralı genotipler ise kısa iz düşüm çizgilerine sahip olmasına rağmen genel ortalamanın altında bitki boyu değerleri vermeleri nedeniyle tanelik tritikale üretimi için yüksek stabilite gösteren genotipler olmuşlardır. Çalışmada 10, 15, 18, 19 ve 24 numaralı genotipler uzun iz düşüm çizgileri ile bitki boyu yönünden düşük stabilite göstermektedir. Bitki boyu yönünden çevreler incelendiğinde eşitlik çizgisi merkeze en yakın olan 2, 6 ve 8 numaralı çevreler stabilitesi yüksek çevreler olarak belirlenmiştir.

Hangi genotipin nerede uygun olduğunu gösteren GGE-biplot analiz görüntüsünde (Şekil 2) 6 sektör oluşmuş ve tüm çevreler bir sektör içinde yer almıştır. Çalışmada incelenen çevreler üçüncü sektör içinde toplanmıştır. Bu da bitki boyu yönünden 8 çevre yerine 1 mega çevrenin yeterli olabileceğini ortaya koymaktadır. Bitki boyu yönünden genotipik seçim için daha farklı çevrelerin belirlenmesi yararlı olacaktır. Poligonun köşelerinde yer alan genotipler bir veya birden fazla ortamda en iyi ya da en kötü performansı gösterirler. Poligonun köşe noktalarında yer alan 18, 21 24, 19, 15, 2, 9 ve 7 numaralı genotipler çevreler için değerlendirilecek genotipler olarak belirlenmiştir. Çalışmada tüm çevrelerin bir sektörde yer alması stabilite yönünden poligonun bu sektöre yakın köşelerinde bulunan genotiplerin dikkate alınması gerektiğini gösterir. On sekiz ve 24 numaralı genotipler arasındaki eşitlik çizgisi, tüm çevreler için 24 numaralı genotipin 18 numaralı genotipten daha uygun olduğunu ortaya koymaktadır.

Aynı şekilde 24 ve 21 numaralı genotipler arasındaki eşitlik çizgisi, 21 numaralı genotipin tüm çevrelerde daha üstün olduğunu göstermektedir. Buna göre 21 > 19 > 15 > 2 > 9 > 7 sıralaması ile genotiplerin tüm çevrelere daha iyi uyum gösterdiği belirlenmiştir. Genotipler yönünden çevreler değerlendirildiğinde 6 ve 8 numaralı çevreler bitki boyu yönünden en uygun çevre olmuştur.

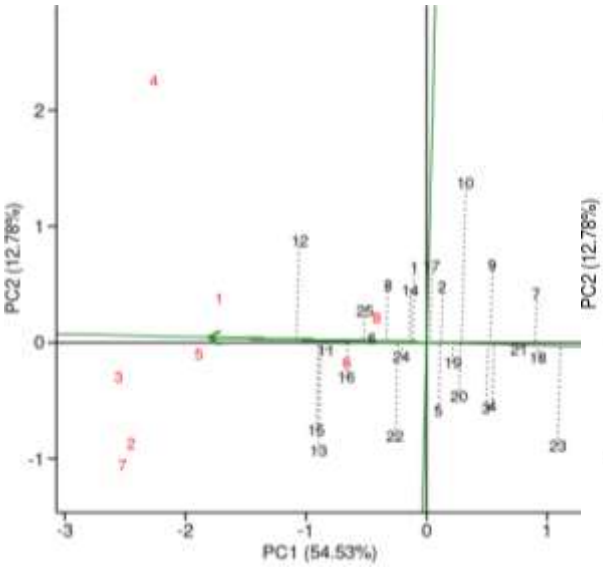
3.2. Bitki Ağırlığı (g)

Farklı tritikale genotiplerinin ortalama bitki ağırlığı değerleri 4,53-5,83 g arasında değişmiştir. Bitki ağırlığı bakımından en yüksek değer NZFT 19 ileri hattından elde edilirken, bu genotipi 5,70 g ile NZFT 20, 5,66 g ile NZFT 24, 5,54 g ile NZFT 27 ve NZFT 11 ileri hatları izlemiştir. Standart çeşitler arasında en yüksek bitki ağırlığı 5,48 g ile GK Szemes ve 5,42 g ile Truva çeşitlerinden elde edilmiştir. GK Szemes, Truva ve Presto 2000 standart çeşitleri genel ortalama (5,19 g)'nın üzerinde bitki ağırlığına sahipken, diğer standart çeşitler genel ortalamanın altında kalmıştır. İleri hatlar değerlendirildiğinde de NZFT 12, NZFT 7, NZFT 14, NZFT 6, NZFT 15, NZFT 8 ve NZFT 28 ileri hatları genel ortalamadan daha düşük bitki ağırlığına sahip olmuştur.

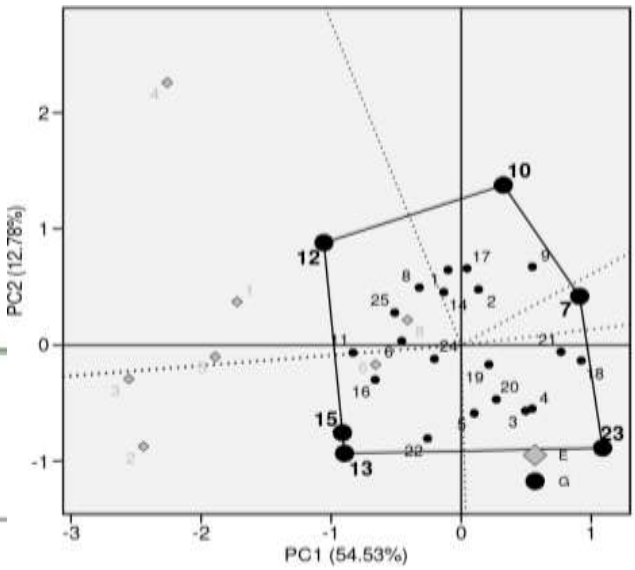
Çevre ortalamalarına göre tritikale genotiplerinin bitki ağırlığı değerleri 4,11-6,29 g arasında değişmiştir. En yüksek bitki ağırlığı 2020 yılı Tekirdağ-Hayrabolu lokasyonundan (E7) elde edilmiş, bu değeri aynı istatistiki grupta yer alan 5,79 g ile 2019 yılında Tekirdağ-Süleymanpaşa lokasyonu (E1) ve 5,58 g 2020 yılında Tekirdağ-Süleymanpaşa lokasyonu (E5) izlemiştir.

Çalışmada ortalama bitki ağırlığı genotipik etkileri incelendiğinde GK Szemes, Truva ve Presto 2000 standart çeşidi dışındaki tüm standart çeşitler negatif genotipik etkiye sahip olmuştur. NZFT 12, NZFT 7, NZFT 14, NZFT 6, NZFT 15, NZFT 8 ve NZFT 28 ileri hatları negatif genotipik etkiye sahipken, diğer ileri hatlar pozitif genotipik etkiye sahip olmuştur. Ortalama bitki ağırlığı çevre etkileri bakımından 2020 yılı Tekirdağ-Hayrabolu lokasyonu (E7), 2019 yılı Tekirdağ-Süleymanpaşa lokasyonu (E1), 2020 yılı Tekirdağ-Süleymanpaşa lokasyonu (E5) ve 2019 yılı Tekirdağ-Hayrabolu lokasyonu (E3) pozitif çevre etkisine sahipken, diğer çevreler negatif etki göstermiştir.

Bitki Ağırlığı Değerlerine İlişkin GGE-Biplot Analizi



Şekil 3. Genel ortalama ve stabilite grafiği



Şekil 4. Hangi genotip nerede kazandı grafiği

Elde edilen genel ortalama ve stabilite grafiği incelendiğinde stabilite bakımından 11, 6, 24, 19, 21 ve 18 numaralı genotipler iz düşüm çizgileri en kısa olan genotiplerdir. Bu genotiplerden genel ortalamanın üzerinde bitki ağırlığı veren 19, 21 ve 18 numaralı genotipler bitki ağırlığı yönünden hem üstün özellik hem de yüksek stabilite göstermiştir. Buna karşın 11, 6 ve 24 numaralı genotiplerin ise kısa iz düşüm çizgisine sahip olmalarına rağmen genel ortalamanın altında bitki ağırlığı değerleri ile stabilite yönünden dikkati çeken genotipler olmadıkları belirlenmiştir. Çalışmada 10, 13, 15, 22, 23 ve 12 numaralı genotipler uzun iz düşüm çizgileri ile bitki ağırlığı yönünden stabiliteleri en düşük olan genotiplerdir. Bitki ağırlığı özelliği için çevreler incelendiğinde eşitlik çizgisi merkeze en yakın olan 6 ve 8 numaralı çevreler stabilite yönünden üstün özellik gösteren çevreler olmuştur.

Hangi genotipin nerede uygun olduğunu gösteren GGE-biplot analiz görüntüsünde 5 sektör oluşmuş ve çevreler 2 sektör içine dağılmıştır. Birinci, ikinci ve üçüncü sektörde çevre dağılımı görülmezken, çevreler dördüncü ve beşinci sektörlerde dağılım göstermiştir. Genotiplerin mümkün olduğunca farklı sektörlere dağılması bitki ağırlığı özelliği bakımında tritikale genotiplerinin seçiminde yararlı olacaktır. Her bir sektör için uygun genotipler poligonun köşe noktalarında yer alan 23, 7, 10, 12, 15 ve 13 numaralı genotipler olmuşlardır. On ve 12 numaralı genotipler arasındaki eşitlik çizgisi, 12 numaralı genotipin 1 ve 8 numaralı çevreler için 10 numaralı genotipten daha uygun olduğunu ortaya koymaktadır. Aynı şekilde 12 ve 15 numaralı genotipler çevrelere göre karşılaştırıldığında 15 numaralı genotipin 2, 3, 6 ve 7 numaralı çevreler bakımından daha uygun olduğu ortaya konmuştur. Çevrelere göre uygunluk yönünden genotipler değerlendirildiğinde 15 > 13 > 23 > 7 > 10 sıralaması oluşmaktadır. Genotipler yönünden çevreler değerlendirildiğinde 8 numaralı çevrelerin bitki ağırlığı yönünden en uygun çevre olduğu belirlenmiştir.

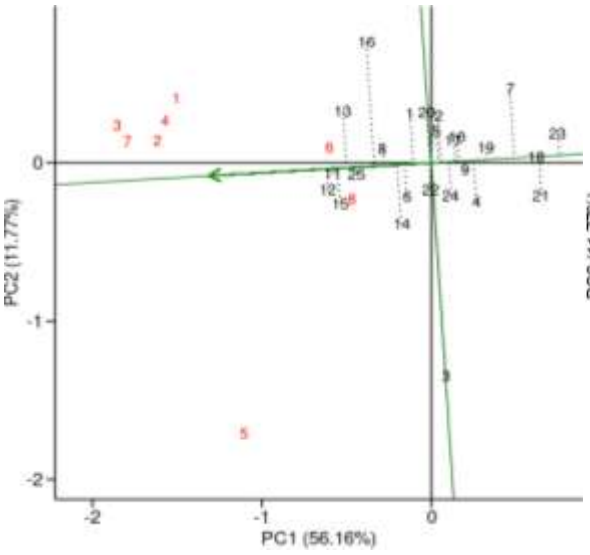
3.3. Başak Ağırlığı (g)

Çizelge 3'e göre farklı tritikale genotiplerinde ortalama başak ağırlığı değerleri 2,46-3,39 g arasında değişmiştir. En yüksek başak ağırlığı değeri NZFT 19 genotipinden elde edilirken, bunu aynı istatistiki grupta yer alan 3,35 g ile NZFT 17, 3,30 g ile NZFT 24, 3,27 g ile NZFT 20 ve 3,26 g ile GK Szemes genotipleri izlemiştir. Genel ortalama (2,96 g)'ya göre NZFT 12, NZFT 7, NZFT 14, NZFT 15 ve NZFT 28 ileri hatlarının genel ortalamadan daha düşük başak ağırlığı değerlerine sahip olduğu görülmüş, NZFT 8 (2,96 g), NZFT 5 ve NZFT 6 (2,98 g) genotipleri ileri hatlar arasında genel ortalamaya en yakın genotipler olarak belirlenmiştir. Standart çeşitler arasında GK Szemes ve GK Maros genel ortalamadan daha yüksek başak ağırlığına sahip olurken, diğer standart çeşitler genel ortalamanın altında yer almıştır.

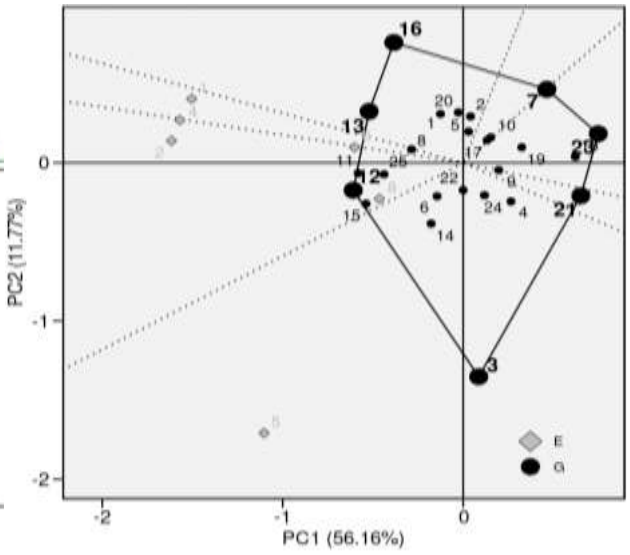
Çevre ortalamalarına göre tritikale genotiplerinin başak ağırlığı değerleri 2,34-3,40 g arasında değişmiştir. En yüksek başak ağırlığı 2020 yılında Tekirdağ-Hayrabolu lokasyonundan (E7) elde edilmiş, bunu aynı istatistiki grupta yer alan 3,38 g ile 2019 yılında Tekirdağ-Süleymanpaşa lokasyonu (E1), 3,35 g ile 2020 yılı Tekirdağ-Süleymanpaşa lokasyonu (E5) izlemiştir.

Sekiz farklı çevreden elde edilen ortalama başak ağırlığı genotipik etkileri bakımından NZFT 12, NZFT 7, NZFT 14, NZFT 15, NZFT 28 ileri hattı dışındaki tüm ileri hatlar, standart çeşitler arasından da GK Szemes, GK Maros çeşitleri pozitif genotipik etkiye sahip olmuştur. Ortalama başak ağırlığı çevre etkileri incelendiğinde ise 2020 yılı Tekirdağ-Hayrabolu lokasyonu (E7), 2019 yılı Tekirdağ-Süleymanpaşa lokasyonu (E1), 2020 yılı Tekirdağ-Süleymanpaşa lokasyonu (E5) ve 2019 yılı Tekirdağ-Hayrabolu lokasyonu (E3) pozitif etkiye sahip olurken diğer çevrelerde negatif etki görülmüştür.

Başak Ağırlığı Değerlerine İlişkin GGE-Biplot Analizi



Şekil 5. Genel ortalama ve stabilite grafiği



Şekil 6. Hangi genotip nerede kazandı grafiği

Şekil 5 incelendiğinde stabilite bakımından 11, 25, 8, 10, 17, 9, 19 ve 18 numaralar iz düşüm çizgileri en kısa olan genotiplerdir. Bu genotiplerden genel ortalamanın üzerinde başak ağırlığı veren 11, 8 ve 25 numaralı genotipler başak ağırlığı yönünden hem üstün özellik hem de yüksek stabilite göstermiştir. Buna karşın 10, 17, 9, 19 ve 18 numaralı genotipler ise kısa iz düşüm çizgisine sahip olmalarına rağmen genel ortalamanın altında başak ağırlığı değerleri ile stabilite yönünden önem taşımamaktadır. Çalışmada 16, 7, 14, 13, 1, 12 ve 20 numaralı genotipler uzun iz düşüm çizgileri ile başak ağırlığı yönünden stabiliteleri en düşük olan genotipler olarak belirlenmiştir. Başak ağırlığı özelliği için çevreler incelendiğinde eşitlik çizgisi merkeze en yakın olan 6 ve 8 numaralı çevreler stabilite yönünden üstün özellik gösteren çevreler olmuştur.

Hangi genotipin nerede uygun olduğunu gösteren GGE-biplot analiz görüntüsünde (Şekil 6) 7 sektör oluşmuş ve çevreler 3 sektör içine dağılmıştır. İkinci, üçüncü, dördüncü ve beşinci sektörde çevre dağılımı görülmezken, çevreler birinci, altıncı ve yedinci sektörlerde dağılım göstermiştir. Başak ağırlığı yönünden seleksiyon için genotiplerin daha farklı sektörlere dağılması yararlı olacaktır. Her bir sektör için uygun genotipler poligonun köşe noktalarında yer alan 3, 21, 23, 7, 16, 13 ve 12 numaralı genotipler olmuşlardır. Üç ve 21 numaralı genotipler arasındaki eşitlik çizgisi, 3 numaralı genotipin 5 numaralı çevre için 21 numaralı genotipten daha uygun olduğunu ortaya koymaktadır. Aynı şekilde 13 ve 12 numaralı genotipler çevrelere göre karşılaştırıldığında 13 numaralı genotipin 1, 2, 3, 4, 6 ve 7 numaralı çevreler bakımından, 12 numaralı genotipin de 8 numaralı çevre için uygun olduğu ortaya konmuştur. Genotipler yönünden çevreler değerlendirildiğinde 6 ve 8 numaralı çevrelerin başak ağırlığı yönünden en uygun çevreler oldukları belirlenmiştir.

3.4. Hasat İndeksi (%)

İncelenen özelliklerden hasat indeksinde çevre etkisi ve genotip etkisi istatistiki olarak % 1 düzeyinde önemli olsa da genotip × çevre interaksiyon etkisi önemsiz bulunmuştur. Bu nedenle hasat indeksi özelliğinde yalnızca birleştirilmiş varyans analiz yorumlaması yapılmıştır.

Yirmi beş tritikale genotipinin ortalama hasat indeksi değerleri %38,58-46,30 arasında değişmiştir. En yüksek hasat indeksi değeri NZFT 13 genotipinden elde edilirken, bu genotipi %45,61 ile GK Szemes ve %43,92 ile NZFT 17 genotipleri takip etmiştir. On dört tritikale genotipi de (%41,25-43,55) aynı istatistiki grupta yer almıştır. En düşük hasat indeksi değeri Truva genotipinden elde edilmiş, bu genotipi %38,98 ile Karma 2000, %38,68 ile Mikham 2002, %40,02 ile Presto 2000, %40,75 ile NZFT 15, %40,78 ile Tatlıcak 97, %41,09 ile Focus ve %41,12 ile NZFT 12 genotipleri izlemiştir. Genel ortalama (%42,17)'ya göre ileri hatlar arasından NZFT 15 (%40,75), NZFT 12 (%41,12), NZFT 14 (%41,25), NZFT 28 (%41,74) ve NZFT 11 (%41,88) genel ortalamadan düşük hasat indeksi değerlerine sahip olmuştur. Standart çeşitler arasından GK Szemes (%45,61) ve GK Maros (%43,44) çeşitlerinin genel ortalamadan daha yüksek hasat indeksi değerine sahip olduğu görülmektedir.

Çevreler ortalama değerlere göre değerlendirildiğinde genotiplerin hasat indeksi değerleri %39,96-46,48 arasında değişmiştir. En yüksek hasat indeksi 2020 yılında Kırklareli-Lüleburgaz lokasyonundan (E8) elde edilmiş, bu çevreyi %43,22 ile 2020 yılı Tekirdağ-Süleymanpaşa lokasyonu (E5) izlemiştir. Çevreler arasında en düşük hasat indeksi değeri ise

2019 yılı Edirne lokasyonundan (E2) elde edilirken, bu çevreyi %40,06 ile 2019 yılı Tekirdağ-Hayrabolu lokasyonu (E3) izlemiştir. Çalışmanın yürütüldüğü diğer dört çevreden elde edilen değerler (%41,62-42,25) aynı istatistiki grupta yer almıştır.

İleri hatlardan NZFT 11, NZFT 12, NZFT 14, NZFT 15 ve NZFT 28 negatif genotipik etki gösterirken, diğer ileri hatların da pozitif genotipik etki gösterdiği belirlenmiştir. GK Szemes ve GK Maros dışındaki tüm standart çeşitlerin de negatif genotipik etkiye sahip olduğu görülmüştür. Ortalama hasat indeksi çevre etkileri incelendiğinde 2019 yılı Tekirdağ-Süleymanpaşa lokasyonu (E1), 2020 yılı Tekirdağ-Süleymanpaşa lokasyonu (E5) ve 2020 yılı Kırklareli-Lüleburgaz lokasyonu (E8) pozitif etkiye sahip olurken, diğer çevreler negatif çevre etkisine sahip olmuştur.

4. SONUÇ VE ÖNERİLER

Bitki boyu bakımından 2019 yılı ortalama bitki boyu değeri, 2020 yılına göre 6,05 cm daha kısa olmuştur. Stabilitesi yüksek olan NZFT 11, Tatlıcak 97 ve Presto 2000 genotipleri uzun boyları ile yeşil ot üretimi için, genel ortalamanın altında ve yüksek stabilite gösteren NZFT 7, NZFT 13 ve NZFT 17 genotipleri ise tane üreticileri ve ıslahçılar açısından ön plana çıkan genotipler olarak belirlenmiştir. 2019 ve 2020 yılı ortalama bitki ağırlığı değerleri oldukça yakın değerler göstermektedir. Bitki ağırlığı bakımından en yüksek değerler NZFT 19, NZFT 20, NZFT 24, NZFT 27 ve NZFT 11 ileri hatlarından alınmış ancak stabilitelerinin düşük olmasından dolayı önem taşımamaktadır. Mikham 2002, Tatlıcak 97 ve Focus standart çeşitleri yüksek stabilite göstermeleri nedeniyle lokasyonlar için en uygun genotipler olmuşlardır. Başak ağırlığı yönünden 1. ve 2. yıl oldukça yakın değerlere sahip olmuştur. Ortalamanın üzerinde başak ağırlığı değerine sahip olan NZFT 17, NZFT 13 ve GK Szemes yüksek stabilite göstererek dört lokasyon için de önerilebilecek en uygun genotipler olmuşlardır. Genotip × çevre interaksiyonunun önemsiz bulunduğu hasat indeksi özelliği için önerilebilecek genotipler ancak genel ortalamanın üzerinde yer alan ve en yüksek değere sahip olan bu genotipler olacaktır. Tüm özellikler göz önüne alındığında NZFT 13, NZFT 17 ileri hatları ile Tatlıcak 97 ve GK Szemes çeşitleri en uygun genotipler olarak belirlenmiştir.

ABSTRACT

Animal-based cheeses, rich in calcium, phosphorus, protein, fat and vitamins (A, B_{12}, D, E, K), have an important place in human nutrition. However, recently, due to the increasing interest in vegan nutrition, the importance of sensitivity towards animals and environmental approach, ethical values, sustainable approach, socio-economic factors, the belief that plant-based foods are healthier than animal-based foods, allergy or intolerance to dairy products, alternative foods to animal-based cheeses have been sought and plant-based cheeses have begun to be produced and preferred in this context. In plant-based cheeses, vegetable oil is generally used instead of animal fat, and plant proteins are used instead of animal protein. Some plant-based protein sources used instead of animal protein in plant-based cheeses include soybeans, almonds, peas, peanuts, chickpeas, wheat gluten, and tapioca flour. Plant-based cheeses have many advantages such as low cost, longer shelf life, and nutritional diversity, but they also have disadvantages. It is quite challenging for the texture and flavor characteristics, vitamin, mineral and other nutritional composition and quality of plant-based cheeses to be the same as those of animal milk-based cheeses. However, many studies are being carried out to ensure that the quality characteristics of plant cheeses are close to those of animal milk-based cheeses and to strengthen and functionalize the contents. In this study, the current status of plant-based cheeses that can be an alternative to cheeses produced using animal milk was examined. In summary, considering the developing technology and the increasing popularity of the product, the plant-based cheese production sector is developing and spreading and it is seen that it comes with many varieties. It is thought that there is a significant difference when compared to animal milk-based cheese equivalents and that more studies should be done on the product, especially in terms of nutrition.

Keywords: nutrition, plant nutrition, dairy products, cheese

PEYNİRE ALTERNATİF YAKLAŞIMLAR: BİTKİSEL BAZLI PEYNİRLER

ÖZET

Kalsiyum, fosfor, protein, yağ ve vitaminler (A, B_{12}, D, E, K) açısından zengin olan hayvansal kaynaklı peynirler insanların beslenmesinde önemli bir yere sahiptir. Ancak son zamanlarda vegan beslenmeye olan ilginin artması, hayvanlara olan hassasiyetin ve çevresel yaklaşımın önem kazanması, etik değerler, sürdürülebilir yaklaşım, sosyo-ekonomik faktörler, hayvansal kaynaklı gıdalara kıyasla bitkisel kaynaklı gıdaların daha sağlıklı olduğuna dair inanç, süt ürünlerine olan alerji veya intolerans gibi birçok etkenden dolayı hayvansal süt kaynaklı peynirlere alternatif gıdalar aranmış ve bu kapsamda bitkisel bazlı peynirler üretilmeye ve tercih edilmeye başlamıştır. Bitkisel bazlı peynirlerde genellikle hayvansal yağ yerine bitkisel yağ, hayvansal protein yerine ise bitkisel proteinler kullanılmaktadır. Bitkisel bazlı peynirlerde hayvansal protein yerine kullanılan bazı bitkisel kaynaklı protein kaynakları arasında soya fasulyesi, badem, bezelye, yer fıstığı, nohut, buğday glüteni, tapyoka unu yer almaktadır. Bitkisel bazlı peynirlerin maliyetinin düşük olması, daha uzun raf ömrü, besinsel çeşitlilik gibi birçok avantajı bulunmasıyla birlikte dezavantajları da bulunmaktadır. Bitkisel peynirlerin doku ve lezzet özellikleri ile vitamin, mineral ve diğer besinsel bileşimi ve kalitesinin hayvansal süt kaynaklı peynirler ile aynı olması oldukça zorlayıcıdır. Ancak bitkisel peynirlerin kalite karakteristiklerinin hayvansal süt kaynaklı peynirlere yakın olması, içeriklerin güçlendirilmesi ve işlevselleştirilmesi amacıyla birçok çalışma yapılmaktadır. Bu çalışmada hayvansal kaynaklı süt kullanılarak üretilen peynirlere alternatif olabilecek bitkisel peynirlerin mevcut durumları incelenmiştir. Özetle, gelişen teknoloji ve ürünün artan popülerliği göz önünde bulundurulduğunda bitkisel peynir üretim sektörü giderek gelişmekte ve yaygınlaşmakta olup birçok çeşidiyle karşımıza çıktığı görülmektedir. Hayvansal süt kaynaklı peynir muadilleri ile kıyaslandığında oldukça büyük bir fark olduğu ve özellikle besleyicilik açısından ürün üzerinde daha çok çalışma yapılması gerektiği düşünülmektedir.

Anahtar Kelimeler: beslenme, bitkisel beslenme, süt ürünleri, peynir

1.INTRODUCTION

Nutrition is a fundamental prerequisite for the maintenance of a healthy lifestyle. Cheese, a dairy product, occupies a significant position in a healthy diet (Doğan et al., 2022). Cheese is the most widely consumed dairy product (Çetinkaya, 2021) and is the most produced (Doğan et al., 2022). The production of traditional cheese involves the utilisation of milk from various animal sources, including cows, buffalo, sheep, and goats (Craig et al., 2022). According to the Turkish Food Codex Cheese Communiqué, cheese is defined as "dairy products obtained by coagulating the raw material using a suitable coagulant and separating the whey from the curd or by coagulating the milk after separating the permeate, with different hardnesses and fat contents, These cheeses can be produced with or without salting with brine or dry salting, with or without starter culture, with or without boiled curd, with or without flavour, and in accordance with specific techniques. They can be consumed either without ripening or after ripening, and they typically exhibit characteristics that are specific to their type (Anonymous, 2015). Cheese constitutes a significant source of minerals such as phosphorus and calcium, vitamins (A, B_{12}, D, E, K), protein, essential amino acids and essential fatty acids (Doğan et al., 2022). It has been documented that approximately 75-80% of the proteins present in milk are retained in the final cheese, and it has been reported that the human body utilises approximately 89% of the amino acids contained within cheese (Demiral, 2022). In addition to these observations, there has been an increasing interest in alternative food sources to animal-based cheeses, with a notable shift towards the production and consumption of plant-based cheeses. There are numerous factors driving this quest for alternatives. These include product development studies aimed at enhancing product diversity, the emergence of sensitivity towards animals, the ethical considerations surrounding the consumption of animal-based foods, the growing interest and popularity of vegan nutrition, the significance of environmental and sustainable living, and studies conducted in this context. Socio-economic factors, the potential for shortages of animal-based food and protein, particularly in the context of a growing population, are also considered. The notion that plant-based foods are healthier than animal-based foods, the presence of allergies or lactose intolerance in some people to dairy products, the desire to consume different types of proteins, the search for healthy alternative products, concerns about the depletion of water resources, the need for land use for animal-based milk production, the increase in greenhouse gas emissions and the desire to take precautions are some of these reasons (Yılmaz, 2023). The present study examined the current status of plant-based cheeses as a potential alternative to cheeses produced using animal-based milk.

2. PLANT- BASED CHEESES

Cheeses that are devoid of animal-based ingredients and are produced exclusively from plant-based components, thereby resembling the taste and appearance of cheeses made from animal milk, are called plant-based cheeses. These cheeses are a viable option for consumers who adhere to a vegan diet or seek to avoid animal-based products. Plant-based products have been shown to contain lower levels of saturated fat in comparison to milk and dairy products, thus rendering them a healthier alternative for individuals with high cholesterol and those suffering from heart disease (PM et al., 2024). Plant-based cheeses can be consumed as a standalone

product, but they are also frequently used in combination with other products or as an ingredient in various dishes. Their use is pervasive in numerous food products, including frozen ready-made pizza, pasta and chip sauces, cheese sauces, cold sandwiches, and hamburgers (Esen et al., 2020). Cheeses manufactured using animal-based milk contain protein, fat, water- and fat-soluble vitamins, minerals, calcium and phosphorus, and amino acids that the human body is incapable of synthesising (Kekik, 2023). Since plant-based cheeses cannot exactly match the content of cheeses made from animal milk, there are difficulties in reflecting the similarity of the cheese's taste, flavor, sensory experience and texture (Kekik, 2023). The elevated levels of plant proteins in plant-based cheeses, in conjunction with the specific functional properties of casein in milk, are the primary factors contributing to this discrepancy (Mefleh et al., 2022).

The production of plant-based cheese is typically undertaken in accordance with a sequence of steps that include formulation, mixing, heating, hot packaging and cooling. The sequence of ingredient addition is dictated by the specific processes involved. Initially, the powdered ingredients are amalgamated with water, subsequently heated to 50 °C using steam, and then subjected to a further 2-3 minutes of mixing. Subsequently, plant-based oils are incorporated, and the mixture is subjected to an average temperature of 85 °C for 5-8 minutes until it becomes molten. Following this, the addition of acidity regulators and flavouring agents such as salt initiates the cooling process. It is important to note that the temperatures and times during cheese making can affect the properties and shelf life of the cheese. In addition, the type, properties and amount of ingredients added can affect many cheese quality parameters such as the structure, taste and hardness of the cheese (Suna and Ersan, 2020). The production of plant-based cheeses involves the utilisation of plant-based products, including fruit, seeds, and vegetables. The production of plant-based cheese typically involves the utilisation of palm, cocoa or coconut oils as a source of vegetable oil; nuts, legumes or seed proteins as a source of plant protein; potato, tapioca or corn starches as a source of carbohydrates; alginic acid, xanthan gum or agar as thickeners; sodium phosphate or sodium citrate as a source of salt; lactic acid, citric acid or acetic acid as acidity enhancers (Kovačević et al., 2024). The utilisation of powdered cellulose as an anti-caking agent is a common practice in the industry. Plant-based cheeses contain significant amounts of nutritional supplements and proteins, the levels of which vary depending on the types of plant ingredients used in their production (Craig et al., 2022). Each constituent employed in the fabrication of plant-based cheeses fulfils a specific function. Plant-based oils play a pivotal role in achieving the desired composition, texture, and dissolvability of plant-based cheeses. Plant protein sources have been shown to increase nutritional value, increase the viscosity of the aqueous phase, and provide emulsification of fat thanks to soluble proteins (Jones et al., 2021). In addition, parameters such as the type, structure, content, and solubility rate of proteins affect the properties of cheese. The water employed in the production process fulfils several functions, including hydrating the protein, preventing the cheese from becoming excessively solid, enhancing its melting capability, and facilitating the dissolution of certain components in the cheese matrix. Starch is often utilised in lieu of casein, exhibiting the capacity to facilitate fat emulsification. Substances utilised as acidifiers contribute to its microbiological stability by ensuring that the pH is appropriately adjusted. As Suna and Ersan (2020) demonstrate, the addition of mineral and vitamin supplements results in an increase in the nutritional components present in plant-based cheeses when compared to those derived from animal milk. These include vitamins, magnesium, zinc, and iron. Plant-

based cheeses can be categorised as either spreadable or solid. In the assessment of the quality characteristics of cheeses with a solid structure, their hardness, brittleness, flexibility, chewiness, and internal stickiness are typically evaluated. In the case of spreadable cheeses, the focus is typically on extensibility, meltability, and viscosity (Beykont, 2009). A study examined vegan cheese substitutes and reported that they were nutritionally different from cheeses containing milk, with higher fat and carbohydrate content and lower protein, sugar, and salt content (Boukid et al., 2022).

Plant-based cheeses offer numerous advantages. The cost-effectiveness of plant-based products, which are generally more affordable than milk, is a key advantage in their production. Plant-based cheeses also have a longer shelf life. They also generally contain a lower saturated fat content. The use of soy in place of milk allows for the production of cheeses with high-quality protein. The use of more sustainable sources other than almond milk is also a key advantage. Furthermore, when sweetened, the taste profile of plant-based cheeses can be enhanced in comparison to conventional cheeses. Fermentation is a key factor in enhancing the nutritional bioavailability and sensory properties of plant-based cheeses (Kilci, 2023). It is estimated that approximately 14.5% of greenhouse gas emissions and around 30% of biodiversity loss are attributable to the animal husbandry sector for the purpose of feeding people (Kilci, 2023). Consequently, the utilisation of non-dairy alternatives in cheese production is hypothesised to engender favourable environmental outcomes (Demirci, 2024). In addition to the advantages, there are many disadvantages. These include the potential for an undesirable taste profile due to the absence of added sweeteners and sugars, which may be a concern for consumers. The environmental impact of almond milk is already detrimental, and this is further exacerbated by its use in plant-based cheese production. Plant-based cheeses exhibit a distinct nutritional profile from their dairy counterparts, potentially leading to nutritional deficiencies. Furthermore, some plant-based cheeses may contain saturated fats from coconut and palm oils, which are high in saturated fat (Kilci, 2023).

3.CONCLUSION

In response to the increasing demand for food, driven by the expanding population and the recognition that existing resources are inadequate, there has been a surge in the development of novel, sustainable products. These novel foods have only recently begun to gain ground in our country, and the production and consumption of plant-based cheeses remain negligible. Conversely, shifting nutritional patterns, the growing inclination towards plant-based nutrition, and the pursuit of novel food products have led to a steady rise in plant-based cheese production and consumption. This development can be attributed to the fact that plant-based cheese is perceived as a viable alternative by a significant proportion of the population who, for various reasons, cannot or do not wish to consume animal-based dairy products. While there are ongoing studies investigating the rate of imitation of animal-based cheese using plant-based products, the inability of plant-based cheese to match the nutritional and sensory properties of animal-based cheese is a significant challenge for the industry. It is anticipated that a significant number of studies will be conducted on plant-based cheeses in the future, leading to the expectation that properties such as texture, taste, and sensory perception will become more

comparable to those of animal-based cheeses. This has the potential to generate a substantial increase in demand for plant-based cheeses, resulting in a notable rise in production and consumption rates.

ABSTRACT

Packaging, which is an important element for packaged foods, is defined as "a material made of paper, cardboard, wood, plastic, etc. that protects the product from external factors, keeps the products inside together, and facilitates transportation, storage, distribution, promotion, and advertising." A new concept, "smart packaging", has emerged due to many reasons such as the desire for more functions than these basic functions to be present in the packaging for packaging a food, developing technology, consumer preferences and expectations. Smart packaging technology meets all the functions in the packaging concept and provides information to the producer and consumer by detecting changes such as humidity, temperature, and deterioration in and around the product during the entire process from the production of food to its consumption. There are basically three different technologies used in intelligent packaging systems. These are sensors, indicators and data carriers. Sensors provide information about temperature changes, freshness, microbiological spoilage and oxidative rancidity changes in foods. While indicators provide information about the quality of the food, data carriers record certain information in the supply chain. Different features can be added to smart packaging according to the needs of the food. For example, there are many features such as freshness indicator for fruits and vegetables, oxygen sensors for oxygen-sensitive foods, and pathogen indicators for meat, poultry, and fish products. Thanks to these features of smart packaging technology, problems that may occur in food can be monitored, economic loss is reduced, food safety is increased, food loss and waste are reduced, consumer satisfaction is increased by protecting the consumer, and thanks to timely information, precautions can be taken, and the shelf life of foods can be extended. Considering the advantages of smart packaging technology, it is thought that its use in foods will be beneficial and that many features will be added in the future and become more useful. This review includes current information and developments about smart packaging systems and technology used in foods.

Keywords: packaging, packaging in foods, intelligent packaging

GIDALARDA AKILLI AMBALAJLAMA TEKNOLOJİSİ UYGULAMALARI

ÖZET

Paketli gıdalar için önemli bir unsur olan ambalaj; "Ürünü dış etkenlerden koruyan, içine konan ürünleri bir arada tutarak taşıma, depolama, dağıtım, tanıtma, reklam gibi işlemleri kolaylaştıran, kâğıt, mukavva, ahşap, plastik ve benzerinden yapılan malzeme." olarak tanımlanmaktadır. Bir gıdayı paketleme için bu temel fonksiyonlardan daha fazla fonksiyonun ambalajda bulunmasının istenmesi, gelişen teknoloji, tüketici tercihi ve beklentileri gibi birçok sebepten dolayı yeni bir kavram olan "akıllı ambalajlama" kavramı ortaya çıkmıştır. Akıllı ambalajlama teknolojisi, ambalaj kavramındaki tüm fonksiyonları karşılamakla birlikte gıdanın üretiminden tüketimine kadar olan tüm süreçte, üründeki ve ürün etrafındaki nem, sıcaklık, bozulma gibi değişikliklerin tespit edilmesini sağlayarak üretici ve tüketiciyi bilgi sahibi yapmaktadır. Akıllı ambalajlama sistemlerinde temelinde üç farklı teknoloji kullanılmaktadır. Bunlar; sensörler, indikatör ve veri taşıyıcılarıdır. Sensörler; gıdalardaki sıcaklık değişimi, tazelik, mikrobiyolojik bozulma ve oksidatif acılaşma değişimleri hakkında bilgi verir. İndikatörler gıdanın kalitesine yönelik bilgi verirken, veri taşıyıcıları tedarik zincirindeki belirli bilgileri kaydederler. Gıdaların ihtiyaçlarına göre akıllı ambalajlara farklı özellikler de eklenebilmektedir. Örneğin meyve ve sebzeler için tazelik göstergesi, oksijene duyarlı gıdalar için oksijen sensörleri ve et, kanatlılar ve balık ürünleri için patojen indikatörü kullanılabilmesi gibi birçok özellik mevcuttur. Akıllı ambalajlama teknolojisinin bu özellikleri sayesinde gıdalarda meydana gelebilecek sorunlar izlenebilir hale gelir, ekonomik kayıp azalır, gıda güvenliği artar, gıda kaybı ve israfı azalır, tüketiciyi koruyarak tüketici memnuniyet oranını yükseltir ve zamanında bilgilendirme sayesinde önlem alınıp gıdaların raf ömrü uzatılabilir. Akıllı ambalajlama teknolojisinin avantajları göz önünde bulundurulduğunda gıdalarda kullanımının yararlı olacağı ve gelecekte birçok özellik eklenip daha faydalı hale geleceği düşünülmektedir. Bu derlemede gıdalarda kullanılan akıllı ambalaj sistemleri ve teknolojisi hakkında güncel bilgi ve gelişmelere yer verilmiştir.

Anahtar Kelimeler: ambalajlama, gıdalarda ambalajlama, akıllı ambalajlama

1. INTRODUCTION

Food packaging is defined as a tool used to protect food against undesirable physical and mechanical external effects, and to prevent deterioration and damage caused by these effects. It is also used to deliver food to the end consumer in a way that ensures food safety (Kocaman and Sarımehmetoğlu, 2010; Karagöz and Demirdöven, 2017). The material composition of packaging may vary, with examples including paper, cardboard, wood, and plastic (Öcal and Çakmak Karapınar, 2016). The primary functions of food packaging can be categorised as follows: promotion and information provision about the product, facilitation of ease of transportation and storage, enhancement of aesthetic appearance and integrity, and protection of food from moisture, pressure, direct contact with light, and undesirable oxidation reactions (Karagöz and Demirdöven, 2017; Yüceer and Caner, 2023). Despite the implementation of physical, microbial, chemical, and sensory analyses prior to the packaging of a food product, it remains impossible to ascertain the product's condition upon reaching the consumer (Ma et al., 2022). The advent of diverse packaging technologies can be attributed to numerous factors, including the aspiration for packaging to serve multifaceted functions beyond mere product protection, advancements in technology, consumer demands, and the competitive landscape. One such technology is smart packaging technology (Takma and Nadeem, 2019). According to the European Food Safety Authority (EFSA), smart packaging technology is defined as "Materials and substances that monitor the condition of packaged food or the conditions around it" (Müller and Schmid, 2019). This technology involves the recording of physical and chemical changes that occur in the product, enabling the producer and consumer to monitor food safety and quality (Takma and Nadeem, 2019). The utilisation of smart packaging technology confers numerous advantages. The technology has the capacity to detect potential issues with food items prior to their occurrence, thereby enabling the implementation of preventative measures. The utilisation of smart packaging facilitates the extension of food shelf life, leading to a reduction in economic losses. Additionally, the technology contributes to a decline in food safety risks, food loss and waste, and the deterioration of food quality. Furthermore, it enhances the perception of freshness and consumer satisfaction by safeguarding against the potential risks of food poisoning. However, it is important to note that this technology is not without its drawbacks. These include the necessity for separate packaging designs for each food item, as well as high production costs (Kasım ve Kasim, 2019). This study aims to provide current information and developments on smart packaging systems and technologies used in foods.

2. APPLICATIONS OF SMART PACKAGING TECHNOLOGY

Smart packaging technology can be defined as a packaging system that uses science and technology to communicate changes in the conditions of food and its external environment, as well as various quality parameters (e.g. humidity, temperature, pH) to the producer and consumer. The purpose of this communication is to make it easier to follow and be informed (Ghaani et al., 2016). A multitude of packages has been conceptualised within the ambit of the smart packaging system. These designs can be categorised into three distinct types: sensors, indicators, and data carriers.

2.1.SENSORS

Sensors utilised within the domain of food packaging are employed to measure and monitor physical or chemical quality parameters in packaged foods. In the event of any change, the sensor emits a signal, thereby alerting the producer or consumer, thus preventing spoilage (Takma and Nadeem, 2019). The sensor is composed of two primary components: a transducer and a receptor. The sensor functions on the principle that the receptors within it convert physical or chemical data into energy, which is then converted into a signal by the transducer (Akkemik and Güner, 2020). Sensors are utilised in the packaging of food products to monitor a variety of features, including the assessment of food freshness, the identification of pH variations and microbiological spoilage, the regulation of temperature fluctuations and oxidative reactions (Çelik and Tümer, 2016; Kadağan and Gürbüz, 2022). A classification of sensors can be established, categorising them into three primary groups: biosensors, gas sensors and nanoscale sensors (Kadağan and Gürbüz, 2022).

A biosensor is a type of sensor that facilitates the monitoring, determination and transmission of biological and biochemical reactions occurring in packaged foods (Kasım and Kasim, 2019). The preference for biosensors can be attributed to their numerous advantages, including cost-effectiveness, compact size, and portability. Applications in the food sector include freshness monitoring of meat, poultry, and seafood; sugar and total microbial load measurement in beverages; and contamination detection (Akkemik and Güner, 2020). A notable example of a biosensor is the "Food Sentinel System". This barcode system functions by ensuring that if the microbial load in a food product exceeds the amount stipulated by the manufacturer or if the product's expiration date has been exceeded, the ink, which is typically invisible, will transfer from the packaging to the barcode, rendering the barcode unusable. This prevents the purchase of the product and the potential consequences of microbial load, such as poisoning (Akkemik and Güner, 2020; Anonymous, 2025).

Gas sensors represent a category of sensor that functions on the principle of the sensor's responsiveness to the gas to be monitored. In the context of the food industry, gas sensors play a pivotal role in the detection of leakage and the assessment of product quality by measuring the levels of oxygen and carbon dioxide. This application was pioneered by Öksüztepe and Beyazgül (2015).

Nano sensors are sensors used to detect spoilage in foods. In the event of foods becoming contaminated with pathogens during transportation or storage, or for any other reason, these sensors are capable of detecting the gases that are produced as a result of spoilage. The sensors then report the status of the spoilage using a colour grading system. The capacity of nano sensors to detect unwanted microorganisms, thereby playing a role in the prevention of food poisoning, has been well documented (Karagöz and Demirdöven, 2017).

2.2. INDICATORS

Indicators represent a subset of smart packaging systems that facilitate the monitoring of the quality of foodstuffs, the external environmental conditions in which food is stored, and the internal environmental conditions of the packaging, including the headspace. It should be noted

that indicators can be categorised as either contact or non-contact with food. The classification of indicators is determined by their function (Hepsağ and Varol, 2018).

Time-temperature indicators, for instance, provide information to the consumer about unwanted temperature changes that occur. In the event of a temperature change resulting from mechanical, chemical, microbial or enzymatic reactions during transportation and storage, a colour change is observed on the label of the packaging, depending on the temperature (Özçildir ve Yetim, 2010). These indicators can be attached to the packaging surfaces separately in each package or as one per batch (Purma and Serdaroğlu, 2006). Time-temperature indicators are of great importance in terms of food safety and quality. As these indicators are based on the shelf life of food items when stored within the required temperature range, depending on the food type, they are not suitable in cases of temperature fluctuations (Yüceer and Caner, 2023). The application of this indicator is particularly relevant in the context of perishable foods, including fresh and frozen meat, poultry, dairy products, and frozen foods (Kocaman and Sarımehmetoğlu, 2010).

Freshness indicators are defined as analytical tools that detect the presence of specific metabolites, including carbon dioxide, ammonia, trimethylamine, dimethylamine, organic acids, ethanol, hydrogen sulfide, toxins, enzymes, glucose, and fluctuations in gas concentrations. These indicators are utilised to assess the shelf life of food products, particularly in instances where storage conditions are suboptimal, there is contact with pathogens, undesirable reactions occur, or microbial spoilage is present. The colour change of the label on the package serves as an indicator of the freshness of the product. (Öksüztepe and Beyazgül, 2015; As stated by Özçildir and Yetim (2010), the colour change function can be utilised to determine the food's consumption status. The colour change function enables the determination of whether the food will be consumed or not. Numerous illustrations of the implementation of these indicators in food products can be provided. A notable example is the "FresTag®" indicator, which provides information regarding the freshness of fish by undergoing a colour change in response to the concentration of volatile amine compounds present within the fish (Purma and Serdaroğlu, 2006). Indicators labelled "It's Fresh®" are employed in meat and seafood packaging, where they convert the pH change into a colour change in the presence of volatile amines or sulfides in the packaging. In the case of chicken and chicken products, indicators provide information about the product by causing the color to change with the reaction of myoglobin and hydrogen sulfide (Öksüztepe and Beyazgül, 2015). Furthermore, indicators known as "RepeSenses®" have been developed for the purpose of determining the ripeness of various fresh fruits. The principle underlying this technology is the identification of metabolites that are characteristic of the ripening process in fresh fruits, in conjunction with the colour change of the indicator. This technology has been employed in a variety of fruits, including pears, avocados, melons, kiwis, and mangoes (Akkemik and Güner, 2020).

Leak indicators are devices that provide information about the presence of gases in packaging by showing a colour change. Given the critical importance of ascertaining the absence of leaks to ensure optimal shelf life, particularly in contexts where gases are employed to prevent the development of microorganisms, the significance of leak indicators cannot be overstated. An illustration of the utilisation of such indicators in the sector is the oxygen gas indicator, termed

"Ageless-Eye®", which undergoes a colour change in accordance with the oxygen gas concentration within the packaging (Hepsağ and Varol, 2018).

The operation of pathogen indicators is underpinned by immunochemical and chemical methodologies, which facilitate the detection of toxins. These indicators provide information about the detection of specific pathogenic bacteria. An illustration of its application in the field of food analysis is its use in the detection of *Escherichia coli* O157:H7 bacteria in meat, poultry, and fish-like products (Yüceer and Caner, 2023).

2.3.DATA CARRIERS

The system under discussion is an intelligent packaging system that records the history of many features of packaged products throughout the supply chain and provides instant traceability. The system offers numerous advantages, including the capacity for remote control and security of the product, as well as the capability to detect and rectify any issues (Çelik et al., 2024).

The barcodes, which are arranged with vertical lines and spaces of varying thicknesses, indicate the product's features and price, allowing electronic devices to read the data and transfer it to another system (Yüceer and Caner, 2023). The numerous advantages of barcodes include their versatility, allowing for use across diverse sectors and products; universality, facilitating seamless integration into existing systems; cost-effectiveness, ensuring affordability without compromising on precision; rapid and instantaneous updates, enabling real-time monitoring and adjustments; compact size, enhancing portability and ease of use; and high data storage capacity, ensuring comprehensive inventory control and efficient data management (Kocaman and Sarımehmetoglu, 2010).

Radio frequency identification (RFID) is a system that facilitates the tracking of products through the utilisation of a reader that employs radio waves. The RFID system comprises a controller, a reader, an interrogator, an antenna and a label (Kadağan and Gürbüz, 2022). The efficacy of this system is evidenced by its ability to facilitate comprehensive control over product inventory throughout the supply chain. In addition, it enables the documentation of fundamental information such as temperature, relative humidity, barcode details, and microbiological data. The system's capabilities extend further, including the identification of counterfeit products and its utilisation in recall scenarios (Özçildir and Yetim, 2010; Kasim and Kasim, 2019).

3. CONCLUSION

The fundamental purpose of packaging is to protect the product; however, with the advancement of technology, a multitude of additional functions have been incorporated into packaging. Consequently, a novel packaging system known as smart packaging technology has emerged. As research progresses, the capabilities of smart packaging are being enhanced, leading to a steady increase in its utilisation and a corresponding strengthening of its position within the sector. The technology offers numerous advantages, including enhanced food quality and safety, reduced food waste, extended shelf life, and facilitated food traceability, which has

been met with approval by producers and consumers alike. However, this technology is not without drawbacks, including its high cost and the necessity for the development of bespoke packaging for certain foods. Therefore, it is considered that the use of smart packaging technology in food is beneficial and will become more widespread in the future.

ABSTRACT

The codling moth, *Cydia pomonella* L. (Lepidoptera: Tortricidae) is a significant pest of pome fruits globally. The present study aimed to monitor the seasonal adult population dynamics and damage rate of the codling moth in pear orchards located in Kocaeli province of Türkiye. The field observations were made from April to October once a week during the 2024 growing season. The research was conducted in five pear orchards (four treated, one untreated) in Kartepe and Gölcük districts. Three pheromone traps were placed in each orchard to monitor the adult population dynamics of codling moths. The first adults of the codling moth were captured in pheromone traps on April 12 in Gölcük and April 27 in Kartepe. The pest populations reached their highest level in the Hisareyn location of the Gölcük district on July 27, with an average of 10 adults per trap. In the Kartepe district, the populations peaked on August 3, recording 16.3 adults per trap in the Maşukiye-2 location, and on August 17, with 8 adults per trap in the Balaban location. Adult pests were last detected in pheromone traps in Kartepe and Gölcük on September 21. To evaluate the damage rates of the fruits, a total of 100 fruits were examined from 10 randomly selected trees, with 10 fruits per tree representing the orchards. The assessment of damage rates was conducted weekly during the initial phase of the first adult flights. The damage rates of fruits in the pear orchards located in Hisareyn and İhsaniye in Gölcük were 4.95% and 1.78%, respectively. In the Balaban, Maşukiye-1, and Maşukiye-2 (untreated) orchards in Kartepe were 1.5%, 1.2%, and 23.95%, respectively. The corrugated board method was employed to monitor the initial emergence of adult codling moths for the summer and autumn generations. The adults of the 2nd generation emerged on July 14, while the adults of the 3rd generation emerged on September 1.

KOCAELİ İLİ ARMUT BAHÇELERİNDE ELMA İÇKURDU *CYDIA POMONELLA* (L.) (LEPIDOPTERA: TORTRICIDAE)'NIN ERGİN POPÜLASYON GELİŞİMİ VE ZARAR ORANLARI

ÖZET

Elma içkurdu, *Cydia pomonella* L. (Lepidoptera: Tortricidae), dünya genelinde yumuşak çekirdekli meyvelerin önemli bir zararlısıdır. Bu çalışma, Elma içkurdu'nun Kocaeli (Türkiye) ilindeki armut bahçelerinde mevsimsel ergin popülasyon dinamiklerini izlemeyi ve zarar oranlarını belirlemeyi amaçlamaktadır. Arazi çalışmaları, 2024 yılının Nisan-Ekim ayları arasında haftalık olarak gerçekleştirilmiştir. Çalışma, Kartepe ve Gölcük ilçelerinde bulunan beş armut bahçesinde (dört ilaçlı, bir ilaçsız bahçe) yürütülmüştür. Elma içkurdu'nun ergin popülasyon dinamiklerini izlemek amacıyla her bahçeye üçer adet feromon tuzağı yerleştirilmiştir. Elma içkurdu erginleri ilk olarak Gölcük ilçesinde 12 Nisan'da, Kartepe ilçesinde ise 27 Nisan'da feromon tuzaklarında tespit edilmiştir. Zararlının popülasyonları, Gölcük ilçesinin Hisareyn lokasyonunda 27 Temmuz'da ortalama 10 birey/tuzak ile en yüksek seviyeye ulaşmıştır. Kartepe ilçesinde ise zararlının popülasyonları, Maşukiye-2 lokasyonunda 3 Ağustos'ta 16.3 birey/tuzak ve Balaban lokasyonunda 17 Ağustos'ta 8 birey/tuzak ile tepe noktasına ulaşmıştır. Ergin bireyler, Kartepe ve Gölcük ilçelerindeki feromon tuzaklarda son olarak 21 Eylül'de tespit edilmiştir. Meyve zarar oranlarını belirlemek amacıyla her bahçede 10 ağaçtan rastgele ağaç başına 10 meyve olmak üzere toplam 100 meyve incelenmiştir. Zarar oranlarının değerlendirilmesi, ilk ergin uçuşlarının başlangıç döneminden itibaren haftalık olarak yapılmıştır. Gölcük ilçesinin Hisareyn ve İhsaniye lokasyonlarında bulunan armut bahçelerinde meyve zarar oranları sırasıyla ortalama %4.95 ve %1.78 olarak belirlenmiştir. Kartepe ilçesinde ise Balaban, Maşukiye-1 ve Maşukiye-2 (ilaçsız) bahçelerinde meyve zarar oranları sırasıyla ortalama %1.5, %1.2 ve %23.95 olarak tespit edilmiştir. Elma içkurdu'nun yaz ve sonbahar döllerine ait ilk ergin çıkışlarını belirlemek amacıyla tuzak bant yöntemi kullanılmıştır. Zararlının ikinci döle ait erginlerinin 14 Temmuz'da, üçüncü döle ait erginlerinin ise 1 Eylül'de çıkış yaptığı belirlenmiştir.

Anahtar Kelimeler: Popülasyon takibi, Zarar oranı, *Cydia pomonella*, Armut, Kocaeli

1. GİRİŞ

Armut (*Pyrus comminus* L.) Rosales takımından, Rosaceae familyası, *Pyrus* cinsi içerisinde bulunmaktadır. Dünyada üretimi yapılan ve 24 türü bulunan *Pyrus* cinsinin içerisinde *P. communis* ekonomik açıdan üretimi yapılan en önemli türdür (Özbek, 1978; Hancock ve Lobos, 2008). Türkiye pek çok meyve türünün anavatanı veya anavatanları arasında yer almakta olup, armutun da anavatanları arasında bulunmaktadır. Ülkemizde yetiştirilen meyve türlerinin bir kısmı kendiliğinden var olmuşken, bir kısmı ise farklı ülkelerden veya bölgelerden ülkemize taşınmıştır (Özbek, 1978). Dünya'daki armut üretim miktarlarına bakıldığında 2023 yılında Çin yaklaşık 20 milyon ton ile birinci sırada yer alırken Türkiye 534.513 ton ile dördüncü sırada yer almaktadır (FAO, 2023). 2024 yılında Türkiye'de bu miktar 630.500 ton olarak gerçekleştirilmiş olup, Kocaeli ilinde ise 5.644 ton üretim yapılmıştır (TÜİK, 2024).

Meyve yetiştiriciliğinde karşılaşılan en önemli sorunların başında zararlı organizmaların etkin mücadelesi gelmektedir. Diğer meyve türlerinde olduğu gibi, armut üretiminde de çeşitli hastalık ve zararlılar önemli verim kayıplarına neden olmaktadır. Bu zararlılar arasında özellikle Elma içkurdu, *Cydia pomonella* L. (Lepidoptera: Tortricidae), ülkemiz meyveciliğinde büyük ekonomik öneme sahip zararlılardan biri olarak öne çıkmaktadır. Elma içkurdu'nun Türkiye'deki en önemli meyve zararlılarından biri olduğu ve bazı yıllarda neden olduğu zarar oranlarının %100'e kadar ulaşabildiği bildirilmiştir (Özbek ve ark. 1995; Yeşilırmak ve ark., 2025). Elma içkurdu'nun neden olduğu zararlar, doğrudan meyve üzerinde beslenen larvaların faaliyetleri sonucu ortaya çıkmaktadır. Larvalar, meyvenin içine doğru ilerleyerek beslenme esnasında galeri açmakta, bu süreçte meyve içinde pislik ve dışkı bırakmakta ve böylece meyvenin pazar değerini önemli ölçüde düşürmektedir. Dişi bireyler yumurtalarını genellikle meyve yüzeyine veya yapraklara bırakmaktadır. Yumurtadan çıkan larvalar kısa süre içerisinde uygun bir meyve bulup kabuk üzerinden giriş yaparak, meyvede derin delikler ve zarar oluşturmaktadır. Larvalar meyvenin çekirdeğine kadar ilerleyerek hem meyvenin gelişimini engellemekte hem de ürün kalitesini ciddi şekilde düşürmektedir (Beers ve ark., 1993; Pajač ve ark., 2011; Kaplan ve Bayram, 2019; Depalo ve ark., 2022).

Fitofag böceklerin popülasyon dinamiklerine ilişkin bilgiler, zararlı böceklerin etkin şekilde yönetilmesinde büyük önem taşımaktadır. Bu tür bilgiler, hedef zararlının bitkiler üzerinde ekonomik zarar oluşturduğu dönemlerin belirlenmesine ve popülasyonu düzenleyici en önemli ölüm kaynaklarının ortaya konmasına olanak tanımaktadır. Özellikle entegre zararlı yönetimi stratejilerinin etkin planlanabilmesi için zararlının biyolojisinin, popülasyon artış eğilimlerinin ve çevresel faktörlerle etkileşiminin ayrıntılı şekilde anlaşılması oldukça önemlidir (Telli ve Yiğit, 2019).

Çalışmanın amacı, Kocaeli ilinde armut bahçelerinde ekonomik kayıplara yol açan başlıca zararlılardan biri olan *C. pomonella*'nın ergin popülasyon gelişimini, ilk ergin çıkış tarihini, popülasyonun oluşturduğu tepe noktalarını, ergin bireylerin doğada aktif olduğu dönemleri ve zararlının neden olduğu zarar oranlarını belirlemektir. Bu veriler, zararlının izlenmesi ve zamanında mücadele edilmesi açısından önemli bir temel oluşturmakla birlikte bölgesel düzeyde uygulanacak entegre mücadele programlarına katkı sağlayacaktır.

2. MATERYAL VE METOT

Cydia pomonella'nın ergin popülasyonlarının takibi ve zarar oranlarının belirlenmesi amacıyla 2024 yılında yapılan çalışma, Kocaeli ilinin Gölcük ve Kartepe ilçelerine bağlı Hisareyn, İhsaniye, Balaban ve Maşukiye lokasyonlarında yer alan toplam beş adet armut bahçesinde yürütülmüştür. Çalışmaların yürütüldüğü dört bahçede kimyasal mücadele uygulanmış olup bir bahçede (Maşukiye-2) herhangi bir mücadele programı uygulanmamıştır. Çalışmaların yürütüldüğü armut bahçelerine ait bilgiler Çizelge 1'de verilmiştir. *Cydia pomonella*'ya karşı yapılan mücadele kapsamında, takip edilen bahçelere göre değişmekle birlikte Nisan ve Eylül ayları arasında üreticiler tarafından ilaçlamalar gerçekleştirilmiştir. Bu uygulamalarda, farklı etken maddelere sahip insektisitler (deltamethrin, emamectin benzoate, diflubenzuron, spinetoram, methoxyfenozide+spinetoram, cypermethrin) kullanılmıştır.

Çizelge 1. Kocaeli ilinde 2024 yılında çalışmanın yürütüldüğü bahçelere ait bilgiler

Lokasyon	Koordinatlar	Alan (da)	Bahçe Yaşı	Çeşit	Ağaç Sayısı
Hisareyn (Gölcük)	40° 41' 54.2" N 29° 50' 56.2" E 0 m	10	15	Margarita	240
İhsaniye (Gölcük)	40° 41' 21.6" N 29° 50' 28.2" E 7 m	14	20	Margarita	300

2.1 Feromon Tuzakları ile *Cydia pomonella* Erginlerinin Popülasyon Değişimlerinin Tespiti

Cydia pomonella erginlerinin popülasyon değişimlerini takip etmek amacıyla, eşeysel çekici feromon tuzaklar (1.5 mg E.E-8.10- dodecadien-1-ol, Kapar, Türkiye) kullanılmıştır. Feromon tuzaklar bahçeyi temsil edecek şekilde hâkim rüzgar yönünde ve yerden yaklaşık olarak 1.5-2.0 m yüksekliğe asılmıştır. Her bir araziye üçer adet delta tipi feromon tuzak 4 Nisan 2024 tarihinde yerleştirilmiştir (Şekil 1). Armutların hasadına kadar tuzaklar haftalık olarak kontrol

edilerek yakalanan ergin sayıları kaydedilmiştir. Çalışmada kullanılan tuzaklardaki feromon kapsülleri ayda bir kez, yapışkan tablalar ise kirlenmeleri durumunda yenisiyle değiştirilmiştir.

Şekil 1. Armut ağaçlarına asılan delta tipi feromon tuzaklar ve tuzaklarda yakalanan *Cydia pomonella* erginleri

2.2 *Cydia pomonella*'nın Meyve Esaslı Metot ile Bulaşıklık Oranlarının Belirlenmesi

Cydia pomonella'nın armut meyvelerinde meydana getirdiği zarar oranlarının belirlenmesi amacıyla ilk ergin uçuşlarının başlaması ile birlikte haftalık olarak bahçeleri temsil edecek şekilde ağacın farklı yönlerinden ağaç başı 4 meyve olmak üzere rastgele seçilen 25 ağaçtan toplam 100 meyve kontrol edilmiştir (Mamay ve Yanık, 2013). Hasat zamanına kadar haftalık olarak meyve esaslı zarar oranı verileri kaydedilmiş ve çalışmanın yürütüldüğü armut bahçelerindeki meyvelerin zarar oranı belirlenmiştir.

2.3 Tuzak Bant Yöntemi ile Ergin Çıkışlarının Belirlenmesi

Cydia pomonella'nın yaz ve sonbahar dölüne ait ilk ergin çıkışlarının belirlenmesi amacıyla, zararlının pupa olma döneminde ağaç gövdelerinde saklanma eğiliminden yararlanmak adına oluklu kartondan hazırlanan tuzak bantlar kullanılmıştır (Zeki ve Özdem, 2013). Bu kapsamda, çalışmaların yürütüldüğü armut bahçelerinde tesadüfi olarak seçilen 10 ağacın gövdesine, yerden yaklaşık 50 cm yüksekliğe 2.5–3.0 cm eninde oluklu karton şeritler haziran ayı başında sarılarak sabitlenmiştir. Karton bantlar, zararlının pupa dönemine geçmesi için uygun mikro-habitatlar oluşturmak amacıyla kullanılmıştır. Temmuz ayından itibaren haftalık olarak yapılan kontrollerde, bu kartonlar dikkatlice çıkarılmış ve *C. pomonella*'nın ikinci ve üçüncü dölüne ait bireylerinin varlığını gösteren pupa ve pupa gömlekleri incelenmiştir. Böylece, ikinci ve üçüncü

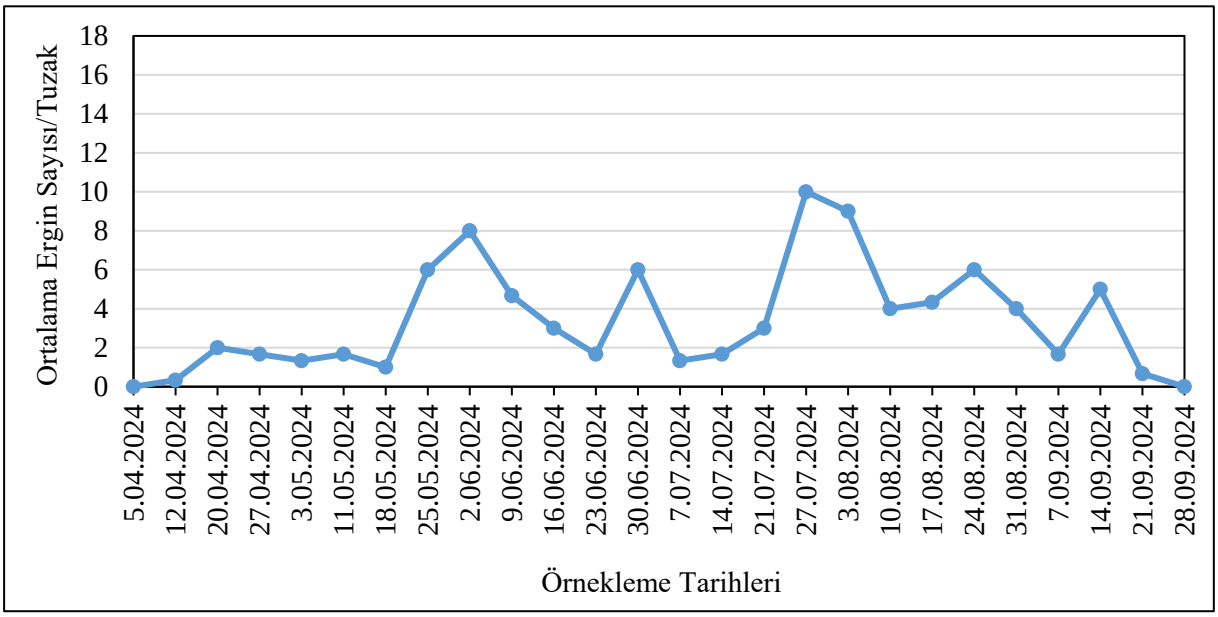
döl ergin çıkışlarının başlangıç zamanı ile popülasyonun gelişim süreci hakkında bilgi elde edilmiştir.

3. BULGULAR VE TARTIŞMA

3.1 Feromon Tuzakları ile *Cydia pomonella* Erginlerinin Popülasyon Değişimlerinin Tespiti

Kocaeli ilinin Gölcük ve Kartepe ilçelerinde 2024 yılının Nisan ve Eylül ayları arasında *C. pomonella* erginlerinin feromon tuzakları kullanılarak popülasyon takibi çalışmaları yürütülmüştür.

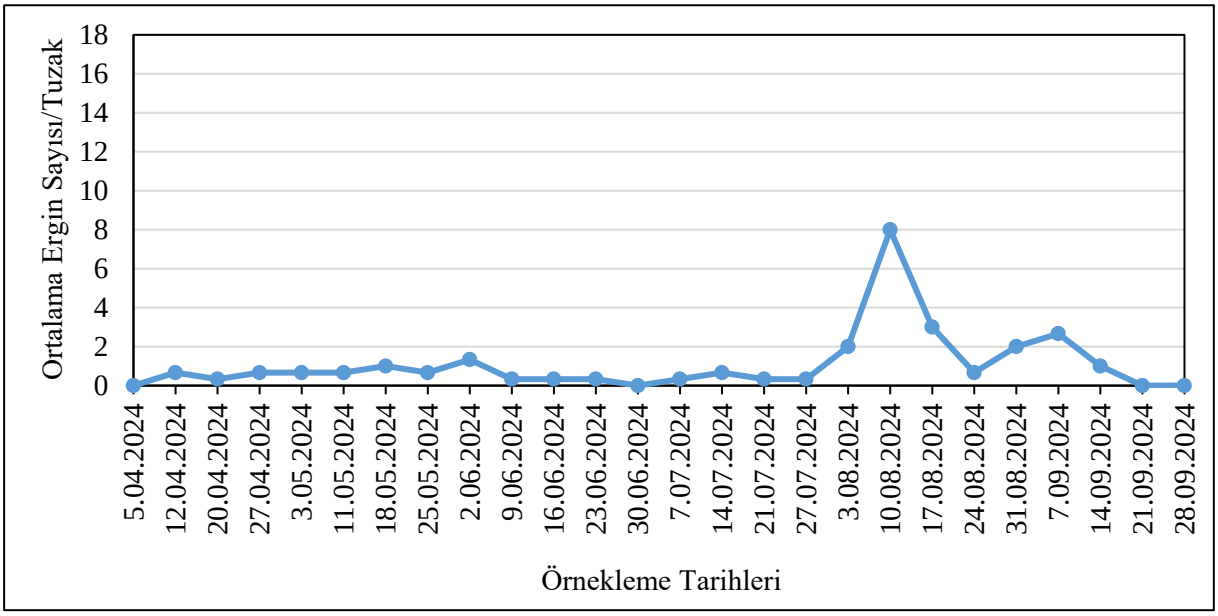
Gölcük ilçesinde yer alan Hisareyn lokasyonunda *C. pomonella*'nın 2024 yılına ait ergin popülasyon değişimi Şekil 2'de verilmiştir. Zararlının ilk ergin bireyleri 12 Nisan'da tuzaklarda tespit edilmiştir. Ergin birey sayısında mayıs ayının sonunda belirgin bir artış gözlenmiş ve ergin popülasyonları 2 Haziran'da ilk tepe noktasına tuzak başına ortalama 8 ergin ile ulaşmıştır. Zararlının erginleri 27 Temmuz tarihinde ise ikinci ve yıl içerisindeki en yüksek seviyesine ulaşmıştır. Bu dönemde ortalama ergin sayısı 10 birey ile popülasyonun tepe noktasını oluşturmuştur. Hisareyn lokasyonundaki erginlerin tuzaklarda yakalandığı son tarih ise 21 Eylül olarak kaydedilmiştir.



Şekil 2. Hisareyn (Gölcük) lokasyonunda *Cydia pomonella*'nın ergin popülasyon değişimi

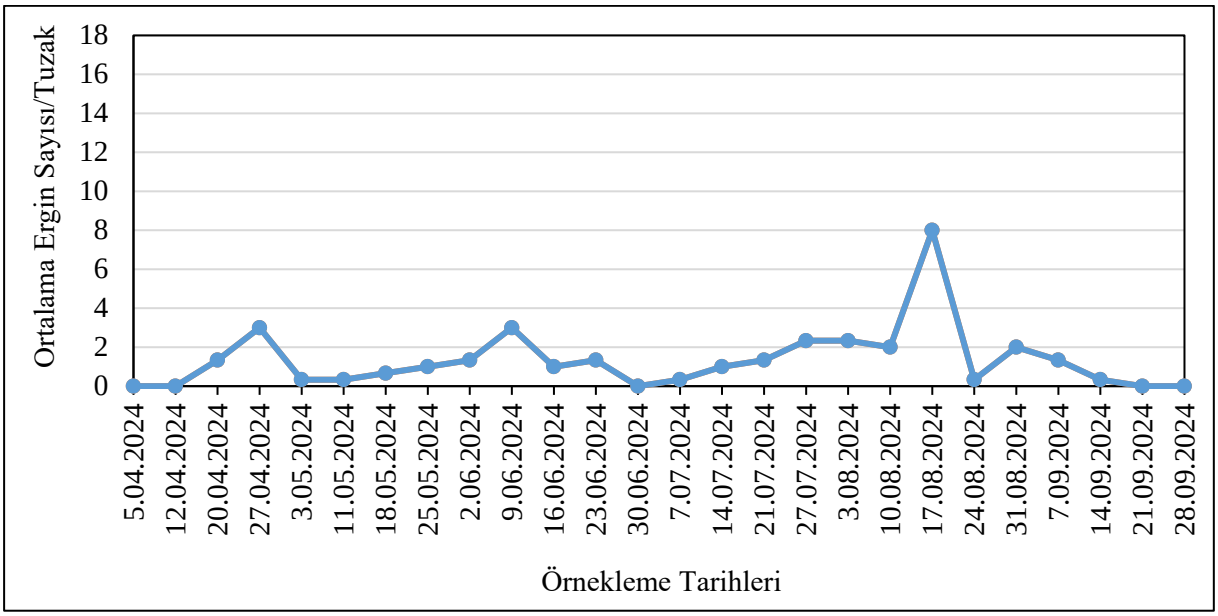
Gölcük ilçesinde yer alan bir diğer lokasyon olan İhsaniye'de ise zararlının ilk erginleri Hisareyn lokasyonu ile benzer şekilde 12 Nisan tarihinde tuzaklarda yakalanmıştır. Zararlının yıl içerisindeki genel popülasyon dinamikleri incelendiğinde Hisareyn lokasyonuna göre daha düşük seviyelerde seyir gösterdiği görülmektedir. İhsaniye lokasyonunda 10 Ağustos tarihinde

zararlının ergin popülasyonları tepe noktasına ulaşmış olup, tuzak başına ortalama 8 ergin yakalanmıştır. Erginlerin son görüldüğü tarih ise 14 Eylül olarak kaydedilmiştir (Şekil 3).



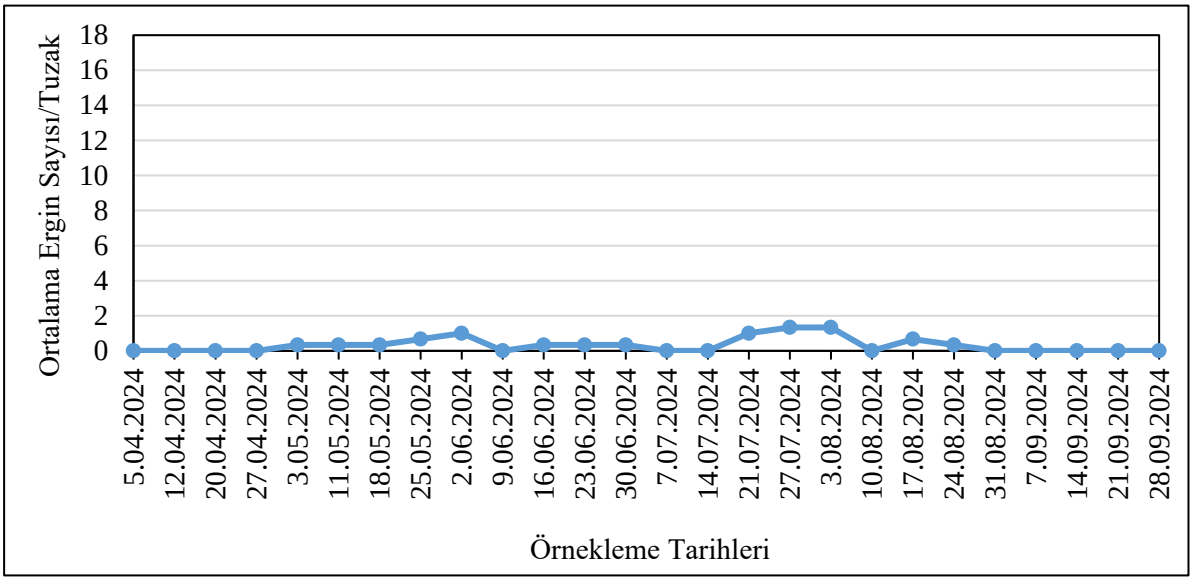
Şekil 3. İhsaniye (Gölcük) lokasyonunda *Cydia pomonella*'nın ergin popülasyon değişimi

Kartepe ilçesinde yer Balaban lokasyonunda *C. pomonella*'nın erginleri ilk olarak Gölcük ilçesindeki lokasyonlardan yaklaşık bir hafta sonra 20 Nisan'da feromon tuzaklarda tespit edilmiştir. Zararlının popülasyonları genel itibariyle düşük seyirde devam etmiş olup, yıl içerisinde yalnızca bir kez tepe noktası oluşturmuştur. Erginlerin popülasyonları tepe noktasına tuzak başına ortalama 8 ergin ile 17 Ağustos tarihinde ulaşmıştır. Erginlerin son görüldüğü tarih ise 14 Eylül olarak kaydedilmiştir (Şekil 4).



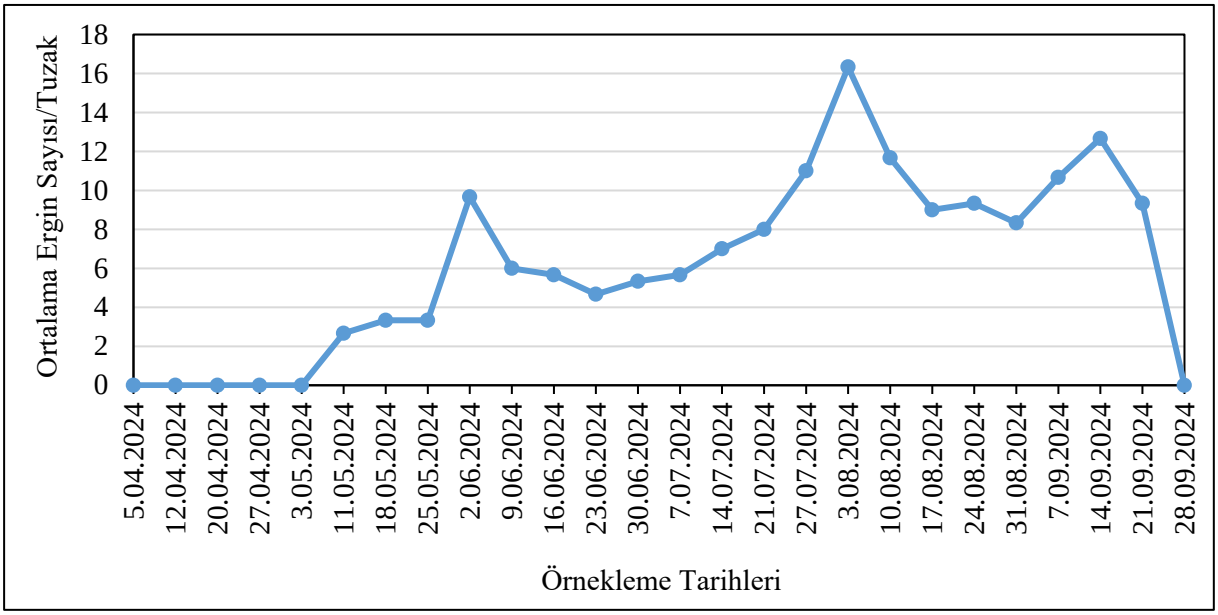
Şekil 4. Balaban (Kartepe) lokasyonunda *Cydia pomonella*'nın ergin popülasyon değişimi

Maşukiye-1 lokasyonunda ise zararlının popülasyonları diğer bahçelerle kıyaslandığında en düşük popülasyonun seyrinin görüldüğü bahçe olarak gözlemlenmiştir. Genel popülasyon düzeyi sürekli olarak düşük seviyelerde kalmış ve en fazla erginin tuzaklarda yakalandığı haftalarda tuzak başına 1.3 ergin birey tespit edilmiştir (Şekil 5). Bahçede yapılan kültürel ve kimyasal mücadelenin *C. pomonella* popülasyonlarını baskı altına aldığı anlaşılmaktadır.



Şekil 5. Maşukiye-1 (Kartepe) lokasyonunda *Cydia pomonella*'nın ergin popülasyon değişimi

Herhangi bir mücadele programının uygulanmadığı Maşukiye-2 lokasyonunda yer alan armut bahçesinde *C. pomonella*'nın ergin popülasyon dinamikleri Şekil 6'da verilmiştir. İlaçlamanın yapılmadığı söz konusu bahçede, zararlının popülasyonları diğer bahçelerdeki popülasyonlara kıyasla oldukça yüksek seviyelere ulaştığı görülmektedir. Zararlının erginleri ilk olarak 11 Mayıs tarihinde tuzaklarda tespit edilmiştir. Ergin popülasyonları yıl içerisinde üç kez tepe noktası oluşturmuştur. Zararlının popülasyonları ilk tepe noktasını tuzak başına 9.7 ergin ile 2 Haziran'da, ikinci tepe noktasını tuzak başına 16.3 ergin ile 3 Ağustos'ta ve üçüncü tepe noktasını ise tuzak başına 12.7 ergin ile 14 Eylül'de oluşturduğu tespit edilmiştir. Bahçedeki armutların hasadı ise 27 Eylül tarihinde gerçekleşmiştir.



Şekil 6. Maşukiye-2 (Kartepe) lokasyonunda *Cydia pomonella*'nın ergin popülasyon değişimi

Kocaeli ili Gölcük ve Kartepe ilçelerinde beş farklı armut bahçesinde yürütülen bu çalışmada *C. pomonella*'nın ilk erginlerinin nisan ayının ilk yarısında eşeysel çekici tuzaklarda yakalandıkları belirlenmiştir. Çanakkale ilinde gerçekleştirilen çalışmalarda, *C. pomonella*'nın ilk ergin çıkışının nisan ayında gerçekleştiği (Özpınar ve ark., 2009) ve Mayıs-Eylül ayları arasında yaklaşık beş ay boyunca aktif kaldığını ortaya koymuştur (Kuyulu ve Genç, 2018). Şanlıurfa ve Bursa illerinde yapılan araştırmalarda ise *C. pomonella*'nın ilk ergin bireylerinin nisan sonu ile mayıs ayının ilk yarısında eşeysel çekici tuzaklarda yakalandığı bildirilmiştir (Kovancı ve ark., 2000; Mamay ve Yanık, 2013). Konya ilinde elma ve ceviz bahçelerinde yürütülen çalışmalarda, *C. pomonella*'nın ilk erginlerinin mayıs ayı sonlarında yakalandığı, popülasyonların üç tepe noktası oluşturduğu bildirilmiştir. Ayrıca zararlının doğada 4-5 ay aktif olduğu ve eylül sonuna kadar popülasyon yoğunluğunu sürdürdüğü kaydedilmiştir (Çelik ve Ünlü, 2017; Aydoğan ve Ünlü, 2019; Işık, 2020). Mersin ve Aksaray illerinde yapılan çalışmalarda da *C. pomonella*'nın mayıs ayında ilk ergin çıkışını gerçekleştirdiği, Eylül sonuna

kadar popülasyonunu koruduğu tespit edilmiştir (Gilik, 2019; Aydın, 2019). Benzer şekilde, Isparta ilinde yapılan bir çalışmada da *C. pomonella* erginlerinin eşeysel çekici tuzaklarda mayıs ayının ilk haftasında ilk olarak yakalandığı bildirilmiştir (İşçi, 2008). Bingöl'de ise ilk ergin çıkışlarının haziran ayı başında başladığı, eylül ayının ilk yarısına kadar sürdüğü ve zararlının doğada yaklaşık 3.5 ay aktif kaldığı rapor edilmiştir (Kaplan ve Bayram, 2019).

3.2 *Cydia pomonella*'nın Meyve Esaslı Metot ile Bulaşıklık Oranlarının Belirlenmesi

Cydia pomonella'nın 2024 yılında Kocaeli'nin Gölcük ve Kartepe ilçelerindeki armut bahçelerinde zarar oranını belirlemek için ilk ergin uçuşlarının tespit edildiği tarihten hasata kadar olan haftalık periyotlarla meyve kontrolleri gerçekleştirilmiştir. Gölcük ilçesindeki Hisareyn lokasyonunda meyvelerdeki ilk zarar 16 Haziran'da, İhsaniye lokasyonunda ise 23 Haziran'da tespit edilmiştir. Haftalık olarak yapılan meyve kontrollerinde ortalama zarar oranı sezon sonunda sırasıyla %4.95 ve 1.78 olarak kaydedilmiştir. Kartepe ilçesinde ise meyvelerdeki ilk zararlanma Balaban lokasyonunda 16 Haziran'da, Maşukiye-1'de 14 Temmuz'da ve ilaçlama yapılmamış bahçe olan Maşukiye-2'de ise 11 Mayıs'ta tespit edilmiştir. Balaban'da yer alan armut bahçesinde ortalama zarar oranı %1.5 olarak tespit edilmiştir. Maşukiye lokasyonunda ise ilaçlama yapılan bahçedeki zarar oranı %1.2 iken, ilaçlama yapılmayan bahçedeki zarar oranı %23.95 olarak kaydedilmiştir. Üreticiler tarafından daha sık ve düzenli ilaçlama yapılan İhsaniye, Balaban ve Maşukiye-1 lokasyonlarında gözlemlenen düşük zarar oranlarının, Hisareyn ve özellikle de hiçbir mücadele programının uygulanmadığı Maşukiye-2 lokasyonuna kıyasla oldukça düşük düzeyde olduğu belirlenmiştir. Elma, Armut ve Ayva Entegre Mücadele Teknik Talimatları'nda *C. pomonella*'nın %2'ye kadar olan zararın tolere edilebileceği bildirilmektedir (Anonim, 2017). İhsaniye, Balaban ve Maşukiye-1'deki bahçelerdeki zarar oranları tolere edilebilir seviyenin üzerinde kalırken Hisareyn lokasyonunda kimyasal mücadele yapılmasına rağmen bu seviyenin üzerinde kalmıştır. Herhangi bir mücadele programının uygulanmadığı Maşukiye-2 lokasyonunda ise oldukça yüksek oranlarda zarar kaydedilmiştir.

Literatürde *C. pomonella*'nın hem ülkemizde hem de dünya genelinde elma ve armut üretiminde en önemli zararlılar arasında yer aldığı vurgulanmaktadır. Croft (1982) dünya genelinde mücadele uygulanmayan alanlarda %25'in üzerinde meyve kaybı yaşandığını ortaya koymuştur. Pedigo (1996), *C. pomonella*'nın zarar oranlarının %20 ile %95 arasında değişebileceğini rapor etmiştir. Özbek ve ark. (1995), *C. pomonella*'nın Türkiye'de elma üretiminde başlıca zararlı türlerden biri olduğunu ve bazı yıllarda zarar oranlarının %100'e kadar ulaşabildiğini bildirmişlerdir. Benzer şekilde, Elma, Armut ve Ayva Entegre Mücadele Teknik Talimatları'nda, mücadele yapılmayan bahçelerde zararın %60, hatta %100 düzeyine çıkabileceği belirtilmiştir (Anonim, 2017). Aydar ve ark. (2007), Isparta ili Eğirdir ilçesinde yaptıkları çalışmada, ilaçsız kontrol parsellerinde bulaşık oranının %74.15 olduğunu belirlemişlerdir. İşçi (2008), Isparta ilinde elma bahçelerinde erkenci çeşitlerin yalnızca *C. pomonella*'nın birinci dölünden etkilendiğini ve bu nedenle zarar oranlarının %35–50 seviyelerinde kaldığını, ancak orta ve geççi çeşitlerde hasat geciktikçe ikinci döl zararlarının artarak %80'e ulaştığını belirtmiştir. Kuyulu ve Genç (2018), Çanakkale ilinde yürüttükleri

çalışmada *C. pomonella* bulaşıklık oranlarını %5 ile %95 arasında değişen değerlerde tespit etmişlerdir. Aydoğan ve Ünlü (2019) ise Konya ilindeki elma bahçelerinde, ortalama zarar oranlarını %10.5-33.9 aralığında belirlemiştir. Farklı bölge ve illerde önceki yıllarda yapılan çalışmalarla bu çalışmadan elde edilen bulgular birlikte değerlendirildiğinde, özellikle ilaçlama yapılmayan Maşukiye-2 lokasyonunda gözlemlenen yüksek zarar oranlarının bu çalışmalarla paralellik gösterdiği anlaşılmaktadır.

Çalışmanın genel bulguları değerlendirildiğinde, *C. pomonella*'nın etkin bir şekilde mücadele edilmediği koşullarda ekonomik kayıpların oldukça ciddi boyutlara ulaşabileceği anlaşılmaktadır. Özellikle Maşukiye-2 lokasyonunda tespit edilen yüksek zarar oranı, üreticilerin doğrudan ürün kaybı yaşamasına ve dolayısıyla ekonomik olarak önemli kayıpların meydana gelmesine neden olmuştur. Bu durum, entegre zararlı yönetimi stratejilerinin, özellikle de zamanında yapılan doğru müdahalelerin, ürün kaybını minimize etmede kritik bir rol oynadığını ortaya koymaktadır.

3.3 Tuzak Bant Yöntemi ile Ergin Çıkışlarının Belirlenmesi

Kocaeli ilinde 2024 yılında yürütülen çalışmalarda, armut bahçelerinde *C. pomonella*'nın yaz ve sonbahar dölüne ait erginlerin çıkış zamanlarının belirlenmesi amacıyla armut ağaçlarının gövdelerine oluklu karton şeritler sarılmıştır. Karton şeritler, zararlının ikinci döl erginlerinin tespiti için 16 Haziran'da, üçüncü döl erginlerinin tespiti için ise 17 Ağustos'ta ağaçlara sarılmıştır. Yapılan gözlemler sonucunda, ikinci döle ait erginlerin ilk çıkışı 14 Temmuz'da, üçüncü döle ait erginlerin çıkışı ise 1 Eylül'de tespit edilmiştir. Zararlının tahmini döl sayısını ve döllere ait erginlerin ilk çıkış tarihlerini belirlemek amacıyla yapılan gözlemler sonucunda, ilk döl erginlerinin nisan ayının ilk yarısında feromon tuzaklarda yakalandığı, temmuz ayında ikinci döle ait erginlerin görüldüğü, eylül ayında ise üçüncü döle ait erginlerin çıkış yaptığı belirlenmiştir. Eylül ayının sonunda ağaçlara yerleştirilen karton şeritlerde ise zararlının larva evresine ait bireyler tespit edilmiş, ancak pupa ve pupa gömleklerine rastlanmamıştır. Eylül ayının sonunda meyve hasadının yapılması, üçüncü dölde çıkan bireylerin uygun besin kaynağı bulamadan yaşam döngüsünü tamamlamasını zorlaştırmasının yanı sıra, düşen sıcaklıklar ve kısalan gün uzunluğu gibi çevresel koşullar da göz önünde bulundurulduğunda, bu bireylerin diyapoz evresine geçerek kışlamaya hazırlandığı düşünülmektedir. Sonuç olarak, Kocaeli ilinde *C. pomonella*'nın üç döl verdiği belirlenmiştir.

Zararlının Türkiye'nin farklı bölgelerinde verdiği döl sayılarındaki farklılıkları, çevresel koşulların popülasyon dinamikleri üzerindeki etkisini açıkça ortaya koymaktadır. Antalya'nın Korkuteli ilçesinde yılda 2 döl verdiği bildirilmiştir (Çiftçi, 1995). Bursa'da 3 döl (Kovancı ve ark., 2000), Şanlıurfa'da ise 3 döl verebildiği bildirilmiştir (Mamay ve Yanık, 2013). Mersin, Konya ve Aksaray illerinde zararlının iklim koşullarına bağlı olarak yılda 2-3 döl verdiği tespit edilmiştir (Çelik ve Ünlü, 2017; Aydın, 2019; Gilik, 2019; Aydoğan ve Ünlü, 2019; Önemli, 2024). Ilgaz (2024), Niğde'de yaptığı çalışmada, yüksek rakım ve düşük sıcaklık nedeniyle Çamardı ve Ulukışla'da zararlının yılda 2 döl, sıcaklığın daha yüksek olduğu Merkez ve Bor'da ise 3 döl verdiğini bildirmiştir. Bu çalışmalar birlikte değerlendirildiğinde, *C. pomonella*'nın döl sayısının iklim koşulları, rakım, sıcaklık, gün uzunluğu ve besin kaynağının mevcudiyeti gibi çevresel faktörlerle doğrudan ilişkili olduğu görülmektedir. Kocaeli ilinde yapılan bu

çalışma, zararlının uygun iklim koşullarında üç döl verebildiğini ortaya koyarak literatürdeki bulguları desteklemekte ve *C. pomonella*'nın bölgesel biyolojisi hakkında önemli katkılar sunmaktadır.

Çalışmadan elde edilen sonuçlar, özellikle entegre zararlı yönetimi uygulamaları açısından büyük önem taşımaktadır. İkinci ve üçüncü döllere ait ergin çıkışlarının izlenmesi, kimyasal ve biyoteknik mücadele zamanlarının doğru belirlenmesine ve gereksiz uygulamaların önlenmesine katkı sağlayabilmektedir. Bu kapsamda, tuzak bant yöntemi gibi basit, maliyeti düşük ve etkili izleme yöntemlerinin yaygınlaştırılması, üreticilerin zararlı popülasyonlarını daha etkin kontrol etmelerine yardımcı olacaktır. Ayrıca, hasat sonrası dönemde ağaçlardan dökülen meyvelerin toplanması ve yok edilmesi gibi kültürel önlemlerle, kışlama potansiyeline sahip larva popülasyonunun azaltılması mümkün olabilecektir.

Şekil 7. Karton tuzak bantlarda tespit edilen *Cydia pomonella*'nın larva (a), pupa (b) ve pupa gömlekleri (c)

4. SONUÇLAR

Cydia pomonella'nın Kocaeli ili armut bahçelerinde ilk ergin uçuşunun nisan ayının ilk yarısında başladığı ve uçuşların eylül sonuna kadar yaklaşık altı ay aktif olarak sürdüğü belirlenmiştir. Zararlının ergin popülasyonlarının oluşturduğu tepe noktaları ve tuzak bant

yönteminden elde edilen sonuçlar dikkate alındığında zararlının üç döl verdiği tespit edilmiştir. Ayrıca, Kocaeli ili armut bahçelerinde *C. pomonella*'nın oluşturduğu zarar seviyelerinin, özellikle mücadele uygulanmayan alanlarda ekonomik zarar eşiğinin üzerinde gerçekleştiği ve zarar oranlarının %25 seviyelerine kadar ulaşabildiği tespit edilmiştir. Bu durum, bölgedeki *C. pomonella* popülasyonunun etkin bir şekilde izlenmesi ve zamanında mücadele programlarının uygulanmasının gerekliliğini ortaya koymaktadır.

ABSTRACT

Over the years, several researchers have worked to model lifetime data in which the distribution of data is skewed to the left. With this aim, several generalizations or extensions of the Bur Type-X distribution have been proposed. In this paper, an attempt is made to develop a hybrid distribution by compounding the Nadarajah–Haghighi and Bur Type-X distributions, namely the Nadarajah–Haghighi Bur Type-X (NHBTx) distribution. It can also be thought of as an extension of the Bur Type-X distribution. The NHBTx distribution has the features of having four parameters exhibiting flexible distributional functions, including a decreasing or unimodal probability density function and an increasing, decreasing, or upside-down bathtub hazard rate function. The statistical applicability of the NHBTx model is demonstrated by using milk production data. In particular, results are compared with Bur Type-X models of importance, such as the Generalized Rayleigh, and Rayleigh models, and it is observed that the NHBTx model fits better.

Keywords: Nadarajah–Haghighi distribution; moments; Bur Type-X distribution; hazard rate function.

1.0 Introduction

several generalizations of the standard probability distributions have been developed and studied in the past decades, and are used as lifetime models in applied sciences. The most popular among the life-time model is the so-called generalized beta-g family of distributions developed and studied by Eugene (2002), the others includes: Kumaraswamy generalized family was developed by Cordeiro and Castro (2011), exponentiated generalized family studied by Cordeiro et al. (2013) Transformed-Transformer (T-X) developed and studied Alzaatreh et al. (2013), Weibull-G family developed by Bourguignon et al. (2014), Exponentiated half-logistic family by Cordeiro et al. (2014), Mead et al. (2020) proposed and studied the Kumaraswamy alpha power-G, modified Kies-G family by Al-Babtain et al. (2020), and generalized linear failure rate-G family was developed by Afify et al. (2022). The characteristics of the generalized family of distributions is to introduce flexibility into the standard probability distribution by controlling its tail weights.

Motivation of the Study

The main motivation of this study is to extend the two-parameter Bur Type-X distribution to a more flexible distribution called Nadarajah- Haghighi Bur Type-X model which is capable of modeling lifetime data of different failure pattern. The new developed model can be applied in agriculture, medicine, reliability study, seismography, insurance, etc.

Burr (1942) introduced twelve different forms of cumulative distribution functions for modeling lifetime data, where among them is the Burr Type X distribution (BX). Several authors considered different aspects of the Burr Type X, for example Ahmad (1997), Raqab (2005), among others. Surles (2005) introduced two-parameter Burr Type X distribution known as the generalized Rayleigh (GR) distribution. The two-parameter generalized Rayleigh distribution is a particular member of the generalized Weibull distribution. Surles (2001) showed that the two-parameter Burr Type-X distribution can be effectively used in modeling strength data. The cumulative distribution function (cdf) of Burr Type-X distribution is given by

$$G(x) = \left(1 - e^{-(\alpha x)^2}\right)^{\theta}, \qquad x > 0 \tag{1}$$

where $\alpha > 0$ is the scale parameter $\theta > 0$ is the shape parameters.

And the associated pdf is given by

$$G(x) = 2\alpha^2\theta x e^{-(\alpha x)^2}\left(1 - e^{-(\alpha x)^2}\right)^{\theta-1} \tag{2}$$

Several generalizations of the Bur Type-X distribution have been developed, for example Half logistic generalized Rayleigh distribution was studied by Ogunde et al. (2023), beta generalized Rayleigh (BGR) by Cordeiro et al. (2013), the exponentiated generalized Burr type X (EGBX)

by Khaleel et al. (2017), beta Burr X by Merovci et al. (2016), and beta compound Rayleigh by Reyad and Othman (2017), among others.

2.0 Nadarajah Haghighi Bur X distribution

A random variable X follows a Nadarajah and Haghighi Bur Type-X ($NHBT-X$) distribution if is cdf is given by

$$F(x) = 1 - e^{1-\left\{1+\beta\left(1-e^{-(\alpha x)^2}\right)^{\theta}\right\}^{v}}, x > 0 \quad (3)$$

The corresponding probability

$$f(x) = 2\alpha^2\beta\theta v e^{-(\alpha x)^2} x\left(1-e^{-(\alpha x)^2}\right)^{\theta-1}\left\{1 + \beta\left(1-e^{-(\alpha x)^2}\right)^{\theta}\right\}^{v-1} e^{1-\left\{1+\beta\left(1-e^{-(\alpha x)^2}\right)^{\theta}\right\}^{v}} \quad (4)$$

where $\alpha > 0$ is the scale parameter β, θ, and $v > 0$ is the shape parameters. The graphs of the distribution and the density function is given in Figure 1.0 for arbitrary values of the parameters of the $NHBT-X$ distribution.

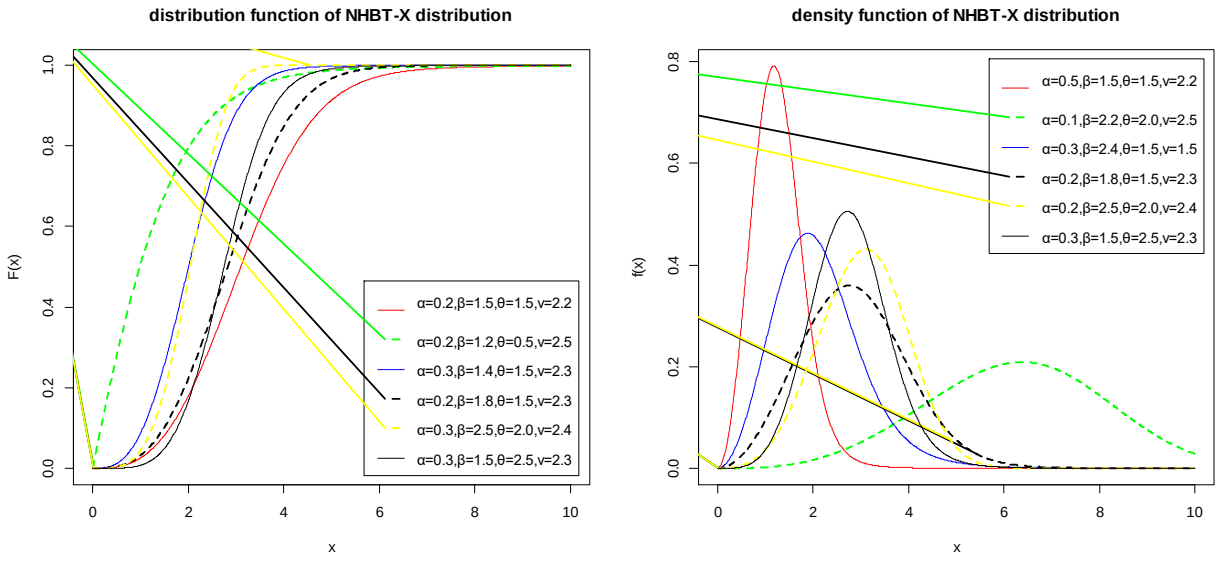

Figure 1.0 Graph of the distribution and the density functions of the NHBT-X model

an expression for the Reliability and the hazard functions is given by

$$R(x) = 1 - F(x) = e^{1-\left\{1+\beta\left(1-e^{-(\alpha x)^2}\right)^{\theta}\right\}^{v}} \quad (5)$$

And

$$h(x) = \frac{f(x)}{R(x)} = 2\alpha^2\beta\theta v e^{-(\alpha x)^2} x\left(1-e^{-(\alpha x)^2}\right)^{\theta-1}\left\{1+\beta\left(1-e^{-(\alpha x)^2}\right)^{\theta}\right\}^{v-1} \quad (6)$$

The graph of the reliability and the survival function is given in Figure 2 for various values of the parameters of the $NHBT-X$ distribution.

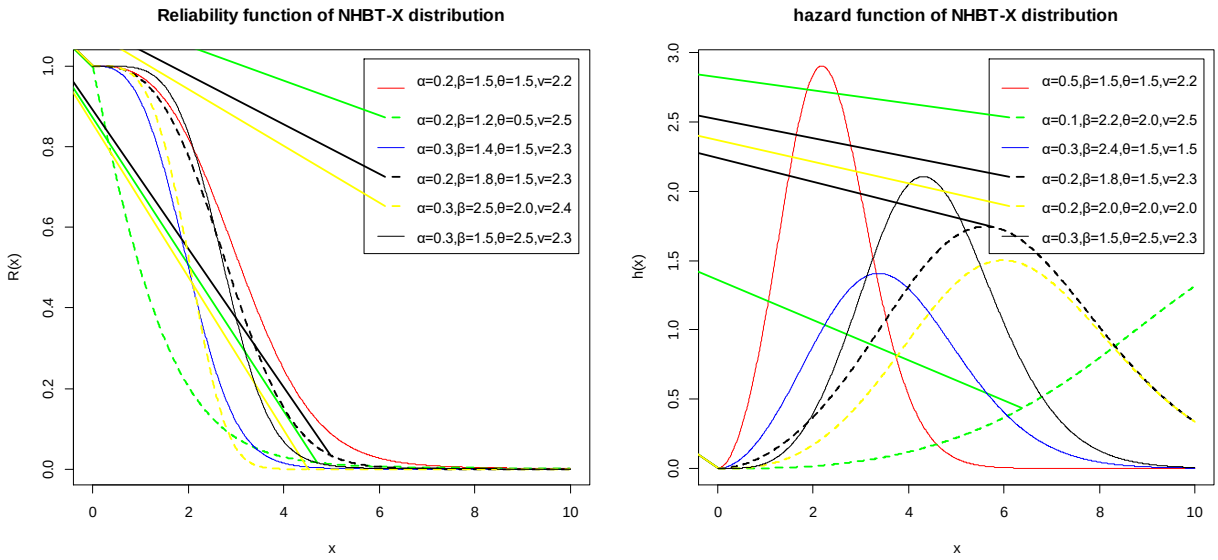

Figure 2.0 Graph of the reliability and the hazard function of the $NHBT-X$ model

3.1 Important representation

In this subsection, an important tool for the expansion of the PDF for $NHBT-X$ is provided. From the generalized binomial series given by

$$(1+m)^{-y} = \sum_{i=0}^{\infty}(-1)^i\binom{y+i-1}{i}m^i \quad (7)$$

For $|m|<1$ and y is a positive real non-integer. Then, by applying the binomial theorem (7) in (4), the density function of $NHBT-X$ distribution becomes

$$f(x) = 2\alpha^2\beta\theta v\sum_{i=j=k=l}^{\infty}(-1)^{j+k+l}\binom{v(j+1)-1}{k}\binom{\theta(k+1)-1}{l}xe^{-(l+1)(\alpha x)^2}. \quad (8)$$

3.2 Moments of $NHBT-X$ distribution

Thus, the r^{th} ordinary moment of a distribution is given by

$$\mu_r' = E(x)^r$$

Thus the r^{th} moment of $NHBT-X$ distribution is given by

$$\mu_r' = \int_{-\infty}^{\infty} x^r f(x;\alpha,\beta,\theta,v)dx \quad (9)$$

Putting equation (8) in (9), we have

$$\mu_r' = 2\alpha^2\beta\theta v \sum_{i=j=k=l}^{\infty} (-1)^{j+k+l} \binom{v(j+1)-1}{k} \binom{\theta(k+1)-1}{l} \int_{-\infty}^{\infty} x^r e^{-(l+1)(\alpha x)^2} dx \quad (10)$$

By letting $m = (l+1)(\alpha x)^2, x = \frac{m^{1/2}}{\alpha^2(l+1)^{1/2}}, dx = \frac{m^{-1/2}}{2\alpha^2(l+1)^{1/2}}$, then we have

$$\mu_r' = \beta\theta v \sum_{i=j=k=l}^{\infty} (-1)^{j+k+l} \binom{v(j+1)-1}{k} \binom{\theta(k+1)-1}{l} \frac{\alpha^{2-r}}{(l+1)^{r+1/2}} \int_{-\infty}^{\infty} m^{r-1/2} e^{-m} dx \quad (11)$$

Finally, we have

$$\mu_r' = \beta\theta v \sum_{i=j=k=l}^{\infty} (-1)^{j+k+l} \binom{v(j+1)-1}{k} \binom{\theta(k+1)-1}{l} \frac{\alpha^{2-r}}{(l+1)^{r+1/2}} \Gamma\left(\frac{r+1}{2}\right) \quad (12)$$

By substituting $r = 1$ in (12), we obtain the first moment which is equivalent to the mean of $NHBT-X$ distribution. Higher moments can be obtained by taking $r = 2,3,4,\ldots$.

4.0. Applications

In this section, we illustrate the performance of the NHBT-X distribution as compared to some alternative distributions using a real data application. For the data set, the estimates of the model parameters by maximum likelihood estimation, Akaike Information Criterion (AIC), Bayesian Information Criterion (BIC), Hanna Quinn Information Criterion (HQIC), and Consistent Akaike Information Criterion (CAIC) are calculated to compare the fitted models. The data is about the total milk production in the first birth of 107 cows from SINDI race. The data is as follows: 0.5140, 0.6907, 0.7471, 0.2605, 0.6196, 0.8781, 0.4990, 0.6058, 0.6891, 0.5770, 0.5394, 0.1479, 0.2356, 0.6012, 0.1525, 0.5483, 0.6927, 0.7261, 0.3323, 0.0671, 0.2361, 0.4800, 0.5707, 0.7131, 0.5853, 0.6768, 0.5350, 0.4151, 0.6789, 0.4576, 0.3259, 0.2303, 0.7687, 0.4371, 0.3383, 0.6114, 0.3480, 0.4564, 0.7804, 0.3406, 0.4823, 0.5912, 0.5744, 0.5481, 0.1131, 0.7290, 0.0168, 0.5529, 0.4530, 0.3891, 0.4752, 0.3134, 0.3175, 0.1167, 0.6750, 0.5113, 0.5447, 0.4143, 0.5627, 0.5150, 0.0776, 0.3945, 0.4553, 0.4470, 0.5285,

0.5232, 0.6465, 0.0650, 0.8492, 0.8147, 0.3627, 0.3906, 0.4438, 0.4612, 0.3188, 0.2160, 0.6707, 0.6220, 0.5629, 0.4675, 0.6844, 0.3413, 0.4332, 0.0854, 0.3821, 0.4694, 0.3635, 0.4111, 0.5349, 0.3751, 0.1546, 0.4517, 0.2681, 0.4049, 0.5553, 0.5878, 0.4741, 0.3598, 0.7629, 0.5941, 0.6174, 0.6860, 0.0609, 0.6488, 0.2747, 0.4365, 0.4260. Table 1 gives the Summary statistics of the Milk data which indicates that the milk data is negatively skewed, under-dispersed and mesokurtic and Table 2 present the measures of the goodness of fit for the data. Figure 3.0 is the plot of the Total Time on Test (TTT) plot which shows that the data exhibits an increasing failure rate and the violin plots.

Table 1 Exploratory data analysis of Milk data

Min.	q_1	*median*	*mean*	q_3	*max*	*Range*	*Skewness*	*Kurtosis*	*variance*
0.02	0.35	0.47	0.47	0.60	0.88	0.86	−0.33	2.68	0.04

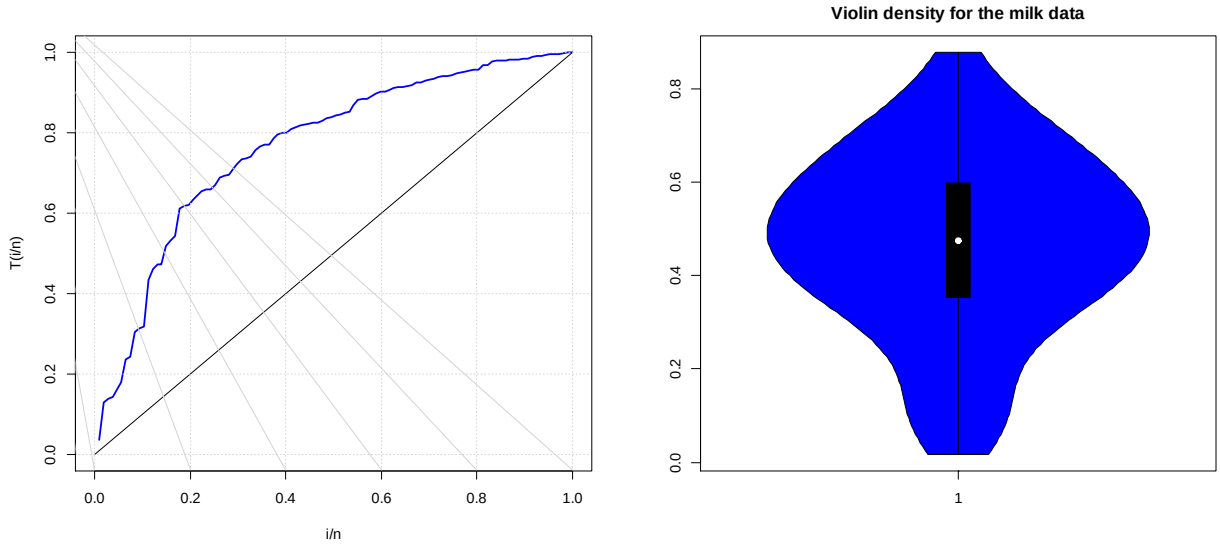

Figure 3.0. TTT and the Violin plot for the milk data.

The model with the smallest values of these measures represents the data better than the others. The numerical values of these measures for the NHBT-X and the other competing distributions of the milk data is provided in Table 2.

Table 2. Measures of goodness of fit of Milk data

	Parameter estimate				*Measures of goodness of fit*				
Model	α	β	θ	v	$-l$	*AIC*	*CAIC*	*HQIC*	*BIC*
$NHBT-X$	0.14 (0.40)	6.748 (3.254)	1.01 (0.09)	19.17 (28.56)	-26.89	-45.80	-45.41	−41.47	-35.11
NHR	0.40 (0.21)	−2.47 (1.96)	– (−)	−5.62 (4.39)	−27.25	−48.49	-48.26	−45.24	-40.47
$BT-X$	2.64 (0.09)	– (−)	1.74 (0.20)	– (−)	52.43	108.87	108.98	111.03	114.21
R	2.42 (0.09)	– (−)	– (−)	– (−)	63.30	128.61	128.64	129.69	131.28

5. Conclusion

In this paper, we have derived and studied the properties and application of the Nadarajah Haghighi Bur Type X distribution also called the generalized Nadarajah Haghighi generalized Rayleigh distribution. The model extends the Burr Type-X ($BT-X$) (or generalized Rayleigh (GR)) distribution. We provide an explicit mathematical expression for some of its statistical properties. We estimated the model parameters by the method of maximum likelihood. Finally, we fit the model to a milk data set to demonstrate its usefulness and flexibility; the results show that the Nadarajah Haghighi Bur Type X distribution provides a better fit than some other competing distributions as measured regarding the AIC, BIC, HQIC, and CAIC. We hope that this distribution will attract wider applications in the areas of sciences and applied sciences.

ABSTRACT

This study evaluates the adsorption performance of activated carbons derived from coconut shell (CS) and orange peel (OP), both individually and in composite formulations, for the removal of chromium (Cr) and lead (Pb) from aqueous solutions under neutral pH (7.0), 25 °C, and a 60 min contact time. Pure CS exhibited the highest efficiencies, achieving 81.5% Cr and 86.5% Pb removal, attributed to its high surface area (>800 m^2/g) and microporous structure. OP alone yielded 77.5% Cr and 82.4% Pb removal, driven by abundant surface functional groups. Composite adsorbents demonstrated ratio-dependent behaviors: CS-rich blends favored

Cr uptake (up to 79.8%), while OP-rich blends enhanced Pb selectivity (up to 84.1%). Physicochemical characterization supported these findings, highlighting the role of porosity, functional groups, and ash content in binding performance. The results underscore the versatility of biomass-derived carbons: CS for broad-spectrum heavy-metal removal, OP for targeted Pb remediation, and tailored mixtures for specific contaminant profiles. Future work should explore adsorbent regeneration, cost benefit analyses, and pilot-scale trials to facilitate practical wastewater treatment applications.

Keywords: Chromium, lead, adsorbents, textile effluent, pollution, environment

1.0 INTRODUCTION

Textile industry plays a crucial role in our lives, providing an employment opportunity that requires minimal skills. This contributes a vital part in the world economy. Textile have a wide range of application, such as clothing and apparel, home furnishing and decor, medical textiles (e.g., wound dressings and medical clothing), technical textiles (e.g. automotive, aerospace and construction materials) etc. Textile industry contributes significantly to the pollution of the environment, with wastewater generated from various stages of production, including dyeing, printing, finishing and washing. This wastewater contains mixtures of pollutants, including heavy metals, dyes, pigment, and other chemicals (Kumar et al, 2020). Textile waste water can cause different health hazards for human being like hemorrhage, ulcers, skin irritation and dermatitis. The increased pollution of the aquatic environment by heavy metals and artificial coloring compounds has negatively impacted many aspects, especially in health terms. Previous studies have reported that effluent from several industries contains heavy metals (Cu, Cr, Pb, Fe, and Zn) with concentrations far above the standards set by WHO (Lewoyehu, 2021).

Heavy metals are naturally occurring metals in the earth's crust and they can be present in small amounts in groundwater due to leaching from the soil and rock formation. Human activities such as industrials processes, mining and agricultural runoff can increase the heavy metals deposition in the water bodies, posing risks to human health and environment. Textile industry significantly contributes to heavy metal pollution in soil and water due to the release of untreated effluent. This effluent contains plenty of heavy metals including chromium, copper, zinc, and nickel which can have devastating effects on the ecosystem. Various pollutants handling technique includes ion exchange, solvent extraction, thermal treatment, microbial reduction and electro dialysis, ultrafiltration chemical precipitation, Nano filtration and coagulation (lewoyehu, 2021) . Although, the methods above have disadvantages such as high operational cost, significant maintenance cost and substantial energy requirement.

Therefore, the efficient and cost effectiveness for handling pollutant in aquatic environment is still an aspect of research, attracting widespread interest and attention. There is need for sustainable solutions that can address these environmental challenges without economic viability. The adsorption method has been utilized as a treatment method for removing pollutants, including heavy metals and dyes; adsorption method has a simple design, easy operation and high adsorption efficiency (Zhang et al., 2012). An effective adsorption process requires adsorbent material with good performance and with high affinity for pollutant analystes. Many organic, inorganic, or a combination of both materials have been developed to produce high-energy adsorption processes. The abundance, renewability and cost effectiveness of carbon precursor materials have made them an attractive focus for researchers exploring carbon-based adsorbents. (Liu et al., 2020)

3 Materials and methodology

3.1 Sample Collection

Textile effluent sample was obtained from Kano state. The sample was collected from the effluent discharge drain originated from the textile waste water treatment plan of the factory. The sample was collected using a 5litres (HDPE) bottle, which was washed with clean water

and rinsed with effluent to be sampled. Orange peels and coconut shells were gotten from samaru market, Zaria.

3.2 Sample Analysis

The collected sample was analyzed for some major parameters of the textile effluent including the pH, and heavy metal. The heavy metals were analyzed using Atomic Absorption Spectroscopy (AAS)

3.3 Preparation of Activated Carbon of Coconut Shell and Orange Peel

Orange peel was washed several times with water to remove dirt and other impurities. Coconut shell was washed to remove impurities such as coconut fiber and sand. The materials were sundried and then dried in an oven at 100 ^{0}C for 24 hours to reduce moisture content. The dried sample was carbonized in a furnace at a temperature of 500^{0}C for 2hrs (absence of oxygen to produce a carbon-rich material). Activation of the carbonized material was done using an activating agent phosphoric acid (H3PO4). Heating the activated material at 450^{0}C for 1-2hours, then wash the activated carbon to remove impurities. Filter and rinse the material to remove any impurities. The activated carbon was then dried at 100^{0}C-150^{0}C for 2hrs. then grind into fine powder.

3.4 Proximate analysis:

Proximate analysis, as defined by ASTM D 121, is the process of determining moisture, ash content, pH, and bulk density using specified techniques. The following process was used to perform the proximate analysis of the various types of activated carbon.

3.4.1 Moisture content:

After measuring the weight of a small sample of activated carbon (soy shell), it was placed in a petri dish. It was evenly distributed across the plate. After that, it was baked for 1.5 hours at a temperature between 105 and 110 degrees Celsius. During the heating process, the petri dish was either left open or uncovered. Following heating, the petri dish was taken out and allowed to cool in a desiccator. The dried sample's weight was determined once it had cooled.

Moisture content M=100(B-F)/(B-G)

B=weight of petri dish +original sample

F=weight of petri dish+ dried sample

G= weight of petri dish

3.4.2 Ash content:

A silica crucible was filled with one gram of the sample. It was heated for one and a half hours to 750˚c in a muffle furnace. The crucible was left open throughout this heating process. The crucible was cooled in a desiccator following the necessary heating, and the weight of the ash was then determined.

Ash content A=100(F-G)/(B-G)

G=Mass of empty crucible

B=Mass of crucible + sample

F=Mass of crucible+ ash sample

3.4.3 Bulk Density:

The weight of a material per unit volume is known as its bulk density. Basically, it is applied to powdered materials. The bulk density test indicates the solid sample's packaging quantity and flow consistency. The unit of measurement is kilograms per cubic meter (kg/m³). The mass of the measuring cylinder used in this experiment should be determined first. After that, the provided activated carbon sample was put inside the cylinder and weighed again. After that, it was placed on the aluminum plate and oven-dried for 60 minutes at 105˚C. The dry sample's weight was determined after it had dried.

DB= (m2- m1)/v

M1= mass of measuring cylinder in grams

M2= mass of measuring cylinder + its contents

V= volume of the measuring cylinder in litre

3.4.4 pH

pH was determined using the standard method ASTMD 3838-80. 1g activated carbon of

soya shell sample was put in a conical flask and 100ml distilled water was added to it.

The mixture was stirred for 1hour. pH readings were taken using pH meter. Repeat the

Procedure for the other two type of activated carbon.

3.5 Textile effluent treatment using the composite (Coconut shell and Orange peel)

The activated carbon composite, prepared from coconut shell and orange peel was used in various ratios to assess its adsorption capacity for heavy metals (Cr, Pb) in 50ml effluent samples. The ratios used were 2g,0.8 -1.2g,1.6-0.4g, 2g,0.8-1.2g and 0.4-1.6g. The pH (7), dosage time and contact time were kept constant. After a contact 30minutes, the mixture was filtered and characterization was done.

4 RESULTS AND DISCUSSION

4.1 Chromium and Lead after Adsorption

Table 1 present the adsorption performance of coconut shell (CS) and orange peel (OP) based activated carbons demonstrated distinct affinities for chromium (Cr) and lead (Pb) ions under identical experimental conditions (pH = 7, contact time = 60 min, temperature = 25°C). Sample A (2.0 g CS) achieved the highest removal efficiencies of 81.5% for Cr and 86.5% for Pb, which

compares favorably with values reported by Rajkumar et al. (2018), who observed 78.2% Cr and 83.4% Pb removal using coconut shell-derived carbon at similar dosages (Rajkumar and Subramanian, 2018). The superior performance of CS can be attributed to its high surface area and abundant microporous structure, facilitating mass transfer and chemisorption of metal ions (Foo and Hameed, 2010).

By contrast, sample D (2.0 g OP) yielded 77.5% Cr and 82.4% Pb removal. These results are consistent with studies by Wang and Wang (2016), who reported 75.0% Cr and 80.0% Pb removal with orange peel biochar at 2 g/L dosage under neutral pH,

Table 1: Percentage removal of chromium and lead after adsorption

S/N	SAMPLE ID	% REMOVAL OF CHROMIUM	% REMOVAL OF LEAD
1	A	81.5	86.5
2	B	79.8	54.8
3	C	78.3	65.3
4	D	77.5	82.4
5	E	72.8	68.0
6	F	75.6	84.1

The composite adsorbents (samples B, C, E, F) exhibited synergistic behaviors. Sample B (0.8 g CS + 1.2 g OP) and C (1.6 g CS + 0.4 g OP) achieved moderate Cr removals (79.8% and 78.3%, respectively) but lower Pb removal (54.8% and 65.3%). This observation aligns with the competitive adsorption reported by Li et al. (2019), who noted that mixed-biomass carbons can experience metal ion competition at active sites, reducing selectivity toward Pb at certain ratios (Li et al., 2019). Sample F (1.6 g OP + 0.4 g CS) yielded 84.1% Pb removal, surpassing both individual adsorbents.

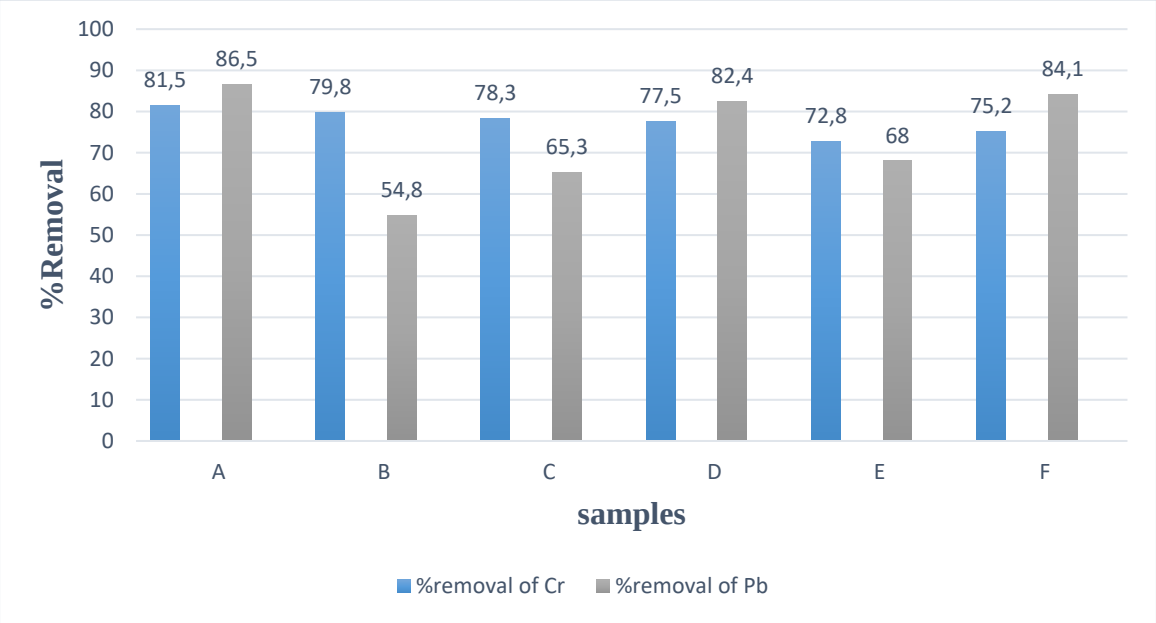

Figure 1: Effect of Activated Carbon on Removal of Heavy Metals (chromium and lead)

4.2 Physical Analysis

Physicochemical characterization (Table 2) showed that CS carbon has slightly higher ash content (9.82%) than OP (8.8%), which can influence pore blockage but also provide additional mineral oxides that act as binding sites (Ahmad and Hameed, 2010). The bulk densities (0.569 vs. 0.553 g/mL) and moisture contents (8.7% vs. 6.2%) are within expected ranges for biomass-derived carbons, ensuring adequate handling and suspension in aqueous media (Downie et al., 2009).

Table 2: Physical analysis of orange peel and coconut shell activated carbon

S/N	characteristics	Coconut shell	Orange peel
1	Moisture content (%)	8.7	6.2
2	Bulk density (g/ml)	0.569	0.553
3	Ash content (%)	9.82	8.8
4	Ph	7	7.5

Overall, the study confirms that coconut shell-derived activated carbon exhibits strong dual-metal removal performance, while orange peel carbon enhances Pb selectivity. Composite formulations can be tailored to target specific contaminants, offering a cost-effective and sustainable approach to wastewater treatment. Future work should include regeneration and reuse cycles, cost–benefit analyses, and pilot-scale trials to validate field applicability.

5 Conclusion

The comparative adsorption study demonstrates that coconut shell-derived activated carbon (CS) offers robust dual-metal removal capabilities, achieving removal efficiencies up to 81.5% for Cr and 86.5% for Pb under neutral conditions. Orange peel-based carbon (OP), while slightly less effective for Cr, shows enhanced Pb selectivity (up to 86.5% in composite adsorbents), composite formulations reveal synergistic and competitive interactions, mixtures rich in CS excel in Cr uptake, whereas OP-rich blends favor Pb adsorption. These findings underline the versatility of biomass-derived CS is optimal for broad-spectrum heavy-metal removal, OP targeted Pb remediation respectively. Future work should prioritize regeneration cycles, economic assessments, and pilot-scale validations to translate laboratory efficacy into field-applicable wastewater treatment solutions.

ABSTRACT

Urban agriculture is gaining momentum as a sustainable solution to food security, environmental conservation, and resource efficiency in urban stings. Rice husk, an abundant agricultural byproduct, has emerged as a promising substrate for urban farming due to its lightweight nature, high porosity, and cost effectiveness. This study explores the potential of rice husk as a growing medium, highlighting its advantages, challenges, and practical applications in urban agriculture systems such as hydroponics, vertical farming, and rooftop gardens. Rice husk was used as substrate in a hydroponic structure for tomato farming in Agricultural & Bioenvironmental Engineering Department, FPI, Ilaro, Ogun State. The study revealed that rice husk provided better aeration and drainage, reducing root diseases and promoting faster plant growth. Germination rates were higher in rice husk (85%) compared to soil (75%). The average plant height and biomass yield were significantly higher in rice husk, with lettuce showing a 20% increase in yield. Water consumption was lower in rice husk-based systems due to its moisture-retentive properties, leading to a 30% reduction in water usage. By repurposing rice husk in urban agriculture, cities can reduce agricultural waste, promote circular economy and enhance food production in limited space.

Keywords: Rice husk, urban agriculture, Substrate, Sustainable farming, Comparative advantage.

Introduction

Urban agriculture faces challenges such as limited arable land, soil degradation, and high input costs. Alternative growing media, such as rice husk, present a sustainable solution for soilless farming. Rice husk, an agricultural byproduct, is lightweight, abundant, and rich in silica, which improves plant growth. This study evaluates the comparative advantage of rice husk as a substrate in urban agriculture compared to conventional soil-based farming, focusing on crop growth, resource efficiency, and sustainability.

Materials and Methodology

A controlled experiment was conducted using rice husk as a substrate and conventional soil as a control. Selected leafy vegetables (lettuce and spinach) were grown in containers under identical conditions. Growth parameters such as germination rate, plant height, leaf count, and biomass yield were measured over six weeks. Water and nutrient consumption were recorded to assess resource efficiency. Soil and rice husk samples were analyzed for their physical and chemical properties, including aeration, moisture retention, and nutrient availability. Statistical analysis was performed to compare the performance of plants grown in rice husk versus conventional soil.

Results and Discussion

The study revealed that rice husk provided better aeration and drainage, reducing root diseases and promoting faster plant growth. Germination rates were higher in rice husk (85%) compared to soil (75%). The average plant height and biomass yield were significantly higher in rice husk, with lettuce showing a 20% increase in yield. Water consumption was lower in rice husk-based systems due to its moisture-retentive properties, leading to a 30% reduction in water usage. However, rice husk required nutrient supplementation due to its low inherent fertility. Despite this, its lightweight nature and recyclability made it a cost-effective and eco-friendly alternative for urban farming.

Conclusion

Rice husk demonstrates significant advantages over conventional soil in urban agriculture by enhancing plant growth, reducing water usage, and promoting sustainability. Its availability as an agricultural byproduct makes it a viable and environmentally friendly substrate for soilless farming. However, proper nutrient supplementation is essential to maximize crop productivity.

Integrating rice husk into urban farming practices can contribute to sustainable food production in space-constrained environments.

ABSTRACT

The traditional linear economy model, with its "take-make-dispose" approach, leads to the rapid depletion of natural resources and environmental degradation. As an alternative to this model, the circular economy aims to minimize waste generation, enhance resource efficiency, and establish closed-loop systems supported by renewable energy sources. The agricultural sector, in particular, represents a significant application area for circular economy strategies, as they contribute to efficient resource use, reduce dependence on external inputs, and support environmental sustainability.

The circular economy approach has the potential to generate environmental and economic benefits in the agricultural sector by optimizing resource use, minimizing waste, and promoting sustainable production systems. Circular farming practices, such as utilizing organic waste for composting, biogas production, and bio-based fertilizers, improve soil health and reduce dependency on chemical inputs. However, integrating circular economy principles into the agricultural sector faces challenges such as financial constraints, infrastructure requirements, and policy support. In this context, this study examines the economic, environmental, and social benefits of circular agriculture while discussing the obstacles encountered in implementation and proposing policy recommendations to facilitate a sustainable transition.

The integration of circular economy principles into agricultural systems not only enhances economic resilience but also ensures environmental sustainability and contributes to the development of policies aligned with the United Nations Sustainable Development Goals. Moreover, the "Farm to Fork Strategy," recognized as one of the key components of the Green Deal, plays a central role in the transition to a circular economy beyond just the food and agriculture sectors.

Unlike traditional linear economic models, the circular economy promotes the more efficient use of natural resources and encourages production and consumption patterns aligned with sustainable development principles. Circular economy strategies applicable in the agricultural sector can support rural development by balancing economic growth with environmental sustainability. The aim of this study is to assess the current state of the subject through a literature review and to present comprehensive policy frameworks that support sustainable agricultural transformation through circular economy practices.

Keywords: Circular Economy, Rural Development, New Green Deal**,** Sustainable Agriculture, Efficient Use of Resources

TARLADAN ÇATALA: DÖNGÜSEL EKONOMİ İLE YENİ NESİL KALKINMA

ÖZET

Geleneksel doğrusal ekonomi modeli, "al-kullan-at" yaklaşımıyla doğal kaynakların hızla tükenmesine ve çevresel bozulmaya neden olmaktadır. Bu modele alternatif olarak ortaya çıkan döngüsel ekonomi, atık oluşumunu en aza indirmeyi, kaynak verimliliğini artırmayı ve yenilenebilir enerji kaynaklarıyla desteklenen kapalı döngü sistemler oluşturmayı amaçlamaktadır. Özellikle tarım sektörü, döngüsel ekonomi stratejilerinin kaynak kullanımında verimlilik sağlama, dış girdilere bağımlılığı azaltma ve çevresel sürdürülebilirliği destekleme açısından önemli bir uygulama alanıdır.

Döngüsel ekonomi yaklaşımı, kaynak kullanımının optimize edilmesi, atıkların minimize edilmesi ve sürdürülebilir üretim sistemlerinin teşvik edilmesi yoluyla tarım sektöründe çevresel ve ekonomik faydalar yaratma potansiyeline sahiptir. Döngüsel tarım uygulamaları, organik atıkların kompost, biyogaz ve biyobazlı gübreler olarak değerlendirilmesi yoluyla toprak sağlığını iyileştirmekte ve kimyasal girdilere olan bağımlılığı azaltmaktadır. Ancak, döngüsel ekonomi ilkelerinin tarım sektörüne entegrasyonu, finansal kısıtlar, altyapı gereksinimleri ve politika desteği gibi çeşitli zorluklarla karşı karşıyadır. Bu bağlamda çalışma, döngüsel tarımın ekonomik, çevresel ve sosyal faydalarını ele alırken, uygulamada karşılaşılan engelleri ve bu dönüşümün sürdürülebilir şekilde gerçekleşmesini destekleyecek politika önerilerini tartışmaktadır.

Döngüsel ekonomi ilkelerinin tarımsal sistemlere entegrasyonu, ekonomik dayanıklılığı artırmanın yanı sıra çevresel sürdürülebilirliği sağlamakta ve Birleşmiş Milletler Sürdürülebilir Kalkınma Amaçları ile uyumlu politikaların geliştirilmesine katkı sunmaktadır. Ayrıca, Yeşil Mutabakat'ın temel unsurlarından biri olarak kabul edilen "Tarladan Çatala Stratejisi", yalnızca gıda ve tarım sektörleri ile sınırlı kalmayıp, döngüsel ekonomiye geçiş sürecinde de merkezi bir rol üstlenmektedir.

Döngüsel ekonomi geleneksel doğrusal ekonomik modellerin aksine, doğal kaynakların daha etkin kullanımını ve sürdürülebilir kalkınma ilkeleriyle uyumlu üretim ve tüketim modellerini teşvik etmektedir. Tarım sektöründe uygulanabilecek döngüsel ekonomi stratejileri, kırsal kalkınmayı destekleyerek ekonomik büyüme ve çevresel sürdürülebilirlik arasında denge kurulmasını sağlayabilir. Bu çalışmanın amacı, konuya ilişkin mevcut durumu değerlendirmek amacıyla literatür taraması yaparak döngüsel ekonomi uygulamaları ile sürdürülebilir tarımsal dönüşümü destekleyecek kapsamlı politika çerçevelerine yönelik öneriler sunmaktır.

Anahtar Kelimeler: Döngüsel Ekonomi, Kırsal Kalkınma, Yeni Yeşil Düzen, Sürdürülebilir Tarım, Etkin Kaynak Kullanımı

1. GİRİŞ

Döngüsel ekonomi, kaynakların etkin kullanımını, atıkların en aza indirilmesini ve sürdürülebilir üretim süreçlerinin teşvik edilmesini amaçlayan bir modeldir. Geleneksel tarım uygulamaları ise çoğunlukla doğrusal bir üretim yaklaşımına dayanır; yani doğal kaynaklar kullanılır, ürünler yetiştirilir ve ardından atıklar bertaraf edilir. Bu süreç, biyokütle geri kazanımı, organik atıkların değerlendirilmesi ve sürdürülebilir tarımsal girdilerin kullanımını içeren bütüncül bir dönüşümü gerektirmektedir. Söz konusu dönüşüm, atıkların geri dönüştürülmesi ve yeniden kullanımı yoluyla yeni değerlerin oluşturulmasını sağlarken, aynı zamanda ekonomik getirilerin artırılmasına da katkıda bulunmaktadır (Özkan 2024). Mevcut sistemlerde, bitkisel ve hayvansal atıklar büyük ölçüde değerlendirilememekte ve çevresel kirliliğe yol açmaktadır. Oysa bu atıklar, kompost veya biyogaz üretimi için kullanılabilir ve böylece hem toprak verimliliği artırılabilir hem de enerji üretimi sağlanabilir. Agegnehu vd. (2016) çalışmalarında tarımda döngüsel ekonomiyi teşvik etmek için biyokömür uygulamasının potansiyel katkılarını incelemiştir. Biyokömür, organik atıkların piroliz yoluyla işlenmesiyle elde edilen karbon açısından zengin bir maddedir ve toprak verimliliğini artırma, su tutma kapasitesini iyileştirme ve sera gazı emisyonlarını azaltma gibi faydaları bulunmaktadır. Makale, biyokömürün tarımsal atıkların yönetiminde sürdürülebilir bir çözüm sunduğunu ve böylece atıkların yeniden kullanımı yoluyla döngüsel ekonomi ilkelerine katkı sağladığını vurgulamaktadır. Ayrıca, biyokömürün toprak sağlığını iyileştirerek bitki büyümesini desteklediği ve kimyasal gübre kullanımını azaltarak çevresel etkileri minimize ettiği belirtilmektedir. Sonuç olarak, biyokömür uygulamasının tarım sektöründe döngüsel ekonomiyi destekleyen etkili bir strateji olduğu ve sürdürülebilir tarım uygulamalarına önemli katkılar sunduğu ifade edilmektedir. Cao vd. (2022), çalışmalarında biyokömürbazlı elektrotların sürdürülebilir enerji üretimine katkı sağlayabileceğini ve döngüsel ekonomi çerçevesinde tarımsal atık yönetiminin iyileştirilmesine yardımcı olabileceğini ortaya koymaktadır. Bulgular, biyokömür kullanımının teşvik edilmesi için politika yapıcılar ve enerji sektörü açısından önemli bilgiler sunmaktadır.Otero vd. (2023), tarımsal yan ürünlerin döngüsel ekonomi modellerine entegrasyonunda karşılaşılan zorlukları, özellikle İspanya'daki pestisit kullanımı bağlamında incelemiştir. Çalışma, pestisit kalıntılarının tarımsal atıkların yeniden kullanımını nasıl engellediğini ve bu durumun döngüsel ekonomi hedeflerini nasıl sekteye uğrattığını analiz etmektedir. Yazarlar, mevcut yasal düzenlemeler ve uygulamaların, pestisit kalıntıları nedeniyle tarımsal yan ürünlerin geri dönüşümünü sınırladığını belirtmektedir. Ayrıca, çalışmada pestisitlerin çevresel ve ekonomik etkileri değerlendirilerek, sürdürülebilir tarım uygulamalarının önemi vurgulanmaktadır. Sonuç olarak, makale, tarımsal yan ürünlerin döngüsel ekonomiye başarılı bir şekilde dahil edilmesi için pestisit kullanımının azaltılması ve daha etkili yönetilmesi gerektiğini önermektedir.

Döngüsel ekonominin etkin şekilde uygulanabilmesi için, atık yönetimi stratejilerinin geliştirilmesi ve çiftçilerin bu konuda bilinçlendirilmesi büyük önem taşımaktadır.Rótolo vd. (2022), Arjantin'de tarımla ilgili sektörlerde döngüsel ekonomi seçeneklerine yönelik algı ve farkındalığı incelemiştir. Çalışma, mevcut sosyo-ekonomik modelin kaynak kıtlığı, çevresel etkiler ve sosyo-ekonomik kısıtlamalar nedeniyle zorluklarla karşılaştığını ve bu nedenle döngüsel ekonomi paradigmasının giderek daha fazla ilgi gördüğünü belirtmektedir. Araştırma

bulguları, tarım sektöründe döngüsel ekonomi ilkelerinin benimsenmesini teşvik etmek için politika yapıcıların ve sektör liderlerinin stratejiler geliştirmesi gerektiğini vurgulamaktadır.

Bununla birlikte, döngüsel tarıma geçiş, tedarik zincirlerinde de yapısal değişiklikler gerektirmektedir.Tarımsal üretimde malzeme geri kazanımı, yeniden kullanım ve geri dönüşüm süreçlerinin iyileştirilmesi için lojistik ve teknik engellerin aşılması gerekmektedir. Santos vd. (2024), tarımsal üretimde döngüsel ekonomi çerçevesinin blokzincir teknolojisi ile entegrasyonunu incelemiştir. Çalışma, pestisit ambalajlarının geri dönüşümü ve tersine lojistik süreçlerinde blokzincirin şeffaflık ve izlenebilirlik sağlayarak sürdürülebilirliği nasıl artırabileceğini değerlendirmiştir. Literatür taraması ve kavramsal analiz yöntemleri kullanılarak yapılan araştırmada, blokzincir teknolojisinin pestisit ambalajlarının geri kazanımı ve bertarafında önemli avantajlar sunduğu bulunmuştur. Bu bulgular, tarımsal üretimde döngüsel ekonomi ilkelerinin uygulanmasını teşvik eden politika ve stratejilerin geliştirilmesi açısından önemli katkılar sunmaktadır.

Döngüsel tarımın başarısı, sadece üreticilerin değil, aynı zamanda tüketicilerin de bu dönüşüme katılımıyla mümkündür. Sürdürülebilir tüketimi teşvik etmek ve tüketici davranışlarını döngüsel ekonomiye uygun hale getirmek için farkındalık artırıcı kampanyalar yürütülmelidir (Lieder ve Rashid, 2016). Tüketicilerin sürdürülebilir ürünlere yönelik tutumlarını anlamak, döngüsel tarım ürünlerinin pazarda daha geniş kabul görmesini sağlayacaktır. Örneğin, biyolojik bazlı gübrelerin ve doğal haşere kontrol yöntemlerinin yaygınlaştırılması, kimyasal girdilere olan bağımlılığı azaltarak sürdürülebilirliği artırabilir. Ancak, bu tür dönüşümlerin başarılı olabilmesi için, tarımsal girdilerin ve çıktıların yeniden değerlendirilmesine yönelik politika ve teşvik mekanizmalarının geliştirilmesi gerekmektedir.

Döngüsel tarımın ekonomik etkileri de dikkatle ele alınmalıdır. Çevresel faydalar iyi belgelenmiş olmasına rağmen, iş yaratma, pazar dinamikleri ve rekabet avantajı gibi ekonomik etkilerin daha fazla araştırılması gerekmektedir (Johnson vd., 2024). Özellikle küçük ve orta ölçekli tarım işletmeleri (KOBİ'ler), döngüsel tarım uygulamalarını benimsemekte finansal zorluklarla karşılaşmaktadır. Bu noktada, yenilikçi finansman mekanizmaları ve kamu-özel sektör ortaklıklarının geliştirilmesi, döngüsel tarıma geçişi destekleyebilir (Durlak ve DuPre, 2008).

Ancak, döngüsel tarım uygulamalarının yaygınlaşmasını engelleyen bazı faktörler de bulunmaktadır. Bunlardan biri değişime karşı dirençtir. Kurumsal atalet ve paydaş direnci, yeni uygulamaların benimsenmesini zorlaştırabilir. Bu nedenle, döngüsel tarıma geçiş sürecinde paydaş katılımını artırmak, etkili iletişim stratejileri geliştirmek ve yeniliğe değer veren bir kültür oluşturmak kritik öneme sahiptir (Greenhalgh vd., 2004). Ayrıca, mevcut tarım sistemlerinin döngüsel modele uyarlanabilmesi için teknik rehberlik ve eğitim programları sağlanmalıdır (Sandelowski, 2000).

Velasco-Muñoz vd. (2021), döngüsel ekonominin tarımsal bağlamda nasıl anlaşılabileceğini tanımlayarak ve döngüsel ekonomi ilkeleri ile stratejilerini tarım sektörüne uyarlayarak mevcut literatürdeki boşluğu doldurmayı amaçladıkları çalışmalarında, literatürde vurgulanan döngüsel ekonomi ilkelerinin büyük ölçüde Ellen MacArthur Vakfı (EMF) tarafından önerilen prensiplerle örtüştüğünü belirterek, bu ilkeleri üç temel başlık altında sıralamaktadır. İlk olarak, "atık ve kirliliği ortadan kaldıran tasarım" ilkesi, sistemin etkinliğini artırmak için çevresel

olumsuz dışsallıkların belirlenmesini ve ortadan kaldırılmasını hedeflemektedir. Tarım sektörü bağlamında değerlendirildiğinde, gübre, herbisit ve pestisitlerin yanlış kullanımı nedeniyle toprak kirliliğine yol açıldığı belirtilmektedir. Bununla birlikte, birçok gelişmiş ülke, kimyasal girdilerin kullanımını sınırlayan veya yasaklayan düzenlemeler getirmiştir. Bu durum, organik gübre kullanımının artmasına ve biyolojik haşere kontrol yöntemlerinin geliştirilmesine katkı sağlamaktadır. İkinci olarak, "ürünleri ve malzemeleri kullanımda tutma" ilkesi, tedarik zincirinin tüm aşamalarında ve farklı tedarik zincirleri arasında, ürünler ile yan ürünlerin değerinin en üst düzeye çıkarılmasını amaçlamaktadır. Bu ilke, kaynakların maksimum fayda sağlayacak şekilde korunmasını ve sürdürülebilir kullanımını teşvik etmektedir. Son olarak, "doğal sistemleri yenileme" ilkesi, ekosistemlerin korunmasını ve iyileştirilmesini sağlamak amacıyla sonlu stokların yenilenebilir kaynaklarla değiştirilmesini kapsamaktadır. Bu ilke, yenileyici (rejeneratif) tarım uygulamalarının gelişmesine olanak sağlamaktadır. Yenileyici (rejeneratif) tarım, sera gazı emisyonlarını azaltma, toprakta ve bitki materyalinde karbon tutma, toprak bozulmasını en aza indirme ve su tutma kapasitesini artırma gibi çevresel faydalar sunmaktadır. Ayrıca, biyolojik olarak aktif toprakları teşvik ederek sentetik girdilere olan bağımlılığı azaltmaktadır. Yenilenme süreci, biyolojik olarak parçalanabilir ambalajların geliştirilmesi, bitki atıklarının yönetimi yoluyla karbon tutulumunun (sekestrasyon) artırılması ve kompostlama gibi malzeme geri dönüşüm uygulamalarını içermektedir. Ancak, bu ilkelerin tarımsal bağlama tam olarak uyarlanmadığı ve uygulamada entegrasyonunun henüz yeterince sağlanamadığı görülmektedir (Velasco-Muñoz vd., 2021).Nguyen vd. (2024), Vietnam'da tarımsal üretimde döngüsel ekonomi uygulamalarının benimsenme düzeyini etkileyen faktörleri incelemiştir. Araştırma, hükümet politikaları, üretim ölçeği, işletmelerin farkındalığı, teknolojik uygulamalar ve finansal yatırımların döngüsel ekonomi uygulamalarına etkisini değerlendirmiştir. Yapısal Eşitlik Modellemesi kullanılarak yapılan analizlerde, finansal faktörlerin en güçlü etkiye sahip olduğu, bunu sırasıyla teknolojik uygulamalar, farkındalık, üretim ölçeği ve hükümet politikalarının izlediği belirlenmiştir.

Tarımda sürdürülebilir bir döngüsel ekonomi yaratmak, devletlerin, uluslararası örgütlerin, kamu otoritelerinin, yerel ve bölgesel toplulukların, işletmelerin, hanelerin ve vatandaşların sorumluluğundadır. Tüm bu kavramlar iyi tanımlanmış olsa da, asıl soru bunların ekonomik veya sosyal olarak ne ölçüde uygulandığıdır. Her kavram evrensel çözümler sunamaz; bazıları eksikliklere sahip olabilir veya belirli koşullar altında uygulanamayabilir (Kadioglu vd., 2025).

Bu bulgular, politika yapıcılar için döngüsel ekonomi ilkelerinin tarımsal üretimde benimsenmesini artırmaya yönelik stratejilerin geliştirilmesinde önemli bilgiler sunmaktadır.

2. TARIMDA SÜRDÜRÜLEBİLİRLİK

Tarımda döngüsel ekonomi uygulamalarının incelenmesi sırasında öne çıkan temel kavramlardan biri de sürdürülebilirliktir. Döngüsel ekonomi, kaynak kullanımını optimize ederek atık oluşumunu ve çevresel kirliliği en aza indirmeyi hedeflemekte, böylece ekonomik ve sosyal refahı artırırken çevrenin korunmasına da katkı sağlamaktadır (Bencomo vd., 2019). Bu bağlamda, döngüsel ekonomi uygulamalarının sürdürülebilir kalkınmayı desteklediği söylenebilir.Dziedzic vd. (2022) uluslararası döngüsel ekonomi stratejilerinin tarımsal su yönetimi üzerindeki etkilerini incelemiş, döngüsel ekonomi ilkelerinin küresel ölçekte tarım

sektöründe sürdürülebilir su yönetimini nasıl destekleyebileceği araştırmıştır. Çalışma, suyun etkin kullanımını ve yeniden kullanımını teşvik eden döngüsel ekonomi stratejilerinin, su kıtlığı sorunlarının hafifletilmesine ve tarımsal üretkenliğin artırılmasına katkı sağlayabileceğini belirtmektedir. Ayrıca, bu stratejilerin uygulanmasının, su kaynaklarının korunması ve çevresel sürdürülebilirliğin sağlanması açısından önemli olduğu vurgulanmaktadır.

Döngüsel bir ekonomi, çiftçilere ve diğer girişimcilere değer yaratırken çevreyi iyileştirmeleri, eşitlik ve etkileşimin sosyal normlarını teşvik etmeleri için ek fırsatlar sunmaktadır (Özkan, 2024). Tarım sektöründe döngüsel ekonomi uygulamaları, organik atıkların biyogaz veya kompost üretiminde kullanılması, su kaynaklarının verimli yönetimi ve sürdürülebilir tarım teknikleri gibi birçok alanı kapsamaktadır. Dijitalleşme ve yapay zekâ teknolojilerinin entegrasyonu, döngüsel sistemlerin optimizasyonunu sağlayarak kaynak kullanımını daha verimli hale getirebilir.

Tarım sektöründe döngüsel ekonomi uygulamalarının en önemli faydalarından biri, biyokütle atıklarının yeniden kullanımı ve geri dönüştürülmesi yoluyla kaynak verimliliğinin artırılmasıdır. Tarımsal üretim süreçlerinde ortaya çıkan organik atıkların kompost, biyogaz veya biyoyakıt olarak değerlendirilmesi, kimyasal gübre kullanımını azaltarak toprak sağlığını iyileştirmekte ve tarımsal ekosistemlerin sürdürülebilirliğini desteklemektedir. Bu durum, çiftçilerin girdi maliyetlerini düşürmelerini sağlarken, tarımsal üretimin çevresel etkilerini de en aza indirir.

Ayrıca, döngüsel ekonomi ilkelerinin tarımsal üretime entegrasyonu, ürün tasarımı ve iş modellerinde inovasyonu teşvik etmektedir. Bu bağlamda, akıllı tarım uygulamaları, hassas tarım teknolojileri ve biyolojik bazlı girdilerin kullanımı gibi yenilikçi yaklaşımlar ile hem üretim verimliliğini artırılması hem de doğal kaynakların korunması amaçlanmaktadır.

Ekonomik faydaların yanı sıra döngüsel ekonomi ilkelerinin benimsenmesi, tarım sektörünün küresel sürdürülebilirlik hedeflerine uyum sağlamasına da yardımcı olmaktadır. Khajuria vd. (2022), döngüsel ekonomi stratejilerinin Birleşmiş Milletler Sürdürülebilir Kalkınma Hedefleri (SDGs) ile özellikle sorumlu tüketim ve üretim (SDG 12) ve iklim eylemi (SDG 13) açısından doğrudan ilişkili olduğunu belirtmektedir. Bu bakımdan döngüsel tarım uygulamaları, sera gazı emisyonlarını azaltarak ve tarımsal ekosistemlerin sürdürülebilirliğini artırarak küresel iklim değişikliğiyle mücadelede kritik bir rol oynamaktadır (EuropeanParliament, 2025).

Bununla birlikte, döngüsel ekonomi uygulamaları çiftçiler ve tarımsal işletmeler için yeni gelir modelleri oluşturma potansiyeline sahiptir. Örneğin, döngüsel sistemler sayesinde atıkların yeniden işlenmesi ve biyoteknolojik süreçlerle yeni ürünlere dönüştürülmesi, tarım sektöründe ek gelir kaynakları yaratabilir. Organik atıklardan biyogaz üretimi veya geri dönüştürülebilir tarımsal ambalajların geliştirilmesi gibi uygulamalar, hem çiftçilerin ekonomik refahını artırmakta hem de döngüsel iş modellerine olan ilgiyi artırmaktadır.

Günümüzde döngüsel ekonomi yaklaşımı, yalnızca endüstriyel süreçlerle sınırlı kalmayıp, kırsal kalkınma stratejilerinde de etkili bir model olarak değerlendirilmektedir. Sonuç olarak tarım sektöründe döngüsel ekonomi entegrasyonu, doğal kaynakların korunması, tarımsal üretimde verimliliğin artırılması, ekonomik sürdürülebilirliğin desteklenmesi ve küresel sürdürülebilirlik hedeflerine katkı sağlanması açısından kritik bir öneme sahiptir. Tarımsal

üretimin döngüsel ilkeler doğrultusunda yeniden tasarlanması, çevresel etkileri azaltırken, çiftçilerin rekabet gücünü artıran ve uzun vadede ekonomik kazanç sağlayan bir dönüşüm yaratacaktır.

2.1. Tarımda Döngüsel Ekonomi Entegrasyonu

Beklenen kaynak temelli, çevresel ve sosyo-ekonomik faydalara rağmen, tarımda döngüsel ekonominin benimsenmesi, uygun şekilde uygulanması için çeşitli engellerin üstesinden gelmelidir. Haque vd. (2023), tarımda döngüsel ekonomi entegrasyonunda mevcut literatüre dayanarak dört temel zorluk alanı belirlemiştir. Bu zorluk alanları; dönüşüm teknolojileri ve ilgili araştırmalar, tedarik zincirinde iş modelleri ile malzeme akışının yönetimi, döngüsel ekonomi uygulamalarına yönelik analitik araçların geliştirilmesi ve paydaş katılımının sağlanması şeklinde sınıflandırılmaktadır.

Bu engellerin başında, mevcut tarımsal üretim modellerinin döngüsel sisteme uyum sağlaması için gerekli olan büyük ölçekli yatırımlar ve devlet desteği gelmektedir. Döngüsel tarım sistemleri, atıkların yeniden kullanımı, organik gübreleme ve suyun verimli yönetimi gibi sürdürülebilir uygulamaları içermekte olup, bu sistemlerin hayata geçirilmesi önemli altyapı değişiklikleri ve teknolojik yatırımlar gerektirmektedir. Ancak, birçok çiftçi ve tarımsal işletme, özellikle de küçük ölçekli üreticiler, bu dönüşüm için gerekli finansmanı sağlamakta zorlanmaktadır. Üstelik, döngüsel tarıma yönelik mali teşvikler ve sübvansiyonlar sınırlıdır ve bu da geçiş sürecini ekonomik açıdan daha zor hale getirmektedir.

Döngüsel ekonominin tarıma entegrasyonundaki bir diğer büyük zorluk, mevcut tarım yöntemlerinin sürdürülebilirlik ilkelerine uygun hale getirilmesi sürecinin karmaşıklığıdır. Geleneksel tarım uygulamaları, yoğun kimyasal kullanımına ve doğrusal bir üretim-tüketim modeline dayanmaktadır. Bu modeli döngüsel hale getirmek, biyolojik döngüleri optimize etmek, toprağın verimliliğini artırmak ve atık yönetimini daha sürdürülebilir bir hale getirmek için yeni teknikler ve süreçler gerektirir.

Çiftçilerin döngüsel tarıma uyum sağlayabilmesi için yenilikçi tarımsal teknikler konusunda eğitilmeleri, sürdürülebilir gübreleme yöntemlerini benimsemeleri ve döngüsel üretim için uygun makinelerle donatılmaları gerekmektedir. Ancak, mevcut bilgi eksikliği ve yeni uygulamalara yönelik direnç, bu süreci zorlaştıran etkenler arasında yer almaktadır (Cantú vd., 2021).

Bunun yanı sıra, tarımsal tedarik zincirinin sürdürülebilir bir şekilde yeniden yapılandırılması da önemli bir lojistik sorundur. Döngüsel tarımın başarısı, organik atıkların verimli bir şekilde geri kazanılması, biyogaz ve kompost üretiminin artırılması ve alternatif pazar mekanizmalarının oluşturulmasıyla yakından ilişkilidir. Ancak, birçok bölgede geri dönüştürülebilir tarımsal atıkların toplanması, işlenmesi ve yeniden kullanımı için yeterli altyapı bulunmamaktadır. Ayrıca, sürdürülebilir tarım girdilerinin tutarlılığı ve kalitesinin sağlanması da üreticiler için bir başka önemli zorluk teşkil etmektedir.

Son olarak, tüketici davranışları ve pazar dinamikleri, tarım sektöründe döngüsel ekonominin yaygınlaşmasını etkileyen kritik faktörlerden biridir. Döngüsel tarım uygulamalarından elde edilen ürünlerin pazarda kabul görmesi ve talep edilmesi, bu dönüşümün sürdürülebilirliği

açısından büyük önem taşımaktadır. Ancak, tüketiciler arasında döngüsel tarım ürünlerine yönelik farkındalık eksikliği ve sürdürülebilir gıdaların maliyetine ilişkin algılar, bu ürünlerin benimsenmesini yavaşlatmaktadır. Döngüsel ekonomi ilkeleriyle üretilen gıdaların pazarda rekabet edebilir hale gelmesi için, bu ürünlerin fiyatlandırma stratejilerinin iyi belirlenmesi ve tüketiciye yönelik bilinçlendirme kampanyalarının artırılması gerekmektedir (Droege vd., 2021).

Döngüsel tarım ekonomisinin yaygınlaştırılması, yalnızca bireysel çiftçilerin veya işletmelerin çabalarıyla mümkün değildir. Bu dönüşüm sürecinde hükümetlerin, akademik kurumların, özel sektörün ve sivil toplum kuruluşlarının ortak hareket etmesi gerekmektedir. Politika yapıcıların, döngüsel tarıma geçişi teşvik edici düzenlemeler getirmesi, finansal destek mekanizmalarını genişletmesi ve sürdürülebilir tarım uygulamalarını destekleyen araştırmaları teşvik etmesi önem arz etmektedir.

Sonuç olarak, tarım sektöründe döngüsel ekonominin entegrasyonu finansal, yapısal ve davranışsal zorluklar içermektedir. Ancak, bu zorlukların üstesinden gelinmesi, yalnızca çevresel sürdürülebilirlik açısından değil, aynı zamanda tarım sektörünün uzun vadeli verimliliği ve gıda güvenliği açısından da kritik bir öneme sahiptir. Bu dönüşümün başarısı, çok paydaşlı iş birlikleri, yenilikçi çözümler ve güçlü bir politika desteği ile mümkün olacaktır.

3. SONUÇ

Döngüsel ekonomi, tarım ve kırsal kalkınma arasındaki ilişki, sürdürülebilir kaynak yönetimi, atıkların azaltılması ve ekonomik dayanıklılığın artırılması açısından kritik bir öneme sahiptir. Tarımsal üretimde döngüsel yaklaşımlar, girdi maliyetlerini düşürmek, ekosistem üzerindeki baskıyı azaltmak ve yerel ekonomileri güçlendirmek adına önemli fırsatlar sunmaktadır. Organik atıkların biyogaz ve kompost üretimi gibi yöntemlerle değerlendirilmesi, suyun yeniden kullanımı ve yenilikçi tarım teknikleri, kırsal bölgelerde ekonomik çeşitliliği artırarak kalkınmayı teşvik etmektedir.

Ancak, döngüsel ekonominin tarıma entegrasyonu ve kırsal kalkınmayı destekleyici hale getirilmesi için politika yapıcıların, çiftçilerin ve özel sektörün iş birliği içinde hareket etmesi gerekmektedir. Teknolojik yeniliklerin benimsenmesi, finansal teşvik mekanizmalarının oluşturulması ve çiftçilerin bilinçlendirilmesi, döngüsel ekonominin tarım sektöründe başarılı bir şekilde uygulanmasını sağlayacaktır.

Bu kapsamda, küçük ve orta ölçekli tarım işletmelerinin döngüsel uygulamalara geçişte yaşadığı finansal zorlukları aşabilmeleri için hibe, düşük faizli kredi ve vergi indirimleri gibi teşvik mekanizmaları oluşturulmalıdır. Özellikle biyogaz, kompost ve geri dönüşüm tesisleri gibi altyapı yatırımları desteklenmelidir. Çiftçilerin ve tarım işletmelerinin döngüsel ekonomi uygulamaları hakkında bilinçlendirilmesi amacıyla yaygın eğitim programları düzenlenmeli, teknik danışmanlık hizmetleri sağlanmalıdır. Sürdürülebilir gübreleme, atık yönetimi ve hassas tarım teknolojileri gibi konulara odaklanılmalıdır. Tarımsal atık yönetimi, organik gübre üretimi ve biyolojik bazlı girdilerin kullanımı gibi alanlarda mevzuat güncellenmeli, kalite standartları belirlenmelidir. Döngüsel tarım uygulamalarının takibini ve denetimini kolaylaştıracak bir yasal altyapı geliştirilmelidir. Tarımda döngüsel ekonomi yatırımlarının

artırılması için kamu-özel sektör ortaklıkları ve çiftçi kooperatifleri desteklenmelidir. Özellikle bölgesel biyogaz ve kompost tesislerinin kurulması için ortak girişim modelleri geliştirilebilir. Döngüsel tarım ürünlerinin pazarda rekabet edebilirliğini artırmak amacıyla tüketicilere yönelik bilinçlendirme kampanyaları yürütülmeli ve döngüsel ürün etiketleme sistemleri geliştirilmelidir. Böylece tüketici talebi güçlendirilerek piyasada sürdürülebilir ürünlere olan ilgi artırılabilir.

Tarımsal faaliyetlerin döngüsellik performansının belirlenmesi ve anlamlı çalışmaların geliştirilmesi için uluslararası kabul görmüş standartların ve yeterli ölçüm birimlerinin tanımlanması gerekmektedir.

Sonuç olarak, tarımda döngüsel ekonomi uygulamalarının yaygınlaştırılması, sadece ekonomik kazanç sağlamakla kalmayıp çevresel ve sosyal sürdürülebilirliği de destekleyerek kırsal kalkınmanın yeniden şekillenmesine önemli katkılar sunacaktır. Bu bağlamda, gelecekte yapılacak araştırmalar ve uygulamalar, döngüsel ekonominin tarımsal üretim sistemlerine entegrasyonunu daha da güçlendirecek ve kırsal bölgelerde refah seviyesinin artmasına katkı sağlayacaktır.

ABSTRACT

Throughout history, humanity has made great efforts to find, develop and disseminate information. In this direction, new inventions have emerged for generations. The most important fact of this chain of stages that has continued for centuries is the discovery of writing and the ability to preserve these inventions for generations. In today's conditions, the greatest blessing that technology has offered us is the ease of recording information. Therefore, access to information and its distribution have gained great importance. Developing and changing technological attacks directly affect human life. The needs and habits of societies are evolving very quickly. This change includes all human-centered sectors. The name of this new process is digital transformation. The most important gain of this new period is that the storage and transfer of information has become much easier than before. With the triggering of this, information production has gained another dimension.

Digital transformation can be a good solution for our current economic, social and environmental problems. With the use of technological developments and the digitalization of processes, it may be possible to achieve the goal of a future in which all societies in the world live more equally and in prosperity.

Developments such as the Internet of Things, artificial intelligence, blockchain technology and big data have begun to increase the efficiency of business models by digitizing processes faster. The rapid increase in the speed of technological advances and socio-economic developments in the last century compared to the previous period has caused problems in the management of resources for the future. In order to eliminate these disruptions, it is valuable for digital transformation to be sustainable. Many studies are being carried out for the future of the world. If digital transformation is planned correctly, it may be possible to develop more sustainable business models. These developments should be evaluated as an opportunity to reduce natural resource consumption, minimize waste production and eliminate social injustice while benefiting from the advancement of technology. Global problems such as raw material scarcity, pollution and climate change caused or may be caused by traditional economic and production models are the biggest problems in terms of sustainability worldwide. In general, the traditional

perspective in the field of production and consumption forms the basis of these problems. In this context, new models based on sustainability have been needed instead of the traditional perspective. Circular economy can be defined as an economic paradigm that aims to find solutions to global sustainability problems such as climate change, biodiversity loss, material scarcity and pollution by using resources more efficiently and minimizing waste, in contrast to the current traditional economic model. In order for the transformation to be successful, digital technologies must be used more effectively. An important part of sustainability is that the circular economy model is supported by digital transformation. This study aims to clarify the concepts of digitalization-sustainability-circular economy, which are the three basic facts of our lives in the recent period, by examining internationally published reports and action plans.

Keywords: Circular Economy, Digitalization, Sustainability, Efficient Use of Resources

DİJİTAL DÖNÜŞÜM VE TARIMDA SÜRDÜRÜLEBİLİR HAREKETLİLİK

ÖZET

İnsanlık, tarih boyunca bilgiyi bulma, geliştirme ve yayma konusunda büyük bir çaba içerinde olmuştur. Bu doğrultuda nesiller boyu yeni icatlar ortaya çıkmıştır.Yüzyıllar boyunca süregelen bu aşamalar zincirinin en önemli olgusu yazının bulunması ve bu icatların nesiller boyunca saklanabilmesidir. Günümüz koşulalrında teknolojinin bizlere sunmuş olduğu en büyük nimet bilginin kayıt altına alınmasında ki kolaylıktır. Dolayısıyla, bilgiye erişim ve bunun dağıtılması çok büyük önem kazanmıştır. Gelişen ve değişen teknoloji atakları insan hayatını doğrudan etkilemektedir. Toplumların ihtiyaçları ve alışkanlıkları çok hızlı bir şekilde evrilmektedir. Bu değişim, insan odaklı tüm sektörleri içine almaktadır. İşte bu yeni sürecin adı dijital dönüşümdür.Bu yeni dönemin en önemli kazanımı ise bilginin saklanması ve aktarılması önceye göre çok kolaylaşmıştır. Bunun tetiklenmesiyle bilgi üretimi bir başka boyut kazanmıştır.

Dijital dönüşüm mevcut ekomik soyal ve çevresel kökenli sorunlarımız için iyi bir çözüm aracı olabilecek niteliktedir. Teknolojik gelişmelerin kullanımı ve süreçlerin dijitalleşmesiyle birlikte dünyadaki tüm toplumların daha eşit ve refah içinde yaşadığı bir gelecek hedefine ulaşma imkanı doğabilir.

Nesnelerin interneti, yapay zekâ, blok zinciri teknolojisi ve büyük veri gibi gelişmeler süreçleri daha hızlı dijitalleştirerek iş modellerindeki verimi arttırmaya başlamıştır.Teknolojik ilerlemelerin ve buna bağlı olarak sosyo-ekonomik gelişmelerinin hızının son yüz yılda önceki döneme göre yüksek oranda artması kaynakların yönetiminde gelecek adına sorunlar çıkmasına neden olmuştur. Bu aksaklıkları giderebilmek için dijital dönüşümün sürdürülebilir olması değerlidir. Dünyanın geleceği için birçok çalışma yapılmaktadır. Dijital dönüşüm doğru planlanırsa daha sürdürülebilir iş modellerini geliştirmek mümkün olabilir. Bu gelişmeler teknolojinin ilerlemesinden yararlanırken, doğal kaynak tüketimini azaltmak, atık üretimini minimize etmek ve sosyal adaletsizliği ortadan kaldırmak için bir fırsat olarak değerlendirilmelidir. Geleneksel ekonomik ve üretim modellerinin yol açtığı veya yol açabileceği hammadde kıtlığı, kirlilik, iklim değişikliği gibi küresel sorunlar, dünya genelinde sürdürülebilirlik açısından en büyük sorunlardır. Genel olarak üretim ve tüketim alanındaki geleneksel bakış açısı bu sorunların temelini oluşturmaktadır. Bu kapsamda geleneksel bakış açısı yerine sürdürülebilirliği temel alan yeni modellere ihtiyaç duyulmuştur. Döngüsel ekonomi, mevcut geleneksel ekonomik modelin aksine kaynakları daha verimli bir şekilde kullanarak ve atıkların en aza indirgendiği, iklim değişikliği, biyoçeşitlilik kaybı, malzeme kıtlığı ve kirlilik gibi küresel sürdürülebilirlik sorunlarına çözüm bulunmasını amaçlayan bir ekonomik paradigma olarak tanımlanabilir.Dönüşümün başarılı olması için dijital teknolojilerin daha etkin bir şekilde kullanılması şarttır. Sürdürülebilirliğin önemli bir parçası, döngüsel ekonomi modelinin dijital dönüşüm tarafından desteklenmesidir. Bu çalışma ile uluslararası yayınlanan raporlar ve eylem planları incelenerek hayatımızın son dönemde üç temel olgusu olan dijitaleşme-sürdürülebilirlik-döngüsel ekonomi kavramlarına açıklık getirilmeye çalışmıştır.

Anahtar Kelimeler: Döngüsel Ekonomi, Dijitalleşme, Sürdürülebilirlik, Etkin Kaynak Kullanımı

1. GİRİŞ

There are approximately 500 million small-scale farmers globally, and these farmers feed 70% of the world's population using only 30% of total resources (EMF, 2021). The Food and Agriculture Organization of the United Nations (FAO) emphasizes that global food production must increase by approximately 70% to meet food demand by 2050 (FAO, 2009). A production approach focused on the amount of production to meet food demand due to increasing population growth causes overuse of natural resources (Doğan and Adanacıoğlu, 2022). Current research examines the effects of the global food and agriculture industry on climate change and the global environmental crisis in detail (Crippa et al., 2021; Akram-Lodhi, 2021). Studies show that failure to manage natural resources effectively and sustainably leads to environmental problems such as soil and water pollution, soil losses, disruption of ecosystem balance and increased carbon emissions, and that unsustainable agricultural practices pose risks of degradation of agricultural lands, erosion, nitrogen, phosphorus and potassium pollution (Mısır and Arıkan, 2022).

Minimizing the environmental impacts of agricultural production necessitates the search for alternative and sustainable methods. In this context, the circular economy stands out as an important strategy that aims to increase resource efficiency and reduce the negative environmental impacts of agricultural activities while improving economic performance (Doğan and Adanacıoğlu, 2022; Velasco-Muñoz et al., 2021). In this context, the “farm to fork” strategy presented by the European Commission in May 2020 represents an important action under the European Green Deal framework. This strategy aims to achieve climate neutrality by 2050 by shifting the current EU food system towards more sustainable models. The “Farm to Fork Strategy”, which is considered one of the fundamental elements of the Green Deal, is not limited to the food and agriculture sectors only, but also plays a central role in the transition process to a circular economy. Circular economy is a critical approach that strengthens the relationship between agriculture and rural development, and aims to increase sustainable resource management, waste reduction and economic resilience. Adopting circular methods in agricultural production has the potential to strengthen local economies by reducing input costs and environmental pressure on ecosystems. At the same time, it represents a transition from the traditional industrial approach to development to an inclusive development paradigm that focuses on sustainability and restoring the ecological balance that has been disrupted (Kadiogluvd., 2025). In this context, the utilization of organic waste through methods such as biogas and compost production, water reuse and the implementation of innovative agricultural techniques increase economic diversity in rural areas and promote sustainable development.

2. RESEARCH AND FINDINGS

This study adopted a qualitative research method to examine the integration of circular economy practices into the agricultural sector. During the research process, the theoretical framework regarding the circular economy was created by reviewing the existing literature, and the European Union's "Farm to Fork" strategy and other sustainable agricultural policies were analyzed.

During the data collection phase, an assessment was made on the effects of circular economy practices in agriculture by examining academic articles, official reports and documents published by regulatory bodies. In addition, various case studies were included to understand the applicability of circular economy models in agriculture in different regions.

The obtained data were examined with the descriptive analysis method and the effects of circular agricultural practices on economic, environmental and social dimensions were determined. The findings were compared with the existing policy frameworks and suggestions were made on strategies that will support the transition to circular economy in the agricultural sector.

2.1. Circular Economy

While the traditional linear economy model, characterized by the “take-make-dispose” approach, leads to rapid depletion of natural resources and environmental degradation, the circular economy has emerged as an alternative to this unsustainable structure. The Ellen MacArthur Foundation (EMF, 2013) defines the circular economy as "an economic system consisting of closed loops in which raw materials, components, and products maintain their quality and value for the longest possible time and systems are powered by renewable energy sources". In this context, the circular economy is not only limited to waste management, but also aims to increase material and energy efficiency and make production and consumption processes more sustainable.

One of the fundamental dynamics of the circular economy is the increasing global demand for raw materials and the environmental pressures associated with it. Moraga et al. (2019) emphasize that circular economy indicators play a critical role in assessing the impact on material consumption, waste volume, and greenhouse gas emissions. These indicators are used to measure the effectiveness of circular approaches and to guide policy makers and businesses towards sustainability goals. In order to successfully implement circular economy strategies, it is not enough to focus only on technical solutions; the economic and social dimensions of this transformation must also be taken into account.

The concept of circular economy has an interdisciplinary perspective and is addressed with different interpretations in various sectors. It is emphasized that circular economy discourses include different approaches and that these discourses are based on different priorities such as technological innovation, social justice and ecological sustainability (Friant et al., 2020). This diversity reveals that circular economy policies and practices should be shaped according to sectoral and regional contexts. Especially in the context of agriculture and rural development, circular economy has great potential in terms of waste management, increasing soil fertility and improving biological cycles. Research conducted since the mid-20th century has revealed the importance of reducing waste and increasing resource efficiency by extending the life of products (Arruda, 2021). Especially in the 1970s and 1980s, the idea that the linear economy model was not sustainable in the long term became widespread and studies on the effective management of resources increased. During this period, the "closed loop economy" approach developed by Stahel and Reday-Mulvey stood out as a system that includes maintenance, repair

and reproduction processes, and the economic and ecological advantages of this model were emphasized (Friant et al., 2020).

Since the 1990s, the concept of circular economy has become more widely adopted in politics and business, and McDonough and Braungart's (2002) "Cradle to Cradle" approach has brought a new perspective on how material cycles can be optimized within sustainable systems. The European Union's implementation of circular economy principles in environmental policies has contributed to the spread of this transformation at the global level (Velenturf& Purnell, 2021).

2.2. The 3R Principle and Its Scope in the Circular Economy Context

The concept of the circular economy has emerged as a transformational approach that aims to promote sustainable development by addressing the limitations of the traditional linear economy. The linear model, characterized by the "take-make-dispose" model, leads to significant depletion of resources and environmental degradation. In contrast, the circular economy aims to create closed-loop systems where resources are reused, reproduced and recycled, thus minimizing waste and reducing environmental impact (Urbinati et al., 2017). The circular economy emphasizes the importance of designing products and processes that facilitate resource efficiency and sustainability, and encourages the transition from ownership to access and performance-based business models. This approach, which forms the basis of the circular economy, requires strategies that ensure efficient use of resources and minimize waste. One of these strategies is the "Reduce, Reuse, Recycle" principles, known as the 3R (the initials of the English concepts of Recycle, Reuse and Reduce). By utilizing the 3R principles, optimum production is aimed by using reduced natural resources and creating minimum pollution, emissions and waste (Gedik, 2020). In addition, 3R offers a framework that encourages sustainable transformations in production and consumption processes, not just waste management, in the circular economy approach (Geisendorf and Pietrulla, 2018).

Within the framework of the circular economy, the first R, "reduction", represents the eco-efficiency effort in both production and consumption processes. The concept of eco-efficiency is expressed as more product and service delivery or more economic and environmental efficiency with less energy and fewer natural resources (Güngör and Felekoğlu, 2018). This approach aims to provide economic and environmental improvements through the efficient use of resources. Although eco-efficiency targets do not directly address the social dimension, the efficient use of resources indirectly increases social welfare by ensuring that more resources are left for future generations.

The second R in the circular economy, "reuse", requires that products and business models be designed in accordance with the "disassembly and reuse" cycle. Reuse aims to extend the life cycle of products and reduce resource consumption and waste. Reuse also includes the full or partial evaluation of waste through repair, renewal or remanufacture, or in the production of other products. This process is an important tool in achieving resource efficiency and sustainability goals (Wang et al. 2014; Yong, 2007). The third R, "recycle", refers to the reprocessing of waste materials for original or different purposes. Recycling provides effective reuse of resources through direct use of waste or functionalization of waste recovery. This process includes the reprocessing of organic materials, but does not include activities such as

energy recovery or processing for use in landfill. In the context of the circular economy, recycling supports the goals of resource conservation and waste reduction, while also encouraging the use of renewable energy solutions (EMF, 2015). In this respect, recycling makes significant contributions to reducing natural resource consumption and increasing environmental sustainability.

Li et al. (2011) conducted a study on the agricultural circular economy model in the Erhai Lake Basin of China. The study evaluated sustainable development strategies based on the 3R principle, which includes the principles of reduce, reuse and recycle. The study analyzed the current agricultural practices in the region and revealed that the application of the 3R principles could make significant contributions to reducing environmental impacts and increasing resource efficiency. It was also emphasized that preferring approaches such as the integrated energy use model, ecological animal husbandry model, integrated agricultural waste use model and agricultural eco-tourism model would help control widespread agricultural pollution at its source and support the construction of an environmentally friendly ecological agriculture system that saves resources. In general, the 3R principle is not limited to waste management alone, but is also a critical tool for restructuring production and consumption processes in accordance with the circular economy approach. The effective application of the recycling principle is of strategic importance in terms of both reducing environmental impacts and increasing economic and social benefits.

2.3. Key Differences Between Linear and Cyclic Models

The transition from a linear economy to a circular economy means a fundamental change in resource management, product design and the perception of waste. In a linear economy, resources are extracted, transformed into products, used and then disposed of following a "take-make-dispose" model that emphasizes short-term economic gains over long-term sustainability (van Langen, 2021). In contrast, the circular economy aims to redefine growth by emphasizing social benefits. It focuses on designing products with their lifespan in mind, thus encouraging reuse, repair, renovation and recycling to establish a closed-loop system that minimizes waste. The main distinction between these models is the resource efficiency and waste management approaches. The linear model often leads to inefficient resource use, causing significant waste and environmental damage. In contrast, the circular model focuses on preserving the value of products, materials and resources within the economy for as long as possible. Using strategies such as product life extension, remanufacturing and recycling, the circular economy helps reduce environmental impact while offering economic advantages through cost savings and the development of new business opportunities.

In addition, the circular economy requires a fundamental change in business models. Companies in the circular framework must innovate to produce durable, repairable and recyclable products. Unlike the linear model, where product design focuses on reducing production costs and increasing sales volumes without considering environmental impacts, the circular model encourages sustainable practices. This includes designing products for longevity and recyclability, which can increase customer loyalty and create new market opportunities (van Langen, 2021). In essence, the transition from a linear economy to a circular economy

requires a comprehensive rethinking of production and consumption patterns. It requires collaboration across sectors and disciplines to develop and implement sustainable solutions that balance economic, environmental and social goals. The circular economy continues to gain traction and promises a more sustainable and resilient future.

As a result, the circular economy, unlike traditional linear economic models, encourages more efficient use of natural resources and production and consumption models that are compatible with sustainable development principles. Circular economy strategies that can be implemented in the agricultural sector can support rural development and provide a balance between economic growth and environmental sustainability. Dimitrov and Ivanova (2017) evaluated the development of organic agriculture in Bulgaria within the framework of the circular economy and examined the contributions of this approach to sustainable rural development. The study emphasized that organic agriculture is a growing sector in Europe and around the world and that consumer demand is increasing steadily. In this context, it was stated that organic agricultural enterprises and cultivated areas in Bulgaria have expanded significantly in recent years. In this context, it was concluded that the integration of organic agriculture with circular economy principles can promote rural development and provide long-term environmental benefits. Future studies can contribute to the development of more comprehensive strategies for policy makers by analyzing the social and economic impacts of circular economy practices in rural areas.

3. RESULT

The circular economy is of critical importance in terms of the relationship between agriculture and rural development, sustainable resource management, reducing waste and increasing economic resilience. Circular approaches in agricultural production offer significant opportunities to reduce input costs, reduce pressure on ecosystems and strengthen local economies. Evaluation of organic waste with methods such as biogas and compost production, water reuse and innovative agricultural techniques increase economic diversity in rural areas and encourage development. However, policy makers, farmers and the private sector need to act in cooperation in order to integrate the circular economy into agriculture and make it supportive of rural development. Adoption of technological innovations, establishment of financial incentive mechanisms and raising awareness of farmers will ensure the successful implementation of the circular economy in the agricultural sector.

ABSTRACT

It is of great importance to carry out comprehensive and multi-environmental Value for cultivation and use (VCU) experiments of the new candidate varieties, to register the ones with superior characteristics, to produce seeds and to deliver them to farmers. In addition, it is necessary to determine whether a candidate variety has the characteristics of a variety by performing distinctness, uniformity and stability (DUS) tests. The registration system in field crops is based on two basic principles: DUS tests and VCU experiments. In Türkiye, the Seed Law (No. 5553) was published in 2006 and many new practices have been implemented with the legislation enacted based on this law. The Regulation on the Registration of Plant Varieties was also issued in 2008, but revisions were made in the following years. Finally, the Regulation on the Registration of Plant Varieties was amended with the same name in 2024 and put into force as a new regulation. In this new regulation, the most important change made in the registration of field crops is the separation of plant species to be registered by conducting VCU. Among the cool season cereals, VCU experiments will be conducted in barley, bread and durum wheat, while registration procedures based only on DUS tests will be carried out in other cool season cereals. Varietal trueness tests have been introduced for the registration in Türkiye of varieties that have been registered in a member country of the International Union for the Protection of New Varieties of Plants and for which DUS tests have been conducted according to UPOV rules. Many new rules have been included in the latest regulation to facilitate the work and procedures of applicants and the Variety Registration and Seed Certification Center (VRSCC). VCU experiments in cool season cereals are carried out regionally and the number of locations should be increased especially in Central Anatolia, which is the most important region of Türkiye in wheat and barley agricultural production. In addition, the number of experiment locations where quality analyzes are carried out should be increased and disease tests should be carried out under artificial epidemic conditions. Plant varieties have a strategic

importance in the agricultural production of countries and it should be ensured that the VRSCC, which tests the performance and characteristics of new candidate varieties, has a strong structure.

Keywords: Registration, Distinctness, Uniformity, Stability, Value for cultivation and use

BİTKİ ÇEŞİTLERİNİN KAYIT ALTINA ALINMASINDA YAPILAN MEVZUAT DEĞİŞİKLİKLERİNİN SERİN İKLİM TAHILLARINA ETKİLERİ

ÖZET

Islah edilen yeni çeşit adaylarının, Tarımsal Değerleri Ölçme (TDÖ) denemelerinin kapsamlı ve çok çevreli yürütülmesi, üstün özelliklere sahip olanlarının tescil edilerek tohumluk üretiminin yapılması ve çiftçilere ulaştırılması büyük önem taşımaktadır. Aynı zamanda bir çeşit adayının Farklılık, Yeknesaklık ve Durulmuşluk (FYD) testlerinin yapılarak çeşit vasfı taşıyıp taşımadığının belirlenmesi gerekmektedir. Tarla bitkilerinde tescil sistemi, FYD testleri ve TDÖ denemeleri olmak üzere iki temel esasa dayanmaktadır. Türkiye'de 2006 yılında Tohumculuk Kanunu yayınlanmış ve bu kanuna istinaden çıkarılan mevzuatlarla birçok yeni uygulama hayata geçirilmiştir. Bitki Çeşitlerinin Kayıt Altına Alınması Yönetmeliği de 2008 yılında çıkarılmış ancak daha sonraki yıllarda yönetmelik üzerinde revizyonlar yapılmıştır. Son olarak Bitki Çeşitlerinin Kayıt Altına Alınması Yönetmeliği 2024 yılında aynı isimle değiştirilerek yeni bir yönetmelik olarak yürürlüğe sokulmuştur. Bu yeni yönetmelikte tarla bitkilerinin tescilinde yapılan en önemli değişiklik, TDÖ yapılarak tescil edilecek bitki türlerinin ayrılmasıdır. Serin iklim tahıllarından arpa, ekmeklik ve makarnalık buğdayda TDÖ denemeleri yapılacak, diğer serin iklim tahıllarında ise sadece FYD testlerine dayalı tescil işlemleri yürütülecektir. Uluslararası Yeni Bitki Çeşitlerinin Korunması Birliği (UPOV) üyesi bir ülkede tescil edilmiş ve FYD testleri UPOV kurallarına göre yapılmış çeşitlerin Türkiye'de tescilinde çeşit doğrulama testleri uygulaması getirilmiştir. Uygulamada başvuru sahipleri ve Tohumluk Tescil ve Sertifikasyon Merkez Müdürlüğü'nün (TTSM) iş ve işlemlerini kolaylaştıracak birçok yeni hüküm son çıkarılan yönetmelikte yer almıştır. Serin iklim tahıllarında TDÖ denemeleri bölgesel olarak yürütülmekte olup, özellikle ülkemizin buğday ve arpa tarımsal üretiminde en önemli bölgesi olan Orta Anadolu'da lokasyon sayısı arttırılmalıdır. Buna paralel olarak kalite analizlerinin yapıldığı lokasyon sayısı da arttırılarak, yapay epidemi koşullarında hastalık testleri yapılmalıdır. Bitki çeşitleri ülkelerin tarımsal üretimlerinde stratejik bir öneme sahip olup, yeni çeşit adaylarının performanslarını ve özelliklerini test eden TTSM'nin güçlü bir yapıya sahip olması sağlanmalıdır.

Anahtar Kelimeler: Tescil, Farklılık, Yeknesaklık, Durulmuşluk, Tarımsal değerleri ölçme

1. GİRİŞ

Ülkemizde çeşit tescilinin bilimsel ve teknik kurallar çerçevesinde yürütülebilmesi için ilk girişimler 1960 yılında Bölge Çeşit Deneme Enstitüsü'nün kurulmasıyla başlamıştır. Türkiye, 1963 yılında tohumculuk konusunda ilk yasal mevzuatlarını çıkarmaya başlamış ve uzun yıllar yürürlükte kalacak olan 308 Sayılı Tohumlukların Tescil, Kontrol ve Sertifikasyonu Hakkında Kanun kabul edilerek yürürlüğe girmiştir. 1986 yılında yapılan yasal bir düzenleme ile Tohumluk Kontrol ve Sertifikasyon Enstitüsü ile Bölge Çeşit Deneme Enstitüsü birleştirilmiş, bundan bir yıl sonra ise kuruluş Tohumluk Tescil ve Sertifikasyon Merkez Müdürlüğü adını almıştır. Bitki çeşitlerinin tanımlanması ve Farklılık, Yeknesaklık ve Durulmuşluk testlerinin yapılmasında uluslararası kural ve yöntemleri ortaya koyan UPOV'a (Uluslararası Yeni Bitki Çeşitlerini Koruma Birliği) 18 Kasım 2007 tarihinde Türkiye üye olmuştur. 2000'li yılların başında tohumculuk konusunda önemli gelişmeler olmuş ve ilk olarak 2004 yılında 5042 Sayılı Yeni Bitki Çeşitlerine Ait Islahçı Haklarının Korunmasına İlişkin Kanun çıkarılmıştır (Anonim, 2004). Bunu 2006 yılında kabul edilerek yürürlüğe sokulan 5553 Sayılı Tohumculuk Kanunu izlemiştir.

2006 yılında kabul edilen 5553 Sayılı Tohumculuk Kanunu ile uzun yıllar boyunca tohumculuk sektöründeki iş ve işlemlerin kurallarını belirleyen 308 Sayılı Kanun yürürlükten kalkmıştır. Tohumculuk Kanunu incelendiğinde, çeşit tescili ve tohumlukların sertifikasyonundan daha çok, Türkiye Tohumcular Birliği ve alt birliklerin kuruluşu, çalışma usul ve esaslarına yönelik hükümler içermektedir (Anonim, 2006). Tohumculuk Kanuna istinaden 2008 yılında Bitki Çeşitlerinin Kayıt Altına Alınması Yönetmeliği çıkarılarak çeşit tescil işlemleri 2024 yılına kadar bu yönetmelik hükümlerine göre yürütülmüştür. 17 Eylül 2024 tarihinde çıkarılan yeni Bitki Çeşitlerinin Kayıt Altına Alınması Yönetmeliği ile çeşit tescilinde önemli değişiklikler yapılmıştır (Anonim, 2024).

Ülkemizde milli çeşit listesinde tarla bitkileri grubunda toplam 3724 tescilli çeşit bulunmakta ve bunun %21.6'sını (806 adet çeşit) serin iklim tahıllarına ait çeşitler oluşturmaktadır (MÇL, 2025). Toplam tescilli çeşit sayısında en büyük oranı mısır, ayçiçeği ve bunlara ait ebeveyn hatlar oluşturmaktadır. 299 mısır ve 170 ayçiçeği çeşidi yanında, bu çeşitlere ait 976 adet ebeveyn hattı milli çeşit listesinde bulunmaktadır. Tarla bitkileri grubunda üretim izinli 820 çeşit bulunmaktadır ve bunun 162'si serin iklim tahıllarına aittir.

Serin iklim tahılları içerisinde ekmeklik buğdayda (*Triticum aestivum* L.) 441 adet, arpada (*Hordeum vulgare* L.) 194 adet, makarnalık buğdayda (*Triticum durum* Desf.) 108 adet, tritikalede (*Triticosecale*) 32 adet, yulafta (*Avena sativa* L.) 23 adet, kaplıca buğdayında (*Triticum monococcum* L.) 3 adet, kavılca buğdayında (*Triticum dicoccum* L.) 3 adet, kavuzlu buğdayda (*Triticum spelta* L.) 2 adet tescilli çeşit bulunmaktadır.

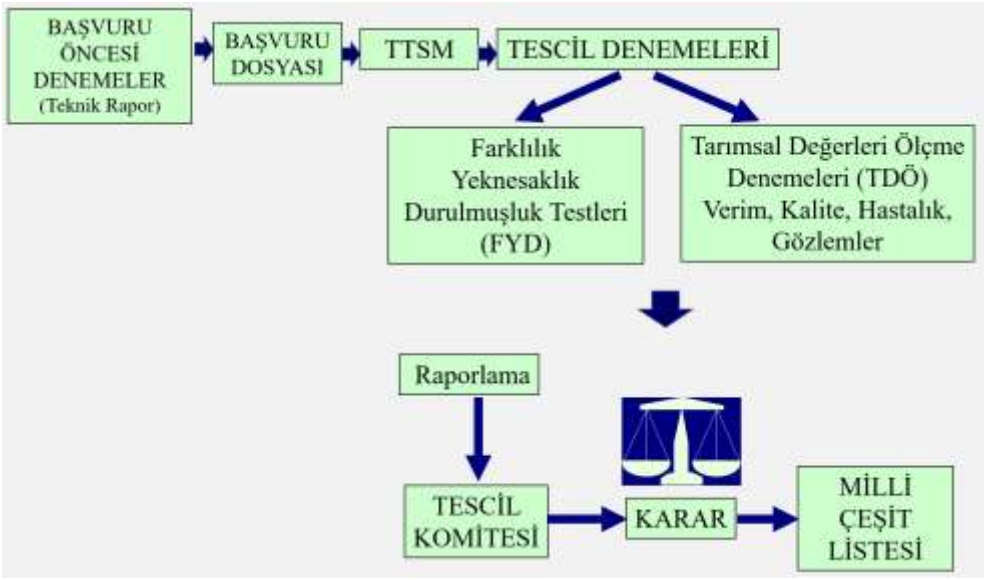
Ülkemizin son 35 yıllık buğday ekiliş alanı ve üretim miktarları üzerinde değerlendirme yapılacak olursa, 9.5 milyon hektar olan üretim alanının yıldan yıla düşerek 6.8 milyon hektarlara inmiştir (TÜİK, 2023). Ekiliş alanındaki düşüşe rağmen ülkemizde yıldan yıla değişmekle birlikte yaklaşık 20 milyon ton buğday üretimi yapılmaktadır. Yaklaşık 2.5 milyon hektarlık ekiliş alanındaki azalmaya karşın üretim miktarının düşmemesi ve hatta artmasındaki en büyük faktör birim alan tane verimindeki artıştır. Bunun da en önemli sebebi geliştirilen yeni çeşitlerin üretime girmesi ve verim seviyesini yükseltmesidir. Çeşitler ülkelerin milli değerleri

arasında yer almaktadır ve stratejik öneme sahiptir (Dönmez ve ark., 2008). Serin iklim tahılları Türkiye'nin sahip olduğu ekolojinin de etkisi ile en önemli tarımsal ürünlerinin başında gelmektedir. Bu çalışmada, çeşit tescil sisteminde ve teknik uygulamalardaki değişikliklerin çeşit geliştirme çalışmaları ile tescilindeki etkileri incelenerek değerlendirmeler yapılmıştır.

2. SERİN İKLİM TAHILLARINDA ÇEŞİT TESCİL SİSTEMİ

Ülkemizde tescil sisteminde bitkiler 4 grupta (Tarla bitkileri, meyve ve asma, sebze ve süs bitkileri) değerlendirilmektedir. Tarla bitkileri dışındaki bitki gruplarında sadece Farklılık, Yeknesaklık ve Durulmuşluk (FYD) testleri yapılarak kayıt altına alınmaktadır. Tarla bitkilerinde ise tescil sistemi FYD testleri ile Tarımsal Değerleri Ölçme (TDÖ) denemeleri olmak üzere iki ana temele dayanmaktadır (Şekil 1). FYD denemeleri Uluslararası Yeni Bitki Çeşitlerinin Korunması Birliği (UPOV) tarafından ortaya konulan kural ve yöntemlere göre TTSM tarafından yapılmaktadır.

Tescil başvurusunda bulunacak gerçek kişi veya kuruluşlar çeşit adayının gelişme tabiatına uygun bir yetiştirme dönemi iki lokasyonda veya bir lokasyonda iki yetiştirme dönemi olacak şekilde denemeler kurması gerekmektedir. Söz konusu denemeler bir araştırma kuruluşu tarafından yürütülerek raporlanmalıdır. Bu denemelerdeki amaç; çeşit sahibinin tescil başvurusunda bulunmadan önce, aday çeşidin yaygın yetiştirilen ve çeşit adayının özelliklerine uygun standart çeşitlerle yarıştırılmasıdır. Yani öncelikle başvuru sahibinin aday çeşidini tanıması ve üstün özelliklere sahip ise tescil başvurusunda bulunmasını sağlamaktır.



Şekil 1. Serin iklim tahıllarında tescil sisteminin genel aşamaları

Başvuru dilekçesi, çeşide ait teknik bilgi-belgeler ve ücret dekontundan oluşan başvuru dosyası ile ağustos ayı içerisinde tescil başvurusu yapılmaktadır. Tohumluk üretici kuruluşlar, gerçek

kişiler ya da bir araştırma kuruluşu tarafından geliştirilmiş çeşitler için tescil başvurusu yapabilmektedir. Başvuru dosyasında herhangi bir eksiklik yok ise TTSM tarafından çeşit adayı tescil denemelerine alınmaktadır. FYD testleri UPOV üyesi bir ülkede, UPOV yöntem ve kurallarına göre yapılmış ise çeşit adayı TDÖ denemelerine alınmaktadır. 2024 yılında yönetmelikte yapılan değişiklik ile serin iklim tahıllarında sadece arpa, ekmeklik buğday ve makarnalık buğdayda TDÖ denemeleri yapılmaktadır. Bitkisel Üretim Genel Müdürlüğü tarafından yayınlanan TDÖ yapılacak bitki türleri listesi bitki grupları bazında Çizelge 1'de verilmiştir (BÜGEM, 2025). TDÖ yapılmayacak diğer serin iklim tahıllarında FYD testleri UPOV kurallarına göre yapılmış olsa da bir yetiştirme dönemi doğrulama testlerine alınması hükmü getirilmiştir.

Çizelge 1. Tarımsal Değerleri Ölçme Denemeleri (TDÖ) yapılarak kayıt altına alınacak tarla bitkileri tür listesi

Serin iklim tahılları	
Arpa	*Hordeum vulgare* L.
Ekmeklik buğday	*Triticum aestivum* L.
Makarnalık buğday	*Triticum durum* Desf.
Sıcak iklim tahılları	
Çeltik	*Oryza* spp. L.
Mısır	*Zea mays* L.
Çayır mera yem bitkileri	
Adi fiğ	*Vicia sativa* L.
İtalyan çimi	*Lolium multiflorum* Lam.
Korunga (Mera tipi hariç)	*Onobrychis viciifolia* Scop.
Macar fiğ	*Vicia pannonica* Crantz
Yem bezelyesi	*Pisum sativum* ssp. *arvense* (L.) Poir
Yonca (Mera tipi hariç)	*Medicago sativa* L.
Endüstri bitkileri	
Ayçiçeği	*Helianthus annuus* L.
Kolza	*Brassica napus* L.
Pamuk	*Gossypium* spp.
Patates	*Solanum tuberosum* L.
Soya	*Glycine max* (L.) Merr.
Şeker pancarı	*Beta vulgaris* L.
Yemeklik baklagiller	
Kuru fasulye	*Phaseolus vulgaris* L.
Mercimek	*Lens culunaris* L.
Nohut	*Cicer arietinum* L.

FYD testlerinde UPOV tarafından oluşturulmuş çeşit özellik belgelerine göre ekmeklik buğdayda (*Triticum aestivum* L. emend. Fiori et Paol.) 27, makarnalık buğdayda (*Triticum turgidum* L. subsp. *durum* Desf. Husn.) 28, arpada (*Hordeum vulgare* L.) 29, yulafta (*Avena sativa* L. ve *Avena nuda* L.) 22, tritikalede (×*Triticosecale* Witt.) 24, çavdarda (*Secale cereale* L.) 21 karakter bakımından gözlemler alınmakta ve çeşit adaylarının özellik belgeleri hazırlanmaktadır (UPOV, 2025)

Serin iklim tahıllarında TDÖ denemeleri bölgesel bazda yürütülmektedir (SİTTT, 2025). Ayrıca bölgenin genel yetiştirme tekniklerinde kuruda veya suluda yetiştiricilik yapılıyorsa, tescil denemeleri de bu şekilde iki farklı set halinde yapılmaktadır (Çizelge 2). Bu bölgeler dışında önemli bir husus da çeşit adayının gelişme tabiatıdır. Başvuru yapılan bölge ile çeşit adayının gelişme tabiatı uyumlu olmalıdır. Çeşidin gelişme tabiatı ile baharlık veya yazlık ekiliş için tescil başvurusu karıştırılmamalıdır. Örneğin yazlık bir arpa çeşidi için Orta Anadolu Bölgesi yazlık ekiliş için tescil başvurusu yapılabilir.

Çizelge 2. Serin iklim tahıllarında TDÖ denemelerinin yürütüldüğü bölgeler ve koşullar

Deneme bölgesi	**Koşullar**
1. Doğu Anadolu Bölgesi	Doğal yağış ve sulu koşullar
2. Orta Anadolu Bölgesi	Doğal yağış ve sulu koşullar
3. Güneydoğu Anadolu Bölgesi	Doğal yağış ve sulu koşullar
4. Akdeniz Bölgesi	Doğal yağış
5. Güney Marmara ve Ege Bölgesi	Doğal yağış
6. Karadeniz Bölgesi	Doğal yağış
7. Trakya Bölgesi	Doğal yağış

TTSM iş birliği yaptığı araştırma enstitüleri ile TDÖ denemelerini iki yetiştirme dönemi süresince yürütmekte; tarla gözlemleri, kalite analizleri ve verim sonuçlarına göre bir sonuç raporu hazırlamaktadır. FYD testlerinde çeşit adayı başarısız olmuşsa, TTSM FYD sonuç raporunu başvuru sahibine göndermekte ve çeşit adayının tescil işlemleri sonlandırılmaktadır. FYD testlerinde başarılı olan çeşit adayları için hazırlanan rapor mart veya nisan aylarında tescil komitesine sunulmaktadır. Tarla Bitkileri Tescil Komitesi'ni oluşturan üyeler ve temsilci sayıları Çizelge 3'de verilmiştir (Anonim, 2024).

Çizelge 3. Tarla Bitkileri Tescil Komitesi üyeleri ve temsilci sayıları

Üye kurum/kuruluş	Temsilci sayısı
Bitkisel Üretim Genel Müdürlüğü	1
Ziraat Fakültesi	1
Kamu Tarımsal Araştırma Enstitüsü	1
TTSM	2
Türkiye Tohumcular Birliği	2
Türkiye Ziraat Odaları Birliği	1
İlgili Sanayi Sektörü	1
Toplam	**9**

Tescil komitesine, şartları ilgili yönetmelikte belirtilen özellikte danışman üye de davet edilebilir. Danışman üyelerin oy kullanma hakkı bulunmamaktadır. Tescil komitesi en az 7 asıl üyenin katılımıyla toplanmakta ve toplantıya katılan asıl üyelerin üçte ikisinin olumlu oyu ile tescil kararı alınmaktadır. Komite çeşit adayını bütün yönleriyle değerlendirmekte, ekonomik değer ifade eden bir veya birkaç karakter bakımından TDÖ'deki kontrol çeşitler ortalamasına eşdeğer ya da üstün çeşit adaylarını tescil etmektedir. Tescil kararı verilen çeşide başvuru sahibinin önerdiği ve komite tarafından ilgili hükümlere göre uygun görülen bir isim verilir. TTSM tarafından ilan edilen miktar ve kriterlere uygun standart numune, başvuru sahibi tarafından TTSM'ye teslim edildikten sonra çeşit milli çeşit listesinde yayınlanmaktadır. Böylece çeşidin ülkemizde sertifikalı tohumluk üretim ve ticareti yapılabilmektedir.

3. BİTKİ ÇEŞİTLERİNİN KAYIT ALTINA ALINMASI YÖNETMELİĞİNDEKİ ÖNEMLİ DEĞİŞİKLİKLER VE ETKİLERİ

17 Eylül 2024 tarih ve 32665 sayılı Resmî Gazete'de yayımlanarak yürürlüğe giren Bitki Çeşitlerinin Kayıt Altına Alınması Yönetmeliği'nde; uygulamalardaki zorlukları giderecek, sürecin hızlı ve etkin yürümesini sağlayacak değişiklikler yanında teknik konularda da önemli değişiklikler yapılmıştır. Tarla bitkileri çeşitlerinin kayıt altına alınması ile ilgili yapılan önemli değişiklikler ve bunların etkilerinin değerlendirilmesi aşağıda yapılmıştır.

Tescil başvurusunun yapılmasından tescil süreci sonlanıncaya kadar TTSM ile başvuru sahibi kişi, kurum veya kuruluşlarla birçok yazışma yapılmaktadır. Bu süreci hızlandırmak ve daha sağlıklı yürütmek için tescil başvuru sahiplerine Kayıtlı Elektronik Posta (KEP) adresi edinmeleri zorunluluğu getirilmiştir. KEP ile elektronik iletilerin gönderimi ve teslimatı hukukî delil niteliğinde olup, böylece yapılacak yazışma ve tebligatlar konusunda firmalar ile TTSM arasında daha hızlı ve etkin bir haberleşme sistemi kurulmuş olmaktadır.

Yeni yönetmelikteki en önemli değişikliklerin başında TDÖ denemeleri yapılacak bitki türlerinin ayrılması gelmektedir. Tarla bitkilerinde TDÖ denemeleri yapılacak bitki türlerini belirleme yetkisi Bitkisel Üretim Genel Müdürlüğü'nde (BÜGEM) olup, yayınlanan TDÖ yapılacak bitki tür listesi Çizelge 1'de verilmiştir. Serin iklim tahılları ülkemizin tarımsal alanlarında en fazla ekiliş alanına sahip türleri kapsamaktadır. Arpa, ekmeklik ve makarnalık buğdayda TDÖ denemeleri yapılmaya devam edilecektir. Ancak yulaf, tritikale, çavdar ve diğer serin iklim tahılları bitki grubunda yer alan türlerde (Karabuğday, kaplıca buğdayı, kavuzlu buğday, kavılca buğdayı, tritordeum) TDÖ denemeleri yapılmayacaktır. Yurtdışında VCU denemeleri (Value for Cultivation and Use) olarak isimlendirilen TDÖ denemelerinin amacı; çok geniş alanlarda tarımı yapılan ve ülke üretiminde stratejik öneme sahip bitki türlerinde üstün çeşitlerin kullanımının sağlanması ve çeşit kaynaklı üretim kayıplarının önüne geçilmesidir. BÜGEM tarafından serin iklim tahılları bitki grubunun en fazla ekiliş alanı ve üretime sahip türleri olan arpa, ekmeklik ve makarnalık buğdayda TDÖ denemelerine devam edilmesi yönünde karar verilmiştir. Bu türlerle karşılaştırıldığında yulaf, tritikale ve çavdarda ülkemiz ekiliş alanı ve üretimi oldukça sınırlıdır. Çavdarda şu an milli çeşit listesinde hiçbir çeşit yer almamaktadır. Bu veriler doğrultusunda, TDÖ denemelerinin yapılacağı serin iklim tahılları türlerinin seçiminde ülke tarımsal üretiminin korunması ve geliştirilmesi bakımından doğru tercihlerde bulunulduğu söylenebilir.

TDÖ denemeleri yapılmadan sadece FYD testlerine göre kayıt altına alınacak bitki türlerinde, bir çeşit UPOV üyesi bir ülkede tescil edilmiş ve FYD testleri UPOV kurallarına göre yapılmış ise; bir yetiştirme dönemi doğrulama testlerine alınması hükmü getirilmiştir. Yürürlükten kalkan yönetmelikte yurtdışında FYD testleri yapılmış çeşit adaylarının TDÖ denemelerinde, FYD kriterlerinde bir problem görülmesi durumunda tescil işlemlerinin sonlandırılması şeklinde bir uygulama yapılmaktaydı. Başvuru sahibinin talep etmesi durumunda, çeşit adayı FYD testlerine alınmak şartıyla tekrar tescil başvurusunda bulunabilmekteydi. Yeni yönetmelikte de benzer uygulama devam etmekte olup, TDÖ denemelerinde çeşidin karakterleri ile çeşit özellik belgesinde uyumsuzluk görülmesi durumunda, başvuru sahibi, durumdan yazılı olarak haberdar edilmekte ve çeşit adayı FYD testlerine alınmaktadır.

Serin iklim tahıllarında geçmişte temmuz ve ağustos aylarında tescil başvurusu yapılabilirken, yeni yönetmelikte tescil başvuruları sadece ağustos ayında yapılabilmektedir. Söz konusu durumun büyük bir etkisi olmayacaktır. Serin iklim tahıllarında hasat zamanı bölgelere göre değişmekle birlikte ağırlıklı olarak temmuz ayında yapılmaktadır. Başvuru öncesi denemelerin hasatlarının yapılarak kalite analizlerinin tamamlanması temmuz ayı başvuru dönemine yetişmemekte ve tescil başvurularının tamamına yakını ağustos ayında yapılmakta idi. Bu nedenle son değişiklik uygulamada bir problem veya hak kaybı oluşturmayacaktır.

Geçmişte TDÖ denemelerinde standart veya kontrol çeşitleri başvuru sahibi önerisi ile TTSM belirlerken, güncel yönetmelikte bu yetki tamamen TTSM'ye verilmiştir. Söz konusu değişikliğin olumsuz bir etkisi öngörülmemektedir. Ayrıca TTSM'nin TDÖ denemelerini yürütmekte zorlandığı bölge ve durumlarda başvuru sahibinden denemelerin yürütülmesinde lokasyon ve imkanları sağlaması istenebilecektir.

Tarla bitkilerinde tescil komitesinin yapısında önemli bir değişiklik yapılmamıştır. Tohum Sanayicileri ve Üreticileri Alt Birliği ile Bitki Islahçıları Alt Birliği komite üyesiyken, yeni mevzuatta 2 üye için Türkiye Tohumcular Birliği'nin üye göndermesi hükmü getirilmiştir.

Geçmişte kayıt süresi uzatımında özellikle serin iklim tahıllarında problemler yaşanabilmekteydi. Yapılan değişiklikle kayıt süresi uzatımında FYD testleri zorunluluğu kaldırılmıştır. Eğer çeşit listeden düşmemiş ise dilekçe ve ücret dekontu ile kayıt süresi uzatılabilecektir. Çeşit milli çeşit listesinden düşmüş ise FYD testlerine alınması hükmü yeni mevzuatta yer almıştır.

Deneme materyallerinin TTSM'ye teslim edilmesinde birçok bitki türünde problemler yaşanmıştır. Eski mevzuatta iki yetiştirme dönemi tohumluk materyal teslim edilmediğinde tescil işlemleri sonlandırılmaktaydı. Yeni mevzuatta deneme materyalinin herhangi bir yetiştirme döneminde teslim edilmemesi durumunda çeşit adayının tescil işlemleri sonlandırılacağına dair hüküm getirilmiştir. Eski mevzuattaki uygulama, TTSM için denemeleri yürütmede ve raporlamada büyük yük getirmekteydi. Bazı başvuru sahipleri ise üretim izni süresini uzatmak için kasıtlı olarak numune vermeme yolunu tercih etmekteydi. Yeni hüküm birçok problemi ortadan kaldıracak ve başvuru sahiplerini daha dikkatli davranmaya sevk edecektir.

Yukarıda açıklanan değişiklikler dışında, Bitki Çeşitlerinin Kayıt Altına Alınması Yönetmeliği'nde başvuru sahipleri ve TTSM'ye bürokratik ve teknik konularda kolaylık sağlayacak birçok değişiklik yapılmıştır.

4. SERİN İKLİM TAHILLARI TESCİL DENEMELERİNDEKİ TEKNİK UYGULAMALARIN DEĞERLENDİRİLMESİ

Serin iklim tahılları ülkemiz tarımında önemli bir yere sahip olması nedeniyle, yeni geliştirilen çeşitlerin tescil denemelerinin bilimsel ve teknik kurallara uygun yapılması stratejik bir öneme sahiptir. TTSM özellikle TDÖ denemelerini kamu tarımsal araştırma enstitüleri ile iş birliği içinde yürütmektedir. Tescil raporlarındaki deneme sonuçları incelendiğinde, TDÖ denemelerinde lokasyon sayılarında düşüşler görülmektedir. Ülkemizin en önemli serin iklim tahılları tarımının yapıldığı Orta Anadolu Bölgesinde yıllık lokasyon sayısının 3 civarında olduğu görülmektedir. Orta Anadolu Bölgesinin tümünü örnekleyecek sayıda lokasyon sayısına ulaşılması, çeşit adaylarının performanslarının daha doğru belirlenebilmesi için uygun olacaktır. Son yıllarda iklim koşullarında yaşanan ekstrem durumlar, deneme maliyetlerinin artması, TDÖ denemelerindeki çeşit sayılarının artması ve enstitülere büyük iş yükü getirmesi, başvuru sahiplerinin denemeler için yeterli tohumluk materyale sahip olmaması gibi nedenlerden dolayı TTSM lokasyon sayısında azaltmaya gitmek zorunda kalmaktadır.

TDÖ denemelerinde verim dışında özellikle kalite analizlerinin sayısında da büyük bir azalma söz konusudur. Geçmişte hemen hemen tüm lokasyonlar için kalite analizleri yapılırken, son yıllarda yetiştirme dönemi başına bir lokasyonda analiz yapılmaktadır. Analiz maliyetlerinin artması ve tescil başvuru ücretlerinin yetersiz kalması bu durumda en büyük faktör olarak görülmektedir.

Serin iklim tahıllarında yaşanan iklim değişikliğinin de etkisi ile hastalıklar daha önemli hale gelmiştir. Serin iklim tahıllarında hastalık testleri yapılmamakta, TDÖ denemelerinde tarla gözlemleri şeklinde çeşit adaylarının reaksiyonları belirlenmektedir. Yapılacak yönetmelik değişikliği ile tescil ücretlerine hastalık testleri için de ücretler eklenmeli ve hastalık testlerinin yapay epidemi koşullarında ilgili enstitü ve üniversiteler tarafından yapılmasının sağlanması gerekli görülmektedir.

SONUÇ

Serin iklim tahılları Türkiye'nin en önemli tarımsal ürünlerini oluşturan bitki grubudur. Biyotik ve abiyotik etmenlerin tarımsal üretimde öneminin arttığı yıllar yaşanmaktadır. Başta kuraklık olmak üzere stres faktörleri ile mücadelede en etkili, çevreci ve ekonomik yöntem, üstün genotiplerin geliştirilmesidir. Bitki ıslahçılarının uzun yıllar ve emek sarf ederek geliştirdiği yeni çeşitlerin en doğru şekilde test edilmesi ve böylelikle tarımsal, teknolojik ve hastalıklara dayanım özelliklerinin ortaya konulması büyük önem arz etmektedir. Bunun için de stratejik bir kurum olan TTSM'nin fiziki ve teknik kapasitesinin üst düzeye yükseltilmesi gerekmektedir.

ABSTRACT

Cool season cereals are the most widely cultivated plant group due to the ecological conditions in Türkiye. Wheat and barley are the two prominent species among cool season cereals and their cultivation in our country is mostly based on natural rainfall. Wheat provides raw materials for flour, pasta, bulgur, biscuits and other foodstuffs, and Türkiye is one of the leading exporters of flour and pasta in the world. Meteorological data, especially the amount of precipitation and its distribution during the growing period, is the main factor determining the amount of production and yield in wheat cultivation. The effects of global warming and climate change are also negatively affecting our country. Türkiye's average temperature between 1970 and 2024 was 13.3 °C, while 2024 was the warmest year recorded in this period with an average of 15.3 °C. Despite the upward trend in temperatures, the average rainfall and relative humidity continue to decline from year to year. Extreme conditions in meteorological data may cause an increase in fungal diseases that are effective in agricultural production. Black point disease, which manifests itself with brown and black discoloration in the area where the embryo is located in the kernel, is one of them. Biotic and abiotic factors can cause discoloration of the kernel. Among biotic factors, black point can be caused by pathogens such as *Alternaria* spp., *Cladosporium* spp., *Cochliobolus* spp., *Curvularia* spp. and *Fusarium* spp. Since black point affects the end product, many countries have imposed limitations on the proportion of infected grains in trade. Black point grains may pose a problem in flour and pasta production due to discoloration, and some fungal species may produce mycotoxins that are toxic and risky for humans and animals. Negative effects may also occur in the use of infected grains as seed material. Infected seeds may cause decreases in germination rate, germination power and emergence rate under field conditions. In the control of the disease, the breeding of resistant

varieties, which is the most economical and environmentally friendly method, should be given importance and care should be taken in irrigation during the grain filling period.

Keywords: Resistant genotypes, Relative humidity, Temperature, Precipitation

DEĞİŞEN İKLİM KOŞULLARI VE SERİN İKLİM TAHILLARINDA EMBRİYO KARARMASI

ÖZET

Serin iklim tahılları Türkiye'nin sahip olduğu ekolojik koşullar nedeniyle en fazla tarımı yapılan bitki grubudur. Serin iklim tahılları içerisinde buğday ve arpa öne çıkan iki cinstir ve ülkemizde daha çok doğal yağışa dayalı olarak yetiştiriciliği yapılmaktadır. Buğday; un, makarna, bulgur, bisküvi ve diğer gıda maddelerine hammadde sağlamakta olup, Türkiye un ve makarna ihracatında dünyada ilk sıralarda yer almaktadır. Meteorolojik veriler özellikle de yağış miktarı ve yağışın yetiştirme dönemindeki dağılımı buğday yetiştiriciliğinde üretim miktarını ve verimi belirleyen ana faktördür. Küresel ısınma ve iklim değişikliğinin etkileri ülkemizi de olumsuz etkilemektedir. Türkiye'nin 1970-2024 yılları arasındaki sıcaklık ortalaması 13.3 °C iken, 2024 yılı ortalaması 15.3 °C ile bu dönemde kaydedilmiş en sıcak yıl olmuştur. Sıcaklıklardaki artış trendine karşın, yağış miktarı ve oransal nem ortalamalarında yıldan yıla bir düşüş trendi devam etmektedir. Meteorolojik verilerdeki ekstrem durumlar, tarımsal üretimde etkili mantari hastalıkların da artışına sebep olabilmektedir. Tanede embriyonun bulunduğu bölgede, kahverengi ve siyah renk değişikliği ile kendini gösteren embriyo kararması hastalığı bunlardan birisidir. Biyotik ve abiyotik faktörler tanede renk bozulmasına neden olabilmektedir. Biyotik faktörler arasında embriyo kararmasına *Alternaria* spp., *Cladosporium* spp., *Cochliobolus* spp., *Curvularia* spp. ve *Fusarium* spp. gibi patojenler sebep olabilmektedir. Embriyo kararması son ürünü etkilediği için, birçok ülke ticarette enfekteli tane oranına yönelik sınırlamalar getirmiştir. Embriyo kararmasına uğramış taneler, renk bozulması nedeniyle un ve makarna üretiminde problem teşkil edebilmekte, ayrıca bazı mantar türleri insan ve hayvanlar için zehirli ve riskli mikotoksinler üretebilmektedir. Enfekteli tanelerin tohumluk materyal olarak kullanımında da olumsuzluklar ortaya çıkabilmektedir. Enfekteli tohumlar tarla koşullarında, çimlenme hızı, çimlenme gücü ve çıkış oranında azalmalara sebep olabilmektedir. Hastalıkla mücadelede en ekonomik ve çevreci yöntem olan dayanıklı çeşit ıslahına önem verilmeli, tane doldurma döneminde yapılacak sulamalarda dikkatli olunmalıdır.

Anahtar Kelimeler: Dayanıklı çeşit, Nispi nem, Sıcaklık, Yağış

1. GİRİŞ

Türkiye, tahıllarda 11.5 milyon hektar ekiliş alanına ve 39 milyon ton üretime sahiptir (TÜİK, 2024). Toplam üretim miktarında; buğday 20.8 milyon ton, arpa 8.1 milyon ton, mısır 8.1 milyon ton ve çeltik 1.0 milyon ton ile en önemli tarımsal ürünleri oluşturmaktadır. Diğer serin iklim tahıllarının (Yulaf, tritikale ve çavdar) yaklaşık 0,9 milyon tonluk üretim değeri mevcuttur. Ülkemizin sahip olduğu ekolojik koşullar serin iklim tahıllarının böylesine yaygın yetiştiriciliğinin temel nedenidir. Serin iklim tahılları tarımı ağırlıklı olarak doğal yağışa dayalı yapılmaktadır. Sulama imkanı olan alanlarda yoğun gübre kullanımı ile birlikte yüksek verim değerlerine de ulaşılabilmektedir. Buğday yetiştiriciliğinin yaklaşık %80'den fazlası doğal yağış koşullarında ve özellikle ülkemizin Orta Anadolu ve geçit bölgelerinde yapılmaktadır (Aydoğan ve Soylu, 2017).

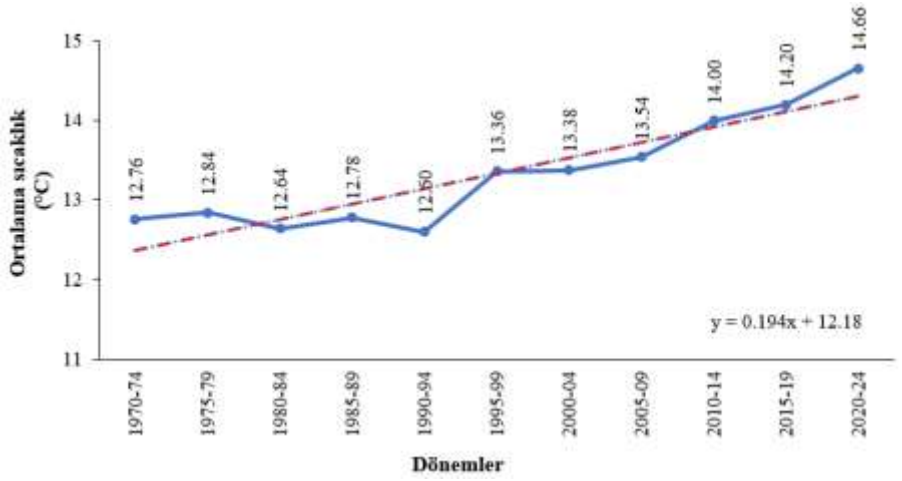
Ülkemiz buğday ekiliş alanı ve üretiminde olduğu kadar, buğdaya dayalı mamul üretiminde ve ihracatında dünyada önemli ülkelerden biridir. 2023 yılında toplam 3.66 milyon tonluk un ihracatından 1.47 milyar $ gelir elde etmiştir (TUSAF, 2023). Toplam makarna üretim kapasitesi 3 milyon ton kadar olup, 2023 yılında 907 bin tonluk ihracat miktarına ulaşılmıştır (TMSD, 2023). Dünyada makarna ihracatında Türkiye ikinci sırada konumlanmaktadır. Yine bulgur, bisküvi ve diğer mamul ürünler bakımından ülkemiz yüksek üretim ve ihracat değerlerine sahiptir.

Dünya nüfusundaki artışa paralel olarak artan gıda ihtiyacına karşın; savaşlar, salgın hastalıklar, iklim değişikliği ve diğer nedenlerden dolayı tarımsal üretimde dalgalanmalar yaşanmaktadır. 2008 ve 2009 yıllarında buğday ekiliş alanları benzer değerlerde iken, üretim miktarı 2008 yılında yaşanan kuraklıktan dolayı 17.8 milyon ton olurken, meteorolojik verilerin uzun yıllar ortalamalarının oldukça üzerinde olduğu 2009 yılında ise 20.6 milyon ton olarak gerçekleşmiştir (TÜİK, 2024). Bu durum ülkemizde buğday tarımının ağırlıklı olarak doğal yağışa dayalı yapılmasının da bir göstergesidir. Fazla yağışın ve ekstrem sıcaklık değerlerinin görüldüğü yıllarda ise görülen bitki fungal hastalıklarından kaynaklanan göreceli verim ve kalite kayıpları da ciddi problemler oluşturmaktadır. Birim alandan fazla tane verimi alınmasına yönelik olarak uygulanan yoğun girdi ve yetiştirme teknikleri, embriyo kararması gibi hastalıklara neden olmakta ve un, makarna, bulgur vs. mamul maddelerin üretiminde olumsuzluklar oluşturmaktadır.

2. TÜRKİYE'DE İKLİMSEL VERİLERDEKİ DEĞİŞİM

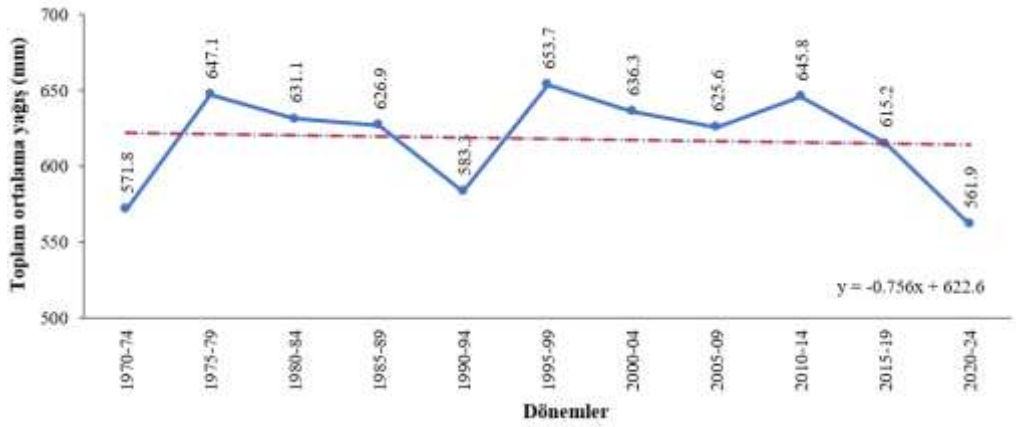
Küresel ısınma ve buna bağlı olarak yaşanan iklim değişikliğinin etkileri tüm dünyada artarak devam etmektedir. Bazı meteorolojik parametreler incelendiğinde Türkiye'nin de iklim değişikliğinden büyük ölçüde etkilendiğini göstermektedir. Meteoroloji Genel Müdürlüğü'nün Meteorolojik Parametrelerin Türkiye Analizi raporlarında 239 istasyondan elde edilen verilere göre; ülkesel ortalama sıcaklık 1970-2024 yılları arasında 13.3 °C'dir. Bu yıllar arasında en sıcak yıl 15.3 °C ile 2024 yılı, en soğuk yıl ise 11.4 °C ile 1992 yılıdır (MGM, 2024). Şekil 1'de Türkiye genelinin beşer yıllık sıcaklık ortalamaları verilmiştir. 1970-74 döneminde ortalama sıcaklık 12.76 °C, 2020-24 döneminde ise 14.66 °C olarak ölçülmüştür. Ortalama sıcaklıklardaki artış eğilimi regresyon sabiti 12.18 iken, regresyon katsayısı 0.194'dür (y=0.194x+12.18). Meteoroloji Genel Müdürlüğü'nün 239 istasyon verilerine dayanarak ortaya

koyduğu bu değerler, ülkemizin ortalama sıcaklıklarındaki artış eğilimini açıkça ortaya koymaktadır.



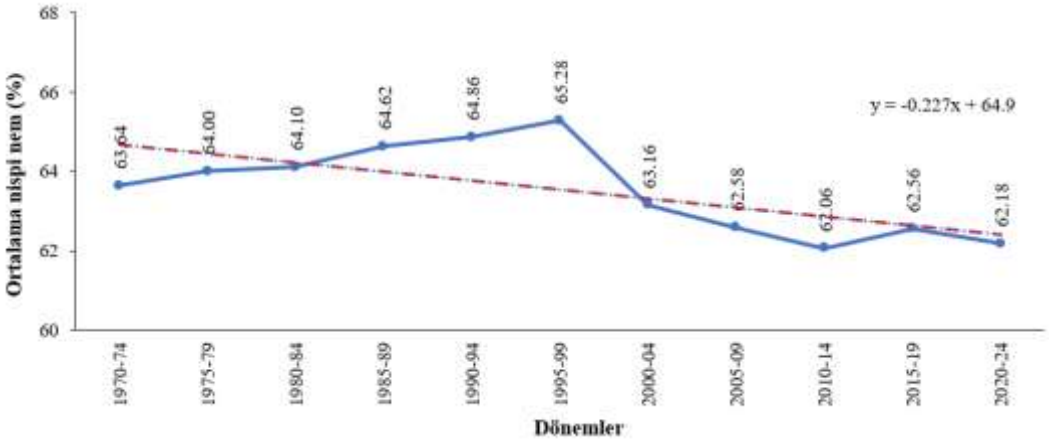
Şekil 1. Türkiye'de dönemsel ortalama sıcaklık (MGM, 2024)

Serin iklim tahılları yetiştiriciliğinde en önemli meteorolojik parametrelerden birisi de yağış ve bu yağışın mevsimsel dağılımıdır. Meteoroloji Genel Müdürlüğü'nün Meteorolojik Parametrelerin Türkiye Analizi raporlarında 224 istasyondan elde edilen verilere göre; ülkemizin ortalama toplam yağışı 618.1 mm'dir. 2009 yılı 793.8 mm ile en fazla yağışlı yıl olurken, yağışın en az kaydedildiği yıl ise 493.1 mm ile 2008 yılıdır. 1970-2024 yılları arasındaki beşer yıllık dönemler esas alındığında, yağış miktarının dalgalı bir seyir izlediği görülmektedir (Şekil 2). Tüm dönemlerdeki verilerin analizi sonucunda negatif regresyon katsayısı (-0.756) elde edilmiştir. Yani dönemsel olarak Türkiye'de yağış miktarında azalış eğilimi görülmektedir (MGM, 2024). Toplam yağışın aylara dağılımında da uzun yıllar ortalamasından sapmalar son yıllarda artmıştır. Embriyo kararmasına etkisi açısından tane doldurma dönemindeki yağışlar önemlidir. Örneğin haziran ayı uzun yıllar ortalaması 32.8 mm iken, 2023 yılı Haziran ayında 54.5 mm yağış düşmüştür.



Şekil 2. Türkiye'de dönemsel toplam ortalama yağış (MGM, 2024)

Şekil 3'de Meteoroloji Genel Müdürlüğü'nün Türkiye genelindeki 236 istasyondan elde ettiği dönemsel oransal nem değerleri verilmiştir. Özellikle 2000 yılından sonraki yıllarda nispi nem ortalamalarındaki düşüş trendi hızlanmıştır. Türkiye'nin uzun yıllar nispi nem ortalaması %63.5 olup, nispi nemin en yüksek (%66.7) kaydedildiği yıl 1991 ve nispi nemin en düşük (%59.6) kaydedildiği yıl ise 2013 yılıdır. Beşer yıllık dönemsel nispi nem ortalamalarının analizinde regresyon sabiti 64.9, regresyon katsayısı ise -0.227'dir (Şekil 3). Yağış miktarında olduğu gibi nispi nem ortalamalarında da yıldan yıla bir düşüş trendi devam etmektedir.



Şekil 3. Türkiye'de dönemsel ortalama nem (MGM, 2024)

Diğer meteorolojik parametreler bakımından Meteoroloji Genel Müdürlüğü'nün Meteorolojik Parametrelerin Türkiye Analizi raporlarında ülkemizin kar örtülü gün sayısında düşüş eğilimi (y =-0,164x + 32,37), farklı toprak derinliklerindeki sıcaklık bakımından yükseliş eğilimi olsa

da yataya yakın bir regresyon katsayısı belirlenmiştir (MGM, 2024). Tarımsal açıdan bir diğer önemli parametre ise dolu yağışının olduğu gün sayısıdır. Daha çok lokal yağışlar olsa da etkileri çok yıkıcı olmaktadır. Meteorolojik Parametrelerin Türkiye Analizi raporunda 1980-2008 yılları arasında, dolulu gün sayısı 0.44-0.99 gün arasında dağılım gösterirken, 2009-2024 yılları arasında ise dolulu gün sayısı 1.21-2.69 gün arasında dağılım göstermiştir.

Yukarıda Meteoroloji Genel Müdürlüğü'nce ortaya konulan parametrelerin analizi, ülkemizin iklimsel verilerinde bir değişimin olduğunu açıkça ortaya koymaktadır. Toplum, ülkemizdeki barajlardaki su seviyelerinin düşüşü, oluşan hortumlar, ceviz büyüklüğündeki dolu yağışları, seller, orman yangınları vs. ekstrem durumları basın yayın ve sosyal medyadan takip etmektedir. Ancak meteorolojik verilerdeki değişimin, insan ve hayvanların besin ihtiyacının karşılanması için yapılan bitkisel üretime etkileri daha geri planda kalmaktadır. Önümüzdeki yıllarda iklimdeki değişimin gerek doğal floradaki ve gerekse de tarımsal üretimdeki etkilerinin daha çok hissedileceği öngörülmektedir.

3. EMBRİYO KARARMASININ ÖNEMİ

Embriyo kararması, tanede embriyonun bulunduğu bölgede kahverengi ve siyah renk değişikliği ile kendini gösteren mantari bir hastalıktır (Masiello ve ark., 2020). Enfeksiyon şiddeti arttıkça embriyonal bölgedeki renk bozulması tanenin diğer kısımlarına da yayılabilir (Tunca ve ark., 2016). Embriyo kararmasına *Alternaria* spp., *Cladosporium* spp., *Cochliobolus* spp., *Curvularia* spp. ve *Fusarium* spp. gibi patojenler sebep olabilmektedir (Ünal ve Çakır 2017). Genellikle mantari etmenler embriyoda kararmaya veya renk bozulmasına neden olsa da bazen fizyolojik stres faktörleri de bu duruma yol açabilmektedir (Mak ve ark., 2006). Abiyotik stres faktörleri, özellikle de tane olum dönemlerindeki yoğun yağış ve nem ile ekstrem sıcaklıklar, embriyoda kararmalara neden olabilmektedir (Kumar ve ark., 2002). Şekil 4'de Yozgat ili Yerköy ilçesinde 2023-2024 yetiştirme döneminde, ekmeklik buğday denemelerindeki embriyo kararmasına uğramış, farklı hastalık şiddetindeki taneler görülmektedir.

Şekil 4. Ekmeklik buğdayda farklı hastalık şiddetindeki embriyo kararmalı taneler

Embriyo kararması ekmeklik ve makarnalık buğday yanında diğer serin iklim tahıllarında da görülebilir. Makarnalık buğday hassas türlerden olup, enfeksiyon görülme sıklığı ve şiddetine bağlı olarak ticaretinde problemler oluşturabilir (Tunca ve ark., 2016). Embriyo kararması son ürünü etkilediği için birçok ülke ticarette enfekteli tane oranına yönelik sınırlamalar getirmiştir. Avustralya'da %5, Kanada'da %10, ABD'de ise %2-4 embriyo kararmasında sınır değerler olarak uygulanmaktadır (Li ve ark., 2014). Türkiye'de buğdaydaki embriyo kararmalı tane oranı %8'i aştığında düşük vasıflı sınıfa girmekte, %14 ise Toprak Mahsülleri Ofisi için üst alım sınırıdır. Embriyo kararmasına uğramış taneler renk bozulması nedeniyle kalitede düşüşlere neden olması yanında, *Alternaria* spp. gibi bazı mantar türlerinin zehirli ve riskli olan mikotoksinleri üretmeleri de büyük problem teşkil etmektedir (Masiello ve ark., 2020; Amatulli ve ark., 2013).

Bazı mantar türlerinin neden olduğu embriyo kararması enfeksiyonu tohumluk materyal üzerinde olumsuzluklar meydana getirmektedir. Enfekteli tohumların kullanımı nedeniyle tarla koşullarında, çimlenme hızı, çimlenme gücü ve çıkış oranında azalmalar görülmektedir (Toklu ve ark., 2008). Bununla birlikte kök ve sürgün gelişimindeki bozukluklar nedeniyle verim üzerinde de etkileri vardır (Li ve ark., 2014; Tunca ve ark., 2016).

Embriyo kararmasında genetik ve çevresel faktörler etkilidir. Genetik olarak hassas olan çeşitlerde çevresel koşullar hastalık epidemisine uygun değilse, hastalık görülme sıklığı ve şiddeti düşük seviyelerde kalmaktadır. Dayanıklı genotiplerde ise hastalık gelişimi için çevresel koşullar uygun olsa da embriyo kararması görülme sıklığı çok düşük seviyelerde kalmaktadır. Aktaş ve Endes (2025) buğday genotiplerinin embriyo kararması hastalığına verdikleri tepkinin farklılık gösterdiğini ve bazı genotiplerin çevresel koşullara bağlı olarak hastalık görülme sıklığında 7-8 kat artış olduğunu ortaya koymuştur. Çevresel koşullar hastalık şiddetinin yüksek seviyede ortaya çıkmasına neden olabilir. Bu nedenle genotiplerin maksimum duyarlılığının belirlenmesi çok önemli hale gelmektedir. Khani ve ark. (2018) ile Li ve ark. (2020) buğdayda embriyo kararmasının ortaya çıkmasında genetik özelliklerin önemli bir faktör olduğunu bildirmişlerdir. Aktaş ve Endes (2025) ile Khani ve ark. (2018) yapılan melezleme çalışmalarında, melez döllerin ebeveynlerin göstermiş olduğu hastalık görülme sıklığı değerleri arasında hastalık gözlem değerleri aldıklarını bildirmektedir.

En yüksek enfeksiyon görülme sıklığı tane doldurma döneminin erken aşamalarında yoğun yağışların gerçekleştiği bölgelerde meydana gelmektedir (Conner ve Kuzyk, 1988). Benzer şekilde Conner (1989) yaptığı çalışmada, tane gelişiminden önceki dönemlerde yapılan sulamaların embriyo kararması görülme sıklığını etkilemediğini, süt veya hamur olum aşamalarında yapılan sulama ve yağış miktarının artmasının enfeksiyon görülme sıklığı ve şiddetini arttırdığını tespit etmiştir. Birim alan tane verimini arttırmak için yoğun gübre kullanımı ve sulamalar embriyo kararmasının ortaya çıkmasında etkilidir.

SONUÇ VE ÖNERİLER

Embriyo kararması son kullanım ürünü olan taneyi etkilemekte ve önemli ticari kayıplara yol açabilmektedir. Enfekteli taneler hem gıda olarak kullanılacak ürünün kalitesini düşürmekte hem de tohumluk olarak kullanılacak materyalin biyolojik değerini azaltmaktadır. Hastalık ile

mücadelede dayanıklı çeşit kullanımı, kimyasal mücadele ve biyolojik mücadele seçenekleri kullanılabilir. Ancak bu yöntemler arasında en çok öne çıkan dayanıklı çeşit ıslahı ve bu çeşitlerin tohumluklarının riskli bölgelerde kullanılmasıdır. Ayrıca yetiştirme tekniklerinde dikkatli olunmalı, özellikle hassas çeşitlerin yetiştirildiği alanlarda döllenme sonrasında yapılacak sulamaların enfeksiyonu tetikleyebileceği unutulmamalıdır. Ekonomik olması yanında, en çevreci mücadele yöntemi olan dayanıklı çeşit geliştirme çalışmalarına önem verilmelidir.

ORCID NO: 0000-0001-6878-1673

ABSTRACT

This study examines the circular economy practices that have the potential to transform the agricultural sector in Turkey and explores the possibilities of transitioning to more sustainable and resilient agricultural practices. Recognizing the environmental and economic challenges facing conventional agriculture, including resource depletion and pollution, this study explores specific applications of the circular economy that are relevant to the Turkish context. These applications include comprehensive organic waste management strategies such as composting and biogas production, innovative water recovery technologies to alleviate water scarcity exacerbated by climate change, and the integration of renewable energy sources to reduce dependence on fossil fuels and lower carbon emissions. The study quantifies the potential benefits by providing a detailed assessment of the environmental sustainability and economic efficiency gains that can be achieved by implementing these circular practices. A key component of this study is to identify the current state of circular agriculture initiatives in Turkey. This includes analyzing existing practices, highlighting key implementation barriers to wider adoption, such as lack of infrastructure and awareness, and identifying critical policy gaps that hinder progress. The analysis aims to contribute to the development of applicable strategies for Turkey by drawing on successful global examples of the circular agriculture examples in diverse geographical and economic contexts. Furthermore, the study explores domestic investment opportunities, including public-private partnerships, that could boost the growth of the circular agricultural practices across the country and improve the overall competitiveness of the sector. Based on the research findings, the study provides concrete and actionable policy recommendations designed to promote circularity within the Turkish agricultural sector. These recommendations are specifically tailored to guide decision makers at the government level, empower farmers to adopt sustainable practices through incentives and training programs, and inform policy makers in developing supportive regulatory frameworks and financial mechanisms. The ultimate goal is to facilitate the creation of a more environmentally sustainable, economically viable and resilient agricultural system in Turkey, contributing to long-term food security, environmental protection and rural development.

SÜRDÜRÜLEBİLİR BİR GELECEK İÇİN DÖNGÜSELLİĞİN BENİMSENMESİ: TARIMDA DÖNÜŞÜM

ÖZET

Bu çalışma, Türkiye'deki tarım sektörünü dönüştürme potansiyeline sahip döngüsel ekonomi uygulamalarını inceleyerek, daha dayanıklı ve sürdürülebilir tarımsal yapıya geçişin olanaklarını araştırmaktadır. Kaynak tükenmesi ve kirlilik de dahil olmak üzere geleneksel tarımın karşı karşıya olduğu çevresel ve ekonomik zorlukları göz önüne alan bu araştırma, Türkiye bağlamına uygun belirli döngüsel ekonomi uygulamalarını araştırmaktadır. Bu uygulamalar arasında kompostlama ve biyogaz üretimi gibi kapsamlı organik atık yönetimi stratejileri, iklim değişikliğiyle daha da şiddetlenen su kıtlığını hafifletmeye yönelik yenilikçi su geri kazanım teknolojileri ve fosil yakıtlara olan bağımlılığı azaltarak ve karbon emisyonlarını düşüren yenilenebilir enerji kaynaklarının entegrasyonu yer almaktadır. Araştırma, bu döngüsel uygulamaların benimsenmesiyle elde edilebilecek çevresel sürdürülebilirlik ve ekonomik verimlilik kazanımlarının ayrıntılı bir değerlendirmesini sunarak potansiyel faydaları nice olarak ortaya koymaktadır. Bu çalışmanın temel bir bileşeni, Türkiye'deki döngüsel tarım girişimlerinin mevcut durumunun ortaya konmasıdır. Bu kapsamda mevcut uygulamaları analiz edilmekte, altyapı ve farkındalık eksikliği gibi daha geniş bir benimsemeyi engelleyen temel uygulama engellerini belirlenmekte ve ilerlemeyi engelleyen kritik politika boşluklarını tespit edilmektedir Analiz, farklı coğrafi ve ekonomik bağlamlarda başarılı küresel döngüsel tarım örneklerinden yararlanarak Türkiye için uygulanabilir stratejileri geliştirilmesine katkı sunmayı amaçlamaktadır. Ayrıca, ülkedeki kamu-özel sektör iş birliği gibi yerel yatırım fırsatları incelenmekte ve bu yatırımların döngüsel tarım uygulamalarının yaygınlaştırılmasında nasıl bir kaldıraç rolü üstlenebileceği değerlendirilmektedir. Araştırma bulgularına dayanarak, çalışma Türk tarım sektöründe döngüselliği teşvik etmeye yönelik somut ve uygulanabilir politika önerileri sunmaktadır. Bu öneriler, özellikle hükümet düzeyindeki karar alıcılara rehberlik etmeyi, çiftçilerin teşvikler ve eğitim programları aracılığıyla sürdürülebilir tarım uygulamalarını benimsemelerini desteklemeyi ve politika yapıcıların uygun yasal çerçeveler ve finansal mekanizmaların geliştirilmelerine katkı sunmayı hedeflemektedir. Nihai hedef, Türkiye'de daha çevre dostu, ekonomik olarak uygulanabilir ve dayanıklı bir tarım sisteminin oluşturulmasını kolaylaştırmak, uzun vadeli gıda güvenliğine, çevre yönetimine ve kırsal kalkınmaya katkıda bulunmaktır.

Anahtar Kelimeler: Döngüsel tarım, Sürdürülebilirlik, Hassas tarım, Çevresel etki, Kaynak verimliliği, Onarımcı uygulamalar, Kontrollü çevre tarımı.

INTRODUCTION

Rising global populations, rapidly diminishing natural resources, climate change and environmental degradation are calling into question the sustainability of traditional economic models. In this context, the circular economy concept has become an important alternative in recent years. The circular economy is a model that aims to minimise waste in production and consumption processes, reuse resources to return them to the economy and create systems compatible with nature (Ellen MacArthur Foundation, 2013). In contrast to the linear economic model of "take-use-throw", the circular economy is based on "redesign, reuse, recycle".

The agricultural sector occupies an important place among the application areas of the circular economy due to its direct dependence on natural resources. Basic inputs such as soil, water, biodiversity and energy are now under severe threat in terms of both quantity and quality. In addition, large amounts of organic waste and greenhouse gas emissions, such as methane produced during agricultural production processes, contribute to global warming (FAO, 2015). In this context, the circular economy offers significant environmental and economic opportunities to ensure sustainability in agriculture. Thanks to applications such as composting, biogas production, wastewater reuse, and integrated farming systems, productivity is increased, and the negative impact on the environment is reduced (Kirchherr et al., 2017).

Global climate change and the resulting risks, such as increasing drought, flooding, and yield losses in agriculture, further exacerbate the problem of food security. According to the FAO (2022) report, around 828 million people worldwide are affected by chronic hunger. Solving this problem requires not only an increase in production but also an efficient and cyclical use of resources. Circular economy applications in agriculture have the potential to create income diversity by reducing costs, especially for small and medium-sized farms (Geissdoerfer et al., 2017).

Looking at Turkey in particular, circular economy approaches have great potential due to its geographical diversity and rural structure based on agriculture. Around 65 million tons of agricultural waste and 160 million tons of animal waste are produced in Turkey every year. a large proportion of which is not recycled economically (Buğday Ekolojik Yaşamı Destekleme Derneği & ACR+, 2016). In this context, the circular economy model can be a strategic tool to increase resource efficiency in agricultural production and contribute to rural development. Environmental sustainability and waste management are among the Ministry of Agriculture and Forestry's Strategic Plan 2023-2027 priorities (Tarım ve Orman Bakanlığı, 2023).

The circular economy approach thus contributes to environmental concerns and increases economic efficiency and social prosperity. The agricultural sector is at the centre of this change and can potentially be the key to sustainable development in Turkey, especially in developing countries (Özkan, 2024).

The main objective of this study is to explore the concept of circular economy in the agricultural sector and to assess the impact of this approach on sustainable agricultural production at conceptual and practical levels. In particular, the potential contribution of applications such as organic waste management, biogas production, water reuse and renewable energy integration to Turkish agriculture will be analysed. In addition, the current status of circular economy

applications in agriculture in Turkey, implementation limitations, policy gaps and structural barriers are discussed, and suggestions for improvement are presented. The study aims to contribute to the scientific literature and guide decision-makers, farmers, and policymakers.

THE CONCEPT OF THE CIRCULAR ECONOMY AND ITS APPLICATION IN AGRICULTURE

The circular economy is an economic model that aims to manage resources effectively and sustainably. Its main goal is to ensure that products, materials and resources remain in the cycle for as long as possible and to minimise waste production (Ellen MacArthur Foundation, 2013). Four basic principles of the circular economy are at the forefront: reuse, recycling, waste reduction and renewability. In line with these principles, it is possible to reduce the environmental impact of economic activities, protect natural resources and develop production processes compatible with ecosystems (Geissdoerfer et al., 2017).

The agricultural sector is one of the most critical areas in which the principles of the circular economy are applied, as it is directly dependent on natural resources such as soil, water and energy. The large amount of organic waste and wastewater generated in agriculture can create economic value if properly managed. In this context, several areas of application should be mentioned.

First, composting organic waste is an important way to improve soil health and reduce the use of chemical fertilisers. Biological materials such as plant residues, animal manure and food waste can be decomposed under controlled conditions and transformed into compost with high nutritional value. This increases soil fertility and reduces dependence on synthetic inputs (FAO, 2015).

Another application is biogas and energy production. Animal waste, agricultural residues and organic food waste can be used for biogas production through biological fermentation. The methane gas produced in this process can be used to generate heat and electricity, while the remaining fermented material can be used as agricultural fertiliser. This method both reduces energy dependency and ensures waste disposal (Gürbüz & Özkan, 2021).

Reusing wastewater through its treatment is also crucial for the sustainable management of water resources in agriculture. Especially in regions with a high drought risk, water savings can be achieved by using municipal wastewater or agricultural drainage water for irrigation. Such systems are increasingly common in Turkey's south-eastern and central Anatolian regions (Özkan, 2024).

Agricultural systems with integrated animal husbandry are another example demonstrating the multiple benefits of the circular economy. In these systems, where crop and animal production are practised together, animal manure is used in the fields, while crop residues can be utilised as animal feed. This model reduces costs and creates a closed cycle on farms (Kirchherr et al., 2017).

Finally, using renewable energy in agricultural production represents the energy dimension of the circular approach. Technologies such as solar-powered irrigation systems, wind-powered

pumping systems or biomass boilers contribute to environmental sustainability by reducing farms' carbon footprint.

Therefore, the principles of the circular economy enable versatile applications that offer both environmental and economic benefits in the agricultural sector. These applications increase resource efficiency and contribute to the sustainability of agriculture.

EXAMPLES FROM GLOBAL APPLICATIONS

Circular economy applications have begun to transform the agricultural sector in many countries globally and have accelerated the transition to sustainable production models. The steps taken in this area in developed and developing countries also provide an important reference for countries with transformation potential, such as Turkey.

The Netherlands: High efficiency, low resource consumption

One of the most impressive examples of circular agricultural applications is the Netherlands. Following the principle of "producing more with less", the Netherlands pursues a policy prioritising both efficiency and environmental sustainability in agriculture. The country adopted the "Circular Agriculture" strategy in 2016 and set itself the goal of making all agricultural systems circular by 2030 (Klerkx et al., 2025)

The use of animal manure in compost and biogas production is widespread in agricultural production in the Netherlands. In addition, energy efficiency is achieved through water recycling and using solar energy in greenhouses (van der Salm et al., 2020). By implementing these practices, the country has significantly reduced agricultural carbon emissions while remaining Europe's second-largest agricultural exporter.

European Union: “Farm to Fork” and “Green Deal” Strategies

The European Union has set ambitious targets for sustainable agriculture with the European Green Deal announced in 2019. The "Farm to Fork" strategy developed within this agreement envisages reducing pesticide use by 50% by 2030, increasing the area under organic farming to 25% and increasing recycling rates for agricultural waste (European Commission, 2020).

Among the circular agriculture projects supported in EU countries, the conversion of biological waste into energy, integrated plant-animal production systems and wastewater reuse stand out (Lange et al., 2021). These policies reflect a holistic approach that focuses on environmental objectives, food security, and rural development (Islam & Zheng, 2025).

China and India: Transformation in Developing Countries

In countries with large populations and agricultural economies, such as China and India, circular agriculture is important from an environmental and social perspective. In China, "Eco-agriculture" projects have become widespread (Lun et al., 2022), including the conversion of

agricultural waste into energy (Wei et al., 2020), the reuse of treated wastewater in irrigation systems (Lyu et al., 2022) and biogas production (Wang et al., 2012. The Chinese government encourages environmentally friendly production by incorporating such practices into rural development plans (Yuan & Bi, 2006).

Circular farming practices are supported in India through various projects that offer environmental and social benefits (Khan & Mahajan, 2023). Small-scale mango producers in India are increasing their crop yields and conserving natural resources by adopting sustainable farming practices (Bisht et al., 2020). Agricultural waste is converted into various types of biofuels, such as biomethane, biohydrogen, biodiesel and biobutanol and used for energy production (Bhatia et al., 2020). Agricultural waste is a raw material for biogas and biofuel production and offers solutions for energy production and waste management (Kapoor et al., 2020).

The Circularity Action Platform for Agriculture and Food Systems (IAFS-CAP) promotes the adoption of circular economy principles in the production, processing and distribution of agricultural products (Intellecap, 2021). Sustainable agricultural practices are encouraged by training farmers (Shetty et al., 2010) on the use of organic fertilisers and biological pest control methods (Chowdhury et al. 2024).

INVESTMENT OPPORTUNITIES AND POTENTIAL AREAS IN TURKEY

From a circular economy perspective, there is substantial investment potential in energy production, waste management and sustainable resource utilisation in the Turkish agricultural sector (Özkan, & Kadağan, 2019). The circular economy approach offers new opportunities for the Turkish agricultural sector in terms of environmental sustainability and economic development. In the face of increasing food demand, depletion of natural resources and climate change, investments in waste management, energy efficiency and water conservation in agriculture are strategically important. Turkey's biomass capacity, sunshine duration and widespread agricultural activities provide suitable grounds for turning this potential into concrete opportunities.

Biogas Plants: Integrated Energy Production with Livestock Farming

The farm manure obtained from large and small livestock amounts to 640,000 tons per day or 234 million tons per year, calculated based on animal units. Assuming that some of this remains on pasture, the amount of controllable farm manure accumulates in barns and stables is over 200 million tons (Baytekin, 2024). This manure can be a valuable resource for biogas production with appropriate facility infrastructure. However, only 5 million tons of waste is used for biogas facilities (Çağatay, 2024).

Farm manure can primarily be used in biogas plants to generate electricity. For this purpose, the highest biogas production capacities are associated with potential facilities in Konya and Ankara, where biogas plants already exist. However, provinces such as Erzurum, Kars, and Diyarbakır in Eastern Turkey (Ertop et al., 2022) and regions such as Biga, Bayındır, Burdur,

Tire, Ödemiş and Karapınar, where intensive dairy farming is concentrated (Baytekin, 2024) but currently have no biogas facilities, also demonstrate significant potential for electricity generation if new plants are established.

There are 273 biomass facilities in Türkiye, 98 of which are biogas, licensed by the Renewable Energy Resources Support Mechanism (Çağatay, 2024). The production capacities and benefits of some prominent biogas plants can be summarised as follows.

Ankara Biogas Plant – ASKOÇ Enerji has the capacity to process 900 tons of animal and green waste per day. This plant produces 12.5 million cubic meters of biogas annually and generates 27.3 million kWh of electrical energy. 90 tons of organic fertiliser from the facility are also offered to the market, providing an annual CO_2 reduction of 400,000 tons (ASKOC, n.d.).

The Diyarbakır Agricultural-Based Specialized Livestock OSB Biogas Facility processes 600 tons of animal waste daily, generating 2,000 kWh of electrical and 2,000 kW of heat energy. In addition, this facility produces 70 tons of organic fertiliser are produced per year, making an economic contribution of approximately 200 million TL to the economy (AA, 2019).

The Akıncı Enerji biogas plant produces biogas mainly from laying hen waste. By processing 120 tons of waste per year, the plant generates 12 million kWh of electricity and 6,750 tons of organic fertiliser (Akıncı Enerji, t.y.).

Bekmezci Energy – Cankiri Biogas Facility processes 194 tons of animal and plant waste daily, generating 4,879.24 kWh of electricity. This facility plays an important role in environmental sustainability by using waste such as cattle waste and chicken manure (Ticaret Bakanlığı, t.y.).

These biogas plants are important examples of energy production from animal waste in Turkey and contribute to reducing environmental impacts. The widespread use of these plants, which create sustainable models in energy production and organic fertiliser production, opens up important opportunities for the country's economy (Gürbüz & Özkan 2021).

Food Waste Processing Systems: Turning Waste into Resources

Approximately 18 million tons of food waste is generated annually in households and retail chains alone (UNFCCC, 2019). Processing and turning this waste into animal feed, compost, or biogas production provides economic and environmental benefits.

The "food banking" and food waste collection projects initiated by the Istanbul Metropolitan Municipality (İBB) are concrete examples of circular economy models in collaboration with the private sector. Food waste collection and redistribution projects carried out in collaboration with the Food Rescue Association bring social and environmental benefits. In addition, many TÜBİTAK- --supported university projects aimed to evaluate food industry wastes in areas such as feed additives or bioplastics production (Özçimen & Karaosmanoğlu, 2019).

The Food Rescue Association (GKTD) was established in Turkey in 2017 to prevent food waste and improve the food banking system. The association increased the national food bank capacity by 30 times and provided regular food aid to 1,100,000 people in need. It also

contributed to saving over 35 tons of food and preventing 80,000 tons of carbon emissions (Gıda Kurtarma Derneği, 2019).

Fazla, a technology-focused waste management platform based in Turkey, was founded in 2016 to bring food, packaging, textile and chemical waste into the circular economy. Among the services offered by Fazla are the Fazla Market, which offers surplus products at a discount, the donation system that allows food donations to those in need, and the channelling of food waste to animal feed producers (Fazla, 2025).

In addition, many university projects supported by TÜBİTAK have aimed to evaluate food industry waste in areas such as feed additives or bioplastic production (Özçimen & Karaosmanoğlu, 2019).

Composting Facilities: Revitalizing the Soil

In line with environmental sustainability goals in Turkey, many municipalities have established composting facilities to manage and utilise organic waste. Major urban centres, such as the Istanbul Metropolitan Municipality and district municipalities like Beyoğlu and Pendik, are engaged in composting activities. Similar infrastructures are also available in Keçiören and Mamak districts in Ankara, as well as in metropolitan municipalities such as Kayseri and Şanlıurfa. Facilities established in different regions such as Adana Seyhan, Mersin (both the Metropolitan Municipality and Yenişehir Municipality), Muğla, Balıkesir and Antalya Organized Industrial Zone process organic waste collected from neighborhood markets, parks and gardens, both to produce fertiliser and to contribute to waste management. Local governments such as Yıldırım and Nilüfer in Bursa, Keşan and Güney Edirne Solid Waste Union in Edirne, Körfez and Gebze Municipalities in Kocaeli, Aydın Söke, Pamukkale in Denizli, Selçuklu in Konya and Altınova and Çiftlikköy in Yalova also actively participate in this process with their compost facilities. These facilities produce environmental benefits, provide fertiliser support to farmers, and contribute to local development.

Solar and Biomass Supported Irrigation Systems

Renewable energy-supported irrigation systems are critical in terms of saving both energy and water, especially in arid regions (Alhejji et al., 2021). In Turkey, the energy consumption of agricultural irrigation is costly, mainly due to electric pumping systems (Yilmaz et al. 2005). Renewable energy-supported irrigation systems are being implemented with various projects to save energy and water, especially in arid regions. Some of the prominent projects in this field are:

In Turkey, renewable energy-supported irrigation systems are supported by important projects in terms of agricultural sustainability, especially in arid regions with limited energy access. The GAPTAEM Channel Solar Power Plant project, implemented in Şanlıurfa by the GAP Agricultural Research Institute and Orbit Energy, stands out as the first solar-powered system installed on an irrigation canal in Turkey. With a capacity of 160 kWe, this system enables off-grid irrigation and provides economic contribution by selling excess energy to the national grid

(Orbit Enerji, 2022). Similarly, solar-powered irrigation systems are being installed throughout Turkey, and projects carried out by CW Energy offer economical, environmentally friendly, and long-lasting solutions, especially in off-grid rural areas (CW Enerji, 2022). A solar energy system consisting of 240 panels was installed in a project supported by Dicle Electric in the Akçakale district of Şanlıurfato to meet the irrigation needs of 300 acres of land, thus eliminating farmers from energy costs (Dicle Elektrik, 2022). The systems installed by Eti Enerji in Tekirdağ and the Thrace region popularise the use of solar-powered irrigation systems in greenhouse farms and large-scale agricultural areas, ensuring both water and energy efficiency are provided (Eti Enerji, 2022). In addition, SolnovaTech in Ankara helps farmers to set up sustainable and integrated systems with solar-powered irrigation solutions and implements energy-efficient projects suitable for existing infrastructures (SolnovaTech, 2023).

Solar-powered drip irrigation systems are implemented to save energy and encourage sustainable agricultural practices, especially in regions where water resources are limited. For example, solar-powered irrigation systems are used as part of projects by the GAP Agricultural Research Institute in Şanlıurfa to meet the energy needs of irrigation channels and prevent water evaporation (Tarım ve Orman Bakanlığı, 2020). In Konya province, solar-powered irrigation systems provide efficiency, especially in the irrigation of agricultural areas. These systems provide energy efficiency by operating the pumps with the energy obtained through solar panels (Özdede et al., 2017). In addition, solar-powered irrigation systems in the Ayaş district of Ankara provide farmers with energy independence and save water (Şentürk, 2023). These projects stand out as important examples that increase efficiency in agricultural production with the effective use of solar energy in agricultural irrigation.

These examples show that the use of renewable energy in agricultural production in Turkey is becoming widespread and that environmental and economic gains are achieved with the modernisation of irrigation systems.

Biomass Supported Irrigation Systems

In recent years, solid waste storage facilities have been established in many cities in Turkey as part of the European Union's harmonisation process and biomass power plants are operating in these facilities. In addition, biogas plants have been built, and biogas power plants operate in regions where poultry, small cattle, and large livestock farming are intensively carried out. According to the 2022 Electricity Energy Outlook report, there are 152 licensed biomass power plants with a total power (MW) of 906,104 (EMO, 2023).

Uninterrupted production is provided throughout the year in the greenhouses heated using biomass energy in the Korkuteli district of Antalya. An evaluation conducted in 2023 found that the heating costs of the greenhouses have decreased by 40%, and the producers' profitability has increased by 25% thanks to biomass energy. A study conducted by Akdeniz University in 2023 stated that efficiency in greenhouses heated with biomass increased by 25%, and carbon emissions decreased by 30% (Altıkardeş, 2024).

In the Silifke district of Mersin, heat production is provided by using local biomass sources such as olive press and pruning waste with a biomass plant established by an agricultural

production cooperative. Thanks to this application, both wastes is utilised, and greenhouses are operated with a sustainable and domestic energy source (Çukurova Kalkınma Ajansı, 2021). Such projects offer important examples of the potential use of biomass energy in agricultural production and greenhouse heating.

RURAL DEVELOPMENT, EMPLOYMENT AND TECHNOLOGY TRANSFER

Circular economy practices provide environmental benefits, increase employment opportunities in rural areas, and encourage women and youth to remain in agriculture (European Parliament, 2015). It also supports the modernisation of domestic production and creates a multiplier effect in terms of technology transfer (Ren et al., 2023). With circular agricultural practices, both technological and managerial knowledge transfer accelerates; this increases resilience in rural areas (Shebanin et al., 2024). For example, the need for technical personnel arises for the operation of biogas facilities, and employment opportunities are opened up for the local young.

The operation of biogas plants in Türkiye creates a need for technical staff and provides employment opportunities for the local young workforce. For example, Konya Biogas Electricity Production Inc. employs approximately 200 people (Konya Biyogaz Elektrik Üretim, t.y.). In addition, the employment creation potential of biogas plants is emphasised in the Elazığ Province Biogas Production Facility Preliminary Feasibility Report and the anticipated salaries for technicians and other personnel are specified (Yatırım ve Destek Hizmetleri Genel Müdürlüğü, 2021).

Turkey also has an important financial infrastructure with mechanisms such as the EU-supported IPARD- IPARD III program (Özkan, 2024) and rural Development Support (Tarım ve Orman Bakanlığı 2025) and TÜBİTAK-TEYDEB (2025) to direct these investments. These funds should be prioritised for circular economy-focused projects.

The dissemination of training programs on circular agricultural practices increases the participation of women and young people, especially those living in rural areas, in agricultural entrepreneurship. Various projects and training initiatives carried out in this scope are noteworthy. For example, the "Sustainable Agricultural Food and Circular Economy Course Program" offered under the Horizon Europe Technical Assistance for Turkey (IPA) project is an important step in this field. Similarly, the Circular Economy Training Program organised by Uludağ College educates students and entrepreneurs about circular business models. In addition, the Circular Business Design Training Program offered by the Turkish Circular Economy Platform (TDEP) contributes to the development of sustainability-oriented business ideas. Such programs support the adoption and implementation of circular economy principles at the local level.

OPPORTUNITIES FOR DOMESTIC AND FOREIGN INVESTORS

To encourage investment in the circular economy investments, Turkey provides grant support of 50% to 75% for investments in biogas plants, compost production and renewable energy

systems under the IPARD III Program. These grants increase to up to 70%, especially for young farmers and organic producers, and can reach 75% with an additional 10% public contribution for investments in waste management and circular economy (Tarım ve Orman Bakanlığı, 2024).

There is a supportive legal framework in environment and energy as part of the EU harmonisation process for foreign investors. An example of environmental and energy projects with foreign partners in Türkiye is the activities of the Dutch company GiraSolar in Türkiye. GiraSolar has implemented various solar energy projects in Turkey. Another example is the PV4Plants Project, led by Kalyon PV. This project is supported by the European Union's Horizon Europe Program and includes 14 project partners from the United Kingdom, Denmark, the Netherlands, Spain, Italy, Greece, and Turkey. As part of the project, an agricultural solar power plant (solar power plant) with a capacity of approximately 100 kilowatts was built on a 1.6-hectare site in the Ayaş district of Ankara. This plant offers an agrovoltaic model that enables both the cultivation of agricultural products and the generation of solar energy to be produced in the same area (Kalyon PV, 2025). The Chinese energy group CEEC signed a strategic cooperation agreement with its investment company CEOIC and Sungen Solar Energy for a renewable energy generation project with a capacity of 250 megawatts (İhlas Holding, t.y.).

POLICY RECOMMENDATIONS

The circular economy stands out as an important tool for the agricultural sector to achieve environmental, economic and social sustainability goals. However, for this transformation to be implemented effectively, decisive and comprehensive strategies must be developed at the political level. The policies to be proposed for the dissemination of circular agriculture in Turkey require a multidimensional approach, ranging from legal regulations, education and financial incentives to technical infrastructure.

1. *A national strategy for the circular economy should be developed.* Circular economy practices in Turkey are currently progressing at a fragmented and sectoral level. Following the example of the "Circular Agriculture" strategy of the Netherlands, a holistic "Circular Agriculture National Action Plan" should be developed for Turkey specifically for agriculture. This strategy should include waste management, energy production, water efficiency, and local production systems and should be implemented under the coordination of the Ministry of Agriculture and Forestry and the Ministry of Environment, Urbanization and Climate Change.

2. *Financial incentives and grant mechanisms should be strengthened.* The scope of existing support programs such as IPARD and the Rural Development Investment Support Program (KKYDP) should be expanded, and innovative practices such as compost production, wastewater recycling and small-scale biogas systems should be included in the scope of incentives. In addition, tax exemptions and green credit schemes can be developed to pave the way for private-sector investment.

3. *Integrated waste management systems should be established in collaboration with local governments.* Municipalities should create an infrastructure to collect food and organic

waste from agriculture and transport it to central processing plants. Examples, such as those in Seferihisar and İzmir, should be disseminated.

4. *Education, dissemination and awareness-raising efforts should be strengthened. The* level of knowledge of farmers and local administrations about circular economy is quite limited. Farmers, especially small producers and cooperatives, should be informed about circular agriculture, and practical training programs should be organised. TÜBİTAK and agricultural faculties should play an active role in this area. Publication activities should be increased in cooperation with universities, chambers of agriculture and provincial agriculture directorates; training programs should be organised primarily for women and young farmers.

5 *Entrepreneurship of youth and women in rural areas should be supported.* Circular agricultural investments provide areas that can create jobs for women and young people. Women's cooperatives should be supported, and young farmers should have access to technology.

6 *Databases and tracking systems should be established.* Data such as agricultural waste, compost production and biogas capacity should be recorded regularly and shared transparently. In this way, investment decisions can be made on a more informed basis.

7. *Cooperation between the public and private sectors should be promoted*. Cooperation models should be created for the food industry, municipalities, agricultural cooperatives, and technology companies. For example, closed-loop systems can be supported, enabling waste to be used as energy or raw materials for industry.

8. The monitoring, measurement and database infrastructure should be strengthened. Indicators such as the amount of agricultural waste, water use efficiency and carbon footprint should be regularly monitored, and publicly accessible digital databases should be established. This system will ensure transparent and accountable monitoring of circular agricultural practices.

CONCLUSIONS

Turkey has great potential for the transformation of the agricultural sector when viewed from a circular economy perspective. Many applications, from biogas to compost, from solar energy to water reuse, can be developed to offer economic efficiency and environmental benefits. However, for this potential to become a reality, policymakers must act with a holistic vision, and local and national stakeholders must cooperate.

Turkey can ensure environmental sustainability and support economic and social development by integrating the circular economy approach into the agricultural sector. This shift points to a multidimensional development model that is not limited to environmental concerns but also increases rural welfare, supports employment and stimulates innovation. However, for this change to be realised, determination at the policy level, coordination between stakeholders and a long-term vision are required.

When looking at global examples, the steps that Turkey can take in circular agriculture become clearer. First, it is crucial to align agricultural policies with long-term sustainability goals. The

European Union's "Farm to Fork" strategy and China's eco-agriculture programs provide important examples for Turkey. As in the case of the Netherlands, creating a national strategy centred on circular agriculture and developing targeted incentive schemes, as in the EU, can provide direction for Turkey. In addition, low-cost, local solutions from China and India can be applied in Turkey's rural areas. Turkey can become one of the pioneer countries in circular agriculture if it develops policies compatible with these global trends. Global examples show that Turkey can make progress not only with advanced technology but also with community-based solutions. In this context, aligning Turkey's agricultural policy with circular economy principles will promote rural development and effectively combat climate change.

ABSTRACT

The use of fertilizers in field crops is an ancient practice dating back approximately 10,000 years, beginning with humanity's transition to agriculture. With the increase in agricultural activities, the natural state of the soil was no longer sufficient to meet human needs. As a result, producers sought different methods to enhance soil fertility. Initially, farmers used organic fertilizers (plant residues, wood ash, and animal manure) to supplement soil nutrients. Choosing the right fertilizer and applying it in the correct dosage is crucial for increasing soil productivity and improving the quality of crops. Organic fertilizers contain high levels of organic matter, microorganisms, and plant nutrients. Due to their composition, organic fertilizers enhance soil fertility and support the healthy growth of crops. These fertilizers include animal manure, biochar, compost, vermicompost, green manure, algae/seaweed fertilizers, microbial fertilizers, and mycorrhizal fertilizers. The excessive and unregulated use of chemical fertilizers leads to the accumulation of heavy metals (Cu, As, Cd, Ni, Pb, etc.) in the soil and increases soil salinity, which disrupts soil structure. The use of nitrogen- and phosphorus-based chemical fertilizers in agriculture contributes to the process of eutrophication as these fertilizers leach into water bodies. Eutrophication disrupts aquatic ecosystems by causing algal blooms, which deplete oxygen levels in the water, leading to the death of aquatic organisms. The acceleration of eutrophication further degrades water sources, reducing water quality and leading to marsh formation. Organic fertilizers play a significant role in sustainable agricultural practices. They optimize soil fertility, support plant growth, and reduce the need for chemical fertilizers. This reduction minimizes environmental pollution and contributes to ecological balance. The effective use of organic fertilizers, especially animal manure, compost, and vermicompost, ensures the slow release of essential nutrients such as nitrogen (N), phosphorus (P), and potassium (K). This prevents the sudden nutrient uptake associated with chemical fertilizers, allowing for controlled nutrient absorption by plants, ultimately enhancing yield. This study aims to examine the effects of organic fertilizer use on yield and quality in field crops. The objectives of this research include: preventing agricultural pollution, contributing to climate change mitigation, reducing or eliminating the negative effects of chemical fertilizers on soil organisms, promoting the widespread use of organic fertilizers to achieve high-quality production, ensuring harmony with nature in agricultural production, supporting the sustainability of plant and animal production, fostering mutual input support in agricultural

systems, and addressing the economic, social, and ecological dimensions of agricultural production.

Keywords: Organic Fertilizer, Chemical Fertilizer Damage, Agriculture

TARLA BİTKİLERİNDE ORGANİK GÜBRE KULLANIMININ VERİM VE KALİTEYE ETKİSİ

ÖZET

Tarla bitkilerinde gübrenin kullanımı insanlığın tarıma başlangıcıyla beraber yaklaşık 10.000 yıllık eski bir uygulamadır. Tarımsal faaliyetlerin artışıyla beraber toprağın doğal saf hali insanlara yeterli gelmemeye başlamıştır. Bu durum sonucu üreticiler toprağın verimliliğini artırmaya yönelik farklı yöntemlere başvurmuştur. Farklı yöntemler arayan üreticiler ilk olarak organik gübre (bitki artıkları, odun külü ve hayvan gübresi) kullanımı ile toprağa besin desteği sağlamıştır. Toprak verimin artması ve üretilen ürünlerin daha kaliteli olması için doğru gübre seçimi ve uygulanacak gübrenin doğru dozda olması hayati önem taşımaktadır. Organik gübreler içerisinde organik madde, mikroorganizmalar ve bitki besin maddelerini yüksek düzeyde içermektedir. Organik gübreler içeriği gereği toprağın verimini ve üretilecek ürünün kaliteli bir şekilde yetişmesini sağlar. Organik gübreler hayvan gübresi, biyokömür, kompost, solucan gübresi, yeşil gübre alg/yosun gübresi, mikrobiyal gübreler ve mikoriza gübrelerini kapsamaktadır. Kimyasal gübrelerin bilinçsiz uygulanması sonucu toprakta ağır metal (Cu, As, Cd, Ni, Pb, vb.) birikimi ve toprak tuzluluk artışına sebep olarak toprağın yapısını bozmaktadır. Azot ve fosfor içerikli kimyasal gübrelerin tarımda kullanılması sonucu suya karışan gübre ötrifikasyon sürecinin başlamasına sebep olur. Ötrifikasyon, su ekolojik sistemini bozarak alg patlamalarına sebebiyet verir ve suda ki oksijen seviyesini düşürerek su canlılarının ölümüne sebebiyet verir. Ötrifikasyonun hızlanması bölgedeki su kaynaklarının yapısının bozulmasına sebebiyet vererek su kalitesinin düşmesine ve bataklıklaşmaya başlamasına sebebiyet verir. Organik gübreler, sürdürülebilir tarım uygulamaları için önemli bir etkiye sahiptir. Toprak verimini en iyi düzeye getirir ve bitki gelişimini destekler. Organik gübre kullanımını kimyasal gübre kullanımını azaltır. Bu durum çevresel kirliliği en aza indirerek çevre ekolojisine katkıda bulunur. Organik gübreler, sürdürülebilir tarım uygulamaları için önemli bir etkiye sahiptir. Toprak verimini en iyi düzeye getirir ve bitki gelişimini destekler. Organik gübre kullanımını kimyasal gübre kullanımını azaltır. Bu durum çevresel kirliliği en aza indirerek çevre ekolojisine katkıda bulunur. Özellikle ahır gübresi, kompost ve solucan gübresi (vermikompost) gibi organik gübrelerin etkili kullanımı, azot (N), fosfor (P) ve potasyum (K) gibi temel besin elementlerinin bitkilere daha yavaş salınımıyla uzun kullanılmasına yardımcı olur. Bu durum, kimyasal gübrelerin sebep olduğu ani besin alınımının önüne geçerek bitkilerin besin alımını kontrol ederek verim artışını sağlar .

Bu araştırma, tarla bitkilerinde organik gübre kullanımının verim ve kalite üzerindeki etkilerini incelemeyi amaçlamaktadır. Bu amaçların kapsamı şunlardır: Tarımsal kaynaklı kirliliği önlenmesine yardımca olmak, iklim değişikliğinin azaltılmasına katkıda bulunmak, kimyasal gübrelerin toprakta yaşayan canlıların sağlığı üzerindeki negatif etkilerini ortadan kaldırmak veya azaltmasında yardımcı olmak, organik gübrelerin kullanımın yaygınlaştırılmasına yardımcı olarak yüksek kalitede üretim yapılmasını sağlamak, Doğa ile uyumlu üretimde bulunmak, bitkisel ve hayvansal üretimin sürekliliğinin sağlanmasına yardımcı olmak, karşılıklı girdilerle üretimlerde karşılıklı desteği sağlamak, tarımsal üretimin ekonomik, sosyal ve ekolojik boyutunu birlikte ele almaktadır.

Anahtar Kelimeler: Organik Gübre, Kimyasal Gübre Zararı, Tarım

1. GİRİŞ

Tarla bitkilerinde gübrenin kullanımı insanlığın tarıma başlangıcıyla beraber yaklaşık 10.000 yıllık eski bir uygulamadır. Neolitik dönemde insanlar toprağı sürerek baklagiller ve tahıl bitkileri gibi ürünler yetiştirmişlerdir. Tarımsal faaliyetlerin artışıyla beraber toprağın doğal saf hali insanlara yeterli gelmemeye başlamıştır. Bu durum sonucu üreticiler toprağın verimliliğini artırmaya yönelik farklı yöntemlere başvurmuştur. Farklı yöntemler arayan üreticiler ilk olarak organik gübre (bitki artıkları, odun külü ve hayvan gübresi) kullanımı ile toprağa besin desteği sağlamıştır(1-3).

2017 yılında Birleşmiş Milletlerin yayınladığı rapora göre 2030 yılında 8,6 milyara, 2050 yılında 9,8 milyara ve 2100 yılında 11,2 milyara ulaşması bekleniyor. Bu verilere dayanarak ileride dünyada daha fazla tarımsal üretime ihtiyaç duyulacağı öngörülebilmektedir. Daha fazla üretim ihtiyacıyla beraber bilinçsiz gübre kullanımı da artmıştır. Toprak verimin artması ve üretilen ürünlerin daha kaliteli olması için doğru gübre seçimi ve uygulanacak gübrenin doğru dozda olması hayati önem taşımaktadır(4).

Organik gübreler içerisinde organik madde, mikroorganizmalar ve bitki besin maddelerini yüksek düzeyde içermektedir. Organik gübreler içeriği gereği toprağın verimini ve üretilecek ürünün kaliteli bir şekilde yetişmesini sağlar. Organik gübreler hayvan gübresi, biyokömür, kompost, solucan gübresi, yeşil gübre alg/yosun gübresi, mikrobiyal gübreler ve mikoriza gübrelerini kapsamaktadır(5).

Kimyasal gübrelerin bilinçsiz uygulanması sonucu toprakta ağır metal (Cu, As, Cd, Ni, Pb, vb.) birikimi ve toprak tuzluluk artışına sebep olarak toprağın yapısını bozmaktadır. Fazla azot içeren kimyasal gübreler toprağın simbiyotik azot sabitleme özelliğini negatif yönde etkileyerek mikroorganizma varlığını düşürmektedir(6). Kimyasal gübreler sadece toprak yapısını değil tarımın yapıldığı bölgedeki suyu ve havayı da kirletmektedir. Azot ve fosfor içerikli kimyasal gübrelerin tarımda kullanılması sonucu suya karışan gübre ötrifikasyon sürecinin başlamasına sebep olur. Ötrifikasyon, su ekolojik sistemini bozarak alg patlamalarına sebebiyet verir ve suda ki oksijen seviyesini düşürerek su canlılarının ölümüne sebebiyet verir. Ötrifikasyonun hızlanması bölgedeki su kaynaklarının yapısının bozulmasına sebebiyet vererek su kalitesinin düşmesine ve bataklıklaşmaya başlamasına sebebiyet verir(7-8). Azot içerikli kimyasal gübre kullanımı sonucu atmosfere azot oksitler (NO_x) ve amonyak (NH_3) yayılmaktadır. Azot oksitlerin atmosfere yayılmasından kaynaklanan sera gazı oluşumu küresel ısınmaya sebebiyet vermektedir. Amonyak (NH_3), sülfatlarla tepkimeye girerek atmosferde asidik bileşikler oluşmasına sebebiyet verir, bunun sonucunda da asit yağmurlarına oluşmaktadır(9-11).

Organik gübreler, sürdürülebilir tarım uygulamaları için önemli bir etkiye sahiptir. Toprak verimini en iyi düzeye getirir ve bitki gelişimini destekler. Organik gübre kullanımını kimyasal gübre kullanımını azaltır. Bu durum çevresel kirliliği en aza indirerek çevre ekolojisine katkıda bulunur(12).

Özellikle ahır gübresi, kompost ve solucan gübresi (vermikompost) gibi organik gübrelerin etkili kullanımı, azot (N), fosfor (P) ve potasyum (K) gibi temel besin elementlerinin bitkilere daha yavaş salınımıyla uzun kullanılmasına yardımcı olur. Bu durum, kimyasal gübrelerin

sebep olduğu ani besin alınımının önüne geçerek bitkilerin besin alımını kontrol ederek verim artışını sağlar (13).

Bu araştırma, tarla bitkilerinde organik gübre kullanımının verim ve kalite üzerindeki etkilerini incelemeyi amaçlamaktadır. Bu amaçların kapsamı şunlardır: Tarımsal kaynaklı kirliliği önlenmesine yardımca olmak, iklim değişikliğinin azaltılmasına katkıda bulunmak, kimyasal gübrelerin toprakta yaşayan canlıların sağlığı üzerindeki negatif etkilerini ortadan kaldırmak veya azaltmasında yardımcı olmak, organik gübrelerin kullanımın yaygınlaştırılmasına yardımcı olarak yüksek kalitede üretim yapılmasını sağlamak, Doğa ile uyumlu üretimde bulunmak, bitkisel ve hayvansal üretimin sürekliliğinin sağlanmasına yardımcı olmak, karşılıklı girdilerle üretimlerde karşılıklı desteği sağlamak, tarımsal üretimin ekonomik, sosyal ve ekolojik boyutunu birlikte ele almaktadır.

2. ORGANİK GÜBRELER VE ÖZELLİKLERİ

2.1. Hayvan Gübresi

Hayvan gübresi, ahır ve çiftlik hayvanlarının yataklık materyallerinin ve dışkılarının karışımından oluşan bir organik gübre çeşididir. Toprak yapısının kimyasal, biyolojik ve fiziksel olarak iyileştirir ve bitki gelişimine yardımcı olur. Hayvan gübreleri kullanılan hayvan kaynaklarına göre kendi arasında 8'e ayrılmaktadır bunlar; Koyun gübresi, sığır gübresi, tavuk gübresi, yarasa gübresi, güvercin gübresi, at gübresi, ördek gübresi, kaz gübreleridir. Hayvan gübrelerinin besin içeriği, gübrenin kaynağı, hayvanın yaşı, yedikleri yemin miktarı, yataklığın cinsi ve miktarı, hayvanların kullanım durumu, gübrenin depolanması faktörlerine bağlı olarak değişmektedir.

Hayvan gübreleri, bitki besin elementleri ve organik madde içeriği açısından zengin olup, araziye uygulandıklarında mineralizasyon ve parçalanma süreçleriyle bitkilerin gelişiminde önemli rol oynayan besin maddelerini serbest bırakırlar. Mineralizasyon ve parçalanma süreci, toprak yapısının kimyasal, biyolojik ve fiziksel olarak iyileştirir ve bitki gelişimine yardımcı olur(14).Hayvan gübresi, kompostlanarak ya da toprak veriminin artması için doğrudan uygulanabilir. Kompostlama, patojen miktarını azaltır ve bitkilerin besin elementlerine daha kolay ulaşabilir hale getirir (15).

Hayvan gübrelerinin uygulanma zamanı; iklim, toprak tekstürü, bitki çeşidi ve hayvan gübresinin olgunlaşma durumuna göre değişmektedir. Hayvan gübreleri mera ve çayır arazilerinde toprak yüzeyine direkt olarak uygulanırken tarla ve bahçe bitkileri yetiştiriciliğinde toprağa karıştırılarak uygulanmaktadır. Üretimde kullanılacak hayvan gübresi toprağın besin ihtiyacına, toprak tekstürüne, üretimi yapılacak bitkinin gübre ihtiyacı belirlenerek seçilmelidir (16).

2.2. Kompost ve Vermikompost

Kompost, organik atıkların biyolojik olarak aerobik veya anaerobik şartlar altında parçalanarak ve daha sonra stabilize edilerek oluşan organik bir üründür. Kompostlama işleminde sıcaklık 45-65°C'ye kadar yükselmektedir bunun nedeni mikroorganizmaların aktif faaliyetleridir.

Sıcaklığın yükselmesi zararlı patojenlerin inaktivasyonuna yardımcı olur. Kompostlama işlemini etkileyen ana faktörler arasında nem, sıcaklık, pH, oksijen seviyesi ve C/N oranı bulunur. Bu faktörler göz önünde bulundurularak, stabil bir kompost ürününün oluşmasına ve organik maddelerin iyi bir şekilde ayrışmasını sağlamaktadır. Ayrıca, patojenlerin inaktivasyonu, yeniden çoğalması ve kontrolü, kompostlama sürecinde kritik bir rol oynar (17).

Kompost 'un temel bileşenleri Azot (N), fosfor (P), potasyum (K), çinko (Zn), demir (Fe), magnezyum (Mg) ve kalsiyum gibi makro ve mikro besin elementleridir. Kompost organik madde yönünden zengin bir üründür. Humus benzeri organik maddeler toprağın su tutma kapasitesini yükseltir ve bitki büyümesini teşvik eder. Kompostun içerisinde mantar, bakteri ve aktinomisetler organik maddelerin ayrışmasında önemli rol alan canlı organizmalar bulunmaktadır. Kompost nem oranı yüksek bir üründür, bu da mikroorganizmalar aktive edilmesi için gereklidir (18-19).

Vermikompost, solucanların ot, çimen, koçan yaprakları, yonca, mısır sapları, çay posası, pancar yaprakları, talaş, karton parçaları ve mutfak artıkları gibi organik atıklarla beslenmesi sonucu dışkılayarak meydana getirdiği bir organik gübredir. Vermikompostun son yıllarda kullanımının artmasının başlıca nedenleri, kimyasal gübrelerin sebep olduğu toprak tekstürünün bozulmasını önlemek ve uzun vadede çevresel kirliliğin önüne geçmektir (20). Vermikompost uygulaması sonucu topraktaki organik madde miktarını artırarak mikrobiyal aktiviteyi teşvik eder ve bitkilerin ihtiyacı olan makro ve mikro besin elementlerini daha kolay bir şekilde alınımını sağlar (21). Vermikompost, içerisinde mikro besin elementleri ve azot (N), fosfor (P), potasyum (K) bulundurur bu sayede bitkilerin verimini ve kalitesini artırır. Vermikompost kullanımı aynı zamanda bitkinin kök sistemini güçlendirir ve içerisinde bulunan mikroorganizmalar sayesinde patojenlerle etkileşime girerek bitkinin hastalık ve zararlılardan korunmasını sağlar (22-23).

Vermikompost ve Kompost, tarımsal üretimde kullanılmak üzere ve organik atıkların işlenerek geri dönüştürülmesinde kullanın iki farklı yöntemdir. Her iki yöntem de bitkiler üzerinde farklı etkiler göstermektedir. Vermikompost ve Kompost kullanımı atıkların geri dönüşümü, toprak tekstürünün iyileştirilmesi ve toprağa gerekli besin maddelerinin kazandırılması gibi faydalı çevresel etkiler sunmaktadır. Fakat vermikompost ve kompost arasında belirgin farklar vardır. Bu farklılıklar organik tarımda hangi yöntemin daha avantajlı olduğunu belirlemektedir.

Özellik	Kompost	Vermikompost
pH Değeri	7.0-8.5	6.5-7.5
Organik Madde (%)	30-40	40-60
Azot (N, %)	1.0-1.5	2.0-3.5
Fosfor (P, %)	0.5-1.0	1.5-2.5
Potasyum (K, %)	0.8-1.5	1.5-2.5
Karbon/Azot Oranı	20-30:1	10-15:1
Toprak Mikrobiyal Aktivite	Orta	Yüksek
Nemin Korunumu	Orta	Yüksek
Parçalanma Süreci	2-6 ay	1-3 ay
Kaynak: (24,25,26)		

Tabloda belirtilen verilere göre, vermikompost komposta kıyasla besin elementleri(N,P,K) ve organik madde miktarı bakımından daha yüksektir. Ayrıca, vermikompost su tutma kapasitesini ve toprak Mikrobiyal aktivitesini daha yüksek bir şekilde etkilemektedir. Vermikompost komposta kıyasla daha etkili ve hızlı bir besin kaynağıdır. Vermikompost parçalanma süresi olarak daha kısa sürede olgunlaşmaktadır. Vermikompost üretiminde teknik bilgi ve kontrollü üretim yapılması gerekmektedir fakat kompostta daha az teknik donanım yeterlidir.

2.3. Biyochar

Biyochar, organik atıkların oksijensiz ortamda ve yüksek sıcaklıkta (300-1000°C) piroliz edilmesiyle elde edilen karbon(C) açısından zengin bir maddedir. Fiziksel ve kimyasal özellikleri, kullanılan atıklar ve piroliz şartlarına bağlı olarak değişiklik göstermektedir. Biyochar'ın yüzey alanı, piroliz sıcaklığı ve organik atık türüne bağlı olarak değişmektedir. Örneğin, kavak talaşından üretilen biyochar'ın yüzey alanı, 300°C'de 758.3 m^2/g iken, 600°C'de 250.8 m^2/g'ye düştüğü gözlemlenmiştir (27). Biyochar'daki düşük yoğunluk, toprak drenajını iyileştirir ve toprağın havalanmasını sağlar. Biyochar hafif yapılı bir madde olduğu için toprağın yoğunluğunu hafifleterek bitki köklerinin daha iyi gelişmesini teşvik eder.

Biyochar genel olarak alkalin özellik göstermektedir ve düşük pH'lı toprakların pH seviyesini yükseltir bu durum bitki gelişimini desteklemektedir. Piroliz sıcaklık derecesinin artmasıyla, biyocharın pH değerlerinin arttığı kaydedilmiştir. Örneğin, farklı piroliz sıcaklıklarında elde edilen biyocharların pH değerleri 7.72 ile 9.72 arasında değişmektedir. Biyocharın oksijen ve hidrojen oranı düşüktür fakat karbon(C) içeriği yüksektir. Bu durum biyocharın toprakta stabil

olarak daha uzun süre kalmasını sağlamaktadır. Piroliz sıcaklığının artması organik madde elementlerini azaltmaktadır ve kül miktarını artırmaktadır (28).

Biyochar, topraktaki su tutma kapasitesini yükseltir ve toprak yapısını iyileştirmektedir, yapılan bilimsel çalışmalarda bu durumu desteklemektedir. Arzika (2019) tarafından yapılan bir araştırmada, %5 oranında kompost ve biyochar uygulamasının, elektrik iletkenliğini iyileştirdiği, kirlenmiş teknosol topraklarındaki pH seviyesini 1-3 birim artırdığı ve su tutma kapasitesinin arttığı gösterilmiştir. Ek olarak, bu uygulama da toprak içerisinde bulunan kurşun (Pb) hareketliliğini %89-%99 oranında azalttığı gözlemlenmiş. Aynı çalışmada, kompost ve biyochar uygulamalarının topraktaki su tutma kapasitesinin artırdığı bildirilmiştir (29).

Biyochar, mikroorganizmaları için uygun ortam sağlayarak mikrobiyal aktiviteyi teşvik eder. Mikroorganizmalar, topraktaki organik madde döngüsünün daha hızlı olmasını sağlayarak bitkinin besin elementlerini daha kolay ve verimli bir şekilde kullanmasını sağlamaktadır. Biyochar, özellikle toprak mikroflorasını yükselterek toprak sağlığının iyileşmesini sağlar ve bu durum sonucu bitki daha iyi bir şekilde gelişir. Biyocharın ve vermikompostun birlikte kullanılması organik madde döngüsü ve mikrobiyal aktiviteler üzerinde daha olumlu etkiler göstermektedir. Mikrobiyal aktivitenin artması, bitkilerin hastalık ve zararlılara daha güçlü bir şekilde başa çıkmasını sağlamaktadır (30-31).

2.4. Yeşil Gübreler

Yeşil gübreleme, bazı yeşil bitkilerin yetişme ortamlarında, büyüme döneminde iken veya çiçeklenme aşamasından hemen sonra toprakla homojen bir şekilde karıştırılıp sürülmesi işlemidir. Yeşil gübreleme, topraktaki organik madde miktarını artırarak ve topraktaki besin elementlerini artırır. Yeşil gübreleme, toprak yapısını iyileştiren önemli bir gübre çeşididir (32). Bu gübre çeşidinde, belli başlı bitkiler üretilerek toprak yüzeyinde veya içinde parçalanması sonucu toprağın yavaş ve dengeli bir şekilde gübrelenmesini sağlar.

Yeşil gübre, organik madde miktarı yüksek ve hızlı yetişen bitkilerin ürettirilerek toprağa karıştırılmasıyla elde edilir. En yaygın kullanılan yeşil gübre bitkileri hardalgiller (Brassicaceae), baklagiller (Fabaceae) ve bazı tahıl çeşitleridir. Baklagil türleri, köklerinde bulunan *Rhizobium* bakterileri toprağa doğal bir azot kaynağı sağlar (33).

Yeşil Gübre Bitkisi	Azot (N) (%)	Fosfor (P) (%)	Potasyum (K) (%)	Organik Madde (%)	Karbon (C) (%)	Kaynak
Yonca (*Medicago sativa*)	2.5 – 3.5	0.2 – 0.4	1.5 – 2.5	45 – 55	40 – 45	Drinkwater & Snapp, 2007
Fiğ (*Vicia sativa*)	2.0 – 3.2	0.2 – 0.5	1.8 – 2.3	40 – 50	38 – 42	Finney et al., 2016
Soya Fasulyesi (*Glycine max*)	3.0 – 4.0	0.3 – 0.6	2.0 – 3.0	50 – 60	42 – 48	Govaerts et al., 2007
Bezelye (*Pisum sativum*)	2.5 – 3.5	0.3 – 0.5	2.0 – 2.8	45 – 55	39 – 44	Lal, 2004
Çavdar (*Secale cereale*)	1.0 – 1.8	0.2 – 0.4	1.5 – 2.2	35 – 45	35 – 40	Teasdale, 1996
Yulaf (*Avena sativa*)	1.2 – 2.0	0.2 – 0.4	1.4 – 2.0	37 – 47	36 – 41	Uphoff et al., 2006

Kaynak:32,33,34,35,36,37						

Yeşil gübreleme; organik madde ve N,P,K,C elementlerini toprağa kazandırdığı bilinmektedir. Yeşil gübreleme verimliliği artırır, su tutma kapasitesini yükseltir, kuraklığa karşı mücadele eder, kök sistemleriyle erozyonu önler, mikrobiyal aktiviteyi artırarak yararlı organizmaların gelişimini destekler, yabancı ot ve zararlıların önüne geçer ve azot(N) bakımından yüksek bitkilerle kimyasal gübre ve herbisit ihtiyacını azaltarak çevresel sürdürülebilirliğe yardımda bulunur. Yeşil gübre bitkileri, toprak yapısı, iklim ve toprağın ihtiyaçlarına göre seçilir. Baklagiller (fiğ, yonca, bezelye, soya fasulyesi) azot bağlayarak toprağın besin maddelerini arttırırken, hardalgiller (hardal, turp) toprak yapısını iyileştirir ve bazı zararlılarla mücadele eder. Tahıllar (çavdar, buğday, yulaf) ise erozyonun önüne geçerek topraktaki organik madde miktarını artırır.

2.5. Alg/Yosun Gübreleri

Algler ve yosunlar, organik tarımda gittikçe daha fazla önem kazanan organik gübre kaynaklarıdır. Alg ve yosun gübreleri, bitki büyümesini teşvik eden makro ve mikro besin elementleri, vitaminler, amino asitler ve büyüme hormonlarını içermektedir. Deniz yosunları,

Azot (N), fosfor (P) ve potasyum (K) gibi makro besinler ve çinko (Zn), demir (Fe), bakır (Cu), bor (B) ve molibden (Mo) gibi mikro besinleri içerisinde barındırır. Bu besin elementleri sayesinde bitki beslenmesini teşvik eder. Toprağın organik madde miktarının artmasını sağlayarak toprak su tutma kapasitesini artırır ve havalanmasını sağlar. İlaveten, alg ve yosun gübreleri pH dengeleme özelliği bakımından topraklarda kireç yerine kullanılabilir.

Deniz yosunu ekstraktları, bitkilerde fotosentez sürecinin ve yaprak ve klorofil içeriğinin de artmasını sağlar. İlaveten, tohumların çimlenme oranını artırarak daha güçlü ve hızlı büyümesini sağlamaktadır. Deniz yosunlarının içerisinde biyoaktif bileşikler bulunur bu sayede bitkiler nematodlara ve fungal hastalıklara karşı daha dirençli hale gelir. Bilhassa Botrytis cinerea gibi fungal enfeksiyonlara karşı önemli derecede direnç gösterir. Virüslere karşı etkin olan alg ve yosun gübreleri zararlılara karşı daha dayanıklı olmaktadırlar. Deniz yosunu gübreleri diğer organik gübreler gibi karbon döngüsüne yardımcı olur ve kimyasal gübrelerin daha az kullanılması sebebiyle ise çevresel sürdürülebilirliğe katkıda bulunmaktadır. Deniz yosunu gübreleri, doğal kaynakların korunmasını sağlarken aynı zamanda organik tarımda sürdürülebilirliğe katkıda da bulunmaktadır (38,39).

Alg ve yosun gübresinin dört farklı kullanımı vardır; Alg ve yosun gübreleri direkt olarak toprağa uygulanabilir. Direkt toprağa uygulama yöntemi bitkilerin kökleri sayesinde hızlıca emilen besin elementlerinin toprakta kolay bir şekilde yayılmasını sağlar. Alg ve yosun gübreleri yaprak gübresi olarak da kullanılabilir. Yaprak gübresi olarak kullanılması sayesinde bitkinin yaprakları vasıtasıyla besin elementlerine hızlı ve kolay bir şekilde ulaşmasını sağlar. Alg ve yosun gübreleri sulama suyuna karıştırılarak da kullanılabilir bu uygulama şekli bitkilerin kök sistemine direkt olarak ulaşmasını sağlar. Alg ve yosun gübreleri, topraksız tarımda besin çözeltisi olarak kullanılabilir. Alg ve yosun gübreleri içerisinde N,P.K besin maddelerini bulunmaktadır. Alg ve yosun gübrelerinin kullanımı topraksız tarımda pestisit ve su ihtiyacını azaltarak çevresel sürdürülebilirliğe katkıda bulunmaktadır (40,41,42).

2.6. Mikrobiyal Gübreler

Mikrobiyal gübreler, bitki yetiştiriciliğinde verim ve kaliteyi artıran mikroorganizma içerikli gübre çeşididir. Mikrobiyal gübrelerde Azot (N), Fosfor (P), Potasyum (K), Kalsiyum (Ca), Magnezyum (Mg), Kükürt (S), Demir (Fe), Çinko (Zn), Bakır (Cu), Mangan (Mn) gibi önemli besin maddeleri bulunmaktadır. Mikrobiyal gübrelerin katı, sıvı ve toz olmak üzeri üç çeşidi vardır (43). Mikrobiyal gübreler uygun dozlarda kullanıldığında bitki gelişimine katkıda bulunmaktadır. Bu gübreler, hastalık ve zararlılara karşı bitkinin direncini artırır ve abiyotik stres koşullarında bitkilerin dayanaklılığını artırmaktadır. Topraktaki yararsız besin maddelerini yararlı hale getirmektedir. Kimyasal gübrelerin bilinçsiz kullanımı sonucu oluşan çevre kirliliği ve ağır metal birikimi sorununa karşılık çevre dostu bir yöntemdir.

Mikrobiyal gübreler, mikorizalar, mantarlar, algler ve bakteriler gibi mikroorganizmaları içerisinde bulundurur. Bu mikroorganizmalar, bitki besin maddelerini serbest bırakmakta, toprak verimliliğini artırmakta ve bitki gelişimini teşvik etmekte kullanılır. Bradyrhizobium ve Rhizobium gibi bakteriler, baklagil bitkileri karşılıklı etkileşime girerek atmosferik azotu bitkilerin kullanabileceği şekle sabitlerler. Azospirillum ve Azotobacter gibi bağımsız hareket

eden bakteriler ise toprakta azot fiksasyonu gerçekleştirerek bitkilerin azot ihtiyacını karşılamaktadırlar. Bacillus, Azotobacter ve Pseudomonas mikroorganizmaları, toprakta bulunan fosfor ve potasyumun çözünürlük kapasitesinin artmasını sağlayarak bitkilerin bu besin elementlerini daha etkin bir şekilde kullanmasını sağlarlar (44,45,46).

Mikrobiyal gübreler uygulanması sonucu topraktaki organik maddelerin ayrışır ve toprağın verimliliğinin desteklenmesini sağlar. Silikat bakterileri, topraktaki potasyum(K) içeriğini artmasını sağlayarak bitki büyümesini teşvik eder. Mikrobiyal gübreler, bitki kök gelişimini, bitki kök gelişimini ve tohum çimlenmesini desteklemektedir. Örneğin, Paenibacillus azotofixans ve Bacillus subtilis bakterileri mısır (Zea mays) bitkisinin protein oranını artırmaktadır (47). Bitkilerin soğukluk, tuzluluk, kuraklık gibi abiyotik stres koşullar altında daha dirençli olmasını sağlayan mikrobiyal gübreler daha verimli ve kaliteli büyümeyi teşvik etmektedir (48). Bununla birlikte, birtakım mikroorganizma türleri hastalık ve zararlılara karşı koruyucu etkiye sahiptir. Örneğin, Bacillus ve Bacillus mikroorganizmaları patojenlere karşı biyopestisit görevi görerek pestisit kullanımının önüne geçmektedir. Mikrobiyal gübreler, bitki gelişiminde verimliliği ve sürdürülebilirliği artıran önemli bir üründür. Bu gübreler, bitki koruma ve bitki besleme amacıyla kullanılmaktadır. Mikrobiyal gübreler hem toprak sağlını koruyarak hem de çevre kirliliğini azaltarak başarılı bir çözüm sunmaktadır.

2.7. Organik Tarım Biliminde Mikorizanın Kullanımı ve Önemi

Organik tarımda yaygın bir kullanım alanına sahip olan mikoriza mantarları, bitkinin kökleriyle simbiyotik ilişkiye girerek besin ve su alınımını artırmaktadır. Fotosentez sürecinde oluşan karbonhidratlar mikoriza mantarları için başlıca enerji kaynaklarından biridir, bu karşılıklı alışveriş sayesinde mantarlar bitkilere su ve besin maddelerini temin etmektedir.

Organik tarımda, mikoriza mantarları kimyasal gübrelere karşı iyi bir alternatiftir çünkü içerdiği başlıca besin maddeleri olan fosfor(P) ve Azot(N) besin elementlerini bitkilere ulaşımını sağlayarak bitkilerin besin ihtiyacını karşılamaktadır. Mikoriza mantar kullanımı toprağın canlı mikroorganizma popülasyonunu artırır ve çevresel kirliliğinde önüne geçer(49).

Mikoriza mantarları bitkilerin hastalık ve zararlılardan korunmasını sağlamaktadır. Bu mantarlar hif ağı oluşturmaktadır ve bu sayede bitki köklerini zararlı patojenlere karşı korur ve su alımını düzenleyerek kuraklık stres koşullarına karşı bitkilerin daha dirençli olmasını sağlar. Bu özellikler sayesinde mikoriza uygulaması organik tarımda sürdürülebilir ve verimli ürün elde etmede önemli bir rol oynamaktadır.

Fakat mikoriza mantarlarının etkinliği bitkinin türü, toprak koşulları ve çevresel faktörlere bağlıdır. Mikoriza mantarı uygulamasının yapılması için bilgi ve donanım gerekir, uygulama yapılmadan önce planlama ve yönetiminin önemli bir şekilde yapılması gerekir. Uzun vadede tarım ekosisteminin sağlığını ve verimliliğinin artması için doğal mikoriza ağlarının korunması büyük önem taşımaktadır (50).

3. ORGANİK GÜBRELERİN VERİM VE KALİTEYE ETKİLERİ

3.1. Tarla Bitkilerinde Verim Artışı

YAZİCİ, L., & ERBAY, M. B. (2024), tarafından yürütülen çalışmada ahır gübresi,çay posası ve çay posası-ahır gübresi kombinasyonları kenevir (Cannabis sativa L.) bitkisinin büyüme ve verim parametreleri üzerindeki etkilerini incelemişlerdir. Ahır gübresi uygulamalarında biyolojik verim en iyi sonucu verdiği bildirilmiştir. (4500,75 kg/da)**,** lif verimi (294,88 kg/da) ve tohum verimi (248,31 kg/da), lif verimi (294,88 kg/da) ve tohum verimi (248,31 kg/da) olarak tespit edildiği belirtilmiştir. Çalışma, organik gübrelerin tarla bitkileri üretiminde verimi artırdığını ve ahır gübresinin en verimli seçenek olduğunu kanıtlamıştır (51).

Büyükfiliz, F. (2016), yapılan çalışmada farklı oranlarda vermikompost uygulamalarının mısır (Zea mays L. indentata) üzerindeki etkileri incelemişlerdir. Çalışma sonucuna göre organik gübre olarak kullanılan vermikompost, verim ve bitki gelişimi değişkenleri üzerinde önemli etkiler gösterdiği tespit etmişlerdir. Özellikle 750 kg/da vermikompost uygulaması**,** en yüksek tane verimi (1561 kg/da) sağlayarak ürün miktarını önemli düzeyde artırdığı bildirilmiştir. Aynı zamanda, bin tane ağırlığı, koçanda tane ağırlığı, bitki boyu, yaprak sayısı ve protein oranı olan verim unsurlarında bariz artışlar gözlemlemişlerdir. Daha düşük dozlarda verim artışı gözlenirken, 750 kg/da uygulamasından sonra verim artışının artmadığı bildirilmiştir (52).

Organik gübrelerin uzun vadede topraktaki besin maddelerini koruduğu akademik çalışmalarda ispatlanmıştır. Sönmez ve arkadaşlarının (2019) yaptığı bir araştırmada, farklı organik gübrelerin (çiftlik gübresi, tavuk gübresi, leonardit ve vermikompost) artan dozlarının toprak özellikleri üzerindeki etkileri incelemişlerdir. Sonuç olarak, organik gübre uygulamalarının toprak verimlilik parametrelerini iyileştirdiğini ve bitki kalitesine katkı sağladığını tespit etmişlerdir (53). Benzer şekilde, Cüre (2022) tarafından yapılan çalışmada, Kimyasal ve organik gübrelerin çevre üzerindeki etkileri incelenmiştir. Bu çalışmada, organik gübrelerin ağır metal birikimi, toprak tuzluluğu ve su kaynaklarını ötrofikasyon etkisinin daha az olduğu vurgulanmıştır. Organik gübrelerin besin maddelerini katkı sağladığı da yapılan çalışmada belirtilmiştir. Ayrıca, organik gübrelerin toprağın organik madde içeriğini artırarak besin elementlerinin korunmasına katkı sağladığı vurgulanmıştır (54). Bu sebeple, tarımda organik gübre kullanımının artırılması çevre koruma ve sürdürülebilir tarım açısından büyük önem taşımaktadır.

Okur, N., ve arkadaşlarının (2007)' de yaptığı çalışmada Leonardit, Biofarm ve Hümik asit gibi organik gübrelerin. Biofarm, Leonardit ve Hümik asit gibi organik gübrelerin, soğuk iklim sebzeleri toprakların biyokütle, mikrobiyal ve enzim aktivitesi üzerindeki etkileri incelemişlerdir. Biofarm gübresinin uygulandığı tüm parsellerde mikrobiyal biyokütle ve enzim aktivitesi yükselttiği bildirilmiştir. Biofarm uygulamaları ile mikrobiyal biyokütle miktarı konvansiyonel tarıma oranla ortalama %77, β-glukozidaz %55, dehidrogenaz %175, proteaz %69 ve alkalin fosfataz %44 oranında daha fazla saptandığı belirtişmiştir (55).

3.2. Tarla Bitkilerinde Kalite Artışı

Organik gübreler, tarla bitkilerinde besin değerlerini artırmakta önemle bir yere sahiptir. Organik gübreler toprak yapısını iyileştirerek bitkilerin besin elementlerinden daha iyi bir

şekilde yararlanmasını sağlamaktadır. Bu gübreler, protein, vitamin ve mineral oranlarının artmasında yardımcı olmaktadır. Organik gübreler bitkilerin besin maddelerinin alınımında doğrudan etkisi olduğu için bitkinin protein içeriğini de etkilemektedir. Yapılan çalışmalar sonucu K-humat ve organomineral gübre uygulamaları tane mısırının protein oranını artırmaktadır ve daha verimli bir üretim sağlamaktadır. Farklı organik gübrelerin kullanımı amonyum sülfata uygulamasına kıyasla da benzer bir artış göstermiştir.

Yaldız, Çamlıca ve Özen (2019) tarafından gerçekleştirilen araştırmada, organik gübre uygulamasının tıbbi ve aromatik bitkilerin kalite ve verim değerlerinin üzerindeki etkilerini incelemiştir. Yapılan çalışmada organik gübre uygulamalarının bitki gelişimine katkı sağladığı ve özellikle uçucu yağ ve fenolik bileşiklerinin içeriğini artırdığı tespit etmişlerdir Organik gübre uygulanan bitkilerin vitamin içeriği doğrudan ölçülmemiş olsa da ikincil metabolitlerin pozitif etkilerine dayanarak vitamin sentezini de artırabileceğini göstermektedir. Ayrıca, farklı araştırmalar organik gübre kullanımının C vitamini, E vitamini ve β-karoten üzerinde pozitif yönde etkiler gösterdiğini ortaya koyduğunu belirtmişlerdir. Azot miktarı yüksek olan organik gübreler, bitkilerde askorbik asit (C vitamini) üretiminin artmasını sağlayabilir ve karotenoid sentezini artırarak provitamin A miktarını yükseltebileceği belirtilmiştir.

Rahımı, A., Arslan, N., & Esmzad, S. (2016) tarafından yürütülen çalışmada, çinko (Zn), demir (Fe), mangan (Mn) ve bor (B) elementlerinin şekerpancarında kaliteyi etkileyen bazı özellikler üzerindeki etkileri incelemişlerdir. Araştırmada, mikro elementlerin şeker oranı, potasyum (K), azot (N) ,sodyum (Na) içerikleri, kristalize edilebilen şeker oranı, alkalinite, melastaki şeker randımanı ve şeker oranı üzerindeki etkileri incelenmiştir.

Çalışma sonucunda, şeker oranı %15.48 ile %17.77, kristalize edilebilen şeker oranı %12.32 ile %13.81 ve şeker randımanı %77.72 ile %79.59 arasında değişmiştir. Uygulanan mikro elementler, sodyum, potasyum ve azot içeriklerini azaltmış; bu da şekerin kristalleşme veriminde artış sağladığı bildirilmiştir.

Demir uygulaması, şeker oranını azaltmasına rağmen en yüksek şeker randımanını sağlamıştır. Bor uygulamasında azot içeriği en düşük seviyede tespit edilmiş, alkalinite en yüksek düzeye ulaşmıştır. Genel olarak mikro elementlerin kullanımı, şekerpancarında kaliteyi belirleyen birçok parametreyi pozitif yönde etkilemiş, özellikle kristalize edilebilir şeker miktarını ve şeker randımanını artışını sağladığı belirtilmiştir (56).

3.3. Toprak Verimliliği ve Uzun Vadeli Etkiler

Türkiye topraklarının büyük bölümü organik madde yönünden noksandır ve %70'ten fazlası erozyon riski barındırmaktadır. Organik madde kaybı, toprak canlılığı ve ekosistem sağlığını doğrudan olumsuz yönde etkilemektedir. Toprak organik maddesinin korunması, toprak sağlığının, verimliliğinin ve karbon dengesinin sürdürülebilirliği için gereklidir (57).

Yılmaz, Alagöz ve Öktüren (2008) tarafından yapılan çalışmada, farklı organik materyal uygulamalarının toprak agregat büyüklük dağılımı ve dayanıklılığı üzerine etkileri ile ilgili araştırmasında, değişik kökene sahip üç adet organik materyal, farklı dozlarda uygulamıştır. Yedi aylık bir inkübasyon zamanında elde edilen sonuçlara göre, uygulamaların toprağın agregat büyüklük dağılımı ve direnci üzerine etkisi değişik agregat boyutlarında çeşitli

düzeylerde gerçekleşmiştir. Agregat büyüklük dağılımı üzerine etki bakımından işlenmiş tavuk gübresi 8–4 mm boyutlu agregatlarda %5, 1–0,5 mm boyutlu agregatlarda %1 düzeyinde, çöp kompostu 2–1 mm boyutlu agregatlarda %1 en etkili oran olduğu belirtilmiştir. (58).

Demir ve ark. (2012) tarafından yapılan çalışmada, kumlu yapıya sahip bir toprağa uygulanan ahır gübresi, leonardit ve su tutucu polimerlerin, tarla kapasitesi ve solma noktası düzeyinde içerdiği su miktarı ile toprakların yarayışlı su tutma kapasitesine olan etkisine bakılmıştır. Araştırma sonuçlarına göre, bu toprak iyileştiricileri, toprağın su tutma kapasitesini, su geçirgenliğini ve organik madde düzeyini artırmış, toprak pH'ını düzenlemiş ve besin elementleri metabolizmalarını etkileyerek bitki gelişimine destek olduğu bildirilmiştir(59).

Karapire ve Özgönen (2013) tarafından yapılan çalışmada, rizosfer mikrobiyolojisi üzerine özellikle ortak mikrobiyal etkileşimi tanımlayan birden fazla çalışmasını, funguslar ve bakteriler üzerine yapmıştır. Barea ve arkadaşlarının yaptığı çalışmada, rizosfer mikroorganizmalarının hem bitki zararlılarını hem de daha önemsiz parazitik ve parazitik olmayan organizmaları etkilediği sonucuna varmışlardır. Bu etkileşimler, bitki gelişimi ve toprak sağlığı üzerinde önemli sonuçlar gösterdiği bildirilmiştir(60).

4. ORGANİK VE KİMYASAL GÜBRELERİN KARŞILAŞTIRILMASI

4.1. Verim Karşılaştırması

Ruşen, D. B. (2020). 'nin yapmış olduğu çalışmaya göre şilempenin içeriğinde bulunan organik madde miktarı ile toprağın içerisindeki organik madde kapasitesini yükselttiği için toprak uygulamasının dane verimini pozitif yönde etkilediği sonucuna varmışlardır. Organik maddece fakir olan topraklarda şilempenin topraktan uygulama yapılması sonucunda buğday yetiştiriciliğinde verim ve kaliteyi pozitif yönde artırdığı sonuçlarda belirtilmiştir (61).

4.2. Kalite Karşılaştırması

Mısır Çeşitlerinde Organik ve Kimyasal Gübre Besin İçeriği Farklılıkları

Gübre Türü	Organik Madde (%)	Azot (N) (%)	Fosfor (P_2O_5) (%)	Potasyum (K_2O) (%)	pH	Nem (%)
Tavuk Gübresi	54.3	3.64	1.63	1.38	6.72	8.20
Çiftlik Gübresi	45.2	2.85	1.65	1.35	7.23	9.80
Solucan Gübresi	48.3	2.23	1.18	1.52	6.25	10.5
Kimyasal Gübre	-	20 kg da^{-1} (N)	8 kg da^{-1} (P_2O_5)	-	-	-

(62).

Kimyasal gübrelerin kalıntı etkileri açısından değerlendirildiğinde, bu gübrelerin büyüme düzenleyiciler ve zirai ilaçlarla birlikte toprak, su, hava ve gıda üzerinde olumsuz etkiler yarattığı ifade edilmiştir. Kimyasal gübrelerin üretimi artırmak amacıyla yaygın kullanımı, su ve toprak kirliliğine yol açmakta, ürün çeşitliliğini ve kalitesini düşürmekte ve toprağın biyolojik yapısını bozarak faydalı kullanım özelliklerini olumsuz yönde etkilemektedir (63).

4.3. Organik Gübrelerin Uzun Vadeli Ekonomik Avantajları

- Organik gübreler, uzun vadede toprak verimliliğini artırarak daha yüksek ürün verimi elde edilmesini sağlar (64).

- Kimyasal gübrelerle kıyasla, organik gübreler toprak yapısını iyileştirmektedir ve su tutma kapasitesini artırır, bunun sonucunda sulama maliyetlerini düşürdüğü bilinmektedir.

- Organik gübre kullanımı, kimyasal gübrelerin sebep olduğu toprak bozulmasına karşı uzun vadeli tarımsal sürdürülebilirliğe destek olmaktadır.

- Organik gübre üretimi, yerel üreticiyi destekleyerek ve dışa bağımlılığı azaltarak ve istihdam sağladığı için ekonomik avantaj sağlamaktadır.

- Organik gübreler, toprağın besin elementlerini doğal yollarla artırarak kimyasal gübrelerin sürekli satın alınmasını gerektiren besin maddelerine olan ihtiyacı azaltır ve uzun vadede çiftçiye ekonomik avantaj sağlar.

5. SONUÇ VE ÖNERİLER

Bu materyalin geri kazanımı ile organik madde içeriği düşük olan topraklarımızın hem organik madde içeriği artırılmış olacak hem de bitki besin maddesi yönünden zenginleşeceği için daha az kimyasal gübre kullanılacaktır.

Organik gübre kullanımının yaygınlaştırılması amacıyla, üreticilerin organik gübre kullanımının özellikle insan sağlığı üzerindeki olumlu etkileri konusunda bilinçlendirilmesi ve buna bağlı olarak da organik gübre üretiminin arttırılması için gerekli çalışmaların yapılması gerekmektedir.

Konvansiyonel tarımın çevreye zararı ve maliyeti göz önüne alınırsa organik gübrelemenin maliyetinin uygun olması ile bu farkı kapatacağı belirtilmiştir.

THE EFFECTS OF SEED SIZE ON GERMINATION AND SEEDLING GROWTH OF SAFFLOWER

Doç. Dr. Emrullah CULPAN*
Tekirdağ Namık Kemal Üniversitesi, Ziraat Fakültesi, Tarla Bitkileri Bölümü, Tekirdağ, eculpan@nku.edu.tr, ORCID NO: 0000-0002-0702-7121 (Sorumlu Yazar)

Prof. Dr. Burhan ARSLAN
Tekirdağ Namık Kemal Üniversitesi, Ziraat Fakültesi, Tarla Bitkileri Bölümü, Tekirdağ, barslan@nku.edu.tr, ORCID NO: 0000-0002-9728-4059

ABSTRACT

The germination and emergence is a very important aspect of crop production, but it also has a significant impact on the subsequent stages of plant growth in the field. One of the most important aspects for safflower production is a uniform emergence and a strong seedling development in the field. Although this is related to seed size, generally large seeds show better germination and seedling development than small seeds. In this research conducted in the analysis laboratory of Tekirdağ Namık Kemal University, Faculty of Agriculture, Department of Field Crops in 2025, it was aimed to determine the effects of different seed sizes on germination and seedling growth in safflower. Two safflower cultivars (Dinçer and Olas) were used in the study and three different seed sizes (Small: 30-35 g, Medium: 40-45 g and Large: 50-55 g) were determined according to the 1000 seed weight. The experiment was conducted at room temperature (20 ± 2°C) with 3 replications according to the randomized split-plot design with cultivars as main plots and seed size as sub-plots. In the study, germination rate (GT), mean germination time (MGT), shoot lenght (SL), root length (RL), shoot fresh weight (SFW), shoot dry weight (SDW), root fresh weight (RFW) and root dry weight (RDW) parameters were investigated. According to the results of the analysis, the effect of seed size was found to be statistically significant, while the effect of cultivars was not found to be statistically significant for all characters examined except root dry weight. Germination rate increased with seed size and the highest germination rate was obtained from medium and large seeds (100.00% and 99.17%, respectively). In addition, as the seed size increased, the germination time of the seeds shortened and the earliest germination was obtained from medium and large seeds (3.20 and 3.05 days, respectively). When the results of the study were analyzed as a whole, it was concluded that germination and seedling growth of large seeds may be better than small seeds.

Keywords: Safflower, Germination, Seedling Growth, Seed Size

ASPİRDE TOHUM İRİLİĞİNİN ÇİMLENME VE FİDE GELİŞİMİ ÜZERİNE ETKİLERİ

ÖZET

Bitkisel üretimde çimlenme ve çıkış çok önemli bir husus olmakla birlikte bitki büyümesinin sonraki aşamaları üzerinde önemli etkilere sahiptir. Aspir tarımı için en önemli hususlardan biri üniform bir çıkış ve kuvvetli fide gelişimidir. Bu durum tohum iriliği ile ilgili olmakla birlikte genellikle iri tohumların küçük tohumlara göre daha iyi çimlenme ve fide gelişimi gösterdiği bilinmektedir. Tekirdağ Namık Kemal Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü analiz laboratuvarında 2025 yılında yürütülen bu araştırmada farklı tohum iriliklerinin aspirde çimlenme ve fide gelişimi üzerine etkilerinin belirlenmesi amaçlanmıştır. Bu amaçla araştırmada iki aspir çeşidi (Dinçer ve Olas) kullanılmış ve tohumların bin tane ağırlığına göre üç farklı tohum iriliği (Küçük: 30-35 g, Orta: 40-45 g ve Büyük: 50-55 g) belirlenmiştir. Deneme Tesadüf Parselleri Deneme Desenine göre çeşitler ana parselde, tohum irilikleri ise alt parselde olacak şekilde 3 tekrarlamalı olarak oda sıcaklığında (20 ± 2°C) yürütülmüştür. Çalışmada çimlenme oranı (ÇO), ortalama çimlenme süresi (OÇS), sürgün boyu (SB), kök boyu (KB), sürgün yaş ağırlığı (SYA), sürgün kuru ağırlığı (SKA), kök yaş ağırlığı (KYA) ve kök kuru ağırlığı (KKA) gibi özellikler incelenmiştir. Araştırmadan elde edilen verilerin varyans analizi sonucuna göre, tohum iriliklerinin etkisi istatistiki olarak önemli bulunurken, çeşitlerin etkisi kök kuru ağırlığı hariç incelenen tüm karakterler bakımından istatistiki olarak önemli bulunmamıştır. Çimlenme oranı tohum iriliğine bağlı olarak artmış ve en yüksek çimlenme oranı orta ve büyük irilikteki tohumlardan elde edilmiştir (sırasıyla %100.00 ve %99.17). Ayrıca tohum iriliği arttıkça tohumların çimlenme süresi kısalmış ve en erken çimlenme yine orta ve büyük irilikteki tohumlardan elde edilmiştir (sırasıyla 3.20 ve 3.05 gün). Çalışmanın sonuçları bir bütün olarak incelendiğinde iri tohumların çimlenme ve fide gelişimleri küçük tohumlara göre daha iyi olabileceği sonucuna varılmıştır.

Anahtar Kelimeler: Aspir, Çimlenme, Fide Gelişimi, Tohum İriliği

1. GİRİŞ

Asteraceae familyasından olan aspir bitkisi (*Carthamus tinctorius* L.) günümüzden 3000 yıl önce kültüre alınmaya başlanmış eski kültür bitkilerinden birisidir. Aspir, tohumlarında %25-45 yağ bulunan, linoleik (omega 6) ve oleik (omega 9) olmak üzere iki ayrı tipi olan, yağı yemeklik olarak kullanılabilen, biyodizel üretimine uygun, küspesi ve karışım halinde ekimi hayvan yemi olarak değerlendirilen, kuraklığa dayanıklı, kışlık ve yazlık formları bulunan, alternatif bir yağ bitkisidir (Arslan ve ark., 2012; Arslan ve Culpan, 2018).

Bitkisel üretimde çimlenme ve çıkış çok önemli bir husus olmakla birlikte bitki büyümesinin sonraki aşamaları üzerinde önemli etkilere sahiptir. Özellikle tek yıllık bitkilerde yüksek verim ve kalite için hızlı ve üniform bir çıkış esastır (Yari ve ark., 2010). Aspir tarımı için en önemli hususlardan birisi üniform bir çıkış ve kuvvetli fide gelişimidir. Bu durum tohum iriliği ile ilgili olmakla birlikte genellikle iri tohumların küçük tohumlara göre daha iyi çimlenme ve fide gelişimi gösterdiği bilinmektedir. Tohum iriliğinin hem arazi hem de laboratuvar denemelerinde birçok karakter üzerinde önemli etkilere sahip olduğu bildirilmiştir (Elliott ve ark., 2007; Siddiqi ve ark., 2007; Sadeghi ve ark., 2011; Alkansaa ve ark., 2019).

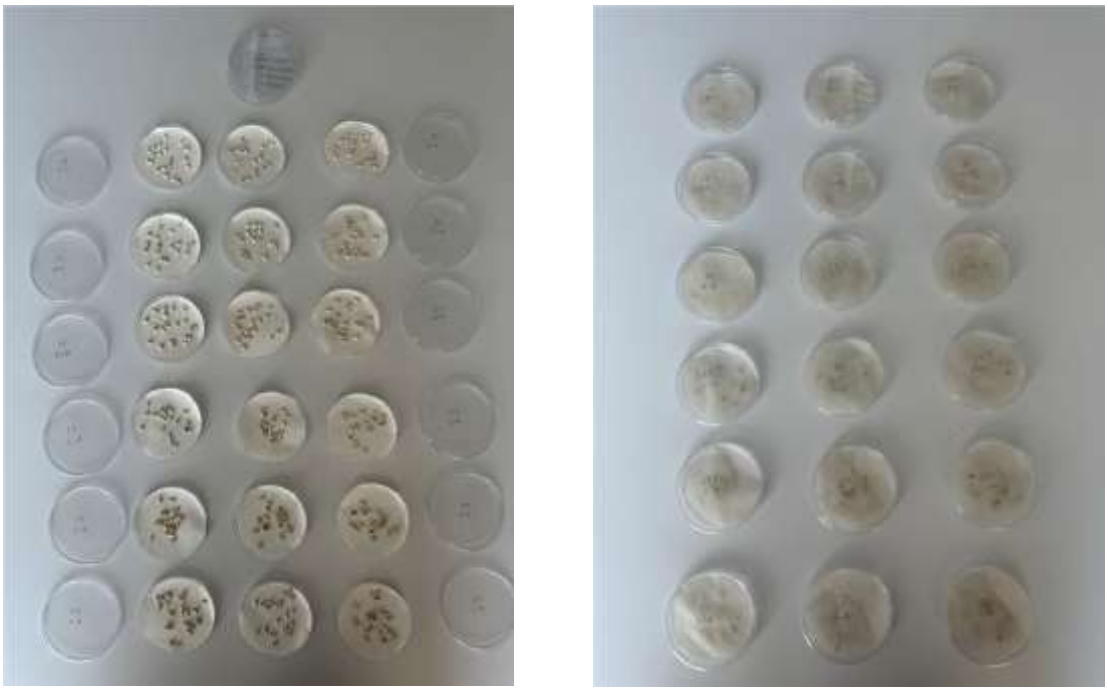
Bu araştırmada farklı tohum iriliklerinin aspirde çimlenme ve fide gelişimi üzerine etkilerinin belirlenmesi amaçlanmıştır.

2. MATERYAL VE METOT

Bu araştırma 2025 yılında Tekirdağ Namık Kemal Üniversitesi Tarla Bitkileri Bölümü Laboratuvarları'nda yürütülmüştür. Araştırmada iki aspir çeşidi (Dinçer ve Olas) kullanılmış ve tohumların bin tane ağırlığına göre üç farklı tohum iriliği (Küçük: 30-35 g, Orta: 40-45 g ve Büyük: 50-55 g) belirlenmiştir. Deneme, "Tesadüf Parselleri Deneme Desenine" göre çeşitler ana parselde, tohum irilikleri ise alt parselde olacak şekilde 3 tekrarlamalı olarak oda sıcaklığında (20 ± 2°C) yürütülmüştür.

Çalışmaya başlamadan önce yüzey sterilizasyonu için tohumlar %5'lik sodyum hipoklorit içerisinde 10 dakika bekletilmişlerdir. Bekletme işleminden sonra birkaç kez saf su ile yıkanmış ve başlangıçtaki ağırlıklarına ulaşıncaya kadar kurutulmuşlardır.

Her tohum iriliği için 20 adet tohum petri kaplarına kurutma kağıtlarının üzerine koyulmuş ve 5 ml sulama yapılmıştır. Filtre kağıtları her iki günde bir değiştirilerek kuruma durumuna göre iki günde bir sulama yapılmıştır (Şekil 1). Tohumlar her gün kontrol edilerek 2 mm kökçük uzunluğuna sahip olanlar çimlenmiş kabul edilmişlerdir (ISTA, 2003).



Şekil 1. Denemeden genel bir görünüm

Ölçümler

- Çimlenme oranı (%)

Çimlenme oranı % = (çimlenmiş tohum sayısı / toplam tohum sayısı) × 100 (Siddiqi ve ark., 2007)

- Ortalama çimlenme süresi (gün)

$$MGT = \sum f.\ x / \sum f$$

f: sayım yapılan gündeki çimlenen tohum sayısı × sayım yapılan gün sayısı (Orchard, 1977).

- Sürgün boyu (cm)

Her bir petrideki bitkilerin kökleri sürgünlerinden ayrılarak sürgünün cetvel ile ölçülmesiyle belirlenmiştir.

- Kök boyu (cm)

Kök ve sürgünleri ayrılmış olan bitkilerin köklerinin cetvel ile ölçülmesiyle belirlenmiştir.

- Sürgün ve kök yaş ağırlığı (g)

Sürgün ve köklerinin hassas terazide tartılmasıyla belirlenmiştir.

- Sürgün ve kök kuru ağırlığı (g)

Sürgün ve kök kuru ağırlıkları ayrı ayrı olarak 48 saat 55 ^{o}C'de kurutulduktan sonra tartılmasıyla belirlenmiştir (Ateş ve Tekeli, 2007).

Denemeden elde edilen sonuçlar TARİST istatistik programı kullanılarak analiz edilmişlerdir. EKÖF testi kullanılarak ortalamalar arasındaki farklılıklar belirlenmiştir ($p \leq 0.05$).

3. BULGULAR VE TARTIŞMA

Araştırmadan elde edilen verilerin varyans analizi sonucuna göre, tohum iriliklerinin etkisi istatistiki olarak önemli bulunurken, çeşitlerin etkisi kök kuru ağırlığı hariç incelenen tüm karakterler bakımından istatistiki olarak önemli bulunmamıştır (Çizelge 1).

Çizelge 1. Çimlenme ve fide özelliklerine ilişkin varyans analizi

**: $p \leq 0.01$ düzeyinde önemli, *: $p \leq 0.05$ düzeyinde önemli, öd: önemsiz, VK: Varyasyon kaynağı, CV: Varyasyon katsayısı, sd: Serbestlik derecesi, ÇO: Çimlenme Oranı, OÇS: Ortalama Çimlenme Süresi, SU: Sürgün Uzunluğu, KU: Kök Uzunluğu, SYA: Sürgün Yaş Ağırlığı, SKA: Sürgün Kuru Ağırlığı, KYA: Kök Yaş Ağırlığı, KKA: Kök Kuru Ağırlığı

Çimlenme oranı tohum iriliğine bağlı olarak artmış ve en yüksek çimlenme oranı orta ve büyük irilikteki tohumlardan elde edilmiştir (sırasıyla %100.00 ve %99.17). Ayrıca tohum iriliği arttıkça tohumların çimlenme süresi kısalmış ve en erken çimlenme yine orta ve büyük irilikteki tohumlardan elde edilmiştir (sırasıyla 3.20 ve 3.05 gün) (Çizelge 2). Mirshekarnezhad ve ark. (2013) yaptıkları çalışmada aspirde iri tohumların küçük tohumlara göre daha hızlı çimlendiğini ve fide özelliklerinin olumlu yönde etkilendiğini bildirmişlerdir. Lambat ve ark. (2017) yaptıkları çalışmada aspirde iri ve sağlıklı görünüme sahip tohumların %100 oranında çimlendiğini bildirmişlerdir.

Çimlenme oranında oluğu gibi sürgün ve kök uzunlukları da tohum iriliğine bağlı olarak artmış (Şekil 2) ve en uzun sürgün boyu orta ve büyük irilikteki tohumlardan elde edilmiştir (sırasıyla 2.07 ve 2.23 cm) (Çizelge 2). Mirshekarnezhad ve ark. (2013) aspirde iri tohumların küçük tohumlara göre daha uzun sürgün ve kök boyuna sahip olduğunu bildirmişlerdir.

Şekil 2. Farklı tohum iriliklerine göre belirlenen sürgün ve kök uzunlukları

Çizelge 2. Aspirde farklı tohum iriliklerine göre incelenen parametrelere ait ortalama değerler

Karakterler	Çeşit	Tohum İriliği			Ortalamalar
		Küçük	Orta	Büyük

	Ortalamalar	0.046 **b**	0.054 **a**	0.058 **a**	
	EKÖF (p≤0.05)	Tohum İriliği: 0.005			

Aynı harfle gösterilen ortalamalar arasında istatistiki olarak fark yoktur

Sürgün ve kök yaş ağırlıkları ile kuru ağırlıkları yine tohum iriliğine bağlı olarak artmış ve en fazla sürgün ve kök yaş ağırlıkları ile kuru ağırlıkları orta ve büyük irilikteki tohumlardan elde edilmiştir. Sadeydi ve ark. (2011) aspirde bin tane ağırlıklarına göre yaptıkları tohum iriliği çalışmasında iri tohumların sürgün ve kök yaş ağırlıkları ile kuru ağırlıklarının olumlu yönde etkilendiğini bildirmişlerdir.

4. SONUÇ

Bu araştırmada artan tohum iriliklerinin aspirde incelenen özellikler bakımından olumlu etkiler yaptığı belirlenmiştir. Özellikle orta (40-45 g) ve büyük (50-55 g) irilikteki tohumların fide gelişimlerinin daha iyi olduğu gözlemlenmiştir.

Çalışmanın sonuçları bir bütün olarak incelendiğinde iri tohumların çimlenme ve fide gelişimleri küçük tohumlara göre daha iyi olabileceği sonucuna varılmıştır.

AN EVALUATION ON KASTAMONU GARLIC

Doç.Dr.H.Güran ÜNAL
Kastamonu Üniversitesi, Mühendislik-Mimarlık Fakültesi, Makina Mühendisliği Bölümü, Kastamonu
Orcid ID: 0000-0003-2891-3488

ABSTRACT

Garlic is widely used in kitchens with its unique aroma and health benefits. It has an important place in nutrition due to its immune system supporting, anti-inflammatory and heart health protective effects. Taşköprü district of Kastamonu stands out with its garlic production and approximately 4000 families make a living from this sector. Kastamonu's market share in Turkey's garlic production has decreased in recent years. Although Kastamonu Taşköprü Garlic is a geographically indicated product, Kastamonu's competitiveness has weakened while other regions (Gaziantep, Kahramanmaraş, Tokat, Aksaray, Konya) have increased their production.

In this study, interviews were held with producers and garlic industrialists in order to evaluate the current situation of the garlic sector in Kastamonu, the main problems encountered in the sector were determined and solution suggestions were presented.

The predominance of traditional methods in production and the inadequacy of technological infrastructure cause costs to remain high. Production is carried out on small parcels with a high workforce, and thousands of tons of garlic are wasted due to ordinary storage. Producers have difficulty in supplying labor and face serious problems in irrigation, storage and marketing. Garlic businesses in the region generally operate as individual or family businesses and the level of institutionalization remains low. Most businesses do not invest in marketing, exports and modern production techniques. One of the biggest problems in the sector is unregistered production and trade, and the marketing of garlic processed without paying attention to hygiene conditions causes unfair competition. In addition, inadequacy of storage facilities, lack of working capital and fluctuating garlic prices, and difficulties in supplying labor force pose great difficulties for companies. Production of value-added products (garlic puree, extract, black garlic, garlic powder, etc.) is very limited or non-existent. The average capacity utilization rate of businesses is 53.2%, and most of them do not consider new investments.

Solution suggestions include establishing a garlic exchange to reduce price fluctuations, preventing imported garlic, reducing product losses and increasing cold storages to ensure 12-month supply, strengthening the organizations of producers and industrialists, and encouraging the production of value-added products. In addition, support mechanisms need to be established for the transition to modern agricultural techniques, the evaluation of garlic waste and the professionalization of the sector. Local governments should allocate more resources to the issue and support it with projects. If these steps are not taken, Kastamonu's leadership in the garlic sector may be in danger.

Keywords: Garlic, Kastamonu, sustainable agriculture, resource efficiency, conscious production

KASTAMONU SARIMSAĞI ÜZERİNE BİR DEĞERLENDİRME

ÖZET

Sarımsak, eşsiz aroması ve sağlık açısından sunduğu faydalarla mutfaklarda yaygın olarak kullanılmaktadır. Bağışıklık sistemini destekleyici, iltihap önleyici ve kalp sağlığını koruyucu etkileri nedeniyle beslenmede önemli bir yer tutmaktadır. Kastamonu'nun Taşköprü ilçesi, sarımsak üretimiyle öne çıkmakta ve yaklaşık 4000 aile bu sektörden geçimini sağlamaktadır. Kastamonu'nun Türkiye'nin sarımsak üretimindeki pazar payı son yıllarda düşüş göstermiştir. Kastamonu Taşköprü Sarımsağı coğrafi işaretli bir ürün olmasına rağmen, diğer bölgeler (Gaziantep, Kahramanmaraş, Tokat, Aksaray, Konya) üretimlerini artırırken Kastamonu'nun rekabet gücü zayıflamıştır.

Bu çalışmada, Kastamonu'daki sarımsak sektörünün mevcut durumunu değerlendirmek amacıyla üreticiler ve sarımsak sanayicileriyle görüşmeler yapılmış, sektörde karşılaşılan temel sorunlar belirlenmiş ve çözüm önerileri sunulmuştur.

Üretimde geleneksel yöntemlerin ağırlıklı olması ve teknolojik altyapının yetersizliği, maliyetlerin yüksek kalmasına yol açmaktadır. Küçük parsellerde yüksek işgücü ile üretim yapılmakta, adi depolama sebebiyle binlerce ton sarımsak heba olmaktadır. Üreticiler işgücü temininde zorluk yaşamakta, sulama, depolama ve pazarlama konusunda ciddi sorunlarla karşılaşmaktadır. Bölgedeki sarımsak işletmeleri genellikle bireysel veya aile işletmeleri şeklinde faaliyet göstermekte ve kurumsallaşma seviyesi düşük kalmaktadır. Çoğu işletme pazarlama, ihracat ve modern üretim tekniklerine yatırım yapmamaktadır. Sektörde en büyük sorunlardan biri kayıt dışı üretim ve ticaret olup, hijyen koşullarına dikkat edilmeden işlenen sarımsakların piyasaya sürülmesi haksız rekabete neden olmaktadır. Ayrıca, depolama imkânlarının yetersizliği, işletme sermayesi eksikliği ve dalgalı sarımsak fiyatları, işgücün temininde yaşanılan zorluklar firmalar için büyük sıkıntılar oluşturmaktadır. Katma değerli ürünlerin (sarımsak püresi, ekstrakt, siyah sarımsak, sarımsak tozu vb.) üretimi oldukça sınırlıdır veya yoktur. İşletmelerin ortalama kapasite kullanım oranı %53,2 olup, büyük bir kısmı yeni yatırım düşünmemektedir.

Çözüm önerileri arasında fiyat dalgalanmalarının azaltılabilmesi için sarımsak borsası kurulması, ithal sarımsağın önlenmesi, ürün kayıpların azaltılması ve 12 ay boyunca tedarik sağlanabilmesi için soğuk hava depolarının artırılması, üretici ve sanayicinin örgütlenmelerinin güçlendirilmesi ve katma değerli ürün üretiminin teşvik edilmesi bulunmaktadır. Ayrıca, modern tarım tekniklerine geçiş, sarımsak atıklarının değerlendirilmesi ve sektörün profesyonelleşmesi için destek mekanizmalarının oluşturulması gerekmektedir. Yerel yönetimler konuya daha fazla kaynak ayırmalı ve projelerle desteklemelidir. Bu adımlar atılmadığı takdirde Kastamonu'nun sarımsak sektöründeki liderliği tehlikeye girebilir.

Anahtar kelimeler: Sarımsak, Kastamonu, sürdürülebilir tarım, kaynak verimliliği, bilinçli üretim

1.GİRİŞ

Sarımsak, hem eşsiz aroması hem de sağlık açısından sunduğu faydalarla mutfaklarda geniş bir kullanım alanı bulmaktadır. Çoğunlukla kuru baş sarımsak şeklinde tüketilse de toz, cips, püre, ekstrakt, tablet, sos ve yağ gibi farklı formlarda da değerlendirilmektedir. Yemeklere doğrudan eklenmesinin yanı sıra sucuk, çemen, pastırma, baharat karışımları, konserve, salamura, turşu, yoğurt ve salça gibi birçok gıda ürününün üretiminde de kullanılmaktadır. Araştırmalar, sarımsağın bağışıklık sistemini destekleyici, iltihap karşıtı, diyabet önleyici, kanser riskini azaltıcı, mikrop kırıcı ve kalp sağlığını koruyucu etkileri olduğunu ortaya koymuştur. Günlük beslenmede sarımsağa yer vermenin sağlık açısından önemli olduğu vurgulanmaktadır. (Kızılaslan ve Tokatlı, 2021)

Kastamonu'nun Taşköprü ilçesi, sarımsak üretimiyle öne çıkmakta olup, bölgedeki tarımsal istihdamın en büyük kısmını oluşturmaktadır. İlçede yaklaşık 4000 aile geçimini sarımsak tarımından sağlamaktadır, bu da nüfusun büyük bir bölümünün bu sektörden gelir elde ettiğini göstermektedir. (Taban vd., 2004). Yoğun iş gücü gerektiren üretim süreci, bölgedeki istihdama doğrudan katkı sağlamakta ve Kastamonu'nun göç veren bir şehir olmasını kısmen önlemektedir. (Koyuncu, 2012; Turfan vd., 2024). Araştırmalar, Kastamonu denildiğinde ilk akla gelen ürünlerden birinin sarımsak olduğunu (Tayfun vd. 2017) ve Taşköprü Sarımsağı'nın Kastamonu'nun en bilinen gıda ürünü olarak tespit edildiğini göstermektedir. (Öner ve Aydoğdu, 2017).

Ancak, Kastamonu Taşköprü sarımsağı, dünya çapında bilinirliğine rağmen modern üretim tekniklerinden yeterince faydalanamamaktadır. Bölgedeki üreticiler, geleneksel yöntemleri sürdürmekte ve yeterli teknolojik altyapıyı sağlayamadıkları için maliyetleri düşürememektedir. Bunun yanı sıra, uygun depolama koşullarının eksikliği ve iş gücüne olan yüksek bağımlılık gibi sorunlar, üretimi ve pazarlamayı zorlaştırmaktadır. Son yıllarda Türkiye'de ve dünyada sarımsak üretimi artarken, Türkiye'nin küresel üretim içindeki payı gerilemiştir. Türkiye'de sarımsak üretiminde Kastamonu'nun payı da zamanla azalmış ve bu durum, rekabet gücünün sorgulanmasına neden olmuştur.

Bu çalışmada, Kastamonu'daki sarımsak sektörünün mevcut durumunu değerlendirmek amacıyla üreticiler ve sarımsak sanayicileriyle görüşmeler yapılmış, sektörde karşılaşılan temel sorunlar belirlenmiş ve çözüm önerileri sunulmuştur.

2. MATERYAL VE METOD

Bu araştırma 2023 yılında Kastamonu'da faaliyet gösteren 17 adet Sarımsak işleme tesisi yöneticisi (K.Ü.ETİK K.K.-7/2-28.04.2023) ve 166 adet sarımsak üreticisi (ETİK K.K.-7/1-28.04.2023) ile yüz yüze anket çalışması yapılarak gerçekleştirilmiştir. Anket verileri MS-Excel programına girilerek istatistiki olarak değerlendirilmiştir.

3.BULGULAR

3.1. Sarımsak üreticileri

Anket sonuçlarının değerlendirilmesiyle, sarımsak üreticilerinin genel profilleri, üretim yöntemleri ve satış alışkanlıklarına dair kapsamlı veriler elde edilmiştir. Ortalama hane halkı büyüklüğünün 5,59 kişi olduğu, eğitim süresinin 8,79 yıl olarak hesaplandığı ve sulanabilir arazi büyüklüğünün 64,18 dekar olduğu belirlenmiştir. Traktörlerin ortalama gücü 68,32 beygir olup, yaşları 11,69 yıl civarındadır.

Tohumluk olarak üreticilerin %60,3'ü iri diş kullanmakta, %41,9'u makineler aracılığıyla dişleyip sınıflandırma yaparken, %62,7'si elle dişleme işlemini gerçekleştirse de boyutlarına göre ayırmaktadır. Kullanılan tohumluk miktarı ortalama 139,4 kg/da olup, verim ise 926,3 kg/da olarak tespit edilmiştir. Üreticilerin %8,9'u makine ve teçhizat alımında proje desteğinden yararlanırken, %9,8'inin dikim makinası, %93,1'inin ise söküm makinası bulunmaktadır. Makine ile söküm yapanların oranı %90,9, makineyle dikim yapanların oranı ise %27,8'dir.

İşgücü ihtiyacını karşılamak için üreticilerin %79,6'sı yevmiyeli işçi çalıştırmakta, ancak %81,8'i ihtiyaç duyduğunda işçi bulmakta zorlanmaktadır. Kimyasal kullanımına bakıldığında, herbisit kullanım oranı %98,7, pestisit kullanımı %83,9, suni gübre kullanımı %79,1, yaprak gübresi kullanımı ise %77,7 seviyesindedir. Üreticilerin tamamı, ürünlerini Taşköprü ve Alatarla sarımsak pazarlarında satışa sunmakta olup, %5,09'u internet üzerinden de satış yapmaktadır. Ürünlerin %10,2'si hasattan önce, %15,9'u ise hasat sonrası tarladan satılmaktadır. Haftada bir kez kurulan sarımsak pazarını yeterli bulan üreticilerin oranı %84,9'dur.

Depolama yöntemlerine bakıldığında, üreticilerin %49,9'u sarımsağını evlerinin altında kısmen serin alanlarda saklamaktadır. Ancak bölgede üreticilerin kullanımına uygun alternatif bir soğuk hava deposu bulunmamaktadır. Üreticiler yılda ortalama 4,3 kez sulama yapmakta olup, %52,8'i sulama hizmetini ücret karşılığında sulama birliklerinden almaktadır. Sulama birliklerinin hizmetlerinden memnun olan üreticilerin oranı %41,5'tir. Tarım sigortası yaptıran üreticilerin oranı %55,7 olup, doğal afetlerden zarar görenlerin tazminat konusunda tatmin düzeyi %59,2'dir. Toprak analizi yaptıran üreticilerin oranı %16,5 olarak belirlenmiştir. Sarımsak üretimiyle ilgili bilgi paylaşımı, dayanışma ve organizasyon sağlayacak bir sivil toplum kuruluşuna ihtiyaç duyan üreticilerin oranı ise %77,3'tür (Ünal 2024a).

3.2. Sarımsak Sanayisi

Kastamonu'daki sarımsak sanayisini oluşturan işletmelerin yapısı incelendiğinde, ortak iş yapma anlayışının yeterince gelişmediği ve çoğunlukla bireysel ya da aile işletmesi şeklinde faaliyet gösterdikleri görülmektedir. Şirket sahipleri, yönetim, pazarlama, satın alma ve AR-GE gibi tüm süreçleri kendileri yürütme eğilimindedir ve bu durum profesyonel yöneticilerin ya da pazarlamacıların istihdam edilmesini sınırlamaktadır. Genel olarak sektörde kurumsallaşmanın yaygın olmadığı gözlemlenmektedir.

Kastamonu'da sarımsak sektörünün sağladığı istihdam yaklaşık 250 kişiyi bulmakta olup, çalışanların büyük bir kısmını kadın işçiler oluşturmaktadır. Özellikle fileleme ve soyma

işlemlerinde vasıfsız kadın işçilerin çalıştığı görülmektedir. Sektör genellikle sarımsak soyma tesislerinden oluşmakta, ardından fileleme tesisleri gelmektedir. Ancak, siyah sarımsak, sarımsak püresi ve sarımsak ekstraktı gibi katma değeri yüksek ürünlerin üretimi oldukça sınırlıdır. Ayrıca, kurutulmuş sarımsak, sarımsak tableti ve sarımsak yağı gibi ürünlerin üretilmediği tespit edilmiştir.

İşletmeler, hammaddeye yakın olabilmek adına genellikle haftalık sarımsak pazarına yakın yerlerde, özellikle Taşköprü-Alatarla-Kastamonu Merkez hattında konumlanmaktadır. Bu durum, hammadde temininde avantaj sağlamaktadır. Kurulan işletmelerin küçük bir kısmı hibe desteği kullanırken, çoğu öz sermaye ile yatırım yapmıştır. Soyulmuş sarımsak üreten işletmelerin, sevkiyat öncesi üretimi muhafaza etmek için küçük ölçekli soğuk hava depolarına sahip olduğu, ancak kısa vadede kullanılacak sarımsağın işletme içindeki kapalı alanlarda saklandığı belirlenmiştir. Üretim sürecinde ortaya çıkan sarımsak atıklarının ise ekonomik olarak değerlendirilmediği, isteyenlere ücretsiz verildiği veya çöpe atıldığı görülmektedir.

İşletmelerin üretim kapasitelerine bakıldığında, soyma tesislerinin günlük ortalama 1305 kg sarımsak işlediği ve %61,2 kapasiteyle çalıştıkları belirlenmiştir. Fileleme tesisleri ise ortalama 1643 kg/gün kapasiteye sahip olup, %54 kapasiteyle faaliyet göstermektedir. Siyah sarımsak üreten işletmelerin günlük ortalama 40 kg üretim yaptığı ve %82,5 kapasiteyle çalıştıkları, ekstrakt üreticilerinin ise 800 kg/gün kapasiteye sahip olup yalnızca %15 kapasiteyle faaliyet gösterdikleri tespit edilmiştir. Genel olarak sektörde ortalama kapasite kullanım oranı %53,2'dir.

Tüm bu veriler doğrultusunda, Kastamonu'da yıllık yaklaşık 4500 ton Taşköprü sarımsağının soyulmuş ve filelenmiş olarak işlendiği tahmin edilmektedir. Buna ek olarak, yıllık yaklaşık 50 ton siyah sarımsak, sarımsak püresi ve sarımsak ekstraktı üretilmekte ve bunun için yaklaşık 60 ton sarımsak kullanılmaktadır. Üretim sürecinde yaklaşık 1100 ton sarımsak atığının oluştuğu hesaplanmaktadır. Soyma tesisleri, daha çok perakende tüketime uygun olmayan, küçük, sapı kopmuş ve görünüm olarak kusurlu sarımsakları işleyerek, piyasada değerlendirilemeyen ürünleri ekonomiye kazandırmaktadır. Fileleme tesisleri ise genellikle orta boy sarımsakları tercih etmektedir.

İşletmelerin öncelikli yatırım ihtiyaçları arasında iş gücünü azaltacak ekipmanlar bulunmaktadır. Soyma tesislerinin bir kısmı, lekeli sarımsakları ayıklamak için renk ayırıcı makineler almayı planlarken, fileleme ve katma değerli ürün üreticileri otomatik tartım, paketleme ve dolum yapabilen makineleri tercih etmektedir. Genel yatırım eğilimleri sorulduğunda, firmaların yaklaşık yarısının üretim kapasitelerini artırmayı düşünmedikleri belirtilmiştir. Pazarlama konusunda işletmelerin yetersiz olduğu gözlemlenmiştir. Reklam, fuar katılımı, online satış ve kalite sertifikasyonu gibi alanlara ilgi göstermemektedirler. İthalat ve ihracat konularında da sınırlı girişimleri bulunmakta, daha çok yerel pazarlarla yetinmektedirler. İşletmeler, hammaddeyi yaklaşık 10 gün vadeli olarak alırken, satışlarını 60 gün vadeli gerçekleştirmektedir. Bu durum, ek sermaye gereksinimini artırmaktadır.

İşletmelerin karşılaştığı en büyük sorunlardan biri işletme sermayesi yetersizliğidir. Firmalar, yatırım için yeterince hibe desteğinden faydalanmadıkları gibi, satış ve alım vadesi arasındaki fark nedeniyle nakit akışı sıkıntısı yaşamaktadır. İşletmeler ayrıca vasıfsız işçi bulmakta zorlanmakta ve özellikle gençlerin sarımsak sektöründe çalışmak istemediği belirtilmektedir.

Dalgalanan sarımsak fiyatları da firmalar için önemli bir sorun teşkil etmektedir. Sermaye yetersizliği ve depolama imkânlarının kısıtlı olması nedeniyle firmalar toplu alım yapamamakta ve bu durum fiyat değişimlerinden daha fazla etkilenmelerine yol açmaktadır. Ayrıca, kayıt dışı faaliyetler sektörde haksız rekabet yaratmaktadır. Ev ortamında hijyen koşullarına dikkat edilmeden işlenen sarımsakların piyasaya sunulması ve vergiye tabi olmadan yapılan satışlar, sektörde ciddi endişelere neden olmaktadır. Kastamonu'daki sarımsak sanayisinin gelişmesi için çeşitli beklentiler bulunmaktadır. İthal sarımsağın önlenmesi, vergi ve SGK primlerinde indirim sağlanması, sarımsak borsasının kurulması, büyük ölçekli soğuk hava depolarının inşa edilmesi ve kayıt dışı ticaretin engellenmesi gibi konular öne çıkmaktadır. Ayrıca, sarımsak atıklarının değerlendirilmesi, sarımsakla ilgili bilimsel araştırmaların artırılması ve sektördeki firmaların iş birliği yaparak ortak pazarlama stratejileri geliştirmesi gerekmektedir. Taşköprü sarımsağının marka değerinin korunması ve katma değerli ürünlerin üretiminin artırılması, sektörün sürdürülebilir büyümesi açısından büyük önem taşımaktadır (Ünal 2024b).

4.SONUÇ ve ÖNERİLER

Sarımsak, hem lezzeti hem de sağlık açısından sunduğu faydalarla dünya genelinde önemli bir gıda maddesi konumundadır. Küresel ölçekte sarımsak üretimi ve tüketimi artış gösterirken, Türkiye'nin üretimdeki payı yıllar içinde azalmıştır. 1994 yılında dünya üretiminin %3,97'sini karşılayan Türkiye, 2008'de %0,8'e, 2023'de ise %0,4'e gerilemiştir (FAO,2025). Türkiye'nin üretim artışı, küresel ölçekte yaşanan gelişmelerle kıyaslandığında yetersiz kalmış ve ülkenin sıralamada geriye düşmesine neden olmuştur. Kastamonu, coğrafi işaretli ve ünlü sarımsağına rağmen üretimini kayda değer ölçüde artırmamış ve marka avantajını yeterince değerlendirememiştir. Buna karşılık, Gaziantep, Kahramanmaraş, Tokat, Aksaray ve Konya gibi iller son on yılda üretimlerini %100 ila %500 oranında artırmayı başarmıştır (TUİK, 2025).

Araştırma sonuçları, Kastamonu'daki sarımsak üreticilerinin ciddi zorluklarla karşı karşıya olduğunu göstermektedir. Küçük ölçekli arazilerde üretim yapılması, iş gücü temininde yaşanan sıkıntılar, sulama sorunları ve yüksek girdi maliyetleri, üreticilerin en büyük sorunları arasında yer almaktadır. Son yıllarda mekanizasyona yönelim sayesinde işçilik maliyetleri bir miktar azalmış olsa da diğer bölgelerdeki üreticilere kıyasla maliyet açısından dezavantaj devam etmektedir. Eğitim seviyesi artsa da toprak analizi, tarım sigortası ve kimyasal kullanım konularında bilinç seviyesi henüz istenen düzeyde değildir. Depolama koşullarının ilkel olması ürün kayıplarına yol açmakta ve bölgede modern soğuk hava depolarına duyulan ihtiyacı artırmaktadır. Pazarlama açısından ise üreticiler yerel piyasa fiyatlarına bağımlıdır ve alternatif pazarlara erişimleri sınırlıdır. Üreticiler genellikle bireysel hareket etmekte, herhangi bir planlama ya da örgütlenme içinde yer almamaktadır. Sarımsak üretimini geliştirmek, üreticilere ekonomik fayda sağlamak ve yeni satış ile ihracat imkânları yaratmak adına bölgede üreticileri destekleyecek bir organizasyona ihtiyaç duyulmaktadır.

Kastamonu'daki sarımsak sanayisi ise iç pazara odaklanmış, kurumsallaşamamış küçük aile işletmesi şeklindedir. İşletme sermayesi yetersizliği, dalgalı Pazar fiyatı, depolama imkânsızlıkları, işgücü temini, yüksek girdi maliyetleri sebebiyle zorluk yaşamaktadırlar. Kurulu kapasitelerinin altında çalışmakta olmalarına rağmen, tanıtım-pazarlama konusunda etkin değillerdir. Çoğunluğu soyulmuş sarımsak ve filelenmiş sarımsak üretmektedir. Katma

değerli ürün yok denecek kadar azdır. Düşük kar marjlarıyla iç piyasada birbirleriyle rekabet ederek ayakta kalmaya çalışmaktadırlar. Son yıllarda 4-5 firma kapanmıştır.

Bu sonuçlar doğrultusunda aşağıdaki önerileri yapmak mümkündür:

*Üreticileri teknik konularda bilinçlendirecek, girdi maliyetlerini düşürecek toplu alım anlaşmaları yapacak, tanıtım ve pazarlama konusunda aktif rol oynayacak yeni sivil toplum örgütleri kurulmalıdır.

*Üretici, kimyasal kullanımı, toprak analizi yaptırması, tarım sigortası yaptırması, depolama koşullarının iyileştirilmesi gibi konularda eğitilmelidir.

*Sarımsak sanayicilerini bir araya getirip, iç pazarda küçük kar marjlarıyla rakip olmaktan öte dış pazarlarda ortak iş yapıp paydaş olmalarını sağlayacak birliktelikler oluşturulmalıdır.

*Gerek üreticilerin gerekse sanayicilerin işgücü maliyetini düşürecek mekanizasyon çözümleri araştırılmalı ve teşvik edilmelidir.

*Sarımsaktan yeni katma değerli ürünler üretilebilmesi için araştırmalar yapılıp, raf ömrünü artırıcı ve sofralarda daha geniş yer bulmasını sağlayacak çözümler üretilmelidir.

*Gerek sanayicinin gerekse üreticinin kullanabileceği büyük soğuk hava depoları yapılmalıdır. Bu sayede adi depolamadan kaynaklı binlerce tonluk zararın önüne geçmek ve Kastamonu sarımsağının 12 ay boyunca bulunabilirliği sağlamak mümkün olacaktır.

*Sarımsak pazarında kayıt dışı alım satım yapan aracı kişiler engellenmelidir. Üretici ve sanayici arasında vergilendirilmemiş 3. şahısların ticareti durdurulmalıdır.

*Kayıt dışı merdiven altı sarımsak işleyicileri engellenmeli, haksız rekabetin önüne geçilmelidir.

* Kastamonu sarımsağının geleceğinde sarımsak işleme tesislerinin de büyük rol oynadığı unutulmamalı, sektör desteklenmeli teşvik edilmelidir.

*Fiyat istikrarının sağlanabilmesi için sarımsak borsası kurulmalıdır. Fiyat belirsizliği azaltılarak sanayicinin önünü görerek güvenli iş bağlantısı yapabilmesinin önü açılmalıdır.

*Sarımsak kabukları ve sapları sebebiyle oluşan atıkların ekonomiye kazandırılması ve çevre kirliliği yaratmaması için gerekli önlemler alınmalıdır.

*Kendi kapasitelerini göz önüne alarak yüksek talepleri geri çevirmek zorunda kalan sanayicilerin bir araya gelerek ortak bir pazarlama ve tedarik sistemi kurması teşvik edilmelidir.

*Sarımsak ithalatı sınırlandırılmalıdır.

*Yerel yönetimler Kastamonu'nun tanıtımında da büyük rol oynayan Taşköprü sarımsağını geliştirmek ve tanıtmak için daha fazla kaynak ayırmalı ve projelerle desteklemelidir.

Mevcut sektör lideri konumunda olan Kastamonu sarımsağı yetiştiriciliğinin ve sanayisinin gerekli önlemlerin alınmaması durumunda yakın gelecekte bu pozisyonunu kaybetmesi kaçınılmazdır.

ABSTRACT

As a result of the intensive and long-term use of herbicides, which are widely used to suppress weeds that are a problem in agriculture and reduce yields, important problems such as herbicide resistance, environmental pollution, residues and reduction in biodiversity have emerged. Therefore, there has been a worldwide search for the development of alternative control methods and the use of natural compounds instead of synthetic herbicides. “Allelopathy”, which is defined as the positive or negative effect of a plant on other plants and organisms, is an important method used for this purpose. The use of allelopathy in weed control is preferred because it is effective as an alternative to herbicides and is not harmful to human and environmental health.

In order to determine the studies on the effect of allelopathic plants to weeds conducted in Türkiye, national and international publications were detected from various printed and internet data sources. After classifying the publications in terms of type of publication, field of science and the geographical regions, the historical change of studies on allelopathy conducted in Türkiye was determined as its subject and scope. In this study, 212 scientific studies conducted in Türkiye between 1980 and 2025 on the effect of allelopathic plants to weeds were compiled.

When the studies were evaluated in general, it was found that the studies on this subject were mostly conducted in the Mediterranean Region and were prepared in the fields of Plant Protection, Field Crops, Horticulture, Biology and Forest Engineering. Also, the studies were focused on the effects of allelopathic plant extracts, essential oils and natural herbicides on weeds that are problematic in agricultural areas. Although the results obtained in the studies are very promising, it was reported that research on new application techniques and formulation types should be emphasized due to some difficulties in their application in greenhouse and field conditions.

Keywords: Allelopathy, Weed, Bibliography, Türkiye.

ALLELOPATİK BİTKİLERİN YABANCI OTLARA ETKİSİ KONUSUNDA TÜRKİYE'DE YÜRÜTÜLEN ÇALIŞMALAR

ÖZET

Tarımda sorun olan ve verimi düşüren yabancı otları, baskı altında tutmak için yaygın olarak kullanılan herbisitlerin yoğun ve uzun süreli kullanımı sonucu herbisitlere dayanıklılık, çevre kirliliği, kalıntı ve biyolojik çeşitlilikte azalma gibi önemli sorunlar ortaya çıkmıştır. Bu nedenle, dünya çapında alternatif mücadele yöntemlerinin geliştirilmesi ve sentetik herbisitlerin yerine doğal bileşiklerin kullanılması arayışına gidilmiştir. Bir bitkinin diğer bitki ve organizmalara olumlu veya olumsuz etki göstermesi olarak tanımlanan "Allelopati" bu amaçla faydalanılan önemli bir yöntemdir. Yabancı ot mücadelesinde allelopatinin kullanımı, herbisitlere alternatif olabilecek düzeyde etkili olması yanında, insan ve çevre sağlığına zararlı olmaması nedeniyle tercih edilmektedir.

Allelopatik bitkilerin yabancı otlara etkisi ile ilgili Türkiye'de yürütülen çalışmaları belirlemek amacıyla, çeşitli basılı ve internet veri kaynaklarından ulusal ve uluslararası yayınlar incelenmiştir. Tespit edilen yayınlar yayın türü, uzmanlık alanı ve yürütüldüğü bölgeler bakımından sınıflandırıldıktan sonra, Türkiye'de bu konuda yürütülen çalışmaların konu ve kapsam olarak tarihsel değişimi belirlenmiştir. Bu çalışmada, Türkiye'de allelopatik bitkilerin yabancı otlara etkisi konusunda 1980–2025 yılları arasında yürütülen 212 adet bilimsel çalışma derlenmiştir.

Çalışmalar genel olarak değerlendirildiğinde, bu konudaki çalışmaların daha çok Akdeniz Bölgesi'nde yapıldığı, alan olarak da Bitki Koruma, Tarla Bitkileri, Bahçe Bitkileri, Biyoloji ve Orman Mühendisliği alanlarında hazırlandığı ortaya çıkmıştır. Ayrıca, araştırmaların allelopatik bitkilerden elde edilen ekstraktların, uçucu yağların ve doğal herbisitlerin tarım alanlarında sorun olan yabancı otlara etkisi konularında ele alındığı belirlenmiştir. Yapılan çalışmalarda elde edilen sonuçlar oldukça ümitvar bulunmakla birlikte, sera ve tarla koşullarında uygulamalarındaki bazı güçlükler nedeniyle yeni uygulama teknikleri ve formulasyon tipleri konusunda araştırılmalara önem verilmesi gerektiği bildirilmiştir.

Anahtar Kelimeler: Allelopati, Yabancı Ot, Bibliyografya, Türkiye.

1. GİRİŞ

Hızla artan dünya nüfusunun gıda ihtiyacının karşılanması en öncelikli konular arasındadır. Bu nedenle tarımsal üretimde verim başta olmak üzere, kalite, ekonomi ve sürdürülebilirlik arzu edilmektedir (FAO 2021; Anonim 2025'ten). Ancak tüm çalışma ve emeklere rağmen, her geçen gün artan dünya nüfusunun ihtiyacını karşılayacak düzeyde tarımsal üretim maalesef ki yapılamamaktadır. Aksine tarımsal üretimde zararlı, hastalık ve yabancı ot sorunlarından dolayı önemli düzeyde kayıplar söz konusudur ve bu kayıplar genellikle kimyasal mücadele yoluyla önlenmeye çalışılmaktadır (Oerke, 2006). Pestisitlerin insan ve çevre sağlığına olan olumsuz etkileri nedeniyle sentetik pestisitlere göre biyolojik olarak çok daha kolay parçalanabilen alternatif çözümler ile ilgili araştırmalar hızlanmıştır (Karaca ve Eren, 2019).

Yabancı otlar kültür bitkilerinin verim ve kalitesini doğrudan veya dolaylı olarak düşürerek tarımsal üretimde önemli sorunlara neden olmaktadır (Zimdahl, 2018). Tarımsal üretimi kısıtlayan yabancı otları baskı altında tutmak için yaygın olarak kullanılan herbisitlere karşı dayanıklılık, çevre kirliliği, kalıntı ve biyolojik çeşitlilikte azalma gibi önemli sorunlar yaşanmaktadır. Bu nedenle, dünya çapında yabancı ot mücadelesinde alternatif mücadele yöntemleri geliştirme ve sentetik herbisitlerin yerine doğal bileşiklerin kullanılması arayışına gidilmiştir. Bu bağlamda, bitkiler arası kimyasal etkileşimleri ifade eden "allelopati" kavramı, son yıllarda sürdürülebilir tarım uygulamaları için dikkat çeken bir araştırma alanı haline gelmiştir. Bu bağlamda, bitkiler arası kimyasal etkileşimleri ifade eden allelopati kavramı, sürdürülebilir tarım uygulamaları açısından dikkat çeken bir araştırma alanı haline gelmiştir (Rice, 1984). Allelopatik etki, bir bitkinin diğer bitki türlerinin büyümesini, gelişmesini veya çimlenmesini engelleyici ya da teşvik edici bileşikler salgılaması yoluyla gerçekleşir. Bu doğal mekanizma, yabancı ot kontrolünde biyolojik temelli stratejilerin geliştirilmesi açısından umut verici bir alternatif sunmaktadır (Macías et al., 2007).

Son yıllarda Türkiye'de yapılan çeşitli araştırmalar, yerli bitki türlerinin allelopatik özelliklerini inceleyerek bu potansiyelin tarımsal mücadelede nasıl değerlendirilebileceği konusunda önemli bilgiler ortaya koymaktadır. Türkiye florası, sahip olduğu yüksek endemizm oranı ve biyolojik çeşitlilik ile allelopatik özellik taşıyan çok sayıda bitki türüne ev sahipliği yapmaktadır (Davis, 1965-1988). Türkiye'de 1980'li yıllardan itibaren hız kazanan botanik ve etnobotanik araştırmalar, birçok yerli bitki türünün geleneksel kullanım alanları yanında, potansiyel allelopatik etkilerini de ortaya koymaya başlamıştır (Baytop, 2021; Sezik et al., 2001). Bu süreçte özellikle tarla denemeleri, laboratuvar analizleri ve literatür taramaları ile bazı bitki türlerinin yabancı otlar üzerindeki bastırıcı etkileri belirlenmiş, bu etkilerin toprak mikrobiyotası, çimlenme oranları ve bitki gelişimi üzerindeki yansımaları bilimsel verilerle desteklenmiştir (Üremiş et al., 2009; Boz, 2016).

2. METOD

Bu çalışmada, Türkiye'de allelopatik bitkilerin yabancı otlara etkisi konusunda yürütülen bilimsel çalışmalar derlenmiştir. Çalışma kapsamında 1980–2025 yılları arasındaki 45 yılda yürütülen 212 adet çalışma değerlendirilmiştir.

Allelopatik bitkilerin yabancı otlara etkisi ile ilgili Türkiye'de yürütülen çalışmaları belirlemek amacıyla, çeşitli basılı ve internet veri kaynaklarından (Anonim 2025a; Anonim 2025b; Google Akademik; Erciş ve ark., 2006) ulusal ve uluslararası literatür gözden geçirilerek konu ile ilgili detaylı bir araştırma yapılmıştır. Konu ile ilgili olarak özellikle YÖK Akademik web sayfasındaki yayınlar ve Türkiye Herboloji Bibliyografyası dikkate alınmıştır. Tespit edilen yayınlar yayın türü, uzmanlık alanı ve yürütüldüğü bölgeler bakımından sınıflandırılmıştır. Daha sonra ilgili yayınların önemli bulguları değerlendirilerek ülkemizde bu konuda yürütülen çalışmaların konu ve kapsam olarak tarihsel gelişimi ve değişimi belirlenmiştir.

3. BULGULAR

Türkiye'de yabancı otlar üzerinde yapılan ilk allelopatik çalışmalar, 1980'li yılların sonları ile 1990'lı yılların başlarına dayanmaktadır. Bu dönemde, özellikle tarım alanlarında yaygın olarak bulunan bazı bitkilerin, diğer bitkilerin gelişmesini engelleyici etkileri olduğu gözlemlenmiş ve bu etkilerin allelopatik mekanizmalarla açıklanabileceği düşünülmüştür. Bu alandaki öncü araştırmalar, özellikle kültür bitkilerinin yabancı otlar üzerindeki baskılayıcı etkilerini incelemiştir. Laboratuvar çalışmalarında, ilk yıllarda çalışmalar genellikle petrilerde yapılan çimlenme denemeleriyle sınırlı kalmıştır. Bitki özlerinin farklı konsantrasyonlarının yabancı ot tohumları üzerindeki etkileri değerlendirilmiştir. İlerleyen dönemlerde yürütülen araştırmalarda, kimyasal analiz yöntemleri ile bitkilerden alınan özütlerdeki fenolik bileşikler gibi allelokimyasal maddelerin tanımlanması yapılmıştır.

Allelopatik bitkilerin yabancı otlara etkisi konusunda Türkiye'de yürütülen çalışmalar yayın türü bakımından değerlendirildiğinde; 58'inin makale, 107'sinin bildiri ve 47'sinin tez olduğu görülmektedir. Yürütülen çalışmaların yayın türü olarak yayınlandığı döneme göre dağılımları Çizelge 1'de sunulmuştur.

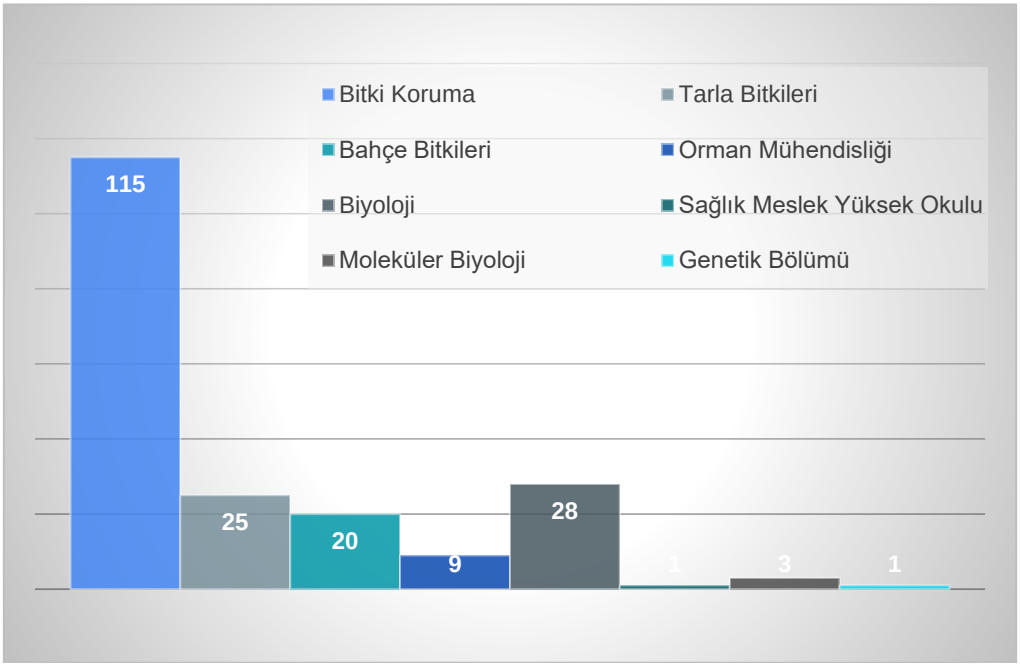
Çizelge 1. Türkiye'de allelopati konusunda yürütülen bilimsel çalışmaların dağılımı

Yıl	Makale	Bildiri	Lisansüstü Tez	Frekans
1980-1990	1	-	-	1
1990-2000	11	1	4	16
2000-2010	10	30	4	44
2010-2020	21	58	22	101
2020-2025	15	18	17	50
Toplam	58	107	47	212

Türkiye'de allelopati konusunda yapılan ilk araştırma, "Kültür turpunun (*Raphanus sativus* L.) Kanyaşa (*Sorghum halepense* (L.) Pers.) olan allelopatik etkisi" konusunda yürütülmüştür (Uygur ve Köseli, 1988). Bu çalışma sonucunda, Kültür turpunun Kanyaş çıkışını önemli ölçüde engellediği belirlenmiştir. Bu konuda Türkiye'de yapılan ilk lisansüstü tez çalışması

"Pamuk kültürü içerisinde Geliçin (*Sorghum halepense* (L.) Pers.) gelişme biyolojisi ve Antep turpunun (*Raphanus sativus* L.) bu biyolojik gelişmeye allelopatik ve biyoherbisit etkisinin araştırılması" konuludur (Köseli, 1991). Bu konuda yayınlanan ilk bildiri ise "Parçalanmış bitki atıklarının mısır kültür bitkisi ile yabancı otların gelişmesine allelopatik ve biyoherbisit etkisi" üzerine olmuştur (Uygur ve ark., 1991). Çalışmalar kronolojik olarak değerlendirildiğinde, allelopati konusundaki çalışmaların süreç içerisinde giderek arttığı, allelopati konusunda özellikle son 10 yılda makale ve bildiriler yayınlandığı dikkat çekmiştir.

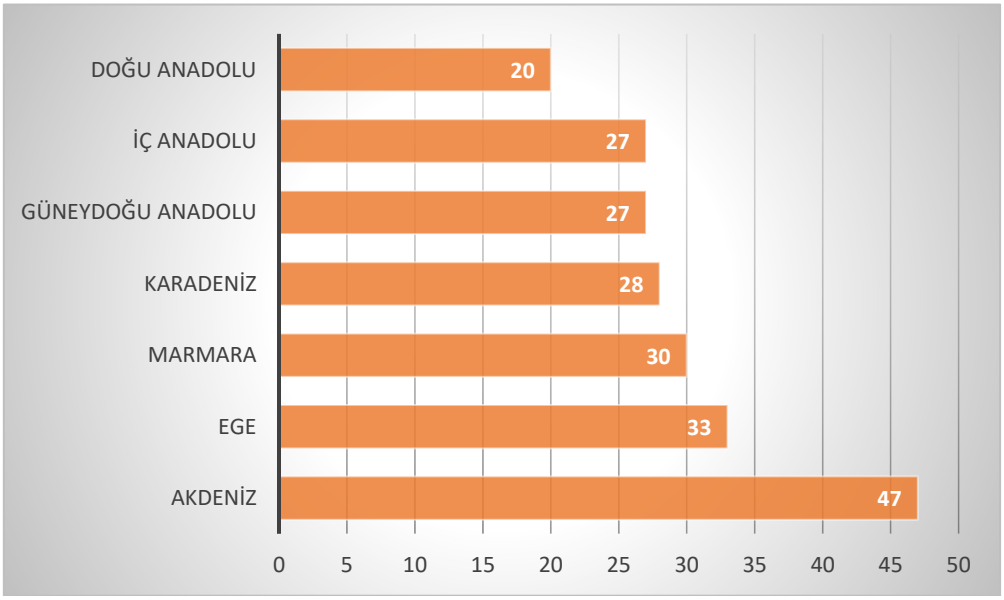
Yürütüldüğü akademik birimler bazında değerlendirildiğinde, ülkemizde yürütülen allelopati konulu çalışmaların 18 farklı akademik birimde yürütüldüğü ortaya çıkmıştır (Şekil 1). Çalışmaların yürütüldüğü Ziraat Fakültelerine bağlı bölümler Bitki Koruma, Tarla Bitkileri, Bahçe Bitkileri, Tarımsal Biyoteknoloji, Tarımsal Yapılar ve Sulama olmuştur. İlgili konuda Fen Fakültesi bünyesindeki Biyoloji, Kimya, Moleküler Biyoloji ve Genetik bölümlerinde, Orman Fakültesinde ise Orman Mühendisliği ve Peyzaj Mimarlığı bölümlerinde çalışmalar yürütülmüştür. Çalışmaların yürütüldüğü Meslek Yüksek Okulları; Bahçe Tarımı, Seracılık, Sağlık, Aşçılık, Turizm ve Otelcilik olmuştur. Çalışmaların büyük çoğunluğunun Bitki Koruma, Biyoloji ve Tarla Bitkileri bölümlerinde yapıldığı, bu bölümleri Bahçe Bitkileri ve Orman Mühendisliği bölümlerinin takip ettiği anlaşılmıştır.



Şekil 1. Türkiye'de allelopatik çalışmaların yürütüldüğü bilimsel alanlar

Türkiye 'de allelopati çalışmalarının yürütüldüğü coğrafik bölgelerin dağılımı incelendiğinde (Şekil 2), en fazla çalışmanın Akdeniz Bölgesi'nde yürütüldüğü ortaya çıkmıştır. Bunun nedeninin, Antep turbu konusunda yürütülen ilk çalışmaların bu bölgede olması, bölgenin fitocoğrafik zenginliği ve tarımsal üretim potansiyelinin yüksek olması nedenlerinden

kaynaklandığı düşünülmektedir. Yürütülen çalışmalar tarımsal üretim potansiyellerine bağlı olarak Akdeniz bölgesinden sonra Ege, Marmara, Karadeniz, Güneydoğu Anadolu, İç Anadolu ve Doğu Anadolu olarak sıralanmıştır. Bu bölgelerde yürütülen çalışmalar kültür bitkileri bazında değerlendirildiğinde; pamuk, şekerpancarı, ayçiçeği, kanola, zeytin, bağ, baklagiller ve tahıl üretim alanlarında sorun olan yabancı otların mücadelesi amacıyla allelopatik çalışmaların yürütüldüğü ortaya çıkmıştır.



Şekil 2. Türkiye'de allelopatik çalışmaların yürütüldüğü coğrafik bölgeler

Türkiye'de 1980–2025 yılları arasında yapılan çalışmalar konu ve kapsam olarak değerlendirildiğinde, daha çok Brassicaceae familyasından bitkilerin veya tıbbi ve aromatik bitkilerin farklı kültür bitkilerinde sorun olan tek yıllık ve çok yıllık pek çok yabancı ot türüne etkinliği konusunda olduğu ortaya çıkmıştır.

Turp (*Raphanus sativus* L.), şalgam (*Brassica rapa* L.), Kekik türleri (*Origanum* spp., *Thymus* spp.) ve Melisa (*Melissa officinalis* L.) gibi bitkilerin güçlü allelopatik etki gösterdiği belirlenmiştir (Karaca ve Eren, 2023; Üremiş ve Efil, 2019). Benzer şekilde, Sarımsak (*Allium sativum* L.), Pelin otu (*Artemisia* spp.), Rezene (*Foeniculum vulgare* Mill.) vd. bazı bitkiler bazı yabancı otların mücadelesinde etkili bulunmuştur (Aydın ve Tursun, 2010; Karaca ve Yurttaş-Kılınç, 2023).

4. SONUÇ ve ÖNERİLER

Yabancı ot mücadelesinde allelopati, insan ve çevre sağlığına zararlı olmaması ile herbisitlere göre daha güvenli olmasından dolayı tercih edilir. Allelokimyasallar bitkilerde sentezlenen doğal bileşikler olduklarından dolayı daha kolay parçalanıp doğada birikmezler çevreye

zararları yoktur. Bu sebeple, yabancı ot mücadelesinde sentetik herbisit yerine allelokimyasalları kullanmak çevre açısından oldukça önemlidir. Allelopatik çalışmalar, çevre sağlığını tehdit eden sentetik herbisitlerin yerine alternatif olabilecek biyoherbisitlere kaynak sağlayabilir.

Türkiye'de allelopati konusunda yürütülen araştırmalar, hem geleneksel bilgilerin modern bilimsel yöntemlerle değerlendirilmesi, hem de doğal kaynaklı herbisitlerin geliştirilmesi açısından bilimsel dayanak oluşturmuştur. Mevcut bulgular ışığında doğal herbisit geliştirme çalışmalarına katkı sunacak bitki türlerinin belirlenmesi ve bu alanda gelecekte yapılabilecek çalışmalara yön verilmesi hedeflenmektedir. Türkiye'de allelopati üzerine yapılan araştırmalar, başlangıçta laboratuvar ortamında yapılan çimlenme denemeleriyle sınırlı kalmıştır. Ancak zamanla, tarla denemeleri ve kimyasal içerik analizleri gibi daha kapsamlı yöntemler kullanılmaya başlanmıştır. Bu alandaki çalışmalar, özellikle organik tarım uygulamalarında doğal mücadele yöntemlerinin geliştirilmesine katkılar sağlayacaktır.

Yapılan çalışmalardan elde edilen sonuçlar oldukça ümitvar bulunmakla birlikte, sera ve tarla koşullarında uygulamalarındaki bazı güçlükler nedeniyle, yürütülecek çalışmalarda yeni uygulama tekniklerinin araştırılmasına önem verilmesi gerekmektedir.

ABSTRACT

Climate change driven by global warming is one of the most pressing issues currently affecting the agricultural sector. The development of genotypes resistant to high temperatures, both in plant and animal production, is crucial for ensuring sustainable agricultural practices and a stable food supply. Developed molecular techniques are widely used to identify the genetic basis underlying heat tolerance in farm animals, as in other fields. Heat Shock Protein (HSP) genes are among the most extensively studied genetic regions related to heat tolerance in various livestock species. One of these gene regions is HSP90AA1 (112G>C) gene and it has been reported that the CC genotype is the desired genotype for heat tolerance**.** This study aimed to determine the HSP90AA1 (112G>C) gene polymorphism in Ile de France × Anatolian Crossbred sheep, which are intensively bred in Central Anatolia. For this purpose, DNA samples from 178 individuals were genotyped using Allele-Specific PCR (AS-PCR). In the studied population, the allele frequencies for G and C were 0.62 and 0.38, respectively. The genotype frequencies for GG, GC, and CC were calculated as 0.60, 0.53, and 0.12, respectively. Additionally, it was determined that the population was in Hardy-Weinberg equilibrium with respect to the HSP90AA1 (112G>C) gene polymorphism. In this study, the CC genotype, which is considered favorable for heat tolerance, was detected, albeit at a low frequency. It was also observed that there was sufficient genetic variation within the population. The results suggest that the HSP90AA1 (112G>C) gene polymorphism can be utilized in Marker-Assisted Selection (MAS) programs aimed at improving heat tolerance in Ile de France × Anatolian Crossbred sheep. However, it is important to recognize that polygenic traits, such as heat tolerance, are influenced by multiple genes and environmental factors.

Keywords: HSP, AS-PCR, sheep, heat stress

ILE DE FRANCE X ANADOLU MERINOSU MELEZİ KOYUNLARDA *HSP90AA1* GEN POLİMORFİZMİNİN BELİRLENMESİ

ÖZET

Küresel ısınma kaynaklı iklim değişikliği günümüzde tarım sektörünün üzerinde baskı yaratan en ciddi sorunlardan bir tanesidir. Gerek bitkisel gerekse hayvansal üretim alanında yüksek sıcaklığa dirençli genotiplerin elde edilmesi sürdürülebilir üretim ve gıda arzı bakımından elzemdir. Gelişen moleküler yöntemler çiftlik hayvanlarında diğer alanlarda olduğu gibi ısıya toleransın altında yatan genetik temelin belirlenmesinde yoğun olarak kullanılmaktadır. Farklı çiftlik hayvanı türlerinde ısıya tolerans ile ilişkili çalışılan gen bölgelerinin başında Isı Şok Proteinlerine (HSP) ait genler gelmektedir. Bu gen bölgelerinden bir tanesi de *HSP90AA1* (112G>C) genidir ve bu gen bölgesindeki polimorfizm sonucu oluşan genotiplerden CC genotipinin ısıya tolerans için istenilen genotip olduğu bildirilmiştir. Bu çalışmada Orta Anadolu'da yetiştiriciliği yoğun olarak yapılan Ile de France X Anadolu Melezi koyunlarda *HSP90AA1* (112G>C) gen polimorfizminin belirlenmesi amaçlanmıştır. Bu amaçla 178 örnekten elde edilen DNA'lar Allel Spesifik PCR (AS-PCR) işlemi ile genotiplendirilmiştir. Çalışılan populasyonda G ce C allel frekansları sırasıyla 0.62 ve 0.38 olarak tespit edilmiştir. GG, GC ve CC genotip frekansları ise sırasıyla 0.60, 0.53 ve 0.12 olarak hesaplanmıştır. Ayrıca çalışılan populasyonun *HSP90AA1* (112G>C) gen polimorfizmi bakımından Hardy-Weinberg dengesinde olduğu tespit edilmiştir. Çalışmada ısıya tolerans için istenilen genotip olan CC düşük frekansta da olsa tespit edilmiştir ve populasyonda yeterli genetik varyasyonun olduğu görülmüştür. Bu çalışmadan elde edilen sonuçlar *HSP90AA1* (112G>C) gen polimorfizminin Ile de France X Anadolu Melezi koyunlarda ısıya toleransın iyileştirilmesi için yapılacak Marker Destekli Seleksiyon (MAS) çalışmalarında kullanılabileceğine işaret etmektedir. Ancak ısıya tolerans gibi poligenik kalıtım izleyen özelliklerin çok sayıda gen ve çevresel faktörlerle şekillendiği unutulmamalıdır.

Anahtar Kelimeler: HSP, AS-PCR, koyun, ısı stresi

INTRODUCTION

One of the greatest challenges facing humanity today is climate change, which threatens both ecological balance and economic stability. The increase in global temperatures due to climate change causes a range of environmental problems, including drought, desertification, irregular rainfall, and the reduction of water resources and forests (Brown et al., 2007; Adamo et al., 2022). Agriculture, due to its vast scale and vulnerability to weather conditions, is the industry most at risk from climate change, which is expected to have a significant negative economic impact. Crop yields are greatly affected by variations in meteorological factors such as temperature and rainfall (Malhi et al., 2021). In livestock breeding, global climate change has both direct effects, such as decreased yield and quality, and fertility, as well as indirect effects, including the reduction in the availability and quality of pasture and grassland areas, and a decline in fodder crop production (Cheng et al., 2022).

The stress caused by high ambient temperatures not only leads to yield loss in livestock but also negatively impacts reproductive characteristics and animal welfare. This situation results in significant economic losses for breeders and poses a threat to the sustainable food supply (Demir et al., 2022). Sheep breeding holds considerable potential for sustainable animal husbandry in the face of rising environmental temperatures, which are expected to increase further due to global warming. However, to harness this potential more effectively, it is crucial to identify candidate gene regions related to heat tolerance in sheep and to enhance their frequency in the population through selective breeding (Demir et al., 2022). By incorporating these identified genes into Marker Assisted Selection (MAS) studies, alongside traditional breeding approaches, it is possible to develop animals resistant to heat stress.

Heat shock proteins (HSPs) and their corresponding gene regions have gained significant attention in molecular genetic studies on heat stress and high-temperature tolerance across various livestock species (Singh et al., 2017; Demir et al., 2022; Rawash et al., 2022; Yurdagül et al., 2023; Uzel et al., 2024). Heat shock proteins are chaperone proteins that vary in molecular weight and biological function, and they are induced under heat and other stress conditions. In the event of cellular damage, HSPs circulating in the blood protect cells from toxic effects and thermal damage caused by heat stress. These proteins are classified into five groups based on their molecular weight: HSP100, HSP90, HSP70, HSP60, and small heat shock proteins (17-30 kDa) (sHSP) (Yer, 2017; Çıldır and Özmen, 2019; Şenel et al., 2019).

This study aimed to identify the polymorphism in the *HSP90AA1* (112G>C) gene in Ile de France x Anatolian Merino crossbred sheep raised in Eskisehir province and to explore its potential use in Marker Assisted Selection (MAS) studies.

MATERIAL and METHODS

Material

The material for this study consisted of DNA isolated from blood samples of 10-11-month-old Ile de France x Anatolian Merino crossbred sheep reared on three different farms in the Günyüzü district of Eskişehir province. A total of 180 samples from these three farms were analyzed. DNA was isolated using the GeneJET Genomic DNA Purification Kit (Thermo

K0721) following the manufacturer's instructions. Quality and quantity assessments of the DNA were performed using a spectrophotometer (Allsheng Nano-400A). The DNA concentration was standardized to 50 ng/µL for use in AS-PCR procedures.

Methods

AS-PCR Process and Genotyping

The C and G alleles in the *HSP90AA1* promoter region of the sheep genome were amplified using the AS-PCR technique described by Singh et al. (2017). Some descriptive information about the primers used in PCR is given in Table 1.

Table 1. Primers utilized in AS-PCR process for determination of HSP90AA1 polymorphism

Gene	Locus	Primer Sequences (5'-3')	Genotype Sizes (bp)	Reference
HSP90AA1	(112G>C)	F: TCAGAACCAGCCGAACAGAC R1: AGGTCCATGGTTAGGGGTATC R2: AGGTCCATGGTTAGGGGTATG	254	Singh et al. 2017

Briefly, the 254-base pair (bp) C and G alleles were amplified with two primer sets in the PCR procedure. To optimize the PCR settings, gradient PCR was performed with annealing temperatures ranging from 55 to 65 °C, with the predicted fragments being clearly visible at 60 °C. The PCR reaction mixture consisted of 50 ng of template DNA, 5 µL of 10X reaction buffer, 0.6 mM dNTP, 2.5 mM MgCl2, 10 pM of each primer, 1 U Taq DNA polymerase (GeNet Bio, Korea), and 31.25 µL of nuclease-free water, for a total volume of 50 µL. The amplification process began with an initial denaturation step at 94 °C for 10 minutes, followed by 31 cycles of denaturation at 94 °C for 40 seconds, annealing at 60 °C for 40 seconds, and extension at 72 °C for 40 seconds. The amplified C and G alleles were visualized using agarose gel electrophoresis for genotyping. Individuals with a single amplification product were genotyped as homozygous (CC or GG), while those with both amplification products were classified as heterozygous (GC).

Statistical Analysis

Gene and genotype frequencies and whether the population was in Hardy-Weinberg equilibrium in terms of the relevant gene region were determined using POPGENE 1.31 (Yeh et al. 1997).

RESULTS

All three genotypes were detected with varying frequencies for *HSP90AA1* (112G>C) gene in Ile de France x Anatolian Merino crossbred sheep (Figure 1). The studied population is polymorphic for the related gene.

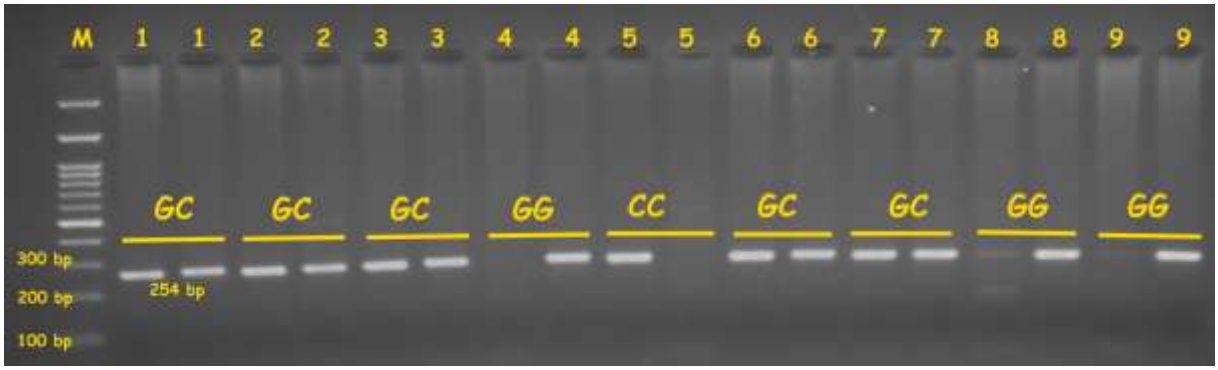

Figure 1. Agarose 2% agarose gel image of *HSP90AA1* (112G>C) polymorphism in studied population

M: Marker (softec, Cat. No: ZT-100BP-1); **1-9:** genotypes obtained

The obtained gene and genotype frequencies, as well as the Hardy-Weinberg equilibrium for the respective genotypes, are provided in Table 2. In the studied population, genotype frequencies ranged from 0.12 (CC) to 0.53 (GC), while the frequencies of the G and C alleles were calculated to be 0.62 and 0.38, respectively. It was determined that the studied population was in Hardy-Weinberg equilibrium ($p < 0.05$) for the relevant gene

Table 2. *HSP90AA1* (112G>C) gene, genotype frequencies, and chi-square values

		Allele frequencies		Genotype frequencies			χ^2
Breed	**n**	**G**	**C**	**GG**	**GC**	**CC**

$\chi^2$0.05;1: 3.84; a: Deviation from Hardy Weinberg Equilibrium is non-significant

DISCUSSION

Identifying and breeding animals with high tolerance to temperature stress is crucial for sustainable animal husbandry, especially under the changing environmental conditions brought about by global warming, which affects food supply. Consequently, in recent years, numerous studies have been conducted to explore the genetic mechanisms underlying adaptation to heat

stress in various livestock species or breeds (Tang et al. 2022; Sheraz et al. 2023; Demir 2024; Karsli 2024; Sabzizadeh et al. 2024). Singh et al. (2017) investigated the relationship between mutations in the *HSP70* and *HSP90* gene regions and heat stress in Chokla, Magra, Marwari, and Madras Red sheep breeds in India. The researchers reported that a polymorphism resulting from a point mutation (112G>C) in the *HSP90AA1* gene was directly associated with thermo-tolerance parameters. Furthermore, they found that the C allele and the CC genotype in this gene region are favorable alleles and genotypes for heat tolerance.

Singh et al. (2017) reported that for the *HSP90AA1* (112G>C) gene, the frequency of the GG genotype ranged from 0.48 (Madras Red) to 0.80 (Marwari) and was commonly observed in Chokla, Magra, Marwari, and Madras Red sheep breeds. The GC genotype frequency ranged from 0.19 (Marwari) to 0.35 (Madras Red). It was also noted that the CC genotype was not detected in the Chokla, Magra, and Marwari breeds, with its frequency being 0.16 in the Madras Red breed. The frequency of the C allele ranged from 0.09 (Marwari) to 0.34 (Madras Red), while the G allele frequency ranged from 0.10 (Madras Red) to 0.90 (Marwari) across the four Indian sheep breeds. In our study, the C allele frequency (0.38) and CC genotype frequency (0.12) in the Ile de France × Anatolian Merino crossbred sheep were relatively higher than those reported in the four Indian sheep breeds. This difference is likely attributable to the origin of the sheep. The Ile de France and Anatolian Merino (Akkaraman and German Mutton Merino crossbred) (Karsli, 2025) sheep used in this study are crossbred and primarily of European origin.

Yurdagül (2023) reported G and C allele frequencies of 0.61 and 0.39, respectively, and the frequencies of CC, CG, and GG genotypes as 0.183, 0.404, and 0.413, respectively, in the Pırlak sheep breed. Demir (2024) reported C allele frequencies of 0.33, 0.45, and 0.25, and CC genotype frequencies of 0.25, 0.16, and 0.10 in the Ivesi, Güney Karaman, and Karakaş sheep breeds, respectively. Bilginer et al. (2024) reported a C allele frequency of 0.50 and a CC genotype frequency of 0.25 in the Hamdani sheep breed. When comparing the C allele frequency (0.38) and CC genotype frequency (0.12) observed in the Ile de France × Anatolian Merino crossbred sheep in this study with the aforementioned studies, it is evident that the values are similar to those found in the Pırlak sheep by Yurdagül et al. (2023), but lower than those reported by Demir (2024) for the Ivesi and Güney Karaman breeds and by Bilginer et al. (2024) for the Hamdani breed.

The İvesi sheep breed is raised in the Gaziantep, Şanlıurfa, and Hatay provinces, which border Syria in southern Türkiye (Çebel, 2023), while the Güney Karaman breed is raised in the Antalya and Mersin provinces (Karsli et al., 2020). Both breeds are known for their ability to adapt to high temperatures and are well-adopted to the hot climatic conditions of the regions where they are bred. Similarly, the Hamdani breed, originally from Iraq and Iran, has become increasingly popular among breeders in Eastern and Southeastern Anatolia due to its excellent adaptability and high dual-purpose yield. Therefore, the C allele and CC genotype may be more prevalent in the HSP90AA1 (112G>C) gene in İvesi, Güney Karaman, and Hamdani breeds. As mentioned earlier, the sheep used in this study are primarily of European origin, which may account for the slightly lower frequency of the CC genotype.

CONCLUSION

The CC genotype, previously reported as a desirable genotype in the HSP90AA1 (112G>C) gene for heat tolerance in sheep (Singh et al., 2017), was detected in the Ile de France × Anatolian Merino crossbred sheep in this study, albeit at a low frequency. Additionally, it was determined that the population was in Hardy-Weinberg equilibrium with respect to the related gene. The findings from this study suggest that the HSP90AA1 (112G>C) gene region could be utilized in future MAS studies to enhance heat adaptation in this breed. However, it is important to recognize that heat stress adaptation follows polygenic inheritance and is influenced by numerous genes and environmental factors. Furthermore, analyzing the relationship between the gene region and thermo-physiological phenotypic parameters is crucial. Evaluation of these and similar gene regions together in MAS studies after being associated with thermos-physiological properties will increase the success.

Thanks and Information Note

This study is based on a section of the first author's master's thesis, titled " *Determination of the Relationships Between Parameters Associated with Heat Stress Tolerance and Some Candidate Genes in Ile de France x Anatolian Merino Crossbred Sheep* ".

This research has been supported by the Scientific Research Projects Coordination Unit of Eskisehir Osmangazi University (grant no. FYL-2024-3032).

ABSTRACT

Allelopathy is defined as the positive or negative effect of a plant on other plants or organisms. The allelopathic effect, whose first definition dates back to the 20th century, has always existed in nature and came to light with the beginning of agriculture. Plants with allelopathic effect interact with other plants or organisms with the compounds in their structure. These compounds secreted by plants and causing positive or negative effects are called allelochemicals. Allelochemicals directly or indirectly affect plants or organisms and affect the yield and quality. Chemical control against diseases, pests and weeds has become an indispensable option, especially in order to meet the basic need of the increasing world population and to obtain maximum yield from unit area. The intensive and prolonged use of these chemicals causes problems for humans and the environment and causes difficulties in control. Long-term use of pesticides with the same site of action result in the development of resistant weed populations and organisms, and therefore the control of resistant pests in agricultural areas becomes more difficult. However, plant-based allelochemicals have many advantages over chemical control, such as low or no potential for harm to humans and the environment, easy biodegradability, and low residue risk. Apart from this, they are also used for different purposes in agricultural areas with applications such as rotation, mixed cultivation, green manuring, preplant, cover crop, and mulching.

This research was carried out in order to reveal the current usage areas of allelopathy in agricultural areas for the control of plant protection agents. For this purpose, a comprehensive literature review on the concept of allelopathy and its use in agricultural areas was conducted and the information was compiled. Increasing research on allelopathy and biopesticide applications will play a major role in creating healthier, more efficient and sustainable agricultural systems in the future.

Keywords: Allelopathy, Allelochemical, Biopesticide, Sustainable Agriculture.

TARIMSAL ÜRETİMDE MASUM BİR YÖNTEM: ALLELOPATİ

ÖZET

Allelopati, bir bitkinin diğer bitki veya organizmalar üzerinde oluşturduğu olumlu veya olumsuz etki olarak tanımlanmaktadır. İlk tanımlaması 20. yüzyıla dayanan allelopatik etki, doğada hep var olmuş ve tarımın yapılmaya başlanmasıyla birlikte de gün yüzüne çıkmıştır. Allelopatik etkiye sahip olan bitkiler yapılarında bulunan bileşikler ile, diğer bitki veya organizmalarla etkileşim kurar. Bitkilerden salgılanan ve olumlu-olumsuz etkilere neden olan bu bileşiklere ise allelokimyasal denir. Allelokimyasallar doğrudan veya dolaylı olarak bitki veya organizmalara etki ederek verim ve kaliteye etki etmektedir. Özellikle artan dünya nüfusunun temel ihtiyacı olan gıdayı karşılamak ve birim alandan maksimum verim alınması için hastalık, zararlı ve yabancı otlara karşı kimyasal mücadele vazgeçilemez bir seçenek olmuştur. Bu kimyasalların yoğun ve uzun süreli kullanımı, insan ve çevre açısından sorunlara yol açmakta ve mücadelede zorluklara sebebiyet vermektedir. Etki mekanizması aynı pestisitlerin uzun süreli kullanımı, dayanıklı yabancı ot popülasyonlarının ve organizmaların gelişmesine neden olur ve bu nedenle tarımsal olanlarda dayanıklı zararlıların mücadelesi zorlaşır. Ancak bitkisel kökenli olan allelokimyasallar, insan ve çevreye zarar verme potansiyelinin düşük olması veya hiç olmaması, doğada kolayca çözünmesi, kalıntı riskinin düşük olması gibi kimyasal mücadeleye göre pekçok avantaja sahiptir. Bunun dışında münavebe, karışık ekim, yeşil gübreleme, ön bitki, örtücü bitki, malçlama şeklindeki uygulamalar ile tarımsal alanlarda farklı amaçlarla da kullanılmaktadır.

Bu araştırma, allelopatinin bitki koruma etmenleriyle mücadele ile tarımsal alanlardaki mevcut kullanım alanlarını ortaya çıkarmak amacıyla yapılmıştır. Bu amaçla allelopati kavramı ve tarımsal alanlarda kullanımı konusunda kapsamlı literatür taraması yapılarak elde edilen bilgiler derlenmiştir. Allelopati konusundaki araştırmaların ve biyopestisit uygulamalarının arttırılması, gelecekte daha sağlıklı, verimli ve sürdürülebilir tarım sistemlerinin oluşturulmasında büyük bir rol alacaktır.

Anahtar Kelimeler: Allelopati, Allelokimyasal, Biyopestisit, Sürdürülebilir Tarım.

GİRİŞ

İnsanoğlunun avcılık ve toplayıcılıktan yerleşik hayata geçmesiyle tarım yapılmaya başlanmıştır. Günümümüzden binlerce yıl öncesine dayanan tarım ile günümüzde yapılan tarım arasında çok büyük farklılıklar olsa da, temelde ikisi de insan hayatının devam edebilmesi için şart olan beslenme ihtiyacını karşılamayı hedeflemiştir. Sağlıklı ve temiz gıdaya erişim her yüzyılda insanların en öncelikli hedeflerinden biri olmuştur. Bu hedef gelecek yüzyıllar için de aynı şekilde devam edecektir. Eski çağlarda tarımın kısıtlı imkanlarla yapılması bile az olan nüfusa yetecek gıda tedariğini belli bir oranda karşılayabildiği bilinmektedir. Ulusal Demografik Araştırmalar Enstitüsü (INED) 2024 verilerine göre dünya nüfusu 8 milyar kişiyi aşmış ve giderek artmaktadır **(INED, 2024).** Dünyada tarım yapılan alanlarda herhangi bir değişiklik söz konusu değildir. Dolayısıyla, nüfusun her geçen gün artmasına karşılık gıda ihtiyacını karşılayacak yeni tarım alanları bulunmamaktadır. Dünya nufüsunun her geçen gün artması sağlıklı ve temiz gıdaya olan erişimin zorlaşmasına neden olacaktır. Bu durumda yeni tarım alanları olamayacağı için var olan tarım alanlarınında birim alandan maksimum verim ve kaliteninde alınması gerekmektedir. Birim alandan maksimum verim alınmasını sınırlayıcı biyotik ve abiyotik etmenler bulunmaktadır. Tarımsal alanlarda ürün miktarını sınırlayan biyotik etmenler hastalık, zararlı ve yabancı otlardır **(Bükün, 2012).** Biyotik etmenlerden kaynaklanan verim kaybının %30 civarında olduğu belirtilmektedir **(Karaca, 2022).** Bu etmenlerden birinin veya birkaçının aynı zamanda olması tarımda %100'e varan oranlarda verim ve kalite kayıplarına yol açmaktadır. Abiyotik etmenlerden kaynaklanan kayıpların önüne geçmek için uygulanabilecek bazı mücadele yöntemleri mevcuttur. Bu yöntemlerden kimyasal mücadele kısa sürede etki göstermesi, işçilik maaliyetinin olmaması veya daha düşük olması, kolay uygulanabilirliği gibi nedenlerden dolayı mücadelede en çok tercih edilen yöntemdir. Tarımda hastalık, zararlı ve yabancı otların mücadelesinde farklı kimyasal maddelerin kullanımı eski çağlarda başlamıştır. Kükürdün insektisit ve fungisit özelliğinin M.Ö. 1000 yılında keşfedildiği **(Öztürk ve Özge, 1978: Ağar ve ark. 1991'dan)** "Hellobore" (*Helleborus niger, Helleborus orientalis* ve *Veratrum album*) adlı bitkilerin fare, sıçan ve böceklerin kontrolü için M.Ö. 100 yılında kullanıldığı bilinmektedir. Ancak sanayinin gelişmesi ve teknolojinin ilerlemesiyle birlikte organik/inorganik kaynaklı maddelerin yerini sentetik kimyasallar almaya başlamıştır. 20. yüzyılla birlikte ilk insektisit, fungisit, herbisit gibi terimler kullanılmaya başlanmıştır. Kısa sürede etki göstermesi, diğer mücadele yöntemlerini göre işçilik maaliyetinin düşük olması gibi nedenlerden dolayı pestisit kullanımı hızla artış göstermiştir. Ancak, sentetik kimyasalların yoğun şekilde ve uzun süreli kullanımı sonucu insan, hayvan ve çevre sağlığına olan etkileri fark edilmiş, pestisit kullanımını kontrol altına alabilmek için yasal düzenlemeler getirilmiştir ve uluslararası faaliyet gösteren kuruluşlara eğitimler verilmiştir. Günümüzde EPPO, FAO, WHO, EEC, EPA gibi kuruluşlar pestisit kullanımı konusunda faaliyet göstermektedir **(Ağar ve ark., 1991).** Sentetik kimyasalların kullanımı sonucunda karşılaşılan en önemli sorunlardan biri de çevrede bıraktığı kalıntı ve kullanıldığı organizmada oluşturduğu dayanıklılıktır. Bu karşılaşılan olumsuzluklardan sonra, 1970'li yıllarda çevre koruma hareketleri hızlanmış ve daha kontrollü kimyasal kullanımı ön plana çıkmıştır **(Ağar ve ark, 1991).** Bitki koruma hareketleriyle başlayan bu süreç, yıllar içinde daha da ilerleyerek diğer mücadele yöntemlerinin de gelişmesine olanak sağlamıştır. Entegre mücadele sistemlerininde tarımsal savaşımda daha fazla paydaya sahip olmasını sağlamıştır. Biyoteknik, biyolojik mücadele yöntemlerinin yanısıra, doğal kaynaklı maddelerinde fark edilmesini ve geliştirilmesi hız kazanmıştır. Sentetik kaynaklı pestisitlerin

yerine kulanılabilecek doğal kaynakların varlığı tarımsal açısından önemli bir gelişme olarak nitelendirilebilir.

"Allelon" (birbiri ile ilgili) ve "Pathos" (zarara girmek) kelimelerinin birleşimi ile "Allopathy" olarak tanımlanan allelopati "Bitkiler veya mikroorganizmalar arasındaki olumlu veya olumsuz etkileşimler" olarak 1937 yılında Molich tarafından ilk kez tanımlanmıştır. Bu kavram, daha sonraki yıllarda "Çevreye saldığı kimyasal bileşiklerle bir bitkinin veya bir mikroorganizmanın diğerini dolaylı veya doğrudan zararlı veya yararlı olarak etkilemesi" olarak daha da genişletilerek ifade edilmiştir **(Rice, 1984).** 20. yüzyılın başlarında dünyada başlayan allelopati çalışmalarına Türkiye ise 1980 yılında dahil olmuş ve günümüze kadar çalışmalar ilerleyerek devam etmektedir **(Karaca ve Eren, 2023)**. Doğada allelopatik etki gösteren çok sayıda bitki bulunmaktadır. Allelopatik etkiye sahip böylesi bitkilere ise allelopatik bitkiler denilmektedir. Allelopatik bitkilerin çeşitli kısımlarından salgıladıkları ve bitkiler üzerinde olumlu veya olumsuz etkiler oluşturan bileşiklere allelokimyasal denir. Bitkiler tarafından üretilen sekonder bileşikler, bitkilerin cins ve türüne göre farklılıklar gösterebilmektedir. Farklı sayıda ve miktarlarda bulunan sekonder bileşikler; toksik gazlar, organik asit ve aldehitler, aromatik asitler, doymamış basit laktonlar, kumarinler, kininler, flavanoidler, taninler, alkoloidler, terpeneoidler ve streroidlerdir **(Özer ve ark., 1997).** Allelokimyasal maddeler bitkilerin tohum, çiçek, polen, yaprak, gövde, rizom, meyve ve kök bölgelerinin birinde veya birkaç bölgesinde bulunur **(Yılmaz ve Köse, 2021).** Bitkilerin farklı noktalarında bulunan bu allelokimyasallar bitkiden buharlaşma (volatilizasyon), kök salgıları, toprak üstü organlardan yıkanma ve bitki artıkların ayrışmasıyla etki edeceği organizmaya ulaşır **(Yılmaz ve Köse, 2021).** Bitkilere ulaşan allelokimyasallar tohumun çimlenmesini engelleyerek, büyüme ve gelişmeyi yavaşlatarak veya besin maddelerinin alımında sorunlar oluşturarak allelopatik etkilerini gösterirler **(Yılmaz ve Köse; Kamal, 2020).** Etki ettiği organizmalarda farklı fizyolojik ve morfolojik etkiler sonucu yaşamsal faaliyetler engellenir. Allelokimyasalların bitkilerde üretimini sınırlayan çeşitli etmenler de bulunmaktadır. Güneş ışınları, bitki besin mineral yetersizliği, bitki organlarının yaşı, stres, nem, sıcaklık gibi abiyotik ve fizyolojik faktörlerin yanı sıra, hastalık, zararlı, yabancı otlar gibi biyotik faktörler deallelokimyasal üretimini sınırlayabilmektedir. **(Rice, 1984)**. Allelopatik bitkilerin etkileri değerlendirildiğinde, bazı durumlarda olumsuz sonuçlar doğurabileceği düşünülse de, muhtemel olumsuz durumları doğru yöntemler kullanarak ortadan kaldırmak mümkündür. Allelokimyasallar biyoherbisit olarak tarımsal savaşta kimyasal mücadeleye alternatif olarak uygulayabildiğimiz, aynı zamanda tarımsal alanlarda münavebe, karışık ekim, yeşil gübreleme, ön bitki, örtücü bitki ve malçlama gibi farklı uygulamalarda da etkisinden faydalandığımız doğal bileşikler olarak önemini korumaktadır.

1. ALLELOPATİNİN TARIMDA KULLANIMI

1.1. Biyopestisit

Allelopati, sentetik kimyasalların uzun yıllar kullanılması sonucu ortaya çıkan çevreye olumsuz etkiler, tarımsal ürünlerde kalıntı ve organizmalarda dayanıklılık sorunlarını minimuma indirebilecek veya tamamen ortadan kaldırabilecek bir yöntem olarak görülmektedir. Bazı alleleopatik bitkilerin böcek kovucu oldukları veya yabancı otları çıkışlarını etkiledikleri eski çağlardan günümüze kadar bilinmektedir. *Helleborus niger* (Noel gülü), *Helleborus orientalis*

(Mercimek gülü) ve *Veratrum album* (Beyaz çöpleme) bitkilerinin M.Ö. 100 yılında haşere ve böcekleri kontrol etmede kullanıldığı bilinmektedir **(Öztürk ve Özge, 1978: Ağar ve ark. 1991'dan)**. Allelopatik bitkilerden salgılanan maddeler doğal kaynaklı olduklarından tabiatta bunları tanıyan ve parçalayan enzimler ve mikroorganizmalar bulunmaktadır. Dolayısıyla, tabiatta birikim yapmadıklarından pestisitlere kıyasla çevreye dost bileşiklerdir **(Dukat et al., 2002; Vyvyan 2002; Bhowmik and Inderjit 2003; Yazlık, 2009'dan).** Bu sebeple tarım alanlarında hastalık, zararlı ve yabancı ot mücadelesinde allelopatik bitkilerden sentezlenen allelokimyasalların biyopestisit olarak kullanılması sentetik pestisitlerin uzun yıllar boyunca ve yoğun biçimde kullanılması sonucunda sebep olduğu çevre kirliliği, biyolojik çeşitlilikte azalma, hedef dışı organizmalarda dayanıklılık gelişimi ve insan sağlığına olumsuz etkiler gibi pek çok sorunun çözümünde etkili olacağı düşülmektedir. Bu olumsuzlukların giderek artması, çevre dostu ve sürdürülebilir alternatif arayışları gündeme getirmiştir. Bu bağlamda, bitkilerin kendi savunma mekanizmaları çerçevesinde sentezlediği doğal bileşikler olan allelokimyasallar, son yıllarda özellikle biyopestisit olarak kullanımları ile dikkat çekmektedir. Allelokimyasalların etkilerinin tespit edildiği pek çok laboratuvar çalışmaları mevcuttur. Çoban kirpiği (*Achillea tenuifolia*) bitkisinden elde edilen aseton ekstraktının Tarla akça çiçeği (*Thlaspi arvense*) ve Yabani marul (*Lactuca serriola*) çimlenmesine ve gelişmesine allelopatik etkileri araştırılmış ve sonuç olarak *A. tenuifolia* bitkisinden elde edilen aseton ekstraktının yabancı ot tohumlarının çimlenme, kök ve sürgün gelişmesini engellediği, doz artışıyla beraber engelleme oranlarının da arttığı ve fide ölümlerine neden olduğu saptanmıştır. Sonuç olarak, Çoban kirpiği ekstraktının allelopatik etkisinin olduğu belirlenmiştir **(Bozhüyük-Usanmaz ve Aslan, 2024).** Yapılan başka bir çalışmada ise Pelin otunun (*Artemisia annua*) yaprak özütleri farklı dozlarda üç farklı kültür bitkisine (ayçiçeği, marul, mısır) ve Horozibiği (*Amaranthus* spp.), Darıcan (*Echinochloa crus-galli*) ve Delice (*Lolium perene*) yabancı otlarına allelopatik etkisi araştırılmış ve Pelin özütlerinin, çalışmadaki tüm kültür bitkilerinin ve yabancı ot türlerinin çimlenmesini azalttığı saptanılmıştır **(Kolören, 2006; Güney ve ark., 2019'dan).** Benzer bir araştırmada, Isırgan otu (*Urtica dioica*) etanol ekstraktları hazırlanmış ve Sarı taş yoncası (*Melilotus officinalis*) ve Kıvırcık labada (*Rumex crispus*) tohum çimlenmesine ve fide gelişimine olan etkisi değerlendirilmiştir. Çalışma sonucunda özellikle 15 mg petri^{-1}'lik konsantrasyonun çimlenme, kök ve sürgün gelişimi bakımından önemli düzeyde başarılı sonuçlar verdiği belirlenmiştir. Saksı denemelerinde, en iyi sonuçlar ilk 24 saatte elde edilmiştir. Yapılan bu çalışmayla ısırgan otu ekstraktının bu yabancı otlara etkili bir biyoherbisit olma potansiyelinin var olabileceği tespit edilmiştir **(Bozhüyük-Usanmaz ve Karaçöl, 2024).**

Bu kapsamda yürütülen araştırmalar, özellikle tarımda kimyasal girdilerin azaltılması, biyolojik çeşitliliğin korunması ve sürdürülebilir üretim sistemlerinin geliştirilmesi açısından büyük önem taşımaktadır. Doğal kökenli olmaları nedeniyle toksisitelerinin düşüklüğü, hedef dışı canlılara zarar vermeme potansiyelleri ve çevresel kalıcılıklarının sınırlı olması gibi avantajlar, bu bileşiklerin gelecekte konvansiyonel pestisitlerin yerini alabilecek güçlü adaylar olduğunu göstermektedir.

Sonuç olarak, allelokimyasallar; doğaya uyumlu yapıları, çevrede kalıntı bırakmama özellikleri ve çok yönlü biyolojik aktiviteleri sayesinde, tarımsal üretimde sentetik pestisitlerin neden olduğu çevresel ve sağlık temelli sorunların azaltılmasında önemli bir rol oynayabilir. Bu doğrultuda yapılacak kapsamlı araştırmalar ve saha çalışmaları, bu doğal bileşiklerin

biyopestisit olarak ticarileştirilmesi ve sürdürülebilir tarım uygulamalarında yaygınlaştırılması açısından büyük önem arz etmektedir.

1.2. Canlı veya Cansız Bitkisel Materyallerle Malçlama

Malçlama, toprağın yüzeyini örtücü bir materyalle kaplama işlemidir ve bu uygulama, özellikle güneş ışığının toprakla doğrudan temasını engelleyerek yabancı ot tohumlarının çimlenmesini büyük ölçüde önler. Fotosentez için gerekli ışığın yokluğu, yabancı otların gelişimini baskı altına alarak kültür bitkilerinin rekabet gücünü artırır. Tarımda verimliliği artırmak ve sürdürülebilir üretimi desteklemek amacıyla geliştirilen çeşitli yöntemlerden biri olan malçlama, kültür bitkilerinin yetiştirileceği alanlarda ekim öncesi veya sonrası dönemde uygulanarak hem yabancı otların kontrolü, hem de toprak yapısının korunması açısından önemli katkılar sağlar.

Malç materyalleri organik ya da inorganik kökenli olabilir. Ancak özellikle allelopatik özellik gösteren bitkilerden elde edilen organik malçların kullanımı, yabancı ot yönetiminde çok daha etkili sonuçlar doğurmaktadır. Allelopatik bitkilerin malç materyali olarak tercih edilmesi, malçlamanın etkisini artırarak yabancı otların çimlenme kabiliyetlerini düşürür ve daha etkin bir mücadele sağlar. Allelopatik bitkiler, salgıladıkları kimyasal bileşiklerle çevrelerindeki diğer bitkilerin çimlenmesini ve gelişmesini baskılayıcı etki gösterirler. Bunlara ek olarak, çok yıllık kültür bitkilerinde örtücü bitkilerin doğadaki predator ve parazitoitlere doğal ortam sağlandığı belirlenmiştir **(Temel ve Torun, 2020).** Bu bitkilerden elde edilen malçlar, yalnızca fiziksel bir engel görevi görmekle kalmaz, aynı zamanda kimyasal yollarla yabancı otların çimlenme ve büyüme süreçlerini engeller. Böylece yabancı ot baskısı minimuma indirilerek hem kültür bitkilerinin gelişimi teşvik edilir, hem de pestisit kullanımına olan ihtiyaç azaltılmış olur. Bitkisel materyallerin kullanıldığı canlı malçlar zamanla ayrışıp toprağın organik madde miktarını artırır. Su tutma kapasitesini yükseltir ve biyoçeşitliliğe de katkı sağlamış olur **(Arıkan ve Elibüyük, 2015).** Malç materyalleri, toprak sıcaklığının düzenlenmesine yardımcı olarak bitki köklerinin daha stabil bir ortamda gelişmesini destekler. Aynı zamanda topraktaki buharlaşmayı azaltarak suyun daha verimli kullanılmasını sağlar. Bu durum özellikle su kaynaklarının kısıtlı olduğu bölgelerde su tasarrufu açısından büyük önem taşımaktadır. Toprak yapısınının iyileştirilmesinde, organik maddenin, karbon dinamiğinin ve mikrobiyal yaşamın canlandırılması gibi noktalarda örtücü bitkilerin önemli faydaları bulunur **(Temel ve Torun, 2020).**

Sonuç olarak, malçlama uygulamaları, modern tarımda hem çevresel, hem de ekonomik açıdan önemli avantajlar sunmaktadır. Yabancı otlarla mücadelede çevre dostu bir alternatif olarak öne çıkan bu yöntem, aynı zamanda toprak sağlığının korunması ve iyileştirilmesi, su verimliliğinin artırılması ve tarımsal biyoçeşitliliğin desteklenmesi gibi birçok olumlu etkiyi beraberinde getirmektedir. Bu bağlamda, özellikle sürdürülebilir tarım ve çevre için allelopatik bitkilerle malçlama uygulamalarının daha geniş alanlarda uygulanması gerekmektedir.

1.2.1. Canlı Bitki Materyalleri ile Malçlama (Örtücü Bitki)

Tek ya da çok yıllık otsu bitkilerden oluşan, hızlı gelişim gösteren ve yüzeyde oluşturduğu sık bitki dokusuyla toprağı örten bitkilere örtücü bitkiler denir **(Kitiş, 2010).** Örtücü bitki uygulamaları tüm yıl yada belirli dönemlerde, tek başına veya karışık olarak tek yada çok yıllık otsu bitkilerle toprağın örtülmesi esasına dayanır. Tarımsal arazilerin sürdürülebilirliği ve işleyişinin korunması bakış açısıyla örtücü bitkilerin kullanımı giderek daha fazla önem

kazanmaktadır. Örtücü bitkiler, toprak yüzeyini kaplayarak hem fiziksel, hem de biyolojik olarak pek çok işlevin yerine geçen bitkilerdir. Özellikle ekim nöbeti uygulamalarının benimsendiği tarım sistemlerinde allelopatik özellik gösteren örtücü bitkiler, yabancı otların çimlenmesini ve gelişmesini engelleyerek etkili bir biyolojik kontrol aracı olarak görev yapar **(Arıkan ve Elibüyük, 2015).** Bu bitkiler, kök salgıları veya ayrışan bitki kalıntıları aracılığıyla çevrelerine allelokimyasal bitkiler salgılayarak yabancı otların toprakta tutunmasını veya çimlenmesini baskılar. Yabancı ot kontrolünün yanında, örtücü bitkilerin toprak koruma açısından da birçok olumlu etkisi bulunmaktadır. Toprağın yüzeyini tamamen kaplayan bu bitkiler, yüzeylerin silinmesi ve rüzgar parçalarına karşı doğal bir bariyer oluşturur. Özellikle eğimli arazilerde ve organik madde açısından fakir topraklarda bu işlev son derece kritiktir. Özellikle yapraklı allelopatik bitkilerin örtücü bitki olarak kullanılmasında pek çok avantajlar bulunmaktadır. Yağmur damlalarının hızını keserek toprağa sert çapmasını, agregatlarının dağılmasını ve kaymak tabakasının oluşumunu engellemektedir. Çim ve baklagil gibi tek yıllık olan örtücü bitkiler bu bağlamda yaygın kullanılmaktadır **(Acar ve ark., 2006).** Bu tür bitkiler, kök sistemleri sayesinde havanın fiziksel olarak stabilize edilmesini sağlar, üst aksamları ile yüzeyin korunmasını sağlar. Ayrıca bu programların ayrı ayrı organik madde miktarının artırılması ve toprak biyotasını destekleyerek agroekosisteme katkısı bulunmaktadır. Dünyada ve ülkemizde örtücü bitki olarak yaygın kullanılan birçok bitki türü bulunmaktadır. Örneğin, tarım alanlarında sorun yaratan Tarla sarmaşığı (*Convolvulus arvensis*) ve Sarı topalak (*Cyperus esculentus*) mücadelesinde Tüylü fiğ (*Vicia villosa*), Yabani hardal (*Sinapis arvensis*) ve İtalyan çimi (*Lolium multiflorum*) mücadelesinde ise Kırmızı üçgül (*Trifolium incarnatum*) örtücü bitki olarak kullanılmaktadır **(Özeker ve Ulutürk, 2006).** Ülkemizde kullanılan Adi fiğ (*Vicia sativa*), Macar fiğ (*Vicia narbonensis*), Börülce (*Vigna sinensis*), Karabuğday (*Fagopyrum esculentum*), Sarı acı bakla (*Lupinus luteus*) da örtücü bitkilere örnek olarak verilebilir **(Kitiş, 2010).**

Sonuç olarak, allelopatik örtücü bitkiler, entegre yabancı ot yönetimi stratejilerinde etkili ve çevre dostu bir yöntem olarak değerlendirilmektedir. Aynı zamanda bunların kesilmesi, toprak yapısının yönetimi açısından da önemlidir. Örtücü bitki uygulamalarının yaygınlaştırılması, sürdürülebilir tarıma erişilebilmesinde temel uygulamalardan biri olarak öne çıkmaktadır.

1.2.2. Cansız Bitki Materyalleri ile Malçlama

Toprak yüzeyinin ışık geçirmeyecek şekilde bitkisel bir materyalle örtülmesi işlemidir. Bu materyaller arasında saman, kuru otlar, odun parçaları, talaş ve çeşitli allelopatik içerikli tarımsal atıklar olabilmektedir. Çimlenen yabancı ot tohumları toprak yüzeyine çıksa bile, ışık alamadıkları için ölürler **(Kolören ve Uygur, 2015, Çil ve ark 2022'den).** Böylelikle toprak nemi korunurken aynı zamanda yabancı otlarla mücadele edilmiş olunur. Malçlama uygulamalarının yabancı ot mücadelesinde başarılı olabilmesi için erken dönemde uygulanması gerekir. Böylelikle hem yabancı ot tohumlarının çimlenmek ve gelişmek için ihtiyaç duydukları ışık engellenmiş olur hem de allelopatik özellik sayesinde çimlenme uzun süreli baskılanır.

1.3. Münavebe

Ekim nöbeti diğer ismiyle münavebe, toprak ve iklim istekleri dikkate alınarak kültür bitkilerinin aynı yerde dönüşümlü olarak ekilmesi olarak tanımlanabilir. Aynı zamanda ekim nöbetinde yetiştirilecek bitki seçimi yapılırken kültür bitkilerinin özelliklerine (allelopatik etki, repellent etki, topraktaki fauna ve floraya etki, bitki besleme ve gübre özellikleri, çapalama vb.)

göre planlı bir şekilde yetiştirilmesini ifade eder **(Uygur ve ark., 1984; Liebman ve Dyck, 1993; Wibberley, 1996, Torun ve Uygur 2019'dan).** Ekim nöbeti, tarımda verimliliğin ve kalitenin artırılması için kullanılan entegre mücadele yöntemlerinden biridir. Monokültür tarımda aynı bitki örtüsünün sürekli olarak ekilmesi sonucu toprak koşulları olumsuz etkilenir ve bunun sonucu olarak toprak yorgunluğu oluşur. Monokültür tarım, bazı yabancı ot türlerinin popülasyonlarını artırarak bu türlerin ana zararlı türler haline gelmesine neden olur. Ancak ekim nöbeti, toprak yorgunluğunun giderilmesine, bununla beraber farklı yabancı otların yetişmesine ve floranın zenginleşmesine, kültür bitkilerinin rekabet gücünün artmasına olanak sağlar **(Melander ve Rasmussen, 2001, Torun ve Uygur2019'dan,)**.

Ekim nöbetinde allelopatik bitkilerin tercih edilmesi mücadeledeki etkinliği artırmaktadır. Örneğin tarım alanlarında verim ve kalite kayıplarına neden olan Pelin otu (*Artemisia vulgaris*)'nun mücadelesinde güçlü allelopatik etkisi bulunan Yonca (*Medicago sativa*) bitkisinin ekim nöbeti sistemine dahil edilmesi, Pelin otu popülasyonunu baskılamıştır **(Önen, 1999).** Sonuç olarak, ekim nöbeti sürdürülebilir tarım için hem yabancı ot yönetimini sağlayarak hem de toprak güvenliğini koruyarak faydalı olmaktadır. Bu sisteme allelopatik bitkiler dahil edilerek agroekosistem yönetiminin daha sürdürülebilir olması sağlanabilmektedir.

1.4. Ön Bitki

Ön bitkiler, tarımda ana kültür bitkileri ekilmeden önce, toprak sağlığını iyileştirmek, yabancı otları kontrol etmek, toprak erozyonunu engellemek ve ekosistem dengesini sağlamak amacıyla ekilen bitkilerdir. Bu bitkiler genellikle geçici bir süreyle ekilir ve bu süreç boyunca çeşitli ekolojik faydalar sağlar. Ön bitkiler, tarımsal üretimin sürdürülebilirliğini artıran, toprak yapısını güçlendiren, organik madde kazandıran ve çevresel etkileri en aza indiren bitkilerdir. Özellikle baklagiller, toprakta azot fiksasyonu yaparak atmosferdeki azotu toprakta kullanılabilir hale getirir. Bu özellik, ekilecek diğer kültür bitkilerinin azot ihtiyacını karşılar ve kimyasal gübre kullanımını azaltarak sürdürülebilir tarımı destekler. Yulaf ve çim bitkileri de, toprak yüzeyini kaplayarak erozyonu engeller ve toprağın su tutma kapasitesini artırır. Çim bitkileri özellikle eğimli tarım alanlarında suyun toprakla etkileşimini düzenler ve toprak kaymalarını önler. Ayrıca, kök yapıları sayesinde toprağın havalanmasına katkı sağlar ve bu da toprak yapısının iyileşmesine yardımcı olur. Ön bitkiler, ekim nöbetinin başlangıcında yer alarak, toprağın besin dengesini sağlar, zararlılarla biyolojik mücadele yapar, toprakta yabancı otları kontrol eder ve toprağın yapısının bozulmasını engeller. Bir başka önemli avantaj ise bu bitkilerin allelopatik etkileridir. Allelopatik bitkiler, çevrelerine kimyasal bileşikler salarak, diğer bitkilerin büyümesini inhibe eder. Bu kimyasal bileşikler, özellikle yabancı otların çimlenmesini engelleyerek, ana kültür bitkilerinin sağlıklı bir şekilde büyümesine olanak tanır. Bu durum, kimyasal herbisitlere olan bağımlılığı azaltarak, çevre dostu bir çözüm sunar. Örneğin Kanyaş (*Sorghum halepense*) pamukta önemli verim ve kalite kayıplarına neden olan bir yabancı ottur. Pamuk ekiminden önce Antep turbunun (*Raphanus sativus*) yetiştirilip bir kısmının hasat edilip bir kısmının toprağa karıştırılması sonrasında tekrar pamuk yetiştirildiğinde, Antep turbundan salgılanan allelopatik maddelerin kanyaşın çıkısını önemli oranda baskıladığı tespit edilmiştir **(Kayandan ve ark., 2002; Kitiş 2011'den).**

Sonuç olarak, ön bitkiler tarımda çok önemli bir rol oynamaktadır. Hem toprak sağlığını iyileştirir, hem de çevre dostu ve sürdürülebilir tarım uygulamalarına katkı sağlar. Bu bitkiler,

toprağa organik madde kazandırır, suyun toprakta tutulmasına yardımcı olur ve erozyon riskini azaltır. Ayrıca, allelopatik bitkiler kullanılarak yapılan yabancı ot kontrolü, kimyasal ilaçlara olan bağımlılığı azaltır ve doğal kaynakların korunmasına yardımcı olur. Tarımsal üretimde verimliliği artıran ön bitkiler, hem çevresel hem de ekonomik açıdan faydalı bir strateji sunar. Bu yüzden, ön bitkilerin kullanımı, modern tarım uygulamalarının vazgeçilmez bir parçası olup ekosistemin sağlıklı bir şekilde işlemesine katkı sağlar.

1.5. Karışık Ekim

Tarımsal üretimde verim düşüklüğü üretimin sürdürülebilirliği açısından çok önemli sorunlardan bir tanesidir. Yoğun monokültür uygulamalarının neden olduğu toprak verimliliğinde azalma, hastalık ve zararlıların baskısı ve diğer etmenlerin etkisiyle beraber verimi etkileyen bir çok faktör bulunmaktadır. Karışık ekim sistemi, verim kayıplarının azaltılması amacıyla kullanılabilecek bir yöntem olarak karşımıza çıkmaktadır.

Karışık ekim, iki veya daha fazla bitkinin aynı periyotta yetiştirilmesi olarak tanımlanabilir. Bu ekim sisteminde kültür bitkileri birbirlerinin verimini arttırırken aynı zamanda yapılarındaki allelokimyasallar sayesinde yabancı otları da baskılayabilmektedir. Özellikle tek başına yetiştirilen bitkilerde geniş alanların bulunması yabancı otların yaşamasına imkan sunmaktadır. Karışık ekim yapıldığında ise birlikte yetiştirilen bitkiler daha yoğun bitki örtüsü oluştururken, fiziksel olarak gölgeleme ve allelopatik maddelerin kimyasal salınımı yoluyla yabancı otların olgunlaşmasını da sınırlandırabilmektedir.

Karışık ekim sistemlerinde kullanılan bitkilerden bazılarının güçlü allelopatik özellikler taşıması, önemli etkiler gerçekleşmesini sağlamaktadır. Yabancı otların çimlenmesini baskılamasının yanında, zararlı böcekleri uzaklaştırıcı ya da topraktaki mikrobiyal dengenin korunmasında da oldukça önemlidir. Mısır ve fasulye kültür bitkisiyle yapılan karışık ekim araştırmalarında sık ekilmeleri durumunda her iki bitkinin tane verimleri daha yüksek olmuştur. Nedeni ise birim alanda daha fazla bitki sayısının olması ve fotosentetik aktivite ile daha fazla kuru madde üretilmesidir **(Takıl ve Kayan, 2020).**

Karışık ekim sistemlerinde allelopatik etkileşimler yalnızca yabancı otların değil, zararlı organizmaların da dayanıklılığını artırmaktadır. Örneğin, Kekik (*Thymus vulgaris*), Fesleğen *(*Ocimum basilicum*) ve Nane (*Mentha* spp.) gibi organik yağ içeriği yüksek aromatik bitkilerle yapılan karışık ekimler, domates ve biber gibi sebze türlerinde yaprak biti, beyaz sinek gibi zararlılara karşı doğal bir engelleyici olabilmektedir. Bu ekim sistemine yem bitkileride dahil edilmelidir. Böylelikle bir yandan yabancı otlarla mücadele edilirken bir yandan da yem bitkisi kullanılarak birim alandan daha fazla ve dengeli ürün alınmış olunur **(Acar ve ark., 2006).**

Sonuç olarak, tarımsal üretimde karışık ekim sisteminin uygulanması sürdürülebilirlik ve ekosistemin korunması açısından büyük bir önem içermektedir. Bu bağlamda, allelopatinin daha iyi anlaşılması ve karışık ekim uygulamalarına uygun bitkilerin belirlenmesine yönelik araştırmaların yapılması önemli bir rol oynayacaktır. Karışık ekim alanlarında allelopatik etkileşimlerin incelenmesi, sürdürülebilir tarım uygulamaları açısından büyük önem arz etmektedir.

ABSTRACT

Developing digital technologies, increasing prevalence of the internet and the pandemic process have significantly affected traditional food purchasing habits and online food shopping has become an increasingly widespread form of consumption. Especially the COVID-19 pandemic, together with mandatory conditions such as social distancing and isolation, has made online food shopping an inevitable choice for many consumers. However, this transformation is closely related not only to technological developments but also to the socio-demographic characteristics of individuals. Based on face-to-face survey data conducted with 1,016 consumers across Turkey, this study analyzes the effects of basic socio-demographic variables such as age, gender, education level, income status, marital status and household size on online food purchasing behavior. The ordered probit model was used in the empirical analyses and variables such as social media use and nutritional preferences were also evaluated. The findings reveal that online food shopping has not yet become widespread, but especially the fact that consumers are young, highly educated, female and live in small households increases the likelihood of online food purchasing behavior. While social media use positively affects online shopping, age and household size have negative effects. It has also been found that consumption tendencies towards certain product groups such as fast food, junk food and supplements increase the probability of online shopping. In contrast, the tendency towards local foods is negatively related to online shopping, indicating consumers' attachment to the physical experience in traditional food supply. In conclusion, online food shopping is a multidimensional phenomenon and is shaped not only by digitalization but also by the socio-cultural structure of the consumer. This study contributes to both academic literature and provides guiding findings in shaping digital retail strategies and public policies.

TÜRKİYE'DE PANDEMİ SONRASI ÇEVRİM İÇİ GIDA SATIN ALMA EĞİLİMLERİ: SOSYO-DEMOGRAFİK FAKTÖRLER EKSENİNDE BİR DEĞERLENDİRME

ÖZET

Gelişen dijital teknolojiler, internetin artan yaygınlığı ve pandemi süreci geleneksel gıda satın alma alışkanlıklarını önemli ölçüde etkilemiş ve çevrim içi gıda alışverişi giderek yaygınlaşan bir satın alma yöntemi haline gelmiştir. Özellikle COVID-19 pandemisi sosyal mesafe ve izolasyon gibi zorunlu koşullarla birlikte çevrim içi gıda alışverişini birçok tüketici için kaçınılmaz bir tercih haline getirmiştir. Ancak bu dönüşüm yalnızca teknolojik gelişmelerle değil, aynı zamanda bireylerin sosyo-demografik özellikleriyle de yakından ilişkilidir. Bu çalışma, Türkiye genelinde 1.016 tüketiciyle yapılan yüz yüze anket verilerine dayanarak, yaş, cinsiyet, eğitim düzeyi, gelir durumu, medeni durum ve hane büyüklüğü gibi temel sosyo-demografik değişkenlerin çevrim içi gıda satın alma davranışı üzerindeki etkilerini analiz etmektedir. Ampirik analizlerde sıralı probit modeli kullanılmış ve sosyal medya kullanımı ile beslenme tercihleri gibi değişkenler de değerlendirilmiştir. Bulgular çevrim içi gıda alışverişinin henüz geleneksel kanallar kadar yaygınlaşmadığını ancak özellikle tüketicilerin genç, eğitim seviyesi yüksek ve kadın olmalarının çevrim içi gıda satın alma davranışını gerçekleştirme olasılığını arttırdığını ortaya koymaktadır. Sosyal medya kullanımı çevrim içi alışverişi pozitif etkilerken, yaş ve hane büyüklüğü negatif etkiler üretmiştir. Ayrıca fast-food, abur cubur ve takviye edici ürünler gibi belirli ürün gruplarına yönelik tüketim eğilimlerinin çevrim içi alışveriş yapma olasılığını artırdığı da tespit edilmiştir. Buna karşılık yerel gıdalara yönelim çevrim içi alışverişle negatif ilişkilidir ve bu da tüketicilerin geleneksel gıda temininde fiziksel deneyime olan bağlılığını göstermektedir. Sonuç olarak, çevrim içi gıda alışverişi çok boyutlu bir olgu olup yalnızca dijitalleşme ile değil, tüketicinin sosyo-kültürel yapısıyla da şekillenmektedir. Bu çalışma, hem akademik literatüre katkı sunmakta hem de dijital perakendecilik stratejileri ve kamu politikalarının şekillendirilmesinde yol gösterici nitelikte bulgular ortaya koymaktadır.

Anahtar Kelimeler: Çevrim İçi Gıda Alışverişi, Tüketici Davranışları, Sosyo-Demografik Faktörler, Sıralı Probit Modeli

1. GİRİŞ

Gelişen dijital teknolojiler ve internet altyapısındaki ilerlemeler geleneksel alışveriş davranışlarını önemli ölçüde etkilemiş ve dönüştürmüştür. Bu dönüşüm özellikle e-ticaret uygulamaları aracılığıyla yapılan gıda alışverişlerinde giderek daha belirgin hale gelmektedir. Çevrim içi gıda alışverişi başlangıçta sınırlı bir kullanıcı grubuna hitap ederken zamanla kolaylık, erişilebilirlik ve zaman tasarrufu gibi avantajları nedeniyle yaygınlaşmıştır. Bununla birlikte küresel COVID-19 pandemisi de bu değişimin hızını ciddi ölçüde artırmış ve çevrim içi gıda alışverişini birçok tüketici için zorunlu bir tercih haline getirmiştir (Jilcott Pitts ve ark., 2018; Lu ve ark., 2022; Karaoğlan ve Hamşioğlu, 2022).

Geleneksel olarak fiziksel temasa dayalı olan gıda satın alımı ürünlerin tazelik, kalite, görünüm ve güvenilirlik gibi niteliklerinin doğrudan gözlemlenmesi ihtiyacı nedeniyle çevrim içi platformlarda diğer ürünlerle karşılaştırıldığında daha sınırlı bir yer edinmiştir (Alaimo ve ark., 2020). Bununla birlikte pandemi süreci sosyal mesafe, izolasyon önlemleri ve sağlık endişeleri gibi nedenlerle tüketicilerin alışveriş davranışlarını yeniden şekillendirmiş ve bu sürçte birçok kişi ilk kez çevrim içi gıda alışverişi deneyimi yaşamıştır. Bu süreçte gelişen kullanıcı deneyimleri, teknolojik adaptasyon ve dijital platformların sunduğu yeni hizmetler (örneğin hızlı teslimat, taze ürün garantisi, kullanıcı yorumları vb.) sayesinde çevrim içi gıda alışverişi kalıcı bir tüketim biçimi haline gelmeye başlamıştır (Gao ve ark., 2020; Gomes ve Lopes, 2022).

Tüketicilerin gıda satın alma kararları yalnızca ürünün içsel özelliklerine veya besleyici değerine değil aynı zamanda bireysel, toplumsal ve çevresel faktörlerin etkileşimine de dayanmaktadır. Sosyo-demografik değişkenler bu kararların arkasındaki temel belirleyiciler arasında yer almakta ve yaş, cinsiyet, medeni durum, gelir ve eğitim düzeyi gibi etmenler bireylerin algı, motivasyon ve tercihlerinde farklılaşmalara yol açmaktadır (Chen ve Antonelli, 2020; Kaya, 2016). Örneğin, genç bireylerde hızlı yaşam tarzı ve zamandan tasarruf arzusu, kolay ulaşılabilir ve pratik gıdalara yönelimi artırırken yaşlı bireyler daha çok sağlık, alışkanlık ve aşinalık temelli seçimlerde bulunma eğilimindedirler (Jáuregui-Lobera ve Bolaños Ríos, 2011). Cinsiyet temelli farklılıklar da ise kadınlar gıda tercihinde daha çok duyusal çekicilik ve sağlık unsurlarına daha fazla önem verirken, erkekler ise fiyat ve tokluk hissine daha çok odaklanmaktadırlar (Phan ve Chambers, 2016; Antin ve Hunt, 2012). Gelir düzeyi açısından değerlendirildiğinde düşük gelirli bireyler için fiyat hassasiyeti ve ürünün ulaşılabilirliği ön planda olurken, yüksek gelir grubundaki bireyler için organik ve doğal içerik gibi nitelikler daha belirleyici olmaktadır (Caswell ve Yaktine, 2013; Kaya, 2016).

Çevrim içi gıda alışverişi davranışlarının belirleyicileri üzerine yapılan çok sayıda araştırma, bu davranışların yalnızca teknolojik gelişmelerle açıklanamayacağını ortaya koymaktadır. Tüketicilerin yaş, cinsiyet, medeni durum, hane yapısı, meslek, eğitim ve gelir düzeyi gibi sosyo-demografik özellikleri alışveriş tercihleri üzerinde doğrudan etkili olmaktadır (Bryła, 2018; Piroth ve ark., 2020; Nguyen ve ark., 2021).

Tüm bu bulgular, çevrim içi gıda alışverişi davranışının yalnızca teknolojik bir dönüşüm olmadığını; aynı zamanda toplumsal yapı, bireysel tercihler, sağlık algısı ve kriz dönemlerine verilen tepkilerle şekillenen çok boyutlu bir olgu olduğunu göstermektedir. Bu nedenle, tüketicilerin sosyo-demografik profillerine dayalı olarak bu davranışın nasıl farklılaştığını incelemek, hem akademik literatür açısından hem de pazarlama ve kamu politikaları açısından

önemli katkılar sağlayacaktır (Piroth ve ark., 2020; Nguyen ve ark., 2021; Bryła, 2018; Vedovato ve ark., 2020; Alaimo ve ark., 2020). Lu ve ark., 2022 çalışmalarının sonuçları da Covid 19 döneminde çevrimiçi taze gıda alışverişinin tedarik sisteminde önemli bir rol oynadığını göstermektedir.

Bu çalışma, COVID-19 pandemisi sonrasında çevrim içi gıda alışverişine yönelik eğilimleri sosyo-demografik değişkenler ekseninde analiz etmeyi amaçlamaktadır. Özellikle yaş, cinsiyet, eğitim düzeyi, gelir, medeni durum, aile yapısı gibi temel demografik faktörlerin çevrimiçi gıda alışverişi sıklığı ve ürün grubu seçimi üzerindeki etkileri incelenerek çevrim içi alışveriş davranışının sosyal boyutları ortaya konulacaktır. Araştırmanın bulguları, hem akademik çalışmalara kuramsal katkı sunmakta hem de dijital gıda perakendecilerine ve politika yapıcılara stratejik planlama açısından önemli veriler sağlayacaktır. Böylece farklı tüketici gruplarının ihtiyaç ve beklentilerine uygun, kapsayıcı ve sürdürülebilir e-ticaret politikalarının geliştirilmesine katkı sağlanabilecektir.

2. MATERYAL VE YÖNTEM

Materyal

Bu araştırmada, tüketicilerin sosyo-demografik özelliklerinin gıda satın alma tercihleri üzerindeki etkisini incelemek amacıyla yüz yüze anket yöntemi kullanılmıştır. Veri toplama süreci, Türkiye'nin yedi coğrafi bölgesini temsilen seçilen İstanbul, Ankara, İzmir, Trabzon, Adana, Van ve Gaziantep illerinde, Nisan-Temmuz 2023 tarihleri arasında gerçekleştirilmiştir. Her bir şehir için belirlenen örneklem büyüklüğü, ilgili ilin ülke nüfusu içindeki payı esas alınarak oluşturulmuştur. Anketler, ticari bir araştırma şirketi olan Ayna Araştırma tarafından toplam 1.016 tüketiciyle gerçekleştirilmiştir. Örneklem büyüklüğü, %95 güven düzeyi ($p = 0,05$) esas alınarak ve sonsuz ana kütle varsayımıyla hesaplanmıştır.

Katılımcıların sosyo-demografik özelliklerine ilişkin bulgular Tablo 1'de sunulmuştur. Bu değişkenler, araştırmada bağımsız değişkenler olarak ele alınmakta olup, tüketicilerin gıda tercih davranışlarının açıklanmasında analitik bir temel sağlamaktadır.

Tablo 1. Örnekleme katılan tüketiclierin sosyo-demografik özellikleri

	f	%		*f*	%
Cinsiyet			*Gelir (₺)*		
Erkek	457	45	Sabit gelir yok	258	25,4
Kadın	559	55	<5500	177	17,4
Yaş			5501–7500	248	24,4
15–24	247	24,3	7501–9000	153	15,1
25–34	334	32,9	9001–11500	95	9,4
35–44	213	21	>11501	85	8,4
45–54	139	13,7	*Eğitim*		
55–65	68	6,7	Okuma yazma yok	15	1,5
≥65	15	1,5	İlk-ortaokul	232	22,8
Hane kişi sayısı			Lise	263	25,9
1	87	8,6	Univerite	449	44,2
2	141	13,9	Lisan üstü	57	5,6
3	271	26,7	*Medeni durum*		
4 ve üzeri	252	24,8	Bekâr	501	49,3
			Evli	515	50.7

Yöntem

Tüketicilerin çevrim içi gıda satın alma sıklıkları ile sosyo-demografik özellikleri arasındaki ilişki, sıralı probit modeli kullanılarak analiz edilmiştir. Sıralı probit modeli, doğal bir sıralamaya sahip kategorik bağımlı değişkenlerin incelenmesinde kullanılan bir regresyon tekniğidir. Özellikle ekonometrik ve sosyal bilimler alanlarında yaygın biçimde uygulanan bu yöntem, araştırmada kullanılan anket sorularının (bağımlı ve bağımsız değişkenler) Likert ölçeğine dayalı olarak düşükten yükseğe doğru sıralanması nedeniyle tercih edilmiştir (Greene, 2018). Lojistik dağılıma dayalı olasılık oranları yerine probit analizi olayların olasılıklarını kümülatif standart normal dağılım değerlerine dönüştürmektedir (Harrell, 2015). Sıralı probit modeli aşağıda gösterilmektedir.

$$y_i^* = x_i'\beta + \varepsilon_i \quad (1)$$

Burada, x_i' tüketicileri ifade etmektedir, β bağımsız açıklayıcı değişkenler vektörüdür ve bilinmeyen eğim parametreleri vektörünü temsil eder ve ε_i standart lojistik dağılıma sahip gözlemlenemeyen bireysel hata terimidir. Kısaca, sıralı probit modelinde, bağımlı değişken (yani bireylerin tüketim sıklığı), gözlemlenemeyen gizli değişken tarafından belirli eşik aralıkları içinde aldığı değerlere göre sınıflandırılır.

$= 0$ eğer $y* \leq 0$ (2)

$= 1$ eğer $0 < y* \leq \mu 1$

$= 2$ eğer $\mu 1 < y* \leq \mu 2$

.

$= J$ eğer $\mu J-1 \leq y*$,

Burada μ değeri ile birlikte tahmin edilmesi gereken bilinmeyen parametrelerdir (Greene, 2012).

Ampirik analiz için, veri analizi kapsamında tanımlayıcı istatistikler SPSS 21 programı kullanılarak hesaplanmış, sıralı probit regresyon modeli ise STATA programı ile analiz edilmiştir.

3. BULGULAR VE TARTIŞMA

Tablo 1. Tüketicilerin gıda satın alımlarında internet kullanımı (%).

Hiçbir zaman	Yılda 1-6	Ayda 1-3	Haftada 1-5	Haftada 5'den fazla
64.5	11.2	12.8	8.9	2.7

Araştırma bulgularına göre çevrim içi gıda alışverişi davranışı Türkiye'de tüketiciler arasında henüz yaygınlaşmamış bir tüketim biçimi olarak öne çıkmaktadır. Örneklem grubunun %64,5'i internetten hiçbir zaman gıda satın almadığını belirtmiş olup bu oran çevrim içi platformların gıda perakendeciliği açısından henüz sınırlı bir kullanım düzeyine sahip olduğunu göstermektedir. Gıda ürünlerini çevrim içi platformlar aracılığı ile haftalık olarak satın alan bireylerin oranı ise %11,6'dır. Bu sonuç, özellikle gıda ürünlerinin doğrudan görsel ve fiziksel değerlendirme ihtiyacı nedeniyle diğer ürün kategorilerine göre çevrim içi kanallarda daha az tercih edildiğini düşündürmektedir. Dominici ve ark. 2021 çalışmaları da çevrim içi gıda satın alan tüketicilerin toplam nüfusun yalnızca küçük bir bölümünü oluşturduğunu ifade etmektedir. Araştırmaya katılan bireylerin yalnızca %2'si çevrim içi gıda satın alımı gerçekleştirmiştir. Bu durum kıyafet veya ev eşyası gibi diğer tüketim mallarının çevrim içi satışlarındaki yüksek pazar paylarıyla çelişmektedir. Brenna Ellison ve ark. 2021 ise COVID-19 pandemisi süresince ABD'de çevrimiçi market alışverişlerinde artışlar olduğunu ortaya koymaktadır.

Tablo 2. Sosyal medya kullanımının ve internetten gıda satın alım davranışına etkisi

Değişken	Katsayı	Std. Hata	P > |z|	[95% Güven Aralığı]	
Sosyal medya kullanımı	.1264081	.0303911	0.000***	.0668426	.1859736

*** $p < 0.010\%$; Prob > $\chi 2 = 0.0000$

Tablo 2'de sosyal medya kullanımının çevrim içi gıda alışverişi davranışı üzerindeki etkisi analiz edilmiş ve bu değişkenin istatistiksel olarak anlamlı ve pozitif yönde etkili olduğu saptanmıştır ($p<0.001$). Elde edilen sonuç sosyal medya kullanımının artmasının, internetten gıda satın alma olasılığını artırdığını göstermektedir. Bu bulgu, sosyal medyanın dijital tüketici davranışları üzerindeki etkisini açıkça ortaya koymakta özellikle ürün tanıtımları, kullanıcı yorumları, fenomen etkisi ve algoritmik reklamların tüketici karar mekanizmalarını etkileyebileceğini göstermektedir. Sosyal medyanın yalnızca iletişim aracı değil aynı zamanda bir pazarlama kanalı olarak da güçlü bir etki yarattığı bu sonuçla doğrulanmaktadır. Liang ve ark. 2011 bulguları da bireylerin interneti kullanma konusunda daha yetkin olmaları durumunda çevrimiçi gıda satın alma isteklerinin arttığını göstermektedir.

Tablo 3. Tüketicilerin gıda satın alımında internet kullanımı ve sosyo-demografik özelliklerin ilişkisi

Değişkenler	**Katsayı**	**Std. Hata**	**P > |z|**	**[95% Güven Aralığı]**	
Cinsiyet	-.00856	.07934	0.914	-.16407	.14693
Medeni durum	-.23850	.09553	0.013**	-.42574	-.0512
Yaş	-.14475	.04013	0.000***	-.22342	-.0660
Eğitim	.20559	.04757	0.000***	.11234	.29884
Gelir	.02686	.02665	0.314	-.02537	.07909
Hane kişi sayısı	-.11290	.03090	0.000***	-.17347	-.05232

** $p < 0.05$, *** $p < 0.010\%$; Prob > $\chi 2 = 0.0000$

Tablo 3'de gösterilen sıralı probit analiz sonuçlarına göre bazı sosyo-demografik değişkenler çevrim içi gıda alışverişi üzerinde anlamlı etkilere sahiptir. Hasanov ve Khalid 2015 demografik faktörlerin çevrimiçi satın alma niyeti üzerinde anlamlı etkisi olduğunu bulunmamıştır. Benzer biçimde Gomes ve Lopes 2022 sosyo-demografik özelliklerin (yaş, eğitim, gelir), pandemi sürecinde çevrimiçi market alışveriş eğiliminde belirleyici olduğunu tespit etmişlerdir.

Bu bağlamda, yaş değişkeni negatif ve anlamlı bir katsayıya sahip olup bu durum yaş ilerledikçe çevrim içi gıda alışverişi yapma olasılığının azaldığını göstermektedir. Bu sonuç yaşlı bireylerin dijital platformlara erişim ve kullanım konusunda daha temkinli ya da isteksiz olduklarını yansıtmaktadır. Wang ve ark. 2020 göre de yaşlı bireylerin yeni teknolojilere uyum sağlama yeteneklerinin daha düşük olması gençlere kıyasla çevrim içi gıda satın alımını daha az benimsemelerine neden olmaktadır. Benzer sonuçlara Rasoli ve ark. 2021 da ulaşmıştır. Buna göre, yaş çevrimiçi gıda alışverişini ile negatif yönde anlamlı ilişki içerisinde olan bir değişkendir. Gao ve ark. 2020 de genç bireylerin teknolojiye daha yatkın olmaları, mobil uygulamalara hâkimiyetleri ve dijital güvenlik konusunda daha az endişe duymaları onları gıda alışverişlerinde çevrim içi yöntemleri kullanmalarını daha belirgin yapmaktadır.

Eğitim düzeyinin ise pozitif ve anlamlı etkisi bulunmuştur bu da yüksek eğitim seviyesine sahip bireylerin teknolojik adaptasyonunun daha güçlü olduğunu ve çevrim içi alışverişe daha yatkın

olduklarını göstermektedir. Alaimo ve ark. 2020 çalışmaları daha yüksek eğitim düzeyine sahip bireylerin çevrimiçi gıda alışverişi deneyiminden daha yüksek düzeyde memnuniyet duyduklarını göstermektedir. Dominici ve ark. 2021 araştırmaları da çevrim içi gıda alışverişi yapma olasılığı ile bireylerin genç ve iyi eğitimli olması arasında anlamlı ilişkiler ortaya koymuştur. Benzer biçimde Gomes ve Lopes 2022 sonuçları da yüksek eğitim seviyesine sahip genç tüketicilerin, pandemi dönemindeki çevrimiçi market alışverişi deneyiminden daha olumlu etkilendiğini göstermektedir.

Medeni durum değişkeni de çevrim içi gıda satın alma davranışı ile anlamlı ilişkiye sahip olup, evli bireylerin evli olmayanlara kıyasla daha yüksek çevrim içi gıda satın alma olasılığına sahip olduğu tespit edilmiştir. Wang ve ark. 2020 da araştırmalarında evli kişilerin çevrimiçi gıda alıcıları olma olasılıklarının bekârlara göre daha yüksek olduğunu sonucuna ulaşmışlardır.

Son olarak da hane halkı kişi sayısı arttıkça çevrim içi gıda alışverişi yapma olasılığı azalmaktadır. Bu durum geniş ailelerin toplu ve fiziksel alışverişi tercih etme eğiliminde olabileceğini göstermektedir. Rasoli ve ark. 2021 çalışmaları da aile üyesi sayısının artmasının çevrimiçi gıda alışverişini anlamlı düzeyde etkilediğini ortaya koymuştur.

Tablo 4. Beslenme paterni ve çevrim içi gıda satın alma ilişkisi

Değişkenler	Katsayı	Std. Hata	P > |z|	[95% Güven Aralığı]	
Yerel gıdalar	-.1572036	.0373803	0.000***	-.2304676	-.08393
Fast-food	.158342	.0415558	0.000***	.0768942	.2397898
Tüketime hazır gıdalar	.0060999	.0346498	0.860	-.0618126	.0740123
Sokak yemekleri	.0223165	.0394684	0.572	-.0550401	.0996732
Diyet gıda	.0662526	.0375395	0.078*	-.0073235	.1398287
Hayvansal gıda	.1114292	.0426844	0.009**	.0277694	.1950891
Bitkisel gıda	-.0644611	.0456069	0.158	-.153849	.0249268
Karbonhidrat	.004102	.0421634	0.922	-.0785366	.0867407
Vejetaryen gıdalar	.0049889	.0372579	0.893	-.0680352	.0780131
Abur cubur	.1953167	.036511	0.000***	.1237564	.266877
Takviye edici	.1394982	.0375344	0.000***	.065932	.2130643

* $p < 0.01$, ** $p < 0.05$, *** $p < 0.010\%$; Prob > $\chi 2 = 0.0000$

Tablo 4 beslenme alışkanlıklarının çevrim içi gıda satın alma davranışı üzerindeki etkilerini göstermekte olup bazı gıda kategorilerinin çevrim içi alışveriş davranışını anlamlı şekilde etkilediğini göstermektedir. Bu bağlamda fast-food, hayvansal gıdalar, abur cubur, diyet ve takviye edici ürünler gibi kolay erişilebilir ve paketlenebilir ürün gruplarını tercih etme sıklığının artması çevrim içi gıda alışveriş yapma olasılığını yükseltmektedir. Buna karşın, yerel gıdalarla çevrim içi alışveriş arasında negatif ve anlamlı bir ilişki bulunmuştur. Bu durum, yerel ürünlerin tüketiciler açısından geleneksel ve doğrudan temin edilme gereksinimi taşıdığına işaret etmektedir.

4. SONUÇ

Bu çalışma, COVID-19 pandemisi sonrasında Türkiye'de çevrim içi gıda alışverişi eğilimlerini sosyo-demografik faktörler bağlamında incelemiş ve çevrim içi alışveriş davranışının çok boyutlu yapısını ortaya koymuştur. Elde edilen bulgular, çevrim içi gıda alışverişinin henüz yaygınlaşmamış bir tüketim biçimi olduğunu, ancak belirli değişkenlerin bu davranışı anlamlı şekilde etkilediğini göstermektedir.

Çalışmanın en dikkat çekici bulgularından biri sosyal medya kullanımının çevrim içi gıda alışverişi üzerindeki güçlü ve pozitif etkisidir. Sosyal medya kullanan bireylerin internetten gıda satın alma olasılıklarının anlamlı şekilde daha yüksek olduğu tespit edilmiştir. Bu durum, sosyal medyanın yalnızca bir iletişim platformu değil, aynı zamanda kullanıcı yorumları, ürün tanıtımları ve dijital reklamlar aracılığıyla tüketici davranışlarını etkileyen güçlü bir pazarlama kanalı olduğunu ortaya koymaktadır.

Sosyo-demografik özellikler de çevrim içi gıda alışverişi davranışında belirleyici rol oynamaktadır. Bu bağlamda, yaş ilerledikçe çevrim içi gıda alışverişi yapma olasılığı anlamlı şekilde azalmaktadır. Bu durum yaşlı bireylerin dijital platformlara erişim ve kullanım konusundaki sınırlılıklarını yansıtmaktadır. Buna karşılık, eğitim düzeyi çevrim içi alışveriş davranışını pozitif yönde etkilemektedir ve yüksek eğitim seviyesine sahip bireylerin bu alışkanlığa daha açıktır. Medeni durum da anlamlı bir faktör olup, evli bireyler bekârlara kıyasla daha fazla çevrim içi alışveriş yapmaktadır. Hane halkı büyüklüğü arttıkça çevrim içi alışveriş yapma olasılığı azalmaktadır. Bu durum büyük ailelerin birlikte fiziksel alışverişi tercih etme eğiliminde olabileceğini düşündürmektedir.

Beslenme tercihlerine bakıldığında ise fast-food, abur cubur, diyet ve takviye edici ürünler gibi hazır ve paketlenmiş gıdalara yönelik yüksek eğilim, çevrim içi gıda alışverişi yapma olasılığını artırmaktadır. Buna karşılık, yerel gıdalara yönelik eğilim çevrim içi alışveriş davranışını negatif etkilemekte bu da geleneksel gıda temininde fiziksel temas ve doğrudan deneyimin halen önemini koruduğunu göstermektedir. Hayvansal gıda tüketimine yatkın bireylerin de çevrim içi gıda satın alma olasılıkları daha yüksek tespit edilmiştir.

Sonuç olarak çevrim içi gıda alışverişi yalnızca teknolojik gelişmelerle değil; bireylerin sosyo-demografik özellikleri, medya kullanım alışkanlıkları ve gıda tercihleriyle birlikte şekillenen çok yönlü bir tüketim pratiğidir. Bu çalışma, dijital perakendecilik stratejileri ve kamu politikalarının şekillendirilmesinde dikkate alınması gereken önemli veriler sunmakta; kapsayıcı ve veri temelli e-ticaret politikalarının oluşturulmasına katkı sağlamaktadır.

ABSTRACT

Food consumption is not only a physiological need, but also a cultural form of action in which individuals construct their social identities, develop social belonging, and adapt to normative behaviors. This study examines the role of social influences in food consumption within a multi-layered framework and examines how basic factors such as social norms, family and peer relationships, and digital media shape individuals' food consumption behaviors. According to the research findings, individuals frequently make changes in their consumption preferences according to the eating habits of others around them, and this situation remains valid both in physical environments (e.g. family meals, school cafeterias) and digital environments (e.g. social media content). While descriptive norms affect how much and what individuals consume, imperative norms define the social approval or pressure for these behaviors. Parental and peer influences are decisive in the formation of eating habits, especially in childhood and adolescence, and social media plays a reinforcing or guiding role in these processes. In this context, the study goes beyond traditional approaches that evaluate food consumption only within the framework of individual preferences or economic conditions and argues that eating behavior gains meaning within a social structure. Food preferences are directly related to the social groups, cultural affiliations and social identities to which individuals belong. What we eat, how we eat and with whom we eat are transformed into symbolic actions that reflect the individual's social status, values and affiliation relations. Therefore, any analysis to be conducted on eating behaviors should take into account the multi-layered structure of the social context and should include a wide range from normative regulations to cultural transmission forms. By adopting this multi-dimensional approach, the study aims to examine the social determinants affecting eating behaviors on a conceptual and empirical level. In addition, the study offers important suggestions for food industry managers, policy makers and public health experts.

GIDA TÜKETİM DAVRANIŞININ SOSYAL BELİRLEYİCİLERİ ÜZERİNE BİR İNCELEME

ÖZET

Gıda tüketimi yalnızca fizyolojik bir gereksinimin karşılanması değil aynı zamanda bireylerin sosyal kimliklerini inşa ettikleri, toplumsal aidiyet geliştirdikleri ve normatif davranışlara uyum sağladıkları kültürel bir eylem biçimidir. Bu çalışma gıda tüketiminde sosyal etkilerin rolünü çok katmanlı bir çerçeveyle ele alarak sosyal normlar, aile ve akran ilişkileri ile dijital medya gibi temel faktörlerin bireylerin gıda tüketim davranışlarını nasıl şekillendirdiğini incelemektedir. Araştırma bulgularına göre, bireyler sıklıkla çevrelerindeki diğer bireylerin yeme alışkanlıklarına göre kendi tüketim tercihlerinde değişiklik yapmakta bu durum hem fiziksel ortamlarda hem de dijital ortamlarda geçerliliğini korumaktadır. Tanımlayıcı normlar, bireylerin ne kadar ve ne tüketeceğini etkilerken, emredici normlar bu davranışlara yönelik toplumsal onay ya da baskıyı tanımlamaktadır. Ebeveyn ve akran etkileri, özellikle çocukluk ve ergenlik döneminde beslenme alışkanlıklarının şekillenmesinde belirleyici olmakta, sosyal medya ise bu süreçleri pekiştirici ya da yönlendirici bir rol üstlenmektedir. Bu bağlamda çalışma, gıda tüketimini yalnızca bireysel tercihler veya ekonomik koşullar çerçevesinde değerlendiren geleneksel yaklaşımların ötesine geçerek, beslenme davranışının toplumsal bir yapı içerisinde anlam kazandığını savunmaktadır. Gıda tercihleri, bireylerin ait oldukları sosyal gruplar, kültürel aidiyetler ve toplumsal kimliklerle doğrudan ilişkilidir. Ne yediğimiz, nasıl yediğimiz ve kiminle yediğimiz, bireyin sosyal statüsünü, değerlerini ve aidiyet ilişkilerini yansıtan sembolik eylemlere dönüşmektedir. Bu nedenle gıda tüketim davranışları üzerine yapılacak her türlü analiz sosyal bağlamın çok katmanlı yapısını göz önünde bulundurmalı ve normatif düzenlemelerden kültürel aktarım biçimlerine kadar geniş bir yelpazeyi içermelidir. Çalışma, bu çok boyutlu yaklaşımı benimseyerek beslenme davranışlarını etkileyen sosyal belirleyicileri kavramsal ve ampirik düzlemde irdelemeyi amaçlamaktadır. Ayrıca çalışma gıda endüstrisi yöneticileri, politika yapıcılar ve halk sağlığı uzmanları açısından önemli öneriler de sunmaktadır.

Anahtar Kelimeler: Gıda Tüketim Davranışı, Sosyal Normlar, Aile ve Akran Etkisi, Medya

1. GİRİŞ

Beslenmek temelde sosyal bir eylemdir. Beslenme ihtiyacının karşılanması gıda tüketiminin temel itici gücü olsa da tüketimin gerçekleştiği sosyal çevre, insanların hem ne tükettiği hem de ne kadar tükettiği üzerinde güçlü bir etkiye sahiptir. Giderek artan disiplinler arası araştırmalar beslenme davranışını şekillendirmede sosyal normların, kültürel geleneklerin, kişilerarası dinamiklerin ve daha geniş toplumsal yapıların rolünü ortaya koymaktadır (Higgs ve ark., 2019; Pliner ve Mann, 2004; Cruwys ve ark., 2015).

Gıda tüketiminde sosyal etki algılanan normlara uyum ve kimliğe dayalı yeme gibi çeşitli yollarla gıda tüketim sürecini etkilemektedir. Deneysel çalışmalar, bireylerin gıda alımlarını çevrelerinde bulunan diğer bireylerin ne yediğine göre ayarladıklarını tutarlı bir şekilde göstermektedir ve bu duruma sosyal modelleme denilmektedir (Cruwys ve ark., 2015). Bu durum bireyler tarafından doğrudan veya çevresel ipuçları gibi dolaylı olarak meydana gelmektedir (Higgs ve Thomas, 2016).

Sosyal normların etkisi sadece akran etkileşimleriyle sınırlı olmayıp aynı zamanda daha geniş kültürel beklentilere ve değerlere de dayanır. Örneğin, ebeveynler ve akranlar özellikle yetkili aile ortamlarında ergenlerin yiyecek tercihlerini ve tüketim kalıplarını önemli ölçüde şekillendirmektedir (Guidetti ve ark., 2016). Benzer şekilde, göçmen topluluklar arasında gözlemlenenler gibi kültürel gelenekler ve beklentiler, kültürleşme ve yaşam tarzı geçişleri bağlamında da yiyecek seçimleri etkilenmektedir (Nicolaou ve ark., 2009).

Bu noktada sosyal etki her zaman sağlıklı beslenme davranışını desteklemez. Bazı durumlarda, sosyal normlar obeziteye yol açan aşırı yemeyi güçlendirebilir veya aşırı kalori alımı gibi uyumsuz durumlara katkıda bulunabilir (Mathieu-Bolh, 2020; Shah ve Asghar, 2023). Akran grupları veya medya etkisiyle daha büyük porsiyon boyutlarının ve yüksek kalorili yiyeceklerin normalleştirilmesi bireylerin sağlıklı beslenme hedeflerini zayıflatabilmektedir (Pliner ve Mann, 2004; Lazaric ve ark., 2020).

Dahası gıda tüketimi giderek küresel ve dijital ağlar tarafından şekillendirilmektedir. Dholakia ve Talukdar 2004, küresel tüketici kültürüne özellikle de Amerikan tüketim normlarına maruz kalmanın, gelişmekte olan pazarlardaki gıda tüketim modellerinde değişimlere yol açtığını göstermektedir. Bu bulgu küreselleşme ve medya yayılımı gibi makro düzeydeki sosyal süreçlerin zaman içinde bireysel beslenme davranışlarını şekillendiren etkili güçler olarak nasıl hareket ettiğini vurgulamaktadır.

Psikolojik mekanizmalar da sosyal yeme davranışına aracılık eder. Bireyler, sosyal onay kazanmak, istenen bir grupla ilişki kurmak veya belirsiz yeme bağlamlarında belirsizliği azaltmak için başkalarının gıda tüketim paternlerini modelleyebilmektedir (Higgs, 2015; Cruwys ve ark., 2015). Bu anlamda, yemek yeme hem bir sosyal performans hem de kimlik oluşturma veya sürdürme aracı haline gelir (Vassallo ve ark., 2016; Goldsmith, 2015; Higgs ve Thomas, 2016).

Bahsi geçen açıklamalar gıda tüketiminin derinden sosyal bir durum ve ilişkisel, kültürel ve yapısal bağlamlara da bağlı olduğunu göstermektedir. Bu çalışmada sosyal etkinin toplumun gıda tüketim davranışını nasıl şekillendirdiği araştırılarak normların, kimliğin, kültürün ve medyanın gıda tüketimimiz için ne anlama geldiğini araştırmaktadır.

2. TEMEL SOSYAL ETKİLER

Sosyal Normlar

Sosyal normlar (sosyal gruplar içindeki davranışları yöneten örtük veya açık kurallar) yeme davranışının en etkili ancak sıklıkla hafife alınan itici güçleri arasındadır. Sosyal varlıklar olarak bireyler, özellikle yiyecek seçimi veya porsiyon büyüklüğü gibi belirsiz durumlarda neyin uygun veya kabul edilebilir olduğu konusunda rehberlik için başkalarından etkilenirler (Cialdini ve ark., 2006; Higgs ve ark. 2019). Yiyecek tüketimi bağlamında sosyal normlar yalnızca insanların ne yediğini değil aynı zamanda ne kadar, ne zaman ve neden yediğini de şekillendirmektedir (Higgs ve Thomas, 2016).

Literatürdeki kritik bir ayrım, çoğu insanın gerçekte ne yaptığına ilişkin algıları ifade eden tanımlayıcı normlar ile başkalarının neyi onayladığı veya onaylamadığına ilişkin algıları ifade eden emredici normlar arasındadır. Tanımlayıcı normlar, belirli bir bağlamda neyin tipik veya beklenen olduğunu işaret ederek davranış üzerinde genellikle daha doğrudan ve acil bir etki uygular (Lally ve ark., 2011; Pedersen ve ark., 2015). Örneğin, bireyler açlık veya tercihten bağımsız olarak yiyecek alımlarını akranlarınınkiyle eşleşecek şekilde ayarlama eğilimindedir ve başkaları daha fazla yediğinde daha fazla, başkaları daha az yediğinde daha az yerler (Pliner ve Mann, 2004; Higgs ve ark. 2019). Bu etkiler, doğrudan etkileşimin olmadığı durumlarda bile devam eder, çünkü restoranlar, kafeteryalar veya sosyal medya gibi ortamlardaki normatif ipuçları uyum davranışlarını harekete geçirebilir (Hawkins ve ark., 2020; Cialdini ve ark., 2006).

Genellikle uzun vadeli niyetler ve tutumlarla ilişkilendirilen emredici normlar ise yeme davranışlarını değiştirmede karışık bir etkinlik göstermiştir. Örneğin çoğu insan sağlıklı beslenme fikrini zaten desteklemektedir ve bu nedenle sağlıklı beslenmenin sosyal olarak onaylandığını vurgulayan mesajlar yeni bir motivasyonel değer sağlamayabilir (Higgs ve ark., 2019). Ancak, tanımlayıcı normlarla eşleştirildiğinde (özellikle aile yemekleri veya akran grupları gibi yüksek bağlılık ortamlarında) emredici normlar belirli davranışların algılanan meşruiyetini ve önemini güçlendirmektedir (Pedersen ve ark., 2015).

Normatif etki yalnızca pasif bir süreç değildir. Bireyler ayrıca sosyal kimlik ve aidiyet ihtiyaçlarına göre yeme normlarını içselleştirir ve yeniden üretebilirler. Cialdini ve ark. 2006 nın Normatif Davranış Odak Teorisine göre normların davranışı etkileme olasılığı en yüksek düzeyde bireylerin norm belirleyen grupla özdeşleştiğinde ortaya çıkmaktadır (Cialdini ve ark., 2006). Örneğin, çalışmalar bir üniversite topluluğuyla güçlü bir şekilde özdeşleşen katılımcıların kampüs arkadaşlarının yeme alışkanlıkları hakkında tanımlayıcı norm mesajlarına maruz kaldıktan sonra sebze alımlarını ayarlama olasılıklarının daha yüksek olduğunu göstermiştir (Higgs ve ark., 2019). Aile ve akran ağları sosyal normların iletilmesinde önemli kanallar olarak işlev görür. Pedersen ve ark. 2015, ergen popülasyonlarında ebeveynlerin tanımlayıcı normlarının (aslında ne yaptıkları) emir normlarından (ne yapılması gerektiğini söyledikleri) daha fazla etkiye sahip olduğunu göstermiştir.

Sonuç olarak, sosyal normlar yaşam boyu yiyecek seçimlerini ve yeme davranışlarını şekillendiren güçlü, çok boyutlu kuvvetler olarak işlev görür. Hem tanımlayıcı hem de emredici normlar davranışı etkilerken, ilki genellikle daha güçlü ve daha tutarlı bir etki uygular - özellikle norm referans grubu belirgin ve sosyal olarak anlamlı olduğunda. Bu nedenle etkili diyet müdahaleleri bireysel eğitimin ötesine geçmeli ve daha geniş sosyal bağlamla etkileşime

girmeli, yanlış algıları düzeltmeli, olumlu normları güçlendirmeli ve güvenilen akranların ve aile üyelerinin etkisinden yararlanmalıdır.

Akran Ve Aile Etkisi

Aile ve akran ilişkileri özellikle çocukluk ve ergenlik döneminde yeme davranışlarını şekillendiren en etkili sosyal ortamlardan ikisidir. Bu ilişkiler yalnızca yiyeceklerin bulunabilirliğini ve öğünlerin yapısını belirlemekle kalmaz aynı zamanda diyet seçimleri, tercihleri ve alışkanlıkları için güçlü kaynaklar olarak da hizmet eder. Çocuklar ergenliğe doğru geçtikçe etki dengesi aileden akranlara doğru kademeli olarak değişir ancak her ikisi de yaşam boyu yeme davranışlarını şekillendirmede önemli olmaya devam eder.

Ebeveynler genellikle yiyecek sosyalleşmesinin en erken ve en tutarlı aracılarıdır ve çocukların yiyecek tercihleri, zamanlaması ve gıdaya yönelik diğer tutumlarla tanışmasına vesile olurlar. Ebeveyn modellemesi yani çocukların ebeveynlerinin yeme davranışlarını gözlemleyip taklit etmesi, diyet tercihlerinin oluşumu üzerinde güçlü bir etkiye sahiptir. Sürekli olarak meyve, sebze ve dengeli öğünler yiyen ebeveynler benzer alışkanlıklara sahip çocuklar yetiştirme eğilimindedirler (Story ve ark., 2002; Chung ve ark., 2017). Ayrıca yemek saatlerinde ebeveyn varlığı, ergenler arasında daha sağlıklı beslenme kalıplarıyla ilişkilendirilmektedir. Videon ve Manning 2003, en az bir ebeveyniyle düzenli olarak yemek paylaşan ergenlerin daha fazla meyve, sebze ve süt ürünü tükettiğini ve kahvaltıyı tek başına veya akranlarıyla yiyenlere kıyasla daha az atlama olasılıklarının olduğunu tespit etmişlerdir.

Gıda tüketim davranışının şekillenmesinde aile yemeklerinin yapısı ve sıklığı önemlidir. Tutarlı yemek zamanı rutinleri sürdüren ailelerden gelen ergenler daha fazla besin yoğunluğuna sahip yiyecekler tüketme eğilimindedir ve işlenmiş atıştırmalıklar ile şekerli içecekleri daha az tüketirler (Xu, 2022). Ebeveyn eğitimi ve denetimi bu etkiyi daha da artırır ve daha eğitimli ebeveynler ergenlerde daha iyi beslenme sonuçlarıyla ilişkilendirilir ve yiyecek seçimleri konusunda daha az özerkliğe sahip ergenlerin yemek atlama veya sağlıksız yiyecekleri tercih etme olasılıkları daha düşüktür (Liu ve ark., 2021; Finnerty ve ark., 2009; Videon ve Manning, 2003).

Çocuklar ergenliğe girdikçe, akran etkisi daha baskın bir rol üstlenmeye başlar. Ev dışında arkadaşlarla sosyal etkileşimler artar ve yemek yeme, akran bağları, kabul ve kimlik oluşumu içinde yer alır. Akran grupları, yeme davranışlarını hem doğrudan (modelleme ve sözlü teşvik yoluyla) hem de dolaylı olarak (grup normlarının oluşturulması yoluyla) etkiler. Çalışmalar, ergenlerin okul kafeteryaları gibi yapılandırılmış ortamlarda veya planlanmamış sosyal yemek yeme etkinliklerinde arkadaşlarının yiyecek seçimlerini ve porsiyon boyutlarını sıklıkla taklit ettiğini göstermektedir (Salvy ve ark., 2012; Ragelienė ve Grønhøj, 2021).

Akranların varlığının yalnızca tüketilen gıdanın türünü değil, aynı zamanda ne kadar tüketileceğine de etkilede bulunduğu tespit edilmiştir. Örneğin, Salvy ve ark. 2011, ergenlerin arkadaşlarıyla yemek yediklerinde, tek başlarına veya tanımadıkları akranlarıyla yemek yediklerinden önemli ölçüde daha fazla yiyecek tükettiğini ortaya koymuştur. Yiyecekle ilgili akran normları, tüketimi hem sağlıklı hem de sağlıksız yönlere de kaydırabilmektedir (Ragelienė ve Grønhøj; 2021)

Akran etkisinin gücü ve yönü cinsiyet, yaş ve arkadaşlık yakınlığı gibi faktörlere bağlı olarak değişebilmektedir. Chung ve ark., 2017, akran etkilerinin yakın, duygusal olarak destekleyici arkadaşlıkları olan ergenler arasında daha güçlü ve kızlar arasında daha belirgin olduğunu vurgulamışlardır.

Kardeşler de yeme alışkanlıklarını şekillendirmede benzersiz, ancak daha az sıklıkla incelenen bir rol oynarlar. Ebeveynler veya akranlar kadar baskın olmasalar da kardeşler, paylaşılan deneyimler ve ince pekiştirme yoluyla diyet davranışlarına katkıda bulunurlar. Ragelienė ve Grønhøj 2021, kardeşleriyle sık sık yemek yiyen ve onlardan sağlıklı beslenme konusunda destek alan çocukların meyve ve sebze tüketiminin önemli ölçüde daha yüksek olduğunu tespit etmişlerdir. Ancak kardeşler olumsuz etkiler olarak da hareket edebilirler. Özellikle rekabetçi veya çatışmalı kardeş dinamiklerinde sağlıklı beslenmeyi engelleyen sağlıksız davranışları alay konusu yapabilir veya modelleyebilirler.

Medya ve Dijital Etki

Son yıllarda medya, özellikle dijital ve sosyal medya yiyecek tercihlerini ve yeme davranışlarını şekillendirmede güçlü bir sosyalleşme aracı olarak ortaya çıkmıştır. Bu etki, Instagram, YouTube, TikTok ve Facebook gibi platformların en sık kullanıcıları olan ergenler ve genç yetişkinler arasında özellikle daha güçlüdür. Bu platformlar yalnızca eğlence veya iletişim kaynakları olarak hizmet etmeyip aynı zamanda yiyecekle ilgili seçimleri ve tutumları etkileyen ortamlar olarak işlev görmektedirler (Qutteina ve ark., 2021; Wu ve ark., 2023; Tan ve ark., 2024).

Sosyal medya platformları kullanıcılarını reklamlar, tanıtımlar ve akranlar tarafından oluşturulan yiyecek gönderileri aracılığı ile sürekli olarak bir içerik akışına maruz bırakmaktadır. Bu maruz kalma, yiyecekle ilgili tutumların, tercihlerin ve davranışların şekillendirilmesiyle tutarlı bir şekilde ilişkilendirilmektedir (Qutteina ve ark., 2021).

Günümüzde yiyecek pazarlamasının dijital platformlardaki etkisi geleneksel reklamcılığın çok daha ötesine uzanmaktadır. Medyada yer alan yiyecek pazarlaması faaliyetleri özellikle ergenler arasında sağlıksız yeme davranışlarına önemli ölçüde katkıda bulunakta ve burada dijital platformlar çok daha büyük etki göstermektedir. Reklamlar, fenomenler ve kullanıcı tarafından oluşturulan promosyonlar gibi teknikler özellikle sağlıksız yiyecekleri sosyal olarak arzu edilir ve normatif hale getirebilmektedir (Qutteina ve ark., 2019).

Yemekle ilgili sosyal medya içeriklerine maruz kalmanın düzensiz beslenme, beden memnuniyetsizliği ve çarpık yiyecek tercihleri gibi çok çeşitli sonuçlarla bağlantılı olduğu görülmüştür. Özellikle, duygusal olarak ilgi çekici anlatılar veya görsel çekicilik içermediği sürece sağlıklı yiyecek içeriklerinin bile sınırlı bir etkisi vardır (Wu ve ark., 2023).

Günümüzün dijital platformları aşırı tüketimi (örneğin, yiyecek meydan okuması veya şımartma videolarında) ve idealize edilmiş vücut imajlarını aynı anda sunarak daha karmaşık bir çelişki de sunmaktadırlar (Harrison ve Cantor, 1997; Wu ve ark, 2023).

Daha geniş bir toplumsal perspektiften bakıldığında, medya aynı zamanda çevresel olarak sürdürülemez gıda seçimlerini de pekiştirmektedir. Dijital estetik ve pazarlama yoluyla ultra

işlenmiş ve aşırı paketlenmiş gıdaların normalleştirilmesi yalnızca yetersiz beslenmeye değil aynı zamanda ekolojik bozulmaya da katkıda bulunmaktadır (Simeone ve Scarpato, 2020).

Tüm bu bulgular bir arada ele alındığında, dijital medyanın yalnızca pasif bir arka plan değil, aynı zamanda modern gıda kültürünü şekillendirmede aktif ve ikna edici bir güç olduğunu göstermektedir. Ergenler ve genç yetişkinler, özellikle etkileyiciler, akranlar ve sosyal eğilimler tarafından güçlendirildiğinde, medya odaklı mesajları içselleştirirler ve bu da estetik çekiciliği, kolaylığı ve bir şeyi önceliklendiren yiyecek tercihlerine yol açar ve popülerlik sağlıktan daha önemlidir. Bu sorunun ele alınması, medya okuryazarlığı eğitimi, gıda pazarlaması konusunda daha güçlü politikalar ve daha sağlıklı, daha sürdürülebilir beslenme normlarını teşvik etmek için sosyal platformlardan yararlanan kamu sağlığı kampanyaları gerektirir (Qutteina ve ark, 2019; Wu ve ark, 2023).

3. SONUÇ

Bu çalışma, gıda tüketim davranışlarının yalnızca bireysel tercihler ya da ekonomik şartların bir yansıması olmadığını; aynı zamanda sosyal normlar, aile ve akran etkisiyle birlikte dijital medyanın da dahil olduğu çok katmanlı sosyal faktörler tarafından şekillendirildiğini ortaya koymaktadır. Sosyal normlar, bireylerin neyi, ne kadar ve nasıl tükettikleri üzerinde hem doğrudan hem de dolaylı yollarla etkili olmakta; özellikle tanımlayıcı normların, emredici normlara kıyasla daha güçlü bir etki yarattığı görülmektedir. Bu normatif etkiler, bireyin sosyal kimliği ve ait olduğu grupla kurduğu bağla da yakından ilişkilidir.

Araştırmanın bulguları, bireylerin beslenme alışkanlıklarının gelişiminde aile ve akran çevresinin zamanla değişen roller üstlendiğini göstermektedir. Çocukluk döneminde aile, özellikle de ebeveynlerin rol model olması, evdeki yemek düzeni ve ebeveyn gözetimi, sağlıklı beslenme davranışlarının kazanılmasında belirleyici olmaktadır. Öte yandan, ergenlik ve genç yetişkinlik döneminde akranlar devreye girmekte; bu dönemde arkadaş çevresinden gelen etkiler hem sağlıklı hem de sağlıksız yeme alışkanlıklarının pekişmesine yol açabilmektedir. Ayrıca kardeş ilişkilerinin de, bu süreçte daha arka planda kalsa da özgün ve dikkat çekici etkiler taşıdığı gözlemlenmiştir.

Günümüzde dijital medya, özellikle gençler arasında önemli bir sosyalleşme alanı haline gelmiş durumdadır. Sosyal medya içerikleri, yiyecek tercihlerinde hem doğrudan hem de dolaylı etkiler yaratmakta; özellikle sağlıksız gıdaları normalleştirme ve çekici kılma potansiyeli taşımaktadır. Bu durum, bireylerin beden algısı, düzensiz yeme davranışları ve sürdürülebilir olmayan beslenme tercihleriyle ilişkili riskleri artırmaktadır. Medyada sıkça karşılaşılan estetik ve cazibe odaklı mesajlar, sağlıklı beslenme davranışlarının yaygınlaşması konusunda yetersiz kalmakta; bu da medya okuryazarlığının geliştirilmesini ve düzenleyici politikaların güçlendirilmesini gerekli kılmaktadır.

Sonuç olarak, bireylerin gıda tüketim alışkanlıkları, çok boyutlu ve iç içe geçmiş sosyal dinamiklerin etkisiyle şekillenmektedir. Bu nedenle sadece bireye odaklanan müdahaleler yetersiz kalmakta; sosyal normların dönüştürülmesini hedefleyen, aile ve akran ilişkilerini kapsayan ve dijital medya etkisini gözeten bütüncül stratejilere ihtiyaç duyulmaktadır. Politika yapıcılar, halk sağlığı uzmanları ve gıda sektöründeki paydaşlar için geliştirilecek uygulamaların, bu sosyal belirleyicileri merkeze alan bir yaklaşımla tasarlanması büyük önem

taşımaktadır. Bu tür sosyal etkileri odağına alan yaklaşımlar, hem sağlıklı hem de sürdürülebilir beslenme davranışlarının toplum genelinde benimsenmesine katkı sağlayacaktır.

ABSTRACT

The study examined the growth rates and trends in fish import and export in Nigeria for the period 1970 – 2022 using time series data. The Secondary data were obtained from National Bureau of Statistics (NBS), Central Bank of Nigeria (CBN) and Federal Inland Revenue Services (FIRS) annual reports. used for this study. Data collected were analyzed using descriptive statistics, graphical charts and exponential growth model. The empirical findings based on the summary statistics revealed that the time series data used were normally distributed but became stationary after first differencing. The minimum fish import (4,230,000) and export (680,000) was recorded in the year 1970, while the maximum fish import (8,590,000,000) and export (386,000,000) was recorded in the year 2022, implying a gradual and consistent upward trend in fish export and import. Also, the trend co-efficient of the fish import (0.0102) and fish export (0.0193) were positive and revealed an exponential growth rate of 1.01% and 1.92%, respectively. Johansen's trace statistics value of 43.8075 and maximum statistics value of 29.7702 at r = 0 was higher than the critical value of 15.41 at 5% probability level, while both the trace and maximum statistics values of 14.0374 at r = 1 was also higher than the critical value of 3.76 at 5% probability level indicating that significant relationship exist between fish import and export in Nigeria. It is recommended therefore that Government should provide enabling environment for fish production in Nigeria and make policy on fish importation in order to protect local production.

Keywords: Growth Rates, Trend, Fish, Export, Import

INTRODUCTION

Fish is one of the most valuable commodities among the various agricultural products (Muhammed *et al.*, 2015). In 2016, about 35 percent of global fish production entered into the international trade in various forms either for human consumption or non-edible purposes (Food and Agriculture Organization (FAO), 2018). The rapid rate of expansion of international trade in fish and fish products over recent decades has taken place in the context of a broader process of globalization, a large-scale transformation of the world economy driven by trade liberalization and technological advancements (FAO, 2018). According to Cocker (2014), fish is Africa's leading agricultural export commodity (in terms of quantity), but the continent is a net importer of low value fish and fish products. As a result, African domestic and regional markets continue to be the main destination of locally produced fish as demand expands. Meanwhile, the growth rate of exports from developing countries has increased faster than from developed ones (United Nations (UN), 2019).

The fishery sub-sector plays an important role in Nigeria's economy, directly contributing about 5.4% of the gross domestic product (GDP) and employing over one million people (Federal Department of Fisheries, 2016). In spite of the unstable macroeconomic indices, there is an increasing trend in its international trade and has grown rapidly over the last two decades, with fish trade values rising from US$15 billion in 1980 to US$140 billion in 2017 (FAO, 2018). A significant share of total fish production in Nigeria (about 36 percent, live-weight equivalent) is exported (FAO, 2018). Contrastingly, the total demand for fish in the country is 3.32 million metric tons and Nigeria is producing about 1.12 million metric tons locally, while the deficit of 2.2 million metric tons is met by imports (Federal Ministry of Agriculture and Rural Development (FMARD), 2022). According to the National Bureau of Statistics (NBS) (2024), Nigeria spent ₦50.8 billion on fish importation in the third quarter of 2023.

Meanwhile, Nigeria exported 117 shipments of fish in 2023 marking a growth rate of 89.0% as compared to the preceding year (NBS, 2024). According to FAO (2020), Nigeria exported approximately 5 tons of smoked fish per month as airfreight or 60 tons per annum mostly for United Kingdom and other countries like Ghana, the Ivory Coast and Cameroon among others. Nigeria's fish export has significant potentials with her vast water resources and growing aquaculture industry. There are opportunities to export fish products such as shrimps, prawns, catfish, tilapia, dried and smoked fish. Despite the opportunity, the sub-sector is faced with numerous challenges not limited to infrastructural gap, quality standard, over-fishing and regulatory bottleneck on the part of Government. However, to overcome these challenges and improve the fish sub-sector of Nigeria, adequate measures need to be taken among which include investment in infrastructure, adherence to quality standard, suitable monetary policies that is strategic for market penetration and adequate research which is the basis for this study.

Therefore, this study was undertaken to provide the needed information to guide policy on the development of fish export and import in Nigeria by examining the growths and trends. The specific objectives of this study were to examine the growths and trends of fish export and import in Nigeria for the period 1970 – 2022 and evaluate the relationship between fish export and import in Nigeria for the period 1970 -2022).

METHODOLOGY

Study Area

This study was conducted in Nigeria which lies between Latitudes 4° and 14°N and Longitudes 3° and 14°E of the equator. The country operates Federal system of government with 36 States, Federal Capital Territory and 774 Local Government Areas (LGAs). Nigeria is located in West Africa on the Gulf of Guinea and It is bounded by the Atlantic Ocean to the South and by the Sahelian countries of Niger and Chad to the North. It is one of the largest and populous countries in Africa occupying a geographical area of about 923,770 square kilometers including 13,000 square kilometers of inland water ways with an estimated population of 223,804,632 using population growth rate of 2.4% (United Nation, 2022). Nigeria enjoys a warm tropical climate with relatively high temperatures throughout the year, and two seasons; the rainy or wet season that lasts from mid-March to November in the South and from May to October in the North, and the dry season that occupies the rest of the year. Larger percentage of the people reside in the rural area where they are engaged in agriculture such farming, livestock and fishing activities as primary occupation.

Method of data collection and analysis

The empirical analysis covers the period between 1970 and 2022. Secondary data (time series) used for the analysis were obtained from National Bureau of Statistics (NBS), Central Bank of Nigeria (CBN) and Federal Inland Revenue Services (FIRS) annual reports, publications and other statistical bulletin. The information obtained were on the export and import of fish and fish products, and other relevant parameters over the period under review. Meanwhile, the time series data collected were analyzed using descriptive statistics to ascertain the normality of the series, exponential growth model, Augmented Dickey-Fuller (ADF) stationarity test and Johansen co-integration test.

Model Specification

The exponential growth rate model is expressed as the difference between two values in time in terms of a percentage of the first value (Ammani, 2012). The growth model is therefore expressed in equation (1):

$$Y_t = Y_o(1+r)t(1) \quad (1)$$

Where:

Y_t = Quantity of fish export / import in a year t (tons);

r = Compound rate of growth of Y (%);

Y_o = Quantity of fish import in a base year (tons);

t = Time (year); and

1 = Constant.

Meanwhile, by linearizing the equation (1), the resulting outcome is expressed in equation (2):

$$LnY_t = LnY_o + Ln(1+r)t \quad (2)$$

Substituting LnY_o with β_1 and $Ln(1+r)$ with β_2 in equation (2), it transforms to equation (3).

$$LnY_t = \beta_1 + \beta_2 t \quad (3)$$

Adding the error term to equation (3), it gave rise to equation (4):

$$LnY_t = \beta_1 + \beta_2 t + \mu \quad (4)$$

Where:

Y_t = Quantity of fish export / import in year t (tons);

β_1, β_2 = Parameters to be estimated;

μ = Error term; and

t = Time

The trends in Nigeria's fish trade flow (export and import) were estimated using exponential regression model as employed by Adamu (2021). The exponential trend for fish trade flow was specified in equation (5):

$$Y_t = \beta_o + \beta_1 t_i + U_t \quad (5)$$

Finding the natural log of both sides gave the linear form of the equation (6):

$$Ln\, Y_t = \beta_o + \beta_1 t_i + U_t \quad (6)$$

Where:

Ln = natural log of fish trade flow (export and import);

Y_t = Qty of fish export or import (tons);

β_o = Constant (intercept of the equation);

t = Time trend (years);

β_1 = Trend coefficient; and

Ut = Error term.

The ADF test is the modified and improved version of the Dickey-Fuller (DF) test. The ADF stationarity test is specified in equation (7).

$$\Delta Z_t = \beta_1 + \beta_1^t + \partial Z_{t-1} + \Sigma_{i-1}^{m} \alpha_1 \Delta_{t-1} + \varepsilon_t \quad (7)$$

Where:

t = Time series variable (estimated parameters);

ΔZt = The change operator;

$\Delta Zt - 1 = (Z_{t-1}-Z_{t-2})$, $\Delta Z_{t-2} = (Z_{t-1}-Z_{t-2})$;

Z_{t-1} = Past values of variables;

β = Estimated parameters of the differenced values of the lagged variables; and

ε_t = White noise error term.

The null hypothesis that the time series data has no unit root or not stationary was tested.

Johansen co-integration was used to test for relationship between export and import time series variables. The study adopted the Johansen Maximum Likelihood procedure because it allowed for all feasible co-integration relationship and the number of co-integrating vectors to be verified practically. Thus, Johansen co-integration model was expressed in equation (8):

$$Z_t = \phi + A_1 Z_{t-1} + \cdots . + A_p Z_{t-p} + \varepsilon_t \quad (8)$$

The equation (8) can be rewritten as in equation (9):

$$\Delta Z_t = \phi + \sum_{i=1}^{n} \Gamma_i \Delta Z_{t-1} + \Pi Z_{t-1} + \varepsilon_t \quad (9)$$

Where;

$\Pi = \sum_{i=1}^{n} A_t - I, \Gamma_i = -\sum_{j=i+1}^{p} A_j$ and Z_t(EP and IP) was n x 1 vector of all the non-stationary I (1) variables in the study.

ϕ is a n x 1 vector of parameter (intercept),

ε_t is an k x 1 vector of innovations or random shocks.

Γ and Π are n x n matrices of parameters, were Γ is a n x 1 vector of coefficients of lagged Z_t variables. The Π is a *n x 1* long-run impact matrix which is product of two *(n x 1)* matrices of Exp (Export) and Imp (Import).

RESULTS AND DISCUSSION

Trend of fish import and export in Nigeria for the period from 1970 – 2022

Figure 1. shows the graphical trends of fish import and export in Nigeria from the period from 1970 to 2022 before differencing. As shown in Figure, there was a gradual and consistent increase in fish import and export over the period under review. Meanwhile, slight downward trend was recorded in rice production in 1990 and 1994 which thereafter gradually rise upward. The minimum fish import (4,230,000) and export (680,000) was recorded in the year 1970, while the maximum fish import (8,590,000,000) and export (386,000,000) was recorded in the year 2022. This implies a gradual and consistent upward trend in fish export and import over the period under review which could be attributed to several factors among which includes demand – supply, government policies and programmes which appears to be the most important factors. This finding is in corroboration with work of Ibrahim (2020) who reported a gradual and consistent increase in importation of most agricultural produce in Nigeria.

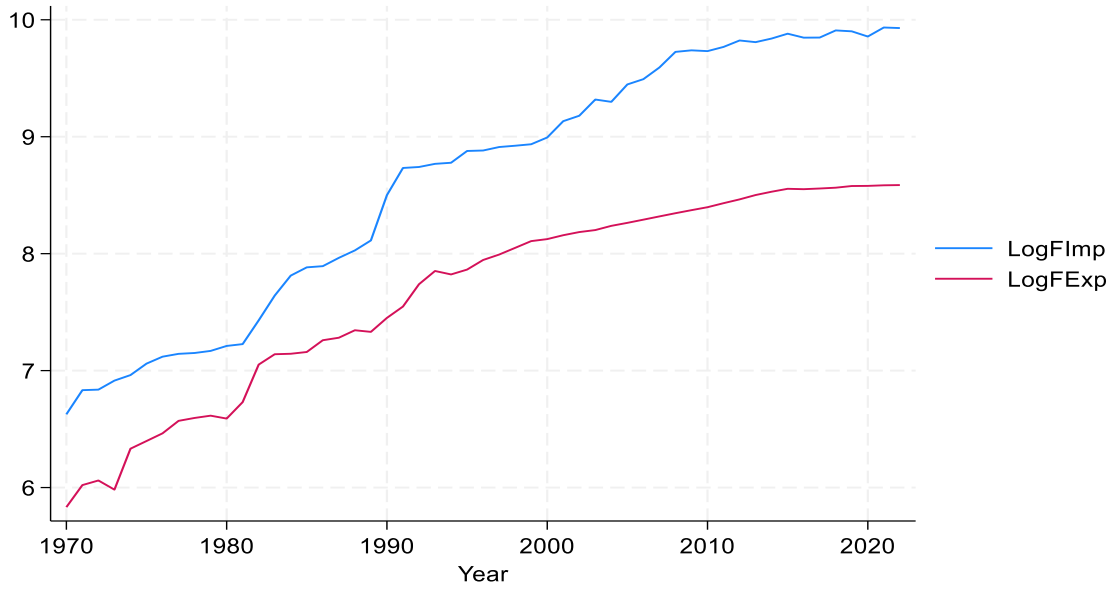

Figure 1: Trend of fish import and export in Nigeria from 1970 – 2022 before difference

More so, Figure 2 shows the graphical trends of fish import and export in Nigeria from the period from 1970 to 2022 after the differencing. The trends became stationary after the differencing at zero implying that the fish import and export has no unit root. This is expected of every time series data before it can be subjected to further analysis. Although, the fish import and export trends revealed the expected pattern of variability as it gives an idea of the past experience and also helps to predict for the future.

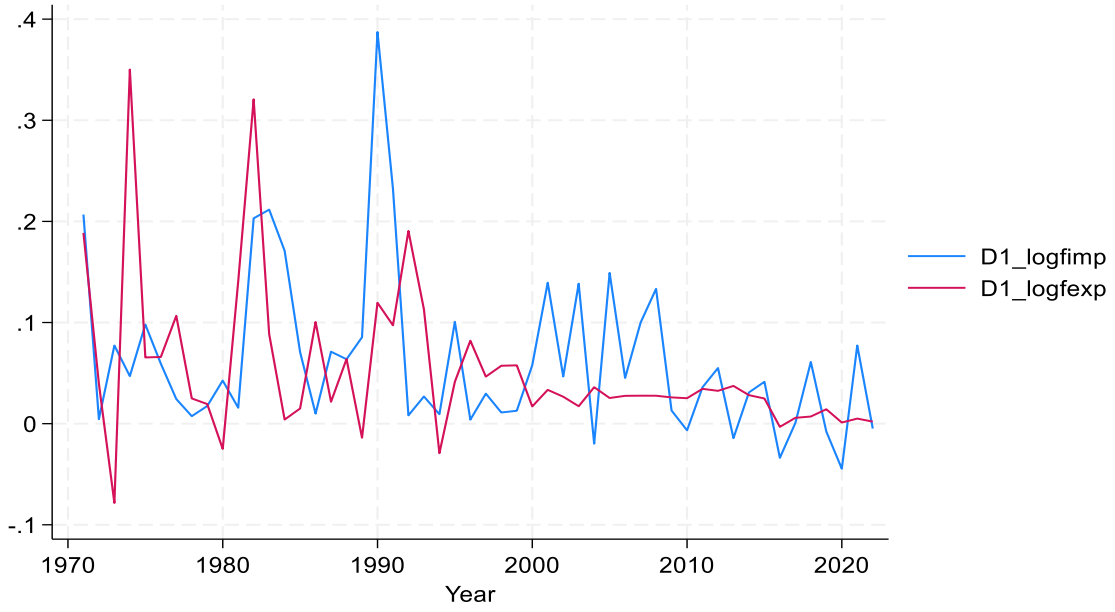

Figure 2: Trend of fish import and export in Nigeria from 1970 – 2022 after difference

Growth Rate of Fish Import and Export in Nigeria from 1970 – 2022

The results of exponential growth rate for fish import and export over the period of 1970 – 2022 are presented in Table 1. The F-statistic value of 10.059 and 37.488 revealed that the time trend was significant in the specified model. This was statistically significant at 5% and 1% level of probability and the time trend was relevant in explaining the variation in the fish import and export, respectively. Meanwhile, the trend co-efficient of the fish import (0.0102) and fish export (0.0193) were positive and revealed an exponential growth rate of 1.01% and 1.92%, respectively, implying a positive and increasing trend in fish import and export over the period under review. Therefore, the null hypotheses that there is no positive trend in the growth rate of fish import and export was rejected, while the accepting the alternate hypotheses.

Table 1: Growth rate of fish import and export in Nigeria from 1970 – 2022

Parameters	Fish Import	Fish Export
F – statistic	10.059**	37.488***
Trend Coefficient	0.0102	0.0193
t – statistic	5.603***	7.593***
Growth rate (%)	1.01	1.92

Note: ** and * implies significant at 5% and 1% level of significance**

Relationship between Fish Import and Export in Nigeria for the period from 1970 – 2022

Summary statistics of fish import and export time series

The summary of the basic features in respect to time series data used in the study is presented in Table 2. As revealed in the Table, the mean value of fish import and export for the period under review (1970 – 2022) was ₦2,440,000,000 and ₦135,000,000, respectively. The skewness results of 1.045 and 2.249 respectively, was less than the acceptable bench mark value of ±3.0, implying that the data set were normally distributed. Meanwhile, the kurtosis results of 7.374 and 10.149 respectively, was greater than the acceptable bench mark value of ±7.0, implying that the datasets were not peaked and flattened. However, Although, the Jarque – Bera value of 10.9747 was statistically significant at $p<0.01$ level of probability. However, the Jarque – Bera value of 48.959 and 148.609 respectively, was statistically significant at $p<0.01$ level of probability, hence the hypothesis that the data sets were not normally distributed was rejected. This finding is in corroboration with the study of Hair *et al.* (2022) who reported that skewness value between -2 to +2 is generally acceptable.

Table 2: summary statistics of the time series data

Description	Obs.	Min.	Max.	Mean	Std. Dev.	S	K	JB
ΔF_Imp.	53	4,230,000	8.59e+09	2.44e+09	3.02e+09	1.045	7.374	48.959
ΔF_Exp.	53	680,000	3.86e+08	1.35e+08	1.37e+08	2.249	10.149	148.609

Source: Time series data from 1970 – 2022 computed using Stata 18

Note: Obs. = Observation, Std. Dev. = Standard Deviation, S = Skewness, K = Kurtosis, JB = Jarque-Bera, Imp = Import and Exp = Exp.

Unit root test of fish import and export time series

Result of the unit root test is revealed in Table 3. The application of most time series models requires data to be stationary (Almuammar and Fasli, 2019). To test for the stationarity of the data set, the lags selection determined was guided by the Akaike Information Criterion (AIC) which ensure absent of serial correlation and loss of degree of freedom in the series. The ADF test values for the fish import (-5.411; -5.603) and fish export (-6.679; -7.593) without trend and with trend were greater than the critical values of 2.929 and 3.499, respectively. This implies that the ADF values for all the variables were higher than the critical values at $p < 0.05$ probability level, thus the variables had no unit root and were stationary around zero at first difference I (1).

Table 3: Estimate of unit root of the ARIMA

Variables	Order	Exogenous	ADF test (P-value)	Critical value at 5%
$\Delta FImp_t$	1(1)	Constant	-5.411 (0.0000)	-2.929
		Trend and Constant	-5.603 (0.0000)	-3.499
$\Delta FExp_t$	1(1)	Constant	-6.679 (0.0000)	-2.929
		Trend and Constant	-7.593 (0.0000)	-3.499

Source: Time series data from 1970 – 2022 computed using Stata 18

Johansen co-integration test of fish import and export time series

After ensuring that the time series data were stationary, the relationship between fish import and export in the period under review was estimated using the Johansen co-integration test. The Johansen co–integration test result of the null hypothesis that there is no relationship or co-integration between fish import and export is presented in Table 4. The results revealed that Johansen's trace statistics value of 43.8075 and maximum statistics value of 29.7702 at r = 0 was higher than the critical value of 15.41 at 5% probability level, while both the trace and maximum statistics values of 14.0374 at r = 1 was also higher than the critical value of 3.76 at 5% probability level. Therefore, the null hypothesis that there is no relationship or co-integration between fish import and export was rejected, while accepting the alternative hypothesis that there is relationship or co-integration between fish import and export with at least one of the co-integrating vectors. This implies that the fish import and export datasets vary independently in the short–run but could be interconnected in the long–run. The is evident from the fact that fish products are critical protein need for human consumption.

Table 4: Johansen co–integration test of fish import and export

Rank	Eigen value	Trace statistic	Critical value	Maximum statistic	Critical value
0	0.0000	43.8075*	15.41	29.7702*	14.07
1	0.4487	14.0374*	3.76	14.0374*	3.76
2	0.24478				

Source: Time series data from 1970 – 2022 computed using Stata 18

Note: * implies significant at p<0.05 critical value

CONCLUSION AND RECOMMENDATIONS

Based on the evidence emanating from the result of the data analysis, it can be concluded that the fish import and export datasets exhibits an upward and consistent trend. More so, there was a positive and increasing growth of fish import and export over the period under review. The datasets were normally distributed but not peaked and has no unit root as it become stationary after differencing. There is a positive relationship between fish import and export but vary independently in the short–run but could be interconnected in the long–run. However, the following recommendations were put forward among others. Fish production should be enhanced and improved by the producers to meet the domestic demand and boost export that will generate foreign exchange for the country. Government should provide enabling environment for fish production in Nigeria and make policy on fish importation in order to protect local production. Time series data used were normally distributed indicating significance of keeping reliable data, thus relevant government agency should ensure sustainable record keeping on fish import and export that will be useful for future research.

ABSTRACT

Emilia sonchifolia's potential bioactive properties were assessed through physicochemical analysis and extraction. Petroleum ether, chloroform, ethyl acetate , methanol and aqueous solvents with increasing polarity have been utilised in a gradually solvent extraction process. A rotary evaporator was used to concentrate the extracts after every sixteen hours extraction, which was agitated periodically. To ensure the plant materials quality and purity, physicochemical characteristics were evaluated. Moisture content and volatile components were determined by drying loss evaluation, while total ash and solvent-soluble ash values were evaluated to identify inorganic elements and impurities. These characteristics provide knowledge of the stability and composition of crude plant extracts and are essential quality control measures for herbal formulations. The findings of this study contribute to standardizing extracts of *Emilia sonchifolia*, making it easier to conduct more phytochemical and pharmacological studies for potential therapeutic uses.

INTRODUCTION

Medicinal plants are a source of great economic value in the Indian subcontinent. Nature has been bestowed on us a very rich botanical wealth and a large number of diverse type of plants grow in different parts of the country. India is rich in all the 3 levels of biodiversity, namely species diversity, genetic diversity and habitat diversity. In India thousands of species are known to have medicinal value and the use of different parts of several medicinal plants to cure specific ailments has been in vogue since ancient times.

Herbal medicines are complex mixtures of plants, animal parts or products, mineral and metals. However, plants and plant products form the dominant part of Materia Medica of traditional medicine practiced in different parts of the world and in particular in Asia, especially China, India, Korea, Philippines, Indonesia and Tibet. In India, for example, the Charaka Samhita (treatise), dating back to 900 BC, lists 341 plants and plant products for medicinal use. Susruta, who practiced surgery about 600 BC, described 395 medicinal plants. Herbal medicine is still mainstay of about 75-80% of the whole population, mainly in developing countries, for primary health care because of better cultural acceptability, better compatibility with the human body and fewer side effects. However, the last few years have seen a major increase in their use in the developed world (Rana and Jain, 2011).

Even though pharmacological industries have produced a number of new antibiotics in the last three decades, resistance to these drugs by microorganisms has increased. In general, bacteria have the genetic ability to transmit and acquire resistance to drugs, which are utilized as therapeutic agents. Such a fact is cause for concern, because of the number of patients in hospitals who have suppressed immunity, and due to new bacterial strains, which are multi-resistant. Consequently, new infections can occur in hospitals resulting in high mortality (Gislene *et al.,* 2000).

Medicinal plants are of great importance to the health of individuals and communities. The medicinal value of these plants lies in some chemical substances that produce a definite physiological action on the human body and these chemical substances are called phytochemicals. These are non-nutritive chemicals that have protective or disease preventive property. The most important of these phytochemicals are alkaloids, flavonoids, tannins and phenolic compounds. Many of these indigenous plants are used as spices and food plants (Subhashini *et al.,* 2010)

Considering the aforesaid, it is assumed that the need of the hour is to search for new antimicrobials. With this in mind, in the present work, some selected plants are screened for their potential antimicrobial activity. A number of such studies have been done in various places of the world (Sudharameshwari and Radhika, 2007). There are several reports on the antimicrobial activity of different herbal extracts (Parekh and Chanda, 2007).

MATERIALS AND METHODS

Herbal medicines derived from plant extracts are being increasingly utilized to treat a wide variety of clinical disease, relatively little knowledge about their mode of action is available. There is a growing interest in the pharmacological evaluation of various plants used in Indian

traditional system of medicine. Such an attempt was made in "*Emilia sonchifolia*" Which is suspected to have the antimicrobial activity.

Successive Solvent Extraction

'Emilia sonchifolia' shoots were washed well with water. They were air dried at 25°C For 5 days in shade and ground well using a mixer grinder (Singh *et al .,* 2025). The powdered medicinal plant material was taken and subjected to successive solvent extraction. The extraction was carried out for 16 hours with the following solvents in the increasing order of Polarity.

- Petroleum ether
- Chloroform
- Ethyl acetate
- Methanol
- Aqueous

PREPARATION OF DIFFERENT PLANT EXTRACTS

Preparation of Petroleum ether extract:

About 25g of powered plant material was extracted with 125ml petroleum. By using a separate funnel with occasional shaking for 16 hours. The extract was concentrated by Rotary flask evaporator. Each time before extracting the next solvent the residue was dried thoroughly to remove the solvent used.

Preparation of Chloroform extract:

After complete drying, the above said residue was extracted with 125ml Chloroform by occasional shaking for 16 hours.

Preparation of Ethyl acetate extract:

The above said residue was extracted with 125ml Ethyl acetate by occasional shaking for 16 hours.

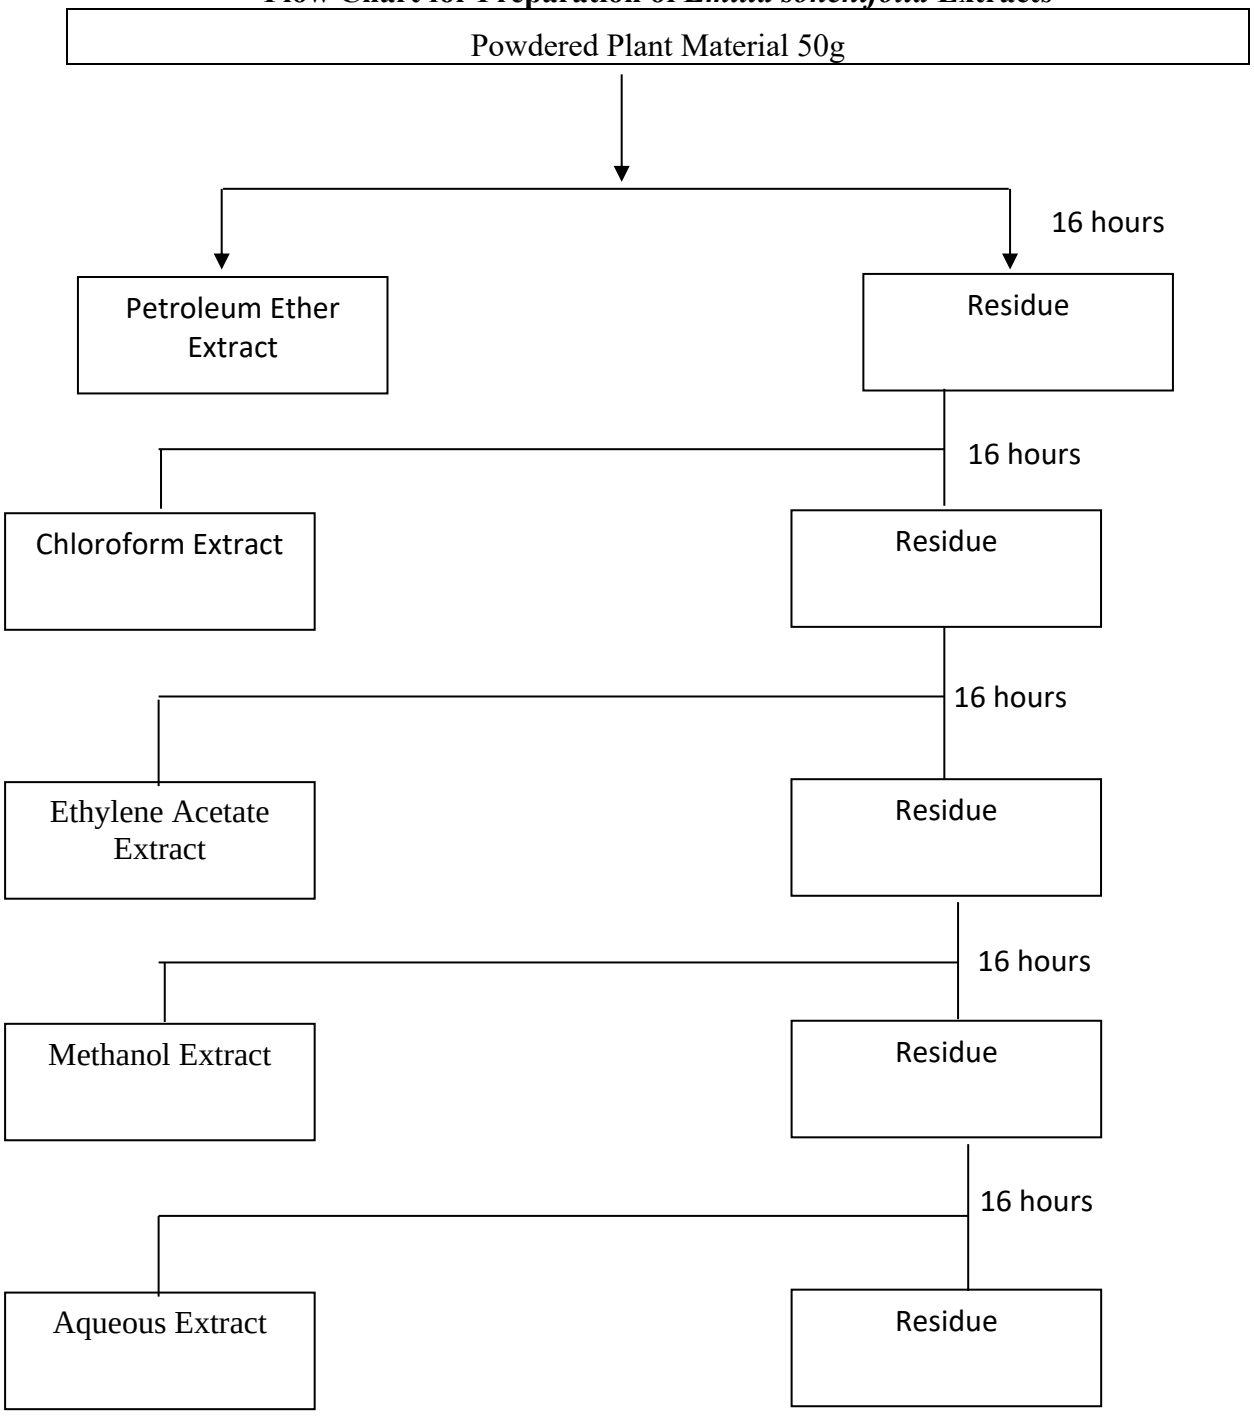
Preparation of Methanol extract:

The above said residue was extracted with 125ml ethanol by occasional shaking for 16 hours

Preparation of Aqueous extract:

The above said residue was extracted with 125ml aqueous by occasional shaking for 16 hours. The flow chart for extraction procedure is given below.

Flow Chart for Preparation of *Emilia sonchifolia* Extracts



DETERMINATION OF PHYSICAL CONSTANTS (Ross *et al.*, 2002)

1) Loss on drying at 110^{0}C

Loss on drying is the loss of mass expressed as per cent w/w. The test for loss on drying determines both water and volatile matter in the crude drug. Moisture is an inevitable component of crude drug, which must be eliminated as far as possible.

An accurately weighed quantity of about 5 g of powdered drug was taken in a tared porcelain dish. The powder was distributed evenly. The porcelain dish kept open in vacuum oven and the sample was dried at a temperature 110°C for 2 h until a constant weight was recorded. Then it was cooled in a desiccator to room temperature, weighed and recorded. % Loss on drying was calculated using the following formula.

$$\% \text{ Loss on Drying} = \frac{\text{Loss in weight of the sample}}{\text{Weight of the Sample}} \times 100$$

2) Ash values

Ash values are helpful in determining the quality and purity of a crude drug, especially in the powdered form. The objective of ashing vegetable drugs is to remove all traces of organic matter, which may otherwise interfere in an analytical determination on incineration, crude drugs normally leave an ash usually consisting of carbonates, phosphates and silicates of sodium, potassium, calcium and magnesium. The total ash of a crude drug reflects the care taken in its preparation

i) Total ash value

Weighed accurately about 2 to 3 g of the powdered drug in a tared silica crucible. Incinerated at a temperature not exceeding 450^{0}C for 4 h, until free from carbon, cooled and weighed. Calculated the percentage of ash with reference to air-dried drug using following formula,

$$\% \text{ Total ash value} = \frac{\text{Wt. of total ash}}{\text{Wt. of crude drug taken}} \times 100$$

ii) Petroleum Ether soluble ash value

Petroleum ether by occasional shaking after 16 hours residue (insoluble matter) tared silica crucible. Incinerated at a temperature not exceeding 450^{0}C for 4 h. Cooled ina desiccator and weighed. The difference in weight represented weight of petroleum ether in soluble ash. Calculated the percentage of petroleum ether insoluble ash with reference to the air-dried drug using the following formula,

Wt. of total ash – Wt.of pet.ether insoluble ash

$$\% \text{ pet.ether insoluble ash value} = \frac{\text{Wt. of total ash – Wt.of pet.ether insoluble ash}}{\text{Wt. of crude drug taken}} \times 100$$

iii) Chloroform soluble ash value

Chloroform by occasional shaking after 16 hours residue (insoluble matter) tared silica crucible. Incinerated at a temperature not exceeding 450^{0}C for 4 h . Cooled in a desiccator and weighed. The difference in weight represented weight of chloroform insoluble ash. Calculated the percentage of chloroform insoluble ash with reference to the air-dried drug using the following formula,

$$\%\text{Chloroform insoluble ash value} = \frac{\text{Wt. of total ash – Wt.of chloroform insoluble ash}}{\text{Wt. of crude drug taken}} \times 100$$

iv) Ethyl acetate soluble ash value

Ethyl acetate by occasional shaking after 16 hours residue (insoluble matter) tared silica crucible. Incinerated at a temperature not exceeding 450^{0}C for 4 h . Cooled in a desiccator and weighed. The difference in weight represented weight of ethyl acetate insoluble ash. Calculated the percentage of ethyl acetate insoluble ash with reference to the air-dried drug using the following formula,

$$\% \text{ ethyl acetate insoluble ash value} = \frac{\text{Wt. of total ash – Wt.of ethyl acetate insoluble ash}}{\text{Wt. of crude drug taken}} \times 100$$

v) Methanol soluble ash value

Methanol by occasional shaking after 16 hours residue (insoluble matter) tared silica crucible. Incinerated at a temperature not exceeding 450^{0}C for 4 h. Cooled in a desiccator and weighed. The difference in weight represented weight of methanol insoluble ash. Calculated the percentage of methanol insoluble ash with reference to the air-dried drug using the following formula,

$$\% \text{ Water insoluble ash value} = \frac{\text{Wt. of total ash – Wt.of water insoluble ash}}{\text{Wt. of crude drug taken}} \times 100$$

vi) Water soluble ash value

Water by occasional shaking after 16 hours residue (insoluble matter) tared silica crucible. Incinerated at a temperature not exceeding 450^{0}C for 4 h. Cooled in a desiccator and weighed. The difference in weight represented weight of water insoluble ash. Calculated the percentage of water insoluble ash with reference to the air-dried drug using the following formula,

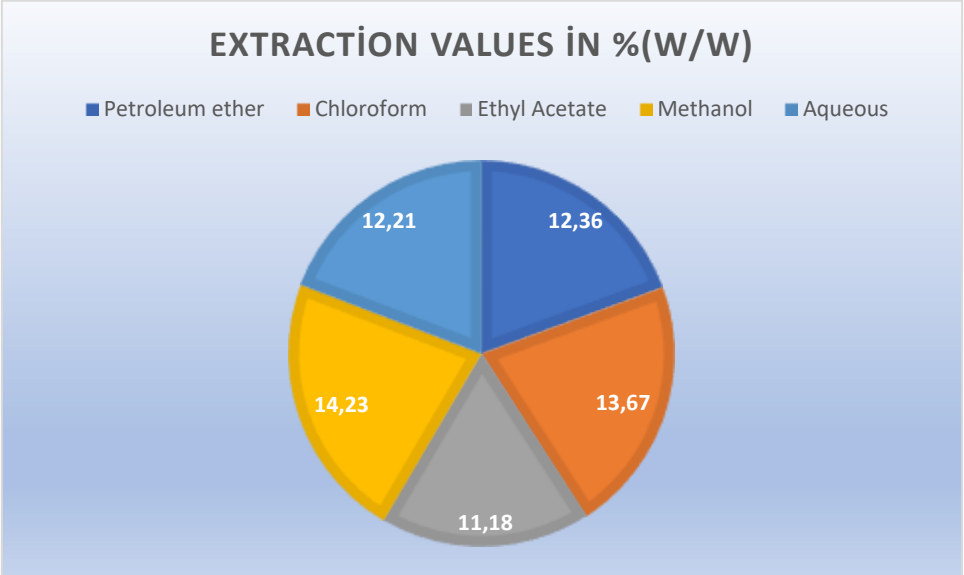
$$\% \text{ Water insoluble ash value} = \frac{\text{Wt. of total ash} - \text{Wt.of water insoluble ash}}{\text{Wt. of crude drug taken}} \times 100$$

RESULTS AND DISCUSSION

Extraction Value

Emilia sonchifolia's extraction yield varied significantly depending on the solvent; methanol obtained the highest extraction value (14.23% W/W) and ethyl acetate obtained the lowest (11.18% W/W). Petroleum ether, chloroform, and aqueous solvents exhibited extraction values of 12.36%, 13.67%, and 12.21% W/W, respectively. The polarity of the solvents and their capacity to dissolve various phytochemical elements are the reasons for the variance in extraction yield between them. Methanol had the highest extraction yield, most likely due to its strong polarity, which allows it to extract a diverse spectrum of polar and semi-polar chemicals such as flavonoids, alkaloids, and phenolics. A comparatively high extraction yield (13.67% W/W) was also demonstrated by the moderately polar solvent chloroform, suggesting that it is useful for extracting specific non-polar and semi-polar molecules.

Figure 1. Extraction Value of *Emilia sonchifolia* in different solvents



Petroleum ether yielded 12.36% W/W, which suggests that non-polar compounds including lipids and terpenoids were present, but in less amounts than more polar components. Ethyl acetate showed the lowest extraction yield (11.18% W/W) due to its intermediate polarity, which would have prevented it from efficiently extracting a wide range of phytochemicals. The aqueous extract (12.21% W/W) showed a moderate extraction efficiency, most likely extracting highly polar components such polysaccharides, glycosides, and tannins. For instance, a study on *Datura metel* leaves found that methanol extraction resulted in a 39.0% yield, while choloroform and petroleum ether yielded 18.9% and 11.2 % respectively (Dixon and Jeena, 2017).

DETERMINATION OF PHYSICAL CONSTANTS

In the present study, plant sample of *Emilia sonchifolia* was investigated for the Physical constants. The observations were tabulated in Table no. 1

Extraction Value

Table 1. Physical constants of *Emilia sonchifolia*

Sl. No	Physico-chemical parameter	Value
1	Loss on drying at 110^0C	2.2 %
2. i)	Ash values- Total ash value	8.1 %
ii	Petroleum ether insoluble ash value	76 %
iii	Chloroform insoluble ash value insoluble ash value	89.8 %
iv	Ethyl acetate insoluble ash value	86.5 %
v	Methanol insoluble ash value	87.2 %
vi	Water insoluble ash value	39.8 %

Emilia sonchifolia physico-chemical investigation revealed the following parameters. 2.2% was lost when drying at 110°C, suggesting a low moisture content. In contrast to the solvent-insoluble ash values, which differed significantly, the total ash value was 8.1%. The insoluble ash content was determined as follows: 76% for petroleum ether, 89.8% for chloroform, 86.5% for ethyl acetate, 87.2% for methanol, and 39.8% for water. The drying loss (2.2%) shows that *Emilia sonchifolia* includes considerable amounts of moisture, which is necessary to keep microorganisms out and ensure the long-term stability of the medicinal ingredients. The presence of inorganic residues, including mineral content and possible interaction with extraneous materials, can be determined by the total ash value of 8.1%. When assessing the quality and purity of botanical products, ash values are essential. In along with assessments of fat, ash, protein, fiber, and carbohydrate content, a study on the nutritional analysis and mineral content of *Emilia sonchifolia* revealed a moisture content of 83.18% (Morshed *et al.,* 2021).

The high solvent-insoluble ash measurements, particularly for methanol (87.2%), ethyl acetate (86.5%), and chloroform (89.8%), indicate that a significant portion of the ash is made up of inorganic substances that are difficult to dissolve in organic solvents. Because petroleum ether dissolves non-polar substances like lipids, its insoluble ash content (76%) is somewhat lower. The lowest water-insoluble ash score of all, 39.8%, indicates that a sizable portion of the ash is water-soluble, possibly including water-soluble minerals and inorganic salts. Water-soluble ash is the percentage of total ash that dissolves in water, indicating the presence of water-soluble minerals and helping to determine the purity of medicinal plant materials. This is consistent with typical pharmacognostic evaluations (Renjini *et al.,* 2024).

SUMMARY AND CONCLUSION

Methanol provided the maximum extraction yield of *Emilia sonchifolia*, whereas ethyl acetate produced the lowest, as a result of variations in phytochemical solubility. According to physico-chemical examination, the total ash content varied, with the lowest water-insoluble ash indicating a considerable presence of water-soluble minerals and the highest insoluble ash in methanol, ethyl acetate, and chloroform. The study shows that the extraction yield of *Emilia sonchifolia* is significantly affected by the solvent selection, with methanol being the most efficient because it can extract a wide variety of bioactive chemicals. The plant's mineral

stability and composition are further highlighted by physico-chemical examination; high solvent-insoluble ash values indicate a strong inorganic content. The low moisture content enhances the plant's potential for long-term therapeutic use. It is suggested to conduct additional qualitative research on the composition of the ash with the goal to investigate its particular mineral content and its pharmacological uses.

ABSTRACT

Multidrug resistant (MDR) bacterial infections pose significant challenges to the public health especially the hospital environment. The study investigate the plasmid curing potential of *Nigella sativa* on multidrug resistant *Staphylococcus aureus* isolated from hospitalized patients. The seed extract of *N sativa* was screened for plasmid curing potential by exposing the isolates to standard antibiotics and subjecting them back to the standard antibiotics after exposure to the extract for reassessment. The *Nigella sativa* post curing treatment of *S aureus* to Levofloxacin 11(91.67%), Amoxicillin 4(33.33%) and *P aeruginosa* to Ofloxacin (87.5%) and Amoxicillin 8(100%). The finding of this study provide insight into the role of plasmid in MDR pathogens and the potential of plant based agents in combating plasmid mediated resistance

Introduction

Resistance to antibiotic may come from parent bacteria however they can as well pick up resistance trait from their competitors (Ringel *et al.*, 2016). Some bacteria have the capacity to inject toxic cocktail into their competitors causing cell lysis and death by genetic materials integration. These organisms may be carrying drug resistance genes that may be transferred into predator by uptake of DNA fragment taken up which has been released by the prey as such signifies that the gene for such resistance can be transferred from one bacterium to another (Barrow & Feltham, 2003; Ringel *et al.*, 2016; Zaman & Chawdhury, 2024).

Plasmid targeting for curing is a promising novel drug if success is recorded because the most essential principal feature of a drug target is for the site not to be analogous to eukaryotic cell, of which only yeast cell is a eukaryote that acquires plasmid and no multicellular organism has that feature of plasmid being in its cell. This paper focus on curing plasmid in multidrug resistant clinical isolates of *Staphylococcus aureus* using organic extracts of *Nigella sativa (*Black seed).

Statement of the Problem

Considering the natural accidental detection of antibiotic, bacterial infections should be treatable with antibiotics but resistance has become a common phenomenon preventing the cure of infections which have varying mechanism in their actions against antibiotics and therefore remain a problem. The antibiotics of different structure, form, mode of action have been developed in curing bacterial diseases but all are almost exhausted due to bacteria resistance which are mostly as a result of alterations in either cellular, physiological or genetic makeup leaving the infection to persist (Sekhi *et al.*, 2021). Such line of drugs have targeted many cellular organelles and other components of the cell but a non-chromosomal DNA known as plasmid contribute to such resistance and render a sensitive bacteria cell to drug resistance by empowering such bacteria host with the ability to resist drugs using such code of genes conferring resistance on the plasmid (Zaman & Chawdhury, 2024).

Justification

Since plasmid has been identified as a problem in the course of AMR, there is need for curing plasmid and reassessment of sensitivity following curing of the plasmid as an identified problem in order to improve the sensitivity of bacteria to antibiotics. The known curing agents like ethidium bromide that have been commonly used cannot be transcribed to human use because of its ability to cause gene mutation since they are known intercalating agents that are dangerous for human use. Therefore there is need to explore organic compounds with minimum health risk as replacement to the chemical like the aforementioned such as acrydine orange and bromide. It will also be a great model to blocking the activity of such plasmid genes capable of rendering antibiotics non active or non-effective (Rithanya & Ezhilarasan, 2021).

The aim of the study is to carry out Plasmid Curing on Multi-drug Resistant *Staphylococcus aureus* with the specific objectives of plasmid curing of MDR *S aureus* using *Nigella sativa*

extracts as curing agents and reassess for sensitivity to the antibiotics the isolates were previously displaying resistance to.

Materials and Methods

Collection of Plants for Plasmid Curing

The seeds of *Nigella sativa* (Black seed, Abbatu sauda) was purchased from herbal store in Sokoto Metropolis and authentication was done in Usmanu Danfodiyo University, Sokoto Biological Science Herbarium with accession number UDU/ANS/0106.

Screening of Extracts of *N sativa* for Antibacterial Activity

Prior to MIC, the screening of extracts of *N sativa* for antimicrobial activity were confirmed using an agar well diffusion with crude extract according to the method of Oyeleke & Manga (2008). For the zone of inhibition, *Nigella sativa* crude of 0.2ml was dispensed in dished borrow of solidified Mueller Hinton Agar.

Determination of Minimum Inhibitory Concentration (MIC) of the Plant Extract

The Minimum Inhibitory Concentration (MIC) of the extract against *S. aureus* were determined using the broth dilution method (Wiegand *et al*., 2008; Cheesbrough, 2006). The MIC is defined as the lowest concentration of extract that inhibited visible growth. Tube dilution method was employed, the N sativa oil extract was serially diluted to obtain varying concentration of 100mg/ml, 50mg/ml, 25 mg/ml and 12.5 mg/ml in Mueller-Hinton Broth containing twin 80.

Standardized suspension of the *S. aureus* was prepared to Mcfarland, typically 10^8 CFU/mL standard. Aliquots 2ml of the prepared Mueller-Hinton broth was introduced into test tubes which was sterilized and cooled before been inoculated with 5µl of the mcfarland standardized bacterial suspension. A series of tubes containing different concentrations of the extracts, (*N sativa*) typically in a doubling dilution series was made. The isolates of *Staphylococcus aureus* (039SA/181SA) suspensions were inoculated into different concentrations prepared in the test tubes. The tubes were incubated at 37^0C for 24hr. The growth was observed, looking for turbidity. The MIC was the lowest concentration of the antimicrobial agent that inhibits growth (Levine, 2018).

Plasmid curing

The plasmid curing was performed as described by Gunjal *et al.* (2020). This process was modified for design of the research plants. The cultures of *S aureus* was grown in Mueller-Hinton broth in the presence of plant extracts *Nigella sativa* at sub-inhibitory concentration of 200, 100 and 50ul/ml for 24 h at 37^0C. The growth were recovered into Nutrient agar to obtain well isolated colonies of cured isolates. Inoculated Acridine orange of (10µg/mL) in Mueller Hinton Broth was used as a positive control and untreated bacteria culture in MHB as a negative control. The bacteria grown in the extract were sub-cultured after 24 hours for reevaluation of their antimicrobial sensitivity. The strain which failed to grow in the presence of an antibiotic,

was considered as putative cured derivatives. The yielded rate of curing response was subjected to sensitivity reevaluation for record of curing efficiency of the plant extracts.

Antimicrobial Activity Test after Curing

Curing require growing the resistant bacteria in the subminimum inhibitory concentration of each extract and then subculture in a freshly prepared nutrient agar before preparing for antibacterial activity of the previously resisted antibiotics. Aliquots of 0.1 mL of inoculum suspension with reference to mcfarland standard of the cured isolates were lawn grown on Mueller Hinton agar plates using the disc diffusion method as previously applied in the initial antibiogram testing. The plates were kept for 30 min for diffusion. Antibiotic discs were impregnated in to the MHA plates. The plates were incubated at 37^0C for 24 hours and the zones of inhibition were measured for Post curing sensitivity in mm as zone of inhibition (Muscara *et al.*, 2021).

Bio-centrifugation for Plasmid DNA Extraction

Plasmid extraction according to Altamirano *et al.* (2021) was slightly modified in accordance with the manufacturer's instruction of Hi yield. Bacteria cells were grown for 24hours, washed in nuclease free water then centrifuged. The supernatant was discarded living the cell pellets. The Hiyield reagents for plasmid DNA extraction was employed and conducted according to Laguerre *et al* (1992). The plasmid curing capacity of *N sativa* was assessed on agarose gel electrophoretic machine showing bands of DNA. This was done according to the protocol of Adeyemo & Onilude, (2015) with little modification. Buffer preparations of Hi yield plus plasmid mini kit protocol was used for spin column. Prior to extraction, kit were optimized as follows; RNase was centrifuged and was entirely added to PD1 Buffer. The mixture were shaken for few seconds and stored at 4°C. Absolute ethanol was added to wash buffer and mixture well shake PD2 was checked for precipitation and observed precipitates were heaped to warm at 37°C. Bacteria colony was harvested with sterile applicator sticks into 1.5ml centrifuged tube containing nuclease free water micro centrifugation for proper harvest yield. In the re-suspension, aliquot (200µl) of PD1 Buffer (RNase A) was added to the 1.5ml centrifuge tube containing cell pellet Two microliter (2µl) of blue mix lysis buffer was added to the same 1.5ml micro centrifuge tube and well mixed by shaking. That is 1:100 mix of Blue mix buffer and PD1. The mixture was continuously pipetted until cells were noticed lysed and dissolved. Then 200µl of PD2 buffer was added and then mixed by inverting the tube 10 times. The mixture were allowed to stand incubated for 2 minutes at room temperature. All precipitates became dissolved after adding PD2 buffer. Then 300µl PD3 buffer was added and mixed by inverting the tube 10 times.

It was centrifuged at 16000kg for 3 minutes. After adding PD3 buffer QPD column was placed in a 2ml collection tube. For DNA binding, all supernatants were transferred to QPD column using a narrow tip pipette. The supernatant was completely centrifuged for 30 seconds at room temperature. The flow through was discarded and QPD column was placed back to the 2ml collection tube. Six hundred microliter (600µl) of buffer was added in the QPD column and centrifuged at 16000kg for 3 minutes at room temperature in order for the column matrix to be

dry. The QPD was transfered to new 1.5ml micro centrifuge tube and second wash was performed.

The elution buffer of 50µl TE was added into the center of the column matrix and allowed to stand for 2 minutes for proper complete absorption of TE. Then followed by centrifugation at 16000xg for 2 minutes to elute all plasmid DNA.

Agarose Gel Electrophoresis of the Plasmid DNA

Agarose powder of 1.0g was dissolved in 100ml of 1× Tris Borate Ethylene di-tetra acetate buffer in a 500mL Erlen Meyer Conical flask. The flask was swirled to dissolve the agarose powder and heated microwave oven until clear solution of the molten agarose was achieved. The molten agarose was allowed to stand before cooling on bench and 5µL of ethidium bromide (intercalating agent) was added into the gel for visual clarity of DNA fragments in the course of imaging. Comb was placed in cast to form well in loading the amplicons. Gel was submerged with 1× Tris EDTA running buffer in the electrophoretic chamber, PCR products was mixed with the loading dye (0.25% bromophenol blue, 0.25% xylene cyanol and 30% glycerol). The first and last well was loaded with 1kb molecular weight marker of DNA ladder as an estimate of resulting DNA fragment. Electrophoretic chamber was connected to source of power and run at 100Volts (6v/cm) for 40minutes. The bands of DNA was viewed by UV light illuminated images (Lee *et al.*, 2012).

The descriptive and Analysis of variance (ANOVA) was used to calculate the differences in the response to antibiotics and response to curing by *C procera* and *N sativa* extracts respectively using Excel Package with degree of confidence gazette at 95% of 0.05 pvalue.

Results

Table 1 shows the zone of inhibition exhibited by *S aureus* to standard antibiotics before subjecting them to plasmid curing indicating over 90% been resistant to amoxicillin and rifampin. Table 2 presents the zone of inhibition for antimicrobial screening of crude extracts of *N sativa*. The crude concentration of the extract was screened on isolate 39SA, 181SA for antimicrobial activities. *N sativa* yielded a zone of inhibition of 15mm on 39SA, 14mm on. Table 3 show the minimum inhibitory concentration of *N sativa* extract at 0.25ml/ml on *S aureus* 39SA/181SA.

Tables 4 is a presentation of the sensitivity pattern as an outcome of plasmids curing with *N sativa* at concentration of 50µl, 100µl and 200µl on multidrug resistant plasmid positive of *S aureus*. The analysis confirmed a variability in the efficacy of antibiotics and the impact of concentration of *Nigella sativa* on *S aureus* susceptibility. Two way ANOVA was conducted with the P-value 1.000 for the effect of antibiotic not been significant however concentration

of *N sativa* gave a significant value of 0.016. This implies that concentration variation has significant effect on the response of the cured *S aureus* isolates to the drugs they were previously resisted to.

DISCUSSION

Effective plasmid curing serve as a means of restoring bacteria susceptibility reinstating antibiotics integrity for effective treatment options rather than closing door at some antibiotics of choice. With the increment of multiple drug resistant bacteria worldwide *P aeruginosa* and *Staphylococcus aureus* pose great danger to the society (Okoye *et al*., 2022). The two bacteria are always disseminated with plasmid mediated resistance (Almuhayawi *et al.*, 2023). Ciprofloxacin resistance pattern is similar in the *S aureus* strain as found against levofloxacin hence similar success of plasmid curing was also achieved with 11(90.9%) of the isolates however 50µl of the oil extract outperformed the 200µl concentration of *N sativa* as 6 and 5

strains were cured respectively. However *Pseudomonas aeruginosa* was 100% sensitive to Ciprofloxacin.

Gentamicin resistance were cured at 100µl and 200µl concentration of the oil extract as 4 of the strains resistant became cured. Among the amoxicillin resistant strain which is most common in this study among the MDR *S aureus* were intermediate resistant however, the effect of *N sativa* was not so pronounced as many do change from their initial status hence only 4(33.33%) reverted sensitive while *P aeruginosa* had only 196PA uncured as 7(87.5%) became cure. In fact, the 33.33% curing affirm the reported output from Yogini *et al.* (2015) with similar curing percentage of *Cuminum sativum* on Acinetobacter sp, and Klebsiella sp. Speaking from this study, one may conclude that specific antibiotics is favored at one concentration of extract to the other as established from the post curing experiments. Streptomycin resistant among the MDR *S aureus* were 100% cured with *N sativa* oil extract while Rifampicin resistance is upheld except for 4(33.33%) that change in zone of inhibition ranging between 16mm to 18mm classifying them as intermediate of sensitive and resistant. This may be that more concentration is required or variation of concentration is needed. The level of plasmid curing of *Nigella sativa* N-Hexane extract is between 33.33%-90.9% on *S aureus* at varying concentrations of 50µl, 100µl and 200µl per milliliter. The result from this study is similar to the report of Maryam *et al*. (2016) who reported 100% cured of MDR bacteria in their study.

Conclusion

The curing electrophoretic gel image revealed a positive outcome from extracts of reversing the resistance of *S aureus* and *P aeruginosa*. Following treatment with *C procera* the reassessment antibiogram indicated *S aureus* resistance reversal to Levofloxacin (100%) and Amoxicillin 5(47.67%) while *P aeruginosa* has resistant reversal to Ofloxacin 8(100%) and Amoxicillin 8(100%) indicating high response. The *Nigella sativa* post curing treatment of *S aureus* to Levofloxacin 11(91.67%), Amoxicillin 4(33.33%) and *P aeruginosa* to Ofloxacin (87.5%) and Amoxicillin 8(100%). The finding of this study provide insight into the role of plasmid and resistant genes in MDR pathogens and the exploration potential of plant based agents in combating plasmid mediated resistance.

ABSTRACT

Early detection of acidemia in calves is important in preventing complications and organ and tissue damage. Therefore, this study aimed to evaluate the relationship between hypoglycemia in calves and blood pH, anion gap and electrolyte concentration. In this study, 30 Simmental calves of different sexes, aged 1-28 days, were used. The hypoglycemic group consisted of 20 calves, while the healthy group consisted of 10 calves. Calves with diarrhea, weakness, no sucking reflex, and glucose concentrations <4.4 mmol/L were included in the hypoglycemic group. Blood samples were taken from the jugular vena of the calves in the study into 1 ml lithium heparin syringes for blood gases and into 2 ml anticoagulant tubes for hematological analyses. Blood gas analysis was performed using a portable automatic device, while leukocyte count was analyzed using a hematology device. There was no statistically significant difference between hypoglycemic and healthy calves in terms of respiratory frequency ($p>0.396$), body temperature ($p>0.279$), sodium ($p>0.691$), potassium ($p>0.152$) and chloride ($p>0.986$). However, heart frequency ($p<0.046$) of hypoglycemic calves was found to be statistically significantly higher than healthy calves. Glucose ($p<0.001$), blood pH ($p<0.001$) and bicarbonate concentration ($p<0.001$) of hypoglycemic calves were found to be significantly lower than healthy calves. In contrast, it was determined that the anion gap ($p<0.001$), WBC ($P<0.005$) and HCT values ($p<0.002$) of hypoglycemic calves were significantly higher than those of healthy calves. In conclusion, this study evaluated blood pH, anion gap and electrolyte concentrations in hypoglycemic calves and revealed a significant relationship between glucose concentration and anion gap, blood pH and bicarbonate levels. In the future, it is necessary to evaluate blood electrolyte concentrations and other variables in large populations and hypoglycemic calves of different severities and to evaluate their effects on mortality.

Keywords: Calf, Diarrhea, Electrolyte, Blood Ph, Anion gap

INTRODUCTION

The first 3-4 weeks of life, referred to as the "neonatal period" in calves, are a critical phase in the survival of calves. It is stated that calf diarrhea in this phase constitutes 86% of the total costs in a farm (Cho and Yoon, 2014; Lewis and Phillips, 2017). Among the problems seen in livestock farms, calf diarrhea is the most common and most common disease in our country and in the world (Berchtold, 2009; Cho and Yoon, 2014). Despite many preventive and therapeutic developments to prevent losses due to calf diarrhea, losses due to calf diarrhea are still serious (Roussel and Brumbaugh, 1991; Lorenz and Trefz, 2024). While an average of at least 15% of calf deaths occur annually in Turkey, the cost of these deaths to the country is quite high (Sahal et al., 2018).

Metabolic acidosis, hyperlactatemia, hypovolemic shock, cardiac and hepatic failure, azotemia, hyponatremia and hypoglycemia are common complications that develop due to diarrhea in calves (Trefz et al., 2016). Among these, hypoglycemia has recently been given careful attention due to its effect on mortality (Trefz et al., 2016; Trefz et al., 2017). Since calves have sufficient energy reserves, maternal factors, congenital disorders and neonatal diseases can potentially lead to disruption of blood glucose homeostasis, as any condition that disrupts energy intake (Carlson, 1996). Trefz et al. (2017) reported in their study that hypoglycemia has an important place in predicting mortality.

Metabolic acidosis is defined as a condition characterized by a decrease in blood pH and blood bicarbonate concentration (Lorenz and Trefz, 2024). Disturbance of blood acid-base balance leads to serious damage to tissues and organs (Adrogue and Madias, 1998). As the severity of acidosis increases, decreases in liver blood flow, glomerular filtration rate, cardiac contractility and cardiac output are common complications (Adrogue and Madias, 1998; Trefz et al., 2017). Early detection of acidemia in calves is important in preventing complications and organ and tissue damage. Therefore, this study aimed to evaluate the relationship between hypoglycemia in calves and blood pH, anion gap and bicarbonate concentration.

MATERIAL AND METHODS

This study was initiated after the approval of the Bingöl University Animal Experiments Local Ethics Committee (Meeting Number: 2025/02, Decision Number: 02/02).

Animal Selection

In this study, 30 Simmental calves of different sexes, aged 1-28 days, were used. The hypoglycemic group consisted of 20 calves, while the healthy group consisted of 10 calves. Calves with diarrhea, weakness, no sucking reflex, and glucose concentrations <4.4 mmol/L were included in the hypoglycemic group (Trefz et al., 2016; Smith et al., 2015). After routine clinical examinations of the calves, the rectum of the calves was stimulated by rectal stimulation in order to determine infectious agents in both healthy and hypoglycemic calves, and their stools were collected in sterile feces containers. Etiological screening was performed using rapid immunochromatographic commercial diarrhea test kits (Anigen Rapid BoviD-5 Ag Test Kit, Bionote, Inc. Korea) for Rotavirus, Coranavirus, Escherichia coli K99, Cryptosporidium

parvum and Giardia lamblia from fecal samples. In addition, calves with prematurity, congenital anomalies and surgical problems were excluded from the study in both groups.

Blood Collection and Laboratory Analysis

Blood samples were taken from the jugular veins of the calves in the study into 1 ml lithium heparin syringes for blood gas and into 2 ml anticoagulant tubes for hematological analyses. Blood gas analyses were performed using a portable automatic device, while leukocyte counts were analyzed using a hematology device.

Statistical analysis

Data were analyzed using software [SPSS 26 (IBM SPSS Statistics for Windows, Version 22.0. Armonk, NY: IBM Corp.) and Graph Pad Prism (Prism 9 for Windows, version 9)]. Data are presented as mean ± standard deviation. Shapiro-Wilk test was used to assess the normal distribution of the data. When analyzing the distinctions between hypoglycemic and healthy calves groups, Mann-Whitney U test was used for data that did not meet the criteria for normal distribution. Conversely, Independent Samples T-test was applied to data showing normal distribution. Correlation between variables was examined by Spearman's rank correlation test. Statistical significance level was determined as $p<0.005$.

RESULTS

Table 1 shows the mean-standard error and statistical significance between groups for clinical examination findings of healthy and hypoglycemic groups. No statistically significant difference was found between hypoglycemic and healthy calves in terms of respiratory frequency ($p>0.396$) and body temperature ($p>0.279$). However, it was determined that the heart rate of hypoglycemic calves ($p<0.046$) was statistically significantly higher than healthy calves.

Table 2 shows the mean-standard error and statistical significance between groups for biochemical values of healthy and hypoglycemic groups. Glucose ($p<0.001$), blood pH ($p<0.001$) and bicarbonate concentration ($p<0.001$) of hypoglycemic calves were found to be significantly lower than healthy calves. In contrast, anion gap ($p<0.001$), WBC ($p<0.005$) and HCT ($p<0.002$) of hypoglycemic calves were found to be significantly higher than healthy calves.

Table 1. Mean-standard error and statistical significance between groups of clinical examination findings of healthy and hypoglycemic groups.

Parameters	Hypoglycemic Group	Healthy Group	P value
Heart rate (Number of heart beats per minute)	122±36.51	102±18.61	0.046
Respiratory Frequency (Respiratory rate per minute)	35.45±11.42	35±0.9	0.396
Body Temperature (oC)	37.54±1.58	36.59±1.31	0.279

The data are given as mean ± standard deviation. a, b: The differences between the groups with different letters on the same line are significant. $p < 0.05$.

Table 2. Mean-standard error and statistical significance between groups of biochemical values of healthy and hypoglycemic groups.

Parameters	Hypoglycemic Group	Healthy Group	P value
Glucose (mmol/L)	$3.1±1.04^a$	$4.85±0.65^b$	0.001
Anion Gap (mmol/L)	$21.8±6.78^a$	$3.6±3.62^b$	0.001
Blood Ph	$7.03±0.3^a$	$7.42±0.12^b$	0.001
Bicarbonate (mmol/L)	$15.64±7.63^a$	$30.51±1.13^b$	0.001
WBC ($x10^9$)	$18.16±10.67^a$	$12.18±1.10^b$	0.005
Sodium (mmol/L)	133.95±7.07	134.2±1.26	0.691
Potassium (mmol/L)	5.78±1.75	5.69±0.31	0.152
Chlorine (mmol/L)	101.75±8.8	102.5±1.75	0.986
HCT (%)	$36.6±7.63^a$	$25.7±4.5^b$	0.002

The data are given as mean ± standard deviation. a, b: The differences between the groups with different letters on the same line are significant. $p < 0.05$.

DISCUSSION

As a result of the limited energy reserves of calves in the neonatal period, the development of diarrhea, pneumonia and other neonatal diseases leads to the deterioration of glucose metabolism in animals. In addition, blood pH, bicarbonate and anion gap variables contribute significantly to the formation of mortality by causing acidemia (Trefz et al., 2017; Trefz et al., 2016; Kiran et al., 2015). However, no study has been found evaluating the relationship between blood pH, bicarbonate and anion gap concentrations of hypoglycemic calves . Therefore, the aim of this study is to evaluate the relationship between hypoglycemia in calves and blood pH, bicarbonate and anion gap.

Blood pH is an important blood gas parameter used in the evaluation of acid and base load in the blood. A blood pH of less than 7.35 is called acidemia, and a blood pH of more than 7.45 is called alkalemia (Trefz et al., 2017). Metabolic acidosis occurs when blood pH is low or bicarbonate loss occurs (Trefz et al., 2017; Trefz et al., 2016). Many studies on critically ill people have reported that blood pH <7.20 indicates high intensive care mortality and poor prognosis (Jung et al., 2011; Kiran et al., 2015). In parallel with studies in human medicine, a study on calves with neonatal diarrhea reported that blood pH <6.85 has a significant effect on mortality in calves and is important in predicting diarrhea (Trefz et al., 2017). Similarly, in a study conducted by Ekinci et al. (2024) on diarrheic calves, it was determined that blood pH was significantly low and was a parameter that had a serious effect on mortality. The reason why blood pH is so effective on mortality is related to the fact that it causes serious damage to many different tissues and organs (Androgue and Madias, 1998). Since the evaluation of the effects of blood pH, bicarbonate and anion gap on mortality in hypoglycemic calves in this study was not included in the scope of this study, it was not evaluated. In this study, the blood pH of the calves in the hypoglycemic group (7.03±0.3) was significantly lower than the calves in the healthy group (7.46±0.05). In addition, it was determined that there was a high correlation between hypoglycemia and blood pH. Therefore, this result should be considered that metabolic acidosis may have developed in diarrheic calves with hypoglycemic blood glucose concentration under field conditions.

The anion gap is a value obtained from the difference between measurable anions and cations and shows the acid-base status of the organism well. This value is calculated according to the electroneutrality principle and presented (Ewaschuk et al., 2003; Ekinci et al., 2024). The anion gap value is an important parameter that cannot be easily measured under field conditions such as D-lactate and L-lactate, but has clinical use because it correlates well with the anion gap value (Trefz et al., 2017; Ekinci et al., 2024). In a study conducted by Gomez et al. (2013) on 264 diarrheic calves, they reported that the anion gap value was significantly correlated with sucking reflex, body posture (sternal, lateral and standing) and poor animal behavior. In a study conducted on cattle with different diseases, it was reported that the anion gap value showed a moderate correlation with L-lactate, but had a limited effect in predicting blood L-lactate concentration (Constable et al., 1997). In a study conducted on 52 diarrhoeic calves by Ewaschuk et al. (2003), it was reported that there was no correlation between the anion gap value and L-lactate concentration, but there was a significant correlation between the anion gap and D-lactate and DL-lactate. The author attributed this difference between the studies to obtaining data from a clinical population and stated that it was related to the experimental nature of diarrhoea in the calves in the previous study (Ewaschuk et al., 2003). In a study conducted

on 89 diarrheal calves with neonatal diarrhea, it was reported that the anion gap concentration was significantly higher in non-survivors than in survivors (Ekinci et al., 2024). Another study conducted by Lee et al. (2020) reported that the anion gap concentration was significantly higher in non-survivors and also that the anion gap level was correlated with the degree of dehydration and worsening of the clinical condition. In line with previous studies, in this study, the anion gap concentration in hypoglycemic calves was significantly higher than in healthy calves and also that the anion gap level was significantly negatively correlated with blood glucose concentration.

Electrolyte levels in the blood are measured through analysis and the condition in which their levels are high or low is called electrolyte imbalance. Imbalances in calcium, magnesium, chloride, phosphorus, sodium and potassium levels cause significant problems that can threaten the lives of animals (Constable, 2003). With the widespread use of blood gas analyzers, the measurement of electrolytes such as sodium, potassium and chloride has become easier. This has allowed the accurate knowledge of the blood electrolyte concentration of diseased cattle and the appropriate treatment (Kim et al., 2015). In some studies, it has been reported that sodium, potassium and chloride have an important effect on the evaluation of mortality in calves and the treatment of the disease (Constable, 2003; Trefz et al., 2017; Ekinci et al., 2024). In a study conducted by Lee et al. (2020), it was determined that sodium, potassium and chloride concentrations had no effect on mortality. In contrast, in a study conducted by Trefz et al. (2017) on 1400 diarrheal neonatal calves, it was determined that sodium and potassium concentrations were significantly higher in non-survivors and that sodium level was a predictor of mortality. In a study conducted by Ekinci et al. (2024) on diarrheal neonatal calves, it was reported that chloride and sodium concentrations were significantly higher in non-survivors than in survivors, but only chloride level had a significant effect on mortality. In this study, no statistically significant difference was determined between hypoglycemic and healthy calves in terms of sodium, potassium and chloride concentrations. The possible reason for this may be related to the degree of dehydration, severity of diarrhea, etiological differences and analytical conditions of the analyses.

In conclusion, this study evaluated blood pH, anion gap and electrolyte concentrations in hypoglycemic calves and revealed a significant relationship between glucose concentration and anion gap, blood pH and bicarbonate levels. In the future, it is necessary to evaluate blood electrolyte concentrations and other variables in large populations and hypoglycemic calves of different severities and to evaluate their effects on mortality.

ABSTRACT

Chemical pesticides are widely used in agriculture to control disease and pest populations. However, these chemicals cause significant problems such as environmental pollution, damage to non-target organisms and the development of insect resistance. Therefore, biological control methods are gaining more and more importance. Entomopathogenic fungi, especially *Beauveria bassiana* and *Metarhizium bruneum*, stand out as effective agents in biological control of insect pests. These fungi infect host insects, causing their death and controlling their populations naturally. Entomopathogenic fungi also exert antagonistic effects against pathogenic fungi in the phyllosphere and rhizosphere or in plant tissues as endophytes through parasitism, competition and antibiosis. However, some fungicides used in agriculture may adversely affect the growth of entomopathogenic fungi. Determination of the interactions of fungicides with biological control agents is of great importance for sustainable agricultural practices. The main objective of this study was to evaluate the compatibility of entomopathogenic fungi *Beauveria bassiana* and *Metarhizium bruneum* isolates with different fungicides in *invitro*. Within the scope of the study, it was aimed to determine the effects of the fungicides on the mycelial growth of the entomopathogenic fungi. Thus, it is aimed to contribute to environmental sustainability in agricultural production by reducing the fungicide use.

ENTOMOPATOJENİK FUNGUS *BEAUVERİA BASSİANA* (BALS.) VUILL.'İ VE *METARHİZİUM BRUNEUMU*'UN FARKLI FUNGİSİTLERLE *İN VİTRO* UYUMLULUĞU

ÖZET

Tarımda hastalık ve zararlı böcek popülasyonlarını kontrol altına almak amacıyla yaygın olarak kimyasal pestisitler kullanılmaktadır. Ancak, bu kimyasallar çevresel kirlilik, hedef dışı organizmaların zarar görmesi ve böceklerin direnç geliştirmesi gibi önemli sorunlara yol açmaktadır. Bu nedenle, biyolojik mücadele yöntemleri giderek daha fazla önem kazanmaktadır. Entomopatojen funguslar, özellikle *Beauveria bassiana* ve *Metarhizium bruneum*, zararlı böceklerle biyolojik mücadelede etkili ajanlar olarak öne çıkmaktadır. Bu funguslar, konukçu böcekleri enfekte ederek onların ölümüne neden olmakta ve popülasyonlarını doğal yollarla kontrol altına almaktadır. Entomopatojen funguslar, filosfer ve rizosferde ya da endofit olarak bitki dokuları içinde patojenlere karşı parazitizm, rekabet ve antibiyosis yoluyla antagonistik etki göstermektedirler. Bununla birlikte, tarımsal üretimde kullanılan bazı fungisitler, entomopatojenik fungusların gelişimini olumsuz etkileyebilir. Fungisitlerin biyolojik mücadele ajanlarıyla olan etkileşimlerinin belirlenmesi, sürdürülebilir tarım uygulamaları açısından büyük önem taşımaktadır. Bu çalışmanın temel amacı, entomopatojen fungus *Beauveria bassiana* ve *Metarhizium bruneum* izolatlarının farklı fungisitlerle *in vitro* ortamda uyumluluğunu değerlendirmektir. Çalışma kapsamında, kullanılan fungisitlerin fungusların misel gelişimi üzerindeki etkilerini belirlemek amaçlanmıştır. Böylece, fungusit kullanımını azaltarak tarımsal üretimde çevresel sürdürülebilirliğe katkı sağlanması amaçlanmaktadır.

1.GİRİŞ

Tarımda kimyasal yöntemlerle mücadele, zararlı organizmaların kontrol altına alınması amacıyla insektisit, fungisit, herbisit gibi pestisitlerin kullanılmasıdır. Bu yaklaşım, kısa sürede yüksek ürün elde etmeyi sağladığı için özellikle modern tarımda sıkça tercih edilmektedir. Ancak pestisitlerin bilinçsiz ve yoğun kullanımı; çevre kirliliğine, yararlı ve hedef dışı canlıların zarar görmesine, ürünlerde kalıntı oluşumuna ve zararlı organizmaların bu kimyasallara karşı direnç kazanmasına yol açmaktadır. Bu sorunlar, bütünleşik zararlı yönetimi ve biyolojik mücadele gibi çevre dostu ve sürdürülebilir yöntemlerin gerekliliğini daha da ön plana çıkarmıştır (Aktar, Sengupta, & Chowdhury, 2009; Pimentel, 2005).

Bitki hastalıklarına karşı biyolojik mücadele yöntemleri, 1920'li yıllarda dikkat çekmeye başlamıştır. Bu alandaki ilk önemli gelişmelerden biri, yeşil gübre uygulamalarıyla patates uyuzu hastalığı etmeni olan *Streptomyces scabies* (Thaxter) Lambert and Loria'nın kontrol altına alınması olmuştur (Özaktan, 2010).

Biyolojik mücadele genel bir ifade ile bitkilere zarar veren mikroorganizmaların faydalı olarak adlandırılan mikroorganizmalar tarafından doğrudan engellenmesi veya zarar seviyelerinin minimuma indirgenmesi olarak ifade edilmekte olup, son yıllarda üzerinde yoğun biçimde çalışılan çevre dostu bir mücadele yaklaşımıdır (Sülü ve ark., 2016).

Biyolojik mücadelede etkili olan doğal düşmanlar predatörler, parazitoidler ve patojenler olarak üç ana grupta toplanmıştır. Predatörler, zararlılar üzerinde doğrudan beslenerek etkili olan faydalı böceklerdir. Parazitoidler, yumurtalarını diğer bir böceğin ergin ya da ergin öncesi dönemleri dediğimiz yumurta, larva ve pupa gibi gelişme dönemleri içerisine bırakarak etkili olan genellikle arı grubundan faydalılardır. Patojenler ise diğer canlılarda olduğu gibi zararlılarda da hastalık yapan etmenlerdir. Hastalık yapan patojenler funguslar, bakteriler ve virüsler gibi etmenlerdir (Weeden et al., 2007). Bu kapsamda mikrobiyal mücadele etmenleri içerisinde yer alan entomopatojen funguslar (EPF) pek çok zararlının doğal yollarla baskı altına alınmasında etkili olan mikroorganizmalardır (Kılıçarslan, 2024). Bu organizmalar, doğrudan böceklerin dış kütikulasına tutunarak enfeksiyon başlatır ve konağın iç dokularında çoğalarak ölümüne neden olurlar. Bu özellikleri sayesinde, özellikle bitki özsuyu ile beslenen zararlılarla mücadelede etkili olmaktadırlar (Sevim ve ark., 2014).

Bakteri ve virüslerden farklı olarak, entomopatojen funguslar konaklarını yalnızca bağırsaktan değil, aynı zamanda solunum deliklerinden ve integumentin yüzeyinden de enfekte edebilmektedir. Bu özellik sayesinde konağı tarafından yenilmesine gerek yoktur ve konak aralığı çiğneme yapan böcekler ile sınırlı kalmamaktadır (Yıldız, 2015).

EPF'ler, sadece zararlı böceklerle mücadelede değil, aynı zamanda bitki gelişimini destekleme ve bitki hastalıklarına karşı direnç kazandırma gibi faydalı etkilere de sahiptir. Örneğin, *Beauveria bassiana* ve *Metarhizium robertsii* gibi türler, bitkilerle endofitik ilişkiler kurarak bitki büyümesini teşvik eder ve patojenlere karşı savunma mekanizmalarını aktive ederbilirler (Mertoğlu, 2022).

2. MATERYAL VE YÖNTEM

2.1 MATERYAL

Çalışmanın ana materyalini Tokat ilinde farklı tarımsal alanlardan izole edilmiş olan Tokat Gaziosmanpaşa Üniversitesi Bitki Koruma Bölümü Fitopatoloji laboratuvarında bulunan Entomopatojen Fungus stok kültüründen steril ortamda çoğaltılmış olan funguslar (Çizelge 2.1) ve %50 Captan Islanabilir Toz (WP), %80 Thiram Suda Islanabilir Toz (WP) oluşturmuştur.

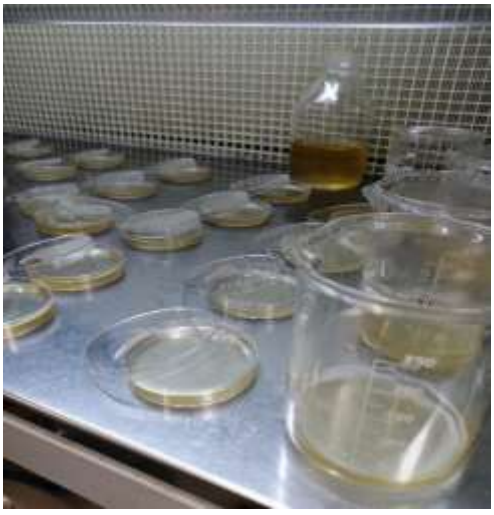
Çizelge 2.1 Çalışmada kullanılan Entomopatojen Funguslar

İZOLAT NUMARASI	BİLİMSEL ADI	KAYNAKLAR	ACCESSION NUMARASI
SİVAS-10	*Beauveria bassiana*	Şeker pancarı	MW07711
BEE2	*Beauveria bassiana*	Biber	MW07712
ORP-13	*Metarhizium brunneum*	Toprak	MW410195
ORP-18	*Metarhizium brunneum*	Toprak	MW410200

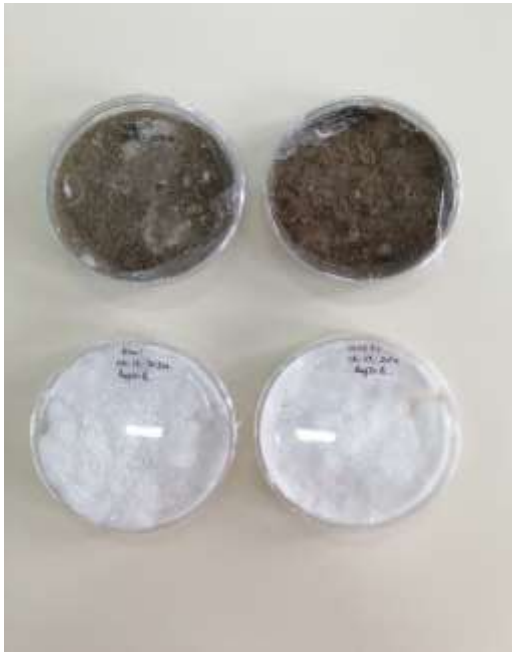
2.2 YÖNTEM

2.2.1 ENTOMOPATOJEN FUNGUS ÜRETİMİ

Steril ortamda hazırlanan Potato Dekstroz Agar (PDA) steril kabin içerisine 90 mm petrilere dökülmüş ve katılaşması beklenmiştir (Şekil 3.1). Besi yeri EPF aktarımına hazır hale geldiğinde fungus diskleri besi ortamı içeren petri kaplarına aktarılarak 25±2 °C de inkübasyona bırakılmıştır (Şekil 3.2).



Şekil 2.1 Steril kabinde PDA hazırlanması



Şekil 2.2 Entomopatojen Fungus

2.2.2 ENTOMOPATOJEN FUNGUSLARIN FUNGUSİTLERE REAKSİYON TESTLERİ

Öncelikle çalışmada kullanılan Thiram ve Captan etkili maddeli fungusitlerin önerilen dozunun 1/8, 1/16 ve 1/32'si otoklovda steril edilen PDA besi ortamları 45-50 ^{0}C'ye eklenerek manyetik karıştırıcıda homojen bir dağılım sağlanana kadar karıştırılmıştır. Daha sonra 60 mm'lik petri kaplarına 10 ml/petri olacak şekilde aktarılmıştır. Geliştirilen taze EPF izolatlarına ait kültürlerin aktif olarak gelişen (ORP13, ORP18, Sivas10 ve BBE2) uç kısımlarından alınan 5 mm'lik misel diskleri ilaçlı PDA ortamlarına aktarılmıştır. Deneme 4 tekerrürlü olacak şekilde kurulmuştur. Fungusit içermeyen PDA ortamları negatif kontrol olarak kullanılmıştır. Parafilm ile kapatılan petriler, 25±1 °C'de karanlıkta 14 gün boyunca (kontrolde fungus ortamı tamamen kaplayana kadar) inkübe edilmiştir. İnkübasyon süresi sonunda radial miselyum büyümeleri hesaplanmıştır.

3. BULGULAR ve TARTIŞMA

On dört günlük inkübasyon süresi sonunda, kontrol grubundaki misel gelişimi ortalama 15.55 mm olarak ölçülmüştür. Çalışmada kullanılan 1/8, 1/16 ve 1/32 oranlarındaki Thiram uygulamaları sonucunda elde edilen misel gelişimleri sırasıyla 15.03 mm, 15.18 mm ve 15.20 mm olarak belirlenmiş olup, bu değerler kontrol grubuyla karşılaştırıldığında istatistiksel olarak anlamlı bir fark gözlenmemiştir. Benzer şekilde, 1/8, 1/16 ve 1/32 oranlarındaki Kaptan

uygulamaları sonucunda misel gelişimleri sırasıyla 12.77 mm, 12.20 mm ve 12.45 mm olarak kaydedilmiş; ancak bu gruplar ile kontrol grubu arasında da anlamlı bir fark tespit edilmemiştir.

Çizelge 3.1 Thiram ve kaptanın farklı dozlarının Beauveria bassiana BBE2 izolatının miselyum gelişimi üzerine etkisi.

Uygulamalar	**Misel Uzunluğu (mm)**
BBE2 Kontrol	15.55bc
%6.25 Kaptan+BBE2 Kombinasyon	12.20a
%3.125 Kaptan+BBE2 Kombinasyon	12.45a
%12.5 Kaptan+BBE2 Kombinasyon	12.77ab
%12.5 Thiram+BBE2 Kombinasyon	15.03c
%6.25 Thiram+BBE2 Kombinasyon	15.18c
%3.125 Thiram+BBE2 Kombinasyon	15.20c

Şekil 3.1 BBE2 Misel Gelişimi

Çalışmada kullanılan bir diğer entomopatojen fungus olan Sivas 10 izolatında, kontrol grubunda misel gelişimi ortalama 14.96 mm olarak belirlenmiştir. Thiramın 1/8, 1/16 ve 1/32 dozlarında ise sırasıyla 14.80 mm, 14.39 mm ve 14.34 mm misel gelişimi ölçülmüştür. Diğer taraftan Kaptanın 1/8, 1/16 ve 1/32 dozlarında misel uzunluğu sırasıyla 14.04 mm, 14.27 mm ve 13.34 mm olmuştur. Bu sonuçlar, hem Thiram hem de Kaptan uygulamalarının, Sivas 10 izolatının misel gelişimi üzerinde önemli bir engelleyici etki göstermediğini ortaya koymuştur.

Çizelge 3.2 Thiram ve kaptanın farklı dozlarının Beauveria bassiana Sivas10 izolatının miselyum gelişimi üzerine etkisi.

Uygulamalar	**Misel Gelişimi**
Kontrol Sivas10	14.96a
%3.125 Kaptan	13.34a
%12.5 Kaptan	14.04a
%6.25Kaptan	14.27a
%3.125 Thiram	14.34a
%6.25 Thiram	14.39a
%12.5 Thiram	14.80a

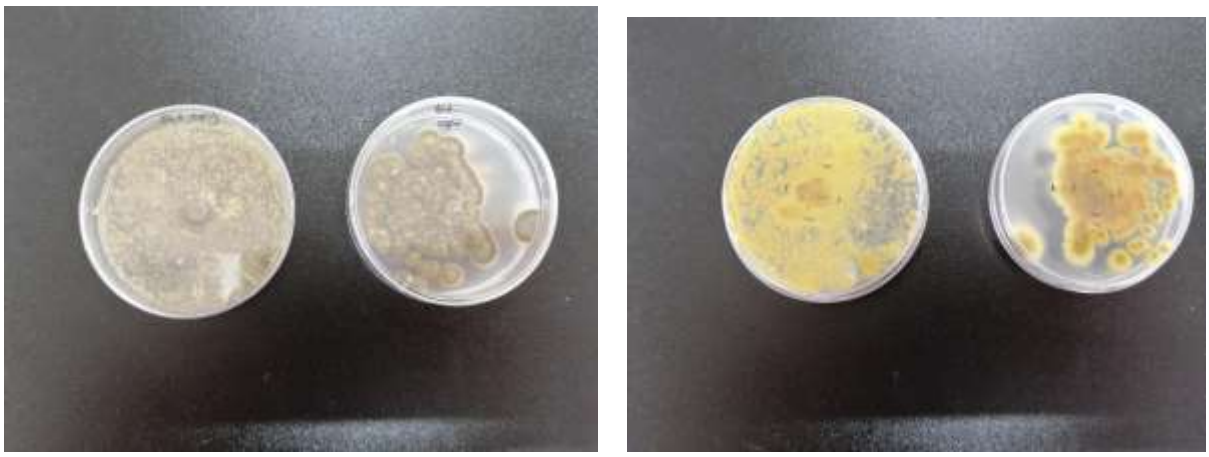
Şekil 3.2 Sivas 10 Misel Gelişimi

Mevcut çalışma bulgularına benzer şekilde Usha ve ark.,(2014) yapmış olduğu çalışmada *Beauveria bassiana*'nın B57 dışındaki izolatlarının uygulanan kükürt dozlarında (0.1X, 0.5X ve 1X) normal gelişim sergilediğini diğer taraftan bakır oksiklorür düşük dozlarında (0,1X) normal gelişirken, yüksek dozlarının (1X) toksik etki gösterdiği belirlenmiştir(1X tavsiye edilen doz, 0.5X tavsiye edilen dozun yarısı, 0,1X tavsiye edilen dozun 1/10).

Yapılan bir diğer çalışmada Fungusit olarak Mankozeb ve Entomopatojen Fungus *(Metarhizium anisopliae, Hirsutella sp., Beauveria bassiana, Paecilomyces sp.)*kullanılmıştır.Çalışmada kullanılan fungusit dozları; önerilen dozun 0.25 katı, 1 katı, 2 katı ve kontrol grubu olarak belirlenmiştir. Çalışmanın sonucunda Mankozeb fungisiti tüm Entomopatojen Fungus izolatlarının gelişimi üzerinde olumsuz bir etki gösterdiği belirtilmiştir.

Çizelge3.3 Thiram ve kaptanın farklı dozlarının Metarhizium brunneum ORP13 izolatının miselyum gelişimi üzerine etkisi.

Uygulamalar	**Misel Gelişimi**
%6.25 Thiram	14.77a
%3.125 Thiram	14.78a
%12.5 Thiram	14.93a
%12.5 Kaptan	15.00a
Kontrol Thiram	15.16a
%6.25 Kaptan	15.22a
%3.125 Kaptan	15.72a

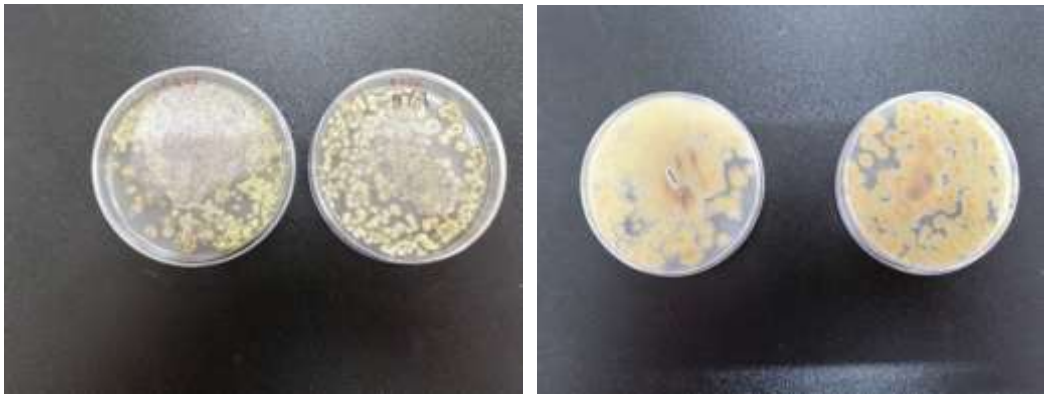


Şekil 3.3 ORP 13 Misel Gelişimi

Çalışmada, 14 günlük inkübasyon süresi sonunda kontrol grubunda ortalama misel gelişimi 15.16 mm olarak ölçülmüştür. Thiram uygulamasında 1/8, 1/16 ve 1/32 oranlarında sırasıyla 14.93 mm, 14.77 mm ve 14.78 mm misel gelişimi kaydedilmiştir.

Çizelge 3.4 Thiram ve kaptanın farklı dozlarının Metarhizium brunneum ORP18 izolatının miselyum gelişimi üzerine etkisi.

Uygulamalar	**Misel Gelişimi**
%3.125 Thiram	14.62
%6.25 Kaptan	14.63
%6.25 Thiram	14.75
Kontrol	14.91
%3.125 Kaptan	14.92
%12.5 Thiram	15.03
%12.5 Kaptan	15.33



Şekil 3.4 ORP 18 Misel Gelişimi

Diğer fungusit olan Kaptan uygulamalarında ise 1/8 oranında 15.00 mm, 1/16 oranında 15.22 mm ve 1/32 oranında 15.72 mm'lik misel gelişimleri gözlemlenmiştir.

Elde edilen veriler, her iki fungusitin de uygulanan oranlarına bağlı olarak misel gelişimini belirgin şekilde etkilemediğini, özellikle düşük konsantrasyonlarda misel gelişiminin kontrol grubuna yakın seyrettiğini ortaya koymaktadır.

On dört günlük inkübasyon süresi sonunda yapılan ölçümlere göre, kontrol grubunda misel gelişimi ortalama 14.91 mm olarak kaydedilmiştir. %12.5 Thiram + ORP18 uygulamasında misel gelişimi 15.03 mm, %12.5 Captan + ORP18 uygulamasında ise 15.33 mm olarak ölçülmüştür. %3.125 Thiram, %6.25 Captan ve %6.25 Thiram uygulamalarında elde edilen misel gelişimi sırasıyla 14.62 mm, 14.63 mm ve 14.75 mm olarak belirlenmiş olup, bu uygulamaların kontrol grubuna kıyasla anlamlı bir fark oluşturmadığı gözlemlenmiştir.

4.SONUÇ

Bu çalışmada, Captan %50 WP ve Thiram %80 WP fungisitlerinin önerilen dozlarının 1/8, 1/16 ve 1/32'lik konsantrasyonlarının entomopatojen fungus izolatlarının (Beauveria bassiana ve Metarhizium bruneum) misel gelişimleri üzerindeki etkileri değerlendirilmiştir. Yapılan in vitro analizler sonucunda, bu düşük dozların entomopatojen fungusların misel gelişimini anlamlı düzeyde baskılamadığı gözlemlenmiştir. Elde edilen bulgular, entomopatojenik fungusların, azaltılmış fungisit dozları ile birlikte uyumlu bir şekilde kullanılabileceğini göstermektedir. Bu durum, özellikle çevre dostu ve sürdürülebilir tarım uygulamaları kapsamında, toprak kaynaklı patojenlere karşı biyolojik mücadelede entegre yöntemlerin geliştirilmesi açısından umut vericidir. Sonuç olarak, entomopatojen funguslar, hem fungal hastalıklara karşı biyolojik kontrol ajanı olarak hem de kimyasal girdilerin azaltılmasına katkı sağlayarak toprak sağlığının korunmasında önemli bir rol üstlenebilir.

ABSTRACT

Accurate sampling and the establishment of pure cultures remain essential for the advanced study of fungal pathogens in plant protection, particularly for genera with complex ecological roles such as *Alternaria*. This genus comprises not only saprophytic and endophytic species but also numerous phytopathogens that affect a wide range of agricultural crops. In Solanaceae family plants—such as tomato (*Solanum lycopersicum*), potato (*Solanum tuberosum*), pepper (*Capsicum spp.*), eggplant (*Solanum melongena*), and tobacco (*Nicotiana tabacum*)—*Alternaria* spp. are predominantly recognized as necrotrophic pathogens responsible for diseases like early blight, brown spot, leaf and fruit lesions, and necrosis of various plant parts, including underground storage organs. These pathogens, which are mostly anamorphic members of the Ascomycota phylum, exhibit a wide geographical distribution and substantial host diversity. Despite similarities in symptom expression—such as concentric ring patterns on leaves and necrotic lesions—there is considerable variation among *Alternaria* species in terms of symptomatology and isolation efficiency. Different species may produce similar symptoms on different host plants, while a single species may induce distinct symptom patterns depending on the host and developmental stage. Critical analysis of the literature reveals that foliar symptoms are more frequently observed and characterized compared to other plant organs. These symptoms often vary subtly among hosts and developmental stages. In terms of isolation protocols, surface sterilization with sodium hypochlorite remains the most common practice, followed by culture on Potato Dextrose Agar (PDA). Optimal incubation temperatures typically range between 20–28 °C, with lighting conditions alternating between day/night cycles or continuous darkness, depending on the study design. Although PDA is the most commonly used medium, other media and environmental conditions are occasionally utilized, albeit less frequently.

Keywords: *Alternaria* spp., Solanaceae, early blight, fungal pathogens, isolation techniques, disease symptoms

1. INTRODUCTION

Fungal pathogens are prevalent across diverse agricultural environments including fields, greenhouses, storage facilities, and natural ecosystems. Given their high diversity and ecological complexity, reliable identification of these pathogens requires the establishment of pure cultures through precise isolation techniques. Accurate sampling, recognition of disease symptoms, and appropriate culture practices constitute the foundational steps for successful pathogen characterization (Narayanasamy, 2011).

Among fungal plant pathogens, species belonging to the genus *Alternaria* hold particular importance due to their wide host range and capacity to cause significant economic and ecological damage. These pathogens can induce diseases such as leaf blight, stem cankers, fruit rot, seed necrosis, and tuber decay in a variety of crop species (Goetz & Dugan, 2006; Adongo et al., 2015; Matić et al., 2020). Moreover, their ability to persist as saprophytes or endophytes complicates their detection and diagnosis (Thomma, 2003; DeMers, 2022).

The Solanaceae family—comprising key crops such as tomato (*Solanum lycopersicum*), potato (*S. tuberosum*), pepper (*Capsicum* spp.), eggplant (*S. melongena*), and tobacco (*Nicotiana tabacum*)—represents a major group affected by *Alternaria* spp. These crops occupy large global cultivation areas and contribute significantly to global food security (FAOSTAT, 2025). Consequently, understanding *Alternaria* infections in Solanaceae is of critical importance for plant protection efforts worldwide.

Infection by *Alternaria* spp. may remain latent, leading to unnoticed contamination of seeds and fruits. Such latent infections can result in damping-off in seedlings or post-harvest decay in fruits, highlighting the importance of sensitive and specific detection strategies. The variation in symptom expression among host plants—woody or herbaceous, tuberous or non-tuberous—demands careful symptom documentation and methodological standardization.

Traditional pathogen detection approaches—such as visual assessment, culturing, and isozyme analysis—remain useful, though modern techniques including polymerase chain reaction (PCR), immunoassays, stress-based detection, and biomarker-based diagnostics offer greater precision (Ray et al., 2017). This review critically examines studies related to the symptom expression and isolation methods of *Alternaria* spp. in solanaceous crops, aiming to outline key methodological insights and highlight areas requiring further refinement.

2. SYMPTOMS OF *ALTERNARIA* SPP. IN SOLANACEAE

Symptom observation is the initial and most crucial step in identifying plant diseases caused by fungal pathogens such as *Alternaria* spp. Foliar symptoms are the most commonly reported manifestations, often preceding infections in other plant parts such as stems, fruits, and roots. Across solanaceous crops, *Alternaria* species are known to induce a range of visible effects—primarily necrotic lesions exhibiting concentric ring patterns, chlorosis, and tissue collapse—although these may vary depending on host species, cultivar, environmental conditions, and pathogen strain.

In tomato (*Solanum lycopersicum*), *Alternaria alternata* has been widely documented as a causal agent of early blight. Typical symptoms begin with yellowing and browning of lower leaves, followed by necrosis extending to the petiole. Under high humidity, lesions often enlarge

and coalesce, forming characteristic concentric rings with dark sporulation, ultimately leading to premature defoliation and yield loss (Akhtar et al., 2004).

Tobacco (*Nicotiana tabacum*) plants have been reported to host both *A. alternata* and *A. longipes*. Comparative symptom analyses revealed that *A. alternata* typically produces larger brown lesions than *A. longipes*. These lesions are often sunken and appear more prominently on sunburned leaves, suggesting interaction between environmental stress and disease expression (Hou et al., 2016).

In *Solanum muricatum* (pepino), *A. alternata* causes elongated, elliptical or V-shaped lesions on foliage, often surrounded by a chlorotic halo and concentric zones. Postharvest fruit symptoms include small brown lesions that expand over time, developing grayish-white mycelial growth in lesion centers, indicative of secondary sporulation (Li et al., 2016; Chen et al., 2022).

Alternaria alternata has also been identified in wild Solanaceae species such as *Solanum rostratum* and *Datura stramonium*. In *S. rostratum*, foliar symptoms initiate as yellowish spots on the abaxial surface, which then develop into dark, necrotic patches under moist conditions. In severe cases, lesions coalesce and lead to complete leaf drop (Guo et al., 2019). In *D. stramonium*, *A. crassa* produces irregular necrotic lesions with concentric rings and chlorotic halos, affecting not only leaves but also petioles, stems, and veins (Bozoğlu et al., 2022).

Potato (*Solanum tuberosum*) is affected by both *A. solani* and *A. alternata*. In some cases, *A. alternata* causes small, brown-black lesions with or without halos, distributed across leaf surfaces. In contrast, *A. solani* infections are distinguished by larger, target-shaped spots exhibiting concentric rings, often beginning on lower leaves and progressing upwards, causing significant foliage damage (Lingwal et al., 2022; Ganie et al., 2013; Schmey et al., 2024).

These findings collectively underscore that *Alternaria* symptoms in Solanaceae exhibit both consistency and variability. While concentric necrotic lesions and chlorosis are commonly observed across hosts, lesion size, distribution, and secondary effects (such as defoliation) differ depending on the host-pathogen interaction. Environmental conditions such as humidity and temperature further modulate symptom severity and appearance, necessitating standardized observational protocols for effective diagnosis and comparison among studies.

3. ISOLATION METHODS OF *ALTERNARIA* SPP. IN SOLANACEAE

Effective isolation of *Alternaria* species from symptomatic solanaceous tissues is fundamental for accurate pathogen identification, pathogenicity assays, and further molecular or morphological analyses. Although the general workflow involves surface sterilization of diseased tissues, culturing on nutrient-rich media, and incubation under defined environmental conditions, significant methodological variations exist among studies.

3.1. Sample Selection and Surface Sterilization:

Diseased plant tissues—commonly leaves, stems, fruits, and occasionally flowers or tubers—are excised at the lesion margins to maximize the chance of recovering viable fungal material. Surface sterilization is typically performed using sodium hypochlorite (ranging from 0.1% to

5%) or ethanol (70–75%) for periods between 30 seconds and 3 minutes, followed by thorough rinsing with sterile distilled water to remove chemical residues (Martinko et al., 2022; Guo et al., 2019; Chen et al., 2022). The choice of sterilizing agent and exposure duration depends on the tissue type and sensitivity to chemical damage.

3.2. Culturing Media and Conditions:

Potato Dextrose Agar (PDA) is the most frequently used medium for initial fungal growth due to its richness and compatibility with sporulation. However, alternative or supplementary media such as Potato Carrot Agar (PCA), Potato Sucrose Agar (PSA), and V8 juice agar have also been employed to enhance sporulation or conidial morphology (Bessadat et al., 2020; Nasehi et al., 2014). Some studies further transfer initial colonies to host extract media to preserve virulence or mimic in planta conditions.

3.3. Incubation Parameters:

Optimal incubation conditions vary, but most studies report growth at 25–28°C under a 12–16 hour photoperiod (white light) or complete darkness, depending on the intended sporulation or mycelial expansion. For recalcitrant isolates that fail to sporulate readily, exposure to direct sunlight, mechanical wounding, or nutrient stress has been reported to enhance sporulation (Bessadat et al., 2017).

3.4. Single-Spore or Pure Culture Isolation:

To obtain genetically uniform isolates, some protocols emphasize single-spore isolation using a stereomicroscope, particularly when morphological or molecular studies are intended. This step minimizes contamination and genetic variation, which may otherwise confound downstream analyses (Nasehi et al., 2014).

3.5. Host-Specific Approaches:

The type of tissue and host plant often dictate protocol modifications. For instance:

- In *Capsicum annuum*, *A. capsicicola* was isolated using single conidium extraction directly from necrotic lesions.
- In *S. muricatum*, fruit tissues required dual sterilization with ethanol and hypochlorite due to higher microbial load.
- In potatoes, lesion margins were first disinfected with ethanol before transfer to modified PDA for incubation under continuous light (Tymon et al., 2016; Lingwal et al., 2022).

3.6. Antibiotic Supplementation:

To reduce bacterial contamination, some protocols incorporate antibiotics such as streptomycin or chloramphenicol into water agar or PDA media during the initial stages of isolation, particularly from highly decomposed or field-collected materials (Park et al., 2024).

Overall, while sodium hypochlorite and PDA remain the gold standards for surface sterilization and culturing respectively, variations in sterilization intensity, media supplementation, and environmental parameters are often tailored to the host species and study objectives. Notably, standardization and molecular confirmation of isolates (e.g., ITS or TEF1-α sequencing) are increasingly necessary to resolve taxonomic ambiguities within the *Alternaria* genus.

4. CONCLUSION AND FUTURE PERSPECTIVE

A critical examination of current literature on *Alternaria* spp. affecting solanaceous crops reveals both commonalities and inconsistencies in symptom expression and pathogen isolation methods. Leaf symptoms—characterized by concentric necrotic lesions, chlorosis, and defoliation—are consistently the most documented, while symptoms on fruits, stems, or roots are reported less frequently and with greater variability. These differences are likely influenced by host species, plant developmental stages, and environmental factors such as humidity and temperature.

In terms of isolation, the majority of protocols employ sodium hypochlorite for surface sterilization and culture the pathogen on nutrient-rich media such as PDA or PCA under moderate temperatures (20–28 °C). However, despite their widespread use, these methods are often adapted to specific host-pathogen systems without standardization. Such variability can hinder reproducibility and inter-study comparisons. Additionally, while traditional methods based on morphology and sporulation remain valuable, the incorporation of molecular tools—such as ITS or TEF1-α sequencing—is becoming increasingly critical for accurate species identification within the *Alternaria* genus.

Future research should aim to:

- Expand symptom characterization beyond foliar tissues to include underground storage organs, reproductive structures, and postharvest conditions.
- Develop standardized isolation protocols that balance effectiveness with reproducibility across host systems.
- Integrate molecular diagnostic techniques into routine isolation pipelines to resolve taxonomic ambiguities.
- Investigate the influence of host physiology, pathogen diversity, and environmental stressors on symptom variability and pathogen aggressiveness.
- Explore the potential of advanced culture-independent techniques, such as metagenomics and environmental DNA (eDNA) analyses, for detecting *Alternaria* spp. in complex plant-microbe communities.

Such integrative approaches will not only improve disease diagnostics and pathogen surveillance in solanaceous crops but also contribute to more sustainable plant protection strategies.

ABSTRACT

The transformation of rural development policies in Türkiye represents an evolutionary shift from traditional modernization approaches to digital integration. This study explores the historical progression and paradigm shifts in Türkiye's rural development policies, emphasizing the transition from conventional modernization strategies to contemporary digital solutions. A mixed-method approach, incorporating historical document analysis and policy evaluation, is employed to examine this transformation. The study categorizes the evolution into three key phases: the revitalization and modernization period (1923-1980), the structural adjustment period (1980-2000), and the digital transformation period (2000-present). Findings indicate that Türkiye's rural development policies have undergone significant changes in response to both global trends and local needs. The initial phase focused on state-led industrialization and agricultural mechanization, aiming to modernize rural structures through technological advancements and infrastructure improvements. The structural adjustment period marked a transition toward market-oriented policies, fostering rural entrepreneurship and private sector involvement. In the contemporary phase, digital transformation has taken center stage, exemplified by initiatives such as the Digital Agriculture Market, smart village applications, and e-agriculture platforms. This digitalization process has introduced new dimensions to rural development, including precision agriculture, digital literacy programs, and ICT-based rural services. However, the digital divide between urban and rural areas remains a significant challenge. Considering the ongoing difficulties in accessing essential resources in rural areas compared to urban regions, it is evident that the full realization of these transformations in rural Türkiye will require time. While digitalization is expected to enhance productivity in rural areas, the extent to which the rural population can adapt to this transition remains an open question. This study is significant in shedding light on the transformation of rural development policies in Türkiye.

Keywords: Rural Development, Digital Transformation, Development Paradigm, Türkiye

1. INTRODUCTION

Rural development policy plays a central role in Türkiye's economic and social development. Historically, Türkiye has focused on the economic development and social welfare of rural areas and has developed various strategies in this context. The modernization process that began in the 1950s led to various reforms aimed at increasing agricultural productivity and improving living standards in rural areas. However, these processes often followed a top-down approach that ignored local dynamics and community needs. As a result, social and economic inequalities in rural areas deepened and the migration of the rural population to the cities increased. From the 1950s onwards, a modernization policy was implemented in Türkiye to promote rural development. In this process, efforts were made to increase agricultural productivity and the loans provided to farmers by Ziraat Bank and agricultural credit cooperatives played an important role in this modernization process. The loans extended to farmers by Ziraat Bank and the institutions it financed increased significantly after 1950. This increase in agricultural loans served to increase production in economic terms (İnci, 2022). Although practices such as the Land Acquisition Law for Farmers enacted in 1947 and the Land and Agrarian Reform Law enacted in 1973 aimed to increase agricultural productivity and capital accumulation and to benefit from support services to a greater extent (Andersen, 1971), they failed to achieve the expected effects because they did not take into account the social structure of local communities (Börtücene, 1978). In the course of the modernization process that began in the 1950s with the mechanization of agriculture, especially through Marshall Aid after the Second World War, there was a considerable expansion of agricultural production areas, and the volume of agricultural production increased accordingly. At the same time, the number of stores and services in the mechanized regions increased and contacts with the outside world continued to develop (Aktan, 1954; Kazgan, 1966). However, mechanization also had a significant social and demographic impact on the countryside. Contact between peasants and urbanites increased thanks to tractors. Peasants became better informed about the opportunities offered by the city. Farmers and workers who had lost their land and jobs due to mechanization began to migrate to the cities, which they believed would offer them a better life (Tütengil, 1969). This situation has shown the need to restructure policies in terms of both rural and urban sociology and development.

Today, digitalization, which is one of the current issues for rural areas, has become an important element in the transformation of rural development policies. The potential of digital technologies to increase agricultural productivity (Bi et al., 2022) has a positive impact on the quality of life in rural areas. Mobile applications and data analysis for farmers enable them to optimize their production processes. Digital agricultural applications contribute to environmental sustainability by promoting the adoption of sustainable agriculture (Beck et al., 2020).

Digitalization also holds significant potential for greater social and economic participation of rural communities. Local people can help to make rural development processes more participatory by identifying their problems and developing solutions using digital tools. It is expected that this situation will contribute to strengthening social capital and increasing social solidarity. The widespread use of digital technology is changing the way interpersonal interactions take place and social relationships are built. It promotes the formation of online communities and provides new opportunities for shaping collective identity and consciousness

(Zhao and Wang, 2023). In addition, the flow of information through digital platforms has the potential to increase the resilience of rural communities. LaRose et al. (2007) state that the problem of physical distance and inadequate provision of services in rural areas can be largely solved by promoting digital connectivity instead of many of these services. However, remote rural areas in particular lack the necessary digital connectivity, which increases the risk of rural areas falling further behind in terms of accessibility to services. In Türkiye, the integration of rural development policy with digitalization is an innovative approach that is compatible with the Sustainable Development Goals in both economic and social terms. This change enables local communities to discover their potential and achieve sustainable development goals. In addition, the opportunities offered by digitalization increase economic diversity by promoting social innovation and entrepreneurship in rural areas. In this context, it should be noted that digitalization has found its way into rural development policy documents (TOB, 2019; TOB, 2021, TOB, 2025). With this study, rural development in Türkiye. This study was an assessment of the transition from modernization to digitalization in rural development policy in Türkiye.

2. MATERIAL AND METHODS

This study was conducted by adopting a qualitative research approach in order to address the change in rural development processes in Turkey from a historical perspective. Qualitative research provides a methodological framework that allows for in-depth analyses aimed at making sense of social phenomena (Yıldırım and Şimşek, 2018). In this context, the main purpose of the study is to understand and interpret the transformation of rural development policies in Turkey over time and the effects of digitalization at this point.

The data used in the study is based on secondary sources. In this context, relevant academic literature, reports published by public institutions (especially the Ministry of Agriculture and Forestry, TÜİK and Development Agencies), strategy documents, legal regulations, project outputs and statistical data were examined. In addition, digital transformation-themed rural development projects, national development plans and technology-focused applications for rural regions were also included in the analysis.

A purposeful sampling method was adopted in the data collection process and sources directly related to the concept of digitalization in the context of rural development were selected. Descriptive analysis technique was used in the analysis of the data. The information obtained through this technique was classified under thematic headings, and the structural and technological changes that occurred in rural development over time were presented in a descriptive manner. With this method, how rural development in Turkey interacted with the digitalization process, the breaking points of this interaction and the transformation it created at the policy level were evaluated from a holistic perspective.

3. RURAL AREA IN TÜRKİYE

In order to talk about rural development policy, it is necessary to define rural areas first. In Türkiye, there have been different approaches to the definition of rural areas since the time of the Republic. Türkiye experienced a problem-free period in terms of defining rural areas from the beginning of the planned period until the 2000s. During this period, definitions were made

according to threshold values based on administrative boundaries of settlements and population sizes. The last threshold was set at 20 thousand in all National Rural Development Strategies published since 2007 (Yardımcı, 2023). However, in the 2000s, the functionality of this definition was eroded due to rapid population growth in Türkiye, internal migration, overcrowded settlements and unplanned urbanization. The necessity of conducting studies within this framework began to be mentioned in high-level policy documents, especially in development plans. However, before a new definition could be made, regulations were made in 2012 with Law No. 6360, Law No. 5216 on Metropolitan Municipality, Law No. 5302 on Provincial Special Administration and Law No. 5393 on Municipality, which fundamentally changed the local administration system in urban and rural areas. As a result of these changes, the population threshold of 20,000 inhabitants and the calculation method referred to in rural policy documents have been significantly affected. The number of provinces with metropolitan municipalities in Türkiye increased to 30, and provincial special administrations, town and village community administrations were closed in the provinces with metropolitan municipalities. A total of 1,582 town municipalities and 16,082 villages, which constitute the core of rural policy in the 30 affected provinces, were transformed into neighborhoods (Yardımcı, 2023). This situation led to a confusion between the neighborhoods that already existed in urban settlement areas and the settlements that were converted from towns and villages to neighborhoods. Soon, in the provinces with metropolitan communities, the term "rural neighborhood" began to be used to distinguish villages and towns that were transformed into neighborhoods from neighborhoods in urban areas (Yardımcı, 2017, 2024). Over time, the concept of rural neighborhood has been incorporated into legislation (Resmi Gazete, 2020a; Resmi Gazete, 2020b). As a result of the changes in the local administrative system, the calculation method became dysfunctional, and the rural population ratio, which was 27.6 percent in 2012 according to the 20,000 population threshold, decreased to 13.3 percent in 2013 and 10.8 in 2022; according to the village-town definition, the village population ratio, which was 22.7 percent in 2012, decreased to 8.7 percent in 2013 and 6.7 percent in 2022 (Figure 1). "There has been a statistical transfer from the rural population to the urban population that does not reflect reality; due to the change in the administrative affiliation of villages and towns, the data calculation method no longer provides reliable results" (Doğan and Yardımcı, 2019).

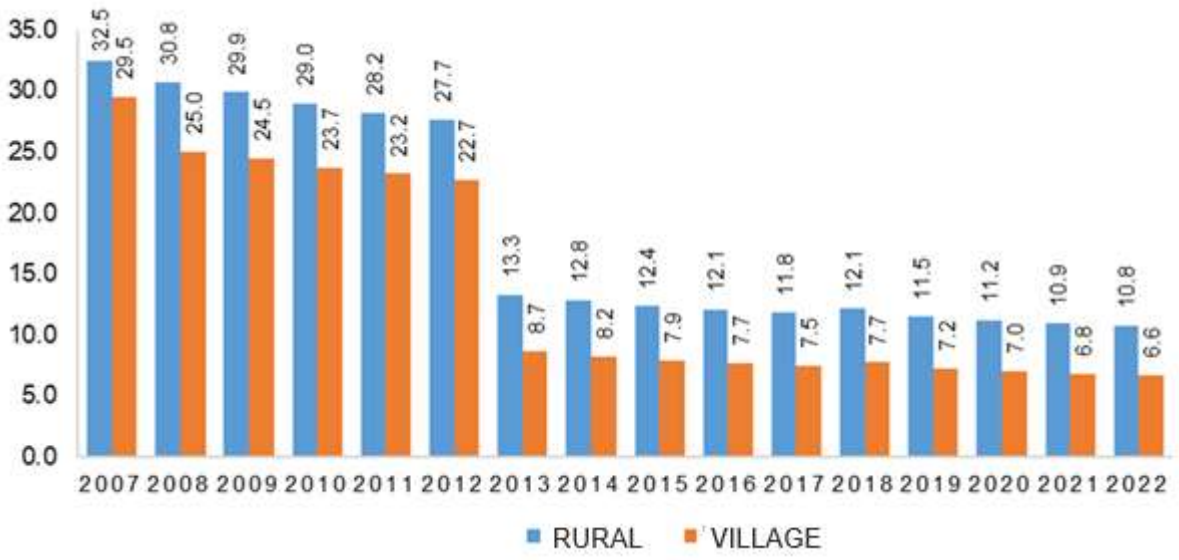

Figure 1. Rural and Village Population Rates According to Urban-Rural and Village-City Definitions (%) (Yardımcı, 2023).

In order to obtain accurate and up-to-date information at the national level and to implement a data-driven rural policy, as well as to harmonize with the EU and various definitions of rural areas of international organizations such as the OECD, it was deemed necessary to update the definition of rural areas in Türkiye. This issue, which was first raised in the 2006 Development Program (DPT, 2005), was also addressed in the National Rural Development Strategy-1 (UKKS-1) (2007-2013) (DPT, 2008) and the 2007 and 2008 Development Programs (DPT, 2006; DPT, 2007). The emphasis on the need to update the definition of rural areas was reinforced in the development plans and other rural development policy documents published during the period of the 2012 Act (Resmi Gazete, 2012) and the 10th Development Plan (2014-2018) (KB, 2014). With the 11th Development Plan (SBB, 2019) prepared by the Presidency for the years 2019-2023, Türkish Statistical Institute (TÜİK) was given the responsibility to revise the urban-rural definitions in a way that takes into account both national and international needs. The new rural definition study, which will reflect the real situation and enable international comparisons, was included in the Official Statistics Program in 2014 (KAGM, 2024). In this context, with the introduction of the Spatial Address Registration System (MAKS), which is the responsibility of the Ministry of Interior, a classification that more accurately reflects the actual urban-rural structure was made by TÜİK in order to produce statistics. In this new classification, which was created in the distinction of “dense urban, medium dense urban and rural”, the "Degree of Urbanization (DEGURBA)" developed by the European Statistical Office was taken as a basis and MAKS and the Address-Based Population Registration System (ADNKS) were used as data sources. In this context, statistics distinguishing between urban and rural areas were compiled again for the first time from 2022 (TÜİK, 2023a). Accordingly, the population distribution in Türkiye according to the new definition is shown in Figure 2. According to the new definition of TÜİK (2023a), the share of rural population in the total population is 17.26%, while according to the data of TÜİK (2023b)

ADNKS 2022, the share of urban and village population in the total population is 6.64%. It can be said that a more accurate approach to determining the rural population has been proposed with the new system.

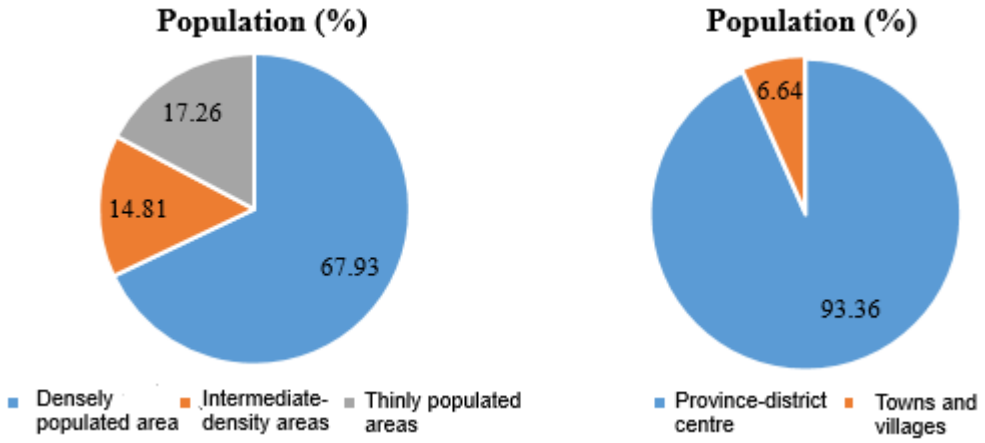

Figure 2. Distribution of population by urban-rural and province-district centres, town and villages classifications (2022) (TÜİK, 2023a)

According to TÜİK's calculations, the dense urban population, which constitutes 67.9 percent of the total population, lives in settlements that constitute only 1.6 percent of the total area; the rural population, which constitutes 17.3 percent of the total population, lives in settlements that constitute 93.5 percent of the total area; and the medium-density urban population, which constitutes 14.8 percent of the total population, lives in settlements that constitute 4.9 percent of the total area (Figure 3).

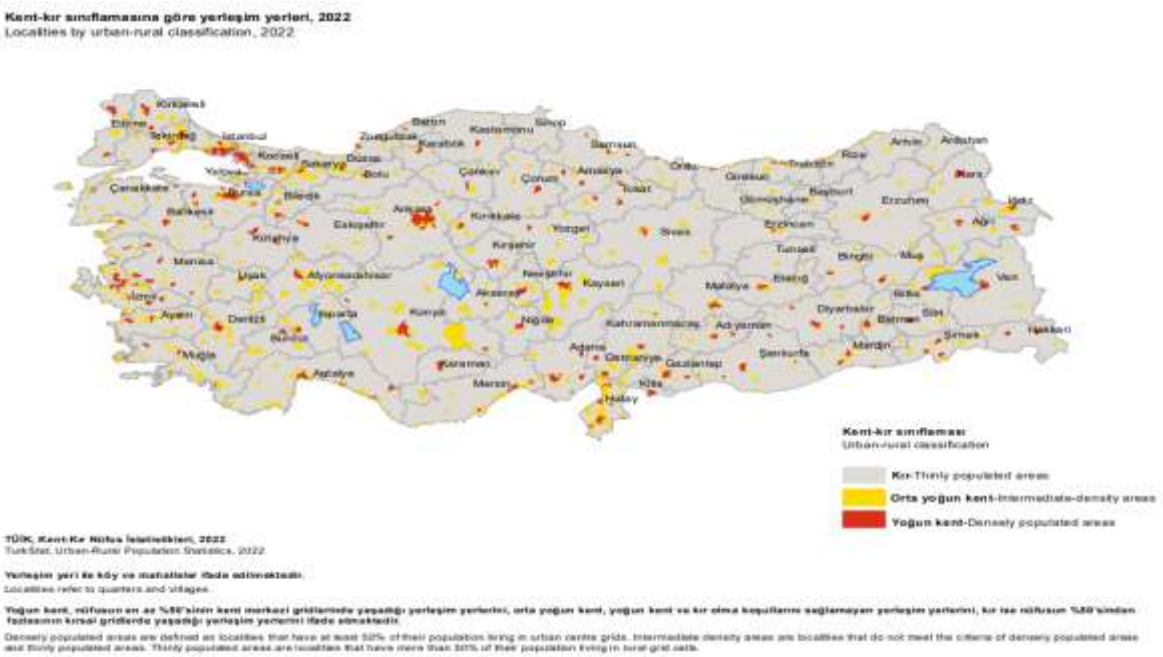

Figure 3. Distribution of Urban-Rural Population by Surface Area in Türkiye (TÜİK, 2023a)

4. TRANSFORMATIONS IN RURAL DEVELOPMENT POLICY OF TÜRKİYE

It is known that rural development efforts in Türkiye started after the proclamation of the Republic in 1923. Immediately after the foundation of the Republic, development efforts in agriculture and rural areas emerged throughout the country. On the other hand, since a large part of the population lives in rural areas and the economy is based on agriculture, it is possible to say that the importance attributed to rural areas has increased. From the proclamation of the Republic until the transition to the planned period in 1963, development efforts in Türkiye were generally made and put into practice in the field of industry. In these periods, when the agriculture-based industry was prioritised and the logic that developments in rural areas and agriculture would follow the processing of raw materials into high value-added goods, agricultural and rural development policies were intertwined and rural development was considered under the umbrella of agricultural development.

In the post-Republican period, the village has an important place in the realisation of Atatürk's ideas on the new Türkiye. The greatest contribution to increasing production through the correct and efficient use of resources comes from the villages. The phrase *"The Peasant is the Master of the Nation"* is also important in terms of showing the value Atatürk attached to the village and the peasant. Atatürk's statement to İsmet İnönü in one of the conversations after a dinner in Çankaya that *"...Development starts from the village, first of all, we have to develop the peasants of our Anatolia; we have to start development from the villages"* is also important in terms of revealing Atatürk's village vision in the agriculture and rural development move in Türkiye. With this perspective, the Village Law No. 442 was enacted on 18 March 1924. The Village Law, which is still in force, is one of the first milestones of the rural development move in Türkiye with its provisions on many issues such as duties related to the village, job

descriptions, legal administrative functioning, and the work to be done by the villagers. The ***"Ideal Republican Village Project"***, which was put forward by experts and with the great contributions of Atatürk in 1937 in the rural development move that started with the village development move in the Republican period, is an important village project of the time. Atatürk supported the implementation of the project, but with his early death, the project could not become widespread.

Increasing industrialisation in Türkiye triggered rural-urban migration in the 1950s (Güreşçi 2010). This situation weakened production in villages. At this point, the aim of village-oriented projects and studies is to transform the village into the basis of education, culture and industry, and to ensure that the villagers become educated, social, cultured, productive people who use modern methods in agriculture and animal husbandry. At the same time, another aim is to remove the differences between rural and urban areas by increasing income and welfare and to make rural settlements more livable (Doğanay 1993, Çolakoğlu 2007). Villages are settlements where national culture, customs and traditions, which should be preserved and made the basis of society, are fully experienced and protected (Dicle 2012). For this reason, another important project put forward before the planned period was the **"Village Institutes"** model. This model, which brought groundbreaking developments in education and training in its period, provided important services in the formation of human capital, which was the most important deficiency of rural development. The Village Institutes, which were the enlightenment and development project of Anatolia, were accepted in 1940 and terminated in 1954.

With the transition of the Turkish economy to the planned period after 1963, a rapid increase in the level of development has been observed with the implementation of the determined plans. Since 1963, a total of twelve development plans have been put into practice. When Türkiye's rural development is analysed within the framework of development plans, it can be said that Türkiye's approaches to rural development have been shaped by the paradigmatic changes in the field of rural development in the world. The rural development approaches, which date back to the beginning of the 19th century, have differentiated over time with the impact of technological and socio-economic factors and the changes that emerged. Popular ideas and terminologies that came to the fore during this differentiation, which can be characterised by **"modernization"** in the 1960s, **"state interventions"** in the 1970s, **"free market-liberilisation"** in the 1980s, "**participation and empowerment"** in the 1990s, **"integration with the environment-green development"** in the 2000s and **"integration with technology-Rural 3.0"** today, have also been remarkable. However, the changes in rural areas in Türkiye can be categorised as modernisation between 1923-1980, structural changes between 1980-2000, and technological adaptation and digitalisation after 2000.

It is understood that the five-year development plans put forward since the beginning of the planned development period contain a traditional regional development approach. The common concept in all the plans put forward in the planned period has been determined as objectives and tools. The main objective of these five-year development plans is to eliminate the imbalance between regions and to ensure balanced regional development. In the first five-year development plan, the structures in the rural areas were negatively affected by the fact that they were scattered and small. For the first time, **"Model Village"** project was implemented. In the third five-year development plan, due to the dispersed structure of the villages, services such as electricity, roads and water to be brought from the centre could not be provided on time and

there were not enough resources, the **"Central Village"** approach was adopted, which aims to determine one of the villages close to each other as a service unit and to provide services to all villages forming the centre established from here. In the fourth five-year development plan, settlements with the characteristics of central villages were identified and efforts were made to provide services to all villages from the identified centre. However, the desired success could not be achieved due to the dispersed and large number of villages. In this plan, the central village approach was replaced by the **"Village City"** model. In the sixth five-year development plan, for the first time, the practices of other countries started to be taken as an example in the theory and practice of regional development policies. It can be said that the first signs of transformation in regional development policies started to be seen in the 1990s. In the seventh five-year development plan, for the first time in Türkiye, the concepts of "regional planning" and "regional development" were replaced by the concept of "sustainable development". In the eighth five-year development plan, the regionalism approach found a wide application area. Administrative functioning in rural areas could not be brought to the desired level and could not fulfil the expectations. Within the framework of sustainable development approach, it is aimed to increase the income level of people living in rural areas by increasing employment and production.

In the Ninth Development Plan, it is planned that Türkiye, which is growing steadily within the framework of the EU membership processes in which our country is going through, has a development that has international competitiveness, provides fair income distribution and has realised all structural arrangements. With this Plan, it can be said that Türkiye has entered into a planned period in the field of rural development. Both the limitation of agricultural supports that distort competition and the market as required by the World Trade Organisation Agreement on Agriculture in the international arena and Türkiye's efforts to harmonise with the European Union (EU) have made the supports for rural development both more visible and more felt in the 2000s. Increasing disparities between rural and urban areas, efforts to improve the welfare of those living in rural areas and the process of harmonisation with the EU are among the most important reasons for Türkiye's transition to the planned rural development period since 2007. Since 2002, Türkiye, which became a candidate country after the Helsinki Summit in 1999, has been benefiting from EU funds for accession to the Union. The EU provides assistance to countries in the process of preparing for membership through pre-accession funds to support their political, institutional, social and economic reforms towards membership and to help them achieve Union standards. These funds, which were initially provided through different Union programmes and financial instruments, were gathered under a single instrument and legal framework called Instrument for Pre-Accession Assistance (IPA) in 2007. IPA funds are planned to cover 7-year periods in accordance with the European Union budget period. In this framework, IPA I, the first IPA implementation, was implemented during the budget period of the European Union covering the years 2007-2013 (IPA, n.d.).

In terms of rural development, Türkiye utilises the Rural Development (RD) instrument of IPA funds. In this context, National Rural Development Strategy (UKKS) documents have been prepared in Türkiye and for the first time, Türkiye has stepped into the planned period of rural development. UKKS-I (2007-2013), UKKS-II (2014-2020), UKKS-III (2021-2023) and most recently UKKS-IV (2024-2028) were prepared and put into effect (Resmi Gazete, 2006; Resmi Gazete, 2015; TOB, 2021, TOB, 2025). At the same time, the reports of the Special Expertise

Commission on Rural Development (ÖİK) prepared within the framework of the Development Plans, which are prepared and activated every five years, are also important in terms of both revealing the current situation and determining the five-year development plan in Türkiye. The most recently completed XIth Development Plan (2019-2023) and the Rural Development ÖİK report prepared within this framework have now been replaced by the XIIth Development Plan (2024-2028) and the Rural Development ÖİK report. When the UKKS documents are analysed in general, the strategic objectives of these documents are presented in Table 1. When the table is examined, it can be seen that the most recent strategy document has a separate heading for technological transformation and digitalisation.

Table 1. Türkiye's National Rural Development Strategies by Periods

UKKS I (2007-2013)	UKKS II (2014-2020)	UKKS III (2021-2023)	UKKS IV (2024-2028)
Strategic Objective 1: Developing the Economy and Increasing Job Opportunities	**Strategic Objective 1:** Developing Rural Economy and Increasing Employment Opportunities,	**Strategic Objective 1:** Developing Rural Economy and Increasing Employment Opportunities	**Strategic Objective 1:** Ensuring Economic Sustainability of Agricultural Production and Long-Term Food Security
Strategic Objective 2: Improving Human Resources, Level of Cooperation and Local Development Capacity	**Strategic Objective 2:** Improvement of Rural Environment and Ensuring Sustainability of Natural Resources,	**Strategic Objective 2:** Improvement of Rural Environment and Ensuring Sustainability of Natural Resources	**Strategic Objective 2:** Developing and Managing Sustainable Use of Natural Resources against Climate and Environmental Change
Strategic Objective 3: Improving Rural Physical Infrastructure Services and Increasing the Quality of Life	**Strategic Objective 3:** Improving the Social and Physical Infrastructure of Rural Settlements,	**Strategic Objective 3:** Improvement of Social and Physical Infrastructure of Rural Settlements	**Strategic Objective 3:** Mitigating the Effects of Natural Disasters on Rural Development
Strategic Objective 4: Protection and Development of Rural Environment	**Strategic Objective 4:** Improving the Human Capital of Rural Communities and Reducing Poverty,	**Strategic Objective 4:** Developing Human and Social Capital of Rural Communities and Reducing Poverty	**Strategic Objective 4:** Dissemination of Technological Transformation and Digitalisation
	Strategic Objective 5: Improving Institutional Capacity for Local Development	**Strategic Objective 5:** Improving Institutional Capacity for Local and Rural Development	**Strategic Objective 5:** Ensuring Rural Livability, Improving Physical Infrastructure and Social Capital
			Strategic Objective 6: Increasing the Effectiveness of Public Institutions for the Development of New Rural Development Models in Local Areas

Sources: Resmi Gazete, 2006; Resmi Gazete, 2015; TOB, 2021a, TOB, 2025

Considering both UKKS documents and Development Plans and related Special Expertise Commission (ÖİK) Reports, the change in rural development strategies in Türkiye can be analysed under the following headings. These are;

Development of social and human capital; Conceptually, the concept of social capital, which constitutes the fourth component along with physical, financial and human capital, constitutes a structure that is more difficult to explain and measure than other capital concepts. However, its impact on social structure and its relationship with development theory is one of the issues that increase the importance of social capital. Studies on social capital, which is so important for development, are important in terms of revealing the role of different variables in terms of community development. Rural development has an important place in the concept of development. In rural areas, it is important to investigate the changes in social capital in today's society 5.0. In the National Rural Development Strategy (UKKS) (2021-2023), the main objective of Türkiye's rural development policy is "*increasing the production capacity of producer associations and family enterprises and the employability of rural labour force, improving the quality of life, reducing poverty, increasing the welfare level of the rural community by providing regular and sufficient income opportunities, ensuring the retention of the population in rural areas, developing and sustaining it with a sustainable rural development approach*". One of the sub-objectives taken into account in achieving these objectives is stated as "*Strengthening human and social capital and activating social policy practices within the scope of poverty reduction*". The addition of the statement on the development of social capital as well as human capital with the UKKS III shows that the targets for social and societal structure are prioritised in Türkiye's rural development strategies. In this context, it can be said that social policies for the rural population have gained key importance in the improvement of Türkiye's basic development indicators. Studies on this subject also indicate that there is significant weakening in norms, social networks and trust, which are the components of social capital in rural areas (Kan et al. 2021; Kan and Özdemir, 2022). This situation shows that the problems in social capital in rural society are gradually increasing, which negatively affects the success of rural development efforts.

Resilient society to climate change, natural disasters and crises; "SDG 11 - Sustainable Cities and Communities" and "SDG 13 - Climate Action", two of the United Nations Sustainable Development Goals, aim both to realise the capacity to adapt to climate change and to support positive economic, social and environmental relations between rural and urban areas and to create a resilient society, including disasters, especially for poor and vulnerable groups. In order to realise these objectives, it is essential to increase the resilience of rural dwellers to climate change and the disasters such as drought, flood, fire, etc. and natural disasters such as earthquakes, and to create a sustainable rural society that is resilient to the effects of economic crises caused by conflicts such as war, embargo, economic sanctions, etc. in national and international arena. The basic approach in the Eleventh Development Plan (SBB, 2019), especially in the Eleventh Development Plan Rural Development Special Expertise Commission Report, is shaped within the framework of "Sustainable Society" (SBB, 2018). Climate change, which has made itself felt more and more in recent years, creates negative pressure on natural resources with its negative effects on rural areas, especially on livelihoods (especially agriculture), water resources due to drought, forests due to excessive heat and fires, and settlements due to floods caused by excessive rainfall. The high dependence of rural life on

natural resources and agriculture makes life more difficult in rural settlements. For this reason, people living in rural areas are among the communities most affected by disasters and crises. On 06 February and 20 February 2023, the earthquakes in Kahramanmaraş and Hatay caused severe damage to rural areas and the agricultural sector. It is stated that approximately 9.1 million people were affected by the earthquakes and 35% of these people were people living in rural areas, and the cost of the earthquakes in the agricultural sector was approximately 6.3 billion USD (FAO, 2023a). As a result of another study conducted in the earthquake region, it is stated that the construction of a society resistant to earthquakes and other natural disasters, especially in rural areas, is one of the most important things to be done. In this context, the Turkey Earthquake Response and Recovery Plan (ERRP) was developed in partnership with the Republic of Türkiye to address the devastating impact of the earthquakes that occurred in February 2023 on the agricultural and rural sectors. The ERRP's three result-oriented plans summarize the situation in rural areas in the earthquake zone. These are; "*Renewing agricultural food systems, including supply and value chains*", "*Revitalizing the agricultural labor market*", *"Strengthening rural communities for sustainable development*" (FAO, 2023b). In the light of these results, the Twelfth Development Plan under the title of rural development, policies and measures in Article 896.1. In Article 899, the protection of the environment and natural resources and increasing the adaptation capacity to climate change are mentioned (SBB, 2023).

The sustainability-based rural development approach integrated with the environment; Environmental issues, especially in relation to agriculture and rural development, have been consistently addressed in Turkish politics since the 1990s. Considering that both agricultural and rural development policies have been significantly shaped within the framework of EU harmonization strategies, approaches in this direction have also begun to gain priority in Türkiye with the significant strengthening of the environment and agriculture relationship in the EU Common Agricultural Policy in 2003. For this reason, rural development strategy documents, agricultural and agricultural forest council results and development plans particularly focus on the environment. In this context, Article 708.2 of the Eleventh Development Plan foresees increasing environmental support and incentives, and Article 899.1 of the Twelfth Development Plan foresees carrying out environmentally focused rural development projects and programs. Strategic objective 4 in UKKS I, and strategic objective 2 in UKKS II and UKKS III indicate an environment-focused rural development policy (Resmi Gazete, 2006; Resmi Gazete, 2015; TOB, 2021). The prioritization of the environment in strategy documents, the support of investments with the 201 measure "Agriculture-Environment Climate and Organic Agriculture" within the IPARD supports, and the inclusion of worm compost production investments in the IPARD III program indicate that policy studies that take into account circularity, especially in agriculture, will continue in rural areas in Türkiye. In addition, the investment logic that prioritizes renewable energy sources in production systems is another example of sustainability and circularity.

The development approach with good bottom-up governance; There have been significant changes in the rural development approach in Türkiye, especially with the introduction of IPARD supports. The best example of these changes in approach is the LEADER approach "Preparation and Implementation of Local Rural Development Strategies". This measure was included in the 2007-2013 Türkiye Program for the implementation of the European Union

Common Agricultural Policy and Rural Development Policy, and Türkiye became acquainted with LEADER thanks to the IPARD I Program. The characteristic of the LEADER approach is that it encourages the establishment of partnerships called local action groups (LAGs) by bringing together representatives of the public, private sector and civil society organizations. Within the scope of this approach, which is important in terms of both a bottom-up development approach and being a good governance model, 50 LAGs are supported in Türkiye. In Türkiye, where new approaches have come to the fore instead of traditional development models, 27 provinces were determined in the IPARD II program, which was called for in 2022, where the Local Development Strategy would be implemented (TKDK, 2022). Within the scope of IPARD III, the LEADER measure is planned to be implemented in 42 provinces where TKDK has a provincial coordinatorship.

Studies on more effective implementation of rural development activities and increasing the effectiveness of rural development supports; One of the important policies and measures included in the Eleventh Development Plan is stated in article 707 as "*Rural development supports will be programmed with a focus on farmers and the environment; arrangements will be made to eliminate the existing multi-headedness in the implementation of supports, complementarity and efficiency will be ensured in implementation*", while in article 898 of the Twelfth Development Plan it is stated as "*Rural development supports will be programmed with a focus on farmers and productivity, and complementarity and efficiency will be increased in implementation by ensuring coordination between the different supports implemented*" (SBB, 2023). It can be said that in the last two development plans, the issues of coordination of supports, their complementarity and increasing their effectiveness came to the forefront in rural development policies in Türkiye. In this context, the process of establishing a National Rural Network (NRN) in Türkiye, in accordance with the European Network for Rural Development (ENRD) approach that emerged with the LEADER approach that was practically initiated in the EU in the period of 1991-1993, was officially launched with a broad participation meeting organized by the Managing Authority on 28 November 2017. The establishment of a rural network aims to implement rural development policies in a more effective and participatory manner, to develop close relations with other networks, to establish and develop experience sharing and cross-border collaborations, and to disseminate good practice examples in this way (NRN, 2021a). As of May 2021, the National Rural Network Communication Strategy document has defined the communication principles and approach, target audiences, methods to be used in the process and communication tools for the National Rural Network (NRN, 2021b).

Prioritization of data-based rural development policy approach; One of the most important issues included in both the 11th Plan and the Rural Development Special Development Board Report, as well as the Twelfth Development Plan, is the strengthening of the infrastructure for collecting statistical information for rural areas and the establishment of rural databases (SBB, 2018, 2019, 2023). It is understood that the process that started with the definition of rural areas will continue with the preparation of village inventory, more active use of geographic information systems, as well as the determination and monitoring of indicators related to socioeconomic and cultural development of rural areas.

Technological transformation and digitalization in rural areas; One of the most important issues that distinguishes it from other rural development documents, especially in both the 12th

Development Plans and UKKS IV (2024-2028), is the issue of technological transformation and digitalization in rural areas. Two priority areas and eight measures have been determined in UKKS IV (TOB, 2025). With the increasing penetration of artificial intelligence into our lives, it is planned to further disseminate digitalization and smart technologies, especially in agriculture. In addition, it is envisaged that internet services will be made more widespread, as well as that technological opportunities will be used more in basic services such as education, which need to be brought to rural areas.

5. DIGITAL TRANSFORMATION IN RURAL AREAS OF TÜRKİYE

Since 2000, which is considered the beginning of the digital age, digitalization has gained an important place in social life. Especially with the impact of the pandemic, remote working and education experiences have brought digitalization to the forefront. However, there is a strong connection between cities and digital culture for digitalization to be sustainable. While information and communication technologies are needed for cities to grow and develop, this situation makes it possible to provide internet access and digital opportunities more easily in urban areas. On the other hand, it is observed that rural settlements do not benefit sufficiently from digitalization. The majority of fiber internet subscriptions in Türkiye are concentrated in large cities in the western regions. These cities are characterized by high education levels and income groups, as well as developed service sectors. In the eastern and southeastern provinces with low income levels, fixed broadband internet subscriptions are quite limited (Ay and Kılıç, 2023).

Moreover, internet cafes still remain an important digital access point in the less developed and poor cities of Türkiye. The number of internet cafes is seen to be higher in regions where internet subscriptions are low. There is also a digital divide in terms of internet speed; internet speeds in rural areas are generally lower compared to urban areas (Ay and Kılıç, 2023). As a result, being away from digitalization is one of the important reasons for migration from rural areas to cities. In short, these inequalities in the digitalization process deepen social and economic imbalances and hinder the development of rural areas.

Although such problems prevent the rapid progress of the digitalization process in rural areas, it can be said that technological transformation and digitalization are important agenda items for rural areas in Türkiye's new century. The most important changes of the 2000s in Türkiye are seen in digital transformation. In particular, the establishment of agricultural information systems in agriculture (e.g. Farmer Registration System, Animal Registration System) is an important start in creating policies based on reliable data. In the decisions taken at the 3rd Agriculture and Forestry Council, the issue of digitalization in agriculture was repeatedly mentioned in many areas, and this Council is one of the important supporting documents for digital transformation in agriculture in Türkiye (TOB, 2019).

One of the most notable studies in rural development studies in recent years is digital transformation in rural areas. While digitalization initiatives and smart agricultural applications are included in the measures in UKKS (2021-2023), access to digital services is included in the policy measures in the Twelfth Development Plan (TOB, 2021; SBB, 2023). In UKKS IV (2024-2028), more technology use in rural areas and digitalization should be included in the

plan at the strategic goal level (TOB, 2025), and it is envisaged that these technologies should be used more in rural life, not just in agriculture, in the new century.

Both international organizations and national institutions and organizations provide significant support to digital transformation projects in rural areas. Some of these include;

TABİT; TABİT, a 'Social Enterprise' born in 2004 together with Türkiye's first Social Agriculture Platform and Agricultural News Agency, aims to meet the information needs of people living in rural areas and engaged in agricultural production, to increase their productivity and profitability, to improve their quality of life and to have a positive impact on the future of the world. Tabit's business models include Technology-based Agricultural Education, Social Responsibility Projects, M2M, IoT, iOS, Android Applications, SMS, MMS, Web-supported Education and Agricultural Technologies. Tabit provides services to 1 million 600 thousand farmers in Türkiye and cooperates with international companies. In addition, Tabit's business models have been implemented in countries such as Egypt, India, Ghana, Tanzania, Kenya and New Zealand and have touched the lives of 7 million farmers. In 2018, Tabit Projects were selected as the "World's Best Social Enterprise" at the World Economic Forum thanks to their international success. In 2015, the first smart village in Türkiye was established by TABİT in Aydın province in order to develop, implement and train farmers in technology (TABİT, 2024).

The joint initiative of Trendyol and UNDP, "Villages of Tomorrow", is designed to reduce inequalities in rural areas and develop gender-sensitive digitalization. The project focuses on increasing the use of e-commerce platforms, creating pilot rural settlements and sustainable digital centers with a holistic perspective. Adopting the logic of change management, strategic goals and principles, the project aims to promote sustainable and inclusive development in rural settlements by ensuring the effective use of digital tools and investing in the future by increasing the capacities of youth, women and disadvantaged groups. In line with this goal, three outputs are expected to be achieved;

- Design and implementation of digital village prototypes in rural areas
- Design and implementation of digital agenda and inclusive models for e-commerce
- Raising awareness and developing capacities on institutionalization, sustainable product development and digital marketing.

In Türkiye, pilot villages and then a digital village network are planned to be established in the provinces of Adana, Diyarbakır and İzmir. The project will enable a pilot activity for the digitalization of rural settlements and provide a case study for local governments and public institutions. Digital centers in targeted villages will make digital technologies accessible to everyone. A set of criteria and a roadmap will be prepared for the establishment of these villages. It is anticipated that the share of new e-commerce entrepreneurs in the pilot provinces will increase by 60% when the project is completed (UNDP, 2024).

Digital Villages Initiative (DVI); This initiative aims to transform villages in Europe and Central Asia into smarter, greener and digitally rich connected centers. It aims to increase agricultural productivity and facilitate access to services by using digital technologies for each village and rural community, and to improve rural life by utilizing local strengths. The initiative was launched in 2023 and operates in Albania, Bosnia and Herzegovina, Georgia and Türkiye with the aim of increasing agricultural productivity in rural areas and ensuring sustainable development. The Digital Villages Initiative, which is carried out in Türkiye in cooperation

with the FAO Europe and Central Asia Office and the Ministry of Agriculture and Forestry, was launched in Boyalı Village, Güdül District of Ankara Province.

E-Agriculture Strategy Document; E-agriculture covers the entire agricultural and food system and supports the use of all kinds of communication tools in agriculture and food production. In this context, the project named "TCP-Support for the Development of National E-Agriculture Strategy Project" was completed in 2022 under the coordination of the General Directorate of Agricultural Research and Policies and in cooperation with the Food and Agriculture Organization of the United Nations (FAO). In the project, the current status of Turkish agriculture in digitalization was determined and a National E-agriculture strategy was developed for the five-year period. With this strategy document, the E-Agriculture vision, which addresses the concepts of smart precision agriculture, agriculture 4.0 and digital agriculture, which have started to be used frequently in our country in recent years, with a holistic approach, was developed and country strategies were put forward to improve the processes for the use of information and communication technologies in all processes from soil to fork. As a result of this study, E-agriculture solutions were listed and organized, and the tasks assigned to the relevant institutions according to the conditions of our country were clarified (Türker and Şahin, 2022).

DİTAP (Digital Agricultural Market); is a digital platform that will bring together agricultural producers and buyers, established in 2020 by the Ministry of Agriculture and Forestry, the Ministry of Trade, the Ministry of Treasury, Finance and TOBB. DİTAP, which was established after the decision taken within the scope of the 3rd Agriculture and Forestry Council on 18-21 November 2019 (TOB, 2019), aims to bring together the stakeholders of agriculture on a digital platform by creating an e-Market.

Türkiye Climate Smart Competitive Agriculture Growth Project (TUCSAP); is designed to increase capacity for sustainable and competitive agricultural growth and to encourage the use of climate-sensitive approaches in the agricultural sector in Türkiye. With this project, which will be implemented between 2022-2028 with a World Bank loan, the following are expected to be achieved (TOB, 2022). These are (TOB, 2022);

- Production and distribution of information for sustainable land and land use planning and management,
- Agricultural data collection and analysis,
- Animal health, and
- Supporting farmers and agricultural enterprises to implement and use smart agriculture and climate-sensitive technologies and increasing capacity in these areas

The fact that development agencies define digitalization as a stand-alone policy tool for economic development to reduce regional development disparities and that they include digital transformation in rural areas as a target in agriculture and rural development policies can be cited as an important example of digital transformation.

6. CONCLUSIONS AND RECOMMENDATIONS

In today's world, where information and communication technologies are becoming more widespread, information is felt to be more power, and concepts such as Industry 4.0 and Society

5.0 are being discussed, it is expected that transformations in rural areas will take place in this direction. It can be said that digitalisation has become more visible in policy changes in rural areas in Türkiye in recent years and that rural areas will be more affected by digitalisation in the future. This study examines the evolution of rural development policies in Türkiye from modernisation to digitalisation and evaluates the effects of digitalisation on rural areas and transformation processes. Türkiye's rural development strategies have historically changed over different periods and different approaches have been adopted to address the needs of local communities in each period. Especially since the 2000s, the effects of digitalisation on rural development have become increasingly visible. However, this transformation process faces obstacles such as existing problems in rural areas and the digital divide.

Today, the importance of digitalisation in rural development is evident in both economic and social terms. The adoption of digital technologies increases agricultural productivity and enables better service delivery to farmers. However, inadequate digital infrastructure and low levels of digital literacy in rural areas hinder the full realisation of this potential. Moreover, ensuring the integration of individuals living in rural areas into the digital world is critical for reducing social and economic inequalities. This will contribute to the empowerment of local communities and the achievement of sustainable development goals of rural areas.

In order to increase the effects of digitalisation in rural development, digital infrastructure should be strengthened first. Expanding internet access in rural areas in cooperation with the state and private sector is important for making digital services more accessible. In particular, the transfer of fibre optic internet infrastructure to rural areas will contribute to the acceleration of the digitalisation process. In addition, expanding mobile internet services will help rural communities increase their access to information and raise their digital literacy levels.

Education is a critical element for the success of digitalisation. Training programmes should be organised to improve the digital skills of individuals living in rural areas. These programmes should aim to train farmers on the use of mobile applications, data analysis and digital marketing. Such trainings to be carried out in cooperation with educational institutions, non-governmental organisations and local administrations will facilitate the adaptation of rural communities to digital transformation.

Furthermore, digitalisation needs to be integrated into rural development policies. National Rural Development Strategies and development plans should identify digitalisation as a priority objective and allocate the necessary resources accordingly. Promoting digital agriculture practices will ensure the adoption of sustainable agriculture in rural areas and contribute to environmental sustainability. In this context, the use of smart agricultural technologies will contribute to rural economic development by increasing the productivity of farmers.

The participation of local people is also of great importance in rural development processes. Local communities should be encouraged to identify their problems and develop solutions using digital tools. This will contribute to strengthening social capital by making rural development processes more participatory. The development of digital projects by local governments in line with the needs of the community will increase social solidarity in rural areas and strengthen social ties.

In conclusion, the evolution of rural development policies in Türkiye towards digitalisation is of great importance in terms of developing policies in line with the needs of local communities.

This transformation requires a new approach to understand the dynamics of rural areas and to develop appropriate solutions for these dynamics. Future studies should aim to increase the knowledge in this field by examining the effects of digitalisation on rural development in depth. In addition, integrating elements such as infrastructure, education and local participation, which are necessary to accelerate digitalisation processes, will play an important role in achieving Türkiye's rural development goals. However, the most important fact that should not be forgotten is that the digitalisation process should not move from a human-centred structure to a machine-centred structure. Ensuring the validity of the concept of Society 5.0, which brings social transformation as well as technological transformation, in both rural and urban areas should be the most important focal point in this transformation.

ABSTRACT

The Covid-19 pandemic has deeply affected both societal and individual life, causing permanent changes in many areas. One of the most significant impacts has been on consumers' food consumption habits and purchasing behaviors. The aim of this study is to examine the changes in consumers' food preferences, concerns, and shopping habits during the Covid-19 period, considering demographic characteristics (such as age and gender). A survey conducted in major cities of Turkey reveals that food supply and consumption during the pandemic have shown significant differences, particularly by gender and age.

The findings of the research indicate that women experienced more anxiety compared to men and expressed greater concerns about food supply. Additionally, younger age groups have become more conscious about healthy food choices and more frequently utilized online shopping. Women tended to prefer local food products, while men showed a preference for packaged food products. Increased concerns about food safety and hygiene during the pandemic have led to a higher demand for hygiene measures and trusted brands in food shopping.

In conclusion, it is anticipated that the effects of the pandemic on food consumption will have long-term consequences. It is emphasized that further research is needed to understand how consumer behavior will be shaped during future health crises. Additionally, the importance of sustainable food systems and food safety has increased in the post-pandemic period.

Key words: Covid-19, Consumer, food consumption preferences, food consumption concerns

COVİD-19 SÜRECİNDE TÜKETİCİLERİN GIDA TÜKETİM TERCİH VE KAYGILARI

ÖZET

Covid-19 pandemisi, tüm dünyada toplumsal ve bireysel yaşamı derinden etkilemiş, birçok alanda kalıcı değişimlere neden olmuştur. Bu süreç, özellikle tüketicilerin gıda tüketim alışkanlıkları ve satın alma davranışlarını önemli ölçüde değiştirmiştir. Bu çalışmanın amacı, Covid-19 dönemi sırasında tüketicilerin gıda tüketim tercihleri, kaygıları ve alışveriş alışkanlıklarındaki değişimleri demografik özellikler (yaş, cinsiyet gibi) açısından incelemektir. Türkiye'deki büyük şehirlerde yapılan anket araştırmasında, pandemi sürecinde gıda temini ve tüketiminde yaşanan değişimler, özellikle cinsiyet ve yaşa göre farklılıklar göstermektedir.

Araştırma bulguları, kadınların erkeklere kıyasla daha fazla kaygı yaşadığını ve gıda tedariki konusunda daha fazla endişe duyduğunu ortaya koymuştur. Ayrıca, genç yaş grubundaki bireylerin sağlıklı gıda tercihleri konusunda daha fazla bilinçli hale geldikleri ve online alışverişi daha yaygın kullandıkları görülmüştür. Kadınlar, yerel gıda ürünlerine yönelme eğilimindeyken, erkekler daha çok paketlenmiş gıda ürünlerine yönelmişlerdir. Tüketicilerin gıda güvenliği ve hijyen konusunda artan kaygıları, gıda alışverişinde hijyen önlemlerine ve güvenilir markalara olan talebi artırmıştır.

Sonuç olarak, pandemi sürecinin gıda tüketimindeki etkilerinin uzun vadeli sonuçları olacağı öngörülmektedir. Bu değişimlerin, gelecekteki sağlık krizlerinde tüketici davranışlarını nasıl şekillendireceğini anlamak için daha fazla araştırma yapılması gerektiği vurgulanmaktadır. Ayrıca, sürdürülebilir gıda sistemleri ve gıda güvenliği konularının önemi, pandemi sonrası dönemde daha da artmıştır.

Anahtar kelimeler: Covid-19, Tüketici, gıda tüketim tercihleri, gıda tüketim kaygıları

1. GİRİŞ

Covid-19 pandemisi, öncelikle sağlık sektöründe buna bağlı olarak ekonomik, sosyokültürel ve psikolojik alanlarda da dünya genelinde büyük bir etki yaratmıştır. Pandemi sürecinde uygulanan kısıtlamalar, tüketici davranışlarında önemli değişimlere neden olmuş, bireylerin alışveriş alışkanlıkları ve gıda tüketim tercihleri farklılaşmıştır (Donthu ve Gustafsson, 2020). Pandemi, tüketicilerin gıda güvenliği ve arz zinciri konularında daha fazla duyarlı olmasına yol açarak, küresel gıda sistemlerini de etkileyen büyük bir dönüşümü tetiklemiştir (Galanakis, 2020).

Türkiye özelinde de Covid-19'un gıda tüketim alışkanlıkları üzerindeki etkisi farklı araştırmalarla incelenmiştir. Osman Kılıç ve Gamze Aydın Eryılmaz'ın Samsun ili özelinde yaptıkları çalışmada, tüketicilerin yerel gıda ürünlerine yönelme oranlarının arttığı ve bireylerin gıda stoklama davranışlarında değişim görüldüğü ortaya konmuştur (Kılıç ve Aydın Eryılmaz, 2022). Aynı zamanda, Covid-19 pandemisinin tüketicilerin psikolojik kaygılarını artırdığı ve bu durumun gıda tüketim alışkanlıklarına doğrudan yansıdığı farklı çalışmalarla da desteklenmektedir (Satici ve ark., 2020; Scarmozzino ve Visioli, 2020).

Gıda tüketiminde gözlenen değişimler yalnızca yerel değil, küresel çapta da incelenmektedir. Güney ve Sangün' (2021) yapmış olduğu araştırma, bireylerin pandemi sürecinde sağlıklı ve organik gıdalara olan ilgisinin arttığını, aynı zamanda online gıda alışverişlerinin büyük bir ivme kazandığını göstermektedir. Benzer bir şekilde, Gao ve arkadaşlarının (2020) Çin örneğinde yaptıkları çalışma, online gıda satın alma oranlarındaki artışı ve pandeminin bu tüketim modeline olan etkisini gözler önüne sermektedir.

Covid-19 pandemisinin tüketici davranışlarına etkisi, yerli ve yabancı turistler özelinde de ele alınmış ve pandemiyle birlikte turistik gıda tüketim alışkanlıklarında değişimler meydana geldiği saptanmıştır (Dağ, ve ark., 2022). Özellikle restoran ve dışarıda yemek yeme alışkanlıklarında büyük bir azalma yaşandığı ve bunun yerine evde yemek yapma oranının arttığı gözlemlenmiştir (Raber ve ark., 2020).

Covid-19 sürecinde tüketicilerin gıda tüketim tercihlerini ve bu sürecin bireyler üzerindeki kaygı yaratma düzeyini incelemeyi amaçlamaktadır. Pandeminin neden olduğu belirsizlik ortamı, tüketicilerin hem fiziksel sağlıkları hem de ekonomik güvenlikleri konusunda kaygı duymalarına nedenolmuştur (Eftimov ve ark., 2020). Bu çerçevede, gıda tüketiminde yaşanan değişikliklerin toplumsal etkilerini daha iyi anlamak için geniş ölçekli bir analiz gerçekleştirilecektir.

Bu çalışmada, tüketicilerin gıda tüketimindeki tercihlerinin değişimleri yaş ve cinsiyet özelliklerine göre incelenecek ve bu değişimlerin uzun vadeli etkileri tartışılacaktır.

2. MATERYAL VE METOD

Araştırmanın materyalini Türkiye'nin yedi bölgesindeki büyük şehirlerde yaşayan bireyler (İstanbul, Ankara, İzmir, Trabzon, Adana, Van ve Gaziantep) oluşturmuştur. Veriler, bilgisayar destekli telefon görüşmesi (CATI) kullanılarak elde edilmiştir. Çalışmanın örneklem büyüklüğü ise aşağıda verilen formül yardımıyla hesaplanmıştır (Sangün ve Güney, 2018).

$$n = \frac{t^2 pq}{d^2}$$

Bu formülde n: örnek hacmini,

p= İncelenecek olayın görülüş sıklığı (olasılığı)

q= İncelenecek olayın görülmeyiş sıklığı (1-p)

t= Belirli serbestlik derecesinde ve saptanan yanılma düzeyinde t tablosunda bulunan teorik değer

d= Olayın görülüş sıklığına göre yapılmak istenen ± sapma olarak simgelenmiştir.

hata payı d = % 5 ve güven aralığının % 95 kabul edildiği hesaplamada sonuç 384 kişi çıkmıştır. Anket çalışmasında eksik ve hatalı anket formları olabileceği düşünülerek anketin 1026 kişi ile anket yapılmıştır. Sonuçlar çapraz tablolar yapılarak yüzde frekans tablosu şeklinde verilmiştir.

3. BULGULAR

Covid-19 Sürecinde Tüketicilerin Kaygı Düzeyleri için cinsiyete ait sonuçlar Tablo 1'de, yaşa ait sonuçlar ise Tablo 2'de verilmiştir.

Tablo 1. Korona virüs salgını sürecinden ne derece kaygı duyuyorsunuz? Sorusuna cinsiyete göre verilen cevaplara ait çapraz frekans tablosu

	Cinsiyet		Toplam
	Kadın	Erkek	
Hiç Kaygı Duymuyorum	24,8	75,2	100
Nadiren Kaygı Duyuyorum	31,3	68,8	100
Bazen Kaygı Duyuyorum	43,9	56,1	100
Sıklıkla Kaygı Duyuyorum	45,9	54,1	100
Her Zaman Kaygı Duyuyorum	53,2	46,8	100
Toplam	44,7	55,3	100

Tablo 1 incelendiğinde, Covid-19 sürecinde kadınların erkeklere kıyasla daha fazla kaygı duyduğu görülmektedir. "Her zaman kaygı duyuyorum" diyen kadınların oranı %53,2 iken, erkeklerin oranı %46,8'dir. Benzer şekilde, "sıklıkla kaygı duyuyorum" diyenlerin %45,9'u kadın, %54,1'i erkektir. Kadınların pandemiye yönelik genel kaygı düzeyinin erkeklerden daha yüksek olduğu söylenebilir.

Tablo 2. Korona virüs salgını sürecinden ne derece kaygı duyuyorsunuz? Sorusuna yaşa göre verilen cevaplara ait çapraz frekans tablosu

	Yaş						Toplam
	25<	25-34	35-44	45-54	55-64	64>	
Hiç Kaygı Duymuyorum	11,3%	23,3%	27,1%	17,3%	10,5%	10,5%	100
Nadiren Kaygı Duyuyorum	18,8%	35,4%	18,8%	10,4%	14,6%	2,1%	100
Bazen Kaygı Duyuyorum	28,0%	23,8%	22,2%	13,8%	10,0%	2,1%	100
Sıklıkla Kaygı Duyuyorum	19,9%	29,9%	16,5%	16,0%	11,7%	6,1%	100
Her Zaman Kaygı Duyuyorum	14,5%	29,3%	18,8%	14,2%	15,6%	7,5%	100
Toplam	18,7%	27,7%	20,1%	14,8%	12,7%	6,1%	100

Yaş gruplarına göre kaygı düzeyi incelendiğinde (Tablo 2), 25-34 yaş grubundaki bireylerin pandemi sürecinde en fazla kaygı duyan grup olduğu görülmektedir. "Her zaman kaygı duyuyorum" diyenlerin %29,3'ü, "sıklıkla kaygı duyuyorum" diyenlerin %29,9'u bu yaş grubuna aittir. 64 yaş ve üzerindeki bireylerin ise en düşük kaygı seviyesine sahip olduğu gözlemlenmektedir.

Gıda Temini ve Tüketimi Konusundaki Kaygı düzeleri için cinsiyete ait sonuçlar Tablo 3'te, yaşa ait sonuçlar ise Tablo 4'te verilmiştir.

Tablo 3. Korona virüs salgını sürecinde gıda temini/tüketimi konusunda ne derece kaygı duyuyorsunuz? Sorusuna cinsiyete göre verilen cevaplara ait çapraz frekans tablosu

	Cinsiyet		Toplam
	Kadın	Erkek	
Hiç Kaygı Duymuyorum	36,6	63,4	100
Nadiren Kaygı Duyuyorum	32,8	67,2	100
Bazen Kaygı Duyuyorum	45,2	54,8	100
Sıklıkla Kaygı Duyuyorum	58,5	41,5	100
Her Zaman Kaygı Duyuyorum	53,8	46,2	100
Toplam	44,7	55,3	100

Cinsiyete göre gıda temini/tüketimi konusundaki kaygılar incelendiğinde (Tablo 3), kadınların erkeklere kıyasla daha fazla kaygı duyduğu anlaşılmaktadır. "Her zaman kaygı duyuyorum"

diyen kadınların oranı %53,8 iken, erkeklerde bu oran %46,2'dir. "Sıklıkla kaygı duyuyorum" diyen kadınların oranı %58,5 olup erkeklerden belirgin şekilde yüksektir.

Tablo 4. Korona virüs salgını sürecinde gıda temini/tüketimi konusunda ne derece kaygı duyuyorsunuz? Sorusuna yaşa göre verilen cevaplara ait çapraz frekans tablosu

	Yaş						Toplam
	25<	25-34	35-44	45-54	55-64	64>	
Hiç Kaygı Duymuyorum	11,0%	26,8%	22,0%	18,5%	14,3%	7,4%	100
Nadiren Kaygı Duyuyorum	27,7%	29,4%	20,2%	8,4%	8,4%	5,9%	100
Bazen Kaygı Duyuyorum	23,8%	23,8%	21,0%	15,7%	12,4%	3,3%	100
Sıklıkla Kaygı Duyuyorum	23,9%	28,3%	17,0%	16,4%	6,3%	8,2%	100
Her Zaman Kaygı Duyuyorum	16,6%	31,7%	18,6%	10,1%	18,1%	5,0%	100
Toplam	18,7%	27,7%	20,1%	14,8%	12,7%	6,1%	100

Yaş gruplarına göre gıda temini ve tüketimi kaygıları incelendiğinde (Tablo 4), 25-34 yaş grubunun diğer yaş gruplarına kıyasla daha fazla kaygı duyduğu görülmektedir. "Her zaman kaygı duyuyorum" diyenlerin %31,7'si ve "sıklıkla kaygı duyuyorum" diyenlerin %28,3'ü bu yaş grubundadır. Bu durum, genç yetişkin bireylerin pandemiye karşı daha hassas olduklarını göstermektedir.

Gıda Tüketiminde Yaşanan Değişimler için cinsiyete ait sonuçlar Tablo 5'te, yaşa ait sonuçlar ise Tablo 6'da verilmiştir.

Tablo 5. Korona virüs salgını sürecinde gıda tüketiminiz ne şekilde değişti? Sorusuna cinsiyete göre verilen cevaplara ait çapraz frekans tablosu

	Cinsiyet		Toplam
	Kadın	Erkek	
Çok Azaldı	55,0%	45,0%	100
Azaldı	31,1%	68,9%	100
Değişmedi	41,7%	58,3%	100
Arttı	55,4%	44,6%	100
Çok Arttı	47,4%	52,6%	100
Toplam	44,7%	55,3%	100

Cinsiyete göre gıda tüketimindeki değişimler incelendiğinde (Tablo 5), kadınların erkeklere kıyasla daha fazla değişim yaşadığı görülmektedir. "Çok azaldı" diyenlerin %55'i kadınlardan oluşurken, "çok arttı" diyenlerin oranı da kadınlarda %47,4'tür. Bu durum, kadınların pandemi sürecinde beslenme konusunda daha fazla değişiklik yaptığını göstermektedir.

Tablo 6. Korona virüs salgını sürecinde gıda temini/tüketimi konusunda ne derece kaygı duyuyorsunuz? Sorusuna yaşa göre verilen cevaplara ait çapraz frekans tablosu

	Yaş						Toplam
	25<	25-34	35-44	45-54	55-64	64>	
Çok azaldı	35,0%	25,0%	15,0%	10,0%	15,0%		100
Azaldı	14,3%	33,6%	18,5%	12,6%	10,9%	10,1%	100
Değişmedi	14,6%	24,6%	22,7%	14,7%	16,0%	7,4%	100
Arttı	26,9%	28,0%	17,7%	16,6%	8,5%	2,2%	100
Çok Arttı	22,8%	43,9%	12,3%	12,3%	3,5%	5,3%	100
Toplam	18,7%	27,7%	20,1%	14,8%	12,7%	6,1%	100

Yaş gruplarına göre gıda tüketimindeki değişimler ele alındığında (Tablo 6), 25-34 yaş grubundaki bireylerin tüketim değişimlerinin en fazla olduğu görülmektedir. "Çok arttı" diyenlerin %43,9'u bu yaş grubundadır. Buna karşılık, "çok azaldı" diyenlerin en büyük oranı %35 ile 25 yaş altı bireylerden oluşmaktadır. Bu bulgular, genç bireylerin pandemi sürecinde tüketim alışkanlıklarında belirgin değişiklikler yaşadığını ortaya koymaktadır.

4. TARTIŞMA VE SONUÇ

Elde edilen bulgular, Covid-19 sürecinin tüketici davranışlarında belirgin değişikliklere yol açtığını göstermektedir. Kadınların ve genç bireylerin pandemi sürecinde gıda tüketimi ve temini konusunda daha fazla kaygı duyduğu görülmektedir. Bu durum, mevcut literatürde belirtilen psikolojik ve sosyoekonomik faktörlerle de uyumludur (Eşiyok ve Divanoğlu, 2022; Soydan, 2022). Özellikle, kadınların kaygı düzeylerinin erkeklere göre daha yüksek olması, pandeminin psikolojik etkilerinin cinsiyetler arasında farklılık gösterdiğini ortaya koymaktadır. Bu bulgu, Osman Kılıç ve Gamze Aydın Eryılmaz'ın Samsun ili özelinde gerçekleştirdiği çalışmayla da paralellik göstermektedir. O çalışmada, kadınların gıda temini konusunda daha fazla kaygı taşıdığı ve yerel gıda ürünlerine yönelme oranlarının arttığı saptanmıştır (Kılıç ve Aydın Eryılmaz, 2022). Bu çalışmadaki bulgularda da kadınların gıda temini ve tüketimi konusunda erkeklere oranla daha yüksek kaygı taşıdığı görülmektedir. Bu, kadınların gıda güvenliği konusunda daha hassas davrandıklarını ve güvenilir gıda kaynaklarına yönelme eğiliminde olduklarını göstermektedir.

Pandemi sürecinde, tüketicilerin sağlıklı gıdalara yöneliminde artış gözlemlenirken, bazı bireylerin tüketim alışkanlıklarında azalma yaşadığı saptanmıştır. Bu bulgular, mevcut araştırmalarla paralellik göstermekte olup, kriz dönemlerinde tüketici davranışlarının

değişkenlik gösterdiğini ortaya koymaktadır (Güney ve Sangün, 2021). Güney ve Sangün'ün araştırmasında, sağlıklı ve organik gıdalara olan ilginin arttığı belirtilmişti; bu çalışmadaki sonuçlarda da kadınların gıda tüketimi konusunda önemli değişiklikler yaşadığı gözlemlenmektedir. Bu, pandeminin, sağlıklı beslenmeye olan ilgiyi artırdığı ve insanların daha bilinçli alışveriş yaptıkları yönündeki mevcut bulguları desteklemektedir.

Ayrıca, genç yaş gruplarının pandemi sürecinde gıda tüketim alışkanlıklarında daha belirgin değişiklikler yaşadığı ve kaygılarının arttığı görülmektedir. Güney ve Sangün'ün çalışmalarında online gıda alışverişinin arttığı vurgulanmıştı (Güney ve Sangün, 2021). Çalışmadan elde edilen bulgularda da gençlerin, özellikle 25-34 yaş grubundaki bireylerin, gıda temini ve tüketimi konusunda daha fazla kaygı duydukları ve alışveriş alışkanlıklarında değişiklikler yaşadıkları gözlemlenmektedir. Bu, dijital platformların kullanımının artmasıyla paralel bir durumdur ve gençlerin online alışverişe daha fazla yönelmesinin bir yansıması olabilir.

Sonuç olarak, pandemi sürecinde tüketicilerin gıda tüketim tercihlerinde yaşanan değişimlerin uzun vadeli etkilerinin incelenmesi gerekmektedir. Özellikle sürdürülebilir gıda sistemleri ve tüketici davranışları üzerine ileriye dönük çalışmalar yapılması önerilmektedir. Ayrıca, Covid-19'un psikolojik ve sosyoekonomik etkilerinin daha derinlemesine incelenmesi, gelecekteki kriz yönetimleri ve gıda güvenliği stratejilerinin geliştirilmesine katkı sağlayacaktır. Bu bağlamda, kadınların ve genç bireylerin pandemi sürecinde daha fazla kaygı duyması, gıda temini konusunda güvenlik önlemlerinin artırılması gerektiğini de göstermektedir.

ABSTRACT

With the rapid advancement of digitalization, social media has become an integral part of daily life and a powerful tool influencing consumption behaviors. The visuals, videos, user reviews, and influencer content shared on social media platforms play a significant role in shaping individuals' preferences for products and services. In this context, the food sector has been notably influenced by social media, as individuals' food purchasing and consumption behaviors are increasingly shaped through digital content. This study investigates the relationship between social media usage and food-related preferences, focusing specifically on how this relationship varies by gender.

The research was conducted using a quantitative method, and the data were analyzed through frequency and cross-tabulation tables. The study assessed participants' frequency of social media use, the types of content they interact with, and how these factors influence their food decisions. The findings indicate that female participants are more influenced by social media content compared to male participants. Women were particularly affected by visual content and posts shared by influencers, which played a decisive role in their food purchasing behaviors. In contrast, male participants showed more interest in informative, content-driven posts, focusing on product details and functional benefits rather than visual appeal.
In conclusion, the relationship between social media and food consumption behaviors differs significantly based on gender. These findings highlight the importance of incorporating gender-based targeting in digital marketing strategies. The study suggests that social media campaigns can be more effective when demographic factors, especially gender, are taken into account in the design and dissemination of content.

Keywords: social media use, food intake, food consumption

SOSYAL MEDYA KULLANIMI VE GIDA ALIMI İLE TÜKETİMİ ARASINDAKİ İLİŞKİNİN DEMOGRAFİK ÖZELLİKLERE GÖRE KARŞILAŞTIRILMASI

ÖZET

Dijitalleşmenin hız kazanmasıyla birlikte sosyal medya, bireylerin gündelik yaşamlarında önemli bir yer edinmiş, özellikle tüketim alışkanlıklarını etkileyen güçlü bir iletişim ve etkileşim aracı haline gelmiştir. Sosyal medya platformlarında paylaşılan görseller, videolar, kullanıcı yorumları ve influencer içerikleri, bireylerin ürün ve hizmet tercihlerinde yönlendirici bir rol oynamaktadır. Bu bağlamda, gıda sektörü de sosyal medyanın etkisinden önemli ölçüde etkilenmekte; bireylerin gıda satın alma ve tüketim davranışları, sosyal medya içerikleri aracılığıyla şekillenebilmektedir. Bu çalışmada, sosyal medya kullanımının bireylerin gıda alım ve tüketim tercihleri üzerindeki etkisi incelenmiş ve bu ilişkinin cinsiyete göre farklılaşıp farklılaşmadığı araştırılmıştır.

Araştırma nicel yöntemle gerçekleştirilmiş olup, elde edilen veriler frekans ve çapraz tablolar aracılığıyla analiz edilmiştir. Katılımcıların sosyal medya platformlarını kullanım sıklıkları, hangi tür içeriklerle daha çok etkileşimde bulundukları ve bu içeriklerin gıda tercihlerini nasıl etkilediği değerlendirilmiştir. Elde edilen bulgular, kadın bireylerin sosyal medya içeriklerinden erkek bireylere göre daha fazla etkilendiğini ortaya koymuştur. Kadınların özellikle görsel içerikler ve sosyal medya fenomenlerinin paylaşımlarından etkilenerek gıda satın alma davranışlarını şekillendirdikleri görülmektedir. Erkek bireyler ise bilgiye dayalı, açıklayıcı içeriklere daha fazla yönelmekte, görsellikten ziyade ürün içeriği ve faydasına odaklanmaktadır.
Sonuç olarak, sosyal medya ile gıda tüketimi ve alımı arasındaki ilişki cinsiyet bağlamında anlamlı farklılıklar göstermektedir. Bu durum, dijital pazarlama stratejilerinde cinsiyet temelli hedefleme yapılmasının gerekliliğine işaret etmektedir. Çalışmanın bulguları, sosyal medyada yürütülen kampanyaların daha etkili olabilmesi için demografik özelliklerin dikkate alınması gerektiğini vurgulamaktadır.

Anahtar kelimeler: sosyal medya kullanımı, gıda alımı, gıda tüketimi,

1. GİRİŞ

Dijitalleşen dünyada sosyal medya, bireylerin günlük yaşamlarında önemli bir yer edinmiştir. Özellikle genç kuşakların yaşam tarzlarını, tutumlarını ve karar alma süreçlerini etkileyen sosyal medya platformları, yalnızca bilgi paylaşımı ya da sosyalleşme amacıyla değil; aynı zamanda tüketim alışkanlıklarının şekillenmesinde de belirleyici bir unsur haline gelmiştir (Hanna, Rohm & Crittenden, 2011). Sosyal medya üzerinden yapılan gıda paylaşımları, influencer'ların yönlendirici içerikleri ve markaların hedefe yönelik dijital pazarlama stratejileri, bireylerin gıda satın alma davranışlarını ve tüketim alışkanlıklarını etkilemektedir (Bragg et al., 2019; Ahmad & Bruno, 2021).

Özellikle ergenler ve genç yetişkinler üzerinde yapılan çalışmalar, sosyal medya platformlarında karşılaşılan gıda içeriklerinin bu yaş grubunun yeme davranışlarını etkileyebileceğini ortaya koymuştur (Qutteina et al., 2021; Holmberg et al., 2016). Genç bireyler, sosyal çevrelerinden gelen etkilerle sosyal medya üzerindeki trendlere daha duyarlı olmakta ve bu durum, sağlıklı beslenme tercihlerinden uzaklaşmalarına neden olabilmektedir (Fleming-Milici & Harris, 2020; Folkvord & de Bruijne, 2020). Sosyal medya, aynı zamanda gıda markalarının pazarlama faaliyetleri için de verimli bir zemin sunmakta; bu durum özellikle hazır gıda, fast-food ve atıştırmalık ürünlerin tanıtımında etkili olmaktadır (Bragg et al., 2019; Gu et al., 2021).

Sosyal medyanın yalnızca bireysel tüketici davranışlarını değil, aynı zamanda küçük ve orta ölçekli gıda işletmelerinin satış stratejilerini de şekillendirdiği görülmektedir. Bouargan ve arkadaşlarının (2020) Brunei'de yaptığı araştırma, sosyal medyanın KOBİ'ler için müşteri ile etkileşim kurma, ürün tanıtımı yapma ve satışları artırma konusunda önemli bir araç olduğunu ortaya koymaktadır. Benzer şekilde, sosyal medyanın tüketicilerin sağlıkla ilgili içeriklere verdiği tepkilerde de önemli bir rol oynadığı, bazı bireylerin sosyal medya üzerinden edinilen bilgilerle bilinçli seçimler yapmaya çalıştığı da literatürde belirtilmiştir (Declercq et al., 2019; Segovia-Villarreal & Rosa-Díaz, 2022).

COVID-19 pandemisi süresince sosyal medya kullanımında yaşanan artış, bireylerin gıda tüketim alışkanlıklarında da belirgin değişiklikler yaratmıştır. Salgın döneminde evde geçirilen zamanın artması, bireyleri sosyal medya içeriklerine daha açık hale getirirken, bu süreçte paylaşılan içerikler de sağlıklı yaşam, sürdürülebilir beslenme ya da evde yemek yapma gibi temalara yoğunlaşmıştır (Güney & Sangün, 2021; Lelisho et al., 2023; Madziva et al., 2022). Ancak bu dönemde sosyal medya üzerinden yayılan yanlış bilgi ve sağlıksız beslenme eğilimleri, özellikle ergenler ve genç yetişkinler için bir tehdit unsuru haline gelmiştir (Draženović et al., 2023).

Bu bağlamda, sosyal medya kullanımı ile gıda alımı ve tüketimi arasındaki ilişkinin anlaşılması, hem bireysel sağlığı hem de toplumun genel beslenme alışkanlıklarını iyileştirmek açısından büyük önem taşımaktadır. Ancak sosyal medya etkisinin bireyler üzerinde tek tip bir yansıması olmadığı, demografik özelliklere göre bu ilişkinin farklılık gösterebildiği de bilinmektedir. Yaş, cinsiyet, eğitim düzeyi ve sosyoekonomik statü gibi faktörlerin, sosyal medya içeriklerine verilen tepkilerde ve bu içeriklerin tüketim davranışlarına etkisinde belirleyici olabileceği öne sürülmektedir (Pucci et al., 2019; Simeone & Scarpato, 2020; van der Bend et al., 2022).

Bu çalışmanın amacı, sosyal medya kullanımının bireylerin gıda alım ve tüketim davranışları üzerindeki etkisini incelemek ve bu ilişkinin demografik özelliklere göre nasıl farklılaştığını

ortaya koymaktır. Çalışma kapsamında sosyal medya kullanımı ile gıda tüketimi ve satın alma davranışları arasındaki ilişkinin cinsiyete göre farklılık gösterip göstermediği incelenecek ve cinsiyet değişkenine göre elde edilen bulgular karşılaştırılarak sunulacaktır.

2. MATERYAL VE METOD

Araştırmanın materyalini Türkiye'nin yedi bölgesindeki büyük şehirlerde yaşayan bireyler (İstanbul, Ankara, İzmir, Trabzon, Adana, Van ve Gaziantep) oluşturmuştur. Veriler, bilgisayar destekli telefon görüşmesi (CATI) kullanılarak elde edilmiştir. Çalışmanın örneklem büyüklüğü ise aşağıda verilen formül yardımıyla hesaplanmıştır (Sangün ve Güney, 2018).

$$n = \frac{t^2 pq}{d^2}$$

Bu formülde n: örnek hacmini,

p= İncelenecek olayın görülüş sıklığı (olasılığı)

q= İncelenecek olayın görülmeyiş sıklığı (1-p)

t= Belirli serbestlik derecesinde ve saptanan yanılma düzeyinde t tablosunda bulunan teorik değer

d= Olayın görülüş sıklığına göre yapılmak istenen ± sapma olarak simgelenmiştir.

hata payı d = % 5 ve güven aralığının % 95 kabul edildiği hesaplamada sonuç 384 kişi çıkmıştır. Anket çalışmasında eksik ve hatalı anket formları olabileceği düşünülerek anketin 1016 kişi ile anket yapılmıştır. Sonuçlar çapraz tablolar yapılarak yüzde frekans tablosu şeklinde verilmiştir.

3. BULGULAR

Bu bölümde, sosyal medya kullanımı ile gıda tüketimi ve satın alma davranışları arasındaki ilişkinin cinsiyete göre farklılık gösterip göstermediği incelenmiştir. Katılımcıların verdikleri yanıtlar doğrultusunda elde edilen çapraz frekans tabloları aşağıda sunulmakta ve her bir tabloya ilişkin bulgular detaylı olarak açıklanmaktadır

Tablo 1.Sosyal medyadaki bilgi ve içeriklerin doğruluğuna güveniyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	45,8%	54,2%	100,0%
Katılmıyorum	41,4%	58,6%	100,0%
Kararsızım	41,0%	59,0%	100,0%
Katılıyorum	53,8%	46,2%	100,0%
Kesinlikle Katılıyorum	68,8%	31,3%	100,0%
Toplam	45,0%	55,0%	100,0%

Bu tablo, sosyal medyadaki bilgi ve içeriklerin doğruluğuna güven düzeyinin cinsiyete göre dağılımını göstermektedir. Erkek katılımcıların çoğunluğu "Katılmıyorum" ve "Kararsızım" seçeneklerinde yoğunlaşırken, kadın katılımcılar "Katılıyorum" ve "Kesinlikle Katılıyorum" seçeneklerinde daha yüksek oranlarda yer almıştır. Bu durum, kadınların erkeklere kıyasla sosyal medya içeriklerine daha fazla güven duyduğunu ortaya koymaktadır.

Tablo 2. Sosyal medyadaki bilgi ve içeriklere güvenmiyorum, fakat bakmaya devam ediyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,7%	58,3%	100,0%
Katılmıyorum	47,2%	52,8%	100,0%
Kararsızım	44,4%	55,6%	100,0%
Katılıyorum	43,9%	56,1%	100,0%
Kesinlikle Katılıyorum	54,5%	45,5%	100,0%
Toplam	45,0%	55,0%	100,0%

Bu tablo, katılımcıların sosyal medya içeriklerine güven duymamalarına rağmen bu içerikleri takip edip etmediklerini cinsiyet açısından ele almaktadır. Erkeklerin "Kesinlikle Katılmıyorum" ifadesi kadınlara göre daha yüksek oranda çıkmıştır. Ancak "Katılıyorum" ifadesi erkeklerde "Kesinlikle Katılıyorum" ifadesi ise kadınlar da daha yüksek çıkmış olup burada kadın ve erkek oranlarının birbirine yakınlaştığı görülmektedir. Bu durum, güven eksikliğine rağmen her iki cinsiyetin de sosyal medyayı takip etmeye devam ettiğini göstermektedir

Tablo 3. Sosyal medyadaki paylaşım ve içerikler yiyecek/gıda tüketim ve satın alma tercihlerimi etkilemektedir sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	44,0%	56,0%	100,0%
Katılmıyorum	39,1%	60,9%	100,0%
Kararsızım	42,9%	57,1%	100,0%
Katılıyorum	51,6%	48,4%	100,0%
Kesinlikle Katılıyorum	60,0%	40,0%	100,0%
Toplam	45,0%	55,0%	100,0%

Bu tablo, sosyal medyada karşılaşılan ürün ve hizmet tanıtımlarının katılımcıların yeme-içme tercihleri üzerindeki etkisini cinsiyete göre göstermektedir. "Katılıyorum" ve "Kesinlikle Katılıyorum" ifadelerinde kadın katılımcıların oranı erkeklere kıyasla oldukça yüksektir. Bu durum, kadınların sosyal medya içeriklerinden daha fazla etkilendiğini ve bu içeriklerin yeme-içme alışkanlıklarında rol oynadığını ortaya koymaktadır. Erkeklerin ise daha yüksek oranda "Katılmıyorum" ve "Kesinlikle Katılmıyorum" ifadelerine yöneldiği görülmektedir.

Tablo 4. Sosyal medyadaki paylaşım ve içerikler yiyecek/gıda satın alacağım yeri (restoran, market vb.) etkilemektedir sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	42,5%	57,5%	100,0%
Katılmıyorum	38,5%	61,5%	100,0%
Kararsızım	45,0%	55,0%	100,0%
Katılıyorum	52,3%	47,7%	100,0%
Kesinlikle Katılıyorum	62,9%	37,1%	100,0%
Toplam	45,0%	55,0%	100,0%

Bu tablo, sosyal medya üzerindeki paylaşımların gıda ürünü satın alacağı yer davranışını cinsiyete göre ortaya koymaktadır. Kadınların "katılıyorum" ve "kesinlikle katılıyorum" seçeneklerinde erkeklerden daha yüksek oranda yer almaktadır.

Tablo 5. Sosyal medyayı yeni gıda ürünleri, restoranlar ve marketler hakkında bilgi edinmek için kullanırım sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,5%	58,5%	100,0%
Katılmıyorum	37,9%	62,1%	100,0%
Kararsızım	47,7%	52,3%	100,0%
Katılıyorum	50,8%	49,2%	100,0%
Kesinlikle Katılıyorum	61,1%	38,9%	100,0%
Toplam	45,0%	55,0%	100,0%

Bu tablo, Sosyal medyayı yeni gıda ürünleri, restoranlar ve marketler hakkında bilgi edinmek için kullanırım davranışını cinsiyet bazında incelemektedir. Erkeklerin "Kesinlikle Katılmıyorum" ve "Katılmıyorum" gibi seçeneklerde erkeklere göre daha yüksek oranlar gösterdiği gözlemlenmektedir. Erkekler, sosyal medyada yeni gıda ürünleri, restoranlar ve marketler hakkında bilgi almakta daha temkinli yaklaşırken, kadınlar daha fazla "Katılıyorum" ve "Kesinlikle Katılıyorum" şeklinde yanıtlar vermiştir. Erkeklerin, sosyal medya üzerinden bilgi edinmeyi erkeklere oranla daha sık tercih ettiği anlaşılmaktadır.

Tablo 6. Gıda ürünleri ile ilgili görüşlerimi belirtmek için sosyal medyayı kullanırım sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	45,2%	54,8%	100,0%
Katılmıyorum	41,3%	58,7%	100,0%
Kararsızım	47,2%	52,8%	100,0%
Katılıyorum	48,1%	51,9%	100,0%
Kesinlikle Katılıyorum	53,7%	46,3%	100,0%
Toplam	45,0%	55,0%	100,0%

Gıda ürünleri ile ilgili görüşlerimi belirtmek için sosyal medyayı kullanırım sorusuna ait frekans tablosu incelendiğinde, Kadınlar, daha fazla "Kesinlikle Katılıyorum" seçeneğine erkeklerin ise daha fazla "Kesinlikle Katılmıyorum" ve "Katılmıyorum" seçeneğine yönelmiştir. Buda kadınların sosyal medyada fikir beyan etmelerinin daha yüksek olduğunu göstermiştir.

Tablo 7. Sosyal medyayı gıda indirimleri ve promosyonlar bulmak için kullanıyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	42,1%	57,9%	100,0%
Katılmıyorum	38,2%	61,8%	100,0%
Kararsızım	51,7%	48,3%	100,0%
Katılıyorum	50,9%	49,1%	100,0%
Kesinlikle Katılıyorum	52,5%	47,5%	100,0%
Toplam	45,0%	55,0%	100,0%

Sosyal medyayı gıda indirimleri ve promosyonlar bulmak için kullanıyorum sorusuna ait frekans tablosu incelendiğinde, Kadınlar "Katılıyorum" ve "Kesinlikle Katılıyorum" seçeneklerinde erkeklerden daha fazla yer almış ve bu da kadınların promosyonlar bulmak için sosyal medyayı erkeklerden daha çok kullasdıklarınmı göstermektedir.

Tablo 8. Sosyal medyada sağlıksız yiyeceklerle ilgili paylaşımlardan etkileniyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	43,7%	56,3%	100,0%
Katılmıyorum	41,4%	58,6%	100,0%
Kararsızım	39,2%	60,8%	100,0%
Katılıyorum	49,3%	50,7%	100,0%
Kesinlikle Katılıyorum	63,8%	36,2%	100,0%
Toplam	45,0%	55,0%	100,0%

Sosyal medyada sağlıksız yiyeceklerle ilgili paylaşımlardan etkileniyorum sorusuna ait frekans tablosu incelendiğinde, Kadınlar, sosyal medya üzerindeki sağlıksız yiyeceklerle ilgili paylaşımlardan daha fazla etkilendiği gözlemlenmiştir.

Tablo 9. Sosyal medya aracılığıyla gıdaların besin içerikleri ile ilgili bilgi sahibi olurum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,8%	58,2%	100,0%
Katılmıyorum	33,6%	66,4%	100,0%
Kararsızım	45,2%	54,8%	100,0%
Katılıyorum	51,6%	48,4%	100,0%
Kesinlikle Katılıyorum	65,4%	34,6%	100,0%
Toplam	45,0%	55,0%	100,0%

Sosyal medya aracılığıyla gıdaların besin içerikleri ile ilgili bilgi sahibi olurum sorusuna ait frekans tablosu incelendiğinde, Kadınlar, gıdaların besin içerikleri ile ilgili önerileri konusunda erkeklere oranla daha fazla dikkat ettiği görülmüştür. Kadınların, sosyal medya üzerinden gıdaların besin içerikleri ile ilgili bilgi edinmeye erkelere göre daha fazla ilgi gösterdikleri gözlemlenmiştir.

Tablo 10. Sosyal medya aracılığıyla yiyeceklerin nasıl tüketileceği hakkında bilgiye sahibi olurum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	38,6%	61,4%	100,0%
Katılmıyorum	35,9%	64,1%	100,0%
Kararsızım	49,2%	50,8%	100,0%
Katılıyorum	53,2%	46,8%	100,0%
Kesinlikle Katılıyorum	63,5%	36,5%	100,0%
Toplam	45,0%	55,0%	100,0%

Sosyal medya aracılığıyla yiyeceklerin nasıl tüketileceği hakkında bilgiye sahibi olurum sorusuna ait frekans tablosu incelendiğinde, Kadınlar, erkeklere oranla yiyeceklerin nasıl tüketileceği hakkında bilgisine daha fazla ilgi gösterdiği ("Kesinlikle Katılıyorum" ve "Katılıyorum") görülmektedir.

Tablo 11. Sosyal medya üzerinden yemek pişirme yöntemleri ve tarifler ile ilgili bilgilere ulaşıyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	34,0%	66,0%	100,0%
Katılmıyorum	31,5%	68,5%	100,0%
Kararsızım	38,7%	61,3%	100,0%
Katılıyorum	54,4%	45,6%	100,0%
Kesinlikle Katılıyorum	73,9%	26,1%	100,0%
Toplam	45,0%	55,0%	100,0%

Sosyal medya üzerinden yemek pişirme yöntemleri ve tarifler ile ilgili bilgilere ulaşıyorum sorusuna ait rekans tablosu incelendiğinde, Kadınlar, yemek pişirme yöntemleri ve tarifler ile ilgili bilgilere sosyal medyada daha fazla baktıkları gözlemlenmiştir ("Katılıyorum" ve "Kesinlikle Katılıyorum").

Tablo 12. Sağlıklı beslenme konusunda sosyal medyanın etkili olduğunu düşünüyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,7%	58,3%	100,0%
Katılmıyorum	35,9%	64,1%	100,0%
Kararsızım	36,7%	63,3%	100,0%
Katılıyorum	56,2%	43,8%	100,0%
Kesinlikle Katılıyorum	60,8%	39,2%	100,0%
Toplam	45,0%	55,0%	100,0%

Sağlıklı beslenme konusunda sosyal medyanın etkili olduğunu düşünüyorum sorusuna ait frekans tablosu incelendiğinde, Kadınlar, sosyal medya üzerinde Sağlıklı beslenme konusunda sosyal medyanın etkili olduğu konusunda erkeklerden daha fazla güvenme eğilimindedir. Kadınlar "Katılıyorum" ve "Kesinlikle Katılıyorum" gibi seçeneklerde erkeklere oranla daha fazla yer almaktadır.

Tablo 13. Gıda/yiyeceklerle ilgili olarak sosyal medyadan geleneksel medyaya göre (gazeteler ve TV'ler) daha doğru bilgi alıyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,9%	58,1%	100,0%
Katılmıyorum	45,7%	54,3%	100,0%
Kararsızım	37,5%	62,5%	100,0%
Katılıyorum	49,8%	50,2%	100,0%
Kesinlikle Katılıyorum	57,1%	42,9%	100,0%
Toplam	45,0%	55,0%	100,0%

Gıda/yiyeceklerle ilgili olarak sosyal medyadan geleneksel medyaya göre (gazeteler ve TV'ler) daha doğru bilgi alıyorum sorusuna ait frekans tablosu incelendiğinde, Kadınlar, bu soruya kesinlikle katılıyorum cevabını erkelerden daha fazla vermiş, erkeler ise kesinlikle katılmıyorum cevabını daha yüksek oranda vermiştir.

Tablo 14. Gıda/yiyeceklerle ilgili olarak sosyal medyadan geleneksel medyaya göre (gazete ve TV) daha kolay bilgi edinebilirim sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,4%	58,6%	100,0%
Katılmıyorum	43,3%	56,7%	100,0%
Kararsızım	39,1%	60,9%	100,0%
Katılıyorum	48,5%	51,5%	100,0%
Kesinlikle Katılıyorum	55,6%	44,4%	100,0%
Toplam	45,0%	55,0%	100,0%

Gıda/yiyeceklerle ilgili olarak sosyal medyadan geleneksel medyaya göre (gazete ve TV) daha kolay bilgi edinebilirim sorusuna ait frekans tablosu incelendiğinde, yine Kadınlar, bu soruya kesinlikle katılıyorum cevabını erkelerden daha fazla vermiş, erkeler ise kesinlikle katılmıyorum cevabını daha yüksek oranda vermiştir.

Tablo 15. Gıda/yiyecek markaları hakkında sosyal medyadan bilgi ediniyorum sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	41,2%	58,8%	100,0%
Katılmıyorum	33,8%	66,3%	100,0%
Kararsızım	45,1%	54,9%	100,0%
Katılıyorum	54,6%	45,4%	100,0%
Kesinlikle Katılıyorum	56,1%	43,9%	100,0%
Toplam	45,0%	55,0%	100,0%

Gıda/yiyecek markaları hakkında sosyal medyadan bilgi ediniyorum sorusuna ait frekans tablosu incelendiğinde**,** Kadınlar, "Katılıyorum" ve "Kesinlikle Katılıyorum" gibi seçeneklerde daha yüksek oranlarla yer alırken, erkekler daha düşük oranlar sergilemektedir. Kadınlar sosyal medyadan gıda markaları hakkında erkeklere göre daha fazla bilgi edinmektedir.

Tablo 16. Diğer insanların sosyal medyada yiyecek konusundaki paylaşımları, deneyimleri ve önerilerinden etkilenmekteyim sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	42,5%	57,5%	100,0%
Katılmıyorum	39,2%	60,8%	100,0%
Kararsızım	46,6%	53,4%	100,0%
Katılıyorum	50,4%	49,6%	100,0%
Kesinlikle Katılıyorum	70,6%	29,4%	100,0%
Toplam	45,0%	55,0%	100,0%

Diğer insanların sosyal medyada yiyecek konusundaki paylaşımları, deneyimleri ve önerilerinden etkilenmekteyim sorusuna ait frekans tablosu incelendiğinde, Kadınların Diğer insanların sosyal medyada yiyecek konusundaki paylaşımları, deneyimleri ve önerilerinden etkilenmekteyim sorusuna "Katılıyorum" ve "Kesinlikle Katılıyorum" seçeneklerinde daha fazla yer alması, onların başkalarından önerilerinden daha fazla etkilendiği göz önüne çıkmıştır.

Tablo 17. Ünlü kişilerin sosyal medyadaki gıda/yiyecek tüketimleri ile ilgili paylaşımlarından etkilenirim sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	43,8%	56,2%	100,0%
Katılmıyorum	38,4%	61,6%	100,0%
Kararsızım	46,8%	53,2%	100,0%
Katılıyorum	53,1%	46,9%	100,0%
Kesinlikle Katılıyorum	65,6%	34,4%	100,0%
Toplam	45,0%	55,0%	100,0%

Ünlü kişilerin sosyal medyadaki gıda/yiyecek tüketimleri ile ilgili paylaşımlarından etkilenirim sorusuna ait frekans tablosu incelendiğinde, Kadınlar, Ünlü kişilerin sosyal medyadaki gıda/yiyecek tüketimleri ile ilgili paylaşımlarından erkeklere göre daha fazla etkilendikleri görülmüştür ("Katılıyorum" ve "Kesinlikle Katılıyorum").

Tablo 18. Arkadaşlarımın sosyal medyadaki gıda/yiyecek paylaşımlarından etkilenirim sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	43,7%	56,3%	100,0%
Katılmıyorum	40,1%	59,9%	100,0%
Kararsızım	45,7%	54,3%	100,0%
Katılıyorum	49,8%	50,2%	100,0%
Kesinlikle Katılıyorum	58,8%	41,2%	100,0%
Toplam	45,0%	55,0%	100,0%

Arkadaşlarımın sosyal medyadaki gıda/yiyecek paylaşımlarından etkilenirim sorusuna ait frekans tablosu incelendiğinde**,** Kadınlar, bu soruya kesinlikle katılıyorum cevabını erkelerden daha fazla vermiş, erkeler ise kesinlikle katılmıyorum cevabını daha yüksek oranda vermiştir. Kadınlar arkadaşlarının paylaşımlarından erkeklere göre daha fazla etkilendiği ortaya çıkmıştır.

Tablo 19. Sosyal medyadaki gurme hesaplarındaki gıda/yiyecek paylaşımlarından etkilenirim sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	44,1%	55,9%	100,0%
Katılmıyorum	39,1%	60,9%	100,0%
Kararsızım	46,1%	53,9%	100,0%
Katılıyorum	49,8%	50,2%	100,0%
Kesinlikle Katılıyorum	68,8%	31,3%	100,0%
Toplam	45,0%	55,0%	100,0%

Sosyal medyadaki gurme hesaplarındaki gıda/yiyecek paylaşımlarından etkilenirim sorusuna ait frekans tablosu incelendiğinde**,** Kadınlar, bu soruya kesinlikle katılıyorum cevabını erkelerden daha fazla vermiş, erkeler ise kesinlikle katılmıyorum cevabını daha yüksek oranda vermiştir. Kadınlar sosyal medyadaki gurmelerin paylaşımlarından erkeklere göre daha fazla etkilendiği ortaya çıkmıştır.

Tablo 20. Bir gıda ürünü, gıda markası veya restoran hakkında sosyal medyadaki olumsuz haberlerden etkilenirim sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	42,5%	57,5%	100,0%
Katılmıyorum	38,5%	61,5%	100,0%
Kararsızım	54,5%	45,5%	100,0%
Katılıyorum	47,5%	52,5%	100,0%
Kesinlikle Katılıyorum	50,0%	50,0%	100,0%
Toplam	45,0%	55,0%	100,0%

Bir gıda ürünü, gıda markası veya restoran hakkında sosyal medyadaki olumsuz haberlerden etkilenirim sorusuna ait frekans tablosu incelendiğinde, gıda markası veya restoran hakkında sosyal medyadaki olumsuz haberlerden her iki cinsiyetinde etkilendiği gözlenmiştir.

Tablo 21. Yiyecek-içecekler mobil uygulamalarını kullanırım (kalorisayar, bisu, starbucks, vivino, dominos vb.) sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	48,3%	51,7%	100,0%
Katılmıyorum	39,6%	60,4%	100,0%
Kararsızım	46,9%	53,1%	100,0%
Katılıyorum	44,9%	55,1%	100,0%
Kesinlikle Katılıyorum	31,3%	68,8%	100,0%
Toplam	45,0%	55,0%	100,0%

Yiyecek-içecekler mobil uygulamalarını kullanırım (kalorisayar, bisu, starbucks, vivino, dominos vb. sorusuna ait frekans tablosu incelendiğinde, erkekler "Katılıyorum" ve "Kesinlikle Katılıyorum" seçeneklerinde daha yüksek oranlarda cevap vermiştir.

Tablo 22. Paket yemek servisleri veya marketlerin eve ürün teslimi (sanal market) için internet ve mobil uygulamalar kullanırım sorusuna ait çapraz frekans tablosu

	Cinsiyet		
	Kadın	Erkek	Total
Kesinlikle Katılmıyorum	46,8%	53,2%	100,0%
Katılmıyorum	38,1%	61,9%	100,0%
Kararsızım	55,0%	45,0%	100,0%
Katılıyorum	43,8%	56,2%	100,0%
Kesinlikle Katılıyorum	39,0%	61,0%	100,0%
Toplam	45,0%	55,0%	100,0%

Paket yemek servisleri veya marketlerin eve ürün teslimi (sanal market) için internet ve mobil uygulamalar kullanırım sorusuna ait frekans tablosu incelendiğinde, erkekler "Katılıyorum" ve "Kesinlikle Katılıyorum" seçeneklerinde daha yüksek oranlarda cevap vermiştir.

5. SONUÇ VE ÖNERİLER

Bu çalışmada, sosyal medya kullanımının gıda alımı ve tüketimi üzerindeki etkileri cinsiyet farklılıklarına göre incelenmiştir. Elde edilen bulgular, sosyal medya kullanım alışkanlıklarının ve içerik türlerinin cinsiyetler arasında farklılıklar gösterdiğini ortaya koymuştur.

Kadınlar, sosyal medya üzerinde sağlıklı beslenme, yemek tarifleri ve mutfak önerilerine erkeklerden daha fazla ilgi göstermektedir. Kadınlar, bu içeriklere yönelik daha yüksek katılım oranlarına sahipken, erkekler bu tür içerikleri daha az takip etmektedir. Bu durum, kadınların gıda tüketiminde daha bilinçli bir yaklaşım sergileyebileceğini düşündürmektedir.

Sosyal medya üzerinden gıda alımı ile ilgili reklamlara ve yorumlara dikkat etme konusunda da kadınlar erkeklerden daha fazla eğilim göstermektedir. Bu bulgu, kadınların sosyal medya üzerindeki gıda reklamlarını ve kullanıcı yorumlarını daha fazla dikkate aldığını ve bu bilgileri satın alma kararlarında bir referans noktası olarak kullanma eğiliminde olduklarını göstermektedir.

Cinsiyetler arasındaki farklar, sosyal medya platformları üzerinde kadınların daha etkileşimli ve bilgi arayışı içinde olduklarını, erkeklerin ise daha pasif bir tutum sergilediklerini ortaya koymaktadır. Erkekler genellikle sosyal medya üzerinden yapılan gıda ile ilgili paylaşımlara daha düşük oranda katılım gösterirken, kadınlar bu paylaşımlar üzerinden daha fazla bilgi edinmeye ve bu bilgileri uygulamaya yönelmektedir.

Sosyal medya üzerinden yapılan yorumlar ve içerikler, tüketici davranışlarını yönlendirme potansiyeline sahiptir. Kadınlar, özellikle sağlıklı beslenme ve yemek tarifleri gibi içeriklere daha fazla odaklanırken, erkekler daha çok yemekle ilgili pratik ve basit önerilere ilgi göstermektedir.

Markaların kadınlara yönelik sosyal medya reklamlarını artırmaları gerekmektedir. Kadınlar, gıda alımı ve tüketimi ile ilgili sosyal medya içeriklerine daha fazla ilgi gösterdiği için, markaların sosyal medya stratejilerini bu eğilimlere göre şekillendirmeleri faydalı olacaktır. Sağlıklı beslenme ve yemek tarifleri gibi içeriklerle kadınları hedef alacak kampanyalar daha etkili olabilir.

Erkekler için daha pratik ve işlevsel içerikler geliştirilmelidir. Erkeklerin sosyal medyada genellikle daha az etkileşime girdiği gözlemlenmiştir. Bu nedenle, erkeklere yönelik sosyal medya içeriklerinde pratik yemek tarifleri veya hızlı hazırlık önerileri gibi daha işlevsel ve basit içerikler sunulması, bu grubun dikkatini çekebilir.

Sosyal medya içeriklerinin etkileşimli hale getirilmesi önerilmektedir. Kullanıcıların içeriklerle daha fazla etkileşime girmesini sağlamak amacıyla, sosyal medya platformlarında anketler, soru-cevap etkinlikleri, interaktif yemek tarifleri gibi etkileşimli içerikler sunulabilir. Bu tür içerikler, kullanıcıların daha fazla katılım göstermesini ve içeriklerle bağlantı kurmalarını sağlayabilir.

Sosyal medya yorumları ve geri bildirimler daha fazla dikkate alınmalıdır. Tüketiciler, sosyal medya üzerinden yapılan yorumları satın alma kararlarında referans olarak kullanmaktadır. Markaların bu yorumları dikkatle izlemeleri ve kullanıcıların geri bildirimlerine hızlı bir şekilde yanıt vermeleri, müşteri memnuniyetini artırabilir.

Sağlıklı beslenme konusundaki farkındalık artırılmalıdır. Özellikle kadınlar arasında sağlıklı beslenme ile ilgili içeriklerin daha fazla rağbet gördüğü göz önüne alındığında, sosyal medya üzerinden sağlıklı beslenme konusunda bilgilendirici ve eğitici kampanyalar düzenlenmesi önerilmektedir. Bu, tüketicilerin daha bilinçli alışveriş yapmalarına ve sağlıklı yaşam tarzlarına yönelmelerine yardımcı olabilir.

ABSTRACT

This study was carried out to determine some quality characteristics of *Cota* species collected from the Southeastern Anatolia Region, which are important for animal nutrition, and the similarities between the locations where these species were collected. *Cota* species were considered as the subject of the study because of their widespread occurrence in pastures and natural areas of Southeastern Anatolia Region and plants of *Cota* species collected from 10 different locations of the region were used as material. Crude protein (CP), acid detergent protein (ADP), acid detergent fiber (ADF), neutral detergent fiber (NDF), digestible dry matter (DDM), dry matter intake (DMI), relative feed value (RFV), calcium (Ca), magnesium (Mg), phosphorus (P) and potassium (K) were determined in the dry grasses of *Cota* species. It was observed that there were significant statistical differences among the locations in terms of these traits. In the study, it was determined that *Cota* species were in the third quality class in terms of CP ratio, second quality class in terms of ADF and DDM ratios, and first quality class in terms of NDF and DMI contents and RFV. P, K, Mg and K:(Ca+Mg) ratios of *Cota* species were also found to be at ideal levels, but Ca content was high and Ca:P ratio was above the required limit value (>2). Cluster analysis was performed to reveal the similarity of the locations. As a result of the cluster analysis, it was determined that 10 different locations showed variation to be divided into two main groups. Among these groups, Gaziantep (2) where *Cota altisima* species was taken and Şanlıurfa (2) where *Cota wiedemanniana* species was taken were the closest to each other, while Diyarbakır and Gaziantep (1) where *Cota altissima* species was taken were the farthest from each other.

Keywords: *Cota* species, Quality characteristics, Minerals, Cluster analysis

BAZI *Cota* TÜRLERİNİN OT KALİTE ÖZELLİKLERİ AÇISINDAN DEĞERLENDİRİLMESİ

ÖZET

Güneydoğu Anadolu Bölgesinden toplanan *Cota* türlerinin, hayvan besleme açısından önem arz eden bazı kalite özellikleri ile bu türlerin toplandığı lokasyonların birbirlerine benzerliklerini tespit etmek amacıyla, bu çalışma yürütülmüştür. *Cota* türleri, Güneydoğu Anadolu Bölgesi'nin mera ve doğal alanlarında yaygın olarak bulunmasından dolayı çalışma konusu olarak ele alınmış ve bölgenin 10 değişik lokasyonundan toplanan *Cota* türlerine ait bitkiler, materyal olarak kullanılmıştır. *Cota* türlerine ait bitkilerin kuru otlarında ham protein (HP), asit deterjanda çözünmeyen protein (ADP), asit deterjanda çözünmeyen lif (ADF), nötral deterjanda çözünmeyen lif (NDF), sindirilebilir kuru madde (SKM), kuru madde tüketimi (KMT), nispi yem değeri (NYD), kalsiyum (Ca), magnezyum (Mg), fosfor (P) ve potasyum (K) oranları saptanmıştır. İncelenen bu özellikler açısından lokasyonlar arasında önemli istatistiksel farklılıkların olduğu görülmüştür. Araştırmada, *Cota* türlerinin HP oranı açısından üçüncü, ADF ve SKM oranları açısından ikinci, NDF ve KMT içerikleri ile NYD açısından birinci kalite sınıfında yer aldığı belirlenmiştir. *Cota* türlerinin P, K, Mg ve K:(Ca+Mg) oranlarının da ideal düzeyde olduğu, ancak Ca içeriklerinin yüksek ve buna bağlı olarak Ca:P oranının ise olması gereken sınır değerin (>2) üzerinde olduğu belirlenmiştir. Lokasyonların benzerlik durumlarını ortaya koyma amacıyla kümeleme analizi yapılmıştır. Yapılan kümeleme analizi sonucunda 10 farklı lokasyonun iki ana gruba ayrılacak şekilde varyasyon gösterdiği belirlenmiştir. Bu gruplar arasında *Cota altisima* türünün alındığı Gaziantep (2) ve *Cota wiedemanniana* türünün alındığı Şanlıurfa (2) lokasyonlarının birbirine en yakın, *Cota altissima* türünün alındığı Diyarbakır ve Gaziantep (1) lokasyonlarının da birbirlerine en uzak lokasyonlar olduğu saptanmıştır.

Anahtar Kelimeler: *Cota* türleri, Kalite özellikleri, Mineraller, Kümeleme analizi

1.GİRİŞ

Astraceae familyası dünyanın her yerinde en fazla taksonla temsil edilen familyadır. Antartika hariç dünyanın her yerine dağılmış yaklaşık 1600-1700 cins ve yaklaşık 24000 türe sahiptir (Funk et al., 2005).

Astraceae familyasının bir üyesi olan *Cota* cinsi, dünyada 49 türe ait 63 takson ile temsil edilmektedir. *Cota* cinsi dünya üzerinde Akdeniz ve İran-Turan fitocoğrafik bölgelerinin birbirleriyle çakıştığı alanlarda yayılış göstermektedir. Çoğunlukla Avrupa'nın kuzeyi hariç bütününde, Afrika'nın kuzeyinde, Kafkaslar ve Güney Rusya'nın bir kısmında ve Anadolu'dan Afganistan'a kadar olan kesimde yayılış göstermektedir. *Cota* cinsinin çeşitlilik merkezlerinden birisi de Türkiye'dir. Özellikle Türkiye'nin Akdeniz ve İran-Turan fitocoğrafik bölgelerinde yaygındır. Türkiye'de *Cota* cinsi 22 taksondan (17 tür, 2 alttür, 3 varyete) oluşmakta ve bunların 9 adedi Türkiye için endemiktir. Bu durum *Cota* cinsi için %41'lik bir endemizm oranına tekabül etmektedir (Özbek, 2010; Özbek et al., 2018; Özbek & Vural, 2020; Özbek et al., 2011).

Türkiye'de *Cota* cinsi ile ilgili olarak yapılan çalışmalara bakıldığında, Gazi Üniversitesi Fen Fakültesi öğretim üyelerinden sayın Doç. Dr. Mehmet Ufuk Özbek'in konu ile ilgili çalışmalara hem yurtiçi hem de yurtdışında öncülük ettiği anlaşılmaktadır. Araştırmacı tarafından, *Cota* cinsinin taksonomik revizyonu (Özbek, 2010), *Cota* cinsine ait bazı endemik taksonların kromozom özellikleri (Özbek et al., 2010), *Cota* cinsinin polen morfolojisi (Özbek et al., 2016), aken morfolojisi (Özbek et al., 2018), *Cota* cinsinin sinopsisi (Özbek & Vural, 2020) gibi birçok çalışmanın başarıyla yapıldığı görülmektedir. Ayrıca araştırmacı tarafından Uludağ'da 2011 yılında bulunan yeni bir tür, *Cota hamzaoglui* U.Özbek & Vural (Asteraceae, Anthemideae) ismi ile bilim dünyasına kazandırılmıştır (Özbek et al., 2011).

Özbek dışında diğer araştırmacılar tarafından yapılan diğer çalışmaların ise daha çok flora çalışmalarında tespit edilen *Cota* türleri veya *Cota* türlerinin geleneksel olarak kullanımları ile ilgili olduğu görülmektedir. Örneğin, Göller bölgesinde yayılış gösteren bitkilerin tehdit sınıfları ve endemizm durumlarının incelendiği bir çalışmada *Cota fulvida* türünün tehdit sınıfı kritik olarak belirlenmiştir (Arslan et al., 2015). Düzce bölgesindeki ballarda yapılan polen analizinde *Cota tinctoria* var. *pallida* türünün %3'ten düşük eser düzeyde polene sahip olduğu bildirilmiştir (Atsay & Çakır, 2022). Güneydoğu Anadolu Bölgesi'nde aktarlarda satılan papatya türlerinin tespitine yönelik yapılan bir çalışmada Siirt, Batman, Mardin, Diyarbakır, Şanlıurfa ve Gaziantep illerinde aktarlar tarafından satılan türlerin %95.7 oranı ile *Cota altissima* (köpek papatyası) türü olduğu bildirilmiştir. *Cota altissima* türünün etnobotanik çalışmalarda hazımsızlık, boğaz ağrısı, yara iyileştirici, adet ağrısı, sarılık, mide rahatsızlığı ve öksürük için kullanıldığı bildirilmiş ise de bunu doğrulayan bilimsel çalışmalara rastlanılmadığı belirtilmiştir (Arslan, 2019). Artvin bölgesinde yapılan floristik bir çalışmada tespit edilen bitki taksonlarının geleneksel kullanımları ele alınmıştır. Bu çalışmada *Cota altissima* ve *Cota tinctoria* türlerinin bronşit ve öksürük giderici olarak kullanıldığı bildirilmiştir (Ergül Bozkurt et al., 2019).

Bu çalışmalar dışında *Cota* türlerinin sahip olduğu ve hayvancılık açısından önem arz eden kalite özelliklerinin tespitine yönelik çalışmaların ise yapılmadığı görülmüştür. Bu nedenle bu çalışma, Güneydoğu Anadolu Bölgesinin farklı lokasyonlarından toplanan *Cota* türlerinin

hayvanlar açısından besleme derecesini ortaya koymak ve türlerin toplandığı lokasyonlar arasındaki benzerlik ve farklılıkları incelemek amacıyla yürütülmüştür.

2.MATERYAL VE METOT

Güneydoğu Anadolu Bölgesi'nin 10 farklı lokasyonundan toplanan *Cota* türlerine ait bitki örnekleri, araştırmanın materyalini oluşturmaktadır. *Cota* türlerinin toplandığı lokasyonlara ait bazı bilgiler (enlem, boylam ve rakım) Tablo 1'de, bu türlere ait bazı fotoğraflar da Şekil 1'de verilmiştir. *Cota* türleri, Tablo 1'de verilen lokasyonlardan çiçeklenme döneminde ve 2023 yılının Mayıs ayı içerisinde toplanmıştır. Toplanan bitki örneklerinin teşhisi Dicle Üniversitesi Fen Fakültesi Biyoloji Bölümü öğretim üyelerinden Prof. Dr. A. Selçuk ERTEKİN tarafından yapılmıştır.

Tablo 1'de belirtilen lokasyonlarda ve belirtilen tarihlerde *Cota* türlerine ait bitki örnekleri, tesadüfi ve üç tekerrürlü olacak şekilde yaklaşık 200 g alınmıştır. Bitki örnekleri 65 ºC'de 48 saat kurutulduktan sonra el değirmeni yardımıyla öğütülmüştür. Öğütülen örnekler 1 mm elekte elendikten sonra analize gönderilmiştir. *Cota* türlerinin HP, ADP, ADF, NDF, Ca, Mg, P ve K analizleri NIRS (Near Infrared Spectroscopy, Foss Model 6500) cihazı ile yapılmıştır. Analizde baklagil yem bitkilerine ait kalibrasyon seti kullanılmıştır (Basbag et al., 2023; Başaran et al., 2011; Cacan et al., 2018; Çaçan et al., 2014; Sayar et al., 2022). Tespit edilen ADF ve NDF değerlerinden hareketle SKM, KMT ve NYD hesaplanmıştır (SKM=88.9-(0.779 x %ADF), KMT= (120/NDF), NYD= (SKM x KMT) / 1.29) (Morrison, 2003).

Tablo 1. *Cota* türlerinin toplandığı lokasyonlar ve bu lokasyonların coğrafi konumları

Türler	Lokasyon	Rakım	Enlem (N)	Boylam (E)

10. Cota wiedemanniana (Fisch. & C.A.Mey.)	Şanlıurfa (2)	773	37°50'34.57"	39° 7'49.64"

Araştırma verileri, tesadüf blokları deneme deseninde üç tekerrürlü olacak şekilde JMP programı vasıtasıyla varyans analizine tabi tutulmuştur. Ortalamalar arasındaki benzerlikler ve farklılıklar Tukey (%5) testi ile karşılaştırılmıştır. Araştırmada türler bir faktör olarak ele alınmış olup, lokasyonların birbirine olan yakınlık ve uzaklıklarını belirlemek için de kümeleme analizi (cluster) yapılmıştır (JMP, 2018).

Şekil 1. *Cota* türlerine ait fotoğraflar (Sırasıyla *Cota altissima*, *Cota coelopoda* ve *Cota wiedemanniana*)

3.BULGULAR VE TARTIŞMA

Farklı lokasyonlarından toplanan *Cota* türlerinin HP, ADP, ADF ve NDF içerikleri Tablo 2'de sunulmuştur. Tablo 2'deki verilere göre, incelenen tüm parametreler açısından *Cota* türleri arasında istatistiksel olarak anlamlı farklılıklar tespit edilmiştir ($P<0.01$).

Cota türlerinin HP oranları %9.2 ile %14.2 arasında değişim göstermiştir. En yüksek HP oranı *Cota coelopoda*'nın Diyarbakır (1) lokasyonundan, en düşük HP oranı ise Gaziantep lokasyonundan alınan *Cota altissima* türünde saptanmıştır. ADP oranı %0.48 ile %0.78 arasında değişim göstermiştir. En yüksek ADP oranı *Cota altissima*'nın Gaziantep (1) ve Gaziantep (2) lokasyonlarından, en düşük ADP oranı *Cota wiedemanniana*'nın Şanlıurfa (1) lokasyonundan alınmıştır. ADF oranı %30.1 ile %41.4, NDF oranı ise %35.8 ile %48.7 arasında değişmiştir. En düşük ADF oranı *Cota wiedemanniana*'nın Diyarbakır (1) ve *Cota coelopoda*'nın Adıyaman (1) lokasyonlarından, en yüksek ADF oranı da *Cota altissima*'nın Diyarbakır, *Cota wiedemanniana*'nın Şanlıurfa (2), *Cota coelopoda*'nın Adıyaman (2) ve *Cota altissima*'nın Gaziantep (2) lokasyonlarından alınmıştır. En düşük NDF oranı da *Cota wiedemanniana*'nın Diyarbakır (1) ve Şanlıurfa (1), *Cota coelopoda*'nın Adıyaman (1) lokasyonlarından, en yüksek NDF oranı da *Cota altissima*'nın Gaziantep (2), Gaziantep (1), Diyarbakır, *Cota coelopoda*'nın Adıyaman (2) ve Diyarbakır (1) ile *Cota wiedemanniana*'nın Şanlıurfa (2) lokasyonlarında saptanmıştır (Tablo 2).

Tablo 2. *Cota* türlerine ait HP, ADP, ADF ve NDF içerikleri

Türler	Lokasyon	HP (%)	ADP (%)	ADF (%)	NDF (%)

**: P<0.01 düzeyinde önemli ve tabloda aynı sütunda aynı harfle gösterilen ortalamalar arasındaki fark önemsizdir.

Ham protein oranı %19'dan yüksek olunca prime, %17-19 arasında birinci, %14-16 arasında ikinci, %11-13 arasında üçüncü ve %8-10 arasında dördüncü kalite sınıfında yer almaktadır. ADF oranı %31'den düşük olması durumunda prime, %31-35 arasında birinci, %36-40 arasında ikinci ve %41-42 arasında üçüncü, %43-45 arasında dördüncü kalite sınıfında yer almaktadır. NDF oranı %40'dan düşük olması durumunda yem bitkilerinin kalite standardı en iyi kalite olan prime, %40-46 arasında olunca birinci ve 47-53 arasında olunca ikinci kalite sınıfında yer almaktadır (Lacefield, 1988).

Ham protein oranı açısından Diyarbakır (1) lokasyonundan alınan *Cota coelopoda* türü ikinci, Gaziantep (1) lokosyonundan alınan *Cota altissima* dördüncü, geriye kalan diğer türlerin ise üçüncü sınıf kalite grubunda yer aldığı görülmektedir. ADF açısından Adıyaman (1) lokasyonundan alınan *Cota coelopoda* ile Diyarbakır (1) ve Şanlıurfa (1) lokasyonlarından alınan *Cota wiedemanniana* türlerinin birinci, Diyarbakır lokasyonundan alınan *Cota altissima* ve Şanlıurfa (2) lokasyonlarından alınan *Cota wiedemanniana* türlerinin üçüncü, geriye kalan diğer türlerin ise ikinci kalite sınıfında yer aldığı görülmektedir. NDF oranı açısından ise Adıyaman (1) lokasyonundan alınan *Cota coelopoda* ile Diyarbakır (1) ve Şanlıurfa (1) lokasyonlarından alınan *Cota wiedemanniana* türlerinin prime, Gaziantep (2) lokasyonundan alınan *Cota altissima*'nın ikinci ve geriye kalan diğer türlerin de birinci kalite sınıfında yer aldıkları görülmektedir.

Asteraceae familyasına ait türlerin kalite özellikleri ile ilgili daha önce yapılan çalışmalara bakıldığında; *Artemisia* sp. türünün HP oranı %17.63, ADF oranı %24.37 ve NDF oranı 26.39, *Tanacetum densum* türünde HP oranı %14.15, ADF oranı %33.00 ve NDF oranı %34.37 olarak tespit edildiği bildirilmiştir (Başbağ et al., 2018). On iki adet Asteraceae familyasına ait türün

kalite özelliklerinin incelendiği başka bir çalışmada ortalama olarak HP oranı %19.18, ADF oranı %26.28, NDF oranı %32.48 olarak tespit edilmiştir (Basbag & Sayar, 2023). Asteraceae familyasının bir üyesi olan *Crepis* cinsinin on farklı lokasyondan toplanan beş farklı türünde ortalama HP oranı %16.5, ADP oranı %0.66, ADF oranı %25.1 ve NDF oranı %34.1 olarak tespit edilmiştir (Başbağ & Çaçan, 2025). Araştırma konusu olan bitkilerin doğadan ve farklı lokasyonlardan toplanıyor olmaları ve elde edilen sonuçların aynı familyanın farklı türlerinden elde edilen sonuçlar olmalarından dolayı, ortaya çıkan farklılıklar olası kabul edilmektedir.

Farklı lokasyonlarından toplanan *Cota* türlerine ait SKM, KMT ve NYD ile ilgili sonuçlar Tablo 3'te yer almaktadır. Tablo 3 incelendiğinde, tüm özellikler açısından lokasyonlar arasında istatistiksel olarak anlamlı farklılıklar bulunduğu görülmektedir (P<0.01).

SKM oranı %56.6-65.4, KMT oranı %2.46-3.35 ve NYD 111-170 arasında değişim göstermiştir. Ortalama SKM oranı %60.1, KMT oranı %2.80 ve NYD ise 131 olarak belirlenmiştir. En yüksek SKM oranı, Diyarbakır (1) lokasyonundan alınan *Cota wiedemanniana* ile Adıyaman (1) lokasyonundan alınan *Cota coelopoda* türlerinde tespit edilmiştir. En düşük SKM oranı Diyarbakır lokasyonundaki *Cota altissima* türünden alınmıştır. En yüksek KMT oranı ile en yüksek nispi yem değeri ise SKM oranı ile benzer olacak şekilde Diyarbakır (1) lokasyonundaki *Cota wiedemanniana* ile Adıyaman (1) lokasyonundaki *Cota coelopoda* türlerinden alınırken, bu türleri Şanlıurfa (1) lokasyonundan alınan *Cota wiedemanniana* türü takip etmiştir. En düşük KMT oranı ile en düşük nispi yem değerleri de geriye kalan diğer tüm lokasyon ve türlerden alınmıştır (Tablo 3).

Tablo 3. *Cota* türlerine ait SKM ve KMT oranları ile NYD

Türler	Lokasyon	SKM (%)	KMT (%)	NYD
1.Cota altissima	Diyarbakır	56.6 e	2.64 c	116 c
2. Cota altissima	Gaziantep (1)	60.6 b	2.58 c	121 c

	Ortalama	**60.1**	**2.80**	**131**
	CV (%)	1.52**	3.43**	4.82**

**: P<0.01 düzeyinde önemli ve tabloda aynı sütunda aynı harfle gösterilen ortalamalar arasındaki fark önemsizdir.

Lacefield (1988), SKM oranı %65, KMT oranı %3.0 ve NYD 151'den büyük olan kaba yemlerde kalitenin en iyi (prime) olduğunu bildirmiştir. Bu açıdan bakıldığında, SKM, KMT ve NYD açısından Adıyaman (1) lokasyonundan alınan *Cota coelopoda* ile Diyarbakır (1) lokasyonundan alınan *Cota wiedemanniana* türünün en iyi kalite olan prime grubunda yer aldığı görülmüştür. Geriye kalan diğer türlerin ise daha düşük kalite sınıflarında yer aldıkları belirlenmiştir.

Asteraceae familyasına ait türlerin kalite özelliklerine bakıldığında; *Artemisia* sp. türünde SKM oranı %69.9, KMT oranı %4.55, NYD 246, *Tanacetum densum* türünde SKM oranı %63.21, KMT oranı %3.49 ve NYD 171 olarak tespit edildiği bildirilmiştir (Başbağ et al., 2018). On iki adet Asteraceae familyasına ait türün kalite özelliklerinin incelendiği çalışmada ortalama olarak SKM oranı %68.43, KMT oranı %3.75 ve NYD de 200 olarak tespit edilmiştir (Basbag & Sayar, 2023). Asteraceae familyasının bir üyesi olan *Crepis* cinsinin on farklı lokasyondan toplanan beş farklı türünde ortalama SKM oranı %69.3, KMT oranı %3.57 ve NYD ise 192 olarak tespit edilmiştir (Başbağ & Çaçan, 2025). Araştırma konusu olan türlerin ve lokasyonların farklı olmasından dolayı, daha öne yapılan çalışmalar ile elde edilen sonuçlar arasında da kısmen farklılıkların olduğu görülmektedir.

Cota türlerinin Ca, P, Ca:P, K, Mg ve K:(Ca+Mg) değerleri Tablo 4'te sunulmuştur. Bu özellikler açısından türler arasındaki farklılıklar, istatistiksel olarak önemli bulunmuştur ($P<0.01$).

Lokasyonların kalsiyum oranları %1.13-1.62, fosfor oranları %0.17-0.34, Ca:P oranları 3.33-9.28, potasyum oranları %1.97-3.28, magnezyum oranları %0.24-0.47 ve K:(Ca+Mg) değerleri ise 1.21 ile 2.08 arasında değişim göstermiştir. Genel bir değerlendirme yapıldığında; en yüksek kalsiyum oranının alındığı Gaziantep (1) lokasyonundaki *Cota altissima* türünden, aynı zamanda en düşük P, en yüksek Ca:P, en yüksek K ve en yüksek Mg oranının alındığı saptanmıştır. En düşük kalsiyum oranının alındığı Diyarbakır (1) lokasyonundaki *Cota coelopoda* türünden ise en yüksek P, en düşük Ca:P, en düşük Mg ve en yüksek K:(Ca+Mg) oranının alındığı görülmüştür. Benzer şekilde en düşük potasyum değerinin alındığı Diyarbakır lokasyonundaki *Cota altissima* türünden de en düşük K:(Ca+Mg) değerinin alındığı görülmüştür.

Tablo 4. *Cota* türlerine ait Ca, P, Ca:P, K, Mg ve K:(Ca+Mg) değerleri

Türler	Lokasyon	Ca (%)	P (%)	Ca:P	K (%)	Mg (%)	K:(Ca+Mg)
1.Cota altissima	Diyarbakır	1.29 bcd	0.23 g	5.71 c	1.97 g	0.34 cd	1.21 f

10. Cota wiedemanniana	Şanlıurfa (2)	1.35 bc	0.28 cd	4.84 e	2.34 ef	0.36 bc	1.37 e
	Ortalama	**1.35**	**0.26**	**5.49**	**2.64**	**0.33**	**1.58**
	CV (%)	2.82**	0.95**	2.98**	4.45**	2.86**	3.12**

**: P<0.01 düzeyinde önemli ve tabloda aynı sütunda aynı harfle gösterilen ortalamalar arasındaki fark önemsizdir.

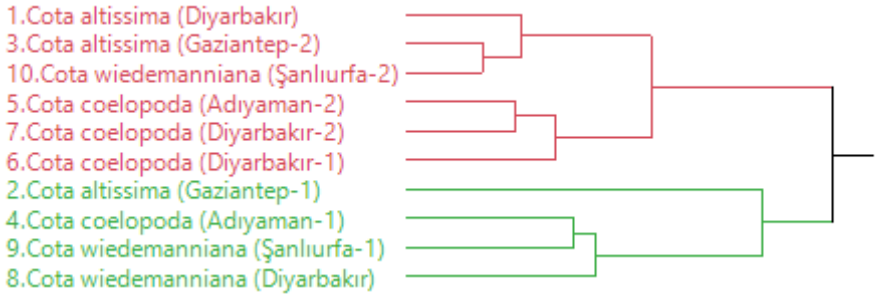
Bitkilerde kalsiyumun %0.10-1.00, fosforun %0.20-0.50, potasyumun %1.00-5.00 ve magnezyumun %0.10-0.40 arasında olması yeterli kabul edilmektedir (Motsara & Roy, 2008). Tablo 4'e göre K oranlarının tüm türler açısından, P ve Mg oranlarının ise Gaziantep (1) lokasyonundaki *Cota altissima* türü dışında kalan diğer türler açısından istenilen düzeyde olduğu görülmüştür. Ancak tüm lokasyonlarda Ca oranlarının olması gereken değerin (%1.00) üzerinde olduğu görülmektedir. Bu durum Ca:P oranının da yüksek olmasına sebebiyet vermektedir. Ca:P oranının 2.0'den fazla olması, hayvanlarda zehirlenmelere yol açabilmektedir (Ayan et al., 2010). Tablo 4'te belirtilen Ca:P dengesizliğin temel nedeninin fosfor eksikliği değil, lokasyonlardan alınan ottaki kalsiyum fazlalığından kaynaklandığı ön görülmektedir.

K:(Ca+Mg) oranının da 2.2'in üzerinde olması, hayvanlarda tetani hastalığı riskini artırmaktadır (Aydın & Uzun, 2002). K:(Ca+Mg) değerinin tüm türler istenilen sınır değerleri içerisinde olduğu, bu türler için böyle bir riskin olmadığı anlaşılmaktadır.

Asteraceae familyasına ait türlerin makro element içeriklerine bakıldığında; *Artemisia* sp. türünde Ca oranı %1.79, P oranı %0.30, Ca:P oranı 5.97, Mg oranı %0.47 ve K oranı %2.66, *Tanacetum densum* türünde Ca oranı %1.59, P oranı %0.30, Ca:P oranı 5.30, Mg oranı %0.49 ve K oranı %2.86 olarak tespit edildiği bildirilmiştir (Başbağ et al., 2018). On iki adet Asteraceae familyasına ait türün makro element içeriklerinin incelendiği çalışmada ortalama olarak P oranı %0.34, K oranı %3.24, Ca oranı %1.41, Mg oranı %0.39, Ca:P oranı 4.25 ve K:(Ca+Mg) oranı da 1.81 olarak tespit edilmiştir (Basbag & Sayar, 2023). Asteraceae familyasının bir üyesi olan *Crepis* cinsinin on farklı lokasyondan toplanan beş farklı türünde

ortalama Ca oranı %1.49, P oranı %0.34, Ca:P oranı 4.46, K oranı %3.42, Mg oranı %0.38 ve K:(Ca+Mg) oranı ise 1.87 olarak tespit edilmiştir (Başbağ & Çaçan, 2025). Daha önce yapılan bu çalışmalar ile mevcut çalışma bulguları arasında büyük oranda benzerlikler olduğu görülmektedir.

Farklı lokasyonlardan toplanan *Cota* türlerinin kümeleme (cluster) analizi sonuçları Şekil 2'de sunulmuştur. Bu analiz, lokasyonlardan elde edilen türlerin benzerlik düzeylerini değerlendirmek amacıyla gerçekleştirilmiştir.



Şekil 2. *Cota* türlerinin toplandığı lokasyonların kümeleme analizi

Şekil 2'de sunulduğu üzere kümeleme analizi neticesinde 2 farklı kümenin oluştuğu ve birinci kümede *Cota altissima* türünün alındığı Diyarbakır ve Gaziantep (2), *Cota wiedemanniana* türünün alındığı Şanlıurfa (2) ile *Cota coelopoda* türünün alındığı Adıyaman (2), Diyarbakır (1) ve Diyarbakır (2) lokasyonlarının, ikinci kümede ise geriye kalan diğer lokasyonların olduğu görülmektedir. Kümelerin benzerlik durumlarına göre birinci kümede *Cota altissima* türünün alındığı Gaziantep (2) ve *Cota wiedemanniana* türünün alındığı Şanlıurfa (2) lokasyonlarının, ikinci kümede *Cota coelopoda* türünün alındığı Adıyaman (1) ve *Cota wiedemanniana* türünün alındığı Şanlıurfa (1) lokasyonlarının benzerlik bakımından birbirlerine en yakın ve benzer lokasyonlar olduğu görülmektedir. İncelenen özellikler bakımından *Cota altissima* türünün alındığı Diyarbakır lokasyonu ile *Cota altissima* türünün alındığı Gaziantep (1) lokasyonunun ise birbirine en uzak olan lokasyonlar olduğu sonucuna varılmıştır.

Kümeleme analizi, lokasyon veya genotiplerin birbirleriyle yakınlıklarını ve uzaklıklarını belirlemek maksadıyla kullanılan analiz yöntemlerinden bir tanesidir. Öten and Albayrak (2016) Batı Akdeniz bölgesinden toplanan yonca popülasyonları arasındaki varyasyon seviyesini belirlemek için kümeleme analizini kullanmışlardır. Yaptıkları kümeleme analizi sonucunda yonca genotiplerinin iki ana ve dört alt gruba ayrıldığını ve birinci grubun %60, ikinci grubun %65 oranında alt gruba ayrıldığını bildirmişlerdir. Yine Öten and Albayrak (2018) 26 yonca popülasyonunun 21 farklı özelliği arasındaki ilişkiyi kümeleme analizi ile incelemişlerdir. Kümeleme analizi neticesinde yonca hatlarının %50 ile %98 arasında benzerlik gösterdiğini ve hatların esasında iki ana gurup altında beş farklı alt guruba ayrıldıklarını tespit etmişlerdir. Başbağ et al. (2019) Güneydoğu Anadolu Bölgesi'nin değişik lokasyonlarından topladıkları *Astragalus hamosus* türünün lokasyonlar arası benzerliklerini tespit etmek için

kümeleme analizini kullanmışlardır. Kümeleme analizi sonucunda 20 farklı lokasyonunun dört grup olacak şekilde varyasyon gösterdiğini bildirmişlerdir. Başbağ and Çaçan (2025) Güneydoğu Anadolu Bölgesinden topladıkları *Crepis* türlerinin lokasyonlar arası benzerliklerini tespit etmek amacıyla da kümeleme analizini kullanmışlardır. Kümeleme analizi sonucunda 10 lokasyonun iki farklı grup olacak şekilde varyasyon gösterdiği bildirilmiştir.

4.SONUÇ

Güneydoğu Anadolu Bölgesinin 10 farklı lokasyonundan toplanan *Cota* türlerinin kalite özellikleri ile bu türlerin toplandığı lokasyonların benzerliklerini belirlemek amacıyla yürütülen bu çalışmada; *Cota* türlerinin HP oranı açısından üçüncü, ADF oranları açısından ikinci, NDF içeriği açısından birinci kalite sınıfında yer aldığı belirlenmiştir. SKM oranı açısından ikinci, KMT oranı ve NYD açısından ise birinci kalite sınıfında yer aldığı belirlenmiştir. *Cota* türlerinin P, K, Mg ve K:(Ca+Mg) oranlarının istenilen seviyede, ancak Ca içeriğinin yüksek ve bundan kaynaklı olarak Ca:P değerinin maksimum seviyenin (>2) üzerinde olduğu görülmüştür. Bu sonuç, *Cota* türlerinden elde edilen otun Ca ve P içerikleri arasında bir dengesizlik olduğunu ve bu dengesizliğin de hayvanlarda zehirlenmelere yol açabileceği anlamını taşımaktadır. Bu şekilde ortaya çıkabilecek olumsuz bir durum, bu türden elde edilen otun ya kurutularak ya da başka otlarla birlikte karıştırılarak hayvanlara yedirilmesi ile engellenebilir. Doğal alanlarda veya meralarda otlayan hayvanlar, karışık beslendikleri için bu şekilde ortaya çıkabilecek bir zehirlenme riski zaten düşük olmaktadır. Yapılan kümeleme analizi neticesinde 10 farklı lokasyonun esasında iki gruba ayrılacak şekilde varyasyon gösterdiği görülmüştür. İncelenen özellikler açısından *Cota altisima* türünün alındığı Gaziantep (2) ve *Cota wiedemanniana* türünün alındığı Şanlıurfa (2) lokasyonlarının birbirine en yakın, *Cota altissima* türünün alındığı Diyarbakır ve Gaziantep (1) lokasyonlarının da birbirlerine en uzak lokasyonlar olduğu görülmüştür.

ABSTRACT

Solar radiation is the Earth's primary source of energy. It plays a vital role in many fields and applications, such as the hydrological cycle, evapotranspiration, climate prediction, agricultural and hydrological modeling, solar energy technologies, and terrestrial ecosystems. Any change in the amount of solar radiation significantly impacts life and the environment. Therefore, understanding the trend direction of solar radiation is essential for explaining meteorological and hydrological processes, ecological functions, energy development, and utilization. In this study, the annual and monthly trends of solar radiation values of Tokat, Amasya, and Samsun stations located in the Central Black Sea Region between 1991-2024 were determined. The Innovative Trend Analysis (ITA) test was applied to the trend analysis and the ITA test results were compared with the Mann-Kendall test, the traditional trend analysis method. When the results were analyzed, it was determined that there were increasing and decreasing changes in many months in Tokat and Amasya stations, while in Samsun station, there was an increase only in April, according to the ITA test. It was determined that there was no change in the annual solar radiation values in general.

Keywords: Solar Radiation, Innovative Trend Analysis, Mann-Kendal Test, Trend Analysis

BAZI ORTA KARADENİZ BÖLGESİ İLLERİNDEKİ SOLAR RADYASYON DEĞİŞİMİNİN YENİLİKÇİ ŞEN VE MANN-KENDALL YÖNTEMLERİYLE BELİRLENMESİ

ÖZET

Solar radyasyon yerkürenin temel enerji kaynağıdır. Hidrolojik döngü, evapotranspirasyon, iklim tahmini, tarımsal ve hidrolojik modelleme, güneş enerjisi teknolojileri ve karasal ekosistem gibi birçok alanda ve uygulamada önemli bir rol oynamaktadır. Solar radyasyon miktarında meydana gelen herhangi bir değişiklik, yaşam ve çevre üzerinde büyük etkilere sebep olmaktadır. Bu nedenle solar radyasyonunun eğilim yönünün anlaşılması, meteorolojik ve hidrolojik süreçleri, ekolojik işlevleri, enerji gelişimini ve kullanımını açıklamak için büyük önem taşımaktadır. Bu çalışmada 1991-2024 yılları arasında Orta Karadeniz Bölgesi'nde yer alan Tokat, Amasya ve Samsun istasyonlarının solar radyasyon değerlerinin yıllık ve aylık değişim eğilimleri tespit edilmiştir. Eğilim analizinde Yenilikçi Trend Analizi (ITA) testi uygulanmıştır ve ITA test sonuçları geleneksel trend analiz yöntemi olan Mann-Kendall testi ile karşılaştırılmıştır. Sonuçlar incelendiğinde Tokat ve Amasya istasyonlarında pek çok ayda artan ve azalan yönde değişimler olduğu, Samsun istasyonunda ise sadece ITA testine göre Nisan ayında artan yönde değişim olduğu belirlenmiştir. Yıllık solar radyasyon değerlerinde ise genel olarak değişim olmadığı saptanmıştır.

Anahtar Kelimeler: Solar Radyasyon, Yenilikçi Trend Analizi, Mann-Kendal Testi, Trend Analizi

1. INTRODUCTION

Solar radiation, which has an essential effect on the formation of climate and weather events, is the source of energy required for the continuity of life. Some radiation passing through the atmosphere is scattered, reflected, or absorbed by atmospheric gases, clouds, and dust. The amount of radiation reaching a horizontal surface is called solar radiation (Rs) (Allen et al. 1998). Solar radiation varies depending on atmospheric conditions, seasons, climate, and geographical location (Solanki, 2002). Therefore, understanding solar radiation clearly is important to minimize the negative environmental impacts of fossil fuels and ensure sustainable development through more effective use of renewable energy sources (Zhang et al., 2017).

Solar radiation data is an important meteorological parameter used in many fields, such as solar energy systems (Yadav & Chandel, 2014; Abdoos et al., 2025), evapotranspiration (Ünlükara, 2014; Cömert et al., 2023), design of agricultural structures (Öztekin et al., 2014; Allardyce et al., 2017), terrestrial ecosystem studies (Ito, 2017), hydrological cycle (Huang et al., 2021) and agricultural production (Domínguez-Álvarez, 2021).

Although solar radiation data are measured at meteorological stations, they are unavailable at most stations, and data from previous years cannot be accessed. In regions where standard measurements cannot be made or where missing data are available, solar radiation data is calculated using the Angstrom formula from the outer surface radiation of the atmosphere and the measured actual sunshine hours. It has been proposed to use temperature differences to derive sunshine hours from the Hargreaves-Samani equation in locations where actual sunshine hours are unavailable (Allen et al., 1998). In recent years, many researchers have modeled solar radiation with different machine-learning methods (Hassan et al., 2017; Dong et al., 2020; Husain & Khan, 2022; Cömert et al., 2023; Arseven & Çınar, 2025).

Mann-Kendall, Linear regression, Spearman Rho, Holt's approach, and Innovative Trend Analysis methods are widely used in the literature to determine the changes in meteorological and hydrological time series (Singh & Kumar, 2016; Öztopal & Şen, 2017; Yürekli et al., 2017; Wang et al., 2019; Cömert et al., 2019; Yürekli, 2022; Laz et al., 2023; Agbo et al., 2023; Şan, 2025). Liu et al. (2010) analyzed the solar radiation trends in China between 1957 and 2008 using the Mann-Kendall approach. Aksoy (2011) obtained the solar radiation series covering 1984-2005 for 20 stations in Turkey from the NASA satellite database and determined the annual change trends with the Mann-Kendall method. In the evaluation, it was determined that there was an increasing trend that started in 1990. Zhou et al. (2018) determined seasonal and annual solar radiation series trends in China between 1962 and 2015 using the Innovative Sen method. They compared the results obtained with the Mann-Kendall and linear regression tests. The trends determined by the Mann-Kendall and linear regression tests were determined at a rate of 99% with the Innovative Sen approach. In approximately 39% of the total time series, the trends determined by the Innovative Sen approach could not be determined by the other two methods. These results show that the Innovative Sen approach is more effective for detecting hidden trends than traditional methods. Gümüş and Şimşek (2020) analyzed the solar radiation change between 1982-2010 in Şanlıurfa with two traditional methods, Mann-Kendall, Spearman Rho and the Innovative Şen Method. While the traditional methods determined an

increasing trend in March and October, it was determined that there was an increasing trend in annual and monthly series with the Innovative Şen approach.

This study was conducted in Tokat, Amasya, and Samsun, which constitute 50% of the Yeşilırmak basin in terms of area. It was aimed to reveal the solar radiation variation, which is one of the critical parameters of plant water requirement in these provinces located in the Central Black Sea Region, where important vegetables, fruits, and field crops are grown with irrigated agriculture. In addition, the Mann-Kendall and Yenilikçi Şen approaches were evaluated together and compared.

2. MATERIALS AND METHODS

In this study, actual sunshine durations measured between 1991 and 2024 at meteorological stations in Tokat, Amasya, and Samsun in the Central Black Sea region (Figure 1) were used as material. Solar radiation data were calculated using the Angstrom equation from the relationship between relative sunshine durations and extraterrestrial radiation in the specified provinces (Allen et al. 1998). The Angstrom equation is given in Equation 1.

$$R_s = \left(a_s + b_s * \frac{n}{N}\right) R_a \quad (1)$$

In the equation, R_s is solar or shortwave radiation (MJ m^{-2} day^{-1}), n is the actual duration of sunshine (hour),N maximum possible duration of sunshine or daylight hours (hour), n/N relative sunshine duration, a_s and b_s are regression constant (a_s=0,25 ve b_s=0,50).

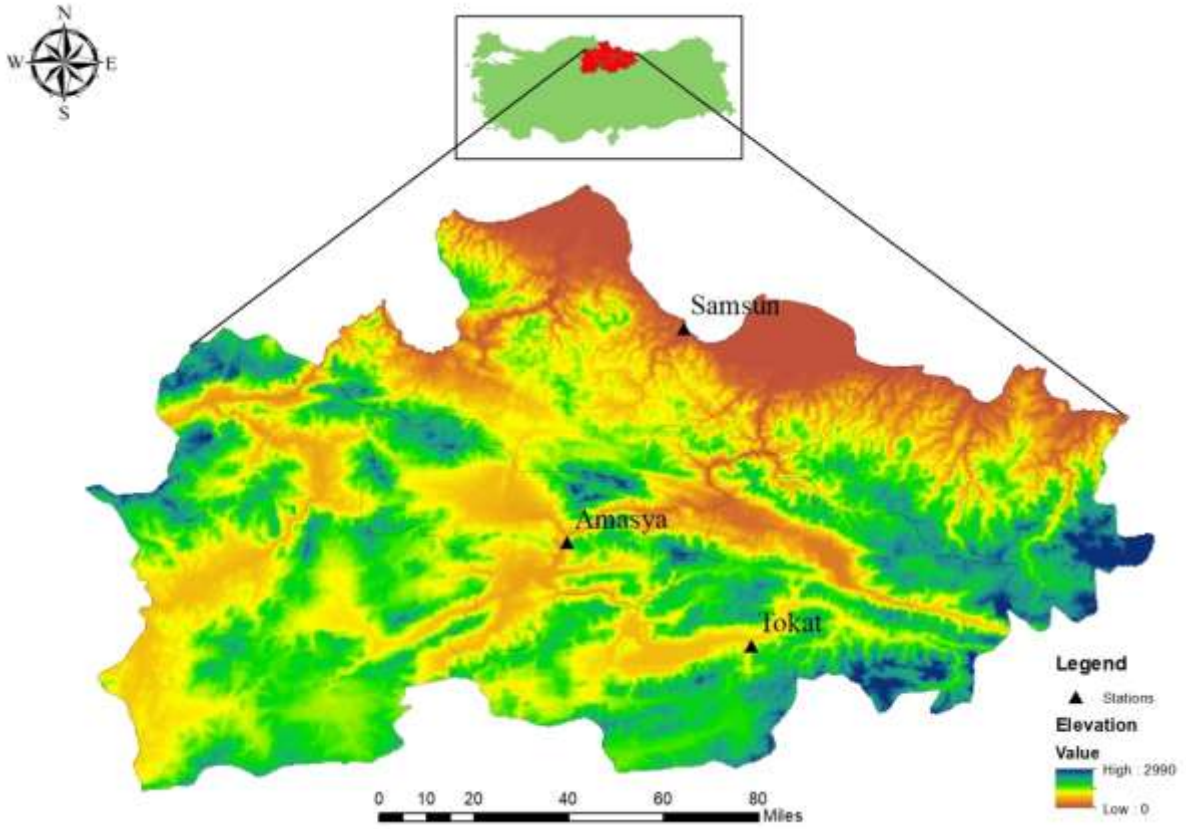

Figure 1. Geographic position of the meteorological stations

2.1. Innovative Trend Analysis (ITA)

The ITA method was first proposed by Şen (2012). Unlike other trend analysis methods, the most significant advantage of ITA is that it does not require any assumptions (serial correlation, non-normality, sample size, etc.). This approach's graphical structure and statistical analysis methodology were introduced to the literature by Şen (2012) and Şen (2017). To visually detect the presence of a trend, the time series is first divided into two equal sub-series, and the sub-series are sorted separately into increasing series. Then, the first and second sub-series of the time series are placed on the X-axis and Y-axis, respectively. Collecting the data on the 1:1 line (45° line) indicates that there is no trend in the time series; if the line is located in the upper triangle area, there is an increasing trend in the time series, and if the line is collected in the lower triangle area, there is a decreasing trend in the time series (Şen, 2012; Şen, 2014). In this way, the trends of low, medium, and high values of any hydrometeorological or hydro-climatic time series can be determined by this method.

The null hypothesis of this approach that there is no statistically significant trend in the data set is accepted when the slope (Scal) value calculated with Equation 3 falls within the confidence interval (CI) obtained from Equation 4. Otherwise, the alternative hypothesis is accepted.

$$S_{cal} = \frac{2(\bar{y}_2 - \bar{y}_1}{n} \quad (2)$$

$$\mathrm{CI}_{(1-a)} = 0 \pm \mathrm{S}_{\mathrm{crit}}\sigma_{\mathrm{S}} \quad (3)$$

In the equations,, $\bar{y}_2$ and $\bar{y}_1$, are the averages of the first and second subseries sequences generated from a complete data set containing "n" observations. The parameter "σ_S" in Equation 3 is calculated as follows.

$$\sigma_S = \frac{2\sqrt{2}}{n\sqrt{n}}\sigma\sqrt{1 - \rho_{\bar{y}_1\bar{y}_2}} \quad (4)$$

Here, the terms " $\rho_{\bar{y}_1\bar{y}_2}$ " and "σ" are the cross-correlation coefficient and standard deviation of the complete data, respectively. The script value is taken from the Standard Normal Distribution Table for a 5% confidence level.

2.2. Mann-Kendal Test

It is a non-parametric test that examines whether there is a trend in time series (Mann, 1945; Kendall, 1962). For a series with dimensions n, when the annual values x_j and x_i are given in years j and i, respectively, and j > i, the Mann-Kendall statistic is obtained as follows:

$$S = \sum_{i=1}^{n-1}\sum_{j=i+1}^{n} sgn(x_j - x_i); \quad with\ sgn(x_j - x_i) = \begin{cases} 1\ if\ (x_j - x_i) > 0 \\ 0\ if\ (x_j - x_i) = 0 \\ -1\ if\ (x_j - x_i) < 0 \end{cases} \quad (5)$$

If x_i are independent and randomly ordered, the S statistic for n > 10 follows a normal distribution with zero mean and variance and is given by:

$$Var(S) = {[n(n-1)(2n+5) - \sum_{i=1}^{m} t_i i(i-1)(2i+5)]}/{18} \quad (6)$$

Here, m is the number of connected groups in the dataset, and t_i is the number of data points in the i. connected group.

Finally, the standard test statistic Z_{MK} is calculated with Equation 7.

$$Z_{MK} = \begin{cases} \dfrac{S-1}{\sqrt{Var(S)}} & for\ S > 0 \\ 0 & for\ S = 0 \\ \dfrac{S+1}{\sqrt{Var(S)}} & for\ S < 0 \end{cases} \quad (7)$$

For a given significance level α, using a two-tailed test, the null hypothesis is rejected if $|Z_{MK}|$ is greater than $Z_{1-\alpha/2}$.

3. FINDINGS AND DISCUSSION

Solar radiation values were calculated using the Angstrom equation using the daily sunshine durations measured between 1991 and 2024 for the Tokat, Amasya, and Samsun stations in the Central Black Sea Region. The temporal graph of the annual solar radiation data of the stations is given in Figure 2.

Figure 2. Temporal graph of annual solar radiation data of stations

Monthly and annual trends of calculated solar radiation values were evaluated and compared with ITA and Mann-Kendall tests. ITA graphs of Tokat, Amasya, and Samsun stations are given in Figure 3, Figure 4, and Figure 5, respectively.

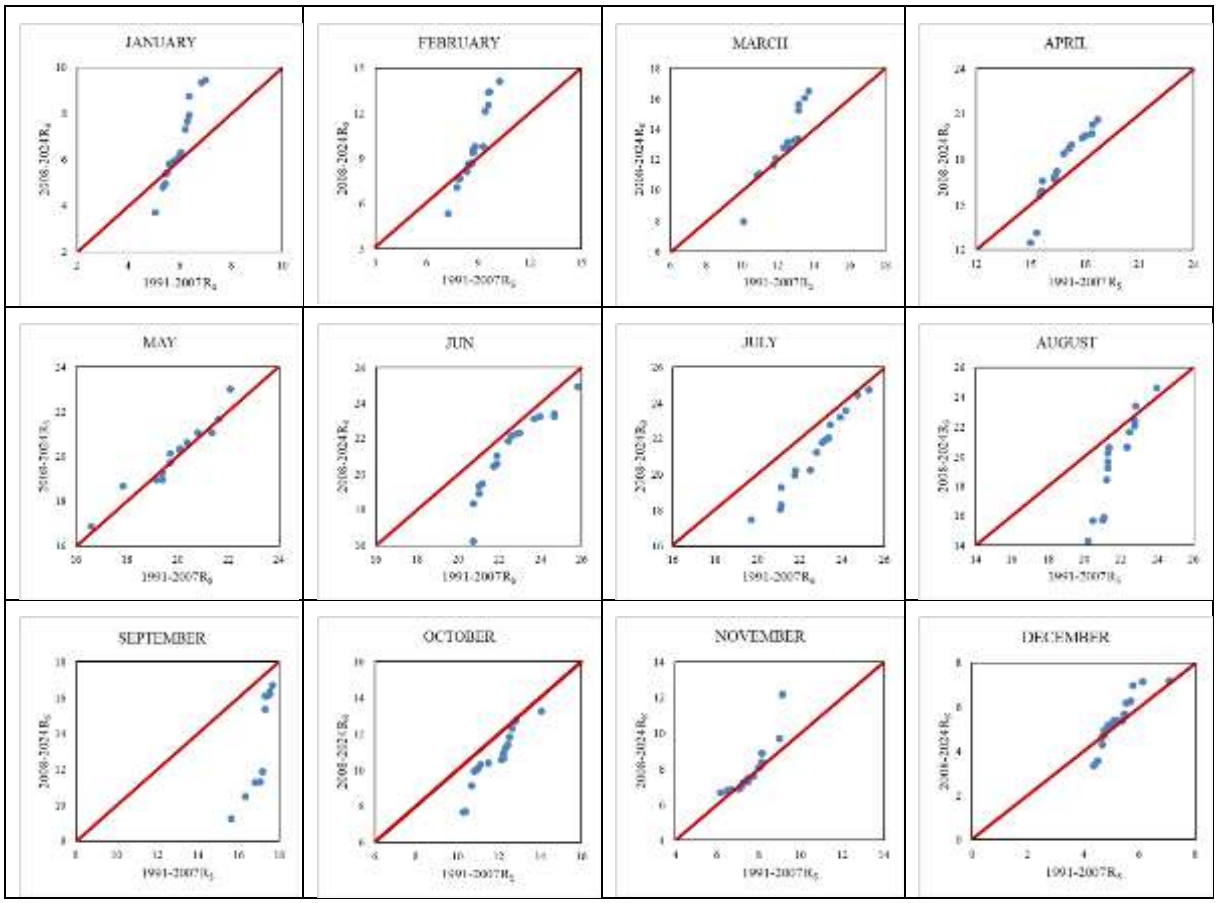

Figure 3. Monthly ITA graph of Tokat station

The data in Tokat station are found on the higher portion of the 1:1 line in January and February, as seen in Figure 3. This situation reveals that there is an increasing trend in these months. In June, July, August, September, and October, the data is located below the 1:1 line. In the graphs, it is seen that there is a decreasing trend in these months. Finally, it is seen that the solar radiation data for March, April, May, November, and December are on the 1:1 line, and there is no trend in these months. When Figure 4 is examined, it is seen that the data at the Amasya station are located on the upper part of the 1:1 line in January, February, April, August, October, November, and December. This situation reveals an increasing trend in the months in question. The data is located at the bottom of the 1:1 line in June. In the graphs, it is seen that there is a decreasing trend in these months. Finally, it is seen that the solar radiation data for March, May, July, and September are on the 1:1 line, and there is no trend in these months. When Figure 5 is examined, it is seen that Samsun is only located above the 1:1 line in April. This situation reveals that there is an increasing trend in April. It is seen that the solar radiation data for other months are located above the 1:1 line, and there is no trend in these months.

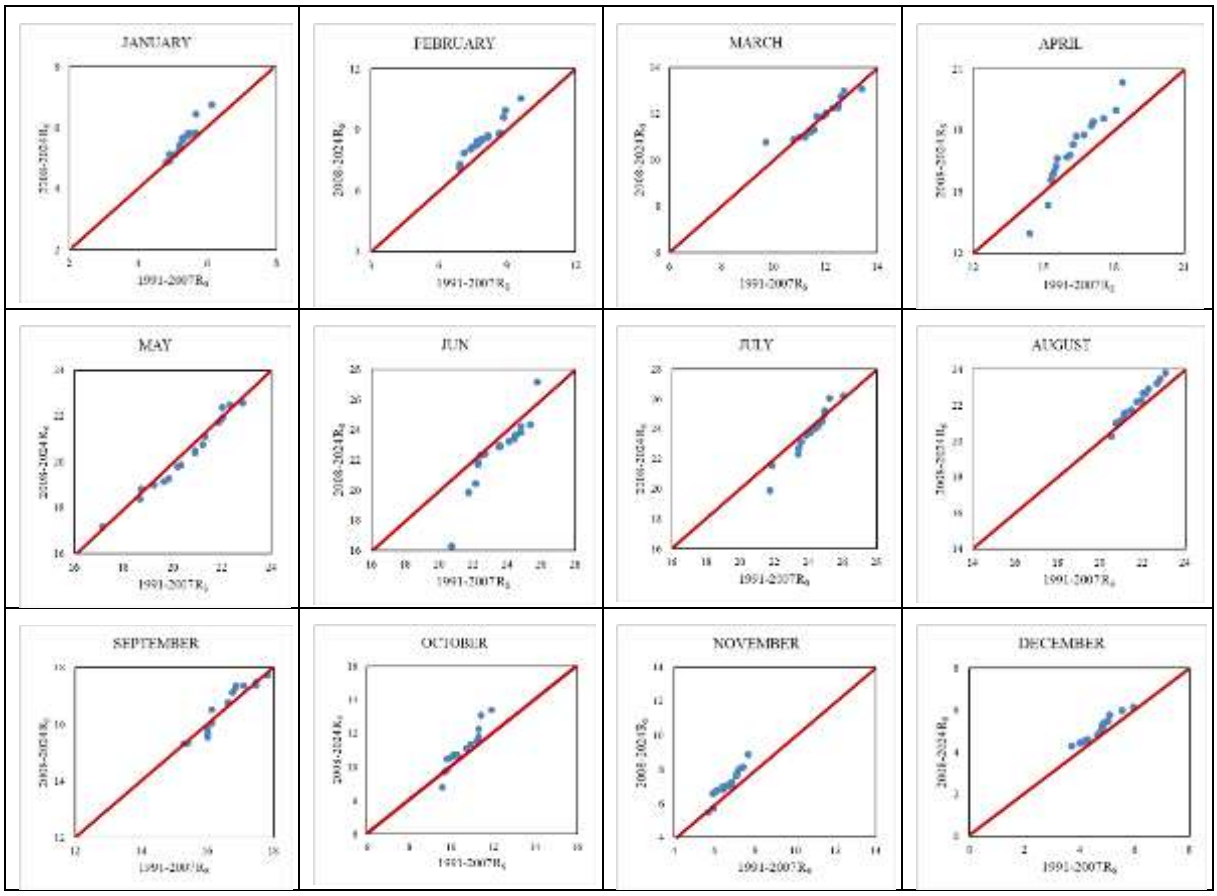

Figure 4. Monthly ITA chart of Amasya station

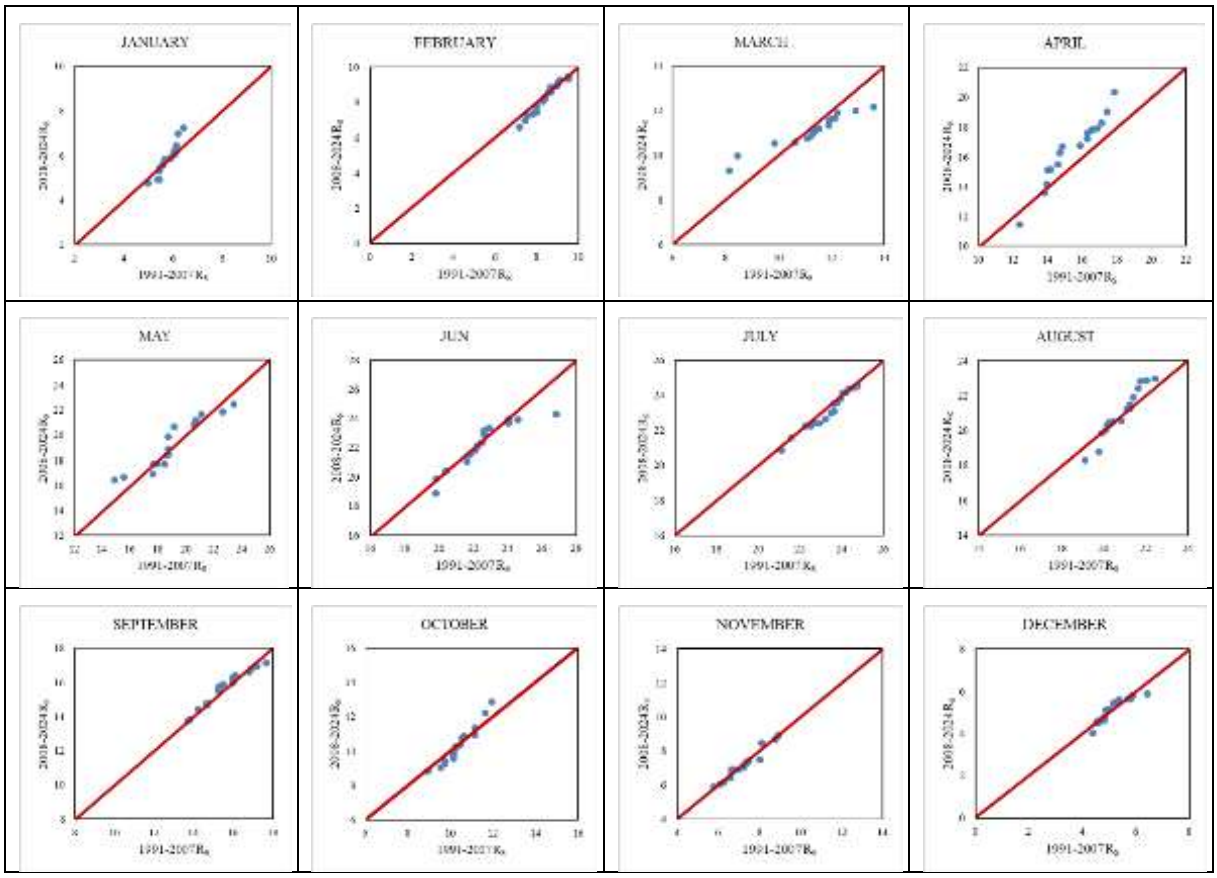

Figure 5. Monthly ITA chart of Samsun station

ITA graphs of annual solar radiation data are given in Figure 6. When the graphs are examined, it is seen that there is an increasing trend at Tokat station, a decreasing trend at Amasya station, and no trend at Samsun station.

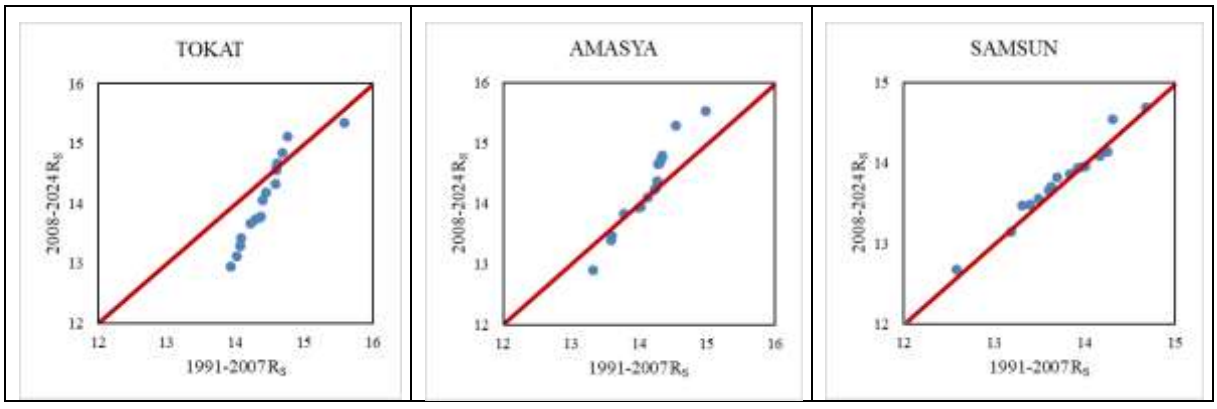

Figure 6. ITA graphs of annual solar radiation data

The data extracted from the ITA graphs has been statistically summarized in Table 1. Upon examination, Table 1 reveals a consistency between the trend results derived from the graphs and the statistically calculated ITA results.

Table 1. Innovative Trend analysis test results of solar radiation data

Months	TOKAT		AMASYA		SAMSUN	
	Slope	Confidence interval	Slope	Confidence interval	Slope	Confidence interval
January	0.035	± 0.033	0.015	± 0.012	0.003	± 0.018
February	0.059	± 0.055	0.035	± 0.022	-0.010	± 0.017
March	0.037	± 0.045	0.001	± 0.019	-0.011	± 0.034
April	0.040	± 0.044	0.041	± 0.032	0.060	± 0.038
May	0.029	± 0.058	-0.013	± 0.048	0.010	± 0.061
June	-0.079	± 0.045	-0.051	± 0.032	-0.018	± 0.042
July	-0.086	± 0.059	-0.021	± 0.029	-0.013	± 0.025
August	-0.117	± 0.083	0.022	± 0.015	0.008	± 0.017

December	0.009	± 0.025	0.021	± 0.014	-0.002	± 0.015
Annual	-0.021	± 0.012	0.009	± 0.008	0.002	± 0.012
	Decreasing trend					
	Increasing trend					
	No trend exists					

The Mann-Kendal test results of solar radiation data are given in Table 2. The Mann-Kendall test results for the Tokat station indicated no trend in January, February, March, April, May, June, and November. Conversely, a decreasing trend was observed in July, August, September, and October, while December showed an increasing trend. It was determined that there was a rising trend in January, February, April, August, November, and December at Amasya station, and there was no trend in March, May, June, July, September, and October. Finally, the Samsun station data analysis revealed no trend across all months. Furthermore, the annual solar radiation data evaluated via the Mann-Kendall test showed no trend for the Tokat and Samsun stations but indicated an increasing trend at the Amasya station.

Tablo 2. Solar radyasyon verilerinin Mann-Kendal test sonuçları

Months	TOKAT	AMASYA	SAMSUN
	Z Value	Z Value	Z Value
January	1.11	2.77	0.00
February	1.95	2.61	0.15
March	1.69	0.49	-0.93
April	1.84	2.34	1.91

	Decreasing trend		
	Increasing trend		
	No trend exists		

4. CONCLUSION

Trend analysis is one of the most critical issues in climate change studies. In this context, ITA and Mann-Kendall tests investigated solar radiation change trends of Tokat, Amasya, and Samsun stations located in the Central Black Sea region between 1991-2024. The ITA method presents the results intuitively and efficiently as a graphical method. In addition, the statistical support of the visual results increases the power of the test. According to the ITA test results, it was concluded that there was an increasing trend in 11 data series at three stations, a decreasing trend in 7 data sets, and no trend in 21 data sets. The Mann-Kendall test identified an increasing trend in 8 data sets, a decreasing trend in 4 data series, and no significant trend in 27 data sets. It was concluded that the ITA test was more successful than the Mann-Kendall test in determining the trends in long-term solar radiation data of the Tokat, Amasya, and Samsun stations in the Central Black Sea region. Evaluation of the results indicated that the ITA test was more effective than the Mann-Kendall test in identifying both increasing and decreasing trends. It is predicted that there will be no increase in water loss through evapotranspiration, especially during the plant growth periods covering May and September (except August at Amasya station), since there is no increasing trend in solar radiation. In these areas where

irrigated agriculture is carried out, examining the relationship between energy exchange and precipitation and developing appropriate water management strategies are vital in alleviating the pressure on water resources.

4. ACKNOWLEDGEMENTS

The authors thank the Turkish State Meteorological Service for providing this study's actual sunshine duration data.

ABSTRACT

Since the early stages of human civilisation, the need to enhance agricultural efficiency, reduce manual labour, and facilitate the storage and transport of harvested crops has led to the development of various mechanised solutions. Among these innovations, balers have emerged as a critical component in modern agricultural mechanisation. Balers significantly facilitate the handling, transportation, and long-term storage of forage crops, straw, and certain industrial agricultural products—particularly in livestock-oriented production systems where efficient feed management is essential. The earliest examples of balers appeared in the United States in the late 19th century and were originally designed as simple mechanical systems. Over time, these machines have undergone substantial technological evolution. Modern balers are now equipped with advanced hydraulic systems, automatic knotting mechanisms, moisture sensors, and global positioning system (GPS) technologies, making them far more efficient and operator-friendly than their predecessors. Balers are generally categorised into two main types: rectangular (prismatic) and round (cylindrical) balers. Prismatic balers typically consist of a pickup mechanism that collects the windrowed crop, a set of tines or feeder arms that direct the material into a compression chamber, a piston system that shapes the bale, and a knotting unit that secures it. Round balers, in contrast, compress the crop into a cylindrical form within a rotating chamber and then wrap and eject it. Depending on the operational scale and intended application, these machines come in various sizes and technical configurations. This review aims to provide a comprehensive examination of the historical development of balers, their integration into agricultural production processes, and the technological advancements that have shaped their modern forms. Furthermore, the paper evaluates innovative approaches within the context of sustainable agriculture, considering environmental impacts and energy efficiency. The transformation observed over time reflects not only the mechanisation of balers

but also significant shifts in farmers' operational practices, expectations, and overall approach to agricultural productivity.

Keywords: Baler, Agricultural Machinery, Agricultural Mechanization, Sustainable Agriculture.

TARIMIN DÖNÜŞÜMÜNDE BALYA MAKİNELERİ: GEÇMİŞTEN GÜNÜMÜZE BİR İNCELEME

ÖZET

Tarım sektöründe verimliliğin artırılması, iş gücünün azaltılması ve hasat sonrası ürünlerin depolanabilir ve taşınabilir hale getirilmesi gerekliliği, insanlık tarihinin erken dönemlerinden itibaren çözüm arayışlarını beraberinde getirmiştir. Bu gereksinimler doğrultusunda geliştirilen pek çok teknolojiden biri de balya makineleri olmuştur. Özellikle hayvancılığın yaygınlaştığı ve yem ihtiyacının arttığı dönemlerde, yem bitkilerinin ve samanın hem taşınmasını hem de uzun süreli depolanmasını kolaylaştıran bu makineler, tarım makineleri arasında önemli bir yer edinmiştir. Balya makineleri, ilk olarak 19. yüzyılın sonlarında Amerika Birleşik Devletleri'nde kullanılmaya başlanmış ve bu süreçten itibaren sürekli olarak evrilmiştir. Başlangıçta basit mekanik prensiplere dayalı olarak çalışan bu makineler, zamanla hidrolik sistemler, otomatik bağlama mekanizmaları, nem sensörleri ve küresel konumlandırma sistemleri (GPS) gibi ileri teknolojilerle donatılmış modern makineler haline gelmiştir. Balya makineleri, genel olarak prizmatik (kare) ve rulo (yuvarlak) balya makineleri olmak üzere iki ana gruba ayrılmaktadır. Prizmatik balya makineleri, genellikle namlu şeklinde tarlada bırakılan yem materyalini toplayan bir ünite, bu materyali balya kanalına ileten parmaklı düzenek, sıkıştırma ve şekil verme işlemini gerçekleştiren piston mekanizması ve son olarak bağlama ünitesinden oluşur. Rulo balya makinelerinde ise yem materyali balya odasında döndürülerek sıkıştırılır; ardından bağlanarak silindirik formda çıkarılır. Bu makineler, işletme ölçeğine ve kullanım amacına bağlı olarak farklı ebatlarda ve özelliklerde üretilebilmektedir. Bu çalışma, balya makinelerinin tarihsel gelişimini inceleyerek, söz konusu makinelerin tarımsal üretim süreçlerine entegrasyonunu, teknolojik ilerlemelerini ve günümüzde ulaştıkları yapısal ve fonksiyonel seviyeyi kapsamlı bir biçimde ortaya koymayı amaçlamaktadır. Ayrıca, sürdürülebilir tarım politikaları çerçevesinde balya makinelerinde geliştirilen yenilikçi yaklaşımlar, çevresel etkiler ve enerji verimliliği açısından da ele alınmıştır. Geçmişten günümüze yaşanan bu dönüşüm yalnızca makinelerin yapısal özelliklerini değil, aynı zamanda çiftçilerin iş yapma biçimlerini, ihtiyaçlarını ve tarımsal üretime bakış açılarını da köklü şekilde değiştirmiştir.

Anahtar Kelimeler: Balya Makinesi, Tarım Makineleri, Tarımsal Mekanizasyon, Sürdürülebilir Tarım.

1. INTRODUCTION

Agriculture is one of human history's oldest and most deeply rooted economic activities (Erdoğan et al., 2021). Its significance in meeting basic human needs such as nutrition, clothing, and shelter has never diminished throughout history; however, it has increased further with population growth and the rise in living standards. Initially relying entirely on human labour, agricultural practices gradually evolved to incorporate animal power and machinery. This evolution has brought about profound changes in the quantity of production and the speed, efficiency, and cost of agricultural processes (Erdoğan et al., 2023).

One of the most critical turning points in the transformation of the agricultural sector has been the introduction of agricultural mechanisation. Mechanisation has enabled agricultural production to be carried out in a shorter time, with less labour and greater efficiency. Fundamental agricultural operations such as soil tillage, sowing, fertilisation, irrigation, and harvesting have gained a systematic structure through the use of machines, thereby significantly reducing dependence on human labour (Ercan et al., 2019).

As a natural consequence of these developments, new needs and challenges have emerged at every agricultural production stage. In particular, the difficulties encountered while transporting and storing post-harvest products have laid the groundwork for the emergence of baling technology as a sub-branch of agricultural mechanisation (do Canto et al., 2011). Agricultural products such as straw, green forage, and silage are inherently bulky, irregular, and difficult to handle. Therefore, compacting these materials has become essential for efficient storage and transportation (Grisso et al., 2020). At this point, balers have gained a significant place in the evolution of agricultural production. By compressing materials into compact masses under a specific pressure, balers facilitate transport and optimise storage space utilisation. Initially based on simple mechanical principles, these machines have gradually evolved—parallel to technological advancements—into modern systems equipped with automatic tying mechanisms, sensor-assisted monitoring technologies, and GPS-supported guidance systems (Shito et al., 2006; Niu et al., 2015).

This study explores the historical development and technological evolution of balers, evaluates their significance within agricultural production processes, and discusses the innovative approaches observed in these machines that align with sustainable agriculture's goals. Furthermore, the study aims to reveal how this transformation, experienced from the past to the present, has altered the machinery and farmers' production paradigms and perspectives on agricultural practices.

2.THE HISTORICAL ORIGINS OF THE NEED FOR BALING

2.1. Challenges of Crop Transportation in Agriculture and Early Solutions

Due to their inherent characteristics—bulky, irregular shape, and highly perishable—agricultural products have always made transportation and storage among the most critical stages of the production process. Products such as straw, green forage, and silage cannot be consumed immediately after harvest and therefore must be stored under appropriate conditions for a specific period. However, traditional methods—such as piling the products in the open or

covering them with tarpaulins—often led to significant product losses and required substantial labour input (Sabancı and Aydın, 2013).

Manual transportation of crops, especially across large fields, resulted in significant time and labour inefficiencies, posing a substantial barrier to agricultural productivity. Moreover, under traditional transport methods, products were directly exposed to environmental conditions such as rain, humidity, and sunlight, leading to quality degradation and economic losses (Sever and Duman, 2023). In response to the need for baling, one of the earliest attempts by agricultural communities involved primitive methods of hand-compressed and tied bundles (Figure 1). Typically performed manually, these procedures entailed placing the products into simple wooden molds for compression and securing them with plant fibres or natural ropes to make them suitable for transport (Figure 2). However, these methods had several disadvantages, including high labour requirements and non-uniform material compression. Consequently, during increased production volumes, these traditional practices proved inefficient. For all these reasons, the search for mechanical solutions to make post-harvest processes more efficient and systematic became inevitable.

Figure 1. Manually collected bundles (Anonymous, 2025a)

Figure 2. Fixed wooden molds (Anonymous, 2025b)

With the influence of the Industrial Revolution, the role of machines in production processes rapidly increased during the 18th and 19th centuries, and the need to mechanize labour-intensive operations in the agricultural sector became more pronounced. In the processing and transporting of post-harvest products, particularly on large-scale farms, the demand for faster and more efficient methods reached a critical level (Wild and Auernhammer, 1999). During this period, research focused on mechanical solutions that could enhance storage and transport efficiency by compressing products into smaller volumes. As a direct result of these needs, the first mechanical balers were designed in the late 19th century and introduced to the agricultural industry (Womac et al., 2012).

2.2. The History of the First Baler Machines

The historical development of baler machines dates back to the late 19th century, particularly during the agricultural revolution period in the United States. By the late 1870s, the scale of agricultural production in the U.S. had rapidly increased, but a growing shortage of labour accompanied this growth. Transporting and storing harvested products, especially on extensive agricultural lands, became a significant challenge (Ülger, 1978). The first balers developed during this period were based on a simple principle. Products were manually fed into the press chamber of the machine, compressed through a mechanical system, and then tied by hand. These balers were powered by horses, which walked on inclined leather or wooden treadmills. When a straw bale reached the correct size, twine or wire was wrapped around it and tied (Busse, 1984; Wedd, 1985). These machines were stationary systems, typically installed at a fixed location on a farm, where products were transported to the machine. In other words, the process was not fully automatic, but it was far more efficient than manual compression (Figure 3).

Figure 3. Image of the stationary baler (Taken by Caner Kövmen)

Following the success of the first mechanical balers, a significant leap occurred in the 1930s. With the widespread adoption of tractors, mobile balers that could be towed by tractors were developed. These machines further reduced the need for labour by offering the possibility of directly collecting and baling crops in the field. Simultaneously, developing tying mechanisms on the machines fully mechanised the baling process. In the 1940s, New Holland developed the "ghost knotter" (Figure 4), a knotting system that automatically cut, tied, and secured the baling twine, thereby maximising mechanical efficiency.

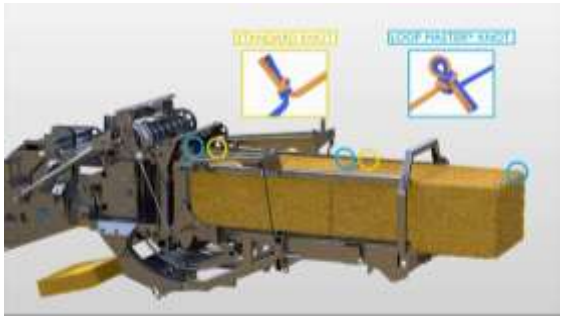

Figure 4. Knotter tying mechanism (Anonymous, 2025c)

In addition, integrating internal combustion engines into agricultural machinery in the early 20th century marked a significant breakthrough in baler technology. The first motorized balers were designed as self-propelled models that could operate independently of tractors. This development enabled the machines to perform pressing and make baling production faster and more continuous. Particularly in the 1930s, motorized balers developed by companies such as Allis-Chalmers and New Holland ushered in a new era in agricultural mechanization.

2.3. The Mechanical Evolution of Baler Machines

Following the development of the first baler machines, technology advanced rapidly, and balers' design and operating principles underwent significant changes over time. The main components of balers (Figure 5)—the collection unit, feeding mechanism, press chamber, tying unit, and bale exit chute—have become more complex and high-capacity in modern machines (Kahraman et al., 2023).

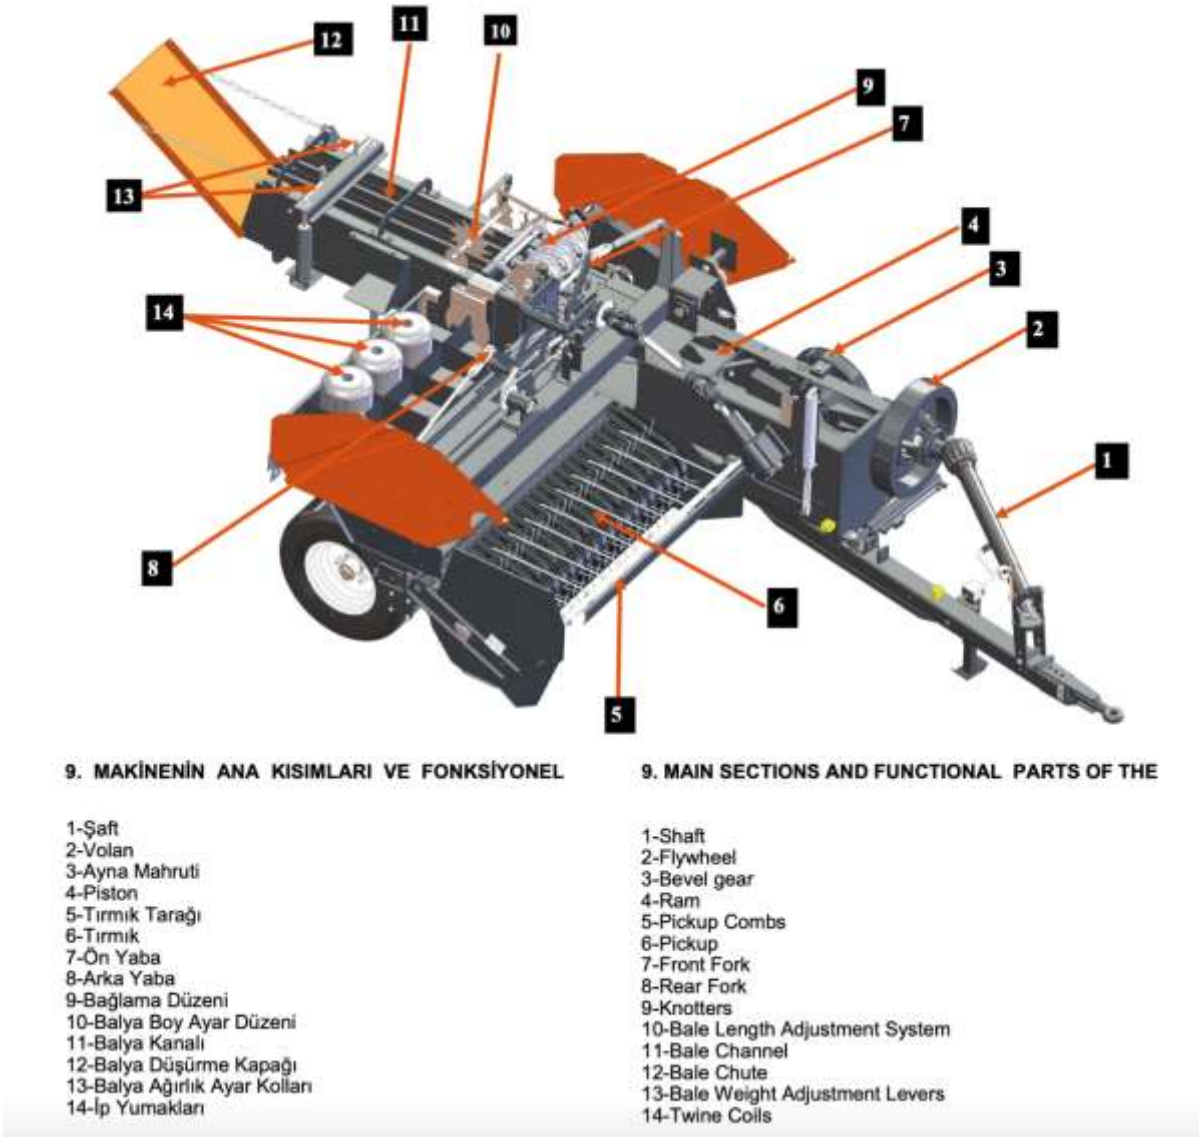

Figure 5. General components of a square baler machine (Paksan ve Gallignani, 2025)

2.3.1. Pickup unit

This unit is designed to collect products from the ground and feed them into the machine. Initially, collectors operated with simple rotary gear systems, but today, they are equipped with adjustable height, width, hydraulic controls, and vibration-reducing systems (Flick et al., 2019).

2.3.2. Feeding mechanism

The collected product is directed to the press chamber (piston chamber) through the feeding mechanism (inside the straw chamber). At this stage, the homogeneous distribution of the product directly affects the density and structural integrity of the bale. Optionally, a chopping

system known as a "hay knife" is located before the piston, which cuts the product before it reaches the piston, resulting in finer chopped material. This allows for a more uniform distribution and provides the option to directly feed the material to animals on farms without a feed mixer (Guo et al., 2022).

2.3.3. Pressing unit

The product is compressed at high density in the press chamber using mechanical or hydraulic force. With hydraulic systems, the pressing force has become more precisely adjustable, and customization according to different product types has become possible (Afzalinia and Roberge, 2008).

2.3.4. Tying unit (Knotter)

The tying unit (knotter) is one of the most critical components in modern baler machines. The knotter mechanism automatically cuts the twine, ties the knot, and secures the bale. The uninterrupted operation of this system directly affects baling efficiency, which is why it has been continuously developed. Additionally, it is equipped with a fan to prevent dust and debris from the hay from affecting the mechanism. Despite this, it remains the most prone to malfunction in the field (Guerrieri et al., 2019).

2.3.5. Bale exit chute

In the final stage, the formed bale is ejected from the exit chute in a controlled manner. This process has also been automated in modern machines, ensuring that the bales are stacked in an orderly line. The most common method, bale collection from the field surface, is still performed manually, although specialized systems for this purpose have been developed (Sun et al., 2010).

2.4. Bale Types and Their Applications

The development of baler machines has not been limited to improving mechanical systems; the types of bales produced have also been diversified to meet different agricultural needs. Various bale types have been developed, considering the intended use of agricultural products, transportation and storage conditions, and farm scales. This diversity has increased flexibility and efficiency in agricultural mechanization.

2.4.1. Rectangular (prismatic) baler machines

These machines produce rectangular bales and are particularly preferred in large-scale agricultural enterprises. The bales' uniform geometric shape makes transportation and stacking extremely easy. It provides significant advantages, especially regarding efficient vehicle space utilization for long-distance hauling (Liu et al., 2022).

Rectangular bales are indispensable when hay and forage crops need to be tightly and systematically stacked in storage areas. Fixed baling machines or large mobile balers can produce these bales. Small square balers (Figure 6) are common in small and medium-sized agricultural enterprises. These machines compress forage crops such as hay, grass, and alfalfa

into standard-sized bales (typically 36x46x90 cm), which are easy to handle. The bales usually weigh between 20 and 30 kg, although this can vary depending on the moisture content of the bale.

Figure 6. Image of a small rectangular (prismatic) baler (Paksan, 2025a)

Large rectangular baler machines (Figure 7) are preferred in large-scale agricultural fields where high efficiency is required. These machines possess significantly higher pressing power and can produce heavy bales with dimensions reaching up to 80×90×240 cm. Typically, their weight ranges from 500 to 600 kg. Large rectangular bales offer high efficiency in terms of both transportation and storage. They are widely used in biomass production, energy farming, and as raw material for industrial purposes, as well as by large-scale livestock farms. However, due to their need for high engine power and advanced technical equipment, these machines generally incur higher maintenance and operational costs than smaller balers. (Paksan, 2025b).

Figure 7. Image of a large rectangular baler machine (Paksan, 2025b)

2.4.2. Round (cylindrical) baler machines

Round balers (Figure 8) were introduced into agricultural mechanisation in the 1970s and quickly gained widespread use. These machines form cylindrical bales by rolling plant material in a spiral manner. The resulting bales typically have a diameter ranging from 1.2 to 1.8 metres and can weigh between 500 and 1,200 kilograms (Ünal, 2003). Round bales are particularly advantageous in pastures and large-scale fields due to their ease of handling. Moreover, they are considered more resistant to weather conditions. Because they are tightly wrapped, the optimal moisture content for fermentation can be maintained, making them an ideal solution for silage production (Wang et al., 2024a).

Figure 8. Image of round baler (New Holland, 2025)

2.5. Modern Balers and Digital Agriculture Integration

The integration of technology into the agricultural sector has caused a serious transformation of traditional mechanical systems, such as balers. Today's modern balers not only perform physical compression and tying operations, but also collect data from the field with advanced electronic systems, optimize the performance of the machines themselves, and provide real-time information to the operator.

2.5.1. Electronic control systems and sensors

Modern balers are equipped with various sensors to measure critical data such as product moisture, bale density and the working status of the tying mechanism. For example, the moisture content in the bale is measured instantly and reported to the operator via the in-cab display, thus preventing excessively moist products from being baled and causing quality loss (Yin et al., 2023). These sensor-based monitoring systems reduce product loss and help maintain feed quality.

2.5.2. GPS-aided guidance systems

Some modern models are equipped with GPS-based field navigation systems. Thanks to these systems, balers follow a more optimized route in the field, reducing fuel consumption and saving time. In addition, GPS data can be used to map crop productivity in the field and provide detailed analysis reports to farmers (Wang et al., 2021).

2.5.3. Autonomous balers and the vision for the future

The use of automation technologies in modern balers plays a groundbreaking role in terms of both productivity and product quality. Advanced sensor systems can continuously monitor the machine’s performance and automatically adjust the pressing density, tying tension and machine speed when necessary (Wang et al., 2024b). For example, load sensors and moisture sensors optimize the machine’s operating parameters according to product conditions, ensuring optimum bale quality. In addition, some advanced models minimize operator intervention with automatic tying yarn or wire changing systems and offer non-stop operation. These systems save time and reduce labor costs, especially in intensive baling operations in large areas (Jiao et al., 2025). In line with the increasing importance of automation in agriculture, autonomous baling machine development studies have gained momentum. Equipped with GPS, LIDAR and camera systems, these machines can navigate the field without human intervention and perform the baling process independently (Tang et al., 2024). Autonomous machines offer great advantages in terms of optimizing working hours, reducing human-related errors and reducing labor costs. In addition, these systems, which can work integrated with precision agriculture applications, increase productivity by minimizing product loss. These systems can determine their own routes by analyzing field conditions (based on data entry) and make automatic speed and pressure adjustments according to product quantity. Autonomous machines offer important

solutions that can increase agricultural productivity, especially in regions with labor shortages (Martelli et al., 2025).

2.5.4. Modern balers for sustainable agriculture

Ensuring sustainability in the agricultural sector is directly related to increasing the energy efficiency of machines and reducing fuel consumption. Thanks to the optimized drive systems, variable speed transmissions and lower resistance mechanical components used in modern balers, energy consumption is minimized. In addition, thanks to the integration in tractors with high engine efficiency and the optimization of the work process with GPS-supported routes, unnecessary fuel consumption is prevented (Karunaratne et al., 2020; Pranga et al., 2021). Thus, both operating costs are reduced and environmental impacts are minimized. The development of modern balers has not only increased production efficiency, but also contributed to reducing the environmental impacts of agricultural activities. Thanks to lower fuel consumption, optimized product handling processes and reduced product losses, balers play an important role in sustainable agricultural practices. In this context, baling technology has become not only an element of agricultural mechanization, but also an indispensable component of sustainable production systems (Vanamburg et al., 2006; Dusseux et al., 2022).

3. CONCLUSION AND GENERAL EVALUATION

Balers are considered one of the cornerstones in agricultural production's modernization and mechanization process. Baling technology, which replaces labor-based, time-consuming, inefficient transportation and storage methods, has accelerated production processes and provided critical advantages such as preserving product quality, reducing storage costs, and increasing agricultural productivity. The evolution from simple mechanical systems to high-tech, sensor-supported, GPS-controlled, and even autonomous balers throughout history demonstrates how technology has led to a profound transformation in the agricultural sector. Initially equipped with fixed and manual tying systems, today machines have evolved into smart systems that can automatically adjust according to field conditions and optimize bale quality by measuring product moisture. This technological development has also made significant contributions to sustainable agricultural practices. Elements such as low fuel consumption, reduced product losses, optimized logistics chains, and minimizing environmental impacts have further strengthened the place of balers in the modern agricultural vision.

Looking to the future, it is expected that balers will become more digital and fully autonomous systems supported by machine learning will become widespread in agriculture. These developments will both reduce labor costs and bring the data-based management approach to the forefront in agricultural production. Thanks to the new tractors developed, the speed level has reached very sensitive levels depending on the bale density.

In conclusion, the historical development of balers is not only a technological success story, but also a concrete indicator of humanity's efforts to achieve more sustainable, efficient and effective agricultural production. This study reveals the evolution of balers from the past to the

present, while also shedding light on the increasing strategic role of these machines in the agriculture of the future.

ABSTRACT

Microclimates are often created from the shading provided by solar panels, causing changes in humidity, temperature, and light levels, thereby altering pests' behavior and their patterns of distribution, as certain pests flourish under different environmental conditions. Moreover, there are many complexities and diversities in agricultural environments, with different conditions and climates for different crop production, and a large amount of robust data is required for effective training of models developed for real-time object detection and monitoring. We aim to (1) control the generation of pests' images and see to it that augmented samples comply with

real-world attributes, (2) enhance the generalization capabilities of pests' detection models to monitor pests' behavioral changes in shaded or unshaded areas in agrivoltaic farms. To achieve this, we propose a Diffusion Model-based Semantic Integration Guidance (DMSIG) and design a Multi-Level Alignment Distillation (MLAD) framework. While DMSIG integrates multi-source semantic features to control the generation of pests' images and see to it that augmented samples comply with real-world attributes, the MLAD framework leverages DMSIG and enhances the generalization capabilities of pests' detection models for real-time monitoring of pests' behavioral changes, where microclimate modifications may impact pest behavior in shaded or unshaded areas in agrivoltaic farms. Experimental results show that our proposed model generates quality images, predicts pests' behavioral changes accurately and produces samples with low FID scores and obtains exceptional AP improvement. This was evaluated by comparing it with various methods (StyleGAN2, AugGAN, DDPM, and LDM) for generative data augmentation and downstream detection tasks (teacher-student YOLOv8 network models) on the IP102 dataset, using the Fréchet inception distance (FID) and Precision evaluation metric.

Keywords: Agrivoltaic**,** Crop yields, Deep learning**,** Pest image generation, Plant pest

1. INTRODUCTION

Timely pest management is essential for healthy growth of plants and increased crop yields, particularly in agrivoltaic farms [1,2]. The advent of artificial intelligence (AI) and its various fields, such as machine learning (ML), deep learning (DL), and computer vision (CV) have facilitated fast and accurate detection, localization and identification of agricultural pests in real-time using various models of these technologies [3,4], thereby furnishing farmers with prompt information about pests and effective measures to control and manage crop production for overall economic gain [5,6]. Microclimates are often created from the shading provided by solar panels, causing changes in humidity, temperature, and light levels, thereby altering pests' behavior and their patterns of distribution, as certain pests flourish under different environmental conditions [7,8].

Moreover, there are many complexities and diversities in agricultural environments, with different conditions and climates for different crop production, and a large amount of robust data is required for effective training of models developed for real-time object detection and monitoring [9-11]. These complexities and heterogenous backgrounds of agricultural environments require that any detection model has capabilities for generalization to enable accurate detection of pests irrespective of the background complexity. Furthermore, it is a herculean task finding images of pest-infected crops, and the current data augmentation methods, though easy to apply to most image processing tasks, find it difficult to produce samples with substantially different features [12].

To cater for the farmers, significant methods that can address the abovementioned challenges were proposed in [13-16]. However, these methods were unable to generate pest images that contained more features and details, making availability of variety of data difficult. Moreover, pests monitoring in real-time is a challenge to the current methods, where microclimate modifications may impact pest behavior in shaded or unshaded areas in agrivoltaic farms. Therefore, we aim to (1) control the generation of pests' images and see to it that augmented samples comply with real-world attributes, (2) enhance the generalization capabilities of pests' detection models to monitor pests' behavioral changes in shaded or unshaded areas in agrivoltaic farms. Our proposed method in this paper is a step towards achieving real-time plant pest monitoring in agrivoltaic farms using deep learning-based pest image generation models for sustainable pest management.

The rest of the paper is structured as follows: Section 2 presents the related work, encompassing existing contributions to pest management, agrivoltaics farms, their methods, and strengths and weaknesses, where applicable. Section 3 presents the methods and materials we used in accomplishing the objectives of the paper. Section 4 presents the results, including implementation and discussions. Section 5 concludes the paper.

2. RELATED WORK

Chen et al. [3] combined AI, sensor technologies and Internet of Things (IoT) for image recognition and pest identification. They also combined DL and AIoT technology for smart agriculture applications. They obtained Tessaratoma papillosa localization using DL YOLOv3

image recognition model and predicted occurrence of pests by analyzing environmental information from weather locations using Long Short-Term Memory (LSTM). They obtained 90% pest identification accuracy from their experiments. However, due to some difficulties encountered in the research institute where the research was conducted, there was a challenge with training samples.

Vervloesem et al. [8] undertook a study on the influences of solar farms on microclimate and vegetation dynamics. They took at different solar farm locations, the surface temperature measurement, air temperature, photosynthetic active radiation, and humidity, for microclimate quantification. The vegetation's multidimensional functional diversity (FD) analysis revealed the presence of less light at a higher humidity and lower temperature under the panels. This revelation means that under-the-panel species preferred a lower pH and a higher nitrogen level.

Maguluri et al. [11] introduced an advanced fusion of Convolution Neural Networks (CNNs) and Transformer models designed for monitoring agricultural activity through remote sensing data. This advanced approach, unlike traditional models, effortlessly combines CNN's extracted spatial features with the all-inclusive contextual insights presented by Transformers. They evaluated the model by comparing it with nine existing models such as Random Forests, Gradient Boosting Machines, standard SVMs, Decision Trees, CNNs, Logistic Regression, RNNs, LSTMs, and GANs. Their model achieved an unparalleled 98.88% accuracy.

Dinesh and Pearce [16] developed a joined simulation model for photovoltaic and agricultural productions, to measure the technical capability of scaling agrivoltaic systems. The results revealed the benefits in using agrivoltaic systems over the traditional agricultural systems. Furthermore, the results demonstrate that the value of solar generated electrical energy in addition to low-light tolerant crop production produced over thirty percent rise in economic value. Employing low-light tolerant crops, as obtained in agrivoltaic farms, reduces crop yield losses, maintaining stability in crop price.

Other works that contributed to agrivoltaic farming and sustainable pest management in terms of using AI and image processing technologies are: Trommsdorff et al. [17], Mahto et al. [18], Wydra et al. [19], and Willockx et al. [20], who evaluated and compared the performance of two bifacial agrivoltaic systems, vertical bifacial and dynamic single-axis tracker, on arable land. They developed an empirical crop model that was based on radiation use efficiency (RUE) and utilized a radiation tool for simulation of crop produce and quality. The findings revealed dynamic solar tracker as a better tracker than the fixed vertical bifacial setup. However, the empirical crop growth model was unable to account for climatic variation in the dry season, limiting its effectiveness during the design phase.

3. MATERIALS AND METHODS

We propose a Diffusion Model-based Semantic Integration Guidance (DMSIG) and design a Multi-Level Alignment Distillation (MLAD) framework. DMSIG integrates multi-source semantic features to control the generation of pests' images and see to it that augmented samples comply with real-world attributes. The MLAD framework enhances the generalization capabilities of pests' detection models to monitor pests' behavioral changes in shaded or

unshaded areas in agrivoltaic farms. The training process is optimized by this framework for downstream detection tasks. This is achieved by the alignment of the intermediate feature representations and outputs (softened logits) of the teacher-student model, in addition to relational graphs construction for feature channels.

In the architecture of the MLAD framework, the teacher-student's intermediate feature representations were output over Convolutional to fused (C2f) blocks, and spatial and channel attention modules were employed for their alignment to reduce tensor dimension differences. Cosine similarity was used for calculating the inter-channel relationships, and L2 loss was used for measuring the differences between adjacent matrices. The distillation loss for output level is got by computing the KL loss with softened outputs from the detection head. The existing Latent Diffusion Model (LDM) [21] performs excellently in data augmentation and text-to-image tasks. LDM comprises forward diffusion and reverse denoising processes, where the forward process is responsible for transforming the sample x_0 into latent space variable z_0 by a Variational Autoencoders (VAEs) [22], as $z_0 = \varepsilon(y_0)$. The z_0 is transformed to z_t by bit-by-bit addition of Gaussian noise to the z_0 using a Markov chain. Equation (1) represents the expression.

$$q(z_t|z_{t-1}) := N(z_t; \sqrt{1-\beta_{tz_t-1,}}\ \beta_t I \qquad (1)$$

The reverse process involves inputting z_t into a U-Net for prediction and elimination of the noise gradually. The $\hat{z}_0$ is then transformed by VAE decoder into the generated image $\dot{y}_0$, as $\dot{y}_0 = D(\hat{z}_t)$. The reverse process is:

$$P_\theta(z_{t-1}|z_t) := N(z_{t-1}; \mu_\theta(z_{t,}t), \sum_\theta(z_{t,}t) \qquad (2)$$

$$\mu_\theta(z_{t,}t) = \frac{1}{\sqrt{\alpha_t}}(z_{t,} - \frac{\alpha_t}{\sqrt{1-\alpha_t}}\epsilon_\theta\ (z_{t,}t)) \qquad (3)$$

The network responsible for noise prediction (ϵ_θ (.)) is employed for generating (μ_θ (.)), for improved performance [23]. The expected loss between true noise and predicted noise is minimized by training with the condition input. By extending DDPM (Denoising Diffusion Probabilistic Models) [23], LDMs employ VAEs in performing the processes of diffusion and denoising in a latent space, thereby increasing the resolution of the images and reducing the cost of computation. In addition, the denoising process is altered by the conditional inputs presented by LDMs; also, a cross-attention mechanism was leveraged by LDMs, making the conversion of text-to-image possible using text prompts converted through CLIP (Contrastive Language-Image Pretraining) [24].

However, the semantic information of the augmented images generated by LDMs is not consistent with the original images. We proposed DMSIG as a solution to the limitation of LDMs, with sole aims of generating improved augmented images. The architecture of DMSIG is shown in Fig. 1. The pre-trained diffusion models were fine-tuned, at a reduced training cost, for the generation of desired images. Moreover, DMSIG exercise control and guidance during the original diffusion model's generation process. The semantic feature maps of an input image are extracted by preprocessors, which comprise various feature extractors to generate the semantic feature maps. The maps generated are combined and converted into shallow latent vectors. The DMSIG component consists of CNNs (for transforming each vector), trainable copies (for guiding the model), and a Multi-Layer Perceptron (MLP), which is a type of feedforward artificial neural network, as the last component.

CNNs transform individual vectors into actionable vectors (input to trainable copy layers) for guiding decisions or actions. The diffusion network's formation and initialization parameters are obtained by the trainable copy layers for the reduction of overfitting possibilities in using the pre-trained diffusion network for training. This is achieved by freezing the diffusion network' parameters, making only the SIG components' parameters trainable. A MLP layer guides the diffusion process while allowing the passage of trainable copy layer's output through it. Moreover, the Low-Rank Adaptation (LoRA) technique was applied for significant reduction of trainable parameters, thereby increasing training speed, reducing memory consumption and model weights.

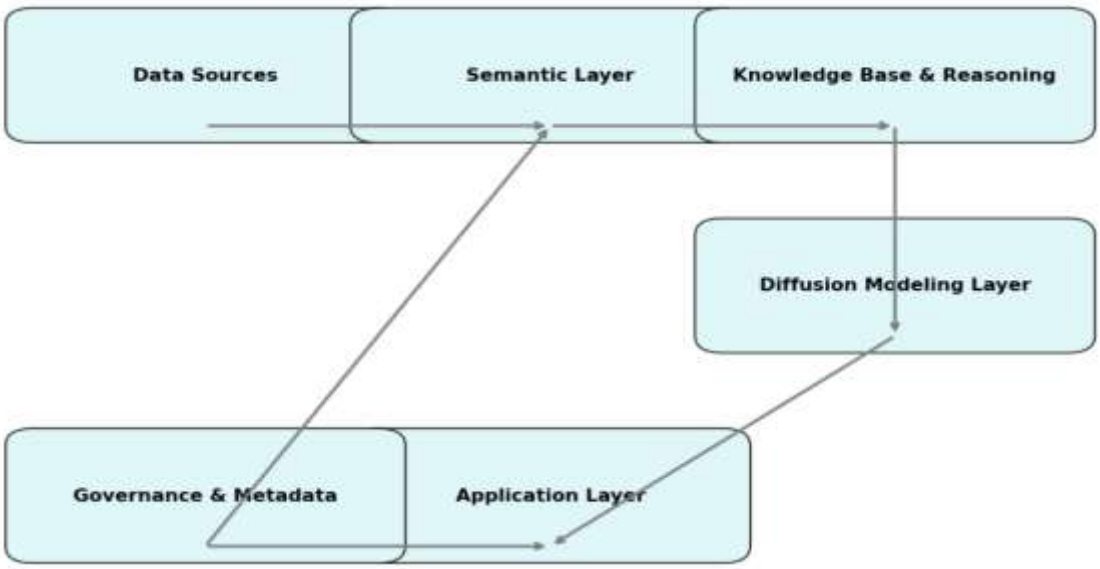

Fig. 1. Architecture of DMSIG and its application to plant pest monitoring in agrivoltaic farms.

For the validation of our proposed model effectiveness, we conducted extensive experiments on the accurately designed IP102 dataset [25] with a total of 75,222 images, categorized into

102 different classes of insect pests for smooth detection research of large-scale insect pests. The dataset, taken from both shaded and unshaded zones, includes pests that usually affect agrivoltaics-based crops and thrive in these zones. The MLAD framework (Fig. 2) was devised for the alignment of knowledge representations at different levels, enabling effective knowledge distillation, which is the technique employed in transferring knowledge from a larger and powerful model (called teacher) to a smaller one and less powerful model (called student) while maintaining validity.

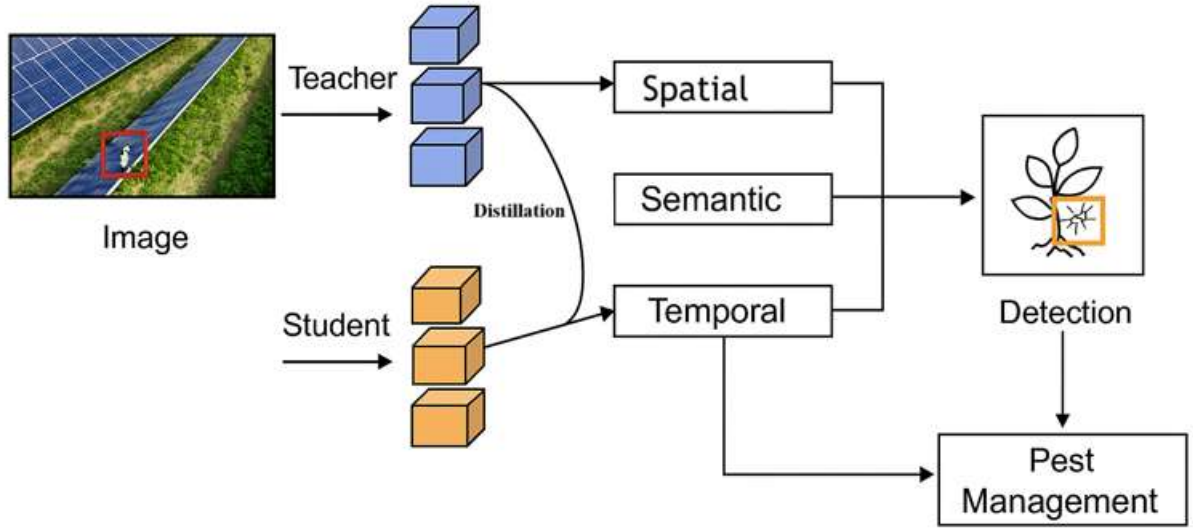

Fig. 2. Multi-level alignment distillation framework for real-time plant pest monitoring in agrivoltaic systems toward sustainable pest management.

Initially, channel attention and spatial attention were sequentially applied by CBAM to the intermediate layer outputs of both the teacher model and student model, facilitating utmost concentration of the model on regions of the feature maps with dense information. Average pooling and max pooling operations including MLP, were used for channel attention calculation, and the generated attention map was applied to the input feature map. As for spatial attention, its calculation is by combining both the average-pooled feature and max pooled feature on the axis of the channel before performing convolution operation, and the generated attention map was applied to the processed feature map. Interpolation and convolution operations enable the alignment of the teacher feature map and student feature map to the same tensor dimension. Following the alignment, a feature distillation loss is calculated to derive the difference between the teacher's and student's aligned feature maps.

Global information within the feature maps can be better captured by the student network using the relationships' distillation between the feature channels. These relationships do not only comprise a combination of local features but also comprise higher-level semantic information. The feature maps' inter-channel cosine similarity was calculated, which is useful for evaluating the relational alignment between the feature maps' channels from the teacher model and student model. Moreover, the relational distillation loss was defined based on the inter-channel cosine

similarity for evaluation of the difference between the contiguity matrices of the teacher model and student model. We employed the Frechet Inception Distance (FID) score and Inception Score (IS) for quality evaluation of the generated images. The distance between feature distributions of real and generated images is measured by FID, and the diversity and quality of generated images are measured by IS. We utilized Average Precision (AP) for performance assessment of both teacher and student models.

4. RESULTS

We employed the following hardware to perform the experiments; 13th Gen Intel(R) Core (TM) i7-1355U (12 CPUs) @ 1.7GHz with NVIDIA GeForce RTX 3090 GPUs of 24,260 MB of memory. For the software, we employed Python 3.10.14 and PyTorch 2.0.1 running on the Windows 11 Operating System. YOLOv8 network was selected for detection and contrast experiments were conducted on both the original and augmented datasets using Stable Diffusion. Adam optimizer was employed for the model training with 100 epochs, 0.0001 learning rate, and 16 batch size. The augmented datasets and the cleaned original datasets were combined under the same scale as the uncleaned original datasets.

The performance comparison of data augmentation techniques such as StyleGAN2 [26], AugGAN [27], DDPM [23], LDM [21], and our proposed method, on three randomly selected classes from the IP102 dataset using the FID and IS metrics is presented in Table 1. An average FID score of 9.1 and average IS score of 2.3 were obtained by DMSIG and IS, respectively, demonstrating the significant performance of our proposed method over others in generating images of high-quality. These results were employed in evaluating the DMSIG capability in improving the performance of object detection (Table 2). Table 3 presents the performance comparison of MLAD framework with other existing methods on the IP102 dataset.

Table 1: The performance comparison of data augmentation techniques such as StyleGAN2, AugGAN, DDPM, LDM and our proposed method, on three randomly selected classes from the IP102 dataset using the FID and IS metrics.

IP	StyleGAN2	AugGAN	DDPM	LDM	Proposed method
085	17.9/1.4	34.7/1.7	41.4/1.4	16.9/1.9	8.4/2.1
092	17.8/1.7	34.5/1.9	42.2/1.2	16.7/1.6	9.1/2.3
099	17.4/2.2	34.4/1.5	41.7/1.3	16.7/1.6	9.7/2.5
Average	17.7/1.8	34.5/1.7	41.8/1.3	16.8/1.7	9.1/2.3

Table 2: Comparison of different generative models and our proposed DMSIG method on downstream detection tasks (YOLOv8n student network).

Teacher	StyleGAN2	DDPM	LDM	Proposed method
YOLOv8l	44.7/43.9/45.8	43.8/42.3/45.2	45.8/44.7/45.9	45.9/45.1/46.7
YOLOv8m	43.9/42.9/45.1	42.9/41.7/44.1	44.5./43.9/45.8	45.1/44.8/46.1
YOLOv8s	42.4/41.1/44.1	42.1/40.1/43.2	43.1/41.6/43.9	44.6/44.1/45.7

Table 3: Performance comparison of MLAD framework with other existing methods on the IP102 dataset. The left values represent results before data augmentation, and the right values represent results after data augmentation.

Method	AP		
Teacher	YOLOv8l 42.6/46.7	YOLOv8m 41.7/45.9	YOLOv8s 40.3/44.6
Student	YOLOv8n 40.1/44.4	YOLOv8n 40.1/44.4	YOLOv8n 40.1/44.4
RKD [28]	40.6/44.9	40.5/44.8	40.2/44.1
FGD [29]	41.4/45.9	40.9/45.1	40.7/44.4
MLKD [30]	41.9/45.8	41.4/45.6	40.9/45.3
Proposed method	43.1/46.3	42.7/45.9	41.5/45.6

In Table 2, each value represents the performance (AP) for Teacher/Student/Distillation. The same original dataset was employed in training all the methods. When the YOLOv8l model was used as the teacher model, DMSIG, the proposed model achieved 45.9/45.1/46.7 AP scores for Teacher/Student/Distillation respectively, indicating the reliability in the images generated by DMSIG in capturing more features and details, thereby leading to an increase in data diversity. In practical applications, the generated pest images can be extended to diverse scenarios and object transformations, aiding the detection model in learning broad and intense feature representations during training. The student model performs better with a large parameter scale of the teacher model. Moreover, the MLAD framework leverages DMSIG for real-time pest monitoring, where microclimate modifications may impact pest behavior in shaded or unshaded areas in agrivoltaic farms.

5. CONCLUSIONS

In this paper, we proposed real-time plant pest monitoring in agrivoltaic farms using deep learning-based pest image generation models for sustainable pest management using DMSIG and a MLAD framework. For the validation of our proposed model effectiveness, extensive experiments were conducted on the accurately designed IP102 dataset with a total of 75,222 images, categorized into 102 different classes of insect pests for smooth detection research of large-scale insect pests. We employed the techniques of both enhanced data augmentation and model optimization for the improvement of the practicality and variety of generated images, for overall robust performance and accuracy in agrivoltaic applications. The results of the experiments significantly validate the accuracy and effectiveness of our approach and proposed model for detecting agricultural pests in complex agrivoltaic environments, providing a sustainable solution for timely pest management, healthy growth of plants and bountiful crop yields.

We understand that agrivoltaic systems influence pest populations in a variety of ways, as certain pests flourish under different environmental conditions. For example, pests like aphids, beetles, and caterpillars habitually have individual environmental preferences. In agrivoltaic systems, these pests might feel more hospitable in the shaded areas, especially if the shaded areas are cooler and more humid in conditions. Likewise, the prevalence of pests like certain types of mites might be less in the shaded regions. We have as our future work, a lot of research to carry out in this regard including the potential of AI in leveraging all the strategies for pest control in these settings for sustainable pest management.

ABSTRACT

Nigeria's local wheat production remains grossly insufficient to meet domestic demand, despite wheat-based foods accounting for about 45% of daily meals consumed in Nigerian households. Wheat is the second-largest contributor to the country's food import bill, with over $2 billion spent annually on the importation of more than five million metric tonnes. This study analyzed wheat production among small-scale farmers and its effect on poverty reduction in Jigawa State, Nigeria. Primary data were collected from 170 respondents during the 2023 farming season using a structured interview schedule. The Cobb-Douglas stochastic frontier cost function revealed that the coefficients for seed cost (0.673), fertilizer cost (-0.749), and agrochemical cost (-0.914) were statistically significant at various levels, indicating that these inputs significantly influence production costs. In the inefficiency model, age (0.179) and farming experience (-0.215) were significant and increased inefficiency, while gender (-0.775) significantly reduced inefficiency. The Foster-Greer-Thorbecke (FGT) poverty indices showed that 58.36% of wheat farmers were below the poverty line, although the poverty gap (21.1%) and severity (7%) were relatively low. The study concludes that wheat production holds potential for improving cost efficiency and alleviating poverty. It recommends enhancing access to credit for wheat farmers through favorable government interventions and commercial bank financing to boost productivity and income.

Keywords: Wheat, Poverty reduction, efficiency, cost of seed, Nigeria

INTRODUCTION

Wheat (Triticum aestivum) is among the most important staple crops globally, serving as a major source of calories and nutrition for billions of people. The global production of wheat is led by China, followed by India, Russia, and the United States. In the marketing year 2024/2025, the global production volume of wheat amounted to approximately 793 million metric tonnes (MMT), reflecting an increase compared to the previous year. In contrast, Africa contributes about 27 MMT, with Sub-Saharan Africa (SSA) accounting for a mere 7.5 MMT. These figures highlight the continent's limited capacity to meet its own wheat demands (Statista, 2025).

Wheat is a cool-season crop that performs best in temperate environments, a factor that has historically made its cultivation challenging in Nigeria due to the country's predominantly hot climate (Haruna et al., 2017). Consequently, wheat farming in Nigeria has remained underdeveloped, despite the crop's significant importance. Wheat-based products constitute a substantial portion approximately 45% of daily meals in Nigerian households, underscoring the country's heavy reliance on the commodity. This dependency has led to an alarming rise in wheat imports, making it the second-largest contributor to Nigeria's food import bill. Over $2 billion is spent annually on importing more than five million metric tonnes of wheat (Central Bank of Nigeria [CBN], 2021).

Nigeria's annual local wheat production remains insufficient to meet growing demand. In 2020, only about 200,000 metric tonnes were produced locally, while national demand was estimated between 4.5 and 5.0 MMT. This glaring production deficit has significant implications—not only for food security but also for the nation's foreign reserves, particularly since the oil price shock between 2014 and 2016. The crisis compelled policymakers to reconsider Nigeria's agricultural potential, especially in terms of increasing wheat production to reduce import dependency (Umar & Muhammad, 2021; Statista, 2025).

Despite the challenges, Nigeria possesses considerable agro-ecological potential to expand wheat production under both irrigated and rainfed conditions. In particular, northern states such as Jigawa have witnessed increasing participation in irrigated wheat farming, with over 1.5 million farmers engaged in the practice during the harmattan period from October to February. Additionally, rainfed wheat is cultivated on the highlands of the Mambilla Plateau in Taraba State, the Jos Plateau in Plateau State, and the Obudu Plateau in Cross River State. Wheat's role as a raw material for the flour industry and its nutritional value further justifies the need to scale up production efforts (Benjamin et al., 2024; Mohammed et al., 2023).

However, despite various government-led initiatives such as the National Agricultural Land Development Authority (NALDA), aimed at revitalizing agriculture in northern Nigeria, wheat production remains stagnant. Many smallholder farmers are abandoning wheat in favor of other more profitable or less demanding crops, such as rice. This shift raises critical concerns, given that small-scale farmers constitute the bulk of Nigeria's wheat producers and are often among the most impoverished segments of the population (Mohammed et al., 2023).

The continued challenges of inadequate funding for research, lack of mechanized farming practices, poor extension services, and limited access to quality inputs have further weakened

local wheat production. These constraints have contributed to persistently low productivity levels and limited income generation among wheat farmers. Therefore, addressing the efficiency of wheat production is a critical step toward enhancing agricultural productivity and alleviating poverty among small-scale farmers. This study seeks to investigate the socio-economic characteristics of wheat farmers in Jigawa State, assess the cost efficiency of smallholder farmers, and examine the extent to which increased wheat cultivation contributes to poverty reduction in the region.

METHODOLOGY

1. Description of the Study Area

The study was conducted in Hadejia Local Government Area (LGA) of Jigawa State, located in north-western Nigeria. Geographically, it lies between latitudes 12°23′N and 12°28′N and longitudes 10°00′E and 10°05′E. The area falls under the Sudan Savannah agroecological zone, characterized by a tropical wet and dry climate. The rainy season typically occurs between May and September, while the dry season spans from October to April. The mean annual temperature is about 25°C, with monthly temperatures ranging from 21°C in the coolest months to 31°C during the hottest months (Hadejia, 2012). The area is situated within the inland drainage basin of Lake Chad, and the Hadejia River flows approximately 828 km through the region.

Farming is the predominant economic activity, with crops such as rice, sorghum, millet, wheat, maize, cotton, cassava, cowpea, soybean, and groundnut widely cultivated. Vegetable crops including tomato, pepper, onion, and carrot are also produced. Livestock rearing is significant, involving cattle, sheep, goats, and poultry.

2 Sampling Techniques and Sample Size

A multistage sampling technique was adopted for the selection of respondents. In the first stage, Hadejia LGA was purposively selected due to the predominance of wheat production. In the second stage, three villages—Aguyaka, Masama, and Gudincin—were purposively selected based on the intensity of wheat production activities. Finally, in the third stage, random sampling was used to select farmers from the sample frame in each village.

Sixty-five percent (65%) of the total sampling frame (170 farmers) was selected, resulting in a final sample size of 110 wheat farmers.

Table 1: Distribution of Sample Size in the Study Area

LGA	Village	Sample Frame	Sample Size (65%)
Hadejia	Aguyaka	65	42
	Masama	49	32
	Gudincin	56	36
Total		**170**	**110**

Source: Field Survey, 2023

3. Method of Data Collection

Primary data were collected using a structured questionnaire. Information was obtained on farmers' socio-economic characteristics such as age, marital status, education level, household size, farming experience, farm size, extension contact, and membership of associations.

4. Analytical Techniques

Descriptive Statistics

Descriptive statistics such as frequencies, means, and percentages were used to describe the socio-economic characteristics of the respondents and the constraints faced in wheat production.

Stochastic Frontier Cost Function

This function was used to assess allocative efficiency and is defined as:

$C = f(P_i, Y_i; \gamma) \cdot \exp(V_i + U_i)$

The Cobb-Douglas form is specified as:

$$lnC = \beta_0 + \beta_1 \ln X_1 + \beta_2 \ln X_2 + \beta_3 \ln X_3 + \beta_4 \ln X_4 + (V_i + U_i)$$

Where: C = total production cost (₦), X_1 = cost of seed (₦), X_2 = cost of fertilizer (₦), X_3 = cost of labour (₦), X_4 = cost of agrochemicals (₦)

The inefficiency model is:

$$U_i = \delta_0 + \delta_1 ln Z_1 + \delta_2 ln Z_2 + \delta_3 ln Z_3 + \delta_4 ln Z_4 + \delta_5 ln Z_5 + \delta_6 ln Z_6 + \delta_7 ln Z_7$$

Where: Z_1 = age (years), Z_2 = years of formal education, Z_3 = farm size (hectares), Z_4 = years of wheat farming, Z_5 = number of extension visits, Z_6 = household size and Z_7 = amount of credit obtained (₦)

The a priori expectation is that coefficients of the efficiency inputs ($\beta_1 to \beta_4$) should be positive, while the coefficients of the inefficiency variables ($\delta_1 to\ \delta_7$) should be negative.

Foster-Greer-Thorbecke (FGT) Poverty Index

The FGT poverty index was employed to determine the poverty status of wheat farmers. It uses a relative poverty line based on the two-thirds mean expenditure of sampled households.

The general formula for the FGT index is:

$$P_{\alpha} = \frac{1}{N}\sum_{i=1}^{H}\left(\frac{z - Y_i}{z}\right)$$

Where: $P_{\propto}$= FGT poverty index, α = poverty aversion parameter (0 = incidence, 1 = depth, 2 = severity), z = poverty line, Y_i = income/expenditure of the *i*th household, H = number of poor households and N = total number of households

The poverty line was set at two-thirds of the mean expenditure. Based on this, the classification is: Non-poor: Expenditure > ⅔ mean, Poor: Expenditure between ⅓ and ⅔ mean

RESULTS AND DISCUSSIONS

Socio-Economic Characteristics of Wheat Farmers

Table 1 presents the socio-economic characteristics of wheat farmers in the study area. Results show that most farmers (29.1%) were aged 26–35 years, indicating an active and productive workforce. Males constituted the majority (96.4%), which may reflect cultural norms influencing gender roles in farming. A large proportion (59.1%) were married, suggesting a stable social structure that can enhance decision-making in farming. About 61% had some form of formal education, with 38.2% having Quranic education. The household size was generally large, with 30% having 11–15 members, implying the availability of family labour. Regarding farming experience, 42.8% had 1–5 years' experience. Only 48.2% belonged to cooperatives, 33.6% had access to credit, and 93.6% had contact with extension agents. Most respondents (73.6%) cultivated only 1 hectare, showing the small-scale nature of production.

Table 2: Socio-Economic Characteristics of Wheat Farmers

Variable	Category	Percentage (%)
Age	26–35	29.1
	Above 36	70.9
Sex	Male	96.4

	No	6.4
Farm Size (ha)	1	73.6
	>1	26.4

Cost efficiency of wheat production among small-scale farmers

The results presented in Table 3 provide insight into the factors influencing cost inefficiency among wheat farmers. The model summary of the Cobb-Douglas Stochastic Frontier Cost Function provides important insights into the efficiency of wheat farmers in Hadejia LGA. The gamma value (0.174) implies that approximately 17.4% of the variation in production cost among farmers is due to inefficiency effects, with the rest attributed to statistical noise. While this value is relatively low, it still justifies the use of the stochastic frontier approach. This result aligns with Adeleke et al. (2023), who analyzed costs and returns of wheat production along the Hadejia Valley irrigation scheme, and Obianefo (2021), who examined efficiency metrics in farming systems in northern Nigeria. The mean efficiency score of 0.163 reflects low cost efficiency, suggesting substantial scope for cost minimization among wheat producers,

consistent with Adeleke et al. (2023), and the findings of Ja'afar-Furo et al. (2020), who emphasized efficiency gaps in cereal marketing

Table 3: Maximum Likelihood Estimates for Cobb-Douglas Stochastic Frontier Cost Function

Variable	Coefficient	Std. Error	T-ratio
Frontier Function			
Constant	0.122	0.166	0.737
Seed cost	0.673*	0.349	1.928
Fertilizer cost	-0.749	0.739	-1.013
Chemical cost	-0.914**	0.430	-2.125
Inefficiency Effects			
Constant	0.251*	0.132	1.899
Age	0.179	0.334	-0.535
Household Size	0.335	0.239	0.138
Farming Experience	-0.215*	0.128	-1.679
Gender	-0.775*	0.423	-1.832
Marital Status	-0.148	0.214	-0.691
Cooperative Group	-0.104	0.504	-0.205
Model Summary			
Sigma	0.496	0.731	0.678
Gamma	0.174	0.217	0.801
Log Likelihood	244.451		
LR Statistic	184.744		
Mean Efficiency	0.163		

Among the frontier function variables, seed cost had a positive and statistically significant coefficient (0.673, $p < 0.10$), indicating that an increase in seed expenditure raises the total cost of production. This is expected, as seeds represent a major input in cereal production. Similar findings were reported by Adeleke et al. (2023), who studied determinants of wheat production costs, and Ja'afar-Furo et al. (2020), who highlighted seed costs as a predictor of production expenses in cereal farming. Chemical cost was also significant, but negatively signed (-0.914, $p < 0.05$), implying that increased spending on agrochemicals leads to a reduction in total cost—possibly due to their impact on reducing yield losses from pests and diseases. This cost-saving

effect has been supported by Ja'afar-Furo et al. (2020), emphasizing the role of agrochemicals in efficiency improvements.

From the inefficiency model, farming experience was found to be negatively significant (-0.215, $p < 0.10$), suggesting that experienced farmers operate at lower levels of cost inefficiency. This aligns with the findings of Adeleke et al. (2023), who discussed farming experience in wheat cultivation, and Obianefo (2021), who highlighted its role in improved resource allocation. Furthermore, gender was significant and negative (-0.775, $p < 0.10$), implying that male farmers tend to be more efficient than their female counterparts, possibly due to differential access to inputs, information, and labor. This observation mirrors the study of Ja'afar-Furo et al. (2020), which discussed gender-based disparities in cereal marketing systems.

Decomposition of Poverty Status of Wheat Farmers

Table 4 presents the decomposition of poverty status among wheat farmers in Hadejia Local Government Area of Jigawa State. The poverty line was estimated at ₦31,733.40, meaning that any household earning below this threshold is considered poor. Based on this benchmark, the poverty headcount ratio stood at 0.58, indicating that 58% of the wheat farming households live below the poverty line. This high headcount suggests a significant prevalence of poverty among the sampled farmers.

Table 4: Decomposition of Poverty Status of Wheat Farmers

Poverty Measure	Value
Poverty Line (₦)	N31,733.40
Poverty Headcount Ratio	0.58
Poverty Gap	0.21
Poverty Severity	0.07
Percentage of Poor (%)	58.3
Percentage of Non-Poor (%)	42.7

The poverty gap index was 0.21, implying that, on average, poor households would require 21% of the poverty line to escape poverty. This reflects the depth of poverty in the area and highlights the level of income shortfall below the poverty threshold. Moreover, the poverty severity index was 0.07, which measures the inequality among the poor. Though lower than the headcount and gap indices, this figure suggests that income distribution among the poor is relatively unequal.

Furthermore, the data show that 58.3% of the respondents were classified as poor, while 42.7% were non-poor. These findings emphasize the pressing need for policy interventions aimed at

increasing farm income, improving access to productive inputs, and facilitating access to social safety nets in order to reduce poverty levels among wheat farmers in the area. These results align with findings by Umar and Haruna (2019), who also reported high poverty rates among rural farming households in Nigeria, particularly in regions with limited access to market infrastructure and agricultural support services.

Constraints Associated with Wheat Production

The Table 5 presents key constraints affecting wheat production. The most frequently reported challenge is pest and disease infestation, cited by 45.45% of respondents. This aligns with findings by Benjamin et al. (2024), who emphasized the devastating impact of pest pressure on cereal crop yields in Sub-Saharan Africa. High cost of seed was identified by 21.82% of respondents as a major constraint, suggesting that access to improved varieties is limited due to unaffordable input prices. This mirrors observations by Umar and Muhammad (2021), who found that input cost was a key barrier to wheat technology adoption in Nigeria. Additionally, 14.55% of farmers highlighted lack of access to credit as a limiting factor, a recurring issue in rural agriculture, as credit availability directly affects the ability of farmers to invest in productivity-enhancing inputs.

The absence of mechanized farming practices (11.82%) and poor extension services (6.36%) further exacerbate these challenges, limiting farm efficiency and farmers' exposure to improved practices. These findings underscore the urgent need for targeted interventions such as affordable input schemes, better extension coverage, and inclusive rural financing mechanisms, in line with recommendations by Benjamin et al. (2024) and Umar and Muhammad (2021) on strategies to boost local wheat production in Nigeria.

Table 5: Constraints Associated with Wheat Production

Constraints	Frequency	Percentage (%)	Rank
Pest and Diseases	50	45.45	1st
High Cost of Seed	24	21.82	2nd
Lack of Access to Credit	16	14.55	3rd
lack of mechanized farming practices	13	11.82	4th
poor extension services	7	6.36	5th

Conclusion

This study investigated the cost inefficiency, poverty status, and production constraints of wheat farmers in Hadejia Local Government Area of Jigawa State, Nigeria. The stochastic frontier cost function revealed that seed and chemical costs significantly influenced the cost efficiency of wheat production, while the inefficiency model showed that gender and farming experience had significant effects on cost inefficiency. The low mean efficiency score of 0.163

indicates substantial room for improvement in minimizing production costs. Furthermore, poverty analysis showed that 58% of the respondents live below the poverty line, with moderate poverty gap and severity indices, pointing to both income shortfall and inequality among the poor. The major constraints affecting wheat production were pest and disease outbreaks, high cost of seed, and limited access to credit. These findings highlight the need for policy interventions targeting access to affordable inputs, improved agricultural extension, credit facilities, and mechanization support to enhance productivity, reduce cost inefficiency, and improve the livelihood of wheat farmers in the study area.

ABSTRACT

The aim of this study is to evaluate the support payments made by the Ministry of Agriculture and Forestry to farmers engaged in plant and animal production in the basin of Mucur District of Kırşehir Province in 2024 in terms of agricultural economy. In this context, official data in the basin of Mucur District were examined and necessary suggestions were made. There is a total of 803,627 da of agricultural land in the district, including 779,567 da of dry land and 24,060 da of irrigated land. There are 3,227 da of vegetable gardens, 6,199 da of fruit gardens, 752 da of vineyards, 482,271 field areas and 29,900 fallow lands. The number of farmers registered in the Farmer Registration System is 3,445. The number of cattle in the district is 29,042, the number of small cattle is 52,597, the number of poultry animals is 357,348 and the number of beehives with bees is around 1,562. The Ministry of Agriculture and Forestry provides various support payments for crop production and animal husbandry in order to ensure the continuity of sustainable production for farmers. The supports provided by the Ministry of Agriculture and Forestry are as follows; Fuel Oil and Fertilizer Support (185 TL per decare), Grain-Premium and Licensed Warehousing Support (kg/ 75 krş – 1.75 krş), Certified Seed Support (15-260 TL per decare), Small Family Businesses Engaged in Plant Production Support (200 TL per decare), Organic Agriculture-Good Agriculture Support (50-400 TL per decare), Fodder Crop Support (180 TL per decare), Fallow Support (50 TL per decare), Free Farm Support, Pregnant Heifer Support, Calf Support (2000-6500 TL per head/piece), Lamb-Kid Support (200-580 TL per head/piece), Raw Milk Support (liter/14.90 krş), Red Meat Support (500 TL per head/piece), TL), Beehive Support (number of hives/80-190 TL) are given many supports. Turkey's agricultural sector is one of the cornerstones of our country's economic and social structure. The labor of our farmers and the sustainability of our agricultural production directly affect not only our food supply security but also our economic growth and rural

development. In this context, agricultural supports and farmer premium payments are vital to maintain and strengthen the vitality of the economy.

KIRŞEHİR İLİ MUCUR İLÇESİ 2024 YILI TARIM VE HAYVANCILIK DESTEKLEMELERİNİN DEĞERLENDİRİLMESİ

ÖZET

Bu çalışmanın amacı, Kırşehir İli Mucur İlçesi havzasında yer alan bitkisel ve hayvansal üretim yapan çiftçilere 2024 yılındaki Tarım ve Orman Bakanlığınca yapılan destekleme ödemelerinin tarım ekonomisi açısından değerlendirilmesidir. Bu kapsamda Mucur ilçesi havzasındaki resmi veriler incelenmiş ve gerekli öneriler getirilmiştir. İlçede susuz arazi alanı 779.567 da, sulu arazi alanı 24.060 da olmak üzere toplam 803.627 da tarım alanı vardır. 3.227 da sebzelik, 6.199 da meyvalık, 752 da bağ, 482.271 tarla alanı ve 29.900 nadas alanı vardır. Çiftçi Kayıt Sistemine kayıtlı çiftçi sayısı 3.445'dir. İlçedeki büyükbaş hayvan sayısı ise 29.042, küçükbaş hayvan sayısı 52.597, kanatlı hayvan sayısı 357.348 ve arılı kovan sayısı 1.562 civarındadır.Tarım ve Orman Bakanlığı tarafından çiftçilerin sürdürülebilir üretimin devamlılığını sağlamak için bitkisel üretim ve hayvancılığa ilişkin çeşitli destek ödemeleri yapmaktadır. Tarım ve Orman Bakanlığı tarafından yapılan desteklemeler; Mazot ve Gübre Desteklemesi (dekar/ 185 TL), Hububat-Prim ve Lisanslı Depoculuk Desteklemeleri (kg/ 75 krş – 1,75 krş), Sertifikalı Tohum Desteklemesi (dekar/ 15- 260 TL), Bitkisel Üretim Yapan Küçük Aile İşletmeleri Desteklemeleri (dekar/ 200 TL) , Organik Tarım- İyi Tarım Desteklemeleri (dekar/ 50-400 TL), Yem Bitkisi Desteklemeleri (dekar/ 180 TL) , Nadas Desteklemesi (dekar/ 50 TL) Ari İşletme Desteklemeleri, Gebe Düve Desteklemeleri, Buzağı Desteklemeleri (baş/adet/2000-6500 TL), Kuzu-Oğlak Desteklemeleri (baş/adet/ 200-580 TL), Çiğ Süt Desteklemesi (litre/14.90 krş), Kırmızı Et Desteklemesi (baş/ 500 TL), Arılı Kovan Desteklemeleri (kovan sayısı/ 80-190 TL) gibi birçok destekler verilmektedir. Türkiye'nin tarımsal sektörü, ülkemizin ekonomik ve sosyal yapısının temel taşlarından biridir. Çiftçilerimizin emekleri ve tarımsal üretimimizin sürdürülebilirliği, sadece gıda arz güvenliğimizi değil, aynı zamanda ekonomik büyümemizi ve kırsal kalkınmamızı da doğrudan etkilemektedir. Bu bağlamda, tarım destekleri ve çiftçi prim ödemeleri, ekonominin canlılığını korumak ve güçlendirmek için hayati önem taşımaktadır.

Anahtar Kelimeler: Mucur, tarım ekonomisi, tarım ve orman, destekleme.

GİRİŞ

Mucur ilçesi Ankara-Kayseri karayolu kenarına kurulmuştur. Ankara'ya 210 km. Kayseri'ye 110 km, Kırşehir'e 23 km uzaklıktadır. Yüzölçümü 1068 km2, yüksekliği ise 935 metredir. Mucur ilçesi bir yayla özelliği gösterir. Dağlar ilçenin kuzeyindedir. Armutlu Dağı (1557m.), Köpekli Dağı (1554 m.), Kırlangıç Dağı (1472 m.), Uyluk Dağı (1356 m.), Kızıldağı (1351 m.) dir. İlçenin güneyinden geçen Kızılırmak nehri ilçenin sınırı halindedir. Başlıca çayı Acıöz çayıdır. İlçenin kuzeyinde 15 km2lik alana sahip Seyfe gölü bulunmaktadır. Bakanlar Kurulunun 90/825 sayılı kararıyla Seyfe gölü ve çevresi Tabiatı Koruma Alanı olarak ilan edilmiştir. Seyfe gölü kuş cennetinde 167 çeşit kuş barınmakta iken ve özellikle Flamingo kuşları dikkati çekmekte iken küresel ısınmanın da etkisiyle suyun azalmasıyla kuşlara rastlanmamaktadır. Mucur İlçesinde tipik karasal iklim gözlenmektedir. Yazlar sıcak ve kurak, kışlar soğuk ve kar yağışlıdır. Yıllık yağış miktarı azdır. Yıllık ve günlük sıcaklık farkları yüksektir. Bitki örtüsü bozkırdır (http://www.kirsehir.gov.tr/).

MATERYAL YÖNTEM

Bu çalışmanın materyalini literatürdeki veriler ve ilgili kurumlardan alınan istatistiki veriler oluşturmaktadır. Araştırmanın yöntemi ise literatür taraması ve sahadaki derinlemesine mülakat verileri oluşturmaktadır. Bu kapsamda TUİK, Kırşehir Tarım ve Orman Bülteni, Mucur İlçe verilerine elektronik olarak erişim sağlanmış ayrıca Mucur İlçe Tarım ve Orman Müdürü ile derinlemesine mülakat yapılmıştır. Araştırma verileri literatür ışığında yorumlanarak bilime katkı sağlaması amaçlanmıştır.

BULGULAR

2024 üretim yılı için Bakanlığın yayınlamış olduğu destekleme tebliği kapsamında Mucur İlçesinde 3445 çiftçi Mazot Gübre desteklemesine başvuruda bulunmuştur.

Aşağıdaki tabloda Mucur İlçesi sınırları içerisinde bulunan 44 köy ve 7 mahallede bulunan çiftçilerin Çiftçi Kayıt Sistemine başvuru yapan çiftçi sayıları mevcuttur.

Mucur Merkez, Kızıldağyeniyapan, Kurugöl, Bayramuşağı, Kuşaklı, Avcı, Geyicek ve Yazıkınık Köyleri köylerinin çiftçi sayısı köylerin nüfusunun fazla olması nedeniyle yüksektir.

Şekil 1.Yamula Barajı Görseli (Kuveloğlu, 2024)

Şekil 2. Yamula Barajı (Kuveloğlu 2024)

Seyfe Gölü ve çevresi doğal hayatı korumaya yönelik çalışmalar sonucunda, farklı koruma statüleri ile koruma altına alınmıştır. Göl ve çevresi ”I. Derece Doğal Sit Alanı”, “Tabiatı Koruma Alanı” ve Ramsar Alanı statülerine sahiptir (Yurteri, 2020).

Bu nedenle Çevre Amaçlı Tarim Arazilerini Koruma Programı (ÇATAK) kapsamında İlçenin Yazıkınık, Gümüşkümbet, Seyfe, Dalakçı, Budak, Kızıldağyeniyapan köylerinde 2006-2020 tarihleri arasında uygulanmıştır.

Bu çalışmanın amacı, Kırşehir İli Mucur İlçesi havzasında yer alan bitkisel ve hayvansal üretim yapan çiftçilere 2024 yılındaki Tarım ve Orman Bakanlığınca yapılan destekleme ödemelerinin tarım ekonomisi açısından değerlendirilmesidir. Bu kapsamda Mucur ilçesi havzasındaki resmi veriler incelenmiş ve gerekli öneriler getirilmiştir. İlçede susuz arazi alanı 779.567 da, sulu arazi alanı 24.060 da olmak üzere toplam 803.627 da tarım alanı vardır. 3.227 da sebzelik, 6.199 da meyvalık, 752 da bağ, 482.271 tarla alanı ve 29.900 nadas alanı vardır. Çiftçi Kayıt Sistemine kayıtlı çiftçi sayısı 3.445'dir. İlçedeki büyükbaş hayvan sayısı ise 29.042, küçükbaş hayvan sayısı 52.597, kanatlı hayvan sayısı 357.348 ve arılı kovan sayısı 1.562 civarındadır (http://www.mucur.gov.tr/). Tarım ve Orman Bakanlığı tarafından çiftçilerin sürdürülebilir üretimin devamlılığını sağlamak için bitkisel üretim ve hayvancılığa ilişkin çeşitli destek ödemeleri yapmaktadır.

Tarım ve Orman Bakanlığı tarafından yapılan desteklemeler; Mazot ve Gübre Desteklemesi (dekar/ 185 TL), Hububat-Prim ve Lisanslı Depoculuk Desteklemeleri (kg/ 75 krş – 1,75 krş), Sertifikalı Tohum Desteklemesi (dekar/ 15- 260 TL), Bitkisel Üretim Yapan Küçük Aile İşletmeleri Desteklemeleri (dekar/ 200 TL) , Organik Tarım- İyi Tarım Desteklemeleri (dekar/ 50-400 TL), Yem Bitkisi Desteklemeleri (dekar/ 180 TL) , Nadas Desteklemesi (dekar/ 50 TL) Ari İşletme Desteklemeleri, Gebe Düve Desteklemeleri, Buzağı Desteklemeleri (baş/adet/2000-6500 TL), Kuzu-Oğlak Desteklemeleri (baş/adet/ 200-580 TL), Çiğ Süt Desteklemesi (litre/14.90 krş), Kırmızı Et Desteklemesi (baş/ 500 TL), Arılı Kovan Desteklemeleri (kovan sayısı/ 80-190 TL) gibi birçok destekler verilmektedir (https://www.tarimorman.gov.tr/).

SONUÇ VE ÖNERİLER

Kırşehir İli Mucur İlçesi, tarımsal üretim açısından önemli bir potansiyele sahip olup, çeşitli tarımsal faaliyetler ve hayvancılık faaliyetleriyle bölge ekonomisine katkı sağlamaktadır. 2024 yılında Tarım ve Orman Bakanlığı tarafından yapılan destekleme ödemeleri, çiftçilerin sürdürülebilir üretim faaliyetlerinin devamını sağlamak amacıyla önemli bir destek aracı olmuştur. İlçedeki tarım alanının büyük bir kısmı tarla arazisinden oluşmakta olup, aynı zamanda sebze, meyve, bağ ve nadas alanları da mevcuttur. Hayvancılık açısından bakıldığında ise büyükbaş, küçükbaş ve kanatlı hayvan sayıları oldukça yüksek seviyelere ulaşmaktadır.

Mucur ilçesindeki çiftçiler, Tarım ve Orman Bakanlığı'nın sağladığı çeşitli desteklemelerle ekonomik anlamda önemli katkılar almışlardır.

Mazot, gübre, tohum, hububat-prim ve küçük aile desteklemeleri gibi doğrudan üretim maliyetlerini azaltmaya yönelik ödemeler, üreticilerin daha verimli çalışmasına olanak tanımaktadır. Bunun yanı sıra, hayvancılık alanında yapılan desteklemeler de üreticilerin üretim kapasitelerini artırmalarına yardımcı olmuştur. Özellikle gebe düve, buzağı, kuzu ve oğlak desteklemeleri ile hayvancılığın sürdürülebilirliği sağlanmaya çalışılmaktadır. Buna rağmen, ilçede sulama alanlarının sınırlı olması, üretim verimliliğini olumsuz yönde etkileyebilmektedir. Bu bağlamda, sulama sistemlerinin geliştirilmesi, üretim alanlarının daha verimli kullanılması açısından önemli bir ihtiyaç olarak öne çıkmaktadır.

Öneriler: Sulama Altyapısının Geliştirilmesi: Mucur ilçesindeki susuz arazi oranının yüksek olması, üretim verimliliğini doğrudan etkileyen önemli bir faktördür. Bu nedenle, ilçeye yönelik sulama altyapısının güçlendirilmesi, Kızılırmak'tan yada çevre illerden getirilecek alternatif su kaynakları ile bu bölge verimli hale gelecektir. Özellikle damla sulama sistemleri gibi verimli sulama yöntemlerinin yaygınlaştırılması önerilmektedir. Bu yöntemler çiftçilerin su kullanımını daha verimli hale getirmelerine olanak tanıyacaktır.

Modern Tarım Tekniklerinin Yaygınlaştırılması: Tarımda verimliliğin artırılması ve sürdürülebilirliğin sağlanması için çiftçilere yönelik modern tarım tekniklerinin eğitimini sağlamak önemlidir. Bu kapsamda, organik tarım, iyi tarım uygulamaları ve agroekolojik yöntemlerin teşvik edilmesi, hem çevresel hem de ekonomik faydalar sağlayacaktır. Üniversiteler ve Tarım ve Orman Müdürlüklerinin destekleri ile çiftçi eğitimlerinin (köy toplantılarının) arttırılması önem arz etmektedir. Hayvancılıkla İlgili Desteklerin Artırılması: Mucur ilçesinde büyükbaş, küçükbaş ve kanatlı hayvancılık faaliyetleri büyük bir yer tutmaktadır. Bu alandaki desteklerin devam ettirilmesi ve artırılması, hayvancılıkla uğraşan çiftçilerin üretim kapasitelerini daha da geliştirecektir. Özellikle süt üretimi ve kırmızı et üretimi alanlarında, daha yüksek desteklemeler ve uygun finansman imkanları sağlanabilir.

Tarım ve Hayvancılık Üreticilerine Finansal Destekler: Tarımsal üretimin finansal yönü, üreticilerin karar alma süreçlerinde önemli bir etkendir. Çiftçilere verilen kredi miktarlarının arttırılması ve üreticilere uygulanan düşük faizlerin tamamen kaldırılması ülkemiz tarım ve hayvancılığın sürdürülebilirliği açısından önem taşımaktadır.

Eğitim ve Danışmanlık Hizmetlerinin Artırılması: Çiftçilerin tarımda verimliliği artırmalarına yardımcı olacak eğitim ve danışmanlık hizmetleri daha fazla yaygınlaştırılmalıdır. Bu hizmetler, çiftçilerin tarım desteklerini doğru şekilde kullanmalarına ve yeni üretim teknikleri hakkında bilgi edinmelerine olanak tanıyacaktır.

Bitkisel üretimde bölgeye dayanıklı ürün çeşitlerin deneme ekimlerinin yapılarak bölgeye adapte edilmesi, kuraklığa dayanıklı aspir gibi bitkilerin ekilişleri arttırılmalıdır. Daha önceki yıllarda bölgelerde uygulanan ÇATAK (Çevre Amaçlı Tarım Arazilerini Koruma) gibi projeler arttırılarak (kanola gibi ürünlerin) devamlılığı sağlanmalıdır.

Sonuç olarak, Mucur ilçesinde tarım ve hayvancılık sektöründeki mevcut potansiyel, verilen desteklerle daha da güçlendirilebilir. Tarımsal üretimin sürdürülebilirliğini sağlamak ve çiftçilerin ekonomik refahını artırmak adına yukarıda belirtilen önerilerin hayata geçirilmesi, bölge ekonomisine uzun vadeli katkı sağlayacaktır.

ABSTRACT

Climate change refers to long-term variations in meteorological events and average temperatures. Drought is one of the most dramatic consequences of climate change and is defined by irregular precipitation patterns and soil moisture imbalance. This condition is an environmental stress factor that directly or indirectly affects plant production, limiting agricultural output at a time when global food demand is steadily increasing.

The reasons of yield reductions of bread wheat due to unfavorable environmental conditions can lead to severe nutritional and economic challenges. High levels of drought stress significantly reduce the grain-filling duration results with early senescence of plants. A shorter grain-filling period does not allow better utilization of stem reserves for grain filling under stress conditions.

Drought is not only the most important risk factor affecting the yield potential of wheat, it also leads to a reduction in the chemical and physical quality parameters of wheat. Mild to moderate drought stress increases the protein content of wheat grains, resulting in improved quality, but causes changes in gliadin/glutenin and HMW glutenin subunits. In general, drought increases the gliadin/glutenin ratio and decreases the HMW glutenin subunits. This situation is often observed during drought, which is generally undesirable and results in a weaker dough and therefore lower gluten quality for bread making. Drought remains a significant threat in all circumstances and efforts to prevent its effects and improve adaptation strategies need to be intensified. Therefore, this study aims to identify and review the effects of drought on gluten quality in wheat.

Keywords: Bread wheat, drought, quality, gluten, glutenin, HMW glutenin

KURAKLIK STRESİNİN EKMEKLİK KALİTE ÜZERİNDEKİ ETKİLERİ: Derleme

ÖZET

İklim değişikliği, meteorolojik olaylardaki ve ortalama sıcaklıklardaki uzun vadeli değişimleri ifade eder. Kuraklık, iklim değişikliğinin en dramatik sonuçlarından biri olmakla birlikte düzensiz yağış rejimi ve toprak nemi yetersizliği ile olumsuz etkileri açığa çıkmaktadır. Bu durum, bitkisel üretimi doğrudan veya dolaylı olarak etkileyen ve küresel gıda talebinin giderek arttığı bir dönemde tarımsal üretimi sınırlayan çevresel bir stres faktör olmaktadır.

Olumsuz çevre koşulları nedeniyle ekmeklik buğdayda verim düşüşlerinin nedenleri bazı beslenme ve ekonomik zorluklara yol açabilmektedir. Yüksek düzeyde oluşan kuraklık stresi, bitkilerin erken yaşlanmasıyla sonuçlanan tane dolum süresini önemli ölçüde azaltır. Daha kısa bir tane dolum süresi, stres koşulları altında tane dolumu için sap rezervlerinin etkili bir şekilde kullanılmasını önlemektedir.

Kuraklık, buğdayın verim potansiyelini etkileyen en önemli risk faktörü olmasının yanı sıra, buğdayın kimyasal ve fiziksel kalite parametrelerinde de azalmaya yol açmaktadır. Hafif ve orta dereceli kuraklık stresi buğday tanelerinin protein içeriğini artırarak kalitenin iyileşmesini sağlar, ancak gliadin/glutenin ve HMW glutenin alt birimlerinde değişikliklere neden olur. Genel olarak, kuraklık, gliadin/glutenin oranını artırır ve HMW glutenin alt birimlerini azaltır. Bu durum genellikle kuraklık sırasında gözlenir ve genellikle istenmeyen bir durumdur ve daha zayıf bir hamur ve dolayısıyla ekmek yapımı için daha düşük gluten kalitesi ile sonuçlanır. Kuraklık her koşulda önemli bir tehdit olmaya devam etmektedir ve etkilerini önlemeye ve adaptasyon stratejilerini geliştirmeye yönelik çabaların yoğunlaştırılması gerekmektedir. Bu nedenle, bu çalışma kuraklığın buğdayda gluten kalitesi üzerindeki etkilerini belirlemeyi ve gözden geçirmeyi amaçlamaktadır.

Anahtar Kelimeler: Ekmeklik buğday, kuraklık, kalie, gluten, glutenin, yüksek molekül ağırlıklı glutenin

1. GİRİŞ

Küresel iklim değişikliği, tarımsal üretimi doğrudan etkileyen en önemli çevresel sorunlardan biri hâline gelmiştir. Bu bağlamda kuraklık, özellikle yarı kurak ve kurak bölgelerde tahıl üretimi için ciddi bir tehdit oluşturmaktadır (Farooq vd., 2014). Kuraklık, toprakta su yetersizliği nedeniyle bitkinin fizyolojik aktivitelerinde bozulmalara yol açarak hem verimi hem de kaliteyi sınırlamaktadır. Buğday (*Triticum aestivum L.*), dünya genelinde temel besin kaynaklarından biri olup, özellikle ekmek üretiminde en çok tercih edilen türlerden biridir. Ancak, su stresine oldukça duyarlıdır ve kuraklık koşulları altında kalite parametrelerinde önemli değişiklikler meydana gelmektedir (Triboï vd., 2003; Gooding vd., 2003).

Kuraklık, buğdayda protein sentezini artırarak bazı durumlarda tane protein oranını yükseltebilirken (Rharrabti vd., 2001), şiddetli su stresi glutenin yapısını bozmakta, düşük çözünebilirlik ve zayıf hamur özellikleri ile sonuçlanmaktadır (Altenbach, 2012). Bunun yanında kuraklık, tane dolgusu süresini kısaltarak nişasta birikimini sınırlandırır ve bin tane ağırlığını düşürür (Barnabás vd., 2008). Sonuç olarak, ekmeklik buğdayın un verimi, işleme kalitesi ve son ürün fonksiyonelliği olumsuz etkilenmektedir.

Dolayısıyla bu çalışmada, kuraklık stresinin ekmeklik buğdayın fiziksel, kimyasal ve teknolojik kalite özellikleri üzerindeki etkileri ele alınmakta; sürdürülebilir tarımsal üretim açısından bu etkilerin bilimsel olarak anlaşılmasının önemi vurgulanmaktadır.

2. İKLİM DEĞİŞİKLİĞİ ETKİSİ

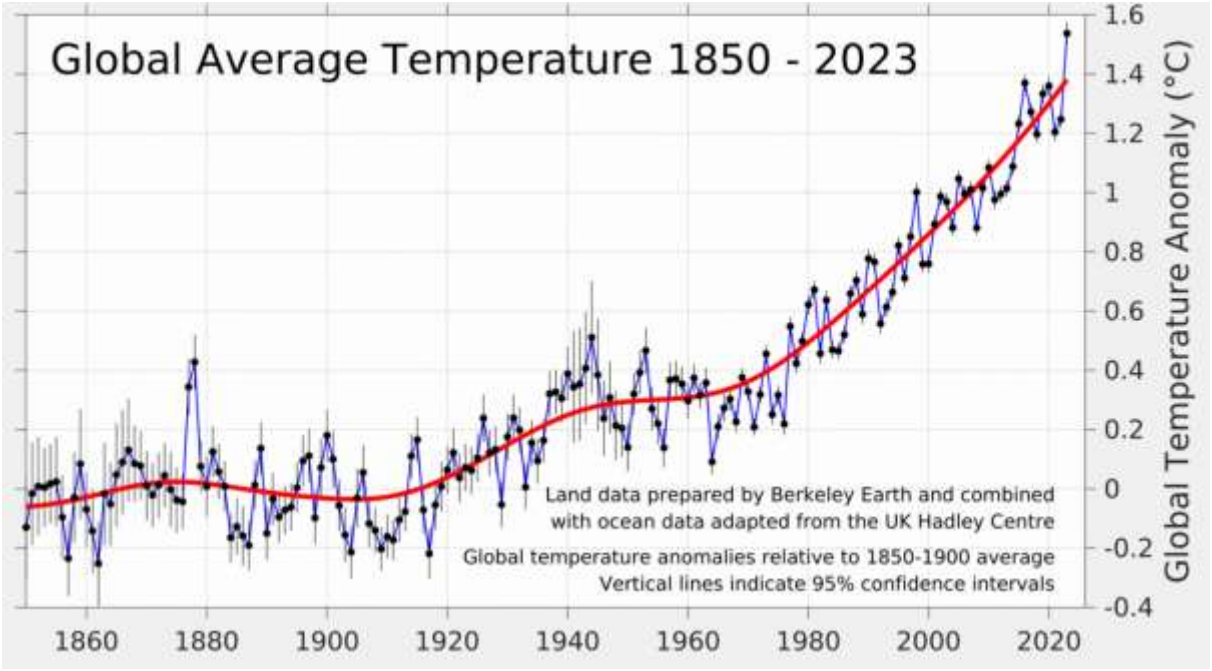
İklim değişikliği, atmosferin bileşiminde ve yer yüzeyindeki enerji dengesinde meydana gelen değişimlerin, uzun dönemli sıcaklık ve yağış rejimlerini etkilemesiyle oluşur. Bu süreç, yüz yıllar boyunca meydana gelir; ancak günümüzde insan kaynaklı etkilerle çok daha hızlı ve şiddetli bir şekilde yaşanmaktadır. İklim değişikliğinin temel nedenleri arasında sera gazı emisyonları (karbondioksit (CO_2), metan (CH_4), azot oksit (N_2O) gibi gazların atmosferde birikmesi (sera etkisi), fosil yakıt tüketimi (Sanayi, ulaşım ve enerji üretimi), ormansızlaşma (karbon yutaklarının azalması), Tarım ve Hayvancılık (metan ve azot oksit salımı), sanayi atıkları ve aşırı tüketimden kaynaklanmaktadır. Tüm ekolojik dengeyi olumsuz yönde etkileyen etkilerinin yanında özellikle tarımsal üretimde düzensiz yağış rejimi, kuraklık, yüksek sıcaklık stresi, ani düşük sıcaklıklar, dolu yağışı, erozyon artışı ve sel gibi doğal afetlerin artması sonucu önemli verim kayıplarına neden olmaktadır.

3. İKLİM DEĞİŞİKLİĞİ VE SONUÇLARI

Son yıllarda etkileri daha da artan iklim değişikliği yanlızca yüksek sıcaklık ve kuraklık şeklinde etkisini göstermemektedir. İklim değişikliğinin geniş çaplı etkileri kısaca aşağıdaki gibi sıralanabilmektedir;

- Küresel ortalama sıcaklıkların artması
- Kutup buzullarının erimesi
- Deniz seviyesinin yükselmesi

- Kuraklık, aşırı yağış, fırtına, orman yangınlarında artış
- Mevsim kaymaları
- Ekosistemlerde bozulma ve biyoçeşitlilik kaybı.



Şekil 1. 1850-2023 yılları arasındaki küresel sıcaklık artış anormallikleri (Anonymous 2025, Artık vd., 2024).

4. BUĞDAY VE ÜRÜN KALİTESİ

Buğday, insan beslenmesinin en temel gıdasıdır ve dünyada 6 kıtanın farklı iklim koşullarına uyum sağlamış bir bitkidir. Gelişmekte olan ülkelerdeki büyük nüfus çoğunluğunun günlük kalori ihtiyacının %21'i ve protein ihtiyacının %20'sini buğday karşılamaktadır. Ekmeklik buğday (*Triticum aestivum* L.), özellikle un kalitesi ve hamur işleme özellikleri bakımından değerlendirilen bir üründür. Kalite hem fiziksel tane özellikleri hem de un ve gluten fonksiyonelliği temelinde belirlenir.

Fiziksel kalite, buğday tanesinin dış özellikleri ile ilgilidir ve endüstriyel işleme uygunluğu açısından önemlidir. Bu özellikler arasında bin tane ağırlığı, hektolitre ağırlığı, tane sertliği, tane şekli ve renk gibi parametreler yer alır. Yüksek hektolitre ağırlığı (≥76 kg/hl), sağlam ve yoğun taneleri işaret ederken, yüksek tane sertliği ise daha iyi öğütme performansı ile ilişkilidir (Perten, 1964). Sert buğdaylar, un elde etmede daha verimli ve yüksek protein içerikli olmaları nedeniyle tercih edilir (Dexter & Marchylo, 2000; Bayhan vd., 2021).

Kimyasal kalite, buğdayın besin içeriğini belirleyen protein, nişasta, kül, yağ ve enzim aktiviteleri gibi parametreleri kapsar. Ekmeklik buğdayda en kritik kimyasal parametre, tane protein oranıdır. Protein oranı genellikle %10–15 arasında değişir ve bu oran, gluten kalitesini

doğrudan etkiler. Bunun yanı sıra, nişasta miktarı da un verimini ve ürün dokusunu belirleyen önemli bir etkendir. Alfa-amilaz enzimi aktivitesi, düşme sayısı testiyle ölçülür ve bu değer, unun pişirme kalitesi açısından belirleyicidir (Finney, 1992).

Buğdayın ekmek üretimine uygunluğunu belirleyen en kritik parametrelerden biri teknolojik kalitedir. Bu kapsamda değerlendirilen özellikler arasında gluten kalitesi, su absorpsiyon kapasitesi, farinograf ve alveograf parametreleri, mikser süresi ve hamur stabilitesi gibi ölçütler yer alır. Gluten, buğday proteinlerinin işleme esnasında suyla birleşerek oluşturduğu kompleks bir ağ yapısıdır. Bu yapı, gaz tutma kapasitesi sağlayarak ekmeğin hacmini, yapısını ve dokusunu belirler (Shewry & Halford, 2002; Dizlek, 2012). Özellikle yüksek moleküler ağırlıklı glutenin alt birimleri (HMW-GS), güçlü ve esnek bir gluten matrisi oluşumunda kilit rol oynar (Payne vd., 1987).

Tablo 1. Ekmeklik buğdayda fiziksel kalite özellikleri (Stojanovic and Milovanovic, 2015).

Fiziksel Parametre	**Birim / Değer**	**Açıklama**
Bin Tane Ağırlığı	g (35–45 g)	Tane dolgunluğu ve nişasta birikimi hakkında bilgi verir.
Hektolitre Ağırlığı	kg/hL (76–82)	Tane hacmine göre kütle; doluluk ve sağlamlık göstergesidir.
Tane Sertliği	Puan (50–80)	Sert buğdaylar yüksek kalite ve irmik verimi sağlar.
Tane Büyüklüğü	mm (2.5–3.5)	Boyut, un verimi ve işleme kalitesi ile ilişkilidir.
Tane Renk Özelliği	L*, a*, b*	Pazarlama ve sınıflandırmada kullanılır, kalite algısını etkiler.
Tane Yoğunluğu	g/cm³ (1.3–1.5)	Tanenin yapısal sağlamlığı ve yoğunluğunu gösterir.

Tablo 2. Ekmeklik buğdayda tane ve ekmeklik kalite özellikleri ve fonksiyonel önemleri (Shewry and Halford, 2002).

Parametre	**Birim/Yöntem**	**Fonksiyonel Önemi**
Protein oranı (%)	Kjeldahl/Dumas/NIRS	Yüksek protein, güçlü gluten ve iyi yoğurma özellikleri sağlar
Gluten İndeksi (%)	Puan (0-100)	Gluten dayanıklılık derecesini ölçer; >%80 yüksek kaliteli gluten anlamına gelmektedir.
Yaş Gluten (%)	Manuel / Glutomatik	Gluten miktarını verir, hamur oluşumu ve esneklik için gereklidir.
SDS sedimentasyon	ml	Gluten kalitesini ve protein gücünü yansıtır.
Alveograf W değeri	10^{-4} J	Unun enerji gücünü ölçer; yüksek W daha güçlü hamur anlamına gelmektedir.
P/LOranı (Alveograf)	Oran	Hamurun elastikiyet/uzayabilirlik dengesini gösterir
Farinograf su absorbsiyonu	%	Hamurun su tutma kapasitesini ve kararlılığını gösterir
Düşme sayısı	sn	Alfa-amilaz aktivitesini belirler; düşük değer erken çimlenmeye işaret eder.

5. EKMEKLİK BUĞDAYDA KURAKLIK ETKİSİNİN FİZYOLOJİK ÖZELLİKLER ÜZERİNDEKİ DEĞİŞİMİ

Kuraklık, özellikle buğdayın dane doldurma döneminde oluştuğunda, fotosentez ürünlerinin taşınmasını, hücre bölünmesini ve solunum süreçlerini sınırlandırır. Bu durum, tanelerde karbonhidrat ve nişasta birikiminin azalmasına, ancak bazı metabolitlerin (özellikle proteinlerin) artmasına neden olur. Sonuç olarak, taneler küçük, buruşuk ve düşük nişasta içerikli olurken, protein oranı görece artar. Ancak bu artış niteliksel değildir; protein yapısı zayıf olabilir (Tsenov vd., 2015; Tatar vd., 2020).

Tablo 3. Ekmeklik buğdayda kuraklığa karşı fizyolojik cevaplar (Plaut vd., 2004; Araus vd. 2005; Kılıç ve Yağbasanlar, 2010)

Fizyolojik Özellik	**Kuraklık Altındaki Etki**	**Açıklama**
Fotosentez Hızı	Azalır	Karbon fiksasyonu sınırlanır, enerji üretimi düşer.
Tane Doldurma Süresi	Kısalır	Taneye madde akışı daha kısa sürede sona erer.
Tane Ağırlığı	Düşer	Küçük, buruşuk taneler oluşur.
Nişasta Birikimi	Düşer	Azalan fotosentez nedeniyle depo karbonhidrat sentezi düşer.
Protein Yüzdesi	Artabilir (göreceli)	Nişasta sentezi azalırken protein oranı göreceli olarak artar.
Transpirasyon Hızı	Azalır	Stomaların kapanmasıyla su kaybı azalır.
Kök Uzaması	Yavaşlar	Toprak nemi azaldıkça kök büyümesi baskılanır.
Fertil çiçek Verimliliği	Azalır	Çiçek organ gelişimi kuraklıkla sınırlandığı için dane verimi düşer.

6. KURAKLIK-KALİTE İLİŞKİSİ

Hafif ve orta dereceli kuraklık stresi buğday tanelerinin protein içeriğini artırarak kalitenin iyileşmesini sağlar, ancak gliadin/glutenin ve HMW (yüksek molekül ağırlıklı) glutenin alt birimlerinde değişikliklere neden olur. Genel olarak, kuraklık, gliadin/glutenin oranını artırır ve HMW glutenin alt birimlerini azaltır. Bu durum genellikle kuraklık sırasında gözlenir ve genellikle istenmeyen bir durumdur ve daha zayıf bir hamur ve dolayısıyla ekmek yapımı için daha düşük gluten kalitesi ile sonuçlanır.

Gluten kompleksinin meydana gelmesini sağlayan başlıca bileşenler glutenin ve gliadin proteinleridir. Toplam miktarlarının ve birbirine oranlarının yanı sıra iki proteinin de özellikleri ayrı ayrı etkilidir. Kuraklık stresi, buğdayda özellikle gluten proteinlerinin fraksiyonel bileşimini ve teknolojik kalitesini önemli ölçüde etkiler. Gerçekleştirilen çeşitli çalışmalarda, kuraklığın gluten protein fraksiyonları olan gliadin, yüksek molekül ağırlıklı glutenin (HMW-GS) ve düşük molekül ağırlıklı glutenin (LMW-GS) üzerindeki etkileri net olarak ortaya konmuştur (Li vd. 2013; Olckers vd. 2022; Sattar vd., 2022).

Tablo 4. Kuraklık şartlarında protein fraksiyonları ve değişimleri

Fraksiyon	Kuraklık Etkisi
Ex-Gliadin	Artar → fazla viskozluk, az elastikiyet
Ex-Glutenin (HMW+LMW)	Azalır → zayıf gluten yapısı
Unextractable HMW/LMW	Azalır → zayıf polimerleşme
G:G Oranı (gliadin/glutenin)	Artar → hamur kalitesi düşer

7. SONUÇ

Küresel iklim değişikliği senaryolarının gelecekteki etkileri göz önüne alındığında mevsimsel değişimler ve sıcaklık değişimlerinin olacağı öngörülmektedir. Buğdayın tane kalitesinin belirlenmesinde en önemli fenolojik dönemler olan çiçeklenme sonrası dönemlerde meydana gelebilecek kuraklık şartları kaliteli buğday kavramına etki edecektir.

Bahar yağışlarının düzensizliği ve generatif dönemde meydana gelen kuraklık şartları sonucu kurak şartlarda her ne kadar bazı kalite özelliklerinde istenilen değişimlere yol açsa da gluten proteinlerinin zayıflaması nedeniyle değirmencilik ve kaliteli ürün açısından önemli bir sorun oluşturması beklenmektedir.

Verim özelliklerin yanında kuraklık ile birlikte tane protein sentezi aşamalarında ekmeklik özelliklerine olumlu etki yapacak proteinlerin sentezlenmesinin moleküler düzeyde anlaşılması stres koşullarında bile kalitesi ve verimi stabil bir çeşit geliştirmeye katkıda bulunacaktır.

ABSTRACT

In the context of the global challenges posed by climate change and the contraction of agricultural areas, it has become imperative to optimize the yield per unit area. In this context, it is of great importance to protect the yield and production potential of maize plants, which have versatile uses in human, animal nutrition and industrial use.

In this paper, the current situation, application errors, causes of yield loss and directions for improvement were discussed in the context of field observations and studies on maize cultivation in the Aegean Region since 2019. A comprehensive evaluation of numerous agronomic practices, ranging from soil preparation to the harvest period, was conducted through field observations. The objective of this study is to provide scientifically based guidance to enhance the productivity of maize in the Aegean Region. In accordance with the field observations, critical practices in maize cultivation were identified, including early sowing and emergence period, appropriate maturity group and variety selection, sowing frequency, soil pH status, herbicide use, irrigation method, fertilization, *fusarium*, aphids, stem borer and harvest moisture.

It is imperative that producers in the Aegean Region adopt scientific, technological and agrotechnical practices that enhance productivity and continuity in maize cultivation, as opposed to adhering to conventional, fixed methodologies. Specifically, practices such as soil analysis-based fertilization, the implementation of drip irrigation systems, and the selection of early and disease-resistant varieties should be adopted on a wide scale. The implementation of these practices will ensure the sustainability of maize agriculture in the region, thereby contributing to the attainment of optimal yield stability and the attainment of high production levels. A comprehensive review of critical practices reveals that the changing precipitation

regime due to climate change poses the primary challenge to future maize agriculture in the region, given its impact on water availability. Consequently, enhancing water use efficiency and formulating effective irrigation methods are of paramount importance.

Keywords: Maize, Aegean region, yield, irrigation, FAO maturity groups, variety

EGE BÖLGESİ'NDE MISIR YETİŞTİRİCİLİĞİNİN MEVCUT DURUMU, SORUNLARI VE GELİŞTİRİLME POTANSİYELİ

ÖZET

Dünya genelinde iklim değişikliği etkisi ve azalan tarım alanları nedeniyle birim alandan maksimum verim alınması zorunlu hale gelmiştir. Bu bağlamda, insan ve hayvan beslenmesi ile endüstriyel anlamda çok yönlü kullanım alanına sahip mısır bitkisinin veriminin ve üretim potansiyelinin korunması büyük önem arz etmektedir.

Bu bildiride, Ege Bölgesi'nde mısır yetiştiriciliği üzerine yapılan 2019 yılından itibaren saha gözlemleri ve çalışmaları ışığında mevcut durum, uygulama hataları, verim kaybı nedenleri ve gelişime açık yönler tartışılmıştır. Toprak hazırlığından hasat dönemine kadar yapılan birçok agronomik uygulama ayrıntılı olarak arazi gözlemleri ile değerlendirilmiştir. Amaç, Ege Bölgesi tarımının sürekliliğini ve verimliliğini artıracak bilimsel temelli yön göstermektir. Yapılan saha gözlemleri doğrultusunda mısır yetiştiriciliğinde kritik uygulamalar; erken ekim ve çıkış dönemi, uygun olum grubu ve çeşit seçimi, ekim sıklığı, toprak pH durumu, herbisit kullanımı, sulama yöntemi, gübreleme, *fusarium*, kırmızı örümcek, sap kurdu ve hasat nemi olmak üzere gözlemlenmiştir.

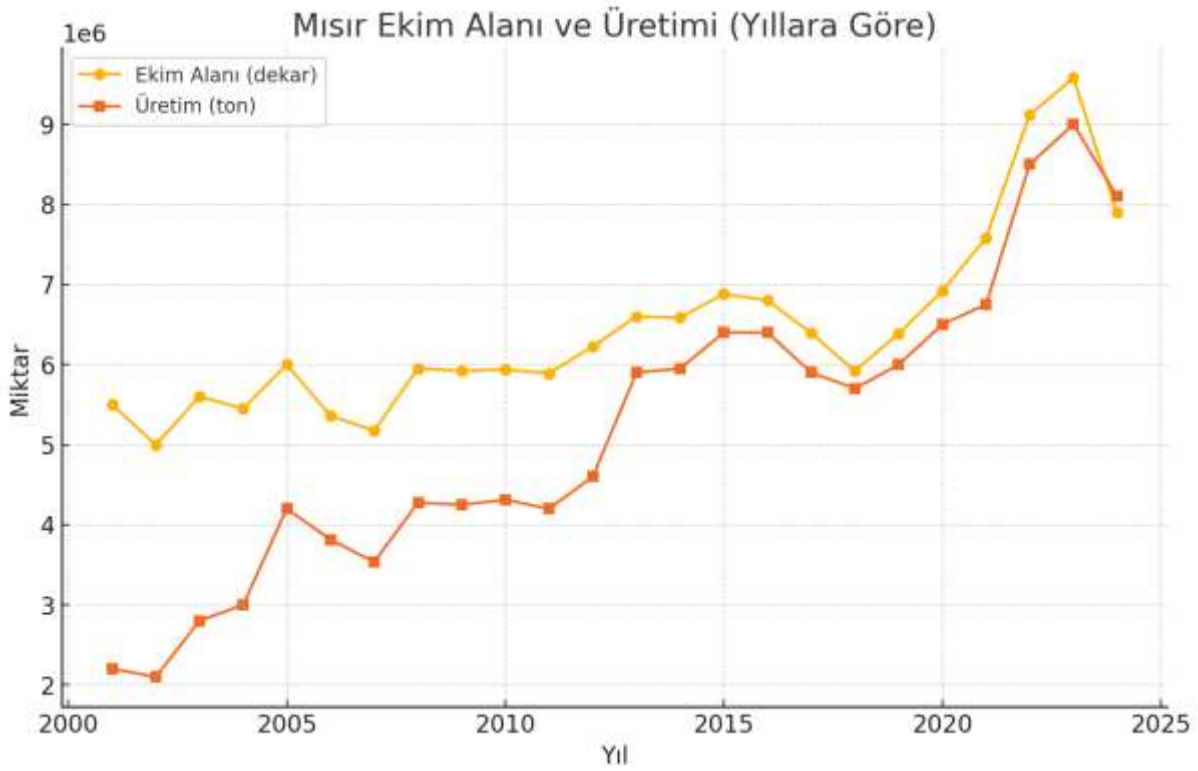
Ege Bölgesi'nde mısır yetiştiriciliğinde süreklilik ve verimliliğin artması, üreticilerin geleneksel ve sabit uygulamalardan ziyade verim artışını sağlayacak bilimsel, teknolojik ve agroteknik uygulamalara yönelmeleriyle mümkün olacaktır. Özellikle toprak analizine dayalı gübreleme, damlama sulama sistemleri, erkenci ve hastalıklara dayanıklı çeşit seçimi gibi uygulamalar yaygınlaştırılmalıdır. Bölgede mısır tarımının güvence altına alınması, optimum verim stabilitesi sağlanması ve yüksek üretim düzeyine ulaşılabilmesi bilinçli tarım uygulamaları neticesinde uygun olabilecektir. Bölgede değerlendirilen tüm kritik uygulamalar içerisinde özellikle iklim değişikliği nedeniyle değişen yağış rejiminin su varlığını etkilemesi ile gelecekte bölgede mısır tarımını kısıtlayacak en temel sorun olduğu gözlemlenmektedir. Bu nedenle su kullanım etkinliğinin arttırılması ve etkin sulama yöntemlerinin geliştirilmesi büyük önem arz etmektedir.

Anahtar kelimeler: Mısır, Ege bölgesi, verim, sulama, FAO olgunlaşma grupları, çeşit

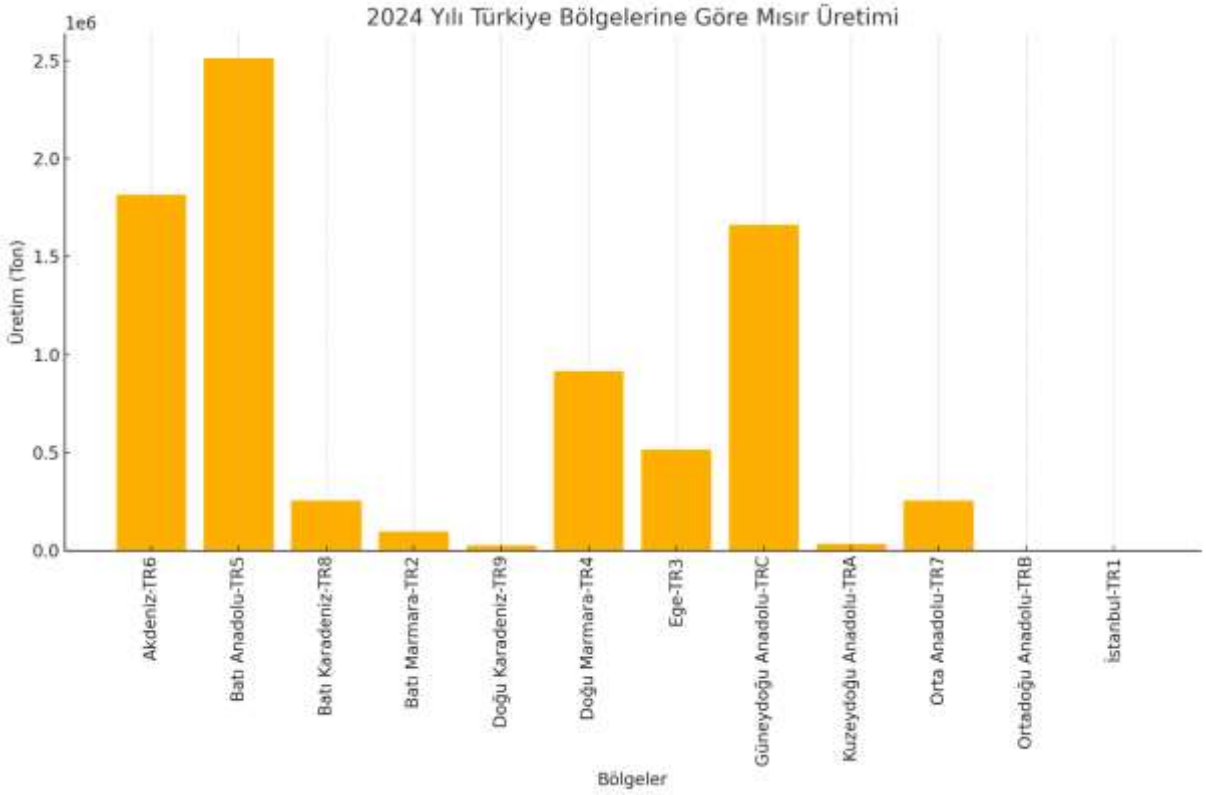
1. EGE BÖLGESİ MISIR ÜRETİM POTANSİYELİ

Dünya'da sınırlı tarım alanlarının bulunması, bu alanların artan dünya nüfusu ve yerleşke sıkıntısı sebebiyle genişletilememesi, birim alanda yüksek tane verimi ve biyolojik ürün elde edilebilecek bitkilerin yetiştirilmesini ve bu bitkilerin yeni teknolojiye ve gelişmelere uyabilecek özellikte olmasını zorunlu kılmaktadır. Kökeni ve gen merkezi Amerika kıtası olan mısır bitkisi; Dünya'da en fazla tarımı yapılan tahıl bitkileri olan buğday ve çeltikten sonra en fazla ekim alanına sahip bitkidir. Bu bitki bitkisel kaynaklı proteinlerin yeterli ve ekonomik üretimi için büyük önem taşımaktadır.

Mısır binlerce yıldır tarımı yapılan bir bitkidir. Anavatanı olan Amerika'da yapılan arkeolojik çalışmalar sonucunda bitkinin geçmişinin 8000-10 000 yıl öncesine dayandığı gözlemlenmiştir (Kün, 1985, Douswell vd. ,1996, Kırtok, 1998). Ülkemize ise adını aldığı ülkeden; Mısır ve Suriye üzerinden girdiği tahmin edilmektedir (Kün, 1985; Kırtok, 1998). Ülkemizde özellikle 2000'li yıllardan sonra mısır ekim alanı ve üretimi önemli düzeyde artmıştır (Şekil 1.).

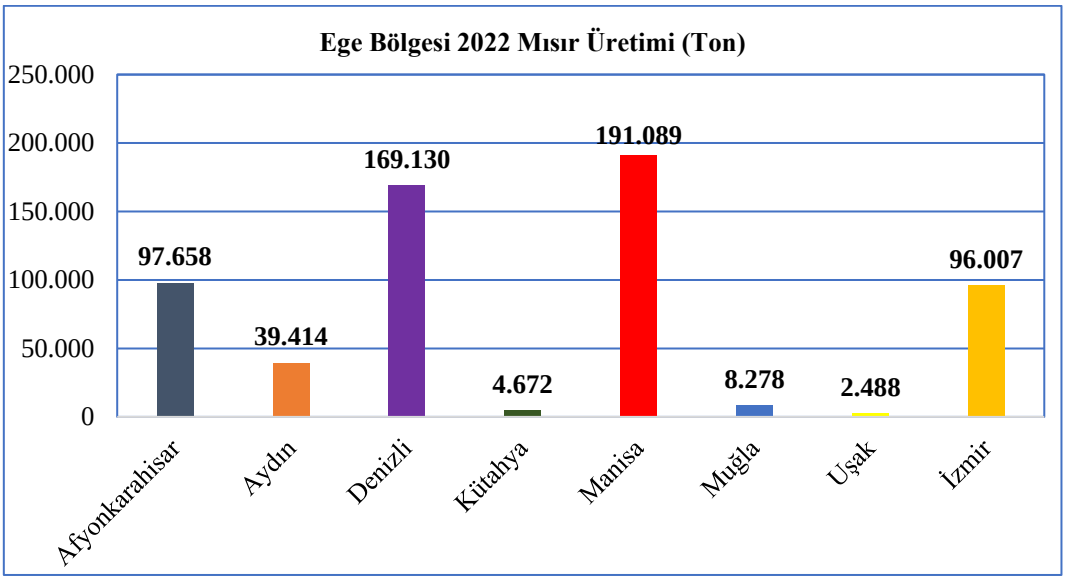


Şekil 1. 2000-2025 yılları arasında ülkemizde mısır ekim alanı (mil. da) ve üretim miktarı (mil. ton), TÜİK, 2025.

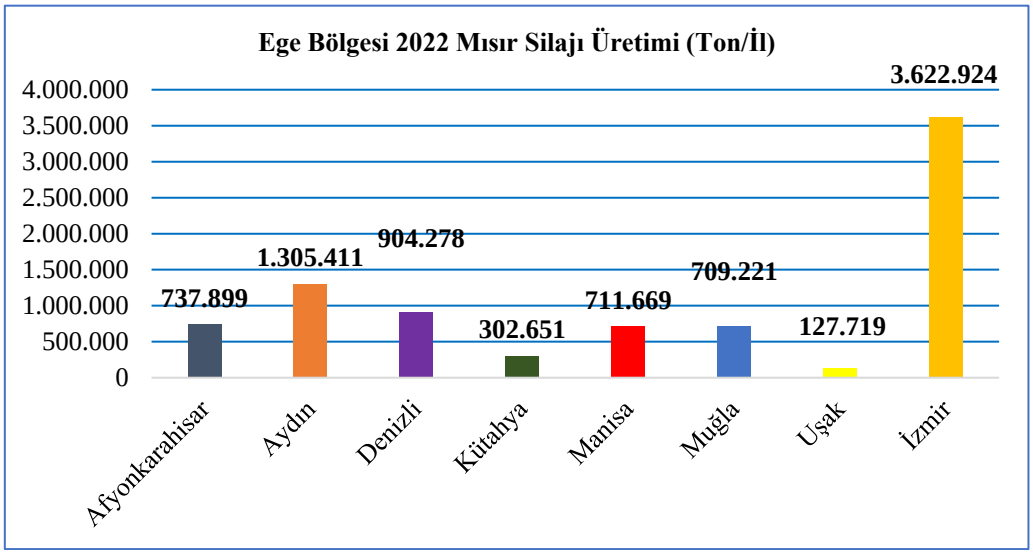


Şekil 2. Ülkemizde 2024 yılında bölgelere göre mısır üretim miktarı (ton), TÜİK, 2025.

Ülkemizde 2024 yılı en fazla mısır üretim miktarına sahip bölgemiz TÜİK Düzey 1 bölgelerinden Batı Anadolu-TR5 (Ankara, Konya, Karaman) ilk sırada yer alırken Güneydoğu Anadolu-TRC ise 2. sırada yer almaktadır. Ege Bölgesi mısır üretim miktarı bakımından ise ülkemizde 5. sırada yer almaktadır (TÜİK, 2025). Ege bölgesi, 3.2 milyon ha tarım alanı ve bu tarım alanlarının %60 düzeyindeki bölümü sulu tarımı yapılabilir olması ile çok büyük bir üretim potansiyeline sahiptir (UHL,2011). Ege bölgesinde dekardan en fazla verim alınan iller Manisa, Aydın ve İzmir'dir. Son dönemlerde pamuk tarımının azalması; mısıra ve diğer bitkilere verilen teşvikler yardımıyla ülke genelinde ve Ege Bölgesinde mısır üretim alanları artmaya başlamıştır.



Şekil 3. Ege Bölgesi 2022 yılı il düzeyinde tane mısır üretim değerleri



Şekil 4. Ege Bölgesi 2022 yılı il düzeyinde silajlık mısır üretim değerleri

Ege Bölgesinde il düzeyinde mısır üretim değerleri incelendiğinde özellikle tanelik ve tohum üretimi açısından Manisa ve Denizli illeri ön plana çıkarken süt sığırı işletmeciliğinin oldukça yaygın olduğu İzmir ilinde ise silajlık mısır üretimi en yüksek düzeyde olduğu tespit edilmiştir (TÜİK, 2022).

2. EGE BÖLGESİ MISIR ÜRETİM SORUNLARI VE TESPİTLER

Bu bildiride, Ege Bölgesi'nde mısır yetiştiriciliği üzerine yapılan 2019 yılından itibaren saha gözlemleri ve çalışmaları ışığında mevcut durum, uygulama hataları, verim kaybı nedenleri ve gelişime açık yönler tartışılmıştır. Toprak hazırlığından hasat dönemine kadar yapılan birçok agronomik uygulama ayrıntılı olarak arazi gözlemleri ile değerlendirilmiştir. Amaç, Ege Bölgesi tarımının sürekliliğini ve verimliliğini artıracak bilimsel temelli yön göstermektir.

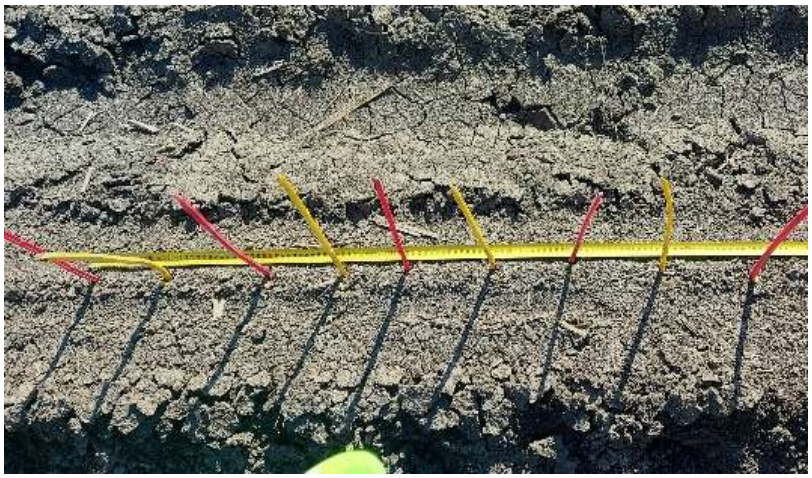
Bu nedenle genel anlamda tespit ve sorunlar aşağıdaki şekilde belirtilmiştir;

A. Toprak Hazırlığı
B. Ekim (Bitki Sıklığı)
C. Ekim Zamanı
D. Gübreleme
E. Generatif Dönem Stres Koşulları
F. Sulama Yöntemi
G. *Fusarium* Hastalık Etmeni
H. İklim değişikliği ve su

Toprak Hazırlığı; Üreticilerimizde mısır bitkisinin, pamuk gibi bitkilerle kıyaslandığında toprak hazırlığı daha önemsiz ve zorlu koşullarda dahi çok rahat çıkış sağlayabilen bir bitki türü olduğu algısı mevcuttur. Ne yazık ki bu algı, toprak hazırlığına yeterince özen gösterilmemesine sebep olmaktadır. Özellikle Bahar yağışlarının düzensizliği nedeniyle toprak hazırlığının geciktirilmesi ekimde nem kayıplarına neden olmaktadır.

Ekim (Bitki Sıklığı); Toprağın homojen ve doğru bir şekilde hazırlanmaması ekim sırasında tohumların aynı derinliğe düşmemesine sebep olabilmekte, bu durum ise homojen olmayan çıkışların yaşanmasına sebep olabilmektedir. Ekim sonrasında yapılacak olan toprak işçiliği, gübreleme, sulama, ilaçlama gibi agronomik faaliyetlerde ise homojen bitki çıkışı son derece önemlidir.

Ege Bölgesi'nde ekseriyetle sıra arası 70 cm sıra üzeri ise 14.5 – 18 cm aralığında ekim sıklıkları tercih edilmektedir. Sıra arası ekim mesafesi genel anlamda çok değişmese de sıra üzeri ekim mesafesi değişkenlik göstermektedir. Bitki sayısının belirlenmesinde ekilecek çeşidin sıklığa olan toleransı iyi bilinmeli ve hasada kadar yaşanılacak bitki kayıpları da göz önünde bulundurulmalıdır. Sık ekimlerde dik yaprak yapısına sahip çeşitlerin tercih edilmesi önerilebilir.



Şekil 5. Arazide ekim sıklığı kontrolü (orijinal Oktay Yavuz)

Ekim Zamanı; Ekim zamanı da diğer uygulamalar gibi verimi doğrudan ya da dolaylı olarak etkileyebilmektedir. Genel itibariyle erken ekimin getirileri olsa da, bölge ve mikro klimalara göre erken ekim tercihleri dikkatlice yapılmadır. Özellikle don tehlikesinin bulunduğu yerlerde erken ekim ile don zararına maruz kalmak sezon sonunda yüksek verim kayıplarına sebep olabilir. Çıkış öncesi yaşanan donlar verime pek etki etmese de çıkış sonrası gerçekleşen donların verim kaybına sebep olması çok yüksek ihtimaldir. Bu durumda üreticiler yeniden ekim yapma tercihine gidebilir. Ege Bölgesi genel olarak ılıman bir iklime sahip olan bir bölge olduğu için mısır yetiştiriciliğinde don zararı pek görülmese de sahile uzak bölgelerde bu tehlike önemsenmelidir. Toprak hazırlığı ve ekim yöntemlerinin sonrasında Ege Bölgesi'nde bitki sayısını ve dolayısıyla verimi etkileyen faktörlerden biri de çıkış sürecinde yaşanan kaymak problemleridir. Özellikle Aydın gibi genel anlamda kumsal toprak tipine sahip bölgelerde çıkış öncesinde gerçekleşen yağışlar kaymak tabakası oluşturmakta ve özellikle çimlenme ve tohum gücü düşük tohumlarda bitkilerde "sarı kıvrım" meydana gelmesine neden olmaktadır. Bu nedenle erken dönemde kaymak tabakası sorununa karşı kaymak kırma aleti kullanılmalıdır.

Şekil 6. Toprak kaymak tabakası sorunu ve çıkış problemi (sol), kaymak kırma aleti (sağ) (orijinal Oktay Yavuz)

Ekim zamanının optimize edilmesi ve özellikle bölge için uygun FAO olum gruplarının tercih edilmesi ile bitkilerin ihtiyaç duydukları vejetasyon süreleri iyi bir şekilde karşılanabilmektedir. Ancak uygun olmayan olum grubu, yanlış çeşit seçimi ve ekim zamanı gecikmesi nedeniyle bölgede önemli verim kayıpları tespit edilmiştir.

Tablo 1. Mısır bitkisinde FAO olum grupları ve olgunlaşma gün sayıları (Croitoru vd., 2020).

Olgunlaşma tipi	FAO Sınıfı	Olgunlaşma gün sayısı (gün)
Aşırı erkenci	100-199	76-85
Erkenci	200-299	86-112
Orta-erkenci	300-399	113-129
Geç olum	400-600	130-145
Çok geç olum	>600	>150

Gübreleme; Ege Bölgesi'nde genel anlamda pH değerleri alkali düzeyde olduğu tespit edilmiştir. Mısır yetiştiriciliğinde toprak pH'ının 6.5–7 (nötr) aralığında olması istenmektedir (Zengin ve Özbahçe, 2013). Bu nedenle toprak analizlerinin düzenli olarak yaptırılması her yetiştiricilik sezonu sonrasında yetiştirilen bitki türü ve uygulanan gübre türü ve miktarları sonucunda oluşan yeni değerlerin saptanmasını sağlamaktadır. Toprak analiz sonucunda önerilen düzeyde yapılan gübreleme ile bölgede önemli verim artışlarının olduğu tespit edilmiştir.

Şekil 7. Ege Bölgesinde bazı mısır arazilerinden alınan toprak analiz sonuçları (orijinal Oktay Yavuz)

Yüksek pH düzeyindeki arazilerde analizler sonucunda toz kükürt uygulaması önemli pH'ın düşmesinde önemli katkı sağlamaktadır.

Şekil 8. Arazide toz kükürt uygulaması (orijinal Oktay Yavuz)

Generatif Dönem Stres Koşulları; Ege Bölgesi'nin yaz aylarında sahip olduğu ortalama sıcaklık değerleri oldukça yüksektir. Bu yüksek sıcaklıklar mısır bitkisinin tozlanma döneminde döllenme problemlerine yol açabilmekte, bu sebeple verim kayıplarına sebep olabilmektedir

(Naveed vd., 2014). Tozlanma ve döllenmenin sıcaklıkların daha düşük olduğu erken döneme denk getirilmesi verim kaybını azaltabilir. Erken ekimin getirilerinden bir diğeri ise genel itibariyle bitkideki kök gelişiminin daha iyi olması ve sonraki dönemlerde kök yapısının bitki beslenmesi ve su ihtiyacının karşılanmasında daha etkin olması söylenebilir.

Sulama Yöntemi; Mısır yetiştiriciliğinde verim kayıplarına sebep olabilen ya da verimi arttırabilen oldukça önemli bir diğer faktör ise sulama yöntemidir. Ege Bölgesi'nde mısır yetiştiriciliğinde damlama, karık ve tava sulama gibi çok çeşitli sulama yöntemleri uygulanmaktadır. Manisa ve Salihli Bölgelerinde damlama sulama yöntemi giderek yaygınlaşmakta olsa da karık sulama yöntemi de birçok alanda uygulanmaktadır. Aydın'da ise tava sulama yöntemi en yaygın kullanılan yöntemdir. Tava sulama yönteminde tarlanın büyüklüğü, su miktarı ve debisi, tesviye gibi kriterler göz önünde bulundurularak belirli bir alan ya da tarlanın tamamı toprak set ile çevrilir ve bu bölge havuz şeklinde su ile doldurulur.

Aydın'da özellikle 2021 yılında yaşanılan kuraklığın getirdiği kayıplar, iklim değişikliğinin etkileri ile yaşanması muhtemel kuraklıklar göz önünde bulundurulduğunda suyun kıymeti çok daha iyi bilinmelidir. Bu nedenle su kısıtlılığı sorununa karşı etkin sulama yöntemi olan damlama sulama ve toprak altı sulama yöntemleri bölgede önerilebilecek sulama yöntemi olarak karşımıza çıkmaktadır.

Şekil 9. Ege Bölgesinde en yaygın kullanılan karık sulama (sol) yöntemi ve önerilen damlama sulama yöntemi (sağ) (orijinal Oktay Yavuz)

Fusarium Hastalık Etmeni; Ege Bölgesi'nde mısır yetiştiriciliğinde görülen başlıca hastalık ve zararlılar içinde *Fusarium*, kırmızı örümcek, yaprak bitleri, koçan kurdu ve sap kurdu, mısır rastığıdır. *Fusarium* mantari bir hastalıktır ve ruhsatlı bir fungusiti mevcut değildir. En iyi mücadele yöntemi olarak toleranslı çeşitlerin tercih edilmesi söylenebilir. Kışı toprakta geçiren bir patojendir. Özellikle üst üste tanelik mısır yetiştiriciliği yapılan tarlalarda etkisini gösterir. Toprağın hastalıktan arınması için uzun yıllar mısır yetiştiriciliği yapılmaması gerekir.

Toleranslı çeşitlerin tercih edilmesinin yanında münavebe uygulamak da bu hastalıkla mücadelede etkili olabilir. Farklı çevre şartlarına uyum sağlayabilen bu hastalık etmeninin genetik çeşitliliğinin tanımlanması hem toleranslı çeşit geliştirmede hem de adaptasyon yeteneğinin anlaşılmasında önemli rol oynamaktadır (Swamy vd. 2020). Bu nedenle üreticiler mısır çeşitlerini seçerken bölgedeki hastalık etmeni yayılışını dikkate alarak toleranslı çeşit seçiminde bulunmak durumunda kalkmaktadırlar.

İklim değişikliği ve su; tüm bu faktörlerin içinde bölgede mısır üretimini sınırlayacak olan faktör "su" durumudur. Özellikle yazlık dönemde sıcaklık artışı ile birlikte toprakta önemli düzeyde nem kaybı yaşanmaktadır. Bu nedenle etkin sulama sistemleri kullanılarak bölgede "su" yönetiminin oldukça etkili bir şekilde yapılması gerekmektedir.

3. SONUÇ

Ege Bölgesi'nde mısır yetiştiriciliğinde süreklilik ve verimliliğin artması, üreticilerin geleneksel ve sabit uygulamalardan ziyade verim artışını sağlayacak bilimsel, teknolojik ve agroteknik uygulamalara yönelmeleriyle mümkün olacaktır. Özellikle toprak analizine dayalı gübreleme, damlama sulama sistemleri, erkenci ve hastalıklara dayanıklı çeşit seçimi gibi uygulamalar yaygınlaştırılmalıdır.

Bölgede değerlendirilen tüm kritik uygulamalar içerisinde özellikle iklim değişikliği nedeniyle değişen yağış rejiminin su varlığını etkilemesi ile gelecekte bölgede mısır tarımını kısıtlayacak en temel sorun olduğu gözlemlenmektedir.

ABSTRACT

Greenhouses are agricultural structures where agricultural production can be carried out using high technology in today's conditions, regardless of climatic environmental conditions. While the technology used in greenhouses is used in many agricultural production areas such as air conditioning, irrigation, fertilization, systems that facilitate management in the greenhouse have come to the forefront. While remote-controlled modern pressurized systems are used in irrigation systems designed in greenhouses, the importance given to applications that facilitate management in the greenhouse in terms of irrigation period, irrigation duration, evapotranspiration values and especially controllers, which provide savings in energy consumption, has increased. In this context, LoRa communication technologies, which are used in many areas, stand out as a technology that should be taken into consideration in terms of irrigation method in greenhouses with their wide coverage area and low energy consumption. In this context, the general features, energy expenditures, coverage areas, sustainability and general application areas of communication technologies such as LoRa-based loT, LPWAN, LoRaWAN have been determined separately in the study, and the possibilities of using these technologies in irrigation management in one or more greenhouses within the greenhouse have been investigated. In addition, the ability to record climatic environmental conditions in greenhouses without human intervention in the use of LoRa technologies in irrigation systems and the feasibility of irrigation planning and control based on this information has been tried to be revealed within the scope of the literature. At the same time, by using LoRa-based communication systems in greenhouses, remote monitoring, control and intervention in necessary cases will be provided in an energy-efficient and economical manner in irrigation management. In addition, as a result of determining soil moisture and climatic conditions in greenhouses, future soil moisture estimation and irrigation time and duration according to these estimations were determined. With the research, it was seen within the scope of the literature that LoRa-based communication systems, which are still a new technology in greenhouses, can be used in irrigation management and that sustainable agricultural production can be achieved by saving energy, manpower and time.

Keywords: Greenhouse, LoRa, LPWAN, loT, LoRaWAN, Greenhouse Irrigation Management.

SERALARDA LORA İLETİŞİM TEKNOLOJİLERİ İLE SULAMA SİSTEMLERİNİN YÖNETİLEBİLİRLİĞİNİN BELİRLENMESİ

ÖZET

Seralar, günümüz koşullarında yüksek teknoloji kullanılarak iklimsel çevre koşullarına bağlı olmaksızın tarımsal üretim yapılabilen tarımsal yapılardır. Seralarda kullanılan teknoloji iklimlendirme, sulama, gübreleme gibi birçok tarımsal üretim alanında kullanılmakla birlikte, sera içerisindeki yönetimi daha fazla kolaylaştıran sistemler ön plana çıkmıştır. Seralarda tasarlanan sulama sistemlerinde uzaktan kontrollü modern basınçlı sistemler kullanılmakla birlikte, enerji tüketiminde tasarruf sağlayan sulama periyodu, sulama süresi, evapotransprasyon değerleri ve özellikle kontrolör açısından sera içerisindeki yönetimi kolaylaştıran uygulamalara verilen önem artmıştır. Bu bağlamda birçok alanda kullanımı bulunan LoRa iletişim teknolojileri kapsama alanının geniş olması ve düşük enerji tüketimi ile seralarda sulama yöntemi açısından dikkate alınması gereken bir teknoloji olarak ön plana çıkmaktadır. Bu bağlamda, çalışmada LoRa tabanlı loT, LPWAN, LoRaWAN gibi iletişim teknolojilerinin genel özellikleri, enerji harcamaları, kapsama alanları, sürdürülebilirlikleri ve genel olarak uygulamalar alanları ayrı ayrı belirlenmiş olup, bu teknolojilerin sera içerisinde bir veya birden fazla serada sulama yönetiminde kullanılabilme olanakları araştırılmıştır. Ayrıca, Lora teknolojilerinin sulama sistemlerinde kullanılmasında sera içerisindeki iklimsel çevre koşullarının insan müdahalesi olmadan kayıt altına alınabilirliği ve bu bilgilerden hareketle sulama planlaması ve kontrolünün yapılabilirliği literatür kapsamında ortaya konulmaya çalışılmıştır. Aynı zamanda seralarda LoRa tabanlı iletişim sistemlerinin kullanılması ile sulama yönetimin uzaktan izlenebilirliği, kontrolü ve gerekli durumlarda müdahalesi de enerji tasarruflu ve ekonomik olarak sağlanmış olacaktır. Bununla birlikte, sera içi toprak nemi ve iklimsel koşulların belirlenmesi sonucunda gelecek dönem toprak nemi tahmini ve bu tahminlere göre sulama zamanı ve süresinin LoRa temelli olarak yapılabilirliği belirlenmiştir. Araştırma ile seralarda henüz yeni bir teknoloji olan LoRa tabanlı iletişim sistemlerinin sulama yönetiminde kullanılabilirliği, bu kullanımın enerji, insan gücü ve zaman tasarrufu sağlayarak sürdürülebilir tarımsal üretimin gerçekleştirilebileceği literatür kapsamında görülmüştür.

Anahtar Kelimeler: Sera, LoRa, LPWAN, loT, LoRaWAN, Sera Sulama Yönetimi.

1. INTRODUCTION

Rapid population growth, globalization and migrations are rapidly increasing, limiting soil and water resources. In addition, the effects of climate change on these resources create negative results. In order to meet the food needs of the increasing population today, studies have accelerated to obtain more yield from unit area in agricultural production [1].

Agricultural structures that can technologically accommodate the conditions that can create the desired climatic environmental conditions for all seasons in terms of plant production are called greenhouses. Greenhouses, which are among the leading agricultural activities globally, are developing in line with the development of technology. As modern systems, they are becoming more responsive to the needs in plant production. Greenhouse systems differ from other agricultural production branches in terms of being carried out under a closed structure, requiring more labor, and the initial investment cost [2].

The increase in yield in agricultural production can be achieved in greenhouses independently of environmental conditions compared to field agriculture. However, it is possible to produce fresh vegetables and fruits continuously in line with demand throughout the entire season with greenhouse farming [3]. However, greenhouses have the potential to contribute to solving the negativities of water, environmental pollution and the ecological system [4].

Compared to agricultural production areas, greenhouses are agricultural structures with high operating costs and where technical knowledge and skills are always at the forefront. In addition, they provide more yield from the unit area. Compared to field agriculture, the possibility of harvesting in the desired season ensures that the products create a high price in the market, increases business profits and allows the reduction of hidden unemployment in agriculture [5].

Greenhouse systems in the modern sense can be defined as agricultural structures where modern cultivation practices are used in terms of structure, cover materials and air conditioning, and where climatic environmental conditions are controlled by automation systems. Soilless cultivation practices are common in modern greenhouses. In these greenhouses, the use of chemical pesticides is low, quality products are grown and high yields are obtained. Modern agricultural production in greenhouses can be achieved by ventilating, cooling, heating, shading the greenhouse and irrigating it as the plant needs [6]. The increase in modern greenhouse areas compared to current conditions has been influenced by the change in consumer demands, environmentally sensitive production, food safety and certification [7].

The most important climatic environmental conditions that must be provided in order to obtain income with maximum yield in greenhouses is the provision of water proportional to the evapotranspiration value of the plant [8]. Irrigation practices are the agricultural practices that affect the increase in yield the most in terms of plant production. In addition to the limited water resources, the increase in industrial and urban water requirements causes the decrease or decrease in quality of water used in irrigation [9]. This situation necessitates obtaining the highest benefit from the decreasing irrigation water, that is, obtaining more products with minimum water consumption per unit area [10].

When evaluated in terms of irrigation, approximately 70% of the existing freshwater resources are used for agricultural purposes. When agricultural production is evaluated in general, the total water application efficiency is very low. In terms of our country, the water application efficiency is around 35%. It is estimated that the total population of the world will reach 9.15 billion in 2050. TÜİK has predicted that our country's population will be 100 million in 2030. While the amount of water per person is approximately 1,519 m3/year in today's conditions, it has been reported that the amount of usable water per person in 2030 could be approximately 1,120 m3/year. Especially the Central Anatolian region of our country is among the regions that will be most affected by water shortage [11].

In terms of the development of modern agricultural production methods, technological developments, primarily communication and internet applications, have gained great importance. The Internet of Things can be defined as the communication of objects with each other. This concept (Internet of Things, IoT) came to the fore in 2000. During this period, it has increased the degree of integration of end products, systems and services, and has gained great fame in technology markets and technological applications with this feature. In today's conditions, it is seen as an advanced generation technology. In addition, IoT and machine-to-machine communication (M2M) concepts have radically changed the interaction between people, devices and machines, paving the way for the creation of interconnected infrastructures everywhere. These promising innovations in terms of the coming periods create very attractive opportunities for both the industry and customers [12].

IoT technologies are developing rapidly, and this has also accelerated the formation of new demands regarding systems. It is seen that ease of use, dependence on a fixed power source and the desire for wireless communication in large areas are at the top of the list among technological constraints. Objects connected to wireless sensor networks (WSN) want to move in as wide an area as possible and in the desired way and talk to each other [13]. The prerequisite for objects to move freely is that they do not need any fixed power source. Many valuable studies have been carried out on the development of energy efficiency and communication methods by obtaining powerful batteries in terms of energy storage. However, despite the acquisition of long-lasting and capacious energy sources, since the components such as high-speed processors and fast storage units developed require more energy, it has not been possible for the batteries to last much longer. In this context, IoT applications need technologies with low-power operating capability that can communicate wirelessly in large areas where the internet is not an infrastructure. These technologies, Low-Power Wide-Area Network (LPWAN) technologies, come to the forefront [14].

In this study, the general features, energy consumption, coverage areas, sustainability and general application areas of communication technologies such as LoRa-based loT, LPWAN, LoRaWAN have been determined separately and the possibilities of using these technologies in irrigation management in one or more greenhouses have been investigated. In addition, the fact that climatic environmental conditions in the greenhouse can be recorded without human intervention in the use of LoRa technologies in irrigation systems and the feasibility of irrigation planning and control based on this information has been tried to be revealed within the scope of the literature. At the same time, with the use of LoRa-based communication systems in greenhouses, remote monitoring, control and intervention in necessary cases will be provided

in an energy-saving and economical way. In addition, as a result of determining the soil moisture and climatic conditions in the greenhouse, the future soil moisture estimate and the feasibility of irrigation time and duration based on these estimates have been determined. With the research, the usability of LoRa-based communication systems, which are still a new technology in greenhouses, in irrigation management, has been seen within the scope of the literature that sustainable agricultural production can be achieved by saving energy, manpower and time with this use.

2. GREENHOUSE PRESENCE IN TÜRKİYE

When Türkiye's greenhouse presence is examined, an increase is seen from the past to the present. According to the greenhouse presence in Türkiye given in Figure 1, a regular increase is seen in the last 20 years according to all the covering materials used in greenhouses. This increase has been greater in plastic covering materials [15].

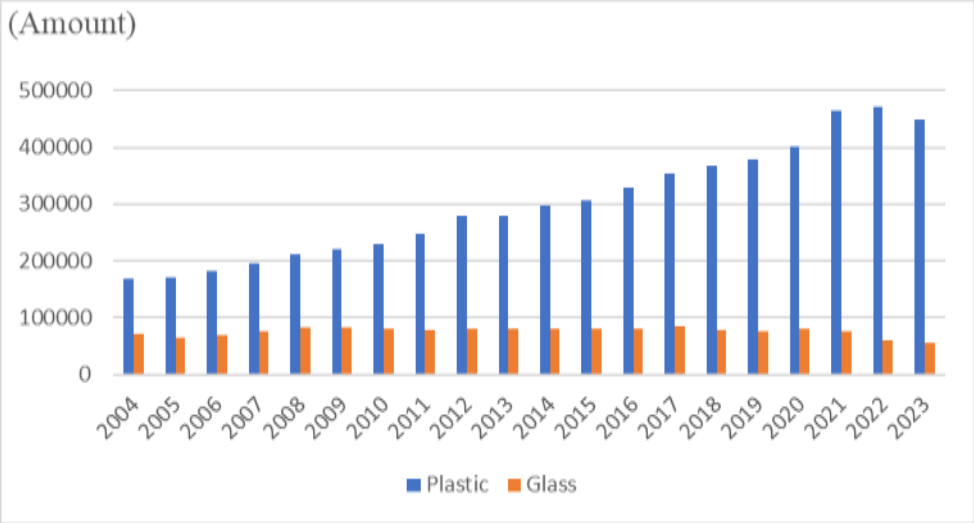

Figure 1. Greenhouse presence in Turkey

Currently, greenhouses with plastic sheeting are more common. According to approximate values, greenhouses with plastic sheeting were twice as many as glass greenhouses in 2004, but today this rate has increased tenfold. In addition, there has been a decrease in the number of glass greenhouses in recent years. This situation can be associated with the cost advantage of greenhouses made of plastic sheeting materials. According to greenhouse farming data in our country, it is generally concentrated in the Mediterranean, Aegean, and Yalova regions in terms of suitability of climatic environmental conditions, and it is also developing in Kütahya and Aydın provinces with the use of renewable geothermal resources for heating [15].

3. IRRIGATION SYSTEMS IN GREENHOUSES

After calculating the evapotranspiration values according to the climate conditions and plant type in the greenhouses, appropriate irrigation programs are made. Fogging method is also applied to provide humidification together with irrigation. Fogging method is one of the systems established to provide the humidity required by the plant in greenhouses and to reduce the internal temperature of the greenhouse (Figure 2.). In the fogging system, heat is absorbed from the ambient air by evaporation of the water sprayed with high pressure and the absorbed heat is carried out of the greenhouse by air. The system is positioned at the top point of the greenhouse [16].

Irrigation is defined as the artificial transmission of the part of the water required for plant development that cannot be met by natural precipitation. The way this irrigation water is given to the soil according to the effective root depths of the plants is called the irrigation method. Sprinkler and micro irrigation methods can be used in greenhouse conditions. Micro irrigation methods include drip, bubbler and micro spray methods [16].

Figure 2. Irrigation method

In sprinkler irrigation systems, irrigation water is transported under pressure to mechanical sprayers in closed pipes and applied to the soil in a manner similar to natural rainfall [17]. With drip irrigation, water is used with maximum efficiency in areas where water availability is most limited. Since events such as evaporation, surface runoff and deep leakage can be prevented in this irrigation system, efficiency is relatively higher. Irrigation water is given to the plant root zone with the help of small diameter pipes [18]

The method applied by using sprinkler heads with a more micro structure compared to the heads used in sprinkler irrigation is called micro spray irrigation system. Irrigation opportunity is provided in narrow areas by using micro structured spray sprinkler heads [19]. Bubbler irrigation systems are generally used in ground cover plants and shrub groups. It consists of a lateral pipe that transmits water with a relatively lower pressure compared to sprinkler irrigation and transparent polyethylene water distribution pipes with a diameter of 10-12 mm [16].

4. INTERNET OF THINGS – COMMUNICATION TECHNOLOGIES

The concept of the Internet of Things (IoT) is explained as the communication of objects with each other. It emerged approximately 25 years ago and has increased the degree of integration of end products, systems and services. In this context, it has been at the forefront of technological applications. It is seen as an advanced technology among the existing technologies in today's conditions. The concepts of IoT and machine-to-machine communication (M2M) have radically changed the interaction between people, devices and machines and paved the way for the creation of interconnected infrastructures everywhere. It creates quite attractive opportunities for the industry and customers in the coming periods [12].

With the very rapid development of IoT technologies, the negative aspects of the systems in practice have also begun to emerge and new demands. When technological and physical constraints are evaluated, it can be said that dependence on a fixed power source and the desire for wireless communication in wide areas come first. Objects connected to wireless sensor networks (Wireless Sensor Network, WSN) want to talk. The prerequisite for objects to move freely is that they do not need any fixed power source [13].

4.1.LORA COMMUNICATION TECHNOLOGIES

LPWAN technologies, which form the basis of LoRa communication technologies, create innovations such as calculating the most appropriate transmission power and providing it with minimum power loss, along with the development of communication technologies to create a more efficient network performance according to the current conditions, and are examined in three different categories. In terms of the first category, cellular technology-based LPWAN systems have NB IoT, LTE-M and GSM IoT varieties. The width of the coverage area, speed, reliability and height of data transmission are at the forefront [20].

In the second category, French companies Sigfox [21] and Telensa [22] have switched to ultra-narrow band application in order to resolve the conflict created by LoT technologies. Sigfox has come to the fore in terms of simplicity, efficiency, integration and two-way communication. Sigfox has a coverage area of 3-10 kilometers in the city and 30-50 kilometers in rural areas [23].

LoRa, which is in the third category, was patented by Semtech in 2014. A global network platform can be easily established. According to the regulations in the countries, it can operate at 868 MHz in Europe, 915 MHz in the United States and 433 MHz in some regions without a license. [24] LoRaWAN technology has come to the fore with its low energy consumption, wide coverage, simplicity, enabling private network installation, security and easy network management. According to the current conditions, LoRa systems have a coverage area of 45 km in rural areas and 5 km in urban areas. [25, 26].

The general working principle of LoRa systems is given in Figure 3 and is generally implemented as LoRaWAN. Sensors with LoRa technology transmit data to the gateway located at a suitable distance. Then, the data is sent to the servers via Wi-Fi, cellular, radio frequency or Ethernet connection [27]. The most important factor that makes LoRa technology

generally prominent and dominant in many application areas is its ability to operate for 10 years with a single energy source. [28].

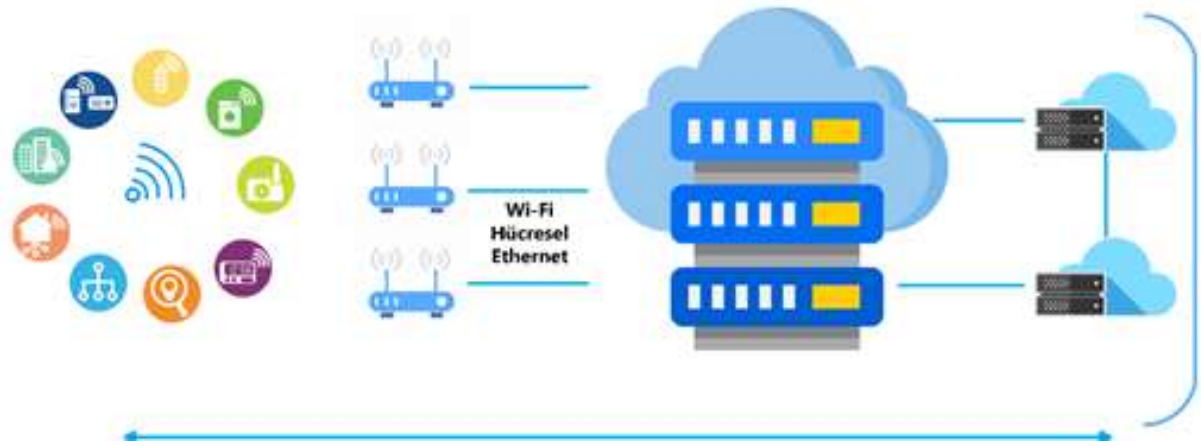

Figure 3. LoRaWan System

4. MANAGEMENT OF IRRIGATION WITH LORA SYSTEMS IN GREENHOUSES

The wide use of modern communication technologies such as the Internet of Things and LoRa in agricultural structures has resulted in the reorganization of agricultural activities [29]. With these technologies, it is possible to reach and monitor agricultural areas from any place and at any time. With LoRa systems, management is provided by giving the necessary commands in agricultural structures and lands through wireless networks and mobile applications. In addition, the use of these technologies and the increase in yield are also seen in the face of the negative effects of climate change. Especially in agricultural structures and lands in rural areas, the use of long-distance technologies based on radio frequency can be an important factor that provides an increase in yield [30].

Greenhouses come to the forefront as agricultural structures equipped with modern sensors and communication technologies and controlled from mobile and web environments with the integration of the LoRa system. In this context, there are many studies on smart greenhouse management, where irrigation can also be managed. Thus, in addition to irrigation management in greenhouses, many variables such as air conditioning, temperature, light intensity and humidity value can be kept under control. [31-34].

With the use of LoRa systems, it is possible to monitor the humidity and temperature values by starting and ending irrigation without going to the area where the greenhouse is located, how many days the irrigation will be done, with the support of sensors. There are many studies on the use of LoRa systems in irrigation management. However, it is possible to use all sprinkler, drip and mist systems with LoRa systems. In this context, it is possible for new generation communication technologies such as LoRa to meet many needs in terms of irrigation management, and access to greenhouses can be provided from any place at any time. It is possible to follow the latest status in greenhouses and to provide irrigation management in

greenhouses by giving the necessary commands through sensors, actuators, wireless networks and mobile applications. An important need in this area is met with radio frequency-based LoRa technologies, especially as an alternative or complement to internet and cellular communication in greenhouses located in rural areas [35-39].

5. CONCLUSİON

Within the scope of the research, the potential of LoRa systems, which are still a very new system in terms of agricultural use, to provide irrigation methods in greenhouses has been evaluated within the scope of literature. According to the results of the study, it is seen that irrigation methods can be performed by using the LoRa system in greenhouses. This situation will create many positive effects. Irrigation duration and planning in greenhouses can be provided with sensor systems integrated with LoRa. In this context, management of sensor systems according to climatic environmental conditions in the greenhouse can also be provided.

Another management element in terms of irrigation projects is solenoid valves. With the irrigation commands sent to the electrovalves from LoRa systems, irrigation water will be delivered to the greenhouse and will be closed appropriately when irrigation is finished. In addition, in cases where a pressure source needs to be created in greenhouse irrigation projects, the management of the pump-hydraulic unit can also be provided by LoRa systems.

The relative humidity level inside the greenhouse can be monitored with humidity sensor systems integrated with LoRa. If the humidity level is outside the desired level, fogging can be operated by activating LoRa systems. Success can be achieved with the full integration of sensor, LoRa and fogging systems. The most important positive effects of LoRa systems in terms of greenhouse farming and agricultural production is the ability to work without internet or wifi. It is possible for LoRa systems to work even when there are problems with the internet in some regions. The fact that LoRa systems work with radio frequencies will be a positive preference for greenhouse farming and agricultural production in general. According to current conditions, the possibility of providing irrigation management with LoRa in greenhouses covering an area of approximately 45 km in rural areas will provide great savings in cost, labor and time.

It can be said that LoRa systems provide irrigation management at a relatively low cost with the use of greenhouses. Currently, controllers used in irrigation management are more costly devices. It can be said that LoRa systems that can be applied instead of controllers can create a cost advantage in today's conditions. In addition, their ability to work in a wide area will also save labor. The fact that more than one and a large number of different greenhouses can be controlled with LoRa systems is among the targets of R&D studies in this regard. In addition, the high communication speed of LoRa systems will ensure that irrigation commands are transmitted without delay. This is important in terms of irrigation duration and start-end times. A delay in the irrigation command may cause an increase in the previously determined irrigation duration in the greenhouse. In such a case, excessive irrigation will be done. With the high communication speed in LoRa systems, it will be possible to prevent excessive consumption of

irrigation water and unnecessary irrigation that exceeds the evapotranspiration value of the plant.

As a result, it is seen that it is possible to manage irrigation systems with LoRa systems in greenhouses. In this respect, it is recommended that LoRa systems, which are a very new field of study in our country, be used in greenhouses as well as in all agricultural structures and irrigation applications. Thus, it can be said that sustainable agricultural production can be achieved with cost, time and labor savings.

RISK PERCEPTION IN LIVESTOCK PRODUCTION

Prof. Dr. Pınar AYVAZOĞLU DEMİR
Kırıkkale Üniversitesi, Veteriner Fakültesi

ORCID NO: 0000-0002-7010-0475

ABSTRACT

The aim of this study is to identify the main economic risk factors encountered in the livestock sector and to analyze their impact on producer behavior through a literature-based evaluation. The livestock sector inherently involves higher risks compared to other agricultural sectors due to its direct engagement with living organisms.

Factors such as age, education level, farm size, and previous experience play a determining role in producers' risk perceptions. Risk management strategies in the livestock sector can be categorized under three main headings: preventive strategies (such as vaccination, hygiene, and care), financial strategies (including insurance and the establishment of cash or credit reserves), and diversification strategies (such as product diversification). In Türkiye, although risk management strategies are not yet fully effective or sufficient, preventive health practices appear to be more commonly employed. In contrast, financial risk management tools—particularly livestock insurance—are significantly underutilized. This reflects both a lack of awareness among producers and the fact that the current insurance system is not sufficiently inclusive or accessible. However, in Türkiye, alongside animal diseases, feed prices and market uncertainty also constitute major risk categories. Despite this, risk management strategies remain limited and are often based on personal experience rather than institutional frameworks.

To ensure the effective implementation of risk management tools, it is essential to strengthen education and extension services targeting producers, develop flexible insurance models tailored to regional characteristics and accessible to small-scale farms, and improve financial support mechanisms through premium subsidies. Particularly in response to price volatility, small-scale producers should be encouraged to enhance their bargaining power through direct marketing, contract farming, and cooperatives, while the state should contribute by implementing input subsidies, price stabilization mechanisms, and market information systems. Moreover, improving communication between producers and veterinarians, who are seen as reliable sources of information in risk perception, is crucial. Such efforts would significantly contribute to increasing the adoption of preventive and protective practices against animal diseases and to reducing overall risk in livestock production.

HAYVANSAL ÜRETİMDE RİSK ALGISI

ÖZET

Bu çalışmanın amacı, hayvancılık sektöründe karşılaşılan başlıca ekonomik risk unsurlarını belirlemek ve bu risklerin üretici davranışı üzerindeki etkilerini literatür temelli bir değerlendirmeyle analiz etmektir. Hayvancılık sektörü, doğrudan canlı organizmalarla ilgilenmesi nedeniyle diğer sektörlerden daha fazla risk içermektedir.

Üreticilerin risk algılarında yaş, eğitim düzeyi, işletme büyüklüğü ve geçmiş deneyim gibi faktörlerin belirleyici olmaktadır. Hayvancılık sektöründe risk yönetim stratejileri ise üç temel başlık altında sınıflandırılabilir: Önleyici stratejiler (aşı uygulamaları, hijyen ve bakım), Finansal stratejiler (sigorta, nakit ve kredi rezervi oluşturma), Çeşitlendirme stratejileri (Ürün çeşitlendirme). Türkiye'de risk yönetimi stratejilerinde ise etkin ve yeterli olmasa da önleyici sağlık uygulamalarının ön planda yer aldığı, buna karşılık, finansal risk yönetimi araçlarının özellikle hayvancılık sigortalarının kullanım düzeyinin oldukça düşük olduğu söylenebilir. Bu durum, hem üretici davranışlarını yönlendirecek bilinçlendirme eksikliğine hem de mevcut sigorta sisteminin yeterince kapsayıcı ve erişilebilir olmamasına işaret etmektedir. Oysa Türkiye'de hayvan hastalıklarının yanı sıra, yem fiyatları ve piyasa belirsizliği gibi alanlar yüksek risk grubu içinde yer almaktadır. Ancak bu risklere karşı yönetim stratejilerinin sınırlı ve çoğunlukla kişisel deneyim temelli olduğu söylenebilir.

Risk yönetim araçlarının başarılı bir şekilde uygulanabilmesi için, üreticiye yönelik eğitim ve yayım hizmetlerinin güçlendirilmesi, bölgesel özelliklere ve küçük ölçekli işletmelere de ulaşabilen esnek sigorta modellerinin geliştirilmesi, prim destekleri ile finansal destek mekanizmalarının geliştirilmesi büyük önem taşımaktadır. Özellikle fiyat dalgalanmalarına karşı, küçük ölçekli işletmelerin doğrudan pazarlama, sözleşmeli üretim ve kooperatifleşme yoluyla pazarlık güçlerini artırmaları; devletin ise fiyat istikrarını destekleyici girdi desteği ve fiyat uygulamaları ile piyasa bilgilendirme sistemleriyle bu sürece katkı sunması gerekmektedir. Ayrıca risk algısında güvenilir bilgi kaynağı olarak ön plana çıkan veteriner hekimler ile üreticiler arasındaki iletişimin etkinleştirilmesi, hastalıklara karşı koruyucu ve önleyici uygulamaların artmasına ve riskin azaltılmasında önemlidir.

Anahtar Kelimeler: Hayvancılık, Risk, Hastalık, Fiyat dalgalanmaları, Hayvancılık sigortası

GİRİŞ

Hayvancılık, gıda arz güvenliğinin sağlanması, kırsal kalkınmanın desteklenmesi ve üretici-sanayi-ülke ekonomisi için stratejik bir öneme sahiptir. Ancak hayvancılık sektörü, doğası gereği çok çeşitli risk unsurlarına maruz kalabilmektedir. Özellikle üretim sürecinin canlı varlıklarla yürütülmesi, hayvansal ürünlerin biyolojik döngülere bağlı olması ve piyasa yapısındaki kırılganlıklar, sektörü hem ekonomik hem de yapısal olarak risklere açık hâle getirmektedir (Gökgöz ve Kayahan, 2021; Özsayın, 2005). Bu riskler hem üretim süreçlerini hem de ekonomik istikrarı etkileyebilmektedir (Njavro ve ark. 2007).

Risk, belirli bir olayın gerçekleşme olasılığı ile bu olayın etkisinin birleşimi olarak tanımlanabilir (Meraner ve Finger 2017). Hayvancılık faaliyetlerinde riskler; üretim riski (hastalık, verim düşüklüğü, ölüm oranları), fiyat ve pazar riski (girdi ve ürün fiyatlarındaki dalgalanmalar), finansal risk (gelir istikrarsızlığı, kredi erişimi), politik ve kurumsal riskler (destekleme politikalarının belirsizliği) ve çevresel riskler (doğal afetler, iklim değişikliği) olarak 5 başlık altında incelenebilir (Meuwissen et al., 2001; Meraner & Finger, 2017). Özellikle kur riski, enflasyon ve faiz oranı gibi makroekonomik değişkenler, doğrudan ya da dolaylı olarak ülke ekonomisinde yaşanan gelişmeler gibi ekonomik risk unsurları hayvancılık işletmelerinin mali sürdürülebilirliğini etkileyebilmektedir (Göktürk ve Yalçınkaya, 2017; Bayramoğlu, 2020). Bu bağlamda, hayvancılık sektöründeki ekonomik kırılganlıkların ve belirsizliklerin yönetilebilmesi, etkin bir risk yönetimi yaklaşımını gerekli kılmaktadır. Zira hayvancılık sektöründe, risk yönetimi stratejileri işletmelerin sürdürülebilirliğini sağlamak için kritik bir öneme sahiptir.

Risk algısı ve bu algıya dayalı davranış biçimleri, üreticilerin hem kısa hem de uzun vadeli kararlarını doğrudan etkilemektedir (Hayran & Gül, 2015). Literatürde, üreticilerin risklere verdikleri tepkilerin genellikle bireysel özellikler (yaş, eğitim, deneyim), işletme ölçeği ve bilgi kaynaklarına erişimle şekillendiği görülmektedir (Njavro et al., 2007; Valeeva et al., 2011). Bu nedenle, hayvancılık sektöründe ekonomik risklerin çok boyutlu olarak ele alınması ve risk yönetim stratejilerinin bölgesel ve işletme bazlı farklılıkları dikkate alacak şekilde tasarlanması gereklidir.

Bu çalışmanın amacı, hayvancılık sektöründe karşılaşılan başlıca ekonomik risk unsurlarını belirlemek ve bu risklerin üretici davranışı üzerindeki etkilerini literatür temelli bir değerlendirmeyle analiz etmektir. Aynı zamanda, risk algısı ile ekonomik sürdürülebilirlik arasındaki ilişki incelenerek, sektörde uygulanabilecek etkili risk yönetimi stratejilerine yönelik politika önerileri sunulacaktır.

Hayvancılıkta Risk Algısı

Hayvancılık sektörü, doğal, ekonomik ve politik koşullarındaki değişkenliklere yüksek derecede duyarlılık gösteren bir üretim alanıdır. Canlı varlıklarla yürütülen üretim sürecinde hastalık, ölüm, verim kaybı gibi üretim risklerine; piyasa yapısındaki dalgalanmalar ise fiyat ve gelir istikrarsızlığına açık hâle getirmektedir (Hardaker et al., 2004; Gökgöz & Kayahan, 2021). Bu kapsamda, üreticilerin karşı karşıya kaldığı belirsizlikler yalnızca ekonomik çıktıları değil, aynı zamanda karar alma davranışlarını da doğrudan etkilemektedir.

Meuwissen et al. (2001) ve Njavro et al. (2007) de Avrupa'daki hayvancılık işletmelerinin fiyat dalgalanmaları ve üretim risklerine karşı kırılgan olduğunu ve bu risklerin sektörel istikrarı tehdit ettiğini bildirmişlerdir. Özsayın (2005) ve Altay (2019) çalışmalarında tarımsal ve hayvansal üretimin doğal, ekonomik ve politik risklere karşı yüksek duyarlılık taşıdığını ve bu nedenle risk yönetim araçlarına ihtiyaç duyulduğunu belirtmişlerdir. Ayrıca Afyonkarahisar'da yapılan bir çalışmaya göre, üreticilerin en çok karşılaştıkları riskler arasında hayvan hastalıkları, yem fiyatları ve devlet politikaları öne çıkmaktadır (Gökgöz ve kayahan, 2021).

Hayvancılık sektöründe risk faktörleri beş başlıkta toplanabilir; Hayvan sağlığı riski (hastalık, ölüm), 2) Fiyat ve Pazar belirsizliği, 3) Finansal, ekonomik sorunlar, 4) Politik belirsizlik, 5) Doğal afet ve iklim riski (Hayran ve Gül, 2015; Yalçınkaya, 2017).

Hayvancılık işletmelerinde en yaygın risk unsurlarından biri, hayvanlarda ortaya çıkabilecek epidemik ve endemik hastalıklardır. Bu hastalıklar, hayvanların büyüme, üreme ve verim performansını olumsuz etkileyerek üretim kapasitesinde ciddi kayıplara yol açmakta ve dolayısıyla işletmenin kârlılığını doğrudan tehdit etmektedir (Hayran & Gül, 2015; Valeeva et al., 2011). Özellikle yüksek hayvan yoğunluğuna sahip entansif üretim sistemlerinde, bulaşıcı hastalıkların yayılma hızı ve etkisi daha büyük olmakta, bu da hem ekonomik hem de biyolojik açıdan riskin şiddetini artırmaktadır. Bu nedenle, hastalık risklerinin etkin biçimde yönetilebilmesi için koruyucu veteriner hizmetlerinin yaygınlaştırılması, düzenli sağlık kontrollerinin yapılması, karantina uygulamalarının benimsenmesi ve biyogüvenlik önlemlerinin işletme ölçeğinde sistematik biçimde uygulanması büyük önem taşımaktadır (Njavro et al., 2007; Garforth et al., 2013). Ayrıca, üreticilerin hastalık riskine ilişkin farkındalık düzeyleri ile bu riski algılama biçimleri, hastalıklarla mücadele stratejilerini doğrudan şekillendirmektedir.

Fiyat ve pazar riski, hayvancılık sektöründe girdi ürünleri ve çıktı ürünlerinin; arz-talepten ya da hükümet tarafından uygulanan politikalar sonucu, fiyatlarda meydana gelen dalgalanmalar olarak tanımlanabilir (Akçaöz ve Kızılay, 2006). Buna göre fiyat riskinin hükümetin uyguladığı tarım ve hayvancılık politikalarıyla doğrudan ve dolaylı olarak ilişkili olduğu ve sektörü olumlu ya da olumsuz etkilediği söylenebilir. Örneğin, yem fiyatlarının yüksek seyretmesine rağmen kaba yem üretimine yönelik desteklerin yetersiz kalması veya girdi sübvansiyonlarının sadece bitkisel üretime yönlendirilmesi, hayvancılık işletmelerini yem maliyetlerini daha artıracak ve gelir kaybına neden olacaktır. Bunun yanı sıra hayvancılık sektörü yem maliyetinin artması olan et, süt, deri vb. çıktı ürünlerinin satış rakamlarının değişmesine ve üretimin azalmasına neden olacaktır. Bu bağlamda, üreticilerin gelecek planlamalarını yaparken hükümetin destekleme politikalarını dikkatle takip etmeleri ve kararlarını bu doğrultuda şekillendirmeleri, fiyat riskine karşı koruyucu bir önlem niteliği taşıması bakımından önemlidir.

Üreticilerin en yoğun olarak algıladığı risk türlerinden biri de girdi maliyetlerinin artmasıdır. Bu durum, yem, aşı-ilaç gibi temel girdilerin dışa bağımlılığının yüksek olması ile açıklanabilir. Özellikle yem fiyatları, enerji, işçilik ve veterinerlik hizmetleri gibi girdilerdeki artış, hayvancılık sektörünün ekonomik sürdürülebilirliğini tehdit eden temel unsurlar arasında yer almaktadır. Meraner ve Finger (2017)'de Almanya'daki üreticilerin risk algılarını analiz ederken, ekonomik çevredeki değişkenliğin özellikle de girdi maliyetlerindeki artış ve piyasa dalgalanmalarının risk algısını etkileyen temel belirleyicilerden olduğunu bildirmiştir. Gökgöz

ve Kayahan (2021), yaptıkları çalışmada üreticilerin, girdi maliyetlerinin yükselmesini ciddi bir risk olarak algıladığını ve bu durumun faiz oranlarındaki artışla daha da derinleştiğini bildirmişlerdir.

Yalçınkaya (2017) yaptığı çalışmada, işletmelerde yem fiyatı riski ile hayvan sayısı arasında negatif bir korelasyon bulmuş ve hayvan sayısı arttıkça yem fiyatı riskinin daha belirgin hâle geldiği bildirilmiştir. Nitekim, yüksek girdi maliyetleri, hayvancılık işletmelerinin kârlılığını azaltıp, işletme sermayesinin yetersizliğine neden olduğu için risk algısını daha da güçlendirmektedir.

Önemli risklerden biri olan pazar riski, hayvansal ürünlerin (et, süt, yumurta vb.) pazarlanması sürecinde meydana gelen belirsizliklerden kaynaklanmakta ve sektördeki gelir istikrarını doğrudan tehdit etmektedir. Pazar riski; fiyat dalgalanmaları, talep daralması, pazara erişimde yaşanan güçlükler, sözleşmeli üretimde karşılaşılan sorunlar ve dış ticaret kısıtlamaları gibi çok yönlü unsurları kapsamaktadır. Özellikle destek politikalarının yetersizliği, girdi fiyatlarının sürekli artışı ve piyasa yapısındaki oligopol yapı, üreticilerin pazarlama gücünü zayıflatarak pazar riskini artırmaktadır. Üreticiler, çoğu zaman ürünlerini maliyetin altında fiyatlarla elden çıkarmak zorunda kalmakta ya da piyasada talep yetersizliği nedeniyle ürünlerini satamama riskiyle karşı karşıya kalmaktadır. Bu durum üretici gelirlerinde azalmaya yol açtığı gibi üretimi artırma kararını da olumsuz etkilemektedir. Bu bağlamda, hayvancılık işletmelerinde pazar riskinin tanımlanması, nedenlerinin ortaya konulması ve bu riske karşı geliştirilebilecek yönetim stratejilerinin belirlenmesi, sürdürülebilir bir hayvansal üretim için büyük önem taşımaktadır.

Son dönemlerde sıkça rastlanan doğal afetler ve iklim kaynaklı çevresel riskler, hayvan sağlığı, yem üretimi, su kaynakları, barınak altyapısı ve genel işletme sürdürülebilirliği üzerinde ciddi tehditler oluşturmaktadır (Göktürk ve Yalçınkaya, 2017; Njavro et al., 2007). Hayvancılıkta karşılaşılan iklimsel riskler, yalnızca hayvanların doğrudan maruz kaldığı sıcaklık stresi, hastalık yayılımı veya ölüm gibi etkilerle sınırlı kalmayıp; aynı zamanda yem bitkilerinin yetişme dönemlerini, su teminini ve genel üretim maliyetlerini de etkilemektedir (Njavro et al., 2007; Altay, 2019). Özellikle kuraklık ve aşırı yağışlar gibi ekstrem hava olayları, hem otlatma alanlarının verimliliğini düşürmekte hem de kaba ve kesif yem teminini sekteye uğratmaktadır. Bu durum, hayvansal üretimin maliyetlerini artırmakta ve gelir dalgalanmalarına neden olmaktadır (Yalçınkaya, 2017; Özsayın, 2005).

Hayvancılıkta Risk Algısının Üretici Davranışlarına Etkisi

Risk algısı, bireyin karşılaştığı olay ya da durumun taşıdığı tehlikeyi nasıl değerlendirdiğini ifade eden öznel bir kavram olup, tarımsal üretimde alınan kararların temel belirleyicileri arasında yer alır (Slovic et al., 1982; Meraner & Finger, 2017). Hayvancılık işletmelerinde risk algısı, sadece nesnel risk düzeyleriyle değil; üreticinin geçmiş deneyimleri, eğitim düzeyi, işletme büyüklüğü, bilgi kaynaklarına erişimi, sosyoekonomik yapısı ve bölgesel şartlara bağlı olarak şekillenmektedir (Meuwissen et al., 2001; Hayran & Gül, 2015). Üreticilerin risk algısına verdiği tepkiler hayvancılıkta koruyucu, uyum sağlayıcı ya da tepkisel biçimde değişkenlik göstermektedir.

Nitekim her üretici, benzer risk ortamında bulunmasına rağmen hastalık riskine karşı farklı düzeyde duyarlılık gösterebilir. Bu fark, genellikle bireyin geçmiş deneyimleri, eğitimi, bilgiye erişim düzeyi ve hastalıkların ekonomik etkilerine ilişkin bilinç düzeyiyle ilgilidir (Meuwissen et al., 2001; Meraner & Finger, 2017). Örneğin genelde küçük ölçekli işletmeler, hayvanlarında sık görülen subklinik mastitis vakalarının üretim kaybına neden olduğunun farkında olmadıklarından, risk algısı daha düşük düzeyde kalır. Ancak bu farkındalık eksikliği, uzun vadede ciddi ekonomik kayıplara yol açabilmektedir.

Valeeva ve ark. (2011)'nın yapmış olduğu çalışmada, üreticilerin bir risk yönetimi stratejisini benimsemesinde geçmiş deneyimlerin önemli olduğu vurgulanmıştır. Özellikle üreticilerin geçmişte yaşadıkları doğal afetler, hayvan hastalıkları veya yem krizleri sonrası bazı koruyucu önlemleri arttırdıkları ancak düzenli önlem alma konusunda sürdürülebilir davranış örüntüsü geliştiremedikleri bildirilmiştir. Buna karşın hayvan hastalıklarıyla ilgili güncel bilgilere ulaşabilen ve veteriner danışmanlık hizmeti alan üreticilerin, riskleri daha doğru değerlendirebildikleri ve koruyucu yöntemlerine daha çok başvurdukları bildirilmektedir (Garforth et al., 2013).

Meuwissen ve ark. (2001) çalışmasında daha büyük ölçekli ticari işletmelerin risk yönetim araçlarına daha yatkın olduğu, küçük ölçekli işletmelerin ise riskleri doğal sürecin bir parçası olarak görüp daha pasif stratejiler benimsediklerini ifade etmiştir. Benzer şekilde Gökgöz ve Kayahan (2021), Afyonkarahisar'daki hayvancılık işletmelerinde sosyoekonomik yapı ile risk algısı arasında anlamlı bir ilişki bulmuş; düşük eğitim düzeyi ve sınırlı ekonomik kaynaklara sahip üreticilerin, riskleri fark etseler bile önlem alma davranışı göstermede isteksiz olduklarını bildirmiştir.

Risk yönetim stratejilerine ilişkin davranışlarda işletme büyüklüğü ve bilgiye erişim önemli belirleyicilerdendir. Yapılan araştırmalar, büyük ölçekli hayvancılık işletmelerinin, risk algısı ve risk yönetimi stratejileri açısından küçük ölçekli işletmelere kıyasla daha sistematik ve planlı bir yaklaşım sergilediklerini göstermektedir. Bu durum, özellikle finansal kaynaklara erişim, teknik bilgi düzeyi ve profesyonel danışmanlık hizmetlerinden yararlanma imkânlarının büyük işletmelerde daha yüksek olmasından kaynaklanmaktadır (Meuwissen et al., 2001; Meraner & Finger, 2017; Valeeva et al., 2011). Ayrıca, finansal güvenceye erişim düzeyi yüksek olan çiftçilerin riskleri yönetme konusunda daha etkili stratejiler geliştirdiği belirlenmiştir (Valeeva ve ark. 2011). Buna karşılık küçük ölçekli üreticiler, risklere karşı daha kırılgan bir yapıya sahip olduğu söylenebilir.

Meuwissen ve ark. (2001) tarafından yapılan çalışmada, büyük ölçekli işletmelerde sigorta kullanımı, kayıt tutma ve danışmanlık hizmetlerinden faydalanma düzeyleri daha yüksek olup, bu işletmeler daha sistematik risk yönetim davranışları sergiledikleri bildirilmiştir. Özsayın (2005)'ın Türkiye özelinde ortaya koyduğu çalışmada ise küçük ölçekli üreticilerde, sigorta primlerinin yüksekliği, bilgiye sınırlı erişim ve risk algısının soyutluğu, koruyucu davranışları sınırlı kaldığı bildirilmiştir.

Küçük ve büyük işletmelerin risk yönetim farklılıkları Tablo 1'de verilmiştir (Meuwissen et al., 2001; Meraner ve Finger, 2017; Valeeva et al., 2011; Hayran ve Gül, 2015).

Tablo 1. Küçük ve Büyük Ölçekli Hayvancılık İşletmelerinin Risk Yönetimi Karşılaştırması

Kriterler	Küçük Ölçekli İşletme	Büyük Ölçekli İşletme
Risk algısı	Düşük-orta (tepkisel)	Orta-yüksek (proaktif)
Önleyici strateji kullanımı (aşılama, biyogüvenlik)	Sınırlı	Yaygın ve sistematik
Sanayi ile etkileşim	Düşük	Yüksek
Teknik bilgiye erişim	Düzensiz	Düzenli/ Veteriner hekim gözetiminde
Hayvancılık Sigorta kullanımı	Düşük	Yüksek
Planlama ve kayıt tutma	Zayıf	Gelişmiş
Finansal Dayanıklılık	Yüksek	Düşük

Tablo incelendiğinde birçok başlıkta büyük ölçekli işletmeler, küçük ölçekli işletmelere oranla risk yönetimde daha etkin olduğu ancak finansal dayanıklılık konusunda küçük ölçekli işletmelerin daha avantajlı oldukları görülmektedir. Nitekim Türkiye koşullarında küçük ölçekli işletmeler, üretimlerini genellikle düşük maliyetli aile işgücünü kullanması, arazi ve yem kaynaklarını büyük ölçüde kendi imkânlarıyla temin etmesi ve faaliyetlerini daha esnek bir yapıda sürdürmelerine neden olmaktadır. Bu esnekliğin, piyasa dalgalanmalarına, girdi fiyatlarındaki artışa ve süt fiyatlarındaki volatiliteye karşı adaptasyon kabiliyetlerini artırdığı ve işletmelerin yaşam süresini uzattığı söylenebilir. Buna karşın, büyük ölçekli süt işletmelerin çok daha yüksek sabit yatırım gereksinimleri (modern tesisler, ileri teknolojili sağım sistemleri, geniş ölçekli yem tedariki vb.) ve yüksek işletme sermayesi ihtiyacı nedeniyle daha kırılgan bir yapıya sahiptirler. Nitekim yatırım ve sabit giderlerin çok ağır olması (kredi geri ödemeleri, enerji, işçilik, amortisman giderleri), Pazar bağımlılıklarının fazla olması (özellikle sanayi tipi alıcılara ya da ihracata bağımlı üretim modelleri), yem katkı maddeleri gibi dışa bağımlılıkların yüksek olması ve devlet desteklerinden yeterince yararlanamama, işgücü yönetiminde yaşanan sorunlar ve profesyonel yönetim eksiklikleri gibi nedenlerle finansal kırılganlık daha fazla olması hızlı iflas ya da faaliyet sonlandırma riski ile karşı karşıya kalmalarına neden olabilmektedir.

Hayvancılık İşletmelerinde Risk Yönetim Stratejileri

Risk algısı, yalnızca tehlikenin varlığına dair farkındalığı değil, aynı zamanda bu tehlikeyi bertaraf etmek için geliştirilen stratejileri de şekillendirmektedir. Üreticiler, riskleri azaltmak amacıyla çeşitli yönetim stratejilerine başvurabilmektedir. Risk yönetim stratejileri ise üç temel başlık altında sınıflandırılabilir: 1) Önleyici stratejiler (aşı uygulamaları, hijyen ve bakım), 2) Finansal stratejiler (sigorta, kredi rezervi oluşturma, erken satış, sözleşmeli üretim), 3) Çeşitlendirme stratejileri (farklı türde hayvancılık, Ürün çeşitlendirme). Ancak bu stratejilerin

seçimi, üreticinin riske yönelik tutumu, kaynak yapısı ve bilgi düzeyi ile doğrudan ilişkilidir (Altay, 2019; Njavro et al., 2007).

Önleyici stratejiler, özellikle hayvan sağlığı risklerinin yönetiminde kritik öneme sahiptir. Aşı uygulamaları, düzenli veteriner kontrolleri, karantina uygulamaları ve hijyen önlemleri gibi uygulamalar, enfeksiyöz hastalıkların yayılımını önlemeye yönelik etkili müdahale yollarıdır. Bu tür stratejiler, Valeeva ve ark. (2011) tarafından yapılan çalışmada da en etkin ve üretici tarafından ilk tercih edilen risk azaltım yolları arasında gösterilmiştir. Ancak bu stratejilerin başarısı, üreticinin bilgi düzeyine, veteriner hizmetlerine erişimine ve işletmenin teknik kapasitesine bağlı olarak değişmektedir. Özellikle küçük ölçekli işletmelerde bu stratejilerin yeterince uygulanmadığı, bilgi eksikliği ve ekonomik kısıtların önemli bir engel oluşturduğu söylenebilir (Garforth et al., 2013; Gökgöz ve Kayahan, 2021).

Finansal stratejiler, risklerin ekonomik etkilerini sınırlamak amacıyla geliştirilmiş olup, özellikle iklimsel ve piyasa temelli belirsizlikler karşısında işletmenin gelir istikrarını koruma işlevi görmektedir. Sigorta sistemleri (hayvan hayat sigortası, doğal afet teminatları), acil durumlar için nakit rezervi oluşturma ve kredi mekanizmaları, maliyeti sabitleme veya düşürme bu başlık altında değerlendirilebilir. Küçük ve orta ölçekli işletmeler için finansal planlama ve gelir-gider kontrolü, nakit akışını izleme ve borç yönetimi açısından önemli bir araç olup, işletmenin uzun vadeli sürdürülebilirliğini güçlendirir.

Hayvancılık işletmeleri için önemli bir risk olan, fiyat dalgalanmalarına karşı özellikle küçük ölçekli işletmeler sermaye birikiminin düşük olması, pazarlık güçleri sınırlı olması ve çoğu zaman üretimin sadece geçimlik düzeyde olması nedeniyle büyük ölçekli işletmelere göre daha kırılgandır. Küçük işletmeler, fiyatlar üzerinde doğrudan kontrol sahibi olamasalar da girdi maliyetlerini azaltarak fiyat dalgalanmasının gelir üzerindeki etkisini sınırlayabilir. Yem girdisi, hayvancılıkta maliyetin %60-70'ini oluşturduğundan, kendi yemini üretmek veya kooperatif yoluyla toplu yem alımı yapmak etkili bir stratejidir (Yalçınkaya, 2017). Ayrıca, düşük verimli hayvanların elden çıkarılması ve sürü yönetiminin rasyonelleştirilmesi, verim başına maliyeti düşürür. Küçük işletmelerin tek başına pazarlık gücü sınırlıdır. Bu nedenle üretici birlikleri ve kooperatifler aracılığıyla hem girdi tedariki hem de ürün satışı alanında kolektif hareket etmek, pazarlık gücünü artırır ve fiyat oynaklığından daha az etkilenmeyi sağlar (Özsayın, 2005). Kooperatifler aynı zamanda stok yönetimi, soğuk zincir ve pazara erişim konularında da destek sağlayabilir. Fiyat dalgalanmasına karşı geliştirilen araçlardan biri de sözleşmeli üretimdir. Bu yöntemle üretici, ürününü önceden belirlenen fiyattan satmayı taahhüt ederek, piyasa dalgalanmasına karşı korunur. Türkiye'de bu yöntem süt, kırmızı et ve bazı yem bitkilerinde yaygınlaşmakla birlikte, küçük üreticilerin bu pazarlara entegrasyonu hâlâ sınırlıdır.

Njavro ve ark. (2007) sigortanın, sistematik risklere karşı etkili bir araç olduğunu belirtmiştir. Ancak uygulamada üreticiler nezdinde sigorta primlerinin yüksekliği, tazminat sürecine olan güvensizlik ve bilgi eksikliği gibi faktörlere bağlı olarak işletmelerde sigortalılık oranları düşük kalmaktadır (Özsayın, 2005). Sigorta gibi formel finansal risk yönetim araçlarının düşük kullanım düzeyleri, Türkiye'deki mevcut tarım sigortası sisteminin hayvancılık sektöründe yeterince yaygınlaşmadığı göstermektedir. Bu bağlamda, finansal stratejilerin etkinliğini

artırmak için devlet desteklerinin güçlendirilmesi, üretici bilgilendirme faaliyetlerinin yaygınlaştırılması gerekmektedir.

Çeşitlendirme stratejileri ise hem üretim hem de gelir kaynaklarının çeşitlendirilmesini içermekte ve işletmenin risklere karşı esnekliğini artırmaktadır. Özellikle piyasa ve fiyat dalgalanmasının etkisini azaltmanın bir diğer yolu, sadece hayvansal üretime bağlı kalmamak, bitkisel üretim, yan işler ya da kırsal turizm gibi alternatif gelir kaynakları oluşturmaktır (Meraner & Finger, 2017). Özellikle mevsimsel ürünler veya aile iş gücüyle yapılabilecek işler, düşük yatırım gerektirir ve riskin farklı sektörlere yayılmasını sağlar. Bu sayede sektörel ve çevresel risklere karşı işletmeler daha dirençli hale gelebilirler (Meraner ve Finger 2017). Ancak çeşitlendirme stratejilerinin uygulanabilirliği, bölgesel kaynaklara, altyapıya ve üreticinin yönetim kapasitesine bağlıdır. Örneğin, yüksek rakımlı ve iklimsel olarak dezavantajlı bölgelerde çeşitlendirme olanakları sınırlı kalabilirken, entansif üretim yapan işletmelerde bu stratejiler daha etkin biçimde uygulanabilmektedir (Yalçınkaya, 2017).

Bu üçlü sınıflama çerçevesi, hayvancılık sektöründe risklerin yalnızca tek boyutlu araçlarla değil, çok katmanlı ve entegre stratejilerle yönetilmesi gerektiğini göstermektedir. Ancak, üreticilerin çoğunun riskleri yönetmek için kendi bilgi ve deneyimlerine dayalı karar alma eğiliminde olduğu, resmi bilgi kaynaklarının (veteriner, danışman, kurumlar) yeterince etkin kullanılmadığı söylenebilir (Garforth ve ark., 2013). Bununla birlikte, eğitim düzeyi yüksek, genç ve büyük ölçekli işletme sahiplerinin daha planlı ve çoklu stratejilere başvurma eğiliminde oldukları söylenebilir (Valeeva et al. 2011; Meraner & Finger, 2017). Özellikle Avrupa'da geliştirilen özelleştirilmiş risk yönetim modellerinin Türkiye koşullarına uygun olarak revize edilmesi ve yaygınlaştırılması, risklerin daha etkin yönetilmesine katkı sağlayabilir.

Sonuç ve Öneriler

Türkiye'de hayvancılık işletmeleri, özellikle hayvan sağlığı, yem fiyatları ve piyasa belirsizliği gibi alanlarda yüksek risk algısına sahip olup, bu risklere karşı başvurdukları yönetim stratejileri genellikle sınırlı ve kişisel deneyim temelli olduğu söylenebilir.

Sonuç olarak, hayvancılık sektöründe risk yönetimi sadece teknik bir süreç değil, aynı zamanda üreticinin risk algısı, davranış biçimi ve çevresel koşulların etkileşiminden oluşan çok boyutlu bir yapıdır. Bu nedenle etkili bir risk yönetimi yaklaşımı, üreticinin bireysel özelliklerini, sosyoekonomik yapısını ve faaliyet gösterdiği bölgenin iklimsel, coğrafi ve altyapısal koşullarını dikkate alan bütüncül bir strateji gerektirmektedir. Risk yönetim araçlarının başarılı bir şekilde uygulanabilmesi için, üreticiye yönelik eğitim ve yayım hizmetlerinin güçlendirilmesi, bölgesel özelliklere göre uyarlanmış sigorta ve finansal destek mekanizmalarının geliştirilmesi büyük önem taşımaktadır. Özellikle fiyat dalgalanmalarına karşı, küçük ölçekli işletmelerin doğrudan pazarlama, sözleşmeli üretim ve kooperatifleşme yoluyla pazarlık güçlerini artırmaları; devletin ise fiyat istikrarını destekleyici fiyat uygulamaları, müdahale alımları ve girdi destekleri ile piyasayı düzenlemesi gerekmektedir.

ABSTRACT

Varieties adapted to abiotic stress have a stronger structure in the growth and development processes, leading to higher quality and higher yield potential. Reducing stress conditions encountered in the plant production process to an optimal level is crucial, especially during germination. In plants, gaining tolerance to stress can be achieved by various biological methods.

This study was conducted to determine some physiological and morphological responses during the germination period in Dinçer Aspir (Carthamus tinctorius L.) cultivar to which mycorrhiza doses (0, 0.03 g, 0.07 g, 0.10 g) were applied under different conditions of irrigation water salinity (0, 1, 4 and 8 dS/m). In the study, the germination rate, germination speed, fresh weight and dry weight decreased with increasing salinity, while the average germination time and root length increased. When mycorrhiza was applied, it was found that the fresh and dry weights generally increased, but the germination rate decreased. The highest fresh weight and average root length were found with the 0.07 g mycorrhiza application at 4 dS/m irrigation. However, the highest germination rate was observed with the 0.03 g mycorrhiza application at the same salinity. The highest germination and biomass increase was generally observed with medium salinity and mycorrhiza application.

As a result, it was concluded that mycorrhizal applications have an effect on enhancing the resistance mechanisms of aspirin under salt stress conditions, but this effect varies according to dose and salinity. In this respect, mycorrhiza can be evaluated as a potential biological support for sustainable production in safflower cultivation.

Keywords: Irrigation Water Salinity, Mycorrhiza, Abiotic Stress, Germination, Safflower

FARKLI SULAMA SUYU TUZLULUĞU KOŞULLARINDA ASPİR (CARTHAMUS TİNCTORİUSL.) TOHUMLARINA MİKORİZA AŞILAMASININ ÇİMLENME ÜZERİNE ETKİSİ

ÖZET

Abiyotik strese adapte olan çeşitler büyüme ve gelişme süreçlerinde daha güçlü bir yapıya sahip olduğu için daha kaliteli ve daha yüksek verim gücüne sahip olurlar. Bitkisel üretim sürecinde karşılaşılan stres koşullarının optimum düzeye indirgenebilmesi özellikle çimlenme döneminde önemli rol oynamaktadır. Bitkilerde, strese karşı tolerans kazanımı çeşitli biyolojik yöntemler ile sağlanabilmektedir.

Bu çalışma, farklı sulama suyu tuzluluğu (0, 1, 4 ve 8 dS/m) koşullarında mikoriza dozları uygulanan (0, 0.03 g, 0.07 g, 0.10 g) dinçer aspir (Carthamus tinctorius L.) çeşidinde, çimlenme dönemine ait bazı fizyolojik ve morfolojik tepkileri belirlemek amacıyla yürütülmüştür. Çalışmada, artan tuzluluk seviyelerinde çimlenme oranı, çimlenme hızı, yaş ve kuru ağırlıklarda azalış meydana gelirken ortalama çimlenme süresi ve kök uzunluğunda artış görülmüştür. Mikoriza uygulamalarında ise genel olarak yaş ve kuru ağırlıklarda artış görülürken çimlenme hızını düşürdüğü tespit edilmiştir. En yüksek yaş ağırlık ve ortalama kök uzunluğu 4 dS/m ile sulanan 0.07 g mikoriza uygulamasında belirlenmiştir. Bununla birlikte en yüksek çimlenme oranı aynı tuzluluk seviyesindeki 0.03 g mikoriza uygulamasında görülmüştür. En yüksek çimlenme ile biyokütle artışı genel olarak orta düzey tuzluluk ve mikoriza uygulamalarında tespit edilmiştir.

Sonuç olarak, tuz stresi koşullarında mikoriza uygulamalarının aspirin direnç mekanizmalarını güçlendirecek etkisinin olduğu, ancak bu etkinin doz ve tuzluluk düzeyine göre değişkenlik gösterdiği sonucuna ulaşılmıştır. Bu yönüyle mikoriza aspir tarımında sürdürülebilir üretim için potansiyel bir biyolojik destek olarak değerlendirilebilir.

Anahtar Kelimeler: Sulama Suyu Tuzluluğu, Mikoriza, Abiyotik Stres, Çimlenme, Aspir

1. GİRİŞ

Artan insan nüfusu ve iklim değişikliğinin yol açtığı sorunlardan ötürü tarım sektörünü daha fazla üretim yapmaya zorlamaktadır. Ancak bu üretimin temelini oluşturan su kaynaklarının hem sınırlı olması hem de iklimsel değişiklikler nedeniyle giderek azalması, süreci daha da zorlaştırmaktadır. Buna ek olarak, suyun bilinçsizce kullanılması ve kirlenerek kullanılamaz hale gelmesi tarımda tuzlu sulama koşullarının yaygınlaşmasına neden olmakta ve bu durum bitkisel üretim açısından ciddi bir sorun haline gelmektedir. Topraklarda ve sulama sularında biriken tuzlar bitkilerin çimlenme, çıkış ve besin alımını zorlaştırmakla birlikte büyüme ve verimde olumsuz etki oluşturmaktadır. Dolayısıyla tarımsal üretim için bitkilerin tuzlu koşullara dayanıklı veya bu koşullarda yetiştirilmesi daha avantajlı olarak görülen stratejik olarak seçilecek tür veya cinslerin seçimi giderek daha önemli olmaktadır. Bu stratejik bitkilerden biri olan aspir *(Carthamus tinctorius L.)* dünya genelinde yaklaşık 816 bin hektarlık ekiliş alanı ve 653 bin tonluk toplam üretimiyle önemli bir yağ bitkisi olarak ön plana çıkmaktadır (Beyyavaş ve ark., 2023; FAO, 2022). Küresel aspir üretiminin ise yaklaşık %95'i Kazakistan, Rusya, ABD, Meksika, Türkiye ve Hindistan gibi ülkeler tarafından ihtiyaç karşılanmaktadır. Türkiye'de üretim alanı olarak ise 14,59 bin hektarlık alanda ekilen aspir bitkisi yıllık olarak 16,20 bin ton üretim miktarı ve buna ek olarak 1.110 kg ha^{-1} Verim potansiyeli ve ekonomik değeriyle tarımsal açıdan öne çıkan önemli bir ürün olarak değerlendirilmektedir (Beyyavaş ve ark., 2023; TÜİK, 2022).

Aspir bitkisinin tohumları, %13–46 oranında değişken olarak yağ içeriğine sahip olup (Beyyavaş ve ark., 2023; Beyyavas ve Haliloglu, 2021; Dogan, 2021), bu yağın yaklaşık %90'ı oleik ve linoleik asit gibi doymamış yağ asitlerinden oluşmaktadır (Belgin ve ark., 2007; Beyyavaş ve ark., 2023; Johnson ve ark., 1993). Ayrıca yüksek tokoferol (E vitamini) içeriği nedeni ile antioksidan özelliklerinin bulunması sayesinde aspir yağının besin takviyesi olarak kullanılmasının yanı sıra kozmetik sanayi gibi alanlarda da oldukça tercih edilmektedir (Bergman ve Kandel, 2019; Beyyavaş ve ark., 2023; Matthäus ve ark., 2015).

Ancak bu değerli olarak görülen ve yüksek besin potansiyeline sahip olduğu bilinen bitkinin tarımsal üretimi özellikle yarı kurak ve kurak bölgelerde karşılaştıkları abiyotik stres faktörlerinden de önemli ölçüde etkilenmektedirler. Kuraklık ve tuzluluk gibi abiyotik stres faktörlerinin tarımsal üretimde de verime ve kalitede sınırlayıcı temel unsurlardan biri olmasına ek olarak (Bot ve ark., 2000; Somerville ve Briscoe, 2001; Ulukapı ve ak., 2020) ılıman iklim kuşağında bulunan Türkiye gibi yarı kurak ve kurak bölgelerde yetişilmekte olan aspir bitkisinin ciddi üretim kayıplarına neden olduğu bilinmektedir (Hamzehzarghani ve ark., 2011; Koç, 2020). Orta Anadolu Bölgesi de Türkiye'de aspir ekiminin en yoğun olarak tarımının yapıldığı alanlardan biri olup burada meydana gelen erken ilkbahar kuraklığı aspir veriminde belirgin bir düşüşe yol açmaktadır. Tarım arazilerinin yaklaşık %45'inin kuraklık tehdidi altında olduğu bildirilmekte ve nüfus artışına, iklim değişikliğine bağlı olarak mevcut su kaynaklarının yetersiz kalacağı tahmin edilmektedir (Somerville ve Briscoe, 2001; Bot ve ark., 2000)

Abiyotik stres faktörlerinden birisi olan kuraklık ile ilgili stres çalışmaları aspir bitkisi için büyük ölçüde eksik ve yersizdir kalmaktadır (Koç, 2020; Singh, 2006). Ancak özellikle tarla bitkilerinde, bu tür abiyotik stres faktörlerinin verim üzerindeki olumsuz etkilerini azaltmak

amacıyla yapılan bazı çalışmalarda kuraklık ve tuzluluk stresine dayanıklı genotiplerin geliştirilmesi ve biyolojik uygulamaların etkinliği üzerine yoğunlaşmaktadır.

Tarımda bitkisel üretimde abiyotik streslerden biri olan tuzluluk faktörünün stresinin azaltılması ve olası verim, büyüme gibi kayıpların en aza indirilmesi için tuz stresine karşı toleranslı genotiplerin ıslahı gibi bazı biyoteknoloji ve fonksiyonel genomik çalışmaların arbusküler mikoriza funguslarının ve bitki gelişimini teşvik edici bakterilerin (Plant Growth Promoting Bacteria–PGPB) kullanılması, bunlara ek olarak hormon uygulamaları ve tohuma priming teknikleri gibi birçok yönetim stratejisi bulunmaktadır (Farooq ve ark., 2017; Gupta ve Rautaray 2025; Iqbal ve ark., 2020; Tarhan ve ark., 2024).

Mercimek (*Lens culinaris M*.) bitkisinin çimlenme ile ilgili yapılmış bir çalışmada 100 mM seviyesinde dahi çimlenme ve fide gelişiminin tüm özelliklerinde kayda değer bir azalış görülmesine karşın, 200 mM NaCl konsantrasyonlarında önemli çimlenme ve gelişme kayıpları ortaya çıktığı bildirilmiştir (Tarhan ve ark., 2024). Bordi (2010) ve Tarhan ve ark. (2024) ise kolzada *(Brassica napus)* NaCl uygulamasına bağlı olarak çimlenme yüzdesinin ve hızının sırasıyla %38 ve %33'e kadar azaldığını raporlamıştır. Benzer şekilde, Khodarahmpour ve ark. (2012) ve Tarhan ve ark. (2024), mısır *(Zea mays)*'da 240 mM NaCl uygulamasının çimlenme oranında %32, kök uzunluğunun da ise %80, sürgün uzunluğunu %78 ve tohum gücünü %95 oranında azalttığını yaptığı çalışma sonucu bildirmiştir.

Görüldüğü üzere tuzluluk stresi ve bitki büyümesi gibi veriminde etkilendiği olumsuzlukların etkilerinden kurtulmak adına pek çok strateji düşünülüp geliştirilmiştir. Bu stratejilerin birçoğu, bitki-mikroorganizma faydalarından yararlanarak sürdürülebilir ve çevre dostu üretimi hedeflemektedir. Özellikle arbusküler mikoriza funguslarının bitki köklerinde simbiyotik bir ilişki oluşturarak su ve besin alımını iyileştirdiği bilinmektedir. Aynı zamanda strese bağlı oluşan iyon dengesizliklerinin etkilerini belirli düzeyde azaltarak bitkileri desteklemektedir (Onoğur, 1999). Bu kapsamda bakıldığında mikoriza uygulamalarının tuz stresi altındaki bitkiler üzerindeki etkileri giderek daha fazla araştırılmakta ve umut verici sonuçlar alınmaktadır.

Mikoriza mantarlarının kolonileşmesinin 1000 milyon yıl öncesine kadar dayandığı düşünülmekte olup bu zamandan itibaren mikoriza fungusları ile bitkilerin aralarında karşılıklı olarak etkileşim kurulmaya başladığı düşünülmekte ve hatta bitkilerin ekosisteme dağılıp yayılması durumuna yol açtıkları tahmin edilmektedir (Smith ve Read, 2008; Yıldız, 2009).

Kurak ve tuzlu tarım alanlarında bitki verimliliğini artırmak ve çevresel stres faktörlerinin etkilerini azaltmak amacıyla biyolojik yöntemlere duyulan ilgi giderek artmaktadır. Mikoriza mantarları, bitki kökleriyle simbiyotik ilişki kurarak su ve besin maddesi alımını artıran önemli biyolojik ajanlardan biridir (Smith ve Read, 2008; Yıldız, 2009). Yapılan araştırmalarda mikoriza uygulamalarının özellikle kuraklık ve tuzluluk gibi stres koşullarında bitki büyümesi ve gelişimi üzerinde olumlu etkiler sağladığını göstermektedir (Çelik ve ark., 2019; Sönmez ve ark., 2013). Mikoriza aşılaması yaprak yaş ağırlığı, yaprak kuru ağırlığı gövde uzunluğu gibi morfolojik özelliklerde de anlamlı artışları desteklemektedir (Özbucak ve ark., 2020).

Yapılan benzer bir artan sulama suyu tuzluluğu koşullar altında soğan bitkisinin mikoriza mantarı ile aşılanmasının yaprak alanı ile yeşil ve kuru aksam ağırlıklarında olumlu artış

sağladığı bildirilmiştir (Borde ve ark., 2010; Küçük ve ark., 2024). Bakla *(Vicia faba)* üzerinde yapılan başka bir benzer çalışmada ise mikoriza aşılamasının tuz stresine karşı toleransı artırarak bitki kuru aksam ağırlığını ve bitki boyunu artırdığı, mikoriza uygulaması yapılmayan diğer bitkilere göre daha yüksek boyda olduğu rapor edilmiştir (Kumar ve ark., 2022; Küçük ve ark., 2024).

Farklı tuz dozları uygulanan arpa bitkisinin *(Hordeum vulgare)* mikoriza (mikorizalı ve mikorizasız) uygulamasının etkilerinin araştırıldığı bir diğer çalışmada, tuz stresine maruz kalan bitkilerde bazı enzim faaliyetlerinin iyileştirildiği belirtilmiştir.100 mM NaCl + mikoriza uygulamasının 200 mM NaCl + mikoriza uygulamasına göre tuzun olumsuz etkisini daha fazla azalttığı mikorizanın tuz stresine karşı fayda sağladığı vurgulanmaktadır (Küçük ve ark., 2024).

Özellikle tuz stresinin aspir bitkisi üzerindeki olumsuz etkileri dikkate alındığında, bu bitkinin stres toleransını artıracak biyolojik yöntemlerin araştırılması büyük önem taşımaktadır. NaCl gibi tuzlar, bitkilerin su alımını azaltarak hücre zarında iyon dengesini bozmakta ve gelişimi engellemektedir (Ahmed ve ark., 2017; Bybordi ve Tabatabaei, 2009; Kereçin ve ark., 2024; Wu ve ark., 2015). Mikoriza mantarı, bitkilerin kök sistemlerini etkili bir şekilde enfekte ettiğinde, bitkiye normal koşullara kıyasla daha fazla besin ve su taşımakta olup tuz stresine karşı bitkiye yardımcı olmaktadır (Ortaş, 1997).

2. Materyal ve Yöntem

3.1. Deneme Alanı ve Koşulları

Bu çalışma, 2025 yılında Ahi Evran Üniversitesi Ziraat Fakültesi Biyosistem Mühendisliği Bölümü Laboratuvarında (39,143445° K; 34,12144° D; rakım 1069 m) yürütülmüştür. Çimlenme denemesi, 25ºC sabit sıcaklığa ayarlanmış inkübatörde karanlık ortamda gerçekleştirilmiştir. Tesadüf parseller faktöriyel deneme deseni düzenine göre 3 tekerrürlü olarak gerçekleştirilmiş olup, sıcaklık ve nem koşulları sabit tutulmuştur.

2.2. Kullanılan Materyaller ve Metot

Denemede kullanılacak petri kapları önce %5'lik (endüstriyel) sodyum hipoklorit ile yıkanıp saf su ile durulama işleminden geçirilmiştir. Daha sonra kullanılacak Petri kapları ve diğer malzemelerde herhangi bir fungisit oluşumunu önlemek amacıyla, petri kaplarına sterilizasyon işlemi tekrar uygulanarak 70°C'de 150 dk boyunca etüvde bekletilmiştir. Çimlenme denemesinde tuzluluk stresi faktörünü oluşturmak amacıyla, kontrol grubunda distile su (0dS/m) tuz ilave edilmeksizin saf su kullanılmıştır. Diğer gruplarda ise dört farklı tuz konsantrasyonu belirlenerek 1 dS/m, 4 dS/m ve 8dS/m seviyelerinde hazırlanmıştır. Bu çözeltiler, Sodyum Klorür (NaCl), Magnezyum Sülfat ($MgSO_4$) ve Kalsiyum Klorür ($CaCl_2$) kullanılarak hazırlanmış ve EC metre ile doğrulanmıştır. Denemede *Dinçer* aspir (*Carthamus tinctorius L.*) çeşidine ait, homojen tohumlardan seçilerek materyal olarak kullanılmıştır. Tohum sterilizasyonu için %1,5'lik sodyum hipoklorit çözeltisi kullanılarak tohumlar 5 dakika süreyle %1,5'lik sodyum hipoklorit çözeltisinde bekletilmiş, hemen ardından 5 dakika süreyle saf su içerisinde tutulmuştur. Mikrobiyal gübre olarak Endo Roots Soluble (ERS) mikoriza kullanılmıştır. Uygulamalarına göre ise 0.03(g), 0,07(g) ve 0,10 (g) miktarları kullanılarak

aşılama uygulanması yapılmıştır. Mikoriza aşılaması çimlenme denemesinde kullanılacak tohumlara doğrudan uygulanarak gerçekleştirilmiştir. Aşılama işlemi için, sterilize edilen tohumlar hafifçe nemlendirilmiş, ardından belirlenen miktarda mikoriza tozu yüzeye eşit şekilde dağıtılmış ve homojen bir şekilde kaplanması sağlanmıştır. Çimlenme ortamı olarak steril Petri kapları ve filtre kağıtları kullanılmıştır. Petri kaplarının tabanına tek kat steril filtre kâğıdı yerleştirilmiş ve tohumlar belirlenen düzene göre yerleştirilmiştir. Her bir Petri kabına 20 adet tohum eklenmiştir. Tohumların kurumasını önlemek ve uygun çimlenme ortamını sağlamak amacıyla, ilgili tuz konsantrasyonlarına sahip çözeltiler 3 mL olacak şekilde her Petri kabına eşit miktarda damlatılmıştır (Kurtuluş ve Boydak, 2022) 2. gün de ise 2 mL solüsyon ile sulandıktan sonra bir daha sulamaya ihtiyaç görülmemiştir. Çözelti uygulaması kontrollü bir şekilde damlalık kullanılarak gerçekleştirilmiştir. Petrilerin kapları buharlaşmayı önlemek adına kapatılmıştır. Çimlendirme denemeleri 5 gün sürdürülmüştür.

2.3. Ölçüm ve Analizler

Bitki boyu (mm) ile kök ve gövde (mm) uzunluklarının belirlenmesinde her bir örnek milimetrik kâğıt üzerine yerleştirilerek kök tacı ile kök ucu arasındaki mesafe ölçülmüştür (Çavumirza ve Demir, 2023). Her bir grup için fidelerin kök uçundan boğaza kadar ölçülen uzunlukları toplayıp, bu toplamı o gruptaki fide sayısına bölerek (mm cinsinden) ortalama kök uzunluğu elde edilir. Fidelerin yaş ağırlıkları, ±0,001 g hassasiyetindeki dijital analitik terazide ölçülmüştür. Ölçümü takiben örnekler, 35 °C'deki etüvde 48 saat boyunca kurutularak sabit ağırlığa ulaşmaları sağlanmıştır. Kuru ağırlıklar da aynı terazinin ±0,001 g doğruluğuyla kaydedilmiştir. Kuru madde içeriği, örneklerin yaş ağırlığı ile kuru ağırlığı arasındaki fark temel alınarak hesaplanmış ve su kaybı miktarı hesaplanmıştır (Kaman, 2017).

Çimlenme oranı (%): Tohumların çimlenme başarısını değerlendirmek amacıyla her bir Petri kabına 20 adet steril edilmiş tohum yerleştirilmiştir. Petri kapları sabit sıcaklık koşullarında tutulmuş tohumlar her gün aynı saatte gözlemlenmiştir. Kökçük uzunluğu 2 mm'ye ulaşan tohumlar çimlenmiş kabul edilerek ortamdan uzaklaştırılmıştır (Goertz ve Coons, 1989; Elkoca, 1997; Kayış, 2014) Çimlenme oranı, aşağıdaki eşitlik 1 kullanılarak hesaplanmıştır.

Çimlenme oranı (%) = (Çimlenen toplam tohum sayısı / 20) x 100 (Eşitlik 1)

Çimlenme hızı: Tohumların belirli bir süre zarfında ne kadar hızlı çimlendiğini gösteren önemli bir fizyolojik parametredir. Bu parametre, özellikle stres koşullarında çimlenmenin zamanlamasındaki farklılıkları ve gecikmeleri sayısal olarak değerlendirmeye olanak sağlar. Çimlenme hızı, her bir günde çimlenen tohum sayısının, o gün sayısına oranlarının toplamı alınarak hesaplanmaktadır (Güldüren, 2012; Abazarian 2011) (Burada n1, n2… çimlenen tohum sayısını, t1, t2…. İse çimlenmenin gerçekleştiği gün sayısını ifade etmektedir.

Çimlenme hızı=n1/t1+n2/t2+……+nn/tn (Eşitlik 2)

Ortalama Çimlenme Süresi (OÇS): Çimlenmenin sadece gerçekleşip gerçekleşmediğini değil, aynı zamanda ne kadar sürede tamamlandığını gösteren ortalama çimlenme süresi (OÇS), tohumların zamana bağlı çimlenme performansını analiz etmede kullanılmıştır. Her gün çimlenen tohum sayısı (f) ile o günün sırası (x) çarpılarak elde edilen toplam, çimlenen tüm tohum sayısına bölünerek ortalama çimlenme süresi hesaplanmıştır (Kaya ve ark., 2005).

$$OÇZ\ (gün)=\Sigma(fx)/\Sigma f \qquad \text{(Eşitlik 3)}$$

3. GELİŞME

4.1.Sulama Suyu Tuzluluk Uygulamaları

Petri kabı kullanılarak yapılan çimlenme denemelerinde elde edilen yaş ve kuru ağırlık verilerinin artan sulama suyu tuzluluğunun aspir bitkisinin gelişiminde ve çimlenmesi üzerinde olumsuz etkiler yarattığını açıkça ortaya koymuştur. En yüksek yaş ve kuru ağırlık değerleri saf su (S1) uygulamasında elde edilmiştir. Tuz konsantrasyonunun artmasıyla birlikte biyokütle üretiminde kademeli bir azalma gözlenmiştir. Özellikle S4 (8dS/m) uygulamasında yaş ve kuru ağırlıklardaki belirgin düşüş gözlemlenmiştir. Yüksek tuzluluk koşulları altında S4 (8dS/m) bitkinin su alımında ve kuru madde birikiminde azalış olmuştur. Elde edilen bulgular doğrultusunda aspir bitkisinin çimlenme sürecinde tuz stresine karşı duyarlı olduğunu ve artan tuz seviyelerinin genç fide gelişimini anlamlı biçimde gerilettiğini doğrulamaktadır (Çavumirza ve Demir, 2023). Kaya ve ark. (2003) çalışmasında, Dinçer aspir çeşidinde artan tuz dozlarıyla birlikte gövde kuru ağırlığında azalma gözlemlemiştir. Bu durumda çalışmamızın sonucunu desteklemektedir. Tuz stresinin Dinçer çeşidinin gövde gelişimini olumsuz etkilediğini ve biyokütle birikiminin tuz düzeyinde artış meydana geldikçe bitki gelişimini azalttığını ortaya koymuştur.

Ortalama kök uzunluğu verilerine bakıldığında tuzluluk düzeylerinin aspir bitkisinin kök gelişimi üzerinde bazı azrtışlar oluşturduğu gözlenmiştir. Özellikle S3 (4 dS/m) uygulamasında kök uzunluğunun en yüksek değere ulaşmış olması bitkinin orta düzey tuz stresine karşı bir yanıt olarak düşünülebilir ve köklerini uzatarak suya ulaşma çabasını artırdığını düşündürmektedir. Ancak S4 (8dS/m) seviyesinde kök uzunluğunda meydana gelen azalma da yüksek tuz konsantrasyonlarının kök gelişimini sınırladığı görülmektedir. Buna karşın, saf su uygulamasında (S1) en kısa kök uzunluğunun ölçülmesi, bitkinin stres altında daha çok kök gelişimi benimsediğini ortaya koymaktadır. Benzer bir şekilde Çavumirza ve Demir, (2023) aspir bitkisinde artan tuz miktarının kök uzunluğunda azalmalar olduğunu yaptıkları çalışma sonucu rapor etmişlerdir.

Farklı tuzluluk seviyelerinde yapılan çimlenme denemeleri sonucunda, artan tuz konsantrasyonunun aspir tohumlarının çimlenme oranlarını olumsuz etkilediği belirlenmiştir. En yüksek çimlenme oranı saf su (S1) uygulamasında elde edilmiştir. Tuzluluk düzeyinin artmasıyla birlikte çimlenme oranlarında kademeli bir düşüş eğilimi gözlenmiştir. Özellikle S4 (8dS/m) uygulamasında çimlenme oranındaki azalışlar yüksek tuz konsantrasyonlarının tohumun su alımını ve çimlenme sürecini engellediğini göstermektedir. Bu durumda aspir bitkisinin çimlenme aşamasında tuz stresine duyarlı olduğunu ve erken dönemde bile

tuzluluğun olumsuz etkilerine maruz kaldığını ortaya koymaktadır. Öte yandan, abiyotik stres olan tuz stresinin tohum çimlenmesi üzerindeki etkisinin özünde osmotik basınç artışı ve iyon toksisitesi ortaya çıkmakta; Sodyum (Na^+) ve Klor (Cl^-) gibi iyonlar tohumun su alımının önüne geçerek çimlenmeyi doğrudan baskılamaktadır (Essa, 2002; Güldüren ve Elkoca, 2012; Sadeghian ve Yavari, 2004).

Tuzlu su uygulamalarının aspir tohumlarının ortalama çimlenme süresi üzerindeki etkisi değerlendirildiğinde, tuzluluk seviyesindeki artışın çimlenme süresini uzattığı görülmüştür. En kısa çimlenme süresi saf su (S1) uygulamasında kaydedilirken, tuz konsantrasyonunun artmasıyla birlikte çimlenme gecikmiş ve S4 (8 dS/m) uygulamasında en uzun süreye ulaşmıştır. Elde edilen bulgular, tuz stresinin yalnızca çimlenme oranını değil, aynı zamanda çimlenme hızını da olumsuz etkilediğini göstermektedir. Farklı aspir çeşitlerinin tuza toleransı üzerine yaptıkları çalışmada, Arslan ve ark. (2012), artan tuzluluğun çimlenme oranı, çimlenme süresi ve erken fide gelişimi üzerinde olumsuz etkiler yarattığını, ayrıca çeşitlerin tuzluluğa karşı farklı tepkiler gösterdiğini belirtmişlerdir. Bu durum, elde edilen bulgularla uyum göstermektedir.

Farklı tuzluluk seviyelerinde yapılan denemelerde, çimlenme hızının tuz konsantrasyonu arttıkça azaldığı belirlenmiştir. En yüksek çimlenme hızı saf su (S1) uygulamasında gözlenmiş olup, artan tuz düzeyleri ile çimlenme süreci yavaşlamış ve en düşük değer S4 (8dS/m) uygulamasında kaydedilmiştir. Bu durum, yüksek tuzluluk koşullarının aspir tohumlarının metabolik aktivasyonunu geciktirerek çimlenme hızını önemli ölçüde düşürdüğünü ortaya koymaktadır. Aydın, (2015) Çalışmamıza uygun olarak tuz stresinin çimlenme hızını tuzluluğun her düzeylerinde arttığını rapor etmiştir.

3.2. Mikoriza Uygulamaları

Aspir bitkisine uygulanan mikoriza dozlarının yaş ve kuru ağırlık üzerine etkilerine bakıldığında mikorizasız grupta (M1) en düşük değerlerin elde edildiği, mikoriza uygulamalarıyla birlikte yaş ve kuru ağırlıklarının anlamlı şekilde arttığı belirlenmiştir. Özellikle orta doz mikoriza uygulaması (M3) en yüksek kuru ağırlık değerini verirken, yaş ağırlıkta da benzer bir artış gözlenmiştir. Bu bulgularla beraber arbusküler mikoriza mantarlarının aspir fidelerinin erken dönem gelişimini desteklediğini ve su-besin alımını iyileştirerek biyokütle birikimini artırdığını göstermektedir. Elde ettiğimiz verilerden yararlanarak uygun dozda mikoriza uygulamasının aspir üretiminde erken gelişim avantajı sağlayabileceğini ortaya koymaktadır. Mikoriza aşılamasının yaprak yaş ağırlığı, yaprak kuru ağırlığı, gövde uzunluğu gibi morfolojik özelliklerde de anlamlı artışlara neden olmuştur (Özbucak ve ark., 2020). Gözlemlendiği üzere, mikoriza uygulaması özellikle tuz stresinin baskıladığı gelişim parametrelerini iyileştirme potansiyeli taşımaktadır. Benzer şekilde, Sönmez ve ark. (2013), mikorizalı uygulamaların mikorizasızlara göre mısır bitkisinde yaş ve kuru ağırlık ile P ve Zn alımında da anlamlı artış sağladığını bildirmiştir.

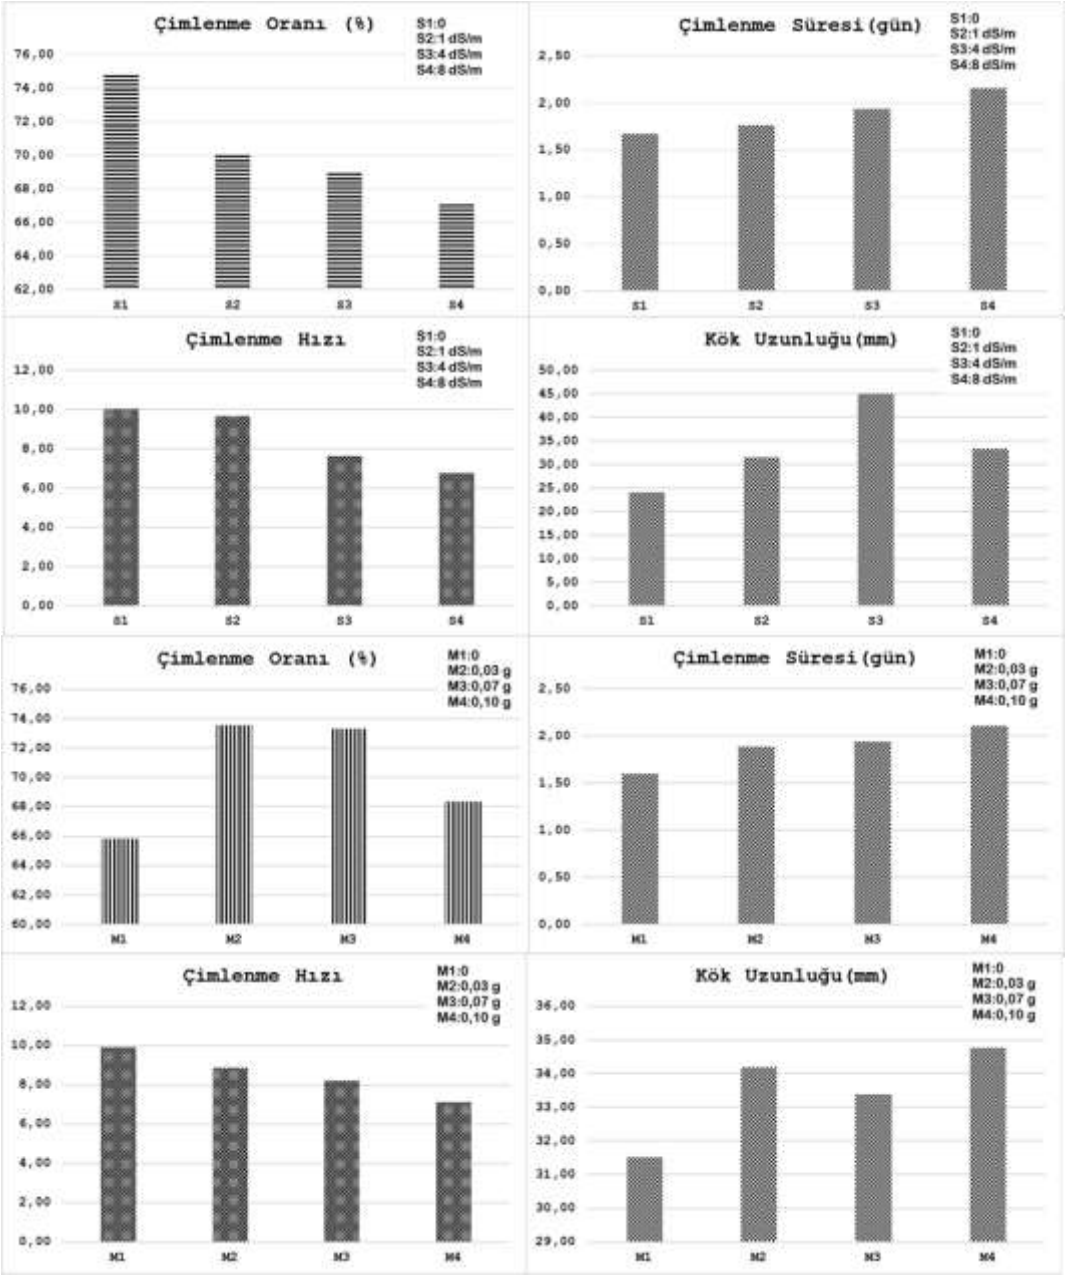
Mikoriza uygulamalarının aspir bitkisinin kök gelişimi üzerindeki etkileri değerlendirildiğinde, mikorizasız gruba kıyasla tüm mikoriza dozlarında kök uzunluğunun arttığı gözlenmiştir. En kısa kök uzunluğu mikorizasız (M1) grupta ölçülürken, en uzun kök değerine yüksek doz

mikoriza uygulamasıyla (M4) ulaşılmıştır. Bu durum, arbusküler mikoriza mantarlarının kök sistemini teşvik edici etkisini ve bitkinin topraktan su ile besin alımını artırarak kök büyümesini desteklediğini göstermektedir. Mikoriza aşılaması aspir bitkisinin kök morfolojisinde iyileşme sağlayarak stres koşullarına karşı adaptasyon kabiliyetini artırabilir. Mikorizanın köklerde simbiyotik olarak yaşamaları sonucunda bitkide besin maddelerinin alımına olumlu etkisinin olması ve bunun sonucunda bitki verimi ve verim değerlerinin artmış olduğu köklerde mikoriza aktivitesi sonucunda daha iyi gelişiminin teşvik edebileceği sonucuna varıldı (Kardüz ve Öztekin, 2015). Mikoriza aşılaması ile aspir bitkisinin gövde uzunluğu, yaş ağırlığı, kuru ağırlığı gibi morfolojik özelliklerde de anlamlı artışlara neden olmuştur (Özbucak ve ark., 2020) Mikorizal aşılama bitkilerde tuz stresine karşı toleransını arttırmada yardımcı olmaktadır (Sharma ve Adholeya, 2004; Çimrin ve ark., 2020).

Mikoriza uygulamalarının aspir tohumlarının çimlenme oranı üzerindeki etkilerine bakılıp değerlendirildiğinde, mikorizasız (M1) uygulamada en düşük çimlenme oranı kaydedilmiştir. Mikoriza aşılaması ile bu oran anlamlı şekilde artmıştır. En yüksek çimlenme oranı orta doz mikoriza (M2) grubunda gözlemlenmiştir. Yüksek dozda (M4) çimlenme oranı bir miktar azalma eğilimi olduğu görülmektedir. Bu durum neticesinde mikoriza fungusunun toz formda olmasından kaynaklanıyor olabilir. Çalışmamızda mikoriza uygulaması, düşük ve orta düzey tuz (S2-S3) koşullarında ve düşük, orta (M2-M3) düzey mikoriza aşılamasının etkisi olarak çimlenmede ve fide gelişimini anlamlı düzeyde desteklemeler görülmektedir. Bu sonuçlar, Altunlu (2019) tarafından bildirilen bulgularla örtüşmektedir.

Farklı dozlarda uygulanan mikoriza mantarlarının aspir tohumlarının ortalama çimlenme süresi üzerindeki etkileri mikoriza uygulamasının çimlenme süresini uzattığı belirlenmiştir. En kısa çimlenme süresi kontrol (M1) grubunda olmuştur. Mikoriza uygulamasında ise çimlenme süresi en uzun değerine ulaşmıştır. Mikoriza uygulamalarının çimlenmeyi geciktirici etkisi olmuştur. Bu durum mikoriza sporlarının toz formda olmasından ve mantarın kök ile ortam neminden yararlanma kaynaklanabilir ve bu durum ortamın ozmotik baskı oluşmasına zemin hazırlamış olabilir. Nitekim önceki çalışmalarda da artan tuzluluk seviyelerinde fasulye ve benzeri türlerde tohum çimlenmesinin ozmotik baskı nedeniyle azaldığı ve çimlenme süresinin uzadığı bildirilmiştir (Esechie, 1994; Goertz ve Coons, 1989; Güvenç ve Kantar, 1996; Özdemir ve Engin, 1994; Kırtok ve., 1994; Kaya ve ark., 2005; Güldüren ve Elkoca, 2012).

Farklı mikoriza dozlarının aspir tohumlarının çimlenme hızı üzerindeki etkilerine bakıldığında çimlenme hızının mikorizasız grupta (M1) en yüksek olmuştur. Mikoriza dozları arttıkça bu hızda kademeli bir azalma gözlendiği belirlenmiştir. Bu durumun mikoriza uygulamalarının çimlenme sürecine başlangıçta gecikmeli bir etki yaratabileceğini, simbiyotik ilişkinin kurulmasının zaman aldığını göstermektedir. Her ne kadar çimlenme oranı ve gelişim parametreleri genel olarak mikoriza lehine olsada, çimlenme hızındaki bu düşüşün uygulama dozunun dikkatli olarak belirlenmesi gerektiğini ve erken dönemde fizyolojik dengenin mikoriza etkisiyle yeniden şekillendiğini ortaya koymaktadır. Mikoriza belirli tuz kuşlularında strese karşı tolerans göstermede etkisi olurken daha yüksek dozlarda etkisini kaybediyor ve çok yüksek tuz koşullarında etkisiz kalabiliyor (Çimrin ve ark., 2020).

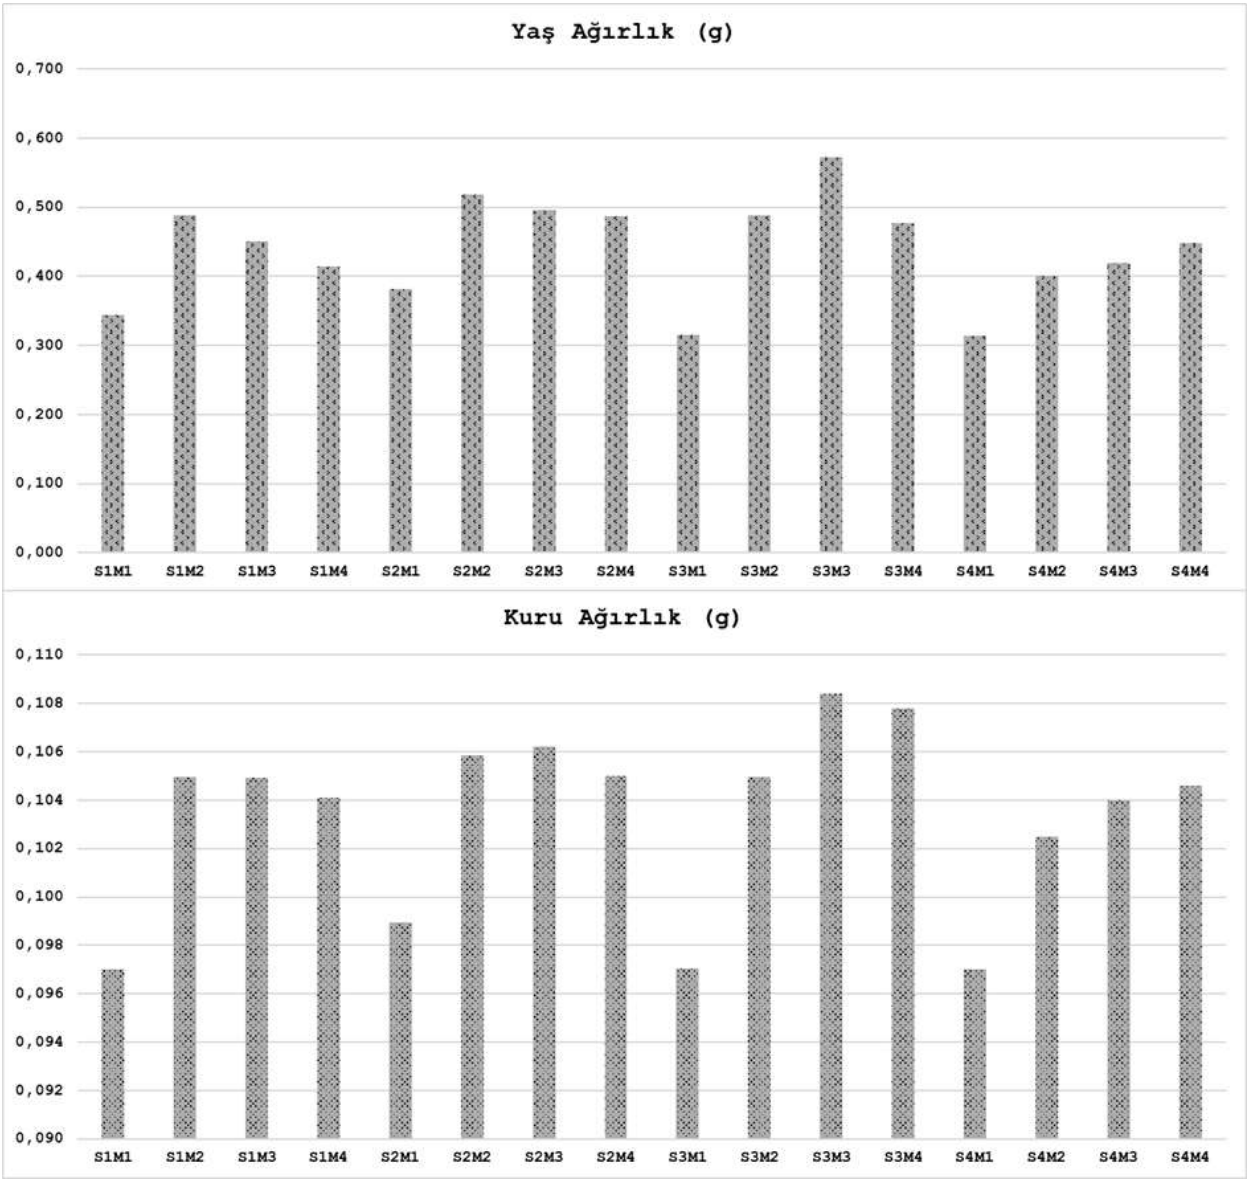


Şekil 1: Tuzluluk ve Mikoriza Uygulamalarının Etkisi

3.3. Tuzluluk ve Mikoriza Etkileşiminin Yaş ve Kuru Ağırlığa Etkisi

Yaptığımız çalışmada farklı tuzlu sulama suyu koşullarında mikoriza dozlarının aspir bitkisi fidelerinin yaş ağırlığı ile kök uzunluğu üzerindeki etkileri incelendi. Düşük tuzluluk koşulunda mikoriza dozu arttıkça bitkinin biyokütlesinde belirgin bir artış gözlenmiştir. S1M4 kombinasyonunda kontrol grubuna kıyasla anlamlı bir kazanım sağlanmış ve kök uzaması da desteklenmiştir. Orta tuzluluk seviyelerinde S2 ve S3'te orta doz (M3) mikoriza uygulamaları

her iki parametrede de en dengeli artışı sağlamıştır. Özellikle S3M3 kombinasyonunda kök gelişimi en etkili biçimde teşvik edilmiştir. Konulara tek tek bakılması durumunda kontrol (S1) grubu için distile su kullanılarak farklı dozlarda mikoriza aşılması aspir bitkisinde yaş ağırlığında doz artışına artış göstermektedir. (S2) grubunda ise S2 kontrolüne kıyasla anlamlı yaş ağırlık artışları gözlemlenmiştir. (S3) grubunda ise yine benzer sonuçlar görülmektedir. Mikoriza aşılamasının yaş ağırlığı orta düzey tuz koşulu altında da etkili olmaktadır. (S4) grubu ise yüksek tuzdan ötürü diğer çalışma gruplarına kıyasla daha az etkili olmuştur. Bu durumda bize açık bir şekilde yüksek tuzlulukta mikoriza aktivitesinde azalma meydana getirmektedir. Saf su koşullarında (S1) mikoriza dozu arttıkça kök sistemine gelişme görülmüştür. (S2) grubunda kök gelişimi mikoriza dozunun artışı ile artış göstermiş belirli bir seviyeden sonra ise doz miktarı fazla gelerek bir miktar azalma eğilimi göstermiştir. (S3) grubunda ise (S2) grubuna benzer bir tablo görülmektedir buna ek olarak yaptığımız çalışmada en iyi sonucu bu grupta elde edilmiştir. S3M3 grubu en uzun kök uzunluğu meydana gelmiştir. Bu durum da bize mikorizanın en iyi gelişim ve aktifliğini belirli tuz stresi altında verdiğini göstermektedir. (S4) grubunda tuz stresi mikoriza kolonizasyonuna fazla geldiği grafikte görülmektedir. Buna rağmen kontrol grubuna kıyasla daha iyi bir sonuç elde edilmiştir. Tuz stresi arttıkça mikoriza aktivitesi yavaşlamaktadır (Çimrin ve ark., 2020).



Şekil 2: Tuzluluk ve Mikoriza Etkileşiminin Yaş ve Kuru Ağırlığa Etkisi

4. SONUÇ VE ÖNERİLER

Yapmış olduğumuz çalışmada aspir (*Carthamus tinctorius L.)* tohumlarının çimlenme ve erken gelişim döneminde hem tuzluluk stresine hem de arbusküler mikoriza uygulamalarına verdiği tepkiler incelenmiştir. Artan sulama suyu tuzluluğunda yaş ve kuru ağırlık, kök uzunluğu, çimlenme oranı, ortalama çimlenme süresi ve çimlenme hızı gibi temel gelişim parametrelerinde belirgin azalmalar aspir bitkisinde süreçlerini olumsuz yönde etkilemiştir. Özellikle yüksek tuzluluk düzeyinde (8dS/m) daha anlamlı değişimler meydana getirmiştir. Çimlenmelerde ise gecikmeler meydana gelmiştir. Buna karşın, mikoriza uygulamaları özellikle düşük ve orta dozlarda çimlenme oranınında artış eğilimi göstermiştir. Gelişim

parametrelerinde ise anlamlı sayılabilecek iyileşmeler sağladığı gözlemlenmiştir. Ancak yüksek doz mikoriza uygulamasının bazı durumlarda çimlenme hızı ve süresi üzerinde olumsuz etkiler oluşturduğu gözlemlenmiştir.

Çalışmamızdaki verilere dayanarak 4 dS/m tuzluluk düzeyine sahip S3 uygulamasında orta düzeyde mikoriza aşılamasının (M3) ile en başarılı çimlenme ve erken gelişim sonuçları elde edilmiştir. Sonuç olarak, ise arbusküler mikoriza uygulamasının, tuz stresinin olumsuz etkilerini hafifletmede ve etkili bir biyolojik araç olarak görülüp uygulanabileceği ancak dozunun dikkatle belirlenerek verilmesi gerektiğini ortaya koymaktadır. Tuzlu koşullarda aspir üretiminin sürdürülebilirliği açısından mikoriza fungusunun doğal ve çevre dostu bir strateji olarak düşünüp değerlendirilebilir. Gelecekte yapılacak çalışmalarda ise farklı mikoriza türlerinin karşılaştırmalı etkileri ve uzun dönemli tarla koşullarındaki verim sonuçları da değerlendirilmelidir.

ABSTRACT

Microplastics, which are particles smaller than 5 mm formed through the degradation of larger plastic materials, can enter environmental systems and subsequently reach the soil, where they influence various properties including physical, chemical, and microbiological characteristics. One of the primary pathways through which microplastics are introduced into soil is the degradation of plastics used in agricultural practices. This study aimed to investigate the potential effects of microplastic residues derived from commonly used polypropylene (PP) ground covers and low-density polyethylene (PE) seedling bags on soil properties.

In the experiment, 5-liter pots were treated with microplastics of two types (PP and PE) at three different concentrations (1%, 2%, and 3%). Each treatment was replicated three times, and three control groups were included, resulting in a total of 21 pots arranged in a completely randomized design. Hot pepper (Capsicum annuum) was used as the test plant. Once the plants reached harvest maturity, both plant and soil analyses were conducted. The plant material was analyzed for total nitrogen (N) and available phosphorus (P), potassium (K), calcium (Ca), magnesium (Mg), iron (Fe), copper (Cu), zinc (Zn), and manganese (Mn). Additionally, soil samples taken from a depth of 0–30 cm were analyzed for bulk density, maximum water holding capacity, moisture content, pH, electrical conductivity, cation exchange capacity, organic matter, total N, and available nutrients. To assess the microbiological characteristics of the soil, dehydrogenase and alkaline phosphatase enzyme activities as well as total bacterial count were measured.

The results indicated that increasing microplastic concentrations led to reductions in soil bulk density for both PP and PE treatments. An increasing trend in maximum water holding capacity was observed in soils treated with PP, while the opposite trend was found for soils treated with PE. Alkaline phosphatase enzyme activity decreased in soils containing PE. Available phosphorus and iron levels increased in soils treated with both types of microplastics, while copper levels declined.

Keywords: Polypropylene (PP), Low-Density Polyethylene (PE), *Capsicum annuum*

MİKROPLASTİK KİRLİLİĞİNİN TOPRAĞIN FİZİKO-KİMYASAL VE MİKROBİYOLOJİK ÖZELLİKLERİ ÜZERİNE ETKİSİ

ÖZET

Plastik atıkların zaman içerisinde daha küçük parçalara ayrılmasıyla ortaya çıkan ve 5 mm'den küçük boyutlara sahip olan mikroplastikler, çevresel ortamlara yayılarak toprağa da ulaşmakta ve toprak sistemlerinin fiziksel, kimyasal ve mikrobiyolojik özelliklerini etkileyebilmektedir. Tarımda kullanılan plastiklerin bozunması, mikroplastiklerin topraklara geçişinde en belirgin nedenlerden biridir. Bu çalışma, tarımsal üretimde sıklıkla tercih edilen polipropilen (PP) taban örtüleri ile düşük yoğunluklu polietilen (PE) fidan torbalarının parçalanmasıyla ortaya çıkan mikroplastik kalıntılarının, toprak özellikleri üzerindeki potansiyel etkilerini incelemeyi amaçlamaktadır.

Araştırmada, 5 litrelik saksılara farklı tür ve dozlarda (PP ve PE olmak üzere %1, %2, %3 oranlarında) mikroplastikler eklenmiş, her uygulama üç tekerrürle birlikte değerlendirilmiş ve üç kontrol grubu da dahil edilerek toplamda 21 saksı kullanılmıştır. Denemeler tesadüf parselleri deneme desenine göre kurulmuş ve test bitkisi olarak sivri biber yetiştirilmiştir. Bitkiler hasat olgunluğuna ulaştığında toprak ve bitki analizleri gerçekleştirilmiştir. Bitki materyalinde toplam azot (N) ile birlikte alınabilir fosfor (P), potasyum (K), kalsiyum (Ca), magnezyum (Mg), demir (Fe), bakır (Cu), çinko (Zn) ve mangan (Mn) düzeyleri belirlenmiştir. Ayrıca 0–30 cm derinlikten alınan toprak örneklerinde hacim ağırlığı, maksimum su tutma kapasitesi, nem içeriği, pH, elektriksel iletkenlik, katyon değişim kapasitesi, organik madde, toplam N ve alınabilir besin elementleri analiz edilmiştir. Toprağın mikrobiyolojik özelliklerini değerlendirmek amacıyla ise dehidrogenaz ve alkalin fosfataz enzim aktiviteleri ile toplam bakteri sayısı ölçülmüştür.

Elde edilen bulgular, mikroplastik dozu arttıkça PP ve PE içeren topraklarda hacim ağırlığında azalmalar olduğunu göstermiştir. PP uygulamalarında maksimum su tutma kapasitesinde artış eğilimi gözlenirken, PE uygulamalarında bu değer azalma eğilimindedir. PE içeren topraklarda alkalin fosfataz enzim aktivitesinde düşüş saptanmıştır. Her iki mikroplastik türüyle işlem gören topraklarda alınabilir P ve Fe miktarlarında artış gözlemlenirken, Cu düzeylerinde azalma meydana gelmiştir.

Anahtar Kelimeler: Polipropilen, Düşük Yoğunluklu Polietilen, Mikroplastik, Toprak Özellikleri, Sivri Biber

1. GİRİŞ

1950'li yıllardan bu yana üretimi süren plastikler; ekonomik olmaları, dayanıklı yapıları, esneklikleri ve suya karşı yüksek dirençleri sayesinde günlük yaşamda yaygın bir şekilde kullanılmaktadır (Li-Huang vd., 2022). Plastik malzemeler yalnızca konfor, sağlık ve güvenlik gibi alanlarda avantaj sunmakla kalmayıp, küresel ölçekte çevresel etkiler yaratacak kadar yaygınlaşmıştır (Ya-Jiang vd., 2021). Kullanım süreci tamamlandıktan sonra bu plastikler, çeşitli yollarla çevreye karışarak potansiyel bir kirlilik unsuru hâline gelebilmektedir (Bruge-Dhamelincourt vd., 2020). Doğaya bırakılan büyük plastik parçalar; ultraviyole ışınları, fiziksel aşınma, hidroliz, erozyon ya da biyolojik süreçlerin etkisiyle zamanla 5 mm'nin altındaki boyutlara parçalanarak "mikroplastik" adı verilen küçük katı partikülleri oluşturmaktadır (Ya-Jiang vd., 2021). Mikroplastikler; lif, granül ya da kırıntı şeklinde karışık yapılarda olabilen, çeşitli plastik türlerini içeren ve çevresel anlamda yeni nesil kirleticiler arasında değerlendirilen maddelerdir (Guo-Huang vd., 2020).

Günümüzde yapılan araştırmalar, mikroplastiklerin yalnızca sucul ekosistemlerde değil; kutup bölgeleri, açık ve derin denizler, kıyı alanları gibi birçok farklı çevresel ortamda da yaygın şekilde bulunduğunu göstermektedir. Bununla birlikte, bu kirleticiler toprak ortamlarında da tespit edilmektedir (Ya-Jiang vd., 2021). (Horton-Walton vd., 2017) çalışmasına göre, mikroplastiklerin karasal ekosistemlerdeki birikimi, deniz ortamlarındakinden 4 ile 23 kat daha fazladır. Bu durum, toprakların da mikroplastik kirliliği açısından ciddi risk altında olduğunu ortaya koymaktadır. Toprakta mikroplastik birikimine neden olan kaynaklar arasında tarım faaliyetleri önemli bir yer tutmaktadır. Özellikle plastik malç filmleri, organik gübreler, kompost materyalleri ve plastik içeren sulama suları mikroplastiklerin tarım topraklarına geçişini kolaylaştırmaktadır (Tian-Jinjin vd., 2022); (Liu-Shao vd., 2021). Bu kaynaklar arasında en baskın olanı plastik malçlama uygulamalarıdır. Soğuk ve kurak iklim koşullarında ürün verimini artırmak ve uygun toprak sıcaklığını korumak amacıyla yaygın olarak kullanılan bu malzemeler, zamanla parçalanarak mikroplastiklere dönüşebilmektedir (Liu-Shao vd., 2021). Benzer şekilde, toprak verimliliğini artırmak için kullanılan kompostlar da mikroplastik kaynakları arasında yer almaktadır. Kompostlama sırasında oluşan yüksek sıcaklıklar ve mikrobiyal aktiviteler, büyük plastiklerin daha küçük parçalara ayrılmasını hızlandırarak toprakta mikroplastik birikimini artırmaktadır (Braun-Mail vd., 2020). Ayrıca, kanalizasyon kaynaklı atık suların sulamada kullanılması da toprağa ek mikroplastik yükü getirebilmektedir (Zhang-Xie vd., 2020). Bu yollarla toprağa giren mikroplastikler, zamanla toprak yapısında çeşitli değişikliklere yol açmaktadır. Fiziksel, kimyasal ve mikrobiyolojik toprak özelliklerinde meydana gelen bu değişimler, doğrudan ya da dolaylı olarak o toprakta yetişen bitkilerin büyüme ve gelişme süreçlerini de etkileyebilmektedir.

2. MATERYAL VE YÖNTEM

2.1. MATERYAL

Düşük yoğunluklu polietilen ve polipropilen plastikleri İzmir'de yer alan Gıda Çarşısı semtindeki tarım plastikleri satan bir dükkândan temin edilmiştir. Düşük yoğunluklu polietilen örneği için 22x35 cm'lik körüklü siyah fidan torbası satın alınmıştır. Polipropilen örneği için

eni 1,5 m olan siyah sera taban örtüsü alınmıştır. Alınan materyallerin saksı denemesinde kullanılacak miktarları toplamda yaklaşık 2'şer kg'dır. 27 Şubat 2024 tarihinde plastik materyaller Ege Üniversitesi Ziraat Fakültesi Dekanlığından temin edilen şerit kâğıt kesme makinesi ile küçük parçalar haline getirilmiştir.

Saksı denemesi şeklinde yürütülen denemede kullanılacak toprak örneği Ege Üniversitesi Ziraat Fakültesi arazisinden 38°27'08"N 27°13'31"E konumundan 1 Şubat 2024 tarihinde alınmıştır. Alınan toprak örneği kış mevsiminin etkisiyle nemli olduğu için yaklaşık 1 ay gibi süre zarfında plastik bir örtünün üzerine serilerek Toprak Bilimi ve Bitki Besleme Bölümü serasında bekletilip kurutulmaya bırakılmıştır. Kuruma işleminin ardından topraklar 8 mm'lik eleklerden geçirilip saksı denemesi kurmaya hazır hâle getirilmiştir. Deneme toprağının bazı fiziksel ve kimyasal özellikleri Çizelge 2.1'de verilmiştir.

Çizelge 2.1: Deneme toprağına ait bazı fiziksel ve kimyasal analizler.

pH	7,37	**Alınabilir (mg kg^{-1})**	**Fosfor (Olsen)**	11,60
EC (dS m^{-1})	1,41		**Potasyum**	405,00
$CaCO_3$ (%)	20,27		**Kalsiyum**	7850,00
Kum (%)	34,24		**Magnezyum**	455,10
Kil (%)	38,00		**Sodyum**	40,00
Mil (%)	27,76		**Mangan**	4,90
Bünye	Killi Tın		**Demir**	7,12
Organik Madde (%)	0,24		**Bakır**	1,80
Toplam N (%)	0,190		**Çinko**	4,10

Yukarıdaki çizelgeye göre deneme toprağı; pH durumuna bakıldığında nötr seviyeyi biraz geçmiş olmakla birlikte düşük alkali düzeyde ve orta derecede tuzluluk seviyesinde, kireçli, organik madde açısından oldukça fakir, N ve P bakımından orta, K bakımından iyi, Ca bakımından çok yüksek, Mg bakımından yüksek, Na bakımından düşük, Fe bakımından ideal, Mn açısından hafif düşük, Cu bakımından yeterli düzeyde ancak yüksek sınıra yakın ve Zn bakımından ise yeterli ve ideal düzeydedir.

2.2. YÖNTEM

Bu çalışma; Ege Üniversitesi Ziraat Fakültesi Toprak Bilimi ve Bitki Besleme Bölümü serasında, 3,5 ay süre zarfında saksı denemesinde sivri biber yetiştirilmesi ile yürütülmüştür. 5 kg kapasiteli bitki saksılarına, 4 kg deneme toprağı ve %1 [doz 1 (D1)], %2 [doz 2 (D2)] ve %3 [doz 3 (D3)] şeklinde 3 farklı doz ile plastik materyal homojen bir şekilde karıştırılarak koyulmuştur. Deneme dozları aşağıdaki çizelgede olduğu gibidir.

Çizelge 2.2: Saksı denemesi için plastik materyal uygulama dozları.

Uygulama Dozları:	%1 (D1)	%2 (D2)	%3 (D3)
1) Polipropilen (PP)	40 g PP	80 g PP	120 g PP
2) Düşük Yoğunluklu Polietilen (LDPE)	40 g PE	80 g PE	120 g PE
3) Tanık (Kontrol)			

Saksı denemesine 3 Mayıs 2024 tarihinde başlanmıştır (Şekil 2.2.1). Geniş bir kap içerisine 4000 g toprak tartılıp, polietilen ve polipropilen içerikli plastiklerden yukarıdaki çizelgede belirtilmiş olan dozlarda (%1, %2 ve %3) homojen bir şekilde karışım sağlanarak 5 kg kapasiteli saksılara koyulmuştur. Tanık (kontrol) gruplarına ise sadece 4000 g toprak tartılıp koyulmuştur. Saksılara koyulan toprak işleminin ardından, Ege Tarımsal Araştırma Enstitüsü Müdürlüğünün bu çalışma için hibe ettiği tatlı sivri biber fideleri tanık ve plastik içerikli saksılara ekilmiştir. 3 Mayıs 2024 tarihinde 600 mL su verilerek başlatılan saksı denemesi, iki günde bir 200 mL musluk suyu ve sulanmayan günlerde de Hoagland Çözeltisi verilmek koşulu ile 11 Haziran 2024 tarihine kadar sulamaya devam edilmiştir. Hava sıcaklıklarının artmasına bağlı olarak her gün 200 mL olacak şekilde 19 Ağustos'a kadar sulama işlemi sürdürülmüştür. 21 Ağustos 2024 tarihinde ise bitkiler hasat edilmiştir.

Bitkilerin hasat edileceği tarihte, bitkiler henüz saksılardan çıkarılmadan önce toprak hacim ağırlığı analizi gerçekleştirilmiştir. Silindir aparat ile alınan toprak örnekleri hava kurusu haline getirilerek kurutulmaya çalışılmıştır (Tüzüner, 1990).

2.2.1. Bitki Analiz Yöntemleri

Bitkiler saksılardan dikkatlice çıkartılıp köklerindeki topraklardan arındırılmak üzere yıkanmıştır. Bitkilerde yaş biyokütle ağırlığı tartılıp not edilmiştir. Ardından kökler ve gövdeler ayrı ayrı kese kağıtlarına koyularak 65ºC'de yaklaşık 48-72 saat süreyle kurutulduktan sonra değirmende öğütülüp toplam N miktarı modifiye makrokjeldahl yöntemine göre (Bremner, 1965); P, Na, K, Ca, Mg, Fe, Cu, Mn ve Zn miktarları ise modifiye (Zarcinas, Cartwright vd., 1987) yöntemine göre mikrodalga yakma cihazında yakılmasından sonra, örneklerin konsantre HCl ile muamelesi sonucunda elde edilen süzükte ICP-OES Cihazı ile okuması yapılarak belirlenmiştir.

2.2.2. Toprağın Bazı Fiziksel ve Kimyasal Analiz Yöntemleri

Toprak reaksiyonu (pH) analizi (Jackson, 1967), elektriksel geçirgenlik (Rayment ve Higginson, 1992), maksimum su tutma kapasitesi (Schlichting ve Blume, 1966), katyon değişim kapasitesi tayini (Jackson, 1967), organik madde miktarı (Black, 1965), toplam azot (N) analizi (Bremner, 1965), alınabilir fosfor (P) tayini (Olsen, Cole vd., 1954), alınabilir kalsiyum (Ca), magnezyum (Mg), sodyum (Na) ve potasyum (K) (Pratt, 1965) yöntemi ile belirlenirken, alınabilir demir (Fe), bakır (Cu), çinko (Zn) ve mangan (Mn) (Lindsay ve Norvell, 1978) yöntemi ile tespit edilmiştir.

2.2.3. Toprağın Bazı Mikrobiyolojik Analiz Yöntemleri

Nemli toprak örneklerinde toprak solunumu (CO_2) (Isermeyer, 1952), alkalin fosfotaz enzim aktivitesi analizi (Eivazi ve Tabatabai, 1977); (Tabatabai ve Bremner, 1969) yöntemi ile belirlenirken dehidrogenaz enzim aktivitesi analizi (Thalmann, 1968) yöntemi ile saptanmıştır. Toplam bakteri sayımı analizi ise dökme plak yöntemi ile petri kaplarında gerçekleştirilmiştir.

2.2.4. İstatistiksel Analizler

Çalışma sonucunda elde edilen bulguların, üç tekerrürün ortalaması olacak şekilde istatistik analizi yapılmıştır. Tüm veriler SPSS 30.0 (SPSS Inc., Chicago, IL, USA) programı kullanılarak One-Way ANOVA analizi ile gerçekleştirilip, ortalamalar arasındaki farklılıklar ise Duncan Çoklu Karşılaştırma Testi ile belirlenmiştir (P<0.05).

3. BULGULAR VE TARTIŞMA

3.1. Mikroplastik İçeriğinin Toprağın Bazı Fiziksel Özellikleri Üzerine Etkisi

Çalışmada polipropilen (PP) ve polietilen (PE) mikroplastik uygulamalarının toprağın hacim ağırlığı, maksimum su tutma kapasitesi ve nem içeriği üzerinde istatistiki anlamda ($p<0.05$) bir etkisi olduğu tespit edilmiştir (Çizelge 3.1). En düşük hacim ağırlığı değerleri PP-D2 ve PP-D3 uygulamalarında (0.95 gr/cm^3 ve 0.93 gr/cm^3), en yüksek hacim ağırlığı değerleri ise PE-D1 ve Kontrol uygulamalarında (1.19 gr/cm^3 ve 1.17 gr/cm^3) ortaya çıkmıştır. Mikroplastiklerin uygulama dozlarındaki artışa bağlı olarak toprağın hacim ağırlığı değerlerinde azalmalar kaydedilmiştir. Araştırma topraklarının hacim ağırlığı değerleri 0.93 g/cm^3 ile 1.19 g/cm^3 arasında değişiklik göstermiştir.

Çizelge 3.1: Farklı mikroplastik uygulamalarının toprağın bazı fiziksel özellikleri üzerine etkisi

Uygulamalar	Organik Madde (%)	pH	EC (dS/m)	Katyon Değişim Kapasitesi (me/100 g toprak)
Kontrol	0.65 *c*	7.58 *a**	1.716	33.94
PP-D1	1.26 *b*	7.54 *b**	1.744	33.23
PP-D2	2.18 *a*	7.54 *bc*	1.753	32.88
PP-D3	2.06 *a*	7.54 *ab*	1.691	33.94
PE-D1	0.58 *c*	7.56 *ab*	1.77	35
PE-D2	0.42 *c*	7.53 *c**	1.819	34.29
PE-D3	0.42 *c*	7.57 *ab*	1.723	33.94

(Aynı harfle gösterilen ortalamalar Duncan testine göre (α =0.05) birbirinden istatistiksel olarak farklı değildir.)

Çalışmamızda, toprakta mikroplastik uygulamalarının hacim ağırlığı üzerinde yarattığı değişiklikler, önceki araştırmalarla benzer sonuçlar göstermektedir. (Qi, Beriot vd., 2020) tarafından yapılan bir çalışmada, nişasta katkılı biyoplastikler ve düşük yoğunluklu polietilen (LDPE) gibi farklı plastik türlerinin toprak hacim ağırlığı üzerindeki etkileri incelenmiştir. Çalışmada, plastik içeriği arttıkça (%1, %2) toprak hacim ağırlığında belirgin bir azalma gözlemlenmiştir. Ayrıca, plastik türlerinin etkisi incelendiğinde, LDPE içeren toprakların nişasta katkılı biyoplastiklerden, makroplastik içeren toprakların ise mikroplastiklerden daha düşük hacim ağırlığına sahip olduğu bulunmuştur.

Mikroplastikler, toprak agregasyonunu ve stabilitesini etkileyerek daha gevşek bir yapı oluşmasına sebep olmuşlardır. Bu yapısal değişim, toprak gözeneklerinin artmasına neden olmuş ve bu durum hacim ağırlığının düşmesiyle sonuçlanmıştır. Ayrıca, mikroplastiklerin genellikle düşük yoğunlukta olması ve toprak içerisindeki yoğunluk dağılımını değiştirmesi, hacim ağırlığında gözlemlenen bu azalmanın bir başka temel nedenidir.

Kontrol grubu ile PP ve PE grupları karşılaştırılarak yapılan incelemede, Kontrol grubunun PP ve PE gruplarından daha düşük maksimum su tutma kapasitesine sahip olduğu bulunmuştur (Çizelge 3.1). Ancak PP grupları artan doza bağlı olarak maksimum su tutma kapasitesinde artış gösterirken, PE grupları artan dozun etkisiyle azalış göstermişlerdir. PP grubu içerisinde en düşük maksimum su tutma kapasitesi PP-D1 grubundadır (%68,27). En yüksek ise PP-D3 grubunda (%71,33) bulunmuştur. PE grubunda en düşük değer PE-D3 grubunda (%67,90) iken en yüksek değer PE-D1 grubunda (%71,47) tespit edilmiştir. Artan mikroplastik konsantrasyonuna bağlı olarak azalan hacim ağırlık, daha gevşek bir toprak yapısı oluşturmaktadır. Bu sebeple PE mikroplastik uygulamaları, maksimum su tutma kapasitesi üzerinde de azaltıcı bir etki göstermiştir. Ayrıca PE mikroplastiğinin kesim işlemi sonrasında, PP mikroplastiğinden nispeten daha büyük parçalardan oluşması, mevcut toprak agregatlarını daha fazla bir araya getirerek topraktaki mikropor saysını azaltıp, yüzey alanını düşürdüğü için maksimum su tutma kapasitesi üzerinde de azaltıcı bir etkiye sebep olmuştur. PP mikroplastik uygulamaları ise toprak parçacıkları arasında fiziksel bir boşluk oluşturarak daha gevşek bir yapı sağlayabilir. Bu gevşek yapı, suyun depolanmasını kolaylaştırabilir. Bu sebeple PP mikroplastik uygulamalarında toprak maksimum su tutma kapasitesinde artış gözlenmiştir. (Lozano, Lehnert vd., 2021) yaptıkları bir çalışmada, mikroplastiklerin şekline bağlı olarak toprak su tutma kapasitesinde değişiklikler gözlemlenmiştir. Çalışmada, özellikle lif formundaki mikroplastiklerin, toprağın su tutma kapasitesini artırdığı ve bu etkinin, mikroplastiklerin şekli ve boyutuna göre değişebileceği vurgulanmıştır. Lif şeklindeki mikroplastikler, toprağın gözenek yapısını gevşeterek, suyun toprakta daha uzun süre tutulmasını sağlayabilir. Benzer şekilde, PP mikroplastiklerinin lifsi formda, toprak üzerindeki etkisi, toprağın su tutma kapasitesinin artmasına neden olmuş olabilir. Bu durum, mikroplastiklerin fiziksel özellikleri içerisinde yer alan şekil yapılarının, toprağın su tutma kapasitesi üzerinde önemli bir etkiye sahip olduğunu göstermektedir. Dolayısıyla, bu çalışmada gözlemlenen su tutma kapasitesindeki artış, PP mikroplastiklerin lifsi yapısının toprağın su yönetimi üzerinde sağladığı faydalı etkilerle açıklanabilir.

Kontrol grubunun nem içeriğinin, PP ve PE mikroplastik uygulamaları ile yapılan karşılaştırılmasında, Kontrol grubunun her iki mikroplastik uygulamalarına göre daha yüksek olduğu bulunmuştur (%23,76). PE mikroplastiklerinin uygulandığı topraklarda, doz artışına

paralel olarak nem içeriğinde belirgin bir azalma gözlemlenmiştir. Buna karşılık, PP mikroplastiklerinin kullanıldığı gruplarda doz artışına rağmen nem içeriğinde belirgin ve düzenli bir değişim eğilimi saptanamamıştır. Ancak her iki mikroplastik uygulamaları da Kontrol grubu ile kıyaslandığında daha düşük nem içeriği değeri göstermiştir. Özellikle PE mikroplastik uygulamalarının toprağın nem içeriğini azaltma mekanizması, toprağın maksimum su tutma kapasitesini düşürmesi ile yakından ilgilidir. Bu mikroplastikler, toprak agregatlarının parçalanmasına ve gözenekli yapının bozulmasına neden olarak toprakta sıkışmayı artırmakta toprakta suyun tutulmasını sağlayamayarak ayrıca suyun toprağa sızmasını engelleyip yüzeyde biriktirmesiyle birlikte suyun daha çabuk buharlaşmasını tetiklemiş olabilirler. Bu nedenle toprak nem içeriği artan PE mikroplastik uygulamalarında azalma eğilimindedir.

3.2. Mikroplastik İçeriğinin Toprağın Bazı Kimyasal Özellikleri Üzerine Etkisi

Bu çalışmada, polipropilen (PP) ve polietilen (PE) mikroplastik uygulamalarının, toprağın organik madde içeriği ile pH değeri üzerinde istatistiksel olarak anlamlı bir etkiye sahip olduğu belirlenmiştir ($p<0.05$). Buna karşın, elektriksel iletkenlik (EC) ve katyon değişim kapasitesi (KDK) parametrelerinde anlamlı bir farklılık tespit edilmemiştir (Çizelge 3.2).

Çizelge 3.2: Farklı mikroplastik uygulamalarının toprağın bazı kimyasal özellikleri üzerine etkisi

Uygulamalar	Organik Madde (%)	pH	EC (dS/m)	Katyon Değişim Kapasitesi (me/100 g toprak)
Kontrol	0.65 *c*	7.58 *a**	1.716	33.94
PP-D1	1.26 *b*	7.54 *b**	1.744	33.23
PP-D2	2.18 *a*	7.54 *bc*	1.753	32.88
PP-D3	2.06 *a*	7.54 *ab*	1.691	33.94
PE-D1	0.58 *c*	7.56 *ab*	1.77	35
PE-D2	0.42 *c*	7.53 *c**	1.819	34.29
PE-D3	0.42 *c*	7.57 *ab*	1.723	33.94

(Aynı harfle gösterilen ortalamalar Duncan testine göre (α =0.05) birbirinden istatistiksel olarak farklı değildir.)

PP mikroplastiklerinin artan dozları, toprak organik maddesi üzerinde belirgin bir artış eğilimi yaratmıştır. Özellikle PP-D2 uygulamasında (%2.18) en yüksek değer gözlenmiş, bu da PP'nin mikrobiyal aktiviteyi uyararak organik madde birikimini teşvik edebileceğini düşündürmektedir. Bu artışın temelinde, PP mikroplastiklerinin yüzey özelliklerinin mikrobiyal kolonizasyonu teşvik etmesi yatmaktadır. (Chen, Wang vd., 2022) tarafından sera tarımı yapılan topraklarda yürütülen bir çalışmada, PP de dâhil olmak üzere çeşitli mikroplastik

türlerinin yüzeylerinde mikrobiyal biyofilm oluşumunun gerçekleştiği gösterilmiştir. PP'nin hidrofobik ve pürüzlü yüzey yapısı, mikroorganizmalar için uygun mikro-nişler sağlayarak biyofilm gelişimini teşvik etmektedir. Bu biyofilmler içerisinde üretilen ekstraselüler polimerik maddeler (EPS), özellikle polisakkarit ve protein gibi karbon bakımından zengin bileşenler içermektedir. Toprakta bu tür biyolojik kökenli karbon bileşiklerinin birikmesi, organik madde düzeyinin yükselmesine yardımcı olabilmektedir. Ayrıca çalışmada, biyofilm topluluklarının çoğunlukla aerobik kemootrof bakterilerden oluştuğu ve bu bakterilerin karbon döngüsünde aktif rol oynadığı vurgulanmıştır. Bu bulgular, PP mikroplastiklerinin mikrobiyal kaynaklı karbon akışlarını artırarak toprak organik madde birikimini dolaylı olarak desteklediğini göstermektedir. Öte yandan PE uygulamalarında, özellikle PE-D2 ve PE-D3 gruplarında (%0.42), organik madde düzeyleri anlamlı şekilde azalmıştır. Bu durum, LDPE'nin toprakta mikrobiyal aktiviteyi baskılaması ve enzimatik süreçlerle ilişkili olması ile açıklanabilir. PE mikroplastikler, toprak mikrobiyal topluluklarının yapısını ve işlevini değiştirerek toprak organik maddesinin ayrışma oranlarını etkileyebilir. Bu etki, toprak organik karbonunun azalmasına yol açabilir. PE mikroplastiklerin toprağın bazı mikrobiyolojik analizleri üzerindeki etkileri de incelendiğinde, Çizelge 3.3'te yer alan enzim analiz sonuçları, mikrobiyal aktiviteyi baskılamasıyla gelişen toprak organik madde içeriğinin azaldığını gösterir niteliktedir. (Liu, Wen vd., 2023) tarafından yapılan bir çalışmada, PE mikroplastiklerinin toprak agregat yapısını bozarak toprak porozitesini azalttığı ve bu durumun su ve hava hareketini kısıtlayarak mikrobiyal habitatları olumsuz etkilediği belirtilmiştir. Bu fiziksel değişiklikler, mikrobiyal çeşitliliğin azalmasına ve dolayısıyla toprak organik madde birikiminin sınırlanmasına yol açmaktadır.

Bu çalışmada, PP ve PE mikroplastik uygulamalarının toprak pH'ı üzerinde istatistiksel olarak anlamlı fakat biyolojik olarak sınırlı etkiler gösterdiği tespit edilmiştir. PP uygulamalarında pH değerleri dozdan bağımsız olarak 7.54 düzeyinde sabit kalırken, PE uygulamalarında pH değeri PE-D2 dozunda en düşük (7.53), PE-D3 dozunda ise kontrol seviyesine yakın (7.57) ölçülmüştür. PP mikroplastiklerinin pH üzerinde sabit ve sınırlı bir etki göstermesi, bu polimerin hidrofobik ve kimyasal olarak daha inert yapısına bağlanabilir. Ayrıca (Chen, Wang vd., 2022) PP yüzeylerinin mikrobiyal kolonizasyonu destekleyerek biyofilm oluşumunu teşvik ettiğini ancak bu biyofilm süreçlerinin toprak pH'ını anlamlı ölçüde değiştirecek düzeyde asidik ürün oluşturmadığını belirtmiştir. Bununla birlikte PE mikroplastik uygulamalarının artan dozuna bağlı olarak, toprak pH değeri üzerinde kararlı ve net bir değişim gözlenmemiştir.

EC ve katyon değişim kapasitesi değerleri ise istatistiksel açıdan anlamlı bulunmamıştır. EC değerleri artan mikroplastik konsantrasyonuna bağlı olarak istikrarlı bir şekilde artma veya azalma göstermemiştir. PE ve PP mikroplastiklerinin toprak katyon değişim kapasitesi (KDK) üzerindeki etkileri değerlendirildiğinde ise, her iki mikroplastik türünün de KDK değerlerinde belirgin bir artış ya da azalma oluşturmadığı, ancak dozlara bağlı küçük dalgalanmalara neden olduğu görülmüştür. Özellikle PE uygulamalarında düşük dozda KDK'nın arttığı (PE-D1: 35), ancak artan dozlarla birlikte bu etkinin azaldığı ve kontrol seviyesine yaklaştığı (PE-D2: 33.36, PE-D3: 34.38) belirlenmiştir. Bu durum, PE mikroplastiklerinin toprak fiziksel yapısına olan etkisiyle açıklanabilir. (Wang, Li vd., 2023) tarafından yapılan bir çalışmada, PE mikroplastiklerinin düşük dozlarda (0.5%) toprak gözenekliliğini artırdığı ve bu sayede toprak içindeki yüzey alanının genişlediği gözlemlenmiştir. Bu artan yüzey alanı, katyonların daha

fazla tutunmasına imkân sağlayarak toprak yapısında iyileşme ve geçici bir katyon değişim kapasitesi (KDK) artışı meydana getirebilmektedir.

3.3. Mikroplastik İçeriğinin Toprağın Bazı Mikrobiyolojik Özellikleri Üzerine Etkisi

Çalışmada polipropilen (PP) ve polietilen (PE) mikroplastik uygulamalarının toprak solunumu (CO_2), dehidrogenaz enzim aktivitesi, alkalin fosfataz enzim aktivitesi analiz sonuçları istatistiksel anlamda ($p<0.05$) anlamlı bulunmuştur. Ancak bakteri sayımı analizi istatistiksel olarak anlamlı bulunmasa dahi Kontrol grubu ile kıyaslandığında daha düşük değerlerde olduğu saptanmıştır (Çizelge 3.3).

Çizelge 3.3: Farklı mikroplastik uygulamalarının toprağın bazı mikrobiyolojik özellikleri üzerine etkisi

Uygulamalar	Toprak Solunumu (CO_2) (%)	Dehidrogenaz Enzim Aktivitesi (µg TPF/g kuru toprak)	Alkalin Fosfataz Enzim Aktivitesi (µg pNP/ gr KM/h)	Bakteri Sayımı (%)
Kontrol	23.63 *bc*	48.69 *a*	430.87 *ab*	$136.92*10^6$
PP-D1	23.34 *bc*	41.4 *b**	424.43 *ab*	$13.41*10^6$
PP-D2	22.34 *c*	46.13 *ab**	417.07 *ab*	$6.26*10^6$
PP-D3	22.43 *c*	42.57 *ab*	433.36 *a**	$12.75*10^6$
PE-D1	25.18 *a*	43.41 *ab*	419.88 *ab*	$11.07*10^6$
PE-D2	23.49 *bc*	44.52 *ab*	414.99 *ab**	$15.73*10^6$
PE-D3	24.57 *ab*	43.8 *ab*	397.56 *b*	$25.74*10^6$

(Aynı harfle gösterilen ortalamalar Duncan testine göre (α =0.05) birbirinden istatistiksel olarak farklı değildir.)

Toprak solunumu, mikroorganizmaların organik maddeleri parçalarken ortama saldığı karbondioksit (CO_2) miktarının belirlenmesini sağlayan bir göstergedir. Dolayısıyla, mikrobiyal aktivitenin en genel göstergelerindendir. Toprak solunumu analizi, PP uygulamalarında Kontrol grubuna göre nispeten azalış göstermiştir. Bu durum PP mikroplastiklerinin; mikrobiyal hücre zarında por yapısını tıkayarak aerasyonu bozduğu ve PP mikroplastiğinin yapısında bulunan toksik katkı maddeleri nedeniyle mikroorganizmaların

çoğalmasını engellediği düşünülebilir. (de Souza, Lau vd., 2018) toprakta, oksijenin mikropor boşluklara girememesi ve anaerobik koşullara kayması sebebiyle PP mikroplastik uygulamalarındaki toprak solunumu üzerindeki düşüşün nedenini belirtmişlerdir. (Lozano, Lehnert vd., 2021) yaptıkları bir çalışmada da, PP mikroplastik parçacıklarının toprak mikrobiyal aktivitesini %20 oranında azalttığını rapor etmişlerdir. PE uygulamalarında ise düşük dozda Kontrol grubundan da fazla seviyede, anlamlı bir yükseliş bulunmuştur. Artan konsantrasyona bağlı olarak toprak solunumu değerlerinde dalgalanma söz konusu olmuştur. Bu durum PE mikroplastiklerinin düşük dozlarda, gözenekli yapısı sayesinde toprakta havalanmayı artırmasıyla açıklanabilir. (Lozano, Lehnert vd., 2021) aynı çalışmada PE mikroplastiklerinin özellikle film şeklinde uygulandığında, toprakta hava boşluğu ve poroziteyi artırıp düşük dozlarda suyun daha iyi dağılımı ve gaz değişimini destekleyen fiziksel bir bir yapı oluşturduğunu, bu durumun mikrobiyal etkinliği destekleyerek toprak solunumunu artırabileceğini ortaya koymuşlardır.

Dehidrogenazlar, mikroorganizmaların organik maddeyi oksitlemesinde görev alan temel enzimlerdir ve toprak canlılığına dair en hassas göstergelerden biridir. Dehidrogenaz enzim aktivitesi analizinde PP-D1'de %15'e yakın düşüş bulunmuştur (PP-D1, 41,4). Bu durum PP'nin mikrobiyal metabolizma enzimlerini doğrudan baskıladığını gösterebilir. PP mikroplastiklerinin parçacık boyutu, toprak mikrobiyal aktivitesi üzerinde önemli bir etkiye sahiptir. Küçük boyutlu PP parçacıkları, toprak mikrobiyal topluluklarını daha fazla etkileyerek enzim aktivitelerinde daha belirgin azalmaya neden olabilir. Bu durum, küçük parçacıkların toprak mikroorganizmalarıyla daha fazla etkileşime girmesi ve potansiyel olarak toksik etkiler göstermesiyle açıklanabilir (Zhao, Lozano vd., 2021). PP-D2'de ise kısmi bir artış gelişmiştir. Bu durum, mikroorganizmaların biyofilm oluşturmuş olabilmeleri ve bu şekilde ortama uyum sağlamaya başladığını gösterebilir. PE mikroplastik uygulamaları ise, toprak dehidrogenaz enzim aktivitesi üzerinde Kontrol grubuna göre stabil olmayan bir düşüş gösterdiği görülmüştür. Mikroplastiklerin toprak ekosistemlerine dahil olması, mikrobiyal hücre zarlarında fiziksel hasara ve hücre içi redoks dengesinde bozulmalara neden olarak oksidatif stres oluşturabilmektedir. Bu durum, hücresel solunum süreçlerinde görev alan dehidrogenaz enzimlerinin NADH/NAD^+ redoks döngüsünü olumsuz yönde etkileyerek enzim aktivitesinde azalmaya yol açmaktadır (de Souza, Lau vd., 2019). Bu durum, çalışmada kullanılan PP ve PE mikroplastik uygulamalarının dehidrogenaz enzim aktivitesi üzerinde gözlemlenen azalmanın olası etkilerini açıklamaktadır.

Alkalin fosfataz aktivitesine ilişkin olarak, yapılan çalışmada PP uygulamalarında özellikle PP-D3 uygulamasında artan alkalin fosfataz enzim aktivitesi, toprakta PP'den kaynaklanan fosfor kullanımının azalmasına bağlı olarak mikroorganizmalar tarafından artmış olabilir. Fosfor eksikliğini hisseden mikroorganizmalar bu enzimi daha fazla salgılamış olabilirler. PE uygulamaları ile karşılaştırıldığında, Kontrol grubunda daha yüksek düzeyde alkalin fosfataz enzim aktivitesi tespit edilmiş; mikroplastik maruziyetinin ise bu enzim aktivitesinde azalmaya yol açtığı belirlenmiştir. Bu durum, mikroplastiklerin alkalin fosfataz enzimi üzerinde inhibitör bir etkisi olduğunu göstermektedir. (Shah, Ali vd., 2023) yaptıkları bir çalışmada da kontrol grubuna göre PE uygulamasında daha düşük alkalin fosfataz enzim aktivitesi değeri bulmuşlardır. PE mikroplastiklerin toprakta mikrobiyal topluluk yapısını değiştirmesi ve nem

içeriği gibi çevresel faktörlerin bu enzimi baskın şekilde etkilemesi, alkalin fosfataz enzim aktivitesindeki azalmanın olası nedenleri arasında yer almaktadır.

Yapılan bu çalışmada PP ve PE mikroplastiklerinin bakteri sayısı üzerindeki etkilerine bakıldığında, her iki mikroplastik uygulamasının Kontrol grubundan daha az bakteri sayısına sahip olduğunu göstermektedir. Bu durum, PP ve PE mikroplastiklerinin toprak mikroorganizmaları üzerinde baskılayıcı bir etkisi olduğunu düşündürmektedir.

3.4. Mikroplastik İçeriğinin Toprağın Bazı Makro ve Mikro Besin Elementleri Üzerine Etkisi

Çalışma kapsamında toprağa uygulanan PP ve PE mikroplastik uygulamalarının, toprak besin elementleri üzerinde de çeşitli etkiler gösterdiği bulunmuştur. Aşağıda yer alan Çizelge 3.4'te toprak makro ve mikro besin elementlerinin mikroplastik varlığında değişen değerleri yer almaktadır. Çizelge 3.4'te potasyum (K) ve azot (N) düzeyleri, PP ve PE uygulamalarında kontrol grubuna göre anlamlı bir değişiklik göstermemiş ve istatistiksel açıdan da anlamlı bir sonuç vermemiştir. Bu durum, mikroplastiklerin toprakta K ve N hareketliliği üzerinde belirgin bir etkisi olmadığını gösterebilir. Toprak sodyum (Na) değerinin PP mikroplastik uygulaması sonucunda Kontrol grubuna göre düşük bir miktar arttığı görülürken, PE mikroplastik uygulaması sonucunda artan doza bağlı olarak azaldığı bulunmuştur. Bu durum PP mikroplastiğinin toprakta Na çözünürlüğünü artırmış olabileceğinin düşündürmektedir. Toprak kalsiyum (Ca) değerleri PP ve PE mikroplastik uygulamaları sonucunda istatistiksel olarak anlamlı çıksa dahi, belirgin bir yükseliş ya da düşüş göstermemiştir. Ancak toprak magnezyum (Mg) değeri PP ve PE mikroplastik uygulamalarında istatistiksel açıdan anlamlı sonuç bulunmuştur. Kontrol grubu ile kıyaslandığında ise en yüksek dozun PP-D3 (454,4 a*) grubunda olduğu ve artan mikroplastik dozuna bağlı olarak toprak Mg değerinin arttığı tespit edilmiştir. Bu durum bazı mikroplastiklerin toprakta Mg çözünürlüğünü artırabileceğini göstermektedir. PP mikroplastiklerinin toprak porozitesini artırması, toprakta su ve hava hareketliliğini iyileştirerek Mg^{2+} gibi katyonların daha serbest hareket etmesine ve bitki kökleri tarafından daha kolay alınmasına olanak tanıyabilir. Ayrıca, artan porozite toprak mikrobiyal aktivitesini de etkileyebilir, bu da besin elementlerinin mineralizasyonunu ve bitki tarafından kullanılabilirliğini artırabilir (de Souza, Lau vd., 2019). PE mikroplastik uygulamalarında ise artan doza bağlı olarak azalan Mg değerleri bulunmuştur. Bu durum PE mikroplastiklerinin toprakta Mg^{2+} gibi katyonların adsorpsiyonunu etkileyerek toprak çözeltisindeki serbest Mg miktarını azaltabileceğini göstermektedir. (Li, He vd., 2024) yaptıkları çalışmada PE mikroplastiklerinin toprakta katyon değişim kapasitesini (KDK) etkileyebileceğini ve bu durumun toprakta bulunan katyonların (Mg^{2+} vb.) toprak çözeltisindeki serbest miktarını azaltabileceğini belirtmişlerdir. PP ve PE mikroplastik uygulamalarının toprak fosforu (P) üzerindeki etkisi, artan mikroplastik dozuna bağlı olarak yükseliş gösterdiği bulunmuştur. Mikroplastiklerin yüzeyleri, mikroorganizmalar için bir taşıyıcı ve kolonizasyon yüzeyi oluşturabilir. Bu durum, fosfor döngüsüne katılan enzimatik faaliyetlerin artmasına sebep olarak toprakta organik fosforun çözünmesi hızlanabilir. PP ve PE mikroplastik uygulamalarının artan dozuna bağlı olarak topraktaki demir (Fe) değerlerinde artış gözlenirken, topraktaki bakır (Cu) değerlerinde düşüş tespit edilip, bu değerler istatistiksel açıdan önemli

bulunmamıştır. Cu değerindeki düşüşün nedeni, PP ve PE mikroplastiklerinin yüksek yüzey alanına sahip olmalarından kaynaklı olarak toprak çözeltisindeki Cu^{2+} iyonlarını adsorbe edebileceği ile ilgili olabilir. Bu durumda Cu iyonları mikroplastik yüzeyine bağlanarak toprak çözeltisinden uzaklaşmış olabilmektedir (Han, Wang vd., 2021).

Çizelge 3.4: Farklı mikroplastik uygulamalarının toprağın bazı makro ve mikro elementleri üzerine etkisi

(Aynı harfle gösterilen ortalamalar Duncan testine göre (α =0.05) birbirinden istatistiksel olarak farklı değildir.)

4. SONUÇ

Bu çalışmada kullanılan polipropilen (PP) ve polietilen (PE) mikroplastiklerin, toprak sağlığını çok yönlü olarak etkilediği belirlenmiştir. Mikroplastik uygulamaları; fiziksel özelliklerde yapısal bütünlüğün bozulmasına, kimyasal özelliklerde ise besin elementlerinin dengesinin bozulmasına yol açmaktadır. Ayrıca, mikrobiyolojik aktivitelerde azalmaya neden olarak toprak biyotasının işlevselliğini zayıflatmaktadır. Bu olumsuz etkiler, özellikle uzun süreli birikim durumunda, toprak verimliliğini azaltabilir ve bitki gelişimini sekteye uğratabilir. PP, bazı mikrobiyal parametrelerde daha az yıkıcı etki gösterirken, yapısal olarak toprağa karışması daha yavaş gerçekleştiğinden uzun vadeli etkileri olabilir. PE, daha esnek ve yaygın bir plastik türü olması nedeniyle fiziksel yapı ve mikrobiyolojik aktivite üzerinde daha belirgin baskılayıcı etkilere sahiptir. Bu sonuçlar, mikroplastiklerin sadece fiziksel ve kimyasal toprak özelliklerini değil, aynı zamanda toprak biyolojik sağlığını da doğrudan etkilediğini göstermektedir. Özellikle enzim aktiviteleri ve mikrobiyal canlılık üzerine olumsuz etkiler, toprağın ekosistem hizmetleri (besin döngüsü, organik madde ayrışması vb.) üzerinde risk oluşturabileceğini ortaya koymaktadır. Bu çalışma, mikroplastiklerin karasal ortamlardaki ekosistem işlevlerini zayıflattığını ve sürdürülebilir tarım için ciddi bir tehdit oluşturduğunu göstermektedir. Mikroplastiklerin toprak sağlığı üzerindeki etkileri yalnızca bir kirlilik sorunu değil, aynı zamanda bir toprak işlevselliği krizi olarak ele alınmalıdır. Gelecek çalışmaların, farklı toprak

tipleri ve uzun vadeli etkiler göz önüne alınarak yürütülmesi, mikroplastiklerin toprak sağlığı üzerindeki etkilerini daha derinlemesine anlamamıza katkı sağlayacaktır.

TEŞEKKÜR

30765 No'lu bu projenin yürütülmesinde maddi olarak destek sağlayan Ege Üniversitesi Bilimsel Araştırma Projeleri Komisyonu'na teşekkür ederiz. Ayrıca, çalışmada kullanılan sivri biber (*Capsicum annuum*) materyalini temin eden Ege Tarımsal Araştırma Enstitüsü Müdürlüğü'ne katkılarından dolayı teşekkür ederiz.

ABSTRACT

The present study analyzed the structure of onion production in Nigeria's Kano State using pseudo-profit function, symmetric normalized quadratic profit function (translog) and constant elasticity of substitution. Using a multi-stage sampling technique to select a representative sample size of 132 respondents, a well-structured questionnaire complemented with an interview schedule was used to elicit cross-sectional data. Besides, both descriptive and inferential statistics were used to achieve the specified objectives. Empirically, onion is a viable enterprise in the study area and input substitution at various combination levels has complimentary effect. Furthermore, change in quantity supply of onion is in conformity with the a priori expectation; change in output supply is in conformity with a priori expectation with respect to inputs' cost- only seeds, NPK fertilizer and petrol-engine oil exerted significant influence. Nevertheless, profit in onion production was influenced by output price, wage rate, NPK fertilizer and petrol-engine oil. However, ten challenges hovered around onion production viz., poor market information, problem of climate change, poor public-private investment, problem of land tenure system etc. Therefore, for output supply enhancement, onus lies on the policymakers to devise a realistic approach that will contain poor pricing efficiency of input prices in the study area.

Keywords: Structure, Supply, Demand, Smallholder, Onion, Nigeria

INTRODUCTION

Onions (*Allium cepa*) are a vital component of Nigeria's agricultural landscape, particularly in Kano State, where small-scale production plays a crucial role in both local consumption and regional economic activity. The production of onions in Kano State contributes significantly to the livelihoods of many rural households and serves as a source of income generation and food security. Despite its importance, the small-scale onion production sector in Kano State faces numerous challenges that impact its productivity and profitability. Key among these challenges are the dynamics of output supply and input demand elasticities, which determine how responsive production levels are to changes in input prices and how input demands fluctuate with changes in output prices (Beckman *et al*., 2022; Vink*et al*.,2022).

Understanding the elasticities of output supply and input demand is essential for designing effective agricultural policies (Camara and Savard, 2023), improving resource allocation (Sadiq *et al*., 2024a), and enhancing overall productivity in the onion farming sector. These elasticities provide insights into the efficiency of resource use, the sensitivity of production decisions to market conditions, and the potential impacts of policy interventions (Nainggolan*et al*., 2022; Wijetunga, 2016). While studies on agricultural production elasticities abound globally, there is a notable gap in empirical research specific to small-scale onion production in Kano State, Nigeria. Existing literature often overlooks the unique socio-economic and environmental factors that characterize onion farming in this region, making it imperative to conduct localized research that addresses these specificities.

This study aims to fill this gap by empirically investigating the output supply elasticity and input demand elasticity of small-scale onion production in Kano State. By employing rigorous econometric methods and leveraging primary data collected through surveys, the research seeks to quantify the responsiveness of onion output to variations in production inputs such as labor, land, seeds, and fertilizer. Additionally, it aims to analyze how input demands respond to changes in input prices and other economic factors within the local context. The findings of this study are expected to provide valuable insights for policymakers, agricultural extension services, and stakeholders involved in the onion production value chain in Kano State. By shedding light on the elasticities governing small-scale onion production, this research aims to inform evidence-based strategies that can promote sustainable agricultural development, enhance farmer livelihoods, and contribute to food security in the region. In summary, this study addresses a critical knowledge gap and aims to offer practical implications for enhancing the efficiency and resilience of small-scale onion production in Nigeria's Kano State. Succinctly, the broad objective was to analyse output supply and inputs demand elasticities of small-scale onion production in Nigeria's Kano State. The specific objectives were to: estimate the costs and return(s) to small-scale onion production; determine the inputs substitution in small-scale onion production; determine the output supply and inputs demand elasticities of small-scale onion production; and determine the challenges affecting small-scale onion production in the study area.

LITERATURE REVIEW

Empirical Review

Empirical evidence highlights the responsiveness of small-scale farmers to changes in input prices and market dynamics, offering insights into productivity and resource allocation. For example, Hayati *et al*.(2024) explored input production elasticity among smallholder maize farmers in East Java, demonstrating that farmers adjust input use to optimize output and efficiency. This study underscores the broader relevance of elasticity analysis in agricultural contexts, including onion farming in Nigeria's Kano State, to enhance policy and economic interventions. Deribe *et al*.(2022) evaluated technical efficiency in irrigated onion production in Ethiopia's Central Rift Valley. Input elasticities were found to be inelastic, highlighting a need for better technological interventions.

Mgale (2020) explored price elasticity in Tanzanian onion markets, emphasizing the relationship between producer and market price transmission. Findings suggested significant inefficiencies in value chain integration. Omotesho *et al*.(2020) studied economic viability in onion production in Benin, reporting farm size had the highest output elasticity, underlining its importance in achieving economies of scale. Alemu *et al*.(2018) examined technical efficiency in smallholder onion farming under Ethiopia's Koga Dam. Results indicated constant returns to scale and strong potential for resource reallocation. Bapari *et al*.(2016) analyzed the economic efficiency of onion production in Bangladesh, finding that seeds and fertilizers significantly impacted production output elasticity. This study underscores the role of input cost management in maximizing returns.

Shettima *et al*.(2016) assessed economic efficiency in Nigeria's vegetable production, identifying significant room for improving irrigation techniques and input allocations. Nigussie *et al*.(2015) focused on onion production under small-scale irrigation systems in Ethiopia. Results showed educational attainment among farmers improved resource utilization and overall productivity. Haile (2015) investigated input elasticities in onion farming in Ethiopia's Kobo District. Findings revealed positive elasticity for inputs like urea and labor, indicating the potential for improving efficiency through resource optimization.

Theoretical Framework

The theoretical framework for analyzing the output supply and input demand elasticities in small-scale onion production is grounded in microeconomic principles of production and consumer behavior. The **production theory** postulates that farmers, as rational economic agents, aim to maximize output or profit given constraints such as input costs, technology, and resource availability. The elasticity of supply reflects the responsiveness of farmers to price changes, emphasizing how economic incentives influence production decisions.

The **demand theory for inputs** complements this by analyzing how input prices and availability affect the quantity of inputs utilized, such as seeds, fertilizers, and labor. This relationship is further framed within the **Cobb-Douglas production function**, which illustrates the marginal productivity of each input and the interplay of inputs in achieving optimal output.

Additionally, the **theory of duality in economics** allows for the derivation of input demand functions from the profit-maximization behavior of producers. This approach integrates market dynamics, price mechanisms, and resource constraints, providing a comprehensive basis for examining elasticities. By situating the study within these theoretical constructs, the framework captures the complexities of small-scale onion farming and its responsiveness to economic variables in Kano State.

Conceptual Framework

The conceptual framework for analyzing the output supply and input demand elasticities in small-scale onion production in Kano State is structured around the interaction of key variables: economic, agronomic, and institutional factors. It emphasizes the dynamic relationship between onion farmers' decisions, market conditions, and external influences.

1. **Input Factors**: Inputs such as seeds, fertilizers, labor, water, and pesticides are central to production. Their availability and price influence input demand elasticity and affect output levels.
2. **Output Supply**: The quantity of onions produced depends on market price, production costs, and farmer responsiveness, captured through supply elasticity.
3. **Market Variables**: Market price fluctuations, demand conditions, and value chain dynamics impact both input demand and output supply decisions.
4. **External Influences**: Institutional support (e.g., subsidies, training, and market access), climatic conditions, and technology adoption act as moderating variables that shape production efficiency and elasticity responsiveness.
5. **Outcome Variables**: Key outcomes include changes in output levels, input utilization patterns, and overall profitability of onion farming.

This framework integrates economic theory with real-world considerations, guiding the study to evaluate how farmers' resource allocation decisions respond to external stimuli, thereby shaping the sustainability and growth of small-scale onion production in Kano State.

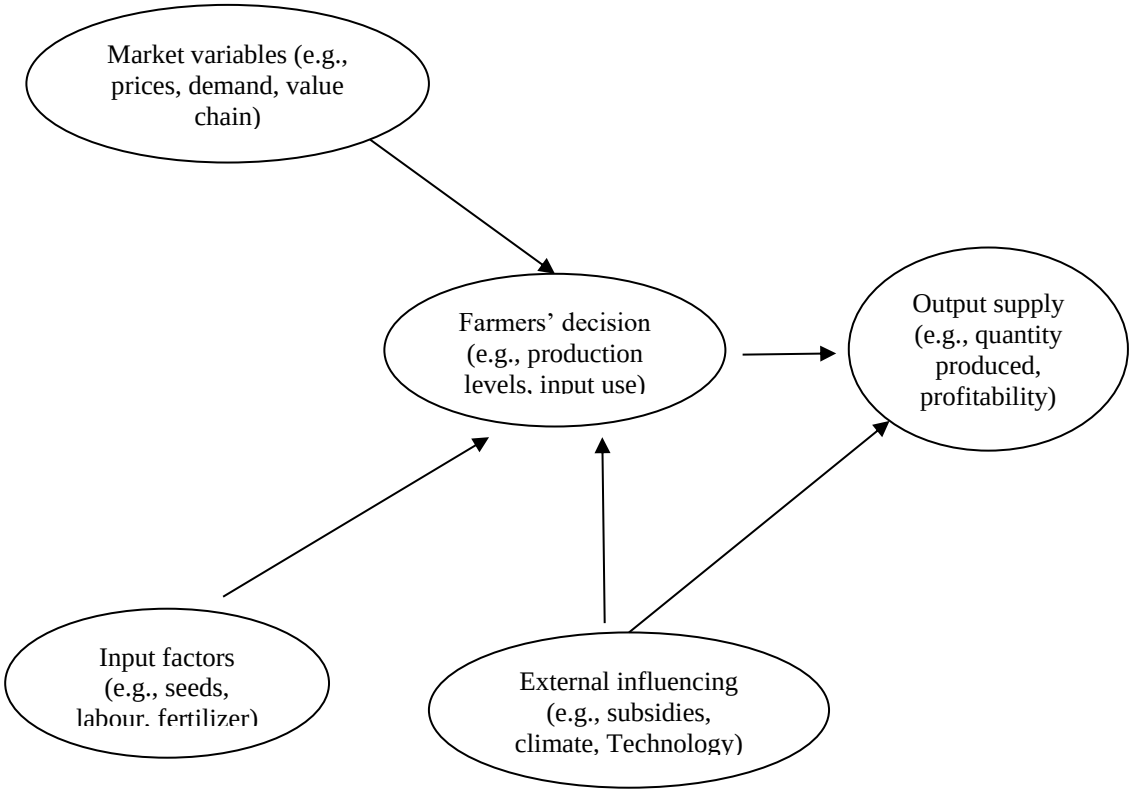

Figure 1: Conceptual framework for onion production analysis

RESEARCH METHODOLOGY

Kano State, located in northern Nigeria, is one of the country's most populous and economically significant states. It is known for its rich cultural heritage, historical significance, and vibrant agricultural sector. The State is bordered by Katsina State to the northwest, Jigawa State to the northeast, and Kaduna State to the southwest. Its geographic coordinates ranged from approximately 11.5°N to 13.5°N latitude and 7.5°E to 9.5°E longitude (Figure 1b). Further, the State exhibits diverse agro-ecological zones, including the Sudan savanna, Sahel savanna, and Guinea savanna. These zones are characterized by varying levels of rainfall, soil types, and vegetation cover, which influence agricultural production systems and cropping patterns within the state. Agriculture is the backbone of the economy in Kano State, employing a significant portion of the population and contributing substantially to the state's Gross Domestic Product (GDP). The state is known for its diverse agricultural activities, including crop cultivation, livestock rearing, and agro-processing industries. Onion production is a prominent agricultural activity in Kano State, with the state being one of the leading onion-producing regions in Nigeria. In other words, the State is renowned for its substantial onion production, with the cultivation of onions being a major economic activity for smallholder farmers in the region. The state's favorable agro-climatic conditions, including sandy soils, warm temperatures, and adequate rainfall during the rainy season, provide conducive environments for onion

cultivation. Smallholder farmers play a significant role in onion production, employing traditional farming practices alongside modern techniques.

The State is characterized by a diverse mix of ethnic groups, including the Hausa, Fulani, Kanuri, and others, each with its unique cultural heritage and farming traditions. Traditional institutions, social networks, and community-based organizations play crucial roles in shaping agricultural practices, resource management, and collective decision-making processes within rural communities. Despite its agricultural potential, Kano State faces various challenges, including land degradation, water scarcity, pest and disease outbreaks, limited access to inputs and credit facilities, and inadequate infrastructure. However, the state also presents opportunities for innovation, investment, and sustainable development initiatives aimed at enhancing agricultural productivity, resilience, and environmental sustainability.

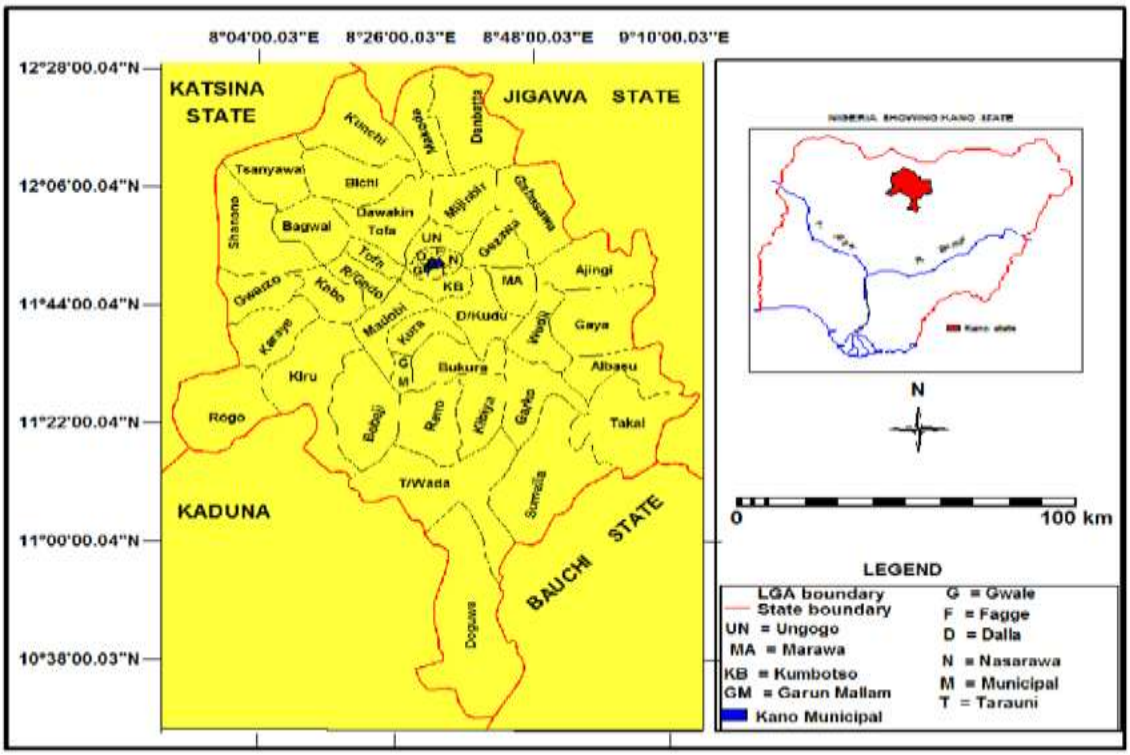

Figure 1b: Map of Kano State

Using a multi-stage sampling technique, a total of 132 onion farmers constituted the sample size. Firstly, given the prevalence of onion cultivation in the state, all the stratified ADP (Agricultural Development Project) zones namely Zones I (Rano), II (Dambatta) and III (Gaya) were adopted. Secondly, a proportionate sampling technique that adopted a scale of 30 percent was used to select the representative Local Government Areas (LGAs). Noteworthy, given the high density of onion production in Zones I and II, all the LGAs totaling twenty seven (27)constituted the sampling frame. Whereas, in Zone III, only eleven (11) out of the seventeen (17) LGAs comprised the sampling frame as the remaining six (6) LGAs are metropolis with little or no onion farming activities. Succinctly, from Zones I and II; and Zone III respectively four (4) and three (3) LGAs each were randomly selected, thus given a total selection of eleven

(11) LGAs. Fourthly, from each of the selected LGAs, three (3) villages were randomly selected. Lastly, due to the absence of finite sampling frame of onion farmers, using a freelance survey, four (4) farmers were randomly selected from each of the chosen villages, thus gave a total sample size of 132 farmers. Further, using an easy-cost route approach, a well-structured questionnaire coupled with an interview schedule was used to elicit cross-sectional data of onion production during the 2023 cropping (rainy) season. Objectives I, II, III and IV respectively were achieved using pseudo-profit function, constant elasticity of substitution (CES), symmetric normalized quadratic profit function (trans-log), and exploratory factor analysis complemented with Kendall's coefficient of concordance and k-means cluster model.

Empirical Model

Farm budgeting technique: The farm budgeting technique gives a blurb of enterprise's profitability. Following Sadiq *et al.*(2024a & 2024b) the model is given below:

$NFI = TR - TC$ …… (1)

$GM = TR - TVC$ …….. (2)

$ROI = GM/TVC$ …….. (3)

$ROCI = NI/TC$ …….. (4)

$BEP(kg) = TFC/(P - V)$ …… (5)

$BEP(Naira) = TFC/(1 - V/P)$ …… (6)

Margin of safety (kg) = Total output – BEP(kg) …… (7)

Where, TR = Total revenue; TC= Total cost (TVC+TFC); TVC= Total variable cost; TFC= Total fixed cost; ROI = Return on Naira invested; ROCI = Return on capital invested; BEP = Break-even-point.

Constant Elasticity of Substitution (CES): Following Hanningsen and Hanningsen (2011), CES production with two inputs in its formal specification is as follows:

$$Y_i = \gamma\left[\delta X_1^{-\rho} + (1-\delta) X_2^{-\rho}\right]^{\frac{\upsilon}{\rho}} \quad \text{…… (8)}$$

Where,

Y_i = Output quantity;

X_{1-2} = Input quantities;

$\gamma \in [0,\infty] =$ Determines the productivity;

$\delta \in [0,1] =$ Determines optimal distribution of the inputs (optimal distribution parameter) $(0 < \delta < 1)$

$\rho \in (-1,0) \cup (0,\infty) =$ Determines the (constant) elasticity of substitution (substitution parameter), which is $\sigma = 1/1+\rho, (\rho \geq -1)$

$\upsilon \in [0,\infty] =$ Is equal to the elasticity of scale (return to scale parameter)

For elasticity of substitution (σ), the following relationships between (σ) and (ρ) hold:

$\sigma = \infty$, then $(\rho = -1)$: CES takes the linear form and the inputs are perfect substitute so that the farmers have no special preference for any of the inputs.

$\sigma = 1$, then $(\rho = 0)$: CES becomes Cobb-Douglas function and expressed a perfect balance between substitution and complementary effects. It implies unity elasticity of substitution between the two inputs.

$\sigma = 1$, then $(\rho > 0)$: CES becomes production function with significant complementarity's effect between inputs.

$\sigma > 1$, then $(\rho < 0)$: CES function shows inputs that are partial substitutes.

$\sigma = 0$, then $(\rho = \infty)$: CES takes the form of Leontief production function. This means that, the optimal inputs combination or substitution in the production process does not depend on input prices but fully determined by the parameters defining the production process.

The formal specification of CES for three inputs is as follows:

$$Y = \gamma \left(\sum_{i=1}^{n} \delta_i x_i^{-\rho} \right)^{\frac{-\nu}{\rho}} \quad \text{..... (9)}$$

With $\sum_{i=1}^{n} \delta_i = 1$

Where, n is the number of inputs and x_{1-n} are the quantities of n inputs.

$$Y = \gamma \left[\delta (\delta_1 x_1^{-\rho} + (1-\delta_1) x_2^{-\rho})^{\rho/\rho} + (1-\delta) x_3^{-\rho} \right]^{-\nu/\rho} \quad \text{..... (10)}$$

The formal specification for CES production for four inputs is as follows:

$$Y = \gamma \left[\delta (\delta_1 x_1^{-\rho 1} + (1-\delta_1) x_2^{-\rho 1})^{\rho/\rho 1} + (1-\delta)(\delta_2 x_3^{-\rho 2} + (1-\delta_2) x_4^{-\rho 2})^{\rho/\rho 2} \right]^{-\nu/\rho}$$

..... (11)

Symmetric normalized quadratic profit function (trans-log)

$$\pi(p,z)=\sum_{i=1}^{n}\alpha_i p_i+\frac{1}{2}w^{-1}\sum_{i=1}^{n}\sum_{j=1}^{n}\beta_{ij}p_i p_j+\sum_{i=1}^{n}\sum_{j=1}^{m}\delta_{ij}p_i z_j+\frac{1}{2}w\sum_{i=1}^{m}\sum_{j=1}^{m}\gamma_{ij}z_i z_j \quad \ldots\ldots\ldots\ldots$$

(12)

With π = profit, p_i = netput prices, z_i = quantities of fixed inputs, $w=\sum_{i=1}^{n}\theta_i p_i$ = price for normalization, θ_i = weights of prices for normalization, and $\alpha_i, \beta_{ij}, \delta_{ij}$ and γ_{ij} = coefficients to estimated.

The netput equations (output supply in input demand) can be obtained by Hotelling's Lemma $(q_i=\partial\pi/\partial pi)$:

$$x_i=\alpha_i+w^{-1}\sum_{j=1}^{n}\beta_{ij}p_j+\frac{1}{2}\theta_i w^{-2}\sum_{j=1}^{n}\sum_{k=1}^{n}\beta_{jk}p_j p_k+\sum_{i=1}^{m}\delta_{ij}z_j+\frac{1}{2}\theta_i\sum_{j=1}^{m}\sum_{k=1}^{m}\gamma_{jk}z_j z_k \quad \ldots\ldots$$

(13)

Noteworthy, Output (kg); inputs: labour (manday), Seed (kg), NPK fertilizer (kg), pesticides (litre), Herbicides (litre), Petrol (litre), Engine oil (litre), Depreciation on capital item (₦), and farm size (hectare).

RESULTS AND DISCUSSION

Costs and Return(s) to Onion Production

The breakdown of the costs and return structures of onion production in Table 1 showed the cost of cultivation cum total variable cost and fixed cost to be ₦456,567.60k, ₦417,873.60k and N38,694.05k respectively. Of the cost of cultivation, the proportions of the total variable cost cum fixed cost were 91.53 and 8.47% respectively. Besides, the costs incurred on labour followed by NPK fertilizer were the highest while incurred cost on engine oil was the lowest. Consequently, the high cost proportion of labour might be attributed to intensive agronomic practices involved in onion production from pre-planting to harvesting stage. Likewise, inability of the farmers to substitute labour for herbicides due to resource paucity is a contributory factor. Noteworthy, the cost of production, i.e., cost incurred per 1kg of onion was ₦6215.22k.

Furthermore, the observed short and long-run profit margins per hectare were ₦952,300.60k and ₦913,606.50k. Besides, nuancing the benefits that accrued to the enterprise, respectively, the benefit-cost ratio indexes in the short and long-run were 2.28(ROI) and 2.00(ROCI). Thus, for the former and latter respectively, for every Naira invested, the cost, i.e., ₦1 is returned and profits of ₦1.28k and ₦1.00 were gained. However, using the ROCI to adjudge the credit solvency, i.e., ability of the farmers to defray a borrowed capital devoid of default/delinquency, at the prevailing cost of credit (interest rate) of 14%, the farmers will be able to retire the principal plus the interest rate and still gain 86 kobo (cent). Nevertheless, the BEP at price and

output are ₦58201.90 and 3.14kg respectively. Besides, the output margin of safety is 70.32kg. Succinctly, it can be concluded that onion production in the study area is not only profitable but a viable venture.

Table 2: Costs and return structure of onion production

Items	Unit	Qty	Unit price	Total value	%

Note: IWC = Interest on working capital; DCI = Depreciation on capital items; CP = Cost of production (i.e., cost per unit of output); ₦ = Naira; k = kobo; BEP = Break-even-point

Inputs Substitution

Keeping land constant (Table 3), the CES production function for two inputs *viz.* lumped working capital and labour showed all the parameter estimates in the model to be within the plausible margin of 10% probability level, thus confirms the fit of the model for the specified crop using lumped capital and labour production inputs. Empirically, it was observed that these two inputs accounted for 74.10% of the variation in the output of onion as evident by the coefficient of multiple determination (R^2) value of 0.7410. Furthermore, the managerial efficiencyparameter (gamma) coefficient of 1.107 implied that managerial efficiency accounted for 1.107% in the productivity of onion production in the study area. However, the low value of managerial efficiency clearly points to poor decision making process by most of the farmers on the business going concern of onion production and the possible reason mightbe due to low educational level, thus affected technological contribution to the onion output. Besides, it showed that the use of primitive implements dominate in the production of onion, i.e., in raising elasticity of substitution, the yield of onion can be raised but its effect may not be potentially large due to the use of conventional farm tools-crude implements. Based on a general normalized CES function, as reported by Idisi *et al*.(2020), Klump and de La Grandville (2000) presented a formal proof on the foregoing conjecture.Furthermore, the return to scale parameter (nu) coefficient of 1.06733, in this case variable proportion to scale, given that land is held constant, showed that the farmers were experiencing an increasing return to scale in the yield of onion. This stage of production is irrational (stage I) as MPP >APP; consequently, the farmers can increase their yield level as there is still room for input mix expansion keeping in-view the input prices or costs so as to attaining the economic optimum level of production in stage II, i.e., rational production level. Moreover, to obtain an optimal distribution of lumped capital and labour for an efficient onion production in the study area, the inputs substitution between lumped capital and labour should be in the ratio of 0.64187 and 0.35813 respectively as evident by the distribution parameter (delta) coefficient that is 0.64187.Further, the constant elasticity of substitution coefficient being less than 1, i.e. 0.5477, implied that the duo of lumped capital and labour in the production of onion had a significant complementary effect. Besides, it indicates that in the study area, the farmers used lumped capital to complement labour in enhancing the productivity of onion. Succinctly, these farmers used more of labour than lumped capitalin the production of onion in the study area. Inspite of the cultivation of onion on small-scale, the complementarity effect of lumped capital over labour was marginal, thus an indication of moderate financial investment in the enterprise. The possible reason could be the costs implication of agronomic practices involved in onion production of the study area.

On the other hand, holding land constant, for the three inputs *viz*. labour, partial lumped working capital and energy/fossil fuel (Table 3), except substitution parameter 1 (rho 1), all the parameter estimates of the CES production function were within the acceptable margin of 10% degree of freedom, thus implying the fitness of the model for the crop using labour, partial lumped working capital and energy/fossil fuels as the production inputs. The coefficient of multiple determination (R^2) been 0.8219 means that these three inputs accounted for 82.19% variation in the yield of onion. The efficiency parameter (gamma) coefficient being 1.269 implied that managerial efficiency that owed to decision making contributed 1.269% to the yield of onion. Besides, this low contribution of management could be attributed to low

educational level of most of the farmers, thus affected the efficiency of the farmers in exploring technological potentials in the production of onion. In addition, the potential effect of management in raising the productivity of onion is minimal and this may not be unconnected with the use of rudimental farm implements in the cultivation of onion in the study area. Further, to achieve an efficient production of onion in the study area, optimal substitutions of labour for partial lumped working capital and energy/fossil fuels should be in the ratio of 0.72947 to 0.27053; and, 0.63887 to 0.36113 respectively, as evident by their respective distribution parameters (delta and delta 1). Moreso, the empirical evidence revealed that the farmers were operating at constant return to scale as indicated by the return to scale parameter (nu) coefficient of 1.00. Thus, the study advises the farmers to be cautious at this rational stage of production and should work meticulously on attaining the economic optimum point given that any input mix expansion will exerts the same marginal effect on the yield level of onion. Furthermore, it was observed that in the production of onion, the constant elasticities of substitution oflabour for lumped partial working capital (0.85418), likewise nested labour and lumped partial working capital for energy/fossil fuels (0.46342) were less than unity as evident by Hicks-McFadden (direct) and Allen-Uzawa/Morishima (partial) elasticities of substitution parameters respectively. These implied that labour and partial lumped working capital; likewise labour and lumped partial working capital combined versus energy/fossil fuels inputs in the production of onion have significant complementarity effect. Therefore, for the direct elasticity, the farmers used labour to complement lumped partial working capital for onion yield enhancement; whereas for the partial elasticity, the farmers combined labour-lumped partial working capital to complement energy/fossil fuel in enhancing the onion's productivity in the study area. Consequently, for the former, farmers used more of lumped partial working capital than labour while for the later the farmers used more of energy/fossil fuels than nested labour-lumped partial working capital. However, the results showed indispensable of the three inputs used in the production of onion in the study area. Nevertheless, for the direct elasticity it can be inferred that the resource poor status of the farmers could be the possible reason for the high deployment of human labour in the production of onion; while for the partial elasticity, the challenge of climate change- dry spell, could be the possible reason that forced the farmers to use appreciable quantity of fossil fuels/energy for irrigation purposes in order to achieve high productivity of onion in the study area.

For the four input combination (labour, seed, biocides an energy/fossil fuels) (Table 3), *ceteris paribus*, the CES function was found to be fit for the specified equation as evident by most of its estimated parameters that were different from zero at 10% degree of freedom. Noteworthy, 79.46% of variation in the output of onion is being explained by the joint influence of all the inputs included in the model as evident by the R^2 value that is 0.7946. The significant of the efficiency parameter entails that there was significant technological progress in the production of onion but due to the use of rudimental implements for cultivation coupled with poor education level that masked the management of the firm, the potential effect of the technical progress was small, i.e., 1.088% as evident by the efficiency parameter coefficient value of 1.088. Further, both the optimal distribution parameter estimates were significant, meaning the presence of proportional substitution between these inputs. For the distribution parameter (delta), the coefficient value of 0.67332 implied that to achieve an efficient onion production in the study, an optimum distribution of labour for seed should be in the proportion of 0.67332

and 0.32668 respectively. Besides, for the distribution parameter (delta 1), the coefficient value been 0.63904, means that an optimum substitution of labour for biocides in the ratio of 0.63904: 0.36096 is needed for the farmers to achieve an efficient onion production. Nevertheless, for labour and energy/fossil fuels, the ratio of 0.48577 to 0.51423 respectively, is the optimum substitution required by the farmers to have an efficient onion production. Moreso, the result showed that the farmers were operating at an increasing proportion to scale as indicated by the coefficient value of return to scale parameter (1.07149). Therefore, given that the operational scale level of production is irrational, keeping inview the input and output prices, by adopting appropriate input mix, the farmers are advised to increase their output level so as to achieve economic efficiency in onion production. Furthermore, as evident by the significant of CES coefficients that are within the acceptable margin of 10% error gap, the constant elasticity of substitution for onion production at various input combinations were less than unity, thus implied significant complementarity effect between inputs at various level of combination in the production of onion in the study area. The complementarity effects of input combinations *viz*. labour and seed; and, biocides and energy/fossil fuels as evident by their respective Hicks-McFadden (direct) elasticity of substitution mean that more of seed than labour is used in cultivation of onion for the former while for the later the farmers used more of energy/fossil fuels than biocides in the cultivation of onion. Nuancing empirically, it can be inferred that the farmers used improved seed varieties and fossil fuels for the purpose of irrigation to improve the yield of onion. Nevertheless, the complementarity effect between combined labour-seed and combined biocides-energy/fossil fuels as indicated by the Allen-Uzawa (partial) elasticity of substitution means that more of combined biocides and energy/fossil fuels than combined labour and seed is used by the farmers to cultivate onion production in the study area. Succinctly, the effect of climate change, attributable to erratic rainfall which inturn makes the crop highly susceptibility to pest and diseases; and, favourable marketfor the cropmakes the farmers to invest more in the purchase of biocides and energy/fossil fuels for higher output in the study area.

Elasticities of Output Supply and Inputs Demand

Presented in Table 4 are the parameter estimates of the symmetric normalized quadratic (translog) profit function for onion production in the study area. Besides, convexity was achieved in the non-linear least square estimation. Empirically, of the 74 parameter estimates, 28 estimated coefficients were asymptotically significant at the acceptable margin of 10% probability level. Nuancing, the coefficients of factor prices vis-à-vis labour, NPK fertilizer and petrol-engine oil had negative significant influence on profit, whereas, the coefficient of the output price had significant-positive influence on the profit, thus conform to the a priori expectations. However, the values of the estimated coefficients were greater than unity, implying that the output-input prices had elastic effect on the profit. Further, all the aforementioned coefficients were elastic in nature, thus, a slight increase in the prices of former and latter will lead to a more than proportionate decrease and increase respectively in the output of onion. However, the non-significant of seed coefficient might be attributed to use of third filial generation of improved seed varieties while that of pesticides and herbicides might be associated with a low usage due to a high substitution effect with labour. Noteworthy, the poor substitutions of pesticides and herbicides for labour have been justified in the discussion of costs and return. Furthermore, in descending order, the coefficient values of labour, petrol-engine oil and NPK fertilizer prices been the highest, implied the high dependency of profit on these prices.

Shown in Table 5a are the elasticities of the output supply cum inputs demand. The own-price elasticity of all the inputs demand were negative (ranged from -0.139 to -4.869), thus, impliedthat all the estimated inputs' demand slopes downward as required for convexity of the profit function. Except the prices of labour and herbicides that were inelastic, all the input prices were elastic, thus meaning that an increase in the input prices of the former will lead to a less than proportionate decrease in their demand while in the case of the latter, the resultant effect will be more than a proportionate increase in their demand. Succinctly, the input demand elasticity of the former implied they are necessary (necessities) goods while that of the latter implied they are luxury goods. Noteworthy, only own-price elasticities of seeds, NPK fertilizer and petrol-engine oil were found to be significant. Therefore, for a unit increase in the prices of seeds, NPK fertilizer and petrol-engine oil respectively by 1%, their respective demand will plummet by 3.061, 3.467 and 4.869%.

Furthermore, the output price of onion (a change in quantity supply) had a significant and positive effect on supply, thus indicated the upward slope of the onion output supply curve. This conforms to the a priori expectation as postulated by the theory of supply. Thus, for a

percent increase in the output price (0.0066), the output supply will increase by 0.0066%. Nevertheless, all the variable factor prices had negative effect on output supply (change in supply); however, only seeds, NPK fertilizer and petrol-engine oil prices were significant. Likewise, fixed inputs *viz*. land and depreciation on capital items were inversely related to the output supply.The negative elasticities with respect to the variable inputs implied that there will be a decline in input use in the eventuality of a price hike, thus plummet the supply of onion output. Given the price coefficients of seeds, NPK fertilizer, and petrol-engine oil been 0.0499, 0.041 and 0.0118 respectively, for a unit price increase (1%), the resultant decrease in their demand will lead to a decline in onion output by 0.0499, 0.041 and 0.0118%. Also, the negative elasticity of land with respects to the output means that diseconomies of size prevailed in production of onion in the study area (Table 5b). This is expected as the operational farm holdings of majority of the farmers are marginal. Likewise, the negative elasticity of depreciation on capital items implied that cost implication of wear and tear decreased output supply of onion. However, the significant of the fixed costs couldn't be ascertained as the R software estimation guide used had no provision for it. Nevertheless, the price and cross-price elasticities of supply were inelastic, thus means that a change in the prices of output-inputs would lead to a less than proportionate change in the supply of onion output. By implication, onion is a necessary commodity in the study area. Generally, it can be inferred that supply of onion is being influenced by its output price and prices of improved seeds, NPK fertilizer and petrol-engine oil. Therefore, the study advises policymakers to devise a realistic means of subsidizing these inputs as hyper-inflation occasioned by petrol subsidy removal has permeated the price efficiency of these inputs. Besides, particularly petrol-engine oil, the farmers are advised to adopt energy friendly tools that used alternative green energy source (e.g., solar driven water pump machines). Though,expensive, but by social capital pooling (co-operative organization) and support from policymakers (private and public), access to this machine and hosts of others are possible.

Challenges Affecting Onion Production

A perusal of the challenges showed that any challenge with a threshold below 2.0 is a very severe constraint that affected onion production: few examples are high perishability, post-harvest losses, inadequate storage facilities etc (Table 6). Further, the challenges with a threshold value of equal to 2.0 and less than 3.0 are perceived as severe constraints (e.g., high cost of transportation, problem of land tenure system etc.); challenges with a threshold value of 3.0 are perceived as moderate constraints (e.g., poor access to market information, seed viability constraint etc.). Generally, the farmers have negative/unfavourable perception about the challenges affecting onion production as evident by the grand mean index value of 2.61 that is less than the likert scale mean threshold value of 3.5. Besides, 43.61 percent of the respondents had negative perceptions on the challenges that affected onion production as evident by the perception index value of 0.4361. Nevertheless, the Kendall's coefficient of concordance showed that the farmers didn't anonymous agreed with the ranking of these challenges as evident by the significant KCC index value of 0.201.

Furthermore, the factor analysis conducted on the barriers affecting small-scale onion farmers, utilizing the verimax rotation method (Table 6), revealed noteworthy insights. The computed Kaiser-Meyer-Olkin (KMO) index, standing at 0.769, along with a statistical significant Barlett's sphericity test (BST), signifies the suitability of the dataset for factor analysis. This is corroborated by a review of the KMO value, which surpasses the recommended threshold value of 0.50 set by Kaiser (1974); Sadiq (2023); Sadiq *et al*.(2024b). Such statistical indicators establish a robust foundation for deriving meaningful factors affecting onion production among small-scale farmers. The factor extraction process, guided by item loadings, yielded eight distinct components representing barriers to onion production. These components are elucidated as follows: Market information problem (F1), Climate change problem (F2), Low public-private investment problem (F3), Land tenure problem (F4), Infrastructure problem (F5), Capital problem (F6), Storage facilities problem (F7), postharvest losses problem (F8), Theft/poaching problem (F9) and Agronomic practices knowledge problem (F10).

The factors affecting onion production and market success are multifaceted, and a comprehensive understanding of these factors is crucial for effective planning and resource allocation. This study explores the explicit barriers associated with various factors, shedding light on critical challenges faced by farmers in optimizing their agricultural practices and navigating market dynamics. In the realm of "market information problem" (factor one), barriers manifest prominently in the form of poor access to market information (.728) and inadequate awareness of postharvest technology usage (.622). Notably, poor access to market information emerges as the most formidable challenge within this factor, underscoring its pivotal role as a major constraint in the context of market information. This revelation emphasizes the urgent need for interventions aimed at enhancing farmers' access to timely and accurate market data. Factor two delves into obstacles related to technical advice on input usage (.882) and Climate change constraints (.715). Here, climate change constraints take center stage with the highest loading, signifying their significance as the primary barriers of climate change challenges. Acknowledging and addressing these constraints are vital for building resilience and sustainability in agriculture, particularly in the face of a changing climate.

Factor three encompasses barriers such as low public and private investment (.737) and challenges in leasing or renting farmland (.596). The highest loading within this factor is attributed to low public and private investment, indicating its pivotal role as the most prominent barrier concerning low public-private investment. Effective strategies to attract and mobilize investments are imperative to bolster the agricultural sector and propel economic growth. Factor four sheds light on obstacles like land tenure system (.552), and disease and insect pests (.431). Additionally, recognizing the significance of land tenure and pest management is crucial for fostering a conducive environment for agricultural development.

Factor five focuses on barriers associated with poor infrastructure (.809) and high perishability (.494). These challenges highlight the critical need for infrastructure development to facilitate efficient agricultural operations and minimize postharvest losses. Factor six, capital problem, emphasizes the significance of lack of sufficient capital (.807) as the predominant barrier. This aligns with broader agricultural research indicating that inadequate capital poses a substantial risk to farm operations. Addressing this challenge requires innovative financial solutions and improved access to credit for small-scale farmers. Factor seven is characterized by the sole presence of inadequate storage facilities (.820) as a barrier. Developing and upgrading storage infrastructure is crucial for mitigating postharvest losses and ensuring food security.

Factor eight (Postharvest losses problem) underscores barriers such as postharvest losses (.884) and a high cost of transportation (.488). These challenges highlight the need for improved postharvest management practices and logistical solutions to minimize losses and enhance market access. Factor nine showed farmers concern on theft/poaching of farm produce; thus, highlight the need to look into this social menace of state of insecurity in the study area. Finally, factor ten emphasized on poor agronomic practices; thus, highlight the need for adequate advisory services for effective dissemination ofimproved innovative technologies. Furthermore, for factors 1, 2, 3, 4 and 5, respectively, the proportions of farmers that expressed concern were 11.36, 6.82, 5.3, 6.82 and 18.94% as evident by the k-means cluster analysis. Likewise, for factors 6, 7, 8, 9 and 10, respectively, the distributions of farmers that showed concern were 3.03, 15.91, 6.82, 6.82 and 18.18%. Comprehensive understanding of these explicit barriers is vital for policymakers, agricultural extension services, and stakeholders to formulate targeted interventions that address the diverse challenges faced by farmers. By strategically tackling these obstacles, it is possible to create a more resilient, sustainable, and prosperous agricultural sector.

CONCLUSION AND RECOMMENDATION(S)

Empirically, onion production is a viable enterprise in the study area and inputs substitution at various levels of combination is complimentary. Moreover, profit significantly influenced price

of the output, and prices of labour, NPK fertilizer and petrol-engine oil. Likewise, except wage rate, supply of onion output significantly relied on prices of its output, seeds, NPK fertilizer and petrol-engine oil. However, the input prices caused a significant decline in the supply of onion output, thus the need for a realistic incentive measures so as to arrest the poor pricing efficiency of these input prices. Nevertheless, the ten challenges viz. poor market information, climate change problem, low public-private investment, land tenure problem etc. should be addressed so as to bolster the production onion in the study area.

Abstract

Basal cell carcinoma is a low-grade neoplastic tumor originating from the basal cells of the epidermis of the skin that occurs in animals, mainly in areas directly exposed to ultraviolet radiation. So far, several reports have been published in cats and dogs, but its incidence in other animals, including rabbits, is rare. A 3-year-old female New Zealand white rabbit was referred to the veterinary hospital with a prominent mass on the right hand. Finally, the mass was surgically removed and sent to the laboratory for histopathological evaluation. Based on macroscopical and histopathological findings, the mass was diagnosed as infiltrative type of basal cell carcinoma. The primary treatment of basal cell tumors is surgery based on the size, number, and location of the tumor.

Keywords: Rabbit, Neoplasia, Pathology, Basal cell carcinoma

Introduction

Basal cell carcinoma (BCC) is a low-grade neoplastic tumor with poor cellular differentiation that originates from the basal cells of the epidermis. This type of tumor is usually the result of chronic and direct exposure to ultraviolet radiation (UV) from sunlight(Solans Vilanova et al., 2023). BCC typically has a high mitotic index and tends to invasion the dermis, but its metastatic potential is low. Histological features such as basaloid cells with hyperchromatic nuclei and little cytoplasm, islands of neoplastic cells in the dermis, and, in some cases, the presence of cystic spaces in the mass are prominent features in the microscopic evaluation of this type of tumor(Martino et al., 2017). So far, numerous reports have been published on the occurrence of BCC in cats and dogs, mainly in hairless areas of the head, neck, and trunk, and its pattern of occurrence is related to the density of skin pigments(Goldschmidt, 1984; Munday et al., 2017). However, its occurrence in rabbits has been reported as a rare event. Based on the research conducted, this study is the first report of the occurrence of basal cell carcinoma in the hand of rabbits, indicating the unusual occurrence of this tumor in rabbits.

Case description

In October 2024, a 3-year-old female New Zealand white rabbit with a prominent mass on right hand measuring 1×2×0.5cm was referred to the veterinary hospital. On physical examination, the mass was raised. During the clinical examination, the general condition and vital signs of the animal were good. Finally, the mass was surgically removed completely and sent to the laboratory for histopathological evaluation. On cut section, it was firm, encapsulated and pale pink in appearance. Tissue samples of the mass were fixed in 10% neutral buffered formalin, routinely processed, dehydrated, embedded in paraffin wax, sectioned at 5µm in thickness and stained with Haematoxylin and Eosin. Sections were examined using a light microscope (Motic, BA310 Epi-LED FL) and representative images were taken.

Result

On histopathological examination, an encapsulated, multilobular and densely cellular neoplastic mass was identified. Extensive infiltration of neoplastic cells to the dermis and subcutaneous tissue were observed. The masses were composed of nests, sheets, lobules and trabeculae of neoplastic cells within a fibrovascular stroma. The palisading basaloid neoplastic cells were markedly extended from the basal cells of the epidermis into the dermis. Most of the neoplastic cells had scant amounts of eosinophilic cytoplasm with indistinct margins, round to ovoid nuclei and typically a single small basophilic nucleolus. The neoplastic cells had no differentiation to squamous epithelium. Mitotic figures were observed. Based on macroscopical and histopathological findings, the mass was diagnosed as infiltrative type of basal cell carcinoma (Figure 1).

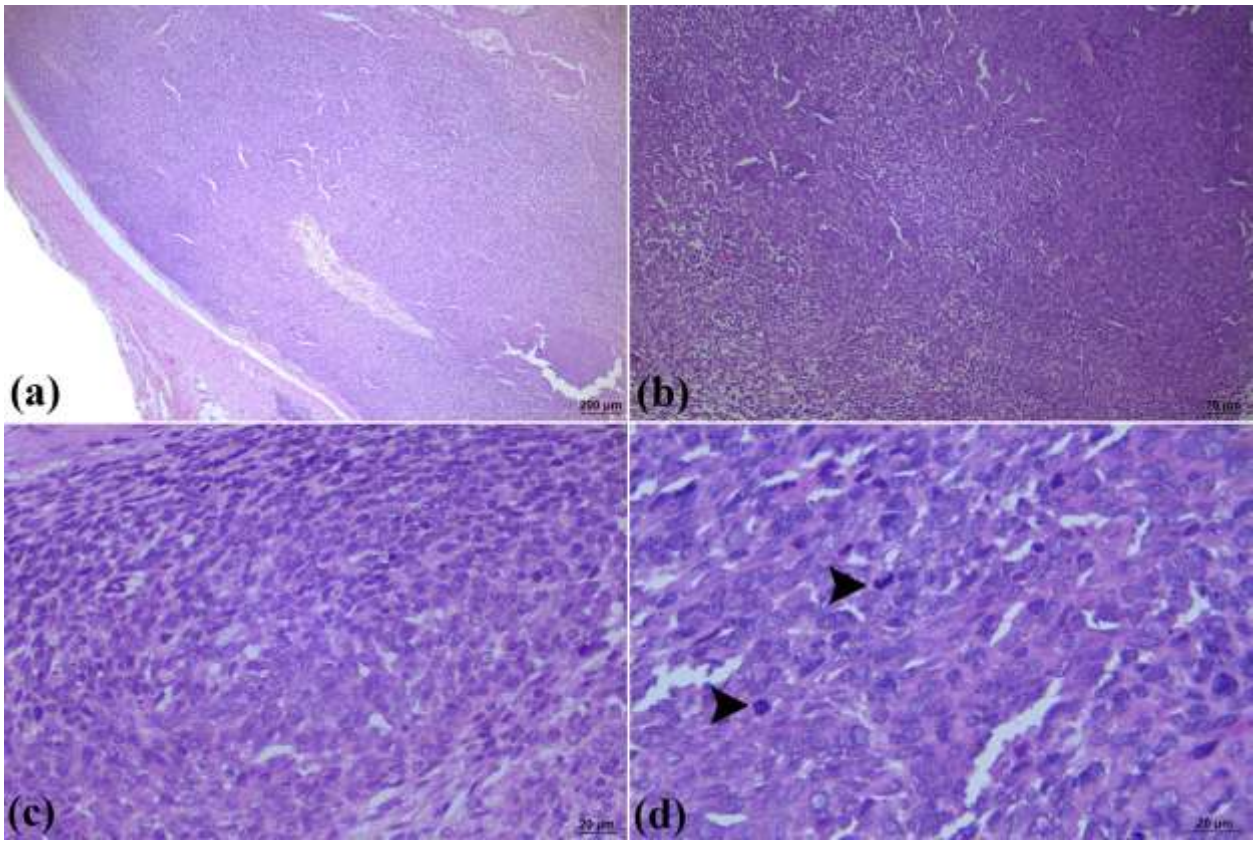

Figure 1(a-d): Histopathological findings of basal cell carcinoma in a rabbit. (a-c): Note the encapsulated and densely cellular neoplastic mass. (d): Two mitotic figures (arrowheads), H&E.

Discussion

In this report, a rare case of basal cell carcinoma in the forelimb of a 3-year-old female New Zealand white rabbit is described. This finding is important because the occurrence of BCC in rabbits has been rarely reported. In terms of histopathological pattern, BCC usually appears as a solitary, nodular, firm, or cystic mass (Di Stefani and Chimenti, 2015). The neoplastic cells had no differentiation to squamous epithelium or adnexal structures. Observation of several mitotic figures was in concurrence with the findings of Goldschmidt and Goldschmidt (2017). In the study by Basheer Ahamad et al., the growth pattern of neoplastic basaloid cells in the form of solid islands with necrotic areas in the center and proliferation of fibrous connective tissue in the dermis was proposed as key characteristics of BCC, which was also observed in the present case with differences in the anatomical region (Ahamad et al., 2014). Considering the anatomical location of the lesion in BCC is of great clinical importance because the occurrence of the tumor in unusual areas delays the diagnosis. In these cases, the use of various diagnostic methods, including biopsy and histopathological examination, is helpful. Given the known role of UV in the pathogenesis of this tumor by inducing mutations in cell cycle regulatory genes in epidermal cells(Basset-Seguin & Herms, 2020), as well as causing chronic skin lesions and increased inflammatory responses (Bohn, et al., 2006), especially in areas

exposed to sunlight, it seems that UV is a possible factor involved in the occurrence of BCC in rabbits in the present study, although other factors may also be effective in the occurrence of this tumor. In various reports, the role of solar radiation as an effective factor in the occurrence of BCC in dogs has also been considered (Saridomichelakis, et al., 2013). on American Staffordshire bull terriers, where UV caused mutations in the P_{53} gene and disruption of tumor suppression and cell cycle control mechanisms, as well as increased cell proliferation and decreased ability to repair DNA damage, which in turn led to the initiation and progression of BCC skin tumors (Saridomichelakis, et al., 2013). However, in the study conducted by Walder and Gross, BCC tumors in feline occurred in areas of the body that were not directly exposed to sunlight(Gross, Ihrke, & Walder, 1992). This clinical and pathological difference seems to be due to the structural and genetic differences in the types of cells involved in each tumor. Considering the effect of UV radiation on the occurrence of BCC, this issue also applies to another epidermal skin tumor called squamous cell carcinoma. The difference is that the effects of UV radiation in SCC are more destructive than in BCC, and its growth rate and metastatic power are also greater than in BCC(Suzuki, Inoue, Kuramochi, Kiyohara, & Ikeda, 1997; Tsujita & Plummer, 2010). The present study shows that Bcc in rabbit is a skin tumor with similar pathological features in domestic animals. The primary treatment of basal cell tumors is surgery based on the size, number, and location of the tumor.

ABSTRACT

The rapid increase in the world population, difficulties in accessing qualified labor in the agricultural sector, the negative effects of climate change on agricultural production, and major problems such as limited resources have made it necessary to find more sustainable methods in agriculture that will minimize human power. This necessity has led to a faster integration of digital technologies into the agricultural sector.

Academic publications published in recent years were examined as a method, and data obtained from research in sources such as DegiPark, Google Scholar, and ResearchGate were taken as basis. Within the scope of the literature research, the effectiveness of the YOLO model in various areas such as the increase in harvest in agriculture, the detection of weeds that damage crops, and automatic diseased areas in fields were analyzed.

The YOLO (You Only Look Once) algorithm is a revolutionary technology in the field of computer vision thanks to its real-time object detection capacity. This powerful algorithm has a wide range of uses in agricultural applications. Early detection of plant diseases in particular plays a critical role in increasing efficiency in agricultural production. Similarly, it provides great convenience in the process of detecting unwanted weeds in fields and gardens in a timely manner and controlling them. In addition, determining the maturity levels of fruits and vegetables contributes to the correct planning of harvest time, which increases product quality. In addition, it is also very useful in livestock enterprises in terms of monitoring the behavior of animals and detecting possible health problems at an early stage.

This study examines the use and impact of the YOLO (You Only Look Once) algorithm in agricultural production. Our research tested the impact of YOLO algorithm in agricultural applications with different situations and evaluated how it performs in important applications such as plant health monitoring, accurate harvesting time determination, irrigation optimization and animal tracking. Our research results show that YOLO-based systems are superior in terms of accuracy, time utilization and cost in agriculture. The study also provides a technical framework to promote the widespread use of AI-based image processing techniques in

agriculture and contributes to the literature by presenting the analysis for future research in this field.

Keywords: YOLO algorithm, agricultural artificial intelligence, image processing, object detection, smart agriculture.

TARIM UYGULAMALARINDA YOLO ALGORİTMA MODELİNİN ETKİNLİĞİ

ÖZET

Dünya nüfusunun hızla artması, tarım sektöründe nitelikli çalışan gücüne erişimde yaşanan zorluklar, iklim değişikliklerinin tarımsal üretim üzerindeki olumsuz etkileri ve sınırlı kaynaklar gibi büyük sorunlar, tarımda daha sürdürülebilir, insan gücünü minimalize edecek olan yöntemler bulmayı zorunlu hale getirmiştir. Bu zorunluluk, dijital teknolojilerin tarım sektörüne daha hızlı bir şekilde entegre olmasına yol açmıştır.

Yöntem olarak son yıllarda yayımlanmış olan akademik yayınlar incelenmiş olup, Özellikle DegiPark, Google Akademik, ResearchGate gibi kaynaklardaki araştırmalardan elde edilen veriler esas alınmıştır. Literatür araştırması kapsamında YOLO modelinin, tarımda hasat miktarındaki artışı, ekinlere zarar veren yabancı otların tespiti, tarlalarda otomatik hastalıklı bölge tespiti gibi çeşitli alanlardaki etkinlikleri analiz edilmiştir.

YOLO (You Only Look Once) algoritması, gerçek zamanlı nesne tespiti yapabilme kapasitesi sayesinde bilgisayarla görme alanında devrim niteliğinde bir teknolojidir. Bu güçlü algoritma, tarım uygulamalarında da oldukça geniş bir kullanım alanına sahiptir. Özellikle bitki hastalıklarının erken teşhisi, tarımsal üretimde verimliliği artırmak adına kritik bir rol oynamaktadır. Aynı şekilde, tarlalarda ve bahçelerde istenmeyen yabani otların zamanında tespit edilerek kontrol altına alınması sürecinde de büyük kolaylıklar sağlamaktadır. Ayrıca, meyve ve sebzelerin olgunluk düzeylerinin belirlenmesi, hasat zamanının doğru bir şekilde planlanmasına katkı sunmakta, bu da ürün kalitesini artırmaktadır. Bununla birlikte, hayvancılıkla uğraşan işletmelerde, hayvanların davranışlarının izlenmesi ve olası sağlık sorunlarının erken safhada fark edilmesi açısından da oldukça faydalıdır.

Bu çalışma, YOLO (You Only Look Once) algoritmasının tarım üretiminde kullanımı ve etkisini incelemektedir. Araştırmamız, YOLO algoritmasının tarım uygulamalarındaki etkisini farklı durumlarla test etmiş ve bitki sağlığı izleme, doğru hasat zamanı belirleme, sulamanın optimizasyonu ve hayvan takibi gibi önemli uygulamalarda nasıl performans gösterdiğini değerlendirmiştir. Araştırma sonuçlarımız, YOLO tabanlı sistemlerin tarımda doğruluk, zaman kullanımı ve maliyet açısından daha üstün olduğunu göstermektedir. Çalışma ayrıca, tarımda yapay zekâ tabanlı görüntü işleme tekniklerinin yaygınlaşmasını teşvik etmek için teknik bir çerçeve sunmakta ve gelecekte yapılacak araştırmalar için bu alanda analizi sunarak literatüre katkı sağlamaktadır.

Anahtar Kelimeler: YOLO algoritması, tarımsal yapay zekâ, görüntü işleme, nesne tespiti, akıllı tarım

GİRİŞ

Dijital tarım çağında, karmaşık algılama, veri işleme, analitik ve dijital teknolojilerin kullanımı ve entegrasyonu daha kolay hale gelmektedir. Çevre üzerinde mümkün olan en az etkiyle gıda üretimini artırmak için dijital tarım teknolojisi kaynak verimliliğinin artırılmasına yardımcı olmaktadır (Fountas vd., 2020). Bu nedenle, artan üretim maliyetleri, işçi eksikliği, bozulan veya tükenen doğal kaynaklar, iklim değişikliği vb. gibi dünyanın gıda sistemlerinin karşı karşıya olduğu büyük sorunlara ana cevaplardan birinin tarımsal otomasyon ve dijitalleştirme olduğu görülmüştür. Otonom ve akıllı sistemlerden oluşan dijital tarım teknolojilerine olan ilginin artması, optik sensör teknolojisi, bilgi işlem gücü ve veri odaklı makine öğrenme tekniklerindeki devam eden gelişmelerin bir sonucudur. Son yıllarda daha düşük donanım maliyetleri ve daha yüksek bilgi işlem gücü nedeniyle, nesne tanıma teknikleri gibi derin öğrenmeye dayalı bilgisayarlı görme uygulamaları tarım sektöründe hızla büyümüştür (Tian vd., 2023). Kameralar, görüntü işleme teknikleri ve derin öğrenme modellerinin bir araya getirilmesiyle oluşturulan nesne tanımlama, resimlerdeki ve videolardaki ilgi çekici öğeleri tespit ederek, tanımlayarak ve izleyerek insan algı sistemlerini taklit etmektedir.

Tarımsal süreçler, büyük hayvanların bakımından küçük meyvelerin hasadına kadar çeşitli işlemleri içermektedir. Nesne tespiti, tarımsal ve hayvansal çiftçilikte pek çok kullanım alanı bulmuştur (Badgujar, vd., 2024). Bu kullanımlar otomatik ve/veya robotik sistemlerin, uzaktan algılama ve/veya izleme, karar destek araçlarının ve daha fazlasının çok ötesine geçmektedir. Dijital tarımın önemli bir unsuru olan nesne tespiti, kaynakları en üst düzeye çıkarırken maliyetleri ve iş gücünü azaltarak tarımsal çıktıyı ve üretkenliği artırmaktadır (Zhang vd., 2023).

Nesne tanımlama modellerinin ön saflarında yer alan derin öğrenmede, evrişimli sinir ağı (CNN) mimarileri kullanılır. Manuel özellik çıkarımı gerektiren geleneksel görüntü işleme veya algılama yöntemlerinin aksine, derin öğrenme teknikleri büyük etiketli görüntü veri kümelerini kullanarak otomatik özellik öğrenimi sağlayarak yüksek performans elde etmektedir (Shehzadi vd., 2023). Bu algoritmalar, hız, doğruluk, verimlilik ve algoritma boyutu arasında denge sağlar ve tasarım konseptleri ve mimarileri bakımından farklılık göstermektedir. (Zhang vd., 2023). Gerçek zamanlı olarak yüksek hassasiyetle çalışma kapasitesi ve az kaynağa sahip cihazlarla uyumluluğu nedeniyle, YOLO olarak bilinen tek aşamalı dedektör, kısa bir sürede tarımda yaygın olarak kullanılmıştır.

Otomasyon, robotik, algılama ve izleme gibi dijital teknolojiler tarımın önemli bir parçası haline gelmiştir. Tarım ürünleri genellikle hem zamanla hem de mekânda değişen, karmaşık ve düzensiz ortamlarda yetişmektedir (Bechar & Vigneault, 2016). Sonuç olarak, tarımsal uygulamalar için eğitilmiş genel bir nesne tanımlama algoritması ya zayıf performans göstermektedir. Ancak, nesne tanıma modelinin performans nitelikleri, teknolojinin nasıl kullanıldığına bağlı olarak değişmektedir. Örneğin, görme tabanlı bir meyve toplama robotunun verimi, algılama doğruluğu ile belirlenirken, hasat verimi hızı ile belirlenir. Bununla birlikte, YOLO'nun tarımdaki araştırması ve uygulaması hızla genişlemektedir, ancak bunlar genellikle dağınık ve disiplinler arasıdır ve dokümantasyon ve titiz değerlendirme gerektirmektedir.

Bu araştırmanın amacı, tarımsal nesne algılama görevleri için YOLO'nun kullanımını analiz etmek ve eleştirel olarak değerlendirmektir. Ayrıca, araştırma tüm YOLO model oluşturma

sürecini ve modelin belirli tarımsal işler için performansını artırmak için yapılan önemli geliştirmeleri inceleyecektir. YOLO'nun son teknoloji algoritmalarla entegrasyonunun avantajlarını ve dezavantajlarını da kapsayan bu araştırma, YOLO tekniğine genel bir bakış sağlayarak tarihsel gelişimi de ele alınmıştır.

Yolo Derin Öğrenme Modelleri ve Tarihsel Gelişim

Nesne tanıma alanında kayda değer bir gelişme, YOLO (You Only Look Once) olarak bilinen derin öğrenme modelidir. Redmon vd., (2016) bu modeli ilk olarak 2016'da sunmuştur. YOLO, fotoğrafları tek geçişte analiz etme ve şeyleri hızlı ve verimli bir şekilde bulma yeteneğiyle dikkat çekiyor. Geleneksel nesne tanımlama tekniklerinden daha hızlı ve daha etkili sonuçlar ürettiği için bu model gerçek zamanlı uygulamalarda popülerlik kazanmıştır.

Tarihte Gelişim

YOLO V1 (2015): Resmi 7x7'lik bir ızgaraya böldükten sonra her hücredeki öğeleri tahmin eden bu yaklaşım, resmi tek bir ağ üzerinden çalıştırarak öğe tanımlamasını hızlandırmakta, ancak yalnızca az sayıda nesneyi tanımaktadır. Redmon vd. (2016), YOLO algoritmasıyla gerçek zamanlı nesne algılamada devrim yaratmıştır.

YOLO V2 (2016): Bu sürümde hız ve doğruluğu artırmak için bir dizi geliştirme bulunmaktadır. "Toplu Normalizasyon" ve "Anchor Boxes" gibi yöntemlerin eklenmesi modelin performansını iyileştirmiştir. Böylece model daha fazla nesneyi tespit edebilmektedir. Redmon ve Farhadi (2017), YOLOv2 algoritmasıyla nesne algılama doğruluğunu artırırken, gerçek zamanlı işleme hızını da korumayı başarmıştır.

YOLO V3'ün (2018) geliştirilmiş özelliği, çeşitli boyutlardaki nesneleri tanımlama kapasitesidir. Modelin çeşitli boyutlardaki nesneleri tanıma yeteneğini geliştirmek için tasarımına daha fazla katman eklendi. Redmon ve Farhadi (2018), YOLOv3 modelini önceki sürümlerine göre daha doğru ve hızlı hale getiren çeşitli mimari iyileştirmeler gerçekleştirdiklerini belirtmişlerdir.

YOLO V4 (2020): Bu sürüm, performansı ve optimizasyonu artırmak için bir dizi strateji kullanmaktadır. "Mozaik Veri Artırma" ve "Kendine Karşı Eğitim" gibi yenilikçi teknikler, modelin genel performansını iyileştirmiştir. YOLO V4 ile daha fazla öğe tespit ederek doğruluk oranları artırılabilmektedir. Bochkovskiy, vd. (2020), YOLOv4 algoritmasına yeni yöntemler uygulayarak nesne algılama hızını ve doğruluğunu önemli ölçüde artırdı.

YOLO V5 (2020): Bu sürüm, gömülü ve mobil sistemlerde kullanım için uyarlanmış, daha hızlı ve daha hafif bir varyant sunmaktadır. Khanam ve Hussain (2024), YOLOv5'in mimarisi ve işlevselliğinin kapsamlı bir incelemesini sunmaktadır. YOLO V5, daha fazla uygulama çeşitliliğini kapsıyor ve sezgisel bir kullanıcı arayüzüne sahiptir.

En son yinelemeler olan YOLO V6 ve V7 (2022–2023), hızı ve doğruluğu artırmak için bir dizi geliştirme içermektedir. Özellikle azaltılmış bilgi işlem gücü ihtiyaçları ve iyileştirilmiş genel performansları ile dikkat çekmektedir. Li vd. (2022) göre YOLOv6 yöntemi, endüstriyel

uygulamalar için uyarlanmış tek aşamalı bir nesne algılama çerçevesi sağlamaktadır. Wang vd. (2022) YOLOv7 algoritması ile gerçek zamanlı nesne tanımada benzeri görülmemiş bir hız ve doğruluk elde etmiştir.

YOLOv8 (2023): Bu sürüm, düşük kapasiteli donanımlarında ve mobil cihazlarda çalışmak üzere tasarlanmıştır. Liu vd. (2023) göre YOLOv8, FPN+PAN boyun yapısı ve CSPNet omurgası gibi son teknoloji özelliklere sahiptir. Ayrıca, nesne algılamayı iyileştirmek için yeni bir mimari kullanımı ile dağıtım ve eğitim prosedürlerini kolaylaştıran sezgisel bir arayüz sağlamaktadır.

YOLO-NAS: Bu sistem, ağ mimarisini otomatik olarak optimize etmek için Sinir Mimarisi Arama'yı (NAS) içermekte ve mümkün olan en iyi hız-doğruluk dengesini sunmaktadır (Terven vd., 2023). YOLO-NAS'ın hibrit niceleme yöntemi ve niceleme farkında modülleri gibi özel özellikleri, zararlı tespiti ve mahsul sağlığı izleme gibi görevler için yüksek performansa ihtiyaç duyulan ancak hesaplama kaynaklarının sınırlı olabileceği tarımdaki uç cihaz uygulamaları için onu daha uygun hale getirmektedir (Qin vd., 2021).

YOLOv9: Önceki sürümlerle karşılaştırıldığında, bu sürüm daha fazla doğruluk ve hız sağlamayı amaçlamaktadır. Wang ve Liao'ya (2024) göre YOLOv9 algoritması nesne algılama doğruluğunu artırmak için GELAN ve PGI gibi son teknoloji yöntemleri kullanır. Model mimarisi optimizasyonlarının bir sonucu olarak nesne tanımlama görevlerinde daha iyi sonuçlar elde edilmiştir.

YOLOv10: Ultralytics, maksimum olmayan baskılama (NMS - non-maximum suppression) ihtiyacını ortadan kaldırarak verimliliği artıran yeni bir tasarıma sahip YOLOv10'u geliştirmiştir. Mükemmel doğruluğu ve düşük işleme maliyeti nedeniyle, bu model gerçek zamanlı nesne tanımlama için çıtayı yükseltmiştir. Wang vd. (2024), YOLOv10 versiyonu ile etkili model tasarımı ve eğitim stratejileri aracılığıyla NMS'ye ihtiyaç duymadan gerçek zamanlı nesne tanımada dikkate değer iyileştirmeler sağlamıştır.

YOLOv11: En son sürüm olan YOLOv11, özellikle hassasiyet ve ortalama F1 skoru açısından YOLOv10'a göre performansta marjinal bir iyileştirme sağlamaktadır. Yangın ve duman algılama gibi özel uygulamalarda, bu model olağanüstü performans göstermiştir (Alkhammash, 2025).

UYGULAMA ÖRNEKLERİ

Bitki Hastalıklarının Tespiti

YOLO algoritmaları, bitki yapraklarındaki hastalık belirtilerini tespit etmek için kullanılan önemli bir araçtır. Makine öğrenimi ve görüntü işleme yöntemlerini birleştirerek bu alanda ilerleme sunmaktadır. Veri toplama yöntemleri arasında açık veri kümeleri ve tarım alanlarının görüntülerini tespit etmek için dronlar veya kameralar bulunmaktadır. Toplanan görüntülerin ön işlenmesi, modelin doğruluğunu artırmak için önemlidir. Alhwaiti vd. (2025), şeftali ve çilek bitkilerinde görülen bakteri lekeleri ve yanık hastalıklarının tespit edilmesinde YOLOv4 modeli kullanılarak %98 oranında doğruluk elde etmiştir. Mathew ve Mahesh (2021), YOLOv5 modelini kullanarak dolmalık biber de bakteriyel hastalıkların meydana getirdiği lekeleri

yüksek hız ve doğrulukta tespit eden bir sistem geliştirdiler. Liu ve Wang (2020), gerçek doğal ortamda domates bitkisindeki hastalıkların tespiti için bir görüntü piramidi oluşturmuşlar ve çok ölçekli özellik algılama özelliği ile çalışan bir YOLOv3 derin öğrenme modeli geliştirmiştir. Ali vd. (2024), turunçgiller de Antraknoz, Melanoz ve Bakteriyel Kahverengi Leke hastalıklarının tespiti için CCL'20 veri setini kullanarak YOLOv5, YOLOv7 ve YOLOv8 modellerinin her birisini ayrı ayrı eğiterek performans karşılaştırması yapmış ve YOLOv8 modelinin %96,1 mAP@50-95 başarı oranı ile en iyi performans verenin modelin YOLOv8 olduğunu ortaya koymuşlardır. Bu sistemler tarımsal üretimdeki zorlukların aşılmasında vazgeçilmez araçlar haline geldiği bu örneklerde açıkça görülmektedir.

Sulama Yönetimi

YOLO algoritmaları, sulama tekniği optimizasyonunda önemli bir hususdur ve akıllı sulama sistemlerinin su kullanımını optimize etmesini ve tarımsal üretimin artırılmasına katkı sağlamaktadır. Wolter-Salas vd. (2023), WS-YOLO modelini kullanarak geliştirmiş oldukları iyi verimli fenotipleme platformu, marul fidelerindeki kuralığın meydana getirdiği stres seviyelerini tespit ederek zamanında tarımsal müdahaleyi mümkün kılmayı hedeflemiş ve bu sayede %93,62 mAP ve %89,31 F1 skoru elde ederek erken stres tespitinde yüksek başarı elde etmiştir. Jayakrishna ve Ganesh (2025), DAD-YOLO modelini kullanarak yürütmüş oldukları çalışmada kanalizasyon ile kirlenmiş olan nehir sularında bulunan zararlı mikro organizmaların, muz bitkisinde besin eksikliğine yol açtığını tespit ettiler ve bu mikro organizmaların % 97 doğruluk oranı ve %94,6 duyarlılık ve %96,5 mAP ile başarılı bir şekilde sınıflandırıldığı ortaya konmuştur. Toprak nemi, hava durumu ve bitki su kullanımı gibi bilgileri değerlendirerek, bu sistemler sulama programlarını otonom olarak değiştirebilir (Karmakar ve Sarkar, 2021). Böylece verimsiz sulama teknikleri su israfına ve bitki sağlığının bozulmasına yol açarken YOLO tabanlı sistemler verimli su kullanımı ve bitki sağlığını korunmasını sağlamaktadır.

Zararlıların Tespiti

Dünya nüfusunun sürekli olarak artışı, tarım endüstrisinin gıda üretim kapasitesini artırması gerekliliğini beraberinde getirmektedir. Ancak, zararlılar bitki verimliliğini azaltarak bitki sağlığını tehlikeye atmaktadır. Geleneksel zararlı tespit yöntemleri genellikle gözlemlere ve kişisel deneyimlere dayanır, bu da yanlış teşhis olasılığını artırır. Bu sorunun çözümünde etkili yaklaşımlardan biri derin öğrenmedir. YOLO (You Only Look Once) zararlıları tespit etmek için en popüler derin öğrenme tekniklerindendir. Lippi vd. (2021), fındık bahçelerinde zararlı böceklerin tespiti için geliştirilen YOLO tabanlı derin öğrenme sistemi, doğal ortamdan toplanan özel bir veri kümesi ile eğitilerek yaklaşık %94,5 oranında bir doğruluk elde etmişlerdir. Dong vd. (2024), tarımsal zararlıların gerçek zamanlı tespiti için geliştirdikleri PestLite modeli, YOLOv5 modelini temel alarak MTSPPF, involution, ECA ve CARAFE gibi gelişmiş mekanizmalar sayesinde hem doğruluk oranını artırmıştır. IP102 veri kümesi üzerinde yapılan testlerde %90.7 mAP50 başarısına ulaşmıştır. Tang vd. (2022), tarımsal zararlılar küçük boyutlu olmaları birbirlerine olan benzerlikleri sebebiyle görüntü işleme tabanlı tespitte yaşanan zorluklara çözüm sunabilmek amacıyla geliştirdikleri Pest-YOLO yöntemi,

geliştirmişler ve 28.000 zararlı görseli içeren bir veri kümesi üzerinde %71.6 mAP ve %83.5 Recall başarı oranı elde etmiştir. Luo vd. (2023), tarımsal zararlıların tespiti ve tanımlama zorluklarına çözüm sağlamak amacıyla geliştirdikleri YOLO tabanlı yazılım hızlı ve doğru özellik çıkarımı ve eş zamanlı olarak nesne tespiti yeteneği sayesinde %92.42 mAP ve %96.8 doğruluk oranı ile yüksek bir başarı oranı göstermiştir.

Yabancı Ot Tespiti

Tarımda yabancı otların tespiti, sebze, meyve ve diğer ekinlerin üretiminde verimliliği ve tarımın sürdürülebilirliğini artırmak açısından büyük önem arz etmektedir. Yabancı otlar tüm ekinlerde su, güneş ışığı ve diğer besin maddeleri gibi kaynakları tüketerek ekinlerde verim kaybına sebep olmaktadır. Dang vd. (2023), pamuk üretimindeki önemli tehditlerden birisi olan yabani otların tespiti için YOLOv3 den YOLOv7 modeline kadar 7 farklı YOLO modeli ile toplam 25 tane YOLO tabanlı dedektörler karşılaştırılmış Monte-Carlo çapraz doğrulaması ile YOLOv4 %95.22 mAP@0.5 doğruluğu ile en yüksek performansı göstermiştir. Chen vd. (2022), susam bitkisi içerisindeki yabancı ot tespiti yapmıştır. Susam bitkisi diğer yabancı otlar ile benzer morfolojik özelliklere sahip olması nedeniyle, güvenilir bir tespite ihtiyaç duyulmaktadır. Bu sorunu çözmek için YOLOv4 mimarisi temel alınarak YOLO-susam modeli geliştirilmiştir. Bu model Fast R-CNN, SSD, YOLOv3, YOLOv4 ve YOLOv4-tiny gibi diğer modeller ile karşılaştırıldığında çok daha yüksek performans gösterdiği saptanmıştır. Susam ve yabancı otlar için sırasıyla 0.91 ve 0.92 F1 skoru ile %96.16 mAP değeri elde edilmiştir. Parico ve Ahamed (2020), YOLOv3 tabanlı bir yabancı ot tespit sistemi olan YOLO-WEED geliştirilmiştir. Yaklaşık 5 dakikalık bir IHA görüntüsünden elde edilen veri kümesinden elde edilen eğitim, doğrulama ve test aşamaları için sırasıyla %69, %17 ve %13 oranında bölünmüştür. NVIDIA GeForce GTX 1060 donanımı ile 24.4 FPS ‘e kadar gerçek zamanlı nesne tespit hızı %93.81 mAP değeri ile 0.94 F1 skoru elde ederek yüksek performans ortaya koymuştur.

Tarımsal Verimliliğin Analizi

Gıda talebi küresel nüfus artışına paralel olarak kayda değer bir şekilde artış göstermektedir. Bu durum, tarımsal üretim kapasitesinin artırılmasını zorunlu kılmaktadır. Büyük ölçekli veri kümelerinin analizi aracılığıyla YOLO, daha yüksek doğrulukta tahminler üretme imkânı sunmaktadır. Badgujar vd. (2024) Tarımda nesne tespit sistemlerinde YOLO algoritmasının kullanımına yönelik gerçekleştirmiş oldukları kapsamlı sistematik ve bibliyometrik incelemeler, izleme, gözetim, gibi pek çok alanda yüksek potansiyele sahip olduğunu ortaya çıkartmışlardır. YOLO Algoritmasının ilk sürümü olan Alif ve Hussian (2024), YOLOv1 den güncel sürümlerinden olan YOLOv10 ‘a kadar ki gelişimini tarım alanındaki kullanımları bağlamında ele alarak detaylı bir inceleme gerçekleştirmiş ve sürdürülebilir tarım üzerindeki katkılarını detaylı olarak almıştır. Ajayi vd. (2023), YOLOv5s modelini kullanarak farklı epoch (eğitim döngüsü) senaryolarından elde ettikleri sonuçlara neticesinde otomatik ürün ve yabancı ot tespitinde en yüksek doğruluğun 600 epoch’ta elde edilebildiğini rapor etmiştir. Zoubek vd. (2025) YOLOv5-x modelinin farklı parametreler kullanılarak YOLOR-D6 ve YOLOv7-D6

modelleri ile karşılaştırıldığı çalışmada özellikle turp bitkisi ve yabancı otların tespit edilmesinde sırasıyla %99, %98 ve %91 başarı oranları elde edilerek mAP_0.5:0.95 skorları elde edilmiştir. Bu çalışmalardan görüldüğü üzere YOLO modelleri tarımsal üretim tahmini için önemli faydalar sunmaktadır.

Hasat Sistemleri

Literatürde YOLO modelleri kullanan bilgisayarlı görüş tabanlı meyve toplama robotları oluşturma konusunda çalışmalar oldukça yaygındır. Magalhães vd. (2021), bir serada domates tanımlaması için YOLO ve modellerini değerlendirerek sera tabanlı domates hasadı uygulamalarında YOLO modellerinin potansiyelini göstermiştir. Bini vd. (2022) domates meyvesi tanıma ve ürün verimi tahmini için YOLOv5 modelinin kullanmıştır. Ayrıca hasat robotlarının geliştirilmesi için çok önemli olan gerçek zamanlı çalışmasının önemini vurgulamıştır. Nergiz (2023), YOLOv7 modelini kullanarak gerçekleştirmiş olduğu bir çalışmada çilek meyvelerinin altı farklı renk sınıfında (yeşil, beyaz, erken dönüşüm, dönüşüm, geç dönüşüm ve kırmızı) başarılı bir şekilde tespit edilmiş ve mAP@0.5 değeri 0.558 ve mAP@0.5:0.95 değeri 0.46 olarak raporlanmış ve böylece dengesiz etiket dağılımı ve belirsiz etiketlenme evresine rağmen gerçek zamanlı uygulamalarda kullanılabilir olduğunu ortaya çıkarmıştır.

Hayvan Sağlığı Takibi

Tarım da hayvancılık ülkelerin, gıda güvenliği, kırsal geçim kaynaklarının sürdürülebilirliği ve ekonomik kalkınma açısından büyük önem arz etmektedir. Bu nedenle tarımda hayvancılığın sürdürülebilirliği açısından hayvan sağlığı takibi önemli bir yer tutmaktadır. Krishnaveni ve Arvinth (2025), çiftlik ortamında YOLO algoritmasını kullanarak, gerçek zamanlı nesne tespit yetenekleri ile OpenCV kütüphanesini birleştiren bir yaklaşım ile çiftlikdeki video görüntülerinde bulunan hayvanların tespiti ve sınıflandırılmasını sağlayan bir sistem geliştirerek %98 oranında başarı elde etmişlerdir. Paramathma vd. (2024), tavuklara ait patolojik özelliklerin tespit edilebilmesi amacıyla kümesteki tavuk görüntülerinden oluşan 500 adet görüntü ile elde edilmiş olan veri kümesini kullanarak tavuklar üzerindeki “kabuklanma”, “şişlik”, “felç” ve “sağlıklı” sınıfları kapsamında değerlendirilerek YOLOv8 modeli eğitilmiş ve eğitilen bu model yüksek başarı oranı göstererek 0.86 F1 skoruna ulaşmıştır. Nithisha vd. (2024), tarımsal ortamda hayvan sağlığını tehdit eden kağıt ve plastik atıklarının tespiti için YOLO tabanlı, nesnelerin interneti (IoT) teknolojisi kullanan bir sistem geliştirdiler. Hayvan sağlığı için zararlı olan bu maddeler hayvanlar tarafından tüketilmesini engellemek için bir uyarı sesi (buzzer) üretmektedir.

SONUÇ

Bu çalışma, YOLO (You Only Look Once) algoritmasının tarım sektöründe sahip olduğu dönüştürücü potansiyeli kapsamlı bir şekilde ortaya koymaktadır. Nüfus artışı, işgücü eksikliği, iklim değişikliği ve doğal kaynakların tükenmesi gibi küresel krizler, tarımsal üretimi tehdit

ederken, YOLO'nun gelişmiş nesne tanıma yetenekleri sayesinde tarımda karşılaşılan birçok soruna etkili çözümler sunmaktadır. Akademik makaleler ve çeşitli uygulamalara dayanan analizler, YOLO'nun erken bitki hastalığı teşhisi, yabancı otların hızlı tespiti ve hassas hasat zamanlaması gibi kritik süreçlerde üretkenliği artırdığını göstermektedir. Ayrıca hayvancılık yönetiminde hayvan davranışlarının izlenmesi ve kalite kontrol süreçlerinde kusurların tespiti gibi alanlarda da önemli katkılar sağladığı gözlemlenmiştir. Geleneksel yöntemlere göre daha hızlı, doğru ve düşük maliyetli çözümler sunan YOLO destekli sistemler hem ürün kaybını azaltmakta hem de ürün kalitesini artırmaktadır. Çalışma, ayrıca YOLO modellerinin dijital tarım uygulamalarında, sulama optimizasyonunda ve bitki sağlığı izleme gibi süreçlerde geleneksel yöntemlerden daha verimli olduğunu görülmüştür. Sonuç olarak bu araştırma YOLO modellerinin tarımda kullanımının ne kadar önemli ve gerekli hale geldiğini vurgulamakta, gelecekte daha sürdürülebilir, dayanıklı ve teknolojik olarak gelişmiş bir tarım ortamı oluşturmak için bu tür teknolojilerin kullanımının teşvik edilmesi gerektiğini önermektedir.

ABSTRACT

Today, the agricultural sector is in a radical transformation process with the impact of rapid developments in information technologies. In this transformation, technologies such as artificial intelligence, machine learning, deep learning, modelling, simulation and image processing come to the fore. Smart agriculture applications supported by sensors, unmanned aerial vehicles (UAVs), robotic systems, autonomous tractors and big data analytics make production processes more efficient, sustainable and environmentally friendly. Image processing techniques have been used for some time in many areas such as plant health monitoring, plant disease and pest detection, weed separation and crop classification. By performing these applications using machine learning and deep learning algorithms, operations can be performed automatically, and more accurate and faster results are obtained. In addition, with real-time and automated expert systems, agricultural decision-making processes are optimized, human errors are reduced, and resource use can be managed more effectively. The integration of these technologies with agricultural machinery and robotic systems enables digitalization and automation in agriculture by going beyond the traditional understanding of agriculture.

In this study, the basic concepts of machine learning are discussed and basic definitions and methods in this field are given. Firstly, the basics of machine learning are explained and its subtypes such as supervised learning, unsupervised learning, semi-supervised learning and reinforcement learning are detailed. Within the scope of each learning type, the working principles of commonly used algorithms are mentioned. Applications in the agricultural constituted one of the focal points of the study. In particular, how machine learning techniques are used in smart agriculture applications such as early diagnosis of plant diseases, crop yield prediction, irrigation and fertilization optimization, and agricultural automation systems are explained with examples. In addition, intelligent systems used in animal health monitoring and productivity analyses in animal husbandry are also evaluated. In this context, the contributions of machine learning to agricultural decision support systems and its potential for future use are discussed.

Keywords: Machine learning, Supervised Learning, Unsupervised Learning, Semi-Supervised Learning, Reinforcement Learning

TARIMDA MAKİNE ÖĞRENMESİ UYGULAMALARI

ÖZET

Günümüzde tarım sektörü, bilişim teknolojilerindeki hızlı gelişmelerin etkisiyle köklü bir dönüşüm sürecindedir. Bu dönüşümde, yapay zekâ, makine öğrenmesi, derin öğrenme, modelleme, simülasyon ve görüntü işleme gibi teknolojiler ön plana çıkmaktadır. Sensörler, insansız hava araçları (İHA), robotik sistemler, otonom traktörler ve büyük veri analitiği ile desteklenen akıllı tarım uygulamaları, üretim süreçlerini daha verimli, sürdürülebilir ve çevre dostu hâle getirmektedir. Görüntü işleme teknikleri bitki sağlığının izlenmesi, bitki hastalık ve zararlılarının tespiti, yabancı otların ayrıştırılması ve ürün sınıflandırması gibi birçok uygulamada bir süredir kullanılmaktadır. Bu uygulamaların makine öğrenmesi ve derin öğrenme algoritmaları kullanılarak gerçekleştirilmesiyle işlemler otomatik olarak gerçekleştirilebilmekte, daha doğru ve hızlı sonuçlar elde edilebilmektedir. Ayrıca, gerçek zamanlı ve otomatik çalışan uzman sistemler ile tarımsal karar verme süreçleri optimize edilmekte, insan hataları azaltılmakta ve kaynak kullanımı daha etkin bir şekilde yönetilebilmektedir. Bu teknolojilerin tarım makineleri ve robotik sistemlerle entegrasyonu, geleneksel tarım anlayışının ötesine geçerek tarımda dijitalleşmeyi mümkün kılmaktadır.

Bu çalışmada, makine öğrenmesine ilişkin temel kavramlar ele alınarak, bu alandaki temel tanımlamalara ve yöntemlere yer verilmiştir. Öncelikle, makine öğrenmesinin temelleri anlatılmış; denetimli öğrenme, denetimsiz öğrenme, yarı denetimli öğrenme ve takviyeli öğrenme gibi alt türleri detaylandırılmıştır. Her bir öğrenme türü kapsamında yaygın olarak kullanılan algoritmaların çalışma prensiplerine değinilmiştir. Tarımsal uygulamalar ise çalışmanın odak noktalarından birini oluşturmuştur. Özellikle bitki hastalıklarının erken teşhisi, ürün verim tahmini, sulama ve gübreleme optimizasyonu gibi akıllı tarım uygulamaları ile tarımsal otomasyon sistemlerinde makine öğrenmesi tekniklerinin nasıl kullanıldığı örneklerle açıklanmıştır. Ayrıca hayvancılıkta hayvan sağlığı takibi ve verimlilik analizlerinde kullanılan akıllı sistemler de değerlendirilmiştir. Bu bağlamda, makine öğrenmesinin tarımsal karar destek sistemlerine katkıları ve gelecekteki kullanım potansiyeli tartışılmıştır.

Anahtar Kelimeler: Makine öğrenmesi, Denetimli Öğrenme, Denetimsiz Öğrenme, Yarı Denetimli Öğrenme, Takviyeli Öğrenme

1. GİRİŞ

Makine öğrenmesi, yapay zekanın bir alt dalıdır. Öncelikle, çeşitli algoritmalar ve teknikler kullanılarak geçmiş verilere bakılmakta ve veriler arasındaki karmaşık desenleri belirleyecek matematiksel modeller oluşturulmaktadır. Daha sonra bu modeller, belirli bir hedef üzerine tahmin yapmak için kullanılmaktadır. Makine öğrenmesi yöntemleri arasında k-en yakın komşu algoritması, Naive Bayes sınıflandırıcısı, karar ağaçları, lojistik regresyon analizi, k-ortalamalar algoritması, destek vektör makineleri ve yapay sinir ağları gibi yöntemler bulunmaktadır. Bu yaklaşımların bazıları tahmin ve kestirim yapabilirken, bazıları veri kümeleme ve sınıflandırma gibi yeteneklere sahiptir (Özgüven, 2019). Makine öğrenmesinin amacı, önceden görülmemiş bir girdi için doğru tahminler yapmak veya kararlar vermek ve bu süreçleri otomatikleştiren verimli algoritmaların geliştirilmesidir. Algoritmalar geliştirilirken, bir uzmanın bir karar verirken nelere dikkat ettiğiyle ilgili kriterler göz önünde bulundurulmalıdır. Makine öğrenmesi yöntemlerinin uygulanmasında hesaplama, eğitim ve eğitilmiş algoritmanın uygulanması gibi karmaşıklıklar bulunmaktadır. Bir algoritmanın performansı genellikle test hatasıyla değerlendirilmektedir. Ayrıca, bir algoritma çalışırken, birçok test noktası bulunabilmekte ve bu noktalarda hızlı kararlar alınması gerekmektedir. Bu nedenle, test işleminin düşük hesaplama yüküne sahip olması önemlidir (Ozguven, 2023).

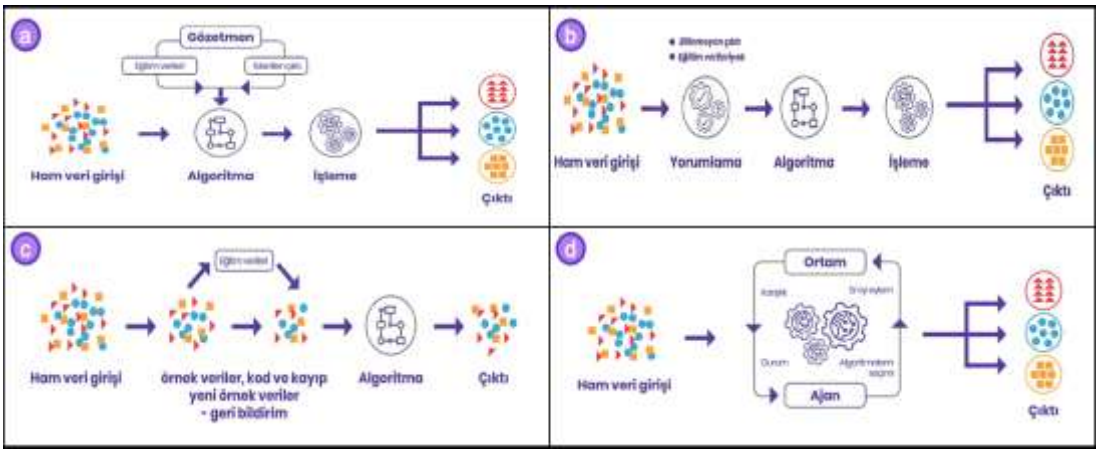
Makine öğrenmesi, sistemlerin açıkça programlanmadan deneyimlerden öğrenmesini ve gelişmesini sağlayan bir yapay zekâ uygulamasıdır. Makine öğrenimi teknikleri, geçmiş eğilimleri belirlemek ve gelecekteki modelleri bilgilendirmek için veri madenciliğinden yararlanmaktadır. Makine öğrenmesi, bilgisayarların verileri analiz etmesine ve kalıpları belirlemesine olanak tanıyan istatistiksel öğrenme ve optimizasyon yöntemlerini kullanmaktadır. Makine öğrenmesi uygulamaları yeni verilerle beslenmekte ve bağımsız olarak öğrenebilmekte, büyüyebilmekte, gelişebilmekte ve uyum sağlayabilmektedir. Ayrıca makine öğrenmesi algoritmalarının performansı, öğrenme süreci sırasında kullanılabilir gözlem sayısının artmasıyla uyarlanabilir şekilde iyileşebilmektedir (Gupta ve ark., 2025).

2. MAKİNE ÖĞRENMESİ TÜRLERİ

Makine öğrenmesinin çeşitli türleri bulunmakla birlikte en sık dört türüne rastlanmaktadır. Bunlar; Denetimli makine öğrenmesi, Denetimsiz makine öğrenmesi, Yarı denetimli makine öğrenmesi, Takviyeli makine öğrenmesi şeklindedir.

Denetimli öğrenme, modelin etiketlenmiş veri setiyle giriş-çıkış ilişkilerini öğrenmesini amaçlayan bir makine öğrenmesi yöntemi olup, algoritmalar bu verilerden örüntüler çıkararak yeni girdiler için tahmin yapmaktadır ve başarısı, öğrendiği kuralların yeni verilere ne kadar doğru uygulandığıyla ölçülmektedir (Şekil 1.a). Denetimsiz öğrenme ise etiketlenmemiş verilerde desenleri ve yapıları keşfetmeyi hedefleyerek veri noktaları arasındaki benzerlikleri değerlendirip gruplama yapmakta veya boyut indirgeme yoluyla veriyi daha sade hale getirmekte, büyük ve karmaşık veri kümelerinde gizli yapıları ortaya çıkarmada etkili olmaktadır (Şekil 1.b). Yarı denetimli öğrenme, denetimli ve denetimsiz öğrenme tekniklerini birleştirerek az sayıda etiketli veriyle modelin genelleme yeteneğini artırırken, etiketleme maliyetinin yüksek olduğu durumlarda kullanışlı olup sınıflandırma ve tahmin gibi

problemlerde etkili olmaktadır (Şekil 1.c). Şekil 1.d'de gösterilen Takviyeli öğrenme ise modelin ödül sinyalleri aracılığıyla karar alma süreçlerini iyileştirdiği bir yöntem olup, ürettiği çıktılara yönelik geri bildirim alarak en iyi stratejiyi belirlemeye çalışmakta ve özellikle yazılım ajanlarının en yüksek kümülatif ödülü elde etmeyi öğrenmesinde kullanılmaktadır (Bishop, 2006; Hastie ve ark., 2009; Alzubi ve ark., 2018; Rizvanche, 2020; Mahesh, 2021; Kuru, 2023).



Şekil 1. a) Denetimli öğrenme, b) Denetimsiz öğrenme, c) Yarı denetimli öğrenme ve d) Takviyeli öğrenme çalışma prensibi (Turhost, 2021).

3. MAKİNE ÖĞRENMESİ MODELLERİ

Makine öğrenmesi modelleri, veri analizi, desen tanıma ve tahmin yapma süreçlerinde kullanılan algoritmalardır. Veri türü, problem yapısı ve hedeflenen çıktı doğrultusunda en uygun model seçimi yapılarak, doğruluk ve verimlilik en üst düzeye çıkarılmaya çalışılmaktadır. Makine öğrenimindeki öğrenme modelleri, Şekil 2'de görüldüğü gibidir.

Şekil 2. Makine öğrenmesi modelleri

Regresyon, geçmiş verilerin süreklilik gösteren sayısal değerlerden oluştuğu durumlarda, bu değerlerden denetimli olarak bir eğri modeli üretme işlemidir (Alpaydın, 2004).

Kümeleme, Geçmiş verilerin hangi sınıf içerisinde yer aldığı belirtilmediği veya bilinmediği durumda verilerin benzerliklerine göre denetimsiz olarak ayrıştırılması işlemidir (Alpaydın, 2004; Liakos ve ark., 2018).

Bayes Modelleri (Bayesian Models), bilinmeyen değişkenlerin sonraki dağılımı üzerinden entegrasyon yaparak ön bilginin eksik veya belirsiz olduğu durumlarda bile ilkeli çıkarım yapılmasına olanak sağlayan bir yöntem olarak tanımlanmaktadır (Lampinen and Vehtari, 2001).

Örnek Tabanlı Modeller (Instance Based Models), model eğitimi yerine doğrudan veri örnekleriyle çalışır. Öğrenme yerine benzerlik karşılaştırmasına dayalı yapısıyla ayırt edilmektedir (Liakos ve ark., 2018).

Karar Ağaçları (Decision Trees), çok sayıda kayıt içeren bir veri kümesini, bir dizi karar kuralları uygulayarak daha küçük kümelere bölmek için kullanılan bir yapıdır (Albayrak ve Yılmaz, 2009).

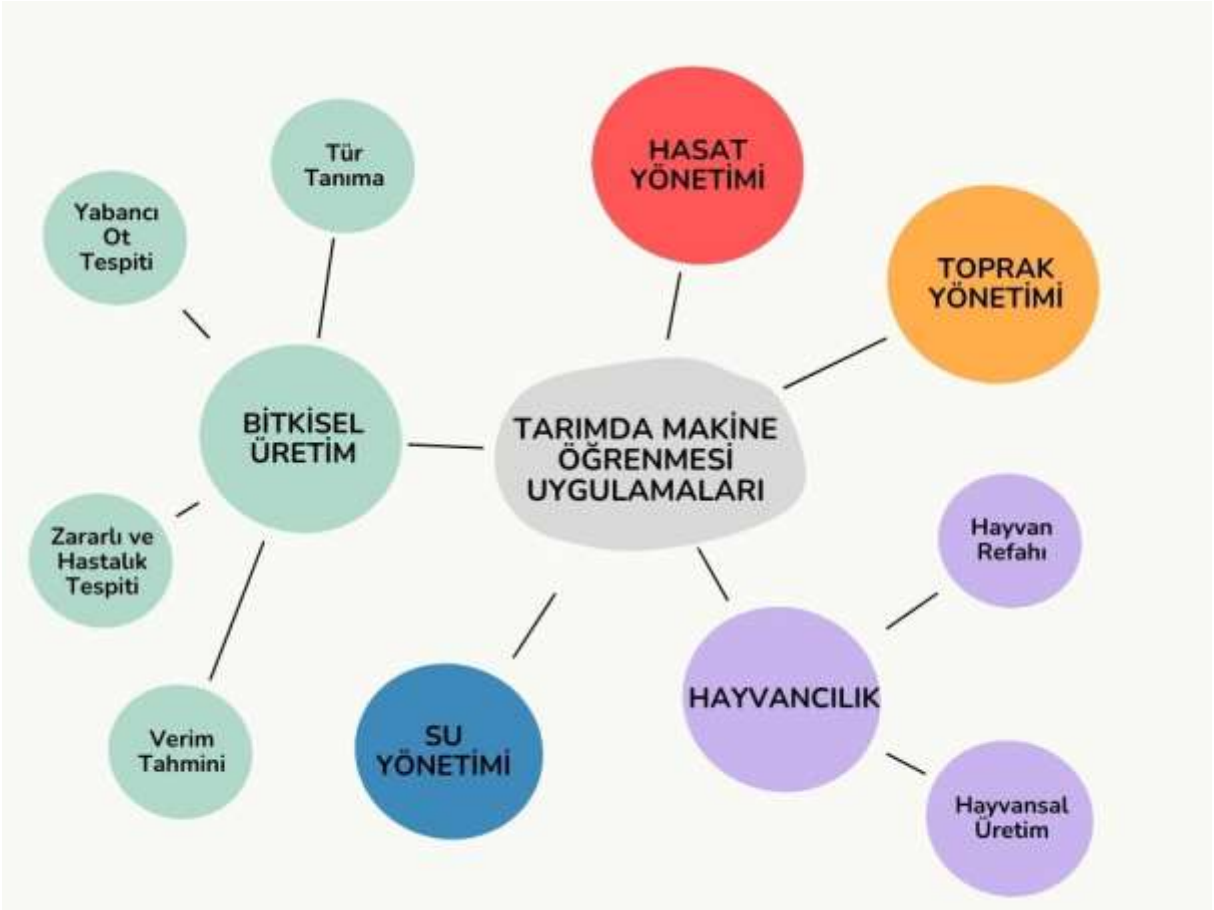
Destek Vektör Makineleri (Support Vector Machines-SVM), verilerin sınıflandırılmasına ve regresyon analizine yardımcı olan denetimli bir öğrenme tekniğidir. SVM, verileri ilgili sınıflara bölen bir hiper düzlem bulmaya çalışmaktadır. En basit düzeyde, bir hiperdüzlem, verileri karşılık gelen sınıflara bölen düz bir çizgidir. Destek vektörleri, bir hiper düzleme en yakın veri noktalarıdır (Kulkarni ve ark., 2020).

Topluluk Öğrenimi (Ensemble Learning), daha iyi genelleme performansı elde etmek için birkaç bireysel modeli birleştirmektedir. Örneğin derin topluluk öğrenimi modelleri hem derin öğrenme modellerinin hem de topluluk öğreniminin avantajlarını birleştirmekte ve böylece son model daha iyi genelleme performansına sahip olmaktadır (Ganaie ve ark., 2022).

Yapay Sinir Ağları (Artificial Neural Networks-ANN), çok sayıda bağlantılı yapay nöron aracılığıyla öğrenme gerçekleştiren modellerdir. Genelleme özelliği sayesinde, geçmişteki olaylardan veya örneklerden karmaşık ilişkileri öğrenebilme ve örüntü tanıma kabiliyetleriyle öne çıkmaktadır (Öztemel, 2006; Liakos ve ark., 2018).

4. TARIMDA MAKİNE ÖĞRENMESİ UYGULAMALARI

Makine öğrenmesi, tarımsal üretimde büyük veri teknolojilerine bağlı olarak birçok uygulamada yararlar ve kolaylıklar sağlamaktadır. Bitkisel üretimde; verim tahmini, hastalık ve yabancı ot tespiti, bitki sınıflandırma, su, toprak ve hasat yönetimi gibi konularda kaynakların daha verimli kullanılması ve sürdürülebilir tarım uygulamalarının desteklenmesi açısından önemli avantajlar sunmaktadır. Hayvansal üretimde ise hayvan hastalıklarının tespiti, uygun yem rasyonlarının hazırlanması, hayvan davranışlarının belirlenmesi gibi konularda hayvan refahının sağlanması ve üretim verimliliğinin artırılmasında rol oynamaktadır. Şekil 3'de, tarımda yaygın olarak kullanılan makine öğrenmesi uygulamalarını gösteren bir zihin haritası yer almaktadır.



Şekil 3. Tarımda makine öğrenmesi uygulamaları

Tarımda makine öğrenmesi uygulamalarının karmaşık veri kümelerinin analizini kolaylaştırdığı, veriye dayalı karar almaya olanak sağladığı, öznel uzmanlığa olan bağımlılığı azalttığı ve çiftlik yönetim stratejilerini iyileştirdiği vurgulanmaktadır. Veri kullanılabilirliği, model yorumlanabilirliği, ölçeklenebilirlik, güvenlik endişeleri ve kullanıcı arayüzü tasarımı gibi ML metodolojilerinin yaygın olarak benimsenmesini engelleyen zorluklara rağmen, paydaşlar arasındaki iş birliği çabaları bu engellerin üstesinden gelinmesine yardımcı olabilecektir (Waqas ve ark., 2025).

4.1. BİTKİSEL ÜRETİM

4.1.1. VERİM TAHMİNİ

Tarımda makine öğrenmesi uygulamaları, bitkisel üretimde verim tahminini mümkün kılmaktadır. Böylece ekimden hasada kadar olan süreçte verim miktarı önceden belirlenerek üretim planlaması daha verimli yapılabilmektedir. Bununla birlikte zaman optimizasyonu

sağlarken, manuel tahminlere kıyasla hata oranını en aza indirmekte ve tarımsal karar alma süreçlerini daha etkin hale getirmektedir.

Bu bağlamda örnek olarak Hou ve ark. (2025) yaptıkları çalışmada, makine öğrenmesi yöntemleriyle yer fıstığının verim tahminini yapmaya çalışmışlardır. Bu amaçla çalışmada 2022, 2023 ve 2024 yıllarında iki farklı ekim deseninden 355 yer fıstığı verim örneği toplanmış ve tahmin modelleri geliştirilmesi için doğrusal regresyon ve rastgele orman olmak üzere iki modelleme yöntemi kullanılmıştır. Çalışma sonucunda R^2 değerinin 0.8201 gibi yüksek bir değere ulaştığını, en düşük MAE ve RMSE değerlerinin ise sırasıyla 0.2878 ve 0.4048 t/ha olarak bulunduğu belirtilmiştir. Araştırıcılar, doğrusal regresyon modeli ve makine öğrenmesi algoritmaları kullanılarak çeşitli özelliklerin entegre edilmesinin, farklı ekim mevsimleri ve bölgelerdeki yer fıstığı veriminin modellenmesinde güvenilir bir çerçeve sağladığını bildirmiştir.

4.1.2. ZARARLI VE HASTALIK TESPİTİ

Bitki zararlı ve hastalıkları, ürünlerin veya bitkilerin bir kısmının yok olmasına neden olarak gıda üretimini azaltmakta ve gıda güvensizliğine yol açmaktadır (Ramesh ve ark., 2018). Bu nedenle, makine öğrenmesi uygulamalarıyla zararlı ve hastalıkların hızlı bir şekilde tespit edilmesi, ortaya çıkardıkları zararların önlenmesini sağlayacaktır. Böylece, bitkisel üretim süreçlerinde hastalık ve zararlılardan kaynaklanan hasar en aza indirilebilecektir. Bu anlamda makine öğrenmesinin zararlı ve hastalık tespiti uygulamalarına örnek olarak;

Zimmermann ve ark. (2025) yaptıkları çalışmada, seralarda domates yetiştiriciliğinde görülen belirli hastalıkların makine öğrenmesi algoritmalarıyla tanımlamaya çalışmışlardır. Çalışmada, sera domatesi üreticileriyle iş birliği içinde veri toplanmıştır. Araştırıcılar, çalışma için 256x256 piksel görüntü boyutlarına ve 15.256 görüntüye sahip Domates Yaprağı Görüntü Veri Kümesi ve 32x32 piksel yama boyutlarına ve 227.218 görüntüye sahip Yama Domates Yaprağı Görüntü Veri Kümesi olmak üzere iki yeni veri kümesi oluşturmuştur. Her iki veri kümesi de dört tür hastalık, aynı yaprak üzerinde iki hastalık kombinasyonu ve sağlıklı yaprak olmak üzere yedi sınıftan oluşturulmuştur. Araştırıcılar, üç evrişimli sinir ağı, özelleştirilmiş bir CNN, VGG19 ve Resnet50 ile sert ve yumuşak kararlar kullanan iki oylama sınıflandırma yöntemini birleştirmeyi önermiştir. Araştırıcılar, veri kümeleri üzerinde yapılan değerlendirmede, patch'ler kullanıldığında sonuçların önemli ölçüde iyileştiğini, %90.48'lik bir doğruluğa ulaşıldığını ve hastalığın evresini belirlemenin mümkün olduğunu bildirmiştir.

4.1.3. YABANCI OT TESPİTİ

Yabancı ot kontrol yönetiminde kritik bir aşama, uygulanacak herbisit türünün ve mücadele yöntemlerinin belirlenmesinde temel oluşturan yabancı otların doğru bir biçimde tanımlanmasıdır (Firmansyah ve ark., 2022). Tarımda makine öğrenmesi uygulamaları sayesinde, görsel veriye dayalı sınıflandırma ve tanıma algoritmaları kullanılarak tarla içerisindeki yabancı otlar ile kültür bitkileri yüksek doğrulukla ayırt edilebilmektedir.

Bu bağlamda, Lambert ve ark. (2019) İHA ve makine öğrenmesi algoritmaları ile buğday tarlalarında yüksek zarara yol açan bir yabancı ot olan kara ot haritalanmıştır. Bu amaçla, iki yıl boyunca 102 tarladan multispektral görüntü verisi toplanmış ve bunların 76'sını analizlerde kullanılabilecek nitelikte olduğu belirlenmiştir. Araştırıcılar, bu verilerden bitki örtüsü indeksi oluşturarak sıfırdan özel bir evrişimli sinir ağı (CNN) modeli eğitmiş ve modelin başarısını artırmak amacıyla veri dengeleme ve temizleme gibi çeşitli veri mühendisliği yöntemleri uygulamıştır. Çalışma sonuçlarına göre, kullanılan veri toplama yöntemi ve CNN uygulamasının, literatürdeki önceki yaklaşımlardan daha başarılı sonuçlar verdiği bildirilmiştir.

4.1.4. BİTKİLERİN SINIFLANDIRILMASI

Bitkilerin doğru sınıflandırılması, tarımsal üretim ve biyolojik çeşitliliğin korunması açısından önemlidir. Makine öğrenmesi algoritmaları sayesinde bitkiler otomatik ve hızlı şekilde sınıflandırılabilmekte, özellikle geniş tarım alanlarında izleme ve kayıt işlemleri kolaylaşmaktadır. Bu sayede insan hataları azalmakta ve karar verme süreçleri desteklenmektedir.

Bu bağlamda, Liu ve ark. (2022) yaptıkları çalışmada bitki görüntüsünü sınıflandırmak için hiperspektral görüntüleme ve derin öğrenme teknikleri birleştirilmiştir. Çalışmada, 470-900 nm aralığında çalışan hiperspektral kamera ile 30 farklı bitki çeşidine ait 1 500 görüntüden oluşan bir bitki görüntü veri kümesi oluşturmuş ve görüntü sınıflandırması yapmak için hafif bir geleneksel sinir ağı (LtCNN) modeli tasarlanmıştır. Araştırıcılar, karşılaştırma amacıyla birkaç CNN sınıflandırıcısı da seçmiştir. Önerilen LtCNN modelinin, yeşil kenar (591 nm), kırmızı kenar (682 nm) ve yakın kızılötesi (762 nm) bantlarının kritik spektral özelliklerini kullanarak bitki sınıflandırmasında tatmin edici bir performans (kappa= 0.95) elde edildiğini bildirilmiştir. Araştırıcılar, LtCNN modelinin AlexNet, GoogLeNet ve VGGNet gibi karmaşık CNN modellerine kıyasla daha az sayıda eğitim verisiyle çalışırken canlı taç görüntülerindeki yaprak özelliklerini tanımada yüksek uyumluluğa sahip olduğunu da belirtmiştir.

4.2. HASAT YÖNETİMİ

Hasat yönetiminde makine öğrenmesi algoritmaları; toprak koşulları, bitki sağlığı ve hava tahminleri gibi çeşitli verileri analiz ederek optimum hasat zamanının belirlenmesine olanak tanımaktadır. Bu sayede çiftçiler, hasat için en uygun koşulları saptayarak zararlı istilaları veya olumsuz hava koşulları gibi risk faktörlerinden kaynaklanan kayıpları en aza indirebilmekte ve ürün verimliliğini maksimize edebilmektedir (Kumari ve ark., 2024).

Örnek olarak Azadnia ve ark. (2023) yaptığı çalışmada, alıç meyvesinin olgunluk seviyesini sınıflandırmak için makine görüsü sistemini ve derin öğrenme tekniklerini kullanmıştır. Bu amaçla, görüntüleri sınıflandırmak için alıcın üç farklı kategorisi (ham, olgun ve aşırı olgun) elde edilmiş ve görüntüler iyi tasarlanmış bir aydınlatma odası kullanılarak hazırlanmıştır. Çalışmada, derin öğrenmenin (DL) performansını artırmak amacıyla veri artırma yöntemi uygulanmıştır. Araştırıcılar, ön işleme adımından sonra, alıç meyvesinin sınıflandırılması için Inception-V3, ResNet-50 ve konvolüsyonel sinir ağlarına (CNN) dayalı DL modellerinin yeteneklerini değerlendirmiştir. Çalışma sonuçlarına göre, Inception-V3 modelinin %100

doğrulama başarısı ile diğer sınıflayıcıların üzerinde bir başarı gösterdiği bildirilmiştir. Araştırıcılar, CNN ve görüntü işleme tekniklerinin, alıç meyvesinin pazarlanabilirliğini artırmada, israfı kontrol altına almada ve geleneksel sınıflandırma yöntemlerini geliştirmede etkili olabileceğini bildirmiştir.

4.3. HAYVANCILIK

4.3.1. HAYVAN REFAHI

Makine öğrenmesi, hayvan refahı risklerinin erken dönemde belirlenmesine yönelik önemli fırsatlar sunmaktadır. Bu yöntemler sayesinde, büyük ölçekli verilerden anlamlı örüntüler çıkarılarak, olası sağlık sorunları ya da hayvan refahı ile ilgili olabilecek ani değişimler önceden öngörülebilmektedir.

Örnek olarak Barker ve ark. (2018), yaptıkları çalışmada sensörler ve makine öğrenmesi algoritmasıyla süt ineklerinde topallık ve yem yeme davranışı arasındaki ilişkiyi belirlenmiştir. Bu kapsamda, serbest duraklı bir ahırda barındırılan 120 başlık sürüden seçilen 19 yüksek verimli süt ineği (10 topal, 9 topal olmayan) üzerinde, konum ve aktivite verileri beş gün boyunca kesintisiz olarak toplanmıştır. Araştırıcılar, boyuna takılan sensörler aracılığıyla elde edilen konum ve ivme verilerini kullanarak, karar ağacı algoritması ile ineklerin davranışlarını yem yeme, yem yememe ve sağım nedeniyle padok dışında bulunma olmak üzere üç kategori altında sınıflandırmıştır. Her bir davranış türü için günlük ortalama davranış sayısını, ortalama süreyi ve toplam süreyi hesaplanmıştır. Araştırıcılar, topal ve topal olmayan inekler arasında davranış farklılıklarının olup olmadığını belirlemek amacıyla, Welch t-testi ve Benjamini-Hochberg düzeltmesi uygulamıştır. Elde edilen bulgular, topal ineklerin günlük toplam yem yeme süresinin, topal olmayan ineklere kıyasla anlamlı düzeyde daha düşük olduğunu ortaya konulduğu belirtilmiştir. Araştırıcılar sonuçların davranış sınıflandırmasında karar ağaçları gibi yorumlanabilir algoritmaların, sensör verilerinden anlamlı örüntüler çıkarma açısından işlevsel olabileceği bildirilmiştir.

4.3.2. HAYVANSAL ÜRETİM

Makine öğrenmesi, yöntemleri sayesinde, büyük ölçekli verilerden anlamlı örüntüler çıkarılarak, yem tüketimi, süt verimi, büyüme hızı gibi üretimle doğrudan ilişkili parametreler analiz edilebilmekte ve optimize edilebilmektedir. Böylece, üretim sürecindeki olumsuzluklar erken dönemde tespit edilerek, daha etkin yönetim stratejileri geliştirilebilmektedir.

Örnek olarak Fuentes ve ark. (2021) yaptıkları çalışmada, ineklerin kalp atış hızı, solunum hızı ve ani hareketlerini tahmin etmek için RGB kameralarla elde edilen görüntüler üzerinden temassız bilgisayarla görme yöntemleri uygulamış ve göz sıcaklığı, süt verimi ve süt kalitesini tahmin etmek amacıyla makine öğrenmesi modelleri kullanılmıştır. Çalışmada, RGB ve kızılötesi termal videolarını, robotik sağım tesisinde bulunan 102 farklı inekten tekrarlı ölçümlerle (n=150) elde edilmiştir. Araştırıcılar, yalnızca RGB kameralarla elde edilen verileri kullanan ANN modelinin, göz sıcaklığı (°C), günlük süt verimi (kg-süt-gün^{-1}), inek başına süt verimi (kg-süt-inek^{-1}), süt yağı (%) ve süt proteini (%) gibi parametreleri tahmin etmede yüksek

doğruluk sağladığını (R= 0.96) ve aşırı öğrenme (overfitting) belirtileri göstermediğini bildirmiştir.

4.4. SU YÖNETİMİ

Makine öğrenimi modelleri, sürdürülebilir hassas sulama yönetimi kapsamında tatlı su kaynaklarının akılcı ve sürdürülebilir kullanımını destekleyen zeka tabanlı etkili bir karar destek sistemi olarak öne çıkmaktadır. Sulama ile ilgili kararların, hava durumu ve toprak koşullarına ilişkin tahminlere dayanarak bitkilerin su gereksinimlerinin öngörülmesi yoluyla daha bilinçli biçimde alınması mümkün hale gelmektedir. Bu yaklaşım, toprak nemi, su ihtiyacı ve verim gibi parametrelerin önceden tahmin edilerek sulama stratejilerinin proaktif bir şekilde belirlenmesini içermektedir (Abioye et al., 2022).

Örnek olarak Sayari ve ark. (2021), karık sulama sistemlerinde su sızmasını tahmin etmek amacıyla Yapay Sinir Ağı (YSA), Uyarlanabilir Nöro-Bulanık Çıkarım Sistemi (ANFIS), Veri İşleme Grup Yöntemi (GMDH), Çok Değişkenli Doğrusal Regresyon (MLR) ve Destek Vektör Regresyonu (SVR) gibi beş yapay zeka modeli ile bunların Firefly Algoritması (FA) ile optimize edilmiş hibrit versiyonlarını geliştirmişlerdir. Çalışmada modelleme sürecinde, karık uzunluğu, giriş hızı, ilerleme süresi, giriş kesit alanı ve sızma fırsat süresi gibi parametreler kullanılmış; veriler literatür kaynaklarından ve İran'ın Kerman kentindeki bir araştırma çiftliğinden elde edilmiştir. FA, model parametrelerini optimize etmek amacıyla kullanılmış ve özellikle SVR ile MLPNN modellerinde belirgin performans artışı sağladığı rapor edilmiştir. Çalışma sonucunda, FA'nın SVR modeli üzerindeki etkisiyle %47 oranında hata azalması ve genel performansta %97'ye varan iyileşme sağladığını, bu yönüyle sulama sızma modellemesinde etkili bir optimizasyon aracı olduğu bildirilmiştir.

4.5. TOPRAK YÖNETİMİ

Makine öğrenimi (ML) yöntemleri, toprak özelliklerinin hızlı ve doğru bir şekilde tahmin edilmesini sağlayarak geleneksel analiz yöntemlerine kıyasla daha verimli bir alternatif sunmaktadır. Özellikle Rastgele Orman (RF) ve XGBoost modelleri; toprak sıcaklığı, nem, organik madde ve pH gibi parametrelerin yüksek doğrulukla tahmininde etkili bulunmuştur. Bu teknikler, sürdürülebilir toprak yönetimi uygulamalarının geliştirilmesine katkı sağlamaktadır (Devi ve Rani, 2024).

Örnek olarak Maleki ve ark. (2023), nar, antep fıstığı ve safran ekili tarım arazilerinde farklı toprak özelliklerine göre yönetim bölgeleri (MZ–Management Zones) belirlenmiştir. Çalışmada, 202 toprak örneği toplanmış ve çevresel değişkenler kullanılarak toprak özellikleri Random Forest modeli ile haritalanmıştır. Modelin doğruluğu, doğrulama setinde Lin's uyum katsayısı (CCC) ile değerlendirilmiş ve 0.65 ile 0.79 arasında değiştiği bildirilmiştir. Çalışmada, toprak haritaları, çalışılan bölgede organik karbon, potasyum, fosfat ve azot düzeylerinin düşük olduğu gösterilmiş ve toprak özellikleri ile çevresel değişkenler arasındaki ilişkiye göre dört farklı yönetim bölgesi tanımlanmıştır. Ayrıca, toprak verimliliği açısından bölgelerin sıralaması MZ4 > MZ1 > MZ3 > MZ2 şeklinde olup, toprak kalite (SQ) haritasına göre her bölgede heterojen bir yapı tespit edilmiş ve 1.65 hektarlık alanda çok düşük toprak kalitesi saptandığı

belirtilmiştir. Çalışma sonunda, gübreleme miktarının bölgeye özgü olarak ayarlanması gerektiğini vurgulayarak, sürdürülebilir tarım için bölgesel toprak yönetiminin önemini raporlanmıştır.

5. TARTIŞMA VE SONUÇ

Tarımda makine öğrenmesi uygulamaları üzerine yapılan çalışmalar, bitkisel üretimden hayvancılığa, toprak analizinden sulama yönetimine kadar pek çok alanda önemli katkılar sunduğunu ortaya koymaktadır. Özellikle verim tahmini, hastalık teşhisi, zararlı tespiti ve kaynak optimizasyonu gibi konularda sağladığı başarılar, makine öğrenmesinin tarımda yaygınlaşmasına neden olmuştur. Ancak bu olumlu gelişmelere rağmen uygulama sürecinde çeşitli zorluklarla karşılaşılmaktadır.

En yaygın sorunlardan biri, geliştirilen modellerin veriye yeterince uyum sağlayamaması ve tarımsal ortamlardaki karmaşık yapıların ve arka plan gürültüsünün fazla olmasıdır. Modelin öğrenme kapasitesinin yetersiz kalması düşük öğrenmeye (underfitting), veriye aşırı derecede uyum sağlaması ise aşırı öğrenmeye (overfitting) neden olmaktadır. Bu durum, modelin genelleme yeteneğini azaltarak, gerçek dünya verileri üzerinde düşük performans sergilemesine yol açmaktadır. Tarımsal görüntülerden elde edilen verilerin kalitesi de, model performansını doğrudan etkilemektedir. Görüntülerdeki bulanıklık, ışık dengesizliği, objelerin birbirine yakınlığı ya da örtüşmesi gibi faktörler, özellikle görüntü tabanlı sınıflandırma ve tespit uygulamalarında makine öğrenmesinin başarısını düşürebilmektedir. Ayrıca, veri etiketlemenin zaman alıcı ve uzmanlık gerektiren bir süreç olması da veri toplama aşamasını yavaşlatmaktadır. Bu bağlamda, transfer öğrenme, veri artırma (data augmentation) ve hibrit modelleme gibi yöntemlerle söz konusu problemlerin aşılması yönünde çeşitli çözüm önerileri literatürde yer almaktadır.

Son olarak, makine öğrenmesi tarımsal faaliyetlerin daha verimli, sürdürülebilir ve hassas bir şekilde gerçekleştirilmesine önemli katkılar sunmaya devam etmektedir. Gelişen algoritmalar, artan veri çeşitliliği ve hesaplama gücündeki ilerlemeler sayesinde bu teknolojilerin tarımda daha etkin biçimde kullanılması mümkün hale gelmektedir. Gelecekte, mevcut sınırlamaların giderilmesiyle birlikte, makine öğrenmesi tabanlı yaklaşımların tarım sektöründe daha yaygın bir şekilde uygulanacağı öngörülmektedir.

ABSTRACT

Grapes are perennial plants with approximately 13,000 varieties worldwide. The development of viticulture requires knowing the characteristics of grape varieties, evaluating each variety separately, identifying varieties that differ from each other and checking whether they comply with registration conditions. In this regard, determining grape varieties is among the important issues in viticulture. In the identification of grape varieties, ampelographic features of shoots, leaves, fruits, clusters and seeds of the varieties are used. Ampelographic features are descriptors that allow grape varieties to be identified. A norm called 'Grape Descriptors' has been prepared with the work of important international organizations. The ampelographic properties of grape varieties are determined according to the characterization features in this norm. These characteristics are varietal-specific characters that are inherently present in grape varieties, can be easily seen when viewed, and can be expressed equally in all environments. However, identifying grape varieties based on ampelographic characteristics using traditional methods is time-consuming, expensive and requires expertise.

Fast and easy determination of grape classification is important for the future of viticulture. For this purpose, digital ampelography techniques have begun to be developed to identify grape varieties by utilizing innovative technologies based on advanced image analysis and artificial intelligence. In particular, deep learning models have been found to yield highly successful results in the automatic classification of grape varieties. Digital ampelography can also be used by farmers who are not experts in ampelography. Therefore, the use of image-based deep learning classifiers for automatic classification of grape varieties has the potential to make significant contributions to the field of viticulture. In this study, sample studies where ampelographic features are transferred to digital environments and grape varieties are identified by image-based and artificial intelligence-based systems are examined and explained.

Keywords: Ampelography, Grape, Classification, Deep Learning, Image processing

AMPELOGRAFİDE SON NOKTA: DİJİTAL AMPELOGRAFİ

ÖZET

Üzüm, dünya genelinde yaklaşık olarak 13.000 kadar çeşidi bulunan çok yıllık bitkidir. Bağcılığın geliştirilmesi üzüm çeşitlerinin özelliklerinin bilinmesini, her çeşidin ayrı ayrı değerlendirilmesini, birbirinden farklı olan çeşitlerin belirlenmesini ve tescil koşullarına uyup uymadıklarının kontrolünü gerektirmektedir. Bu bakımdan üzüm çeşitlerinin tespit edilmesi bağcılıkta önemli konular arasında yer almaktadır. Üzüm çeşitlerinin tespitinde çeşitlerin sürgün, yaprak, meyve, salkım ve çekirdeklerine ait ampelografik özelliklerden faydalanılmaktadır. Ampelografik özellikler, üzüm çeşitlerinin tespit edilmesini sağlayan tanımlayıcılardır. Uluslararası önemli kuruluşların çalışmaları ile 'Üzüm Tanımlayıcıları' adıyla bir norm hazırlanmıştır. Üzüm çeşitlerinin sahip olduğu ampelografik özellikler bu normdaki karakterizasyon özelliklere göre belirlenerek ortaya çıkarılmaktadır. Bu özellikler üzüm çeşitlerinde kalıtsal olarak var olan, bakıldığında rahatlıkla görülebilen ve tüm ortamlarda eşit olarak ifade edilebilen çeşitlere özgü karakterlerdir. Ancak geleneksel yöntemler kullanarak ampelografik özelliklere göre üzüm çeşitlerinin belirlenmesi zaman alıcı, pahalı ve uzmanlık gerektirmektedir.

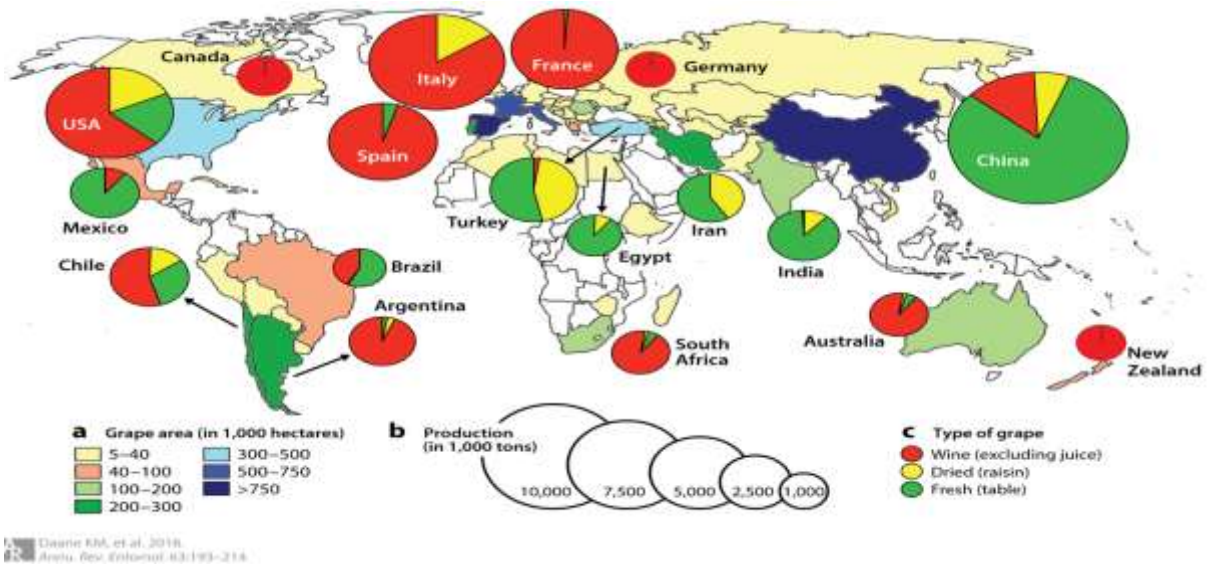
Üzüm sınıflandırma işleminin hızlı ve kolay tespit edilmesi bağcılığın geleceği bakımından önem arz etmektedir. Bu amaçla gelişmiş görüntü analizine tabanlı ve yapay zeka tabanlı yenilikçi teknolojilerden yararlanarak üzüm çeşitlerinin belirlenmesi amacıyla dijital ampelografi teknikleri geliştirilmeye başlanmıştır. Özellikle derin öğrenme modelleri üzüm çeşitlerinin otomatik sınıflandırılmasında yüksek başarılı sonuçlar verdiği tespit edilmiştir. Dijital ampelografi, ampelografi konusunda uzman olmayan çiftçiler tarafından da kullanılabilmektedir. Bu nedenle, üzüm çeşitlerinin otomatik sınıflandırılması için görüntü tabanlı derin öğrenme sınıflandırıcılarının kullanılması bağcılık alanına önemli katkılar sağlama potansiyeline sahiptir. Bu çalışmada, ampelografik özelliklerin dijital ortamlara aktarılarak üzüm çeşitlerinin tespitinin görüntü tabanlı ve yapay zekalı tabanlı sistemler tarafından yapıldığı örnek çalışmalar incelenerek açıklanmıştır.

Anahtar Kelimeler: Ampelografi, Üzüm, Sınıflandırma, Derin Öğrenme, Görüntü İşleme

1. GİRİŞ

Asma bitkisinin yetiştiriciliği antik çağlara kadar dayanmaktadır. Dünya genelinde meyvesi en yaygın olarak üretilen ve tüketilen, günümüzde küresel ekonomik olarak ülkelere büyük katkı sağlayan önemli bir bitki türüdür. Bağcılık, alan ve değer bakımından tarımsal üretim arasında en çok büyüme gösteren bir potansiyele sahiptir. Bu büyümede, uluslararası ticaretin artması, küresel gelirlerin iyileşmesi, üretim, depolama ve taşımadaki teknolojik ilerlemeler, sağlıklı ürünlerin elde edilmesine sebep olan yan ürünlerin işlenmesi ve kullanılmasının yanında üzüm gibi antioksidan bakımından zengin olan gıdaların farkındalığının artması gibi faktörler etkili olmaktadır. Bu bakımından dünya bağcılığının geliştirilmesi, ileri seviyede kaliteli ve verimli ürün elde edilmesi gerekmektedir (Hbyaj et al, 2014; Semerci ve ark., 2015; Daane ve ark., 2018; Carneiro ve ark., 2024).

Üzüm hem taze olarak sofralık hem de şarap, reçel, meyve suyu, kurutulmuş üzüm, sirke ve üzüm çekirdeği yağı gibi işlenmiş şekilde tüketilebildiği için dünyanın en değerli meyveleri arasında sayılmaktadır (Venkitasamy ve ark., 2019). Gerek aroması gerekse ekonomik faydası bakımından üretimi her geçen gün artış göstermektedir. Üretime bağlı olarak dünyadaki üzüm bağları alanı ve çeşit sayısı artmaktadır. Şekil 1'de Dünyadaki bağcılığa ait veriler gösterilmektedir. Üzüm çeşitlerinin her birinin kendine özgü karakterizasyon özellikleri bulunmaktadır. Çeşitlerin ticari değeri ise kendilerine has özelliklerine göre değişebilmektedir. Bu özelliklerin bilinmesi, her bir çeşidin ayrı ayrı değerlendirilmesi, birbirinden farklı olan çeşitlerin tespiti ve tescil koşullarına uygunluklarının ortaya çıkarılması üzüm yetiştiriciliğinin ileri seviyeye taşınmasını sağlamaktadır (Yağcı ve İlter, 2018; Adão ve ark., 2025).



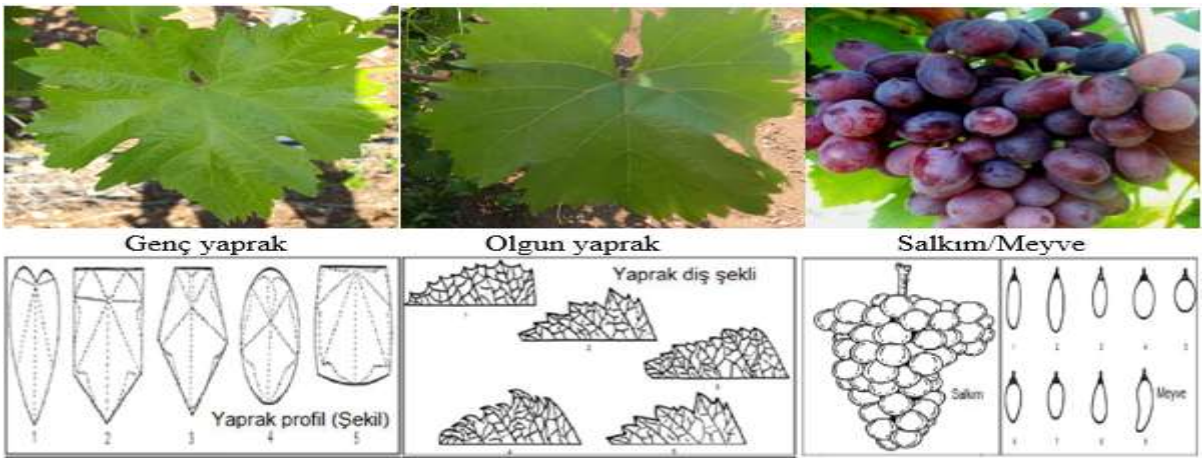
Şekil 1. Dünya bağcılığına ait veriler. a) Üzüm bağları arazi alanı, b) En üretken 18 ülkenin her birinden elde edilen üretim, c) En üretken 15 ülkenin her birinden elde edilen üzüm meyvesinin yüzdesi (Daane ve ark., 2018).

Bu çalışmada, derin öğrenme yöntemlerini kullanarak üzüm çeşitlerini sınıflandırmak için dijital ampelografiyi kullanan çalışmalar incelenmiştir.

2. AMPELOGRAFİ

Yunanca ampelos (asma) ve graphe (açıklama) kelimelerinden türeyen ampelografi üzüm türlerini tanımlayan ve sınıflandıran bir bilim dalıdır. Üzüm çeşitlerinin tanımlanması yapraklar gibi organlarının görsel olarak incelenmesini ve ayırt edici karakterlerin tespit edilmesini içeren ampelografi gibi metotlara dayanmaktadır (Tassie, 2010; Dexheimer, 2011).

Ampelografik özellik olarak belirtilen tanımlayıcılar, üzüm çeşitlerinde genelde yüksek oranda kalıtsal olarak var olan ve gözle bakıldığında kolayca görülebilen ve tüm ortamlarda eşit olarak ifade edilen, çeşitlerin sürgünlerine, çiçeklerine, yapraklarına, salkım/meyvelerine ve çekirdeklerine ait karakterlerdir (Anonymous, 1997). Şekil 2'de bir asma bitkisinin farklı bölümlerine ait bazı görüntüler ve görüntülerin hangi çeşide ait olduğunu tespit etmek için kullanılan bazı ampelografik özellikleri gösterilmektedir.



Şekil 2. Bir asma bitkisinin farklı bölümlerine ait görüntüler ve bazı ampelografik özellikler.

Ampelografik özelliklerin ortaya çıkarılması dikkatli araştırma ve çalışmaların olduğu zahmetli ve uzun süreli bir uğraştır. Ampelografik özelliklerin tespiti genç sürgünlerin ortaya çıkmasıyla başlayarak, çiçeklenme, genç/olgun yaprak, salkım/meyve ve odunsu sürgün karakterlerinin kendi dönemleri boyunca yapılabilmektedir. Bu sebeple bir çeşidin ampelografik özelliklerini ortaya çıkarmak yaklaşık 5-6 aylık bir süreç gerektirmektedir (Terzi, 2023).

Aynı özelliklere sahip olan çeşitlere bölgelere göre farklı isimler verilebilmektedir. Uluslararası yöntem birliği çalışmaları kullanılarak bu farklılıkların önüne geçilebilmektedir. Ampelografik özelliklerinin ortaya çıkarılmasında uluslararası yöntem birliğini sağlamak amacıyla Uluslararası Bitki Gen Kaynakları Enstitüsü (The International Plant Genetic Resources Institute- IPGRI) adına oluşturulmuş bir çalışma ekibi ile Bağcılık ve Şarapçılık Ofisi (Office

International de la Vigne et du Vin-OIV) ve Uluslararası Yeni Bitki Çeşitlerinin Korunması Birliği (International Union for the Protection of New Varietes of Plants- UPOV) ile iş birliği içinde yapılan çalışmalarla geliştirilmiş normlar Üzüm Tanımlayıcıları (Grape Descriptors) adıyla yayınlanmıştır. Bu normlar, üzerinde daha sonra bazı değişiklikler yapılarak ve üzüm genotipleri karakterizasyonu ile akrabalık ilişkilerinin tespitinde yürütülecek çalışmalar için yüksek oranda ayırıcı özellik taşıyan unsurlar olarak belirlenmiştir. Bu yöntemle günümüzde genotip tanımlama çalışmaları için kullanılan Descriptors for Grapevine (Vitis spp.) listeleri oluşturulmuştur (Anonymous, 1997).

2.1. DİJİTAL AMPELOGRAFİ

Üzüm çeşitlerinin tespit edilmesinde ve sınıflandırılmasında meydana gelen karışıklığın giderilmesi, üretim ve kalitenin geliştirilmesi bakımından önemlidir. Bu sebeple bağcılıkta verim tahmini ve öngörüsü, hassas bağcılık yöntemlerinden yararlanılarak verimli ürün yönetiminde kullanılmaktadır (Sozzi ve ark., 2022). Dünya genelinde çeşit bakımından zengin olan üzüm çeşitlerinin hızlı ve kolay tespit edilmesi tarım sektörüne ve bağcılığa önemli katkılar sağlamaktadır (Pınar ve ark., 2018). Bu görev alanında uzmanlaşmış yetenekli ampelograflar tarafından yapılabilmektedir (Garcia-Muñoz ve ark., 2011). Ancak bu yeteneklerin sayısının azalması, insan odaklı diğer faaliyetlerde olduğu gibi ampelografik özelliklerin belirlenmesinde de yoğun çabaya gerek duyulması, zaman alıcı olması ve insan kaynaklı hatalara yol açması sebebiyle (Magalhães ve ark., 2023; Adão ve ark., 2025), hızlı ve pratik çalışabilen teknolojik sistemlere ihtiyaç duyulmaktadır (Altas ve ark., 2018). Ayrıca başarılı bir tarımsal işletmecilik için her bir bileşendeki değişimler doğru ve zamanında belirlenmeli, olabilecek etkileşimlerde göz önüne alınarak yapılacak uygulamalara karar verilmelidir (Ozguven, 2023). Bu bakımdan dijital tarım uygulamalarının sahip olduğu yazılım donanım sistemleri tarımsal alanda verilerin gerçek zamanlı toplanmasına, analiz edilmesine, depolanmasına ve veriye bağlı işlemlerin yönetilmesine olanak sağlaması bakımından tarımsal işlemlerin hızlı ve pratik olarak ilerlemesine büyük katkı sağlamaktadır (Özgüven, 2023). Dijital ampelografi üzüm çeşitlerinin tespiti ve sınıflandırılması amacıyla çeşitlere ait ampelografik özelliklerin dijital teknolojiler kullanılarak analiz edildiği bir durumdur. Geleneksel ampelografinin temelini gözle yapılan morfolojik analizler oluştururken, dijital ampelografide bu durum görüntü işleme, makine öğrenmesi ve yapay zekalı teknolojilere dayanmaktadır (Vélez ve ark., 2021; Nasiri ve ark., 2021).

3. İLGİLİ ÇALIŞMALAR

Literatürde bulunan çalışmaların bazılarında sadece üzüm yaprakları sınıflandırılmıştır. Bu çalışmalara örnekler şunlardır. Pereira ve ark. (2018) altı farklı üzüm (Tinta Amarela, Tinta Barroca, Tinto Cão, Touriga Franca, Touriga Nacional, Tinta Roriz) çeşidine ait asma yapraklarını sınıflandırmak için renk modeli ve eşik teknikleri kullanarak bölge büyümesine dayalı bir segmentasyon algoritması önermişlerdir. Çalışmada önerilen asma yaprağı segmentasyon algoritmasının doğruluğunu değerlendirmek için, segmente edilmiş bir görüntünün elle segmente edilmiş bir görüntüyle karşılaştırıldığı bir denetlenen değerlendirme

yöntemi kullanıldığı belirtilmiştir. Çalışmanın sonunda %94,8'lik bir doğruluk elde edildiği bildirilmiştir. Carneiro ve ark. (2023), ImageNet üzerinde önceden eğitilmiş EfficientNetV2S modelini kullanarak on iki üzüm (Codega, Rabigato, Malvasia Rei, Tinta Roriz, Moscatel Galego, Tinto Cao, Mourisco Tinto, Touriga Nacional) çeşidine ait 308 yaprak görüntüsünü sınıflandırmışlardır. Çalışmanın sonunda iki veri setinde de 0,88 ve 0,58 doğruluk elde edildiği bildirilmiştir.

Bazı çalışmalarda sadece üzüm taneleri veya salkımlara göre sınıflandırma yapılmıştır. Bu çalışmalara örnekler şunlardır. El-Mashharawi ve ark. (2020) CNN derin öğrenme modelini kullanarak 6 adet üzüm çeşidini (Black, Crimson, Yellow, Dark Blue, Green, Pink) sınıflandırmışlardır. Veri seti, her biri farklı renkte olan üzüm çeşitlerine ait üzüm taneleri şeklinde alınan 4565 adet görüntüden oluşmaktadır. Çalışmanın sonunda %100 sınıflandırma doğruluğu elde edildiği bildirilmiştir. Franczyk ve ark. (2020) Keras Standart Modeli (KSM), Restnet, ExtRestnet modellerini kullanarak 5 üzüm çeşidini (Chardonnay, Cabernet Franc, Cabernet Sauvignon, Sauvignon Blanc, Syrah) sınıflandırmışlardır. Veri seti 300 salkım görüntüsünden oluşmaktadır. Çalışmada bu görüntülerin, model eğitimi ve testi için 3957'ye çıkarıldığı bildirilmiştir. Çalışma sonunda, KSM sınıflandırması için %47, Restnet için %89 ve ExtRestnet için %99 doğruluk elde edildiği rapor edilmiştir.

Çalışmaların bazılarında hazır veri seti veya orijinal veri seti kullanılmıştır. Bu örnek çalışmada iki farklı orijinal veri seti kullanılmıştır. Pereira et al. (2019) üzüm çeşitlerinin otomatik sınıflandırılabilmesi için AlexNet mimarisine dayalı bir model önermişlerdir. Çalışmada veri seti olarak altı farklı üzüm (Tinta Amarela, Tinta Barroca, Tinta Cao, Touriga Franca, Touriga Nacional, Tinta Roriz) çeşidine ait 224 salkım görüntüsünden oluşan iki doğal bağ görüntülerini kullanılmıştır. Eğitim ve sınıflandırma işlemlerinde ise farklı veri kümeleri meydana getirmek amacıyla görüntü eğriltme algoritması ve görüntü işleme yöntemleri uygulanmıştır. Çalışma sonunda AlexNet tabanlı transfer öğrenme yöntemiyle elde edilen ve dört köşe bir arada yöntemi ile önceden işlenmiş bir görüntü veri kümesi üzerinde eğitilen deneysel sonuçlar, %77,30'luk doğruluk elde edildiği rapor edilmiştir. Aynı sınıflandırıcı modelinin uygulanmasıyla popüler Flavia yaprak veri kümesinde %89,75'lik bir doğruluk elde edildiği rapor edilmiştir.

Bazı çalışmalarda laboratuvar ortamında elde edilen RGB veya multispektral görüntüler kullanılarak sınıflandırma yapılmıştır. Örnek olarak Nasiri ve ark. (2021) laboratuvar ortamında elde edilen altı üzüm çeşidine ait (Asgari, Fakhri, Keshmeshi, Mirzaei, Shirazi ve Black) görünür spektrumda (400-700 nm) elde edilen 300 yaprak görüntüsünü kullanarak üzüm çeşitlerinin otomatik olarak sınıflandırılması için değiştirilmiş bir VGG16 mimarisi önermişlerdir. Çalışma sonunda önerilen model ile %99,11 oranında bir sınıflandırma doğruluğu elde edildiği bildirilmiştir. Adão ve ark. (2025) beyaz arka planlı altı üzüm çeşidine ait (Touriga Nacional, Tinto Cão, Códega, Moscatel, Tinta Roriz, Rabigato) yaprak görüntülerini ve doğal ortamlardan alınan on iki üzüm çeşidine ait (Códega, Malvasia Fina, Malvasia Preta, Malvasia Rei, Moscatel, Mourisco Tinto, Rabigato, Tinta Amarela, Tinta Barroca, Tinta Roriz, Tinto Cão, Touriga Nacional) yaprak görüntülerini sınıflandırmışlardır. Çalışmada özellikle Xception sinir ağı mimarisi kullanılmış olup, iki veri seti için sırasıyla %95 ve %98 hassasiyet oranları elde edildiği bildirilmiştir.

Bazı çalışmalarda ise farklı derin öğrenme modelleri kullanılarak sınıflandırma yapılmıştır. Rajab ve ark. (2024) üzüm çeşitlerinin sınıflandırılmasında derin öğrenme tabanlı VGG-16 ve VGG-19 mimari yapılarını önermişlerdir. Araştırıcılar veri seti olarak çeşit başına 100 görüntü olacak şekilde toplam 500 görüntüden oluşan beş üzüm çeşidini (Ak, AlaIdris, Buzgulu, Dimnit, Nazli) kullanmışlardır. Çalışma sonunda VGG-16 mimarisi için %96,6 oranında bir başarı elde edilirken, VGG-19 mimarisi için ise %100 oranında bir başarı elde edilmiştir. Terzi ve ark. (2023) çalışmalarında beş üzüm çeşidini (Corint, Merlot, Tayfi, Michele palieri, Narince) üzüm çeşitlerinin ampelografik özelliklerinden faydalanarak derin öğrenme teknikleri ile sınıflandırılmasını yapmışlardır. Mimari yapı olarak özgün şekilde geliştirilen 15 katmanlı bir evrişimli sinir ağı önermişlerdir. Çalışmada beş sınıftan oluşturulan veri setinde üzüm çeşitlerinin salkım ve meyvelerine ait 227x227x3 boyutlarında 1028 adet görüntü kullanılmış ve önerilen modelin üzüm çeşitlerini sınıflandırmada %96,10 oranında doğruluk elde ettiğini bildirilmiştir.

Bazı çalışmalarda Android veya IOS uygulamalar geliştirilmiştir. Liu ve ark. (2021) üzüm çeşitlerini otomatik ve gerçek zamanlı olarak tespit edebilen ve üreticilerin çeşit bilgilerini hızlı bir şekilde öğrenmelerine yardımcı olabilen Android uygulama geliştirmiştir. Veri seti olarak yirmi bir üzüm çeşidine ait (Aglianico, BeiMei, Cabernet Sauvignon, Aligote, Welschriesling, Pinot Noir, Riesling, Malbec, Marselan, Merlot, MeiLi, Cabernet Franc, Sangiovese, Vidal, Viognier, Syrah, Chardonnay, Petit Manseng, Petit Verdot, Yan, Sauvignon Blanc) toplamda 5164 görüntü kullanılmıştır. AlexNet, VGG-16, ResNet101, ResNet18, DenseNet ve GoogLeNet modelleri kullanılarak yapılan sınıflandırmada doğruluk değerleri sırasıyla %94,70; %96,85; %97,24; %95,68; %94,70; %99,66 elde edildiği bildirilmiştir.

Bazı çalışmalarda ise aynı çalışmada hem yapraklar hem de salkım ve meyveler sınıflandırılmıştır. Örnek olarak çalışmada aynı zamanda ampelografik özelliklere göre sınıflandırma yapılmıştır. Terzi ve ark. (2024) Crimson seedlees, Bilecik karası, Michele palieri, Tekirdağ çekirdeksizi, Lival, Trakya ilkeren, Karaerik, Flame seedlees, Horoz karası, Royal, Alphonse L., Prima, Cardinal, Süperior seedlees, Victoria, Red globe, Sultani çekirdeksiz, Mevlâna, İtalia, İzabel, Narince, Vakkas, Erciş, Pinot noir, Abalıhoca, Hasandede, Cabarnet france, Syrah, Cabarnet sauvignon, Kyoho, Corinth, Merlot, Rub. Du. Lot., 1103 Paulsen, Muhammediye, Helvani, Çavuş, 110R, Tayfi, Black magic, Bronx seedlees, Autumn royal, Yalova incisi, 41R, 5BB, Regent, Rizessi, Kısmısh vatkana, Rizellim, Rizpem 50 adet üzüm çeşidini yeni ve özgün bir CNN modeli ile sınıflandırmışlardır. Çalışmada doğal bağ alanlarından alınan 9.854 yaprak, 8.745 salkım ve 8.721 meyve olmak üzere toplam 27.320 görüntü kullanılmıştır. Araştırıcılar, veri setlerini yaprak ve salkım/meyve olarak iki gruba ayırmışlar ve yaprak grubunda beş ve salkım/meyve grubunda dört farklı kategori olmak üzere toplam dokuz farklı kategoride sınıflandırma yapmışlardır. Önerilen CNN modeli ile en yüksek doğruluk başarısı Kategori 4'te yer alan yaprak grubu %94,10 ve salkım/meyve grubundan %97,20 olarak elde edildiği bildirilmiştir. Önerilen modelin performansını ve veri setinin farklı modellerle uygunluğunu karşılaştırmak için veri setlerini transfer öğrenme yöntemi ile GoogleNet ve AlexNet modellerine de uygulanmış ve sırasıyla %84,39 ve %92,31 başarı oranı elde edildiği rapor edilmiştir.

ABSTRACT

Pomegranate seeds constitute approximately 10% of the total weight of the fruit and the majority of the pulp resulting from the production of pomegranate products. Pomegranate pulp is mostly used as animal feed or thrown away. However, the oil obtained from pomegranate seeds is a very valuable oil due to its polyunsaturated fatty acids, which are necessary for human health, cannot be synthesized in the body, and must be taken from outside and high tocopherol content. The fatty acids found in pomegranate oil have anticarcinogenic, anti-inflammatory and antiobese effects, and the tocopherols have antioxidant effects.

The pomace obtained after the production of pomegranate seed oil creates a problem as waste unless it is used as animal feed. However, pomace is very rich in bioactive components, especially phenolic compounds. Phenolic compounds, which are natural antioxidants, are secondary metabolites produced by plants and are of great importance for human health.

In this study, dry matter, total fat, total phenolic content (TPC) and antioxidant activity (DPPH and ABTS) of the pomaces obtained by soxhlet (SxE), cold (solvent) (SE), enzymatic (EE), roasting-assisted enzymatic (KE), microwave-assisted enzymatic (ME) and ultrasound-assisted enzymatic (UE) extraction methods were determined.

The dry matter and oil contents of the pomace were found to be between 93.09-96.77% and 0.00-7.05%, respectively. While no oil residue was detected in the pomace of the soxhlet extraction, the highest oil content (7.05%) was detected in the pomace of the enzymatic extraction. Total phenolic content, 2,2-diphenyl-1-picrylhydrazyl (DPPH) and 2,2-azinobis-3-etilbenzotiazolin-6-sulfonik asit (ABTS) values of the pomace were determined between 979.14-2516.73 mg GAE/kg DM, 6.81-16.99 mmol TE/g DM and 6.74-14.99 mmol TE/g DM, respectively.

The findings show that the pomegranate seed pomace, which is produced in large quantities in the pomegranate industry, has functional properties that can be evaluated especially in the food industry, and is of great importance in terms of environmental sustainability, economy and human health.

Key words: ABTS, DPPH, pomegranate seed pomace, total phenolic content

NAR ÇEKİRDEĞİ KÜSPESİNİN TOPLAM FENOLİK MADDE İÇERİĞİ VE ANTİOKSİDAN AKTİVİTESİ

ÖZET

Nar çekirdeği, nar meyvesinin toplam ağırlığının yaklaşık %10'unu ve nar ürünlerinin üretiminden sonra ortaya çıkan posanın da büyük bölümünü oluşturmaktadır. Bu posa çoğunlukla hayvan yemi olarak değerlendirilmekte veya atılmaktadır. Oysa nar çekirdeğinden elde edilen yağ, insan sağlığı için gerekli olan, vücutta sentezlenemeyip dışarıdan alınması gereken çoklu doymamış yağ asitleri ve yüksek tokoferol içeriği nedeniyle oldukça değerli bir yağdır. Nar çekirdeği yağında bulunan yağ asitlerinin antikanserojenik, antiinflamatuvar ve antiobez etkileri, tokoferollerin de antioksidan etkisi bulunmaktadır.

Nar çekirdeği yağı üretildikten sonra arta kalan küspe hayvan yemi olarak kullanılmadığı taktirde atık olarak sorun oluşturmaktadır. Ancak küspe başta fenolik bileşikler olmak üzere biyoaktif bileşenler açısından oldukça zengindir. Doğal antioksidan olan fenolik bileşikler, bitkiler tarafından üretilen sekonder metabolitler olup insan sağlığı açısından büyük öneme sahiptirler.

Bu çalışmada sokselet (SxE), soğuk (çözücü) (SE), enzimatik (EE), kavurma destekli enzimatik (KE), mikrodalga destekli enzimatik (ME) ve ultrases destekli enzimatik (UE) ekstraksiyon yöntemleri ile elde edilen küspelerin kuru madde, toplam yağ, toplam fenolik madde (TFM) ve antioksidan aktivite (DPPH ve ABTS) değerleri saptanmıştır.

Küspeye ait kuru madde ve yağ miktarları sırasıyla, %93.09-96.77 ve %0.00-7.05 aralığında bulunmuştur. Sokselet ekstraksiyonu sonucu küspede hiç yağ kalıntısı tespit edilmezken, en yüksek yağ içeriği (%7.05) enzimatik ekstraksiyon uygulanan küspede saptanmıştır. Küspelerin toplam fenolik madde, 2,2-diphenyl-1-picrylhydrazyl (DPPH) ve 2,2-azinobis-3etilbenzotiazolin-6-sulfonik asit (ABTS) değerleri ise sırasıyla, 979.14-2516.73 mg GAE/kg KM, 6.81-16.99 mmol TE/g KM ve 6.74-14.99 mmol TE/g KM arasında bulunmuştur.

Elde edilen bulgular, nar endüstrisinde yüksek miktarda ortaya çıkan nar çekirdeği küspesinin özellikle gıda endüstrisinde değerlendirilebilecek düzeyde fonksiyonel özellikte bileşenlere sahip olduğunu, çevresel sürdürülebilirlik, ekonomi ve insan sağlığı açısından büyük önem taşıdığını göstermektedir.

Anahtar kelimeler: ABTS, DPPH, nar çekirdeği küspesi, toplam fenolik madde

1. GİRİŞ

Nar (*Punica granatum* L.) Punicaceae familyasına ait, genellikle tropik ve subtropik bölgelerde yetişen bir bitki olup (Kurt & Şahin, 2013) üretimi ülkemizde giderek artmaktadır. Türkiye'de nar üretimi 2023 yılında 638821 ton, 2024 yılında ise bir önceki yıla göre %10.1 artarak 703425 ton olmuştur (Anonim, 2025).

Nar çekirdeği, meyvenin toplam ağırlığının %3.7-7.9'unu oluşturmakta olup (Aslan Bakkalbaşı ve Cavidoğlu, 2024; Fernandes ve ark., 2015), nar endüstrisinde posa olarak ortaya çıkan yan ürünün önemli bir bölümünü oluşturmaktadır (Tehranifar ve ark., 2010; Fernandes ve ark., 2015). Posa genellikle hayvan yemi olarak kullanılmakta veya atılmaktadır. Oysa çekirdekten elde edilen yağ, çoklu doymamış yağ asitleri, tokoferoller, steroller, karotenoidler ve fenolik bileşikler açısından oldukça zengindir (Çavdar ve ark., 2017; Khoddami ve ark., 2014; Caligiani vd., 2010). Yapılan araştırmalarda, nar çekirdeği yağında bulunan yağ asitlerinin antikanserojenik (Grossmann ve ark., 2010) ve antiinflamatuar (Boussetta ve ark., 2009) etkileri olduğu bildirilmiştir. Ayrıca, nar çekirdeği takviyesinin obezite ve insülin direnci gibi beslenme kaynaklı sağlık sorunlarını iyileştirebileceği belirtilmiştir (Vroegrijk ve ark., 2011). Günümüzde, nar çekirdeği yağının tıp ve kozmetik alanlarında sağladığı faydalarının belirlenmesiyle birlikte, bu yağa olan ilgi giderek artmaktadır (Aruna ve ark., 2016).

Nar çekirdeği yağı, genellikle kurutulmuş çekirdeklerden presleme, organik çözücü ekstraksiyonu veya her iki yöntemin kombinasyonu ile elde edilmektedir. Ancak bu yöntemlerin birtakım dezavantajları bulunmaktadır. Bu dezavantajları ortadan kaldırmak amacıyla son yıllarda süper kritik akışkan ekstraksiyonu, mikrodalga destekli ekstraksiyon, vurgulu elektrik alan ekstraksiyonu, enzim destekli ekstraksiyon ve ultrases destekli ekstraksiyon gibi yeni teknikler geliştirilmektedir (Moradi ve ark., 2017).

Nar çekirdeği yağının çıkarılmasından sonra geriye kalan küspe, özellikle fenolik bileşikler olmak üzere biyoaktif maddeler açısından oldukça zengindir. Fenolik bileşikler hücre savunmasını uyarmakta ve oksidatif hasarı önlemeye yardımcı olmaktadırlar (Bermudez-Oria ve ark. 2019). Bu bileşikler meyve ve sebzelerde yüksek oranda bulunan suda çözünen önemli antioksidanlardır (Meral ve ark., 2012).

Bu bileşikler, insan vücudunda birçok fizyolojik ve dejeneratif hastalik riskinin kontrolündeki önemli rollerinden dolayı insan sağlığı açısından büyük öneme sahip bileşiklerdir (Aadil ve ark., 2013). Kanda kolesterol düzeyini azalttığı, osteoporotik ve antikanserojen etkili olduğu ve antioksidan aktiviteye sahip oldukları pek çok çalışmada belirtilmiştir (Meral ve ark., 2012). Bitki ekstraktlarındaki fenolik bileşiklerin varlığı, antioksidan aktiviteyi önemli ölçüde artırmakta olup, bu ilişki birçok araştırmada ortaya konulmuştur (Anesini ve ark., 2008; Pasko ve ark., 2009). Doğal antioksidan olarak rol almaları fenolik bileşiklerin çeşitli ürün formülasyonlarına girmelerine ve fonksiyonel ürün geliştirilme çalışmalarında dikkatleri üzerine çekmelerine neden olmuştur (Meral ve ark., 2012).

Gıda maddelerinin raf ömrünü uzatmak ve besin değerlerini korumak amacıyla uzun yıllardır kullanılan sentetik antioksidanlar, olası toksik, alerjik ve kanserojen etkileri nedeniyle bazı kısıtlamalara tabi tutulmakta ve hatta yasaklanmaktadır. Bu sebeple, son yıllarda yapılan araştırmalar, geniş çeşitliliğe sahip bitkisel kaynaklardan ekonomik, yenilebilir ve güvenli

antioksidanlar ile antimikrobiyal bileşiklerin elde edilmesine odaklanmaktadır (Lourenco ve ark., 2019). Zengin kimyasal bileşimi ve yüksek polifenol içeriği nedeniyle nar çekirdeği tozunun gıdaların muhafazasında kullanımının teşvik edilmesi gerektiği bildirilmiştir (Rowayshed vd., 2013). Bu nedenle, nar yan ürünlerinin özellikle gıda endüstrisinde doğal antioksidan olarak değerlendirilmesi, çevresel sürdürülebilirlik, ekonomik fayda ve insan sağlığı açısından büyük önem taşımaktadır.

Bu çalışmada hem konvansiyonel nar çekirdeği yağı üretim teknikleri hem de son yıllarda geliştirilen bazı diğer yağ üretim teknikleri sonucunda ortaya çıkan küspelerin kuru madde, toplam yağ, TFM değerleri ve antioksidan aktivitelerinin saptanarak literatürdeki eksiğin giderilerek katkı sağlanması amaçlanmıştır. Ayrıca yüksek miktarda ortaya çıkan bu atığın gıda endüstrisinde doğal antioksidan kaynağı olarak değerlendirilmesine dikkat çekilmesi çevre, ekonomi ve sağlık açısından büyük önem taşıdığı düşünülmektedir.

2. LİTERATÜR ÖZETİ

Bu konuda yapılan araştırmaların büyük bölümü nar çekirdeğinin fenolik bileşimi ve antioksidan aktivitesi üzerine yoğunlaşmıştır. Nar çekirdeği küspesinin bu açıdan araştırıldığı çalışma sayısı kısıtlı olmakla birlikte literatür taramamız sonucunda bu alanda yapılan bazı çalışmalar aşağıda verilmiştir.

Farklı 3 nar çeşidine ait nar çekirdeklerinin TFM, DPPH ve ABTS değerlerinin incelendiği bir çalışmada bu değerler sırasıyla, 3.88–4.96 mg/g, 5.01–8.61 µmol TE/g, ve 1.61–2.53 µmol TE/g olarak tespit edilmiştir (Peng, 2019).

Yapılan başka bir çalışmada soğuk pres uygulanarak üzüm ve nar çekirdeği yağı atıklarından elde edilen sulu ekstraktların toplam fenolik madde içeriği nar için 2959.10 mg/L, üzüm için 3737.38 mg/L olarak bulunmuştur. Maltodekstrin ile kaplanıp püskürterek kurutularak enkapsüle edilen bu ekstraktlar salata sosu formulülasyonunda kullanılması ürünün oksidatif stabilitesini arttırmakla birlikte biyokatif bileşenler açısından da zenginleştirdiği bildirilmiştir. (Aksoy, 2017).

Çin'in Shanxi bölgesinde yetiştirilen 4 farklı nar çeşidine ait çekirdeklerin antioksidan ve fitokimyasal bileşimlerinin araştırıldığı bir çalışmada, %50 aseton ve %80 metanolle ekstrakte ettikleri nar çekirdeği unu ekstraktlarının toplam fenolik içeriğini 1.29-2.17 mgGAE/g olarak saptamışlardır. Aynı çalışmada ekstraktların DPPH radikaline karşı EC_{50} değerleri 6.4-19.8 mg/mL olarak, ABTS değerleri 7.4-17.8 µmol TE/g un olarak belirlenmiştir(Jing vd., 2012).

Li ve ark. (2011) süperkritik CO_2 yöntemi ile yağı alınmış nar çekirdeği küspesinden %70:30 aseton:su ile elde ettikleri ekstraktın TFM içeriğini 2427.90 mg kateşin Eş./100 g KM olarak tespit etmişler ve nar çekirdeği yağı atığının nütrasötik olarak kullanılabileceğini belirtmişlerdir.

3. MATERYAL VE YÖNTEM

3.1. Materyal

Farklı ekstraksiyon yöntemleri (SxE, SE, EE, KE, ME ve UE) uygulanarak Hicaznar çeşidine ait nar çekirdeğinden yağlar elde edildikten sonra ortaya çıkan küspeler laboratuvar ortamında 20-22°C'de ortalama %5 nem içeriğine kadar kurutulduktan sonra kahve öğütücüsünde öğütülüp 0.85 mm'lik elekten geçirilmiştir. Öğütülmüş küspe örnekleri analiz edilinceye kadar -18°C'de depolanmıştır.

3.2. Yöntem

3.2.1 Toplam Kuru Madde

5 g öğütülmüş nar çekirdeği küspesi darası alınan kurutma kaplarına tartılıp 105°C'deki etüvde sabit ağırlığa gelinceye kadar kurutuldu. Sonuçlar % kuru madde miktarı olarak hesaplanıştır (AOAC, 2006, metot no: 934.01).

3.2.2 Toplam Yağ

10 g öğütülmüş nar çekirdeği küspesi 150 mL n-hekzan ile sokselet ekstraktöründe 6 saat süre boyunca ekstraksiyona tabii tutulmuştur. Ekstraksiyon sonunda n-hekzan, vakum altında rotary evaporatörde 40°C'de uzaklaştırılmıştır. Geriye kalan yağ etüvde 85°C'de sabit ağırlığa gelinceye kadar tutulmuştur (AOAC, 1995).

3.2.3 Metanolik Ekstraktların Hazırlanması

Yaklaşık 1 g nar çekirdeği küspesi üzerine 25 mL metanol ilave edilerek 300 rpm'de 2 saat boyunca çalkalanmıştır. Daha sonra 8000 g'de 10 dk boyunca santrifüjlenmiştir. Üstteki süpernatant kaba filtre kağıdından geçirilerek 25 mL'lik balon jojeye aktarılmıştır. Balon ölçü çizgisine metanol ile tamamlanıp analiz edilinceye kadar -18°C'de depolanmıştır.

3.2.4 Toplam Fenolik Madde (TFM) Analizi

TFM analizleri Singleton ve Rossi (1965)'e göre yapılmıştır. 0.4 mL metanolik ekstrakt alınıp üzerine 2 mL 1/10 oranında su ile seyreltilmiş Folin-Ciocalteu ajanı ve 1.6 mL %7.5 sodyum karbonat çözeltisi eklenmiştir. Reaksiyon karışımı 1 saat oda sıcaklığında (karanlıkta) bekletildikten sonra spektrofotometrede 765 nm'de okuma yapılmıştır. Sonuçlar gallik asit ile oluşturulan kalibrasyon grafiğinden yararlanılarak gallik asit eşdeğeri (mg GAE/kg KM) olarak ifade edilmiştir.

3.2.5 Antioksidan Aktivite Analizleri

3.2.5.1 DPPH (2,2-diphenyl-1-picrylhydrazyl)

DPPH radikali sönümleme aktivitesi Pyo vd. (2004) tarafından önerilen yöntem kullanılmıştır. Bu yöntem, mor renkli stabil bir bileşik olan DPPH radikalinin yok edilmesi sonucu renkte oluşan azalmanın spektrofotometrik olarak ölçülmesi ilkesine dayanmaktadır. Uygun oranda seyreltilmiş 0.1 mL metanolik ekstrakt 3.9 mL DPPH çözeltisi (0.025 g/L metanol) ile karıştırıldıktan sonra oda sıcaklığında 60 dk. karanlıkta tutulmuştur. Süre sonunda örneğin absorbansı 515 nm'de UV-spektroskopisi kullanılarak ölçülmüştür. DPPH radikalinin inhibisyon değerleri Eşitlik (1)'e göre hesaplanmıştır.

$$\%\ İnhibisyon = \frac{Abs\ (kontrol) - Abs\ (örnek)}{Abs\ (kontrol)} * 100 \qquad (1)$$

Sonuçların hesaplanmasında sentetik antioksidan olan Troloks standart kurvesinden yararlanılarak sonuçlar troloks eşdeğeri (mmol Troloks eş./g KM) cinsinden ifade edilmiştir.

3.2.5.2 ABTS (2,2-azinobis-3etilbenzotiazolin-6-sulfonik asit)

ABTS analizleri Re vd. (1999) tarafından önerilen yönteme göre yapılmıştır. Bu yöntem, ABTS˙+ radikali tarafından tutulan antioksidatif maddelerin miktarının, sentetik bir antioksidan olan Troloks'un miktarlarıyla oranlayarak belirlenmesi ilkesine dayanmaktadır. Ölçümler, ABTS+ radikalinin giderilmesinin spektrofotometrik olarak belirlenmesiyle yapılmaktadır. Çalışmada öncelikle 7 mmol ABTS ile 2.45 mmol potasyum persulfatın oda sıcaklığında ve karanlıkta 12-16 saat reaksiyonu sonucunda ABTS˙+ radikal katyonu oluşturulmuştur. Elde edilen ABTS˙+ radikal katyonu 734 nm'de 0.700±0.02 absorbans verecek şekilde etanol ile seyreltilmiştir. 1980 µL seyreltilen ABTS˙+ radikal katyonu 20 µL metanolik ekstrakt ile karıştırılmıştır. Karışım oda sıcaklığında 6 dk. tutulduktan sonra 734 nm'de absorbansı ölçülmüştür. Sonuçların hesaplanmasında Troloks standart kurvesinden yararlanılmış ve sonuçlar mmol Trolox eş./g KM olarak ifade edilmiştir.

3.3 İstatistiksel Analiz

Bu çalışmada, elde edilen veriler arasındaki fark SPSS Statistic 25.0 paket programı kullanılarak tek yönlü varyans analizi (One-Way ANOVA) ile belirlenmiştir. Gruplar arasındaki farklılıklar Duncan çoklu karşılaştırma testi ile değerlendirilmiştir ($p<0.05$).

4. BULGULAR VE TARTIŞMA

Farklı ektraksiyon yöntemleri ile nar çekirdeği yağları elde edildikten sonra ortaya çıkan küspelerin kuru madde ve toplam yağ içerikleri Çizelge 4.1'de verilmiştir.

Çizelge 4.1. Yağ üretiminden arta kalan küspelerin kuru madde ve toplam yağ değerleri (ortalama±standart sapma)

Yöntem	Kuru Madde (%)	Toplam Yağ (%)
EE	96.77±0.28^{e}	7.05±0.01^{e}
ME	94.40±0.13^{b}	3.52±0.41^{b}
KE	95.26±0.22^{c}	3.99±0.42^{b}
UE	96.70±0.04^{e}	6.31±0.08^{d}
SxE	93.09±0.03^{a}	0.00±0.00^{a}
SE	95.68±0.10^{d}	4.71±0.05^{c}

Küçük harfler yöntemler arasındaki farkı ifade eder

Küspelerin kuru madde oranları %93.09-96.77 arasında değiştiği saptanırken, yöntemin kuru madde üzerindeki etkisi istatistiksel açıdan önemli ($p<0.05$) bulunmuştur. En yüksek kuru madde oranı EE yöntemi sonucu elde edilen küspede saptanırken, en düşük kuru madde oranı sokselet yöntemi sonucu elde edilen küspede tespit edilmiştir. Küspelerin toplam yağ miktarları %0.00-7.05 arasında olduğu belirlenirken yöntemler arasındaki farklılık istatistiksel açıdan önemli ($p<0.05$) bulunmuştur. Sokselet yönteminde küspede yağ kalıntısı kalmadığı, EE sonucu arta kalan küspede ise en fazla yağ kalıntısı tespit edilmiştir.

Küspe örneklerin TFM, DPPH ve ABTS değerleri Çizelge 4.2'de verilmiştir. Küspelere ait TFM değerleri 979.14-2516.73 mg GAE/kg KM arasında değişmiştir. En yüksek TFM değeri SE sonucu, en düşük ise ME sonucu elde edilen küspede saptanmıştır. Enzimatik ekstraksiyon öncesi mikrodalga ve ultrases ön işlemlerinin uygulanması küspenin TFM miktarını etkilemezken ($p>0.05$), kavurma ön işlemi TFM miktarını arttırmıştır ($p<0.05$). Soğuk ekstraksiyonun fenolikleri etkilemediği, dolayısıyla küspede fazla miktarda tespit edildiği düşünülmektedir. Kavurma ön işlemi uygulanarak yağ ekstraksiyonundan çıkan küspe SE'den sonra en yüksek TFM içeriğine sahip olmuştur. Bu durum kavurma işlemi sırasında yüksek ısı uygulamasının nar çekirdeğinde bağlı fenolik bileşenlerin açığa çıkarak TFM içeriğinin yüksek çıkmasına yol açtığı düşünülmektedir. Akdaş ve Bakkalbaşı (2017), ısıl işlem sırasında fenolik maddedeki artışın, bağlı fenoliklerin hücre duvarının parçalanması sonucu serbest hale gelmesinden kaynaklanabileceğini belirtmişlerdir. Mikrodalga ön işleminde de nar çekirdeği yüksek sıcaklığa maruz kalmaktadır. Ancak bu işlemde ısı çekirdeğin tümüne yayılmaktadır. Bu da hücre duvarındaki fenolik bileşenleri açığa çıkartırken bazılarının da parçalanmasına neden olabilmektedir. Mikrodalga uygulanan yöntemindeki küspelerin düşük TFM orana sahip olması fenolik bileşiklerin parçalanma hızının, bağlı olan fenolik bileşiklerin açığa çıkma hızından daha yüksek olmasından kaynaklanıyor olabileceği akla gelmektedir. Gölükçü ve ark. (2008), ülkemizde yetiştirilen nar çeşitlerine ait çekirdeklerin TFM 1535-3701 mg/kg arasında saptarken, çalışmada Hicaznar çeşidine ait çekirdeğin TFM miktarı 2298 mg/kg olarak belirlenmiştir. Li ve ark. (2011), nar çekirdeği küspesinin TFM içeriğini 2427.90 mg kateşin Eş/100 g KM olarak saptamışlardır.

Çizelge 4.2. Yağ üretiminden arta kalan küspelerin TFM, DPPH ve ABTS değerleri (ortalama±standart sapma)

Yöntem	Toplam Fenolik Madde (mg GAE/kg KM)	DPPH (mmol TE/g KM)	ABTS (mmol TE/g KM)
EE	1100.53±20.12^{a}	8.26±0.64^{ab}	8.07±0.78^{ab}
ME	979.14±146.30^{a}	6.81±0.52^{a}	6.74.±0.27^{a}
KE	1920.66±35.33^{b}	10.96±1.29^{c}	12.08±0.07^{c}
UE	1172.97±111.43^{a}	9.00±0.50^{b}	7.40±0.63^{a}
SxE	1876.76±245.29^{b}	12.35±0.12^{c}	10.94±1.77^{bc}
SE	2516.73±355.48^{c}	16.99±0.02^{d}	14.99±1.31^{d}

Küçük harfler yöntemler arasındaki farkı ifade eder

Küspe örneklerinin DPPH değerleri 6.81-16.99 mmol TE/g KM arasında değişmiştir (Çizelge 4.2). En yüksek DPPH değeri SE sonucu, en düşük değer ise ME yöntemi sonucu elde edilen küspelerde saptanmıştır. Enzimatik ekstraksiyon öncesi nar çekirdeğine kavurma ve ultrases ön işlemlerinin uygulanması DPPH değerini önemli düzeyde arttırırken ($p<0.05$), mikrodalga ön işleminin herhangi bir etkisi olmamıştır ($p>0.05$). SxE ve KE yöntemlerine ait küspeler TFM içeriği açısından olduğu gibi DPPH miktarları açısından da istatistiksel olarak aynı grupta yer aldığı saptanmıştır. SE yöntemine ait posa DPPH açısından en zengin küspe olmuştur. Aksoy (2017), nar çekirdeği küspesinin DPPH değerini %66.43 olarak tespit etmiştir.

Nar çekirdeği küspelerine ait ABTS değerleri 6.74-14.99 mmol TE/g KM arasında değişmiştir (Çizelge 4.2). En yüksek ABTS değeri SE, en düşük değer ise ME yönteminden elde edilen küspede saptanmıştır. ME ve UE yöntemlerine ait küspeler ABTS miktarı açısından aynı grupta yer almıştır. Enzimatik ekstraksiyon öncesi nar çekirdeğine kavurma ön işleminin uygulanması ABTS değerini önemli düzeyde arttırırken ($p<0.05$), mikrodalga ve ultrases ön işlemlerinin ABTS üzerine herhangi bir etkisi olmamıştır ($p>0.05$). SxE ve KE yöntemlerine ait küspeler ABTS miktarları açısından aynı grupta yer almıştır. Genel olarak bakıldığında, örneklerin fenolik bileşenler içerikleri ile DPPH ve ABTS değerleri arasında doğru orantı olduğu tespit edilmiştir. Jing ve ark. (2012), 4 farklı çeşit nar çekirdeği unlarının ABTS değerlerini 7.4-17.8 µmol TE/g un olarak tespit etmişlerdir.

5. SONUÇ

Tüm yöntemlerle elde edilen küspelerin TFM ile DPPH ve ABTS değerleri arasında genel anlamda doğru orantı olduğu görülmüştür. En yüksek TFM, DPPH ve ABTS değerleri SE yöntemi ile elde edilen küspede saptanırken, KE ve SxE yöntemleri ile elde edilen küspeler bu parametreler açısından SE'yi izlemişlerdir. Isı uygulaması olmadan uygulanan SE yönteminin en yüksek TFM, DPPH ve ABTS değerlerine sahip olması, bu yönteminin tercih nedeni olabilir.

Sonuç olarak farklı yöntemlerle elde edilen küspelerin yüksek TFM içeriği ve antioksidan aktiviteye sahip olmaları bu atıkların gıda, ilaç ve kozmetik sektörlerinde doğal antioksidan kaynağı olarak değerlendirilebilecek potansiyele sahip olduğunu göstermektedir. Bu anlamda, kaynaklarımızın sınırsız olmadığı gerçeğini de göz önünde bulundurarak fenolik bileşikler açısından zengin gıdaların artıklarının uygun yöntemlerle değerlendirilerek insan yaşamına fayda sağlayacak bir şekle dönüştürülmesi önem kazanmaktadır.

ABSTRACT

Nigeria's Yobe State, characterized by its challenging socio-economic conditions exacerbated by factors such as climate variability and limited infrastructure, serves as a pertinent case study. Through rigorous empirical analysis and qualitative research methods, this study seeks to contribute valuable insights into the effectiveness of NEAZDP (North East Arid Zone Development Programme) as a poverty alleviation strategy. Consequently, the study endeavors to assess how participation in NEAZDP influences the economic status and social mobility of its beneficiaries. Further, the study used an undated/cross sectional households survey data collected in the year 2023 through a well-structured questionnaire coupled with an interview schedule from a total of 322 households carefully selected from three targeted population using a multi-stage sampling technique. Moreover, using a FGT poverty matrix index and Alkaire's multidimensional poverty index, the collected data were efficiently analyzed for the achievement of the research objectives. Furthermore, the study revealed that the NEAZDP has been effective in reducing both unidimensional and multidimensional poverty among beneficiaries in Yobe State, Nigeria. Initially, there was a notable decline in the proportion of beneficiaries below the poverty threshold, although a slight increase was observed in the final phase of the programme. Multidimensional poverty among beneficiaries was significantly lower compared to spill-over and control groups, indicating the programme's success in improving socio-economic conditions. However, challenges persist in dimensions such as standard of living, empowerment, and environment, suggesting targeted interventions are necessary to sustain and enhance these gains. Succinctly, despite NEAZDP has made significant strides in reducing poverty and improving social mobility among beneficiaries in Yobe State, continued efforts are needed to address remaining challenges and ensure sustainable development outcomes. By focusing on targeted interventions, sustainability, and policy integration, the program can further enhance its impact and contribute to inclusive growth and poverty reduction in the region.

Keywords: Development, Intervention, Poverty Alleviation, Sustainability, Nigeria

INTRODUCTION

Yobe State, located in northeastern Nigeria, remains entrenched in poverty exacerbated by its arid and semi-arid climate, limited infrastructure, and socio-economic challenges (Gadzama, 2017; Umar, 2024; Madaki *et al*., 2024). The North East Arid Zone Development Programme (NEAZDP) was implemented to address these issues by promoting economic empowerment and sustainable development among vulnerable populations (Mukhtar et al., 2017; Galadima and Isa, 2020). However, the effectiveness of NEAZDP in facilitating social mobility and alleviating poverty among its beneficiaries' remains underexplored.

Despite the program's interventions in agriculture, entrepreneurship, and infrastructure development, there is a need to critically evaluate its impact on poverty levels and socio-economic mobility within Yobe State. Key questions arise regarding the extent to which NEAZDP has improved livelihoods, increased income levels, and enhanced access to essential services among its beneficiaries. Additionally, the program's ability to foster long-term economic resilience and reduce dependency on subsistence agriculture in the face of environmental challenges and security threats remains uncertain.

Moreover, the unique socio-economic and environmental context of Yobe State poses specific challenges that may influence the outcomes of NEAZDP interventions differently compared to other regions. Understanding these nuances is crucial for refining policy approaches and optimizing the impact of poverty alleviation strategies in similar marginalized areas across Nigeria (Orunbon and Adeleke, 2024; Kabari and Nwogo, 2021; Ogbari *et al*., 2024; Kolawole and Samuel, 2024) and sub-Saharan Africa (Wudil *et al*., 2022; Schotte, 2023; Ncube *et al*., 2024; Woode, 2024) .

Therefore, this study aims to address these gaps by investigating the social mobility of poverty among NEAZDP beneficiaries in Yobe State. By examining the experiences, outcomes, and challenges faced by participants, the research seeks to provide empirical evidence to inform policy-making, enhance program effectiveness, and contribute to sustainable development efforts in northeastern Nigeria. Consequently, this study attempts to assess the role of NEAZDP on social mobility of poverty in Yobe State of Nigeria. The specific objectives were to assess the role of NEAZDP on unidimensional poverty among the beneficiary group and multidimensional poverty status of the beneficiary group against the non-beneficiary group.

Theoretical Framework

The theoretical framework for the study on *The Role of NEAZDP on Social Mobility of Poverty in Yobe State of Nigeria* provides a foundation for understanding the mechanisms through which the North-East Arid Zone Development Programme (NEAZDP) influences poverty alleviation, social mobility, and economic redistribution. The framework is built on established theories of poverty, social mobility, and economic development to analyze the program's impact on its beneficiaries, spillover groups, and control groups. The following theories underpin the study:

1. **Capability Approach (Amartya Sen, 1999)**

The Capability Approach, developed by Amartya Sen, serves as a key theoretical lens for assessing how NEAZDP impacts multidimensional poverty. This approach argues that poverty should not only be understood in terms of income deprivation but also in terms of lack of access to fundamental capabilities such as education, healthcare, and employment.

2. **Social Mobility Theory (Blau & Duncan, 1967)**

Social mobility theory explains how individuals or groups move within the socioeconomic hierarchy over time. Mobility can be **intergenerational** (changes across generations) or **intragenerational** (changes within an individual's lifetime).

3. **Growth and Redistribution Theory (Bourguignon, 2004)**

This theory posits that economic growth alone is insufficient to reduce poverty unless there is an equitable redistribution of wealth and resources. A pro-poor growth strategy ensures that the benefits of economic expansion reach the lowest-income groups.

4. **Poverty Dominance Approach (Atkinson, 1987)**

The Poverty Dominance Approach assesses poverty by comparing multiple poverty distributions across different population groups. It helps in understanding whether a given poverty intervention benefits all groups or only a specific subset.

5. **Demographic Transition Theory (Notestein, 1945)**

The Demographic Transition Theory explains how population dynamics, including birth rates, mortality rates, and migration, influence economic development and poverty levels.

6. **Multidimensional Poverty Index (MPI) Framework (Alkire & Foster, 2011)**

The MPI framework extends beyond income-based poverty measures to include health, education, and living standards as key dimensions of poverty.

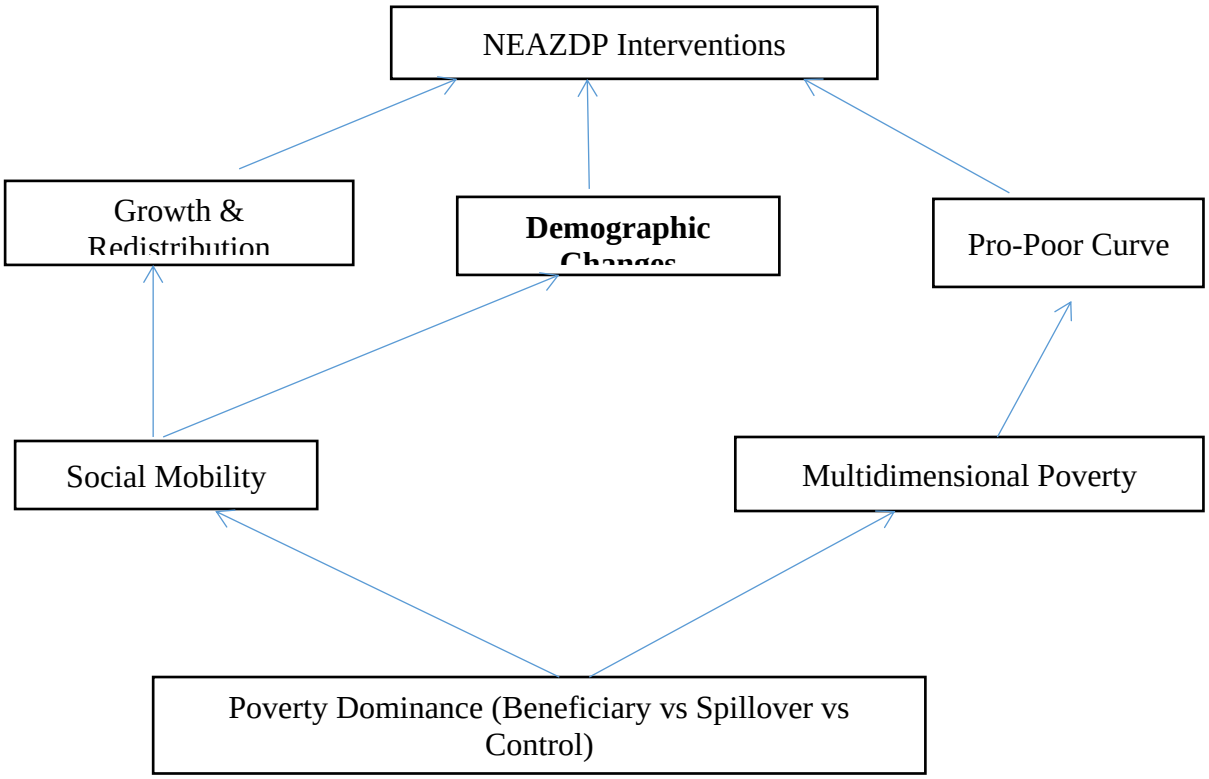

Figure 2a: Conceptual framework

Key Components of the Conceptual Framework

1. **Independent Variable:**
- **NEAZDP Interventions** (Agricultural Support, Skill Acquisition, Education, Financial Assistance, Infrastructure Development)

2. **Mediating Variables:**
- **Growth and Redistribution:** How economic growth and wealth redistribution affect poverty reduction.
- **Demographic Changes:** Household size, dependency ratio, migration, and employment status.
- **Pro-Poor Curve:** The extent to which NEAZDP benefits reach the poor compared to wealthier groups.

3. **Dependent Variables (Outcomes):**
- **Social Mobility:** Changes in income, education, and employment status.
- **Multidimensional Poverty Status:** Access to healthcare, education, and living conditions.

- **Poverty Dominance:** Comparison of poverty levels among beneficiaries, spillover groups, and control groups.

Explanation of the Conceptual Framework Diagram

- ✓ **NEAZDP Interventions** (Independent Variable) are at the top, representing programs such as **agricultural support, skill acquisition, education, financial assistance, and infrastructure development.**
- ✓ These interventions influence **Mediating Variables**:
  - **Growth and Redistribution** (economic upliftment strategies)
  - **Demographic Changes** (household structure, migration, employment)
  - **Pro-Poor Curve** (extent of poverty impact across different groups)
- ✓ The mediating variables lead to **two primary outcomes (Dependent Variables):**
  - **Social Mobility** (improvements in income, education, and employment)
  - **Multidimensional Poverty** (better health, education, and living standards)
- ✓ Finally, these outcomes determine **Poverty Dominance**, comparing poverty levels among NEAZDP beneficiaries, spillover groups, and control groups.

Empirical Review

This section reviews empirical studies on the role of the North-East Arid Zone Development Programme (NEAZDP) in reducing poverty, enhancing social mobility, and addressing multidimensional poverty in Yobe State, Nigeria. The review also considers broader studies on poverty alleviation programs and their effectiveness.

1. NEAZDP and Poverty Reduction

Studies indicate that NEAZDP has been instrumental in providing sustainable livelihoods for rural communities in Yobe State by promoting agricultural support, water supply, and environmental conservation (Mukhtar *et al*., 2017). The program's success in mitigating soil degradation and desertification has contributed to improved food security, which directly impacts poverty reduction (Danjuma & Daura, 2014).

A study by Mukhtar, Bababe, and Abba (2020) found that while NEAZDP interventions have improved access to essential services in northern Yobe, sustainable poverty reduction remains a challenge. The authors argue that limited government funding and policy inconsistencies hinder long-term impact.

2. Social Mobility and NEAZDP Beneficiaries

NEAZDP has facilitated upward social mobility among beneficiaries by improving literacy rates, skill acquisition, and economic opportunities. Lembi & Yahaya (2023) assert that economic empowerment initiatives, including small-scale irrigation schemes and microcredit **access**, have helped households escape poverty. However, the study highlights that spillover

groups (non-beneficiaries in the same communities) often experience limited benefits, which exacerbates inequality.

3. Growth, Redistribution, and the Pro-Poor Curve

Economic growth alone does not guarantee poverty alleviation-redistributive policies are crucial (Gadzama, 2017). A study on the pro-poor curve of NEAZDP beneficiaries revealed that income growth among the poorest households was slower than among wealthier participants. This suggests that while the program aids economic development, income inequality persists among beneficiaries.

4. Impact of Demographic Changes on Poverty Reduction

Demographic factors-such as family size, migration, and dependency ratio-influence the effectiveness of poverty reduction programs (Naibbi, 2013). A study on population trends in Yobe State found that larger households benefited less from NEAZDP interventions due to the higher economic burden. Similarly, rural-urban migration led to differential access to program benefits, with urban migrants often missing out on key services.

5. Poverty Dominance among Beneficiaries, Spillover, and Control Groups

Comparing NEAZDP beneficiaries, spillover, and control groups, Usman *et al*.(2019) found that poverty levels were significantly lower among beneficiaries. However, spillover effects-where non-beneficiaries benefit indirectly from development programs-were minimal. This raises concerns about the program's inclusivity and its ability to reach wider populations.

6. NEAZDP and Multidimensional Poverty Reduction

NEAZDP's impact on multidimensional poverty (MPI) has been mixed. A study by Odihi (2023) found that while the program improved health, education, and living conditions, gaps remain in employment generation and financial security. The study recommends expanding vocational training and social protection mechanisms to achieve sustained poverty reduction.

RESEARCH METHODOLOGY

Yobe State is located in northeastern Nigeria (Umar, 2024); lies on Latitude 11^0 44ˆ and 55.90ˆN and longitude $11^{0'}$ 57ˆ and 57.71^0E; bordered by Borno State to the east and Niger Republic to the north (Figure 1b). It experiences a hot desert climate with temperatures often exceeding 40°C (104°F) during the dry season. The state's agro-ecological conditions are predominantly Sahelian, characterized by sparse vegetation and periodic droughts, making agriculture challenging without adequate irrigation. Agricultural activities such as crop production, livestock rearing, agricultural marketing etc. are the major source of livelihood earnings in the state (Madaki *et al*., 2024).

Using a multi-stage sampling technique, from three targeted population, a total of 396 respondents were randomly selected for the study. The targeted population were treated (project participating sites), spill-over and the control units (Figure 1). Noteworthy, the programme is confined to the northern part of the state and covered only nine (9) Local Government Areas (LGAs) viz. Bade, Jakusko, Bursari, Geidam, Yunusari, Yusufari, Nguru, Karasuwa and Machina LGAs. Firstly, to have a balance across the sampling units, of the nine (9) treated LGAs, four (4) LGAs, namely, Bade; Jakusko, Bursari and Geidam were randomly selected. Besides, for the spill-over and control groups respectively, four LGAs each, namely, Tarmuwa, Nangere, Fune and Fika; and, Damaturu, Potiskum, Gujba and Gulani, were purposively selected because the former fell within the radius of 20-50km while the latter fell within the radius of greater or equal to 100km as adopted by Sadiq *et al*.(2020). Furthermore, given the peculiarity of the treated sites, from each of the selected treated LGAs, one (1) Development Area (DA) was selected and thereafter a random selection of three (3) clusters from each of the selected DA, thus gave a total of twelve (12) selected clusters. Moreover, from each of the selected clusters-treated unit; spill-over and the control units respectively, two (2) villages were randomly selected, thus gave a total of forty (40) randomly selected villages. Lastly, using a sampling frame obtained from NEAZDP coupled with reconnaissance survey (Table 1), from each of the selected programme villages, five (5) out of a total of fifteen (15) beneficiaries were randomly selected, thus gave a total of one hundred and twenty (120) randomly selected beneficiaries. However, given the non-availability of a finite sample frame for the non-beneficiary group, the sample size was generated using the error margin formula as proposed by Bartlet *et al*.(2002) (Equation 1) . Generally, a total of three hundred and ninety six (396) respondents' vis-à-vis treated (120), exposed (138) and control (138) groups selected randomly constituted the sample size for this study (Table 1). Further, using an easy-route cost approach, a well-structured questionnaire complemented with an interview schedule was used by trained enumerators to elicit cross sectional data in the year 2023. Moreover, the objective related to the economic/income (unidimension) aspect of poverty were achieved using a Foster-Greer-Thorbecke (FGT) index (Equation 2-15) while the objective related to social (multi-dimension) aspect of poverty was achieved using Alkire and Foster multidimensional poverty index (MPI).

According to the Bartlett's formula, the sample size of the unknown can be generated using the following formula:

$$N_{nb} = Z^2 * P(1-P)/e^2 \quad \text{……………………………….. (1)}$$

Where, N_{nb} is the sample size of the non-beneficiaries, Z is Z-statistic at 5% probability level (1.96), P is the sample proportion (10%) and e is the error gap at 5%.

Empirical model

1. Economic/Income (unidimension) approach of poverty measurement

a. The decomposition of the FGT index across growth and redistribution effects

Datt and Ravallion (1992) decompose the change in the FGT index between two periods, t_1 and t_2, into growth and redistribution components as follows:

$$P_2 - P_1 = [P(\mu^{t2}, \pi^{t1}) - P(\mu^{t1}, \pi^{t1})] + [P(\mu^{t1}, \pi^{t2}) - P(\mu^{t1}, \pi^{t1})] + R/ref = 1 \quad \text{..... (2)}$$

$$P_2 - P_1 = [P(\mu^{t2}, \pi^{t2}) - P(\mu^{t1}, \pi^{t2})] + [P(\mu^{t2}, \pi^{t2}) - P(\mu^{t2}, \pi^{t1})] + R/ref = 2 \quad \text{..... (3)}$$

Where

$P_2 - P_1$ = difference (variation) in poverty between t1 and t2;

Component 1 (C1) = growth component/ impact;

Component 2 (C2) = redistribution component/effect;

R = residual; and,

Ref. = period of reference.

$P(\mu^{t1}, \pi^{t1})$: the FGT index of the first period

$P(\mu^{t1}, \pi^{t2})$: the FGT index of the second period

$P(\mu^{t2}, \pi^{t1})$: the FGT index of the first period when all incomes y_i^{t1} of the first period are multiplied by μ^{t2} / μ^{t1}

$P(\mu^{t1}, \pi^{t2})$: the FGT index of the second period when all incomes y_i^{t2} of the second period are multiplied by μ^{t1} / μ^{t2}

The Shapley value decomposes the variation in the FGT Index between two periods, t_1 and t_2, into growth and redistribution components as follows:

$$P_2 - P_1 = C_1 + C_2 \quad \text{..... (4)}$$

$$C_1 = \frac{1}{2}([P(\mu^{t2}, \pi^{t1}) - P(\mu^{t1}, \pi^{t1})] + [P(\mu^{t2}, \pi^{t2}) - P(\mu^{t1}, \pi^{t2})]) \quad \text{..... (5)}$$

$$C_2 = \frac{1}{2}([P(\mu^{t1}, \pi^{t2}) - P(\mu^{t1}, \pi^{t1})] + [P(\mu^{t2}, \pi^{t2}) - P(\mu^{t2}, \pi^{t1})]) \quad \text{..... (6)}$$

b. *Pro-poor curves*

Pro-poor curves can be drawn using either the primal or the dual approach. The former uses income levels. The latter is based on percentiles.

The change in the distribution from state 1 to state 2 is s-order absolutely pro-poor with standard *cons* if:

$$\Delta(z,s) = (P_2(z+cons, \alpha = s-1)) < 0 \forall z \in [0, z^+] \quad \ldots\ldots\ldots\ldots\ldots\ldots (7)$$

The change in the distribution from state 1 to state 2 is s-order relatively pro-poor if:

$$\Delta(z,s) = (P_2(z\frac{\mu_2}{\mu_1}, \alpha = s-1) - P_1(z, \alpha = s-1)) < 0 \forall z \in [0, z^+] \quad \ldots\ldots\ldots\ldots\ldots\ldots (8)$$

c. *Impact of demographic changes*

This application computes the impact of a change (by a given percentage) in the proportion of a group *t*. That change is accompanied by an exactly offsetting change in the proportion of the other groups.

If the population proportion of group *t* increases by pc percent, such that $\phi(t) \rightarrow (\phi(t)(1+pc))$, the total estimated impact on poverty is as follows:

$$\Delta P = [\phi(t) * P(t; z, \alpha) - \sum_{k \neq s}^{K} \frac{\phi(t)}{1-\phi(t)} * \phi(k) * P(k; z, \alpha)] * pc \quad \ldots\ldots\ldots\ldots\ldots\ldots (9)$$

If the population proportion of group *s* increases by absolute pc percent of the total population, such that $\phi(t) \rightarrow (\phi(t)(1+pc))$, the total estimated impact on poverty is as follows:

$$\Delta P = [P(t; z, \alpha) - \sum_{k \neq s}^{K} \frac{\phi(k)}{1-\phi(t)} * P(k; z, \alpha)] * pc \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (10)$$

Where, $P(t; z; \alpha)$ is the FGT poverty index for subgroup k and $\bar{\phi}(k)$ is the proportion of the population found in that subgroup.

d. *FGT Poverty: decomposition by population subgroups*

This decomposition takes the form

$$\hat{P}(z;\alpha)=\sum_{g=i}^{G}\hat{\phi}(g)\hat{P}(z;\alpha;g) \quad \text{...} (11)$$

Where, G is the number of population subgroups. The results show:

The estimated FGT index of subgroup $g : \hat{P}(z;\alpha;g)$

The estimated population share of subgroup $g : \hat{\phi}(g)$

The estimated absolute contribution of subgroup g to total poverty: $\hat{\phi}(g)\hat{P}(z;\alpha;g)$

The estimated relative contribution of subgroup g to total poverty: $(\hat{\phi}(g)\hat{P}(z;\alpha;g))/\hat{P}(z;\alpha)$

e. Decomposition of change in FGT poverty by poverty and population group components -sectoral decomposition

Additive poverty measures, like the FGT indices, can be expressed as a sum of the poverty contributions of the various subgroups of population. Each subgroup contributes by its population share and poverty level. Thus, the change in poverty across time depends on the change in these two components. Denoting the population share of group k in period I by $\phi_1(k)$, the change in poverty between two periods can be expressed as follow (Huppi, 1991 and Duclos and Araar, 2006):

$$P_2-P_1=[\sum_{k=1}^{K}\phi_1(k)(P_2(k;z;\alpha)-P_1(k;z;\alpha))]+[\sum_{k=1}^{K}P_1(k;z;\alpha)(\phi_2(k)-\phi_1(k))]+$$

$$[\sum(P_2(k;z;\alpha)-P_1(k;z;\alpha))(\phi_2(k)-\phi_1(k))] \quad \text{.............................} (12)$$

Where,

$P_2-P_1=$ difference (variation) in poverty between 1 and 2

C1 = intra-sectoral/intra-group impacts/within-group poverty effect

C2 = impact of changes in subgroup proportions/demographic or sectoral effect

C3 = interaction effect/ interaction term

This decomposition uses the initial period as the one. If the reference period is the final, the decomposition takes the form:

$$P_2-P_1=[\sum_{k=1}^{K}\phi_2(k)(P_2(k;z;\alpha)-P_1(k;z;\alpha))]+[\sum_{k=1}^{K}P_2(k;z;\alpha)(\phi_2(k)-\phi_1(k))]+$$

$$[\sum(P_2(k;z;\alpha)-P_1(k;z;\alpha))(\phi_1(k)-\phi_2(k)))$$ …….. (13)

To remove the arbitrariness in selecting the reference period, we can use the Shapley decomposition approach, finding:

$$P_2-P_1=[\sum_{k=1}^{K}\phi_1(k)(P_2(k;z;\alpha)-P_1(k;z;\alpha))]+[\sum_{k=1}^{K}P_1(k;z;\alpha)(\phi_2(k)-\phi_1(k))]$$ …… (14)

Where, $\bar{\phi}(k)$ is the average population share $=0.5(\phi_1(k)+\phi_2(k))$ and $\bar{P}(k;z;\alpha)=0.5(P_1(k;z;\alpha)+P_2(k;z;\alpha))$.

f. Poverty dominance

Distribution 1 dominates distribution 2 at order *s* over the conditional range $\lfloor Z^-, Z^+ \rfloor$ if only if:

$$P_1\xi;\alpha)>P_2(\xi;\alpha)\forall\xi\in\lfloor Z^-,Z^+\rfloor \text{ for } \alpha=s-1$$ ……. (15)

This involves comparing stochastic dominance curves at order *s* or FGT curves with $\alpha=s-1$. This application checks for the points at which there is a reversal of the dominance conditions. Said differently, it provides the crossing points of the dominance curves, that is, the values of ξ and $P_1(\xi;\alpha)$ for which $P_1(\xi;\alpha)=P_2(\xi;\alpha)$ when sign $(P_1(\xi-\eta;\alpha)-P_2(\xi-\eta;\alpha))=$ sign $(P_2(\xi-\eta;\alpha)-P_1(\xi-\eta;\alpha))$ for a small η

The crossing points of ξ can also be referred to as “critical poverty lines”.

2. ***Multidimensional poverty index (MPI)***: The MPI is a composite indicator of poverty that accounts for both the distribution of deprived areas and their prevalence (Appendix 1) (Sadiq and Sani, 2022). The following are the indexes involved in the measurement:

Multidimensional headcount ratio (H): Is the proportion of persons who have been classified as multidimensionally poor, i.e. those who fall below the poverty line, and is expressed as:

$$H=q(k)/n$$ ……..… (16)

The number (or headcount) of multidimensionally poor persons according to parameter k is *q(k)*.

$$(q(k)=\sum_{i=1}^{n}p_k(\chi_i,z))$$ ……..…… (17)

The average deprivation share across the poor is defined as the intensity of poverty A, often known as the breadth of poverty. This is presented as:

$$A = \sum_{i=1}^{q} c_i(k) / q(k) \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (18)$$

The percentage of the d indicators in which the average multidimensionally poor person is deprived is the intensity of poverty.

The measure M_0 is the so-called adjusted headcount ratio when $\alpha = 0$.

$$M_0 = HA \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (19)$$

When$\alpha = 1$, the measureM_1, adjusted poverty gap, defined as the weighted average of indicator-specific poverty gaps is used. G is poverty gap.

$$M_1 = HAG \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (20)$$

$$G = \sum_{i=1}^{n} \sum_{j=1}^{d} g_{ij}^{1}(k) \Big/ \sum_{i=1}^{n} \sum_{j=1}^{d} g_{ij}^{0}(k) \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (21)$$

Finally, when $\alpha = 2$, the adjusted squared poverty gap (M_2) is calculated as the weighted average of the indicator-specific squared poverty gaps. S is poverty severity.

$$M_2 = HAS \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (22)$$

$$S = \sum_{i=1}^{n} \sum_{j=1}^{d} g_{ij}^{2}(k) \Big/ \sum_{i=1}^{n} \sum_{j=1}^{d} g_{ij}^{0}(k) \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (23)$$

Seth and Alkire (2014) as reported by Sadiq and Sani (2022) suggested an additively decomposable inequality measure that is a positive multiple of "variance" and has within-group and between-group components. The inequality measure I^q employs the vector of deprivation scores of the q impoverished people $c_i(k)$ to quantify inequality among the poor at the national or sub-national level.

$$I^q = \frac{\tilde{\beta}}{q} \sum_{i=1}^{q} [c_i(k) - A]^2 \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots \quad (24)$$

To calculate the measure of inequality, the difference between each poor person's deprivation score and average intensity is squared, then the squared distances are added together and multiplied by a constant $\tilde{\beta}$. We set $\tilde{\beta}$ =1/49 since the poor's deprivation ratings vary from 1/7 to 1. This is the greatest permissible number for the inequality gauge, guaranteeing that the inequality gauge is constrained between zero and one, given the spectrum of deprivation scores. Nevertheless, a lower degree of poverty or a decline in poverty does not necessarily mean that every region or demographic categories have experienced an equal reduction in poverty (Sadiq and Sani, 2022; Sadiq et al., 2024).

RESULTS AND DISCUSSION

The Role of NEAZDP on Social Mobility of Poverty among the Beneficiary Group

A perusal of Table 2 revealed the unidimensional social and economic mobility of poverty for the beneficiary group as the programme transit through time period from the initial period to

the final period. The matrix showed that at the first quarter phase of the programme, 24.17% of the beneficiaries were significantly below the poverty threshold. Subsequently, as the programme passes through time period, at the second quarter phase of the programme the proportion of the beneficiaries below the poverty threshold significantly declined to 16.67%. This significant decline in the proportion of the beneficiaries that were below the poverty threshold persists till the third quarter phase (15.83%) of the programme implementation. Conversely, at the last (fourth-quarter) phase of the programme implementation, there was a sudden reversal in the trend of poverty proportion (increase) among the beneficiaries in the study area, i.e., 20.83% of the beneficiaries was significantly below the poverty threshold. The initial decline in poverty levels across the phases indicates positive economic mobility for the beneficiaries. They were initially moved towards improved economic conditions; potentially finding better employment opportunities or increasing their income through the programme's support. The increase in poverty levels in the last phase signifies a reversal in economic mobility. It could imply that the economic gains achieved earlier were not sustained or that external factors such as economic downturns, changes in policy, or programmatic issues have caused deterioration in economic status. Fluctuations in poverty levels can affect social stability. A sudden increase in poverty levels as seen in the last phase might lead to social unrest or dissatisfaction among beneficiaries. Therefore, policymakers should consider the factors that contributed to poverty increase in the last phase. This might involve addressing systemic issues, enhancing program monitoring and evaluation, or providing a longer-term support to ensure sustained economic and social improvements. Summarily, while the NEAZDP programme initially showed positive impacts on reducing poverty and enhancing mobility among beneficiaries, the increase in poverty levels in the last phase highlights challenges in achieving sustained social and economic mobility. Addressing these challenges is crucial for ensuring that interventions lead to lasting improvements in the lives of beneficiaries.

Impact of Growth and Redistribution on Poverty of NEAZDP Beneficiaries

Furthermore, in assessing the effects of income growth and redistribution on poverty reduction of the beneficiary group (Table 3 and Figure 2), after programme intervention, due to growth in the economy, i.e., economic growth, poverty declined by 6.20%. Contrarily, income redistribution increased poverty among the beneficiaries after programme intervention, an indication of a poor system of tax administration; likewise, the social safety measure(s) is not pro-poor, i.e., it favours the non-poor against the poor in the beneficiary group. Inspite of the programme impact on economic growth, the poor states of public expenditure (i.e., subsidies, social safety measures) and the presence of ineffective progressive tax administration system constitutes a clog in the wheel of the programme success and long-term sustainability in the study area. In other words, despite the NEAZDP's positive impact on economic growth and poverty reduction, the ineffective income redistribution, inadequate public expenditure, and flawed tax administration undermine its success and sustainability, necessitating targeted reforms in tax policy, public expenditure, and social safety measures to better support the poor.

Put differently, the results indicate that while NEAZDP-induced economic growth reduced poverty by 6.20%, flawed income redistribution increased poverty among beneficiaries, highlighting issues in tax administration. This suggests that the benefits of economic growth are not reaching the poorest members of the community, potentially exacerbating inequality. For the NEAZDP to achieve its poverty reduction goals sustainably, it is crucial to reform tax policies to ensure more equitable distribution of income, so that the poorest beneficiaries are effectively supported and can share in the program's benefits.

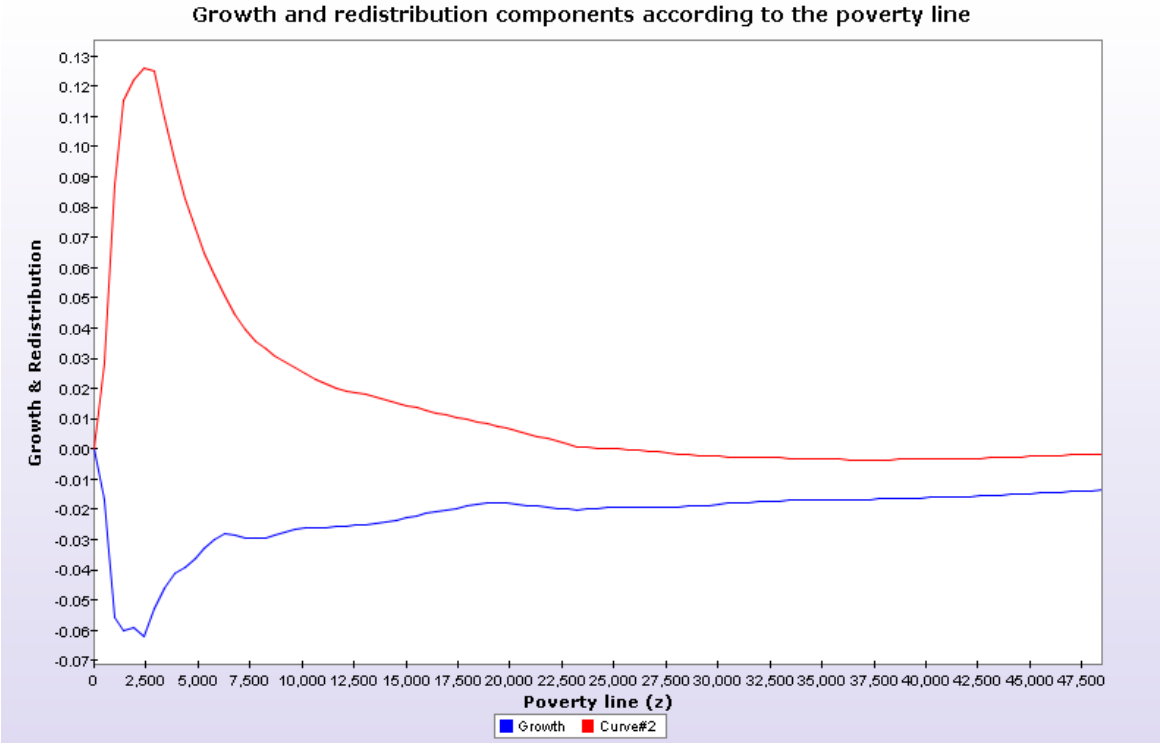

Figure 2: Growth and redistribution effects on poverty of NEAZDP

Pro-Poor Curve of NEAZDP Beneficiaries

Moreover, in assessing the pro-poor growth, after programme participation, the results in Table 4 (depicted in Figure 3) showed a decline in the growth incidence (18.75%) of poverty and a significant decline in the growth severity (17.22%) of poverty. Succinctly, it can be inferred that the policies of the programme directly targeted the poorest of the poor; in other words, the policies of the programme are more generally aimed at poverty alleviation. Likewise, it can be concluded that the incomes of poor households in the beneficiary group grows faster than that of the whole population of the non-beneficiary group. Succinctly, for growth to be pro-poor, it means there is a fall in income inequality of the beneficiary group compared to the non-beneficiary group. Noteworthy, pro-poor growth is the type of growth that enables the poor to actively participate in economic activity(s) and benefit proportionally more than the non-poor from overall income increase. This suggests that the program has effectively targeted and benefited the poorest individuals within the beneficiary group, leading to meaningful improvements in their living conditions. The significant decline in poverty severity also implies that the most vulnerable members are experiencing less extreme poverty, which is a positive outcome for long-term poverty reduction and improved well-being in the region. In other words, the NEAZDP has effectively targeted the poorest households, leading to significant reductions in poverty incidence and severity, and ensuring that poor households benefit more proportionally from economic growth compared to the non-beneficiary group. Therefore, to enhance its impact, the programme should continue focusing on equitable income growth and implement measures to further reduce income inequality.

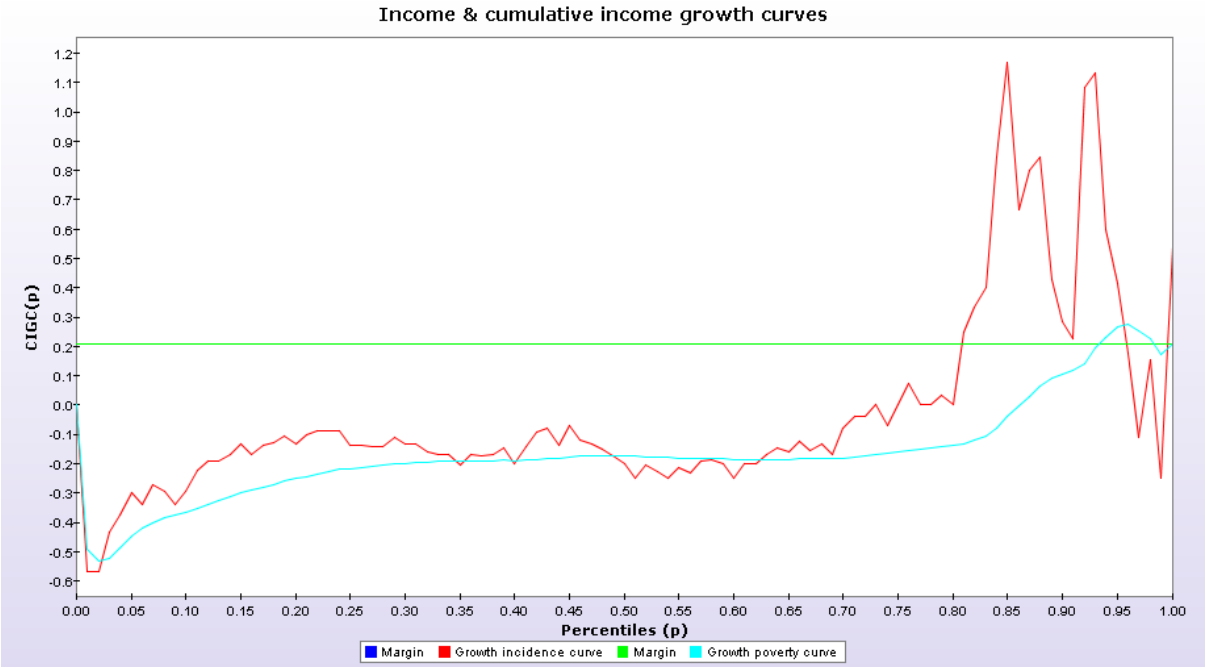

Figure 3: Pro-poor curve of the beneficiary group

Impact of Demographic Change on Poverty of NEAZDP Beneficiaries

In assessing the impact of demographic on poverty (relative to group) (Table 5), between beneficiary and spill-over groups respectively, for a 10% change (increase) in the size of each group, poverty will significantly decline by 0.64% and incline by 0.86%, as evident by their respective impact coefficient at 10% degree of freedom. Besides, the results showed a decrease (28.03% to 26.21%) in the proportion of poor in the beneficiary group against an increase (39.40% to 43.34%) in the proportion of poor in the spill-over group. Moreover, relative to population, the results showed that a 10% increase in each of the population of the beneficiary and spill-over groups respectively, will significantly makes poverty to decline and incline by 1.63 and 2.18%. On the other hand, relative to group, between beneficiary and control groups respectively, a 10% increase in the size of each group will significantly plummet and increase

poverty by 0.44 and 1.63%. Nevertheless, relative to population, for a 10% increase in the group size of the beneficiary group, poverty will significantly plummet by 1.34% whereas relative to the control group, poverty will significantly surged by 5.01%. The NEAZDP has effectively reduced poverty among beneficiaries compared to the spill-over and control groups, with a 10% increase in the beneficiary group size leading to a significant 1.34% decrease in poverty. Therefore, to maximize impact, the programme should focus on expanding its reach while ensuring effective measures are in place to prevent increasing poverty in control and spill-over groups. Put differently, the results indicate that the NEAZDP effectively reduces poverty within the beneficiary group, with a 10% increase in group size leading to a 1.34% decrease in poverty. However, the spill-over and control groups experience rising poverty with similar population increases. This suggests the program is successfully targeting the beneficiary group but may be contributing to increased inequality and poverty in surrounding areas. To enhance overall impact, the program may need to extend benefits to spill-over and control groups or address the negative effects on these non-beneficiary groups.

Note: Value in ( ) is standard error; ***, **, * & ^{NS} mean significant at 1, 5, 10% and non-significant respectively; 1 = Beneficiary, 2 = Spillover, 3 = Control

Furthermore, in assessing poverty decomposition for two groups, between the beneficiary and spill-over groups (Table 6), the empirical evidence showed that 28.34 and 9.87% of the significant 35.21% that were poor among the beneficiary group were relatively poor (have basic necessities but face social exclusion) and absolutely poor (lack basic necessities). Contrarily, of the significant 21.80% that were poor among the spill-over group, 8.59% faced relative poverty while 24.66% faced absolute poverty. Further, between the beneficiary and control groups, of the 32.27% that were significantly poor among the former, 27.15% are challenged with relative poverty whereas 9.04% are challenged with absolute poverty. Contrarily, of the significant 50.13% that were poor among the control group, 48.98% were relatively poor while 16.32% were absolutely poor.

Nevertheless, in assessing poverty decomposition by groups (a broader perspective, i.e., overall), between beneficiary against spill-over and control groups, it was observed that of the significant 32.27% that were poor among the beneficiary group, 28.29 and 9.04% respectively, were relatively and absolutely poor. Contrarily, of the significant 19.40% that were poor among the spill-over group, 23.91 and 7.65% respectively, were relatively and absolutely poor. Likewise, of the significant 46.94% that were poor among the control group, 47.81 and 15.29% respectively, were relatively and absolutely poor. The NEAZDP has been more successful in addressing absolute poverty among beneficiaries compared to the spill-over and control groups,

significantly reducing absolute poverty while still encountering notable relative poverty. Thus, the programme should continue focusing on reducing absolute poverty while also developing targeted interventions to address relative poverty and social exclusion. In other words, the results suggest that the NEAZDP has had a more substantial impact on reducing absolute poverty than relative poverty. The beneficiary group shows a higher proportion of individuals facing relative poverty compared to absolute poverty, indicating that while basic needs are generally met, issues of social exclusion persist. In contrast, both the spill-over and control groups experience higher rates of absolute poverty, especially the control group. This highlights the need for the NEAZDP to focus not only on reducing absolute poverty but also on addressing social exclusion and relative poverty to improve overall well-being.

Moreover, from a broader dimension, i.e., the sectoral decomposition of differences in poverty (natural); between the beneficiary versus the spill-over and control groups, the results showed a very drastic decline in the proportion of beneficiary group that are challenged with absolute poverty against its counterparts in spill-over and control groups (Table 7). Besides, due to programme impact, as evident by the intra-group impact, the proportion of households in beneficiary group that faces absolute poverty is 1.51% against their counterparts in spill-over group (2.40%). Likewise, the proportion of households in the beneficiary group challenged with absolute poverty is 1.085% against their counterparts in the control group (2.09%). Generally, it can be inferred that programme impact plays a great role in minimizing absolute poverty among the beneficiary against their counterparts in the spill-over and control groups. Nevertheless, the results obtained under Shapley's decomposition model exhibited a similar trend. Conclusively, the NEAZDP has significantly reduced absolute poverty among beneficiaries compared to both spill-over and control groups, demonstrating its effectiveness in addressing severe poverty. Therefore, to enhance overall impact, the programme should continue its focus on absolute poverty reduction while also exploring strategies to mitigate relative poverty and ensure broader social inclusion.

Poverty line = 11788.41

Poverty Dominance (Beneficiary versus Spill-over and Control Groups)

In assessing the poverty dominance, between the beneficiary and spill-over groups, the results showed poverty to dominate in the spill-over group against the beneficiary group (Table 8). At cross 1 (case #1), the poverty crossing value for the beneficiary group out of critical relative poverty line is ₦7, 647.18 whereas the relative poverty crossing point for the spillover group is ₦7, 657.59 at cross 2 (case #2). Likewise, at cross 3 case #2, the significant amount needed by the beneficiary group to cross over the line of relative poverty is ₦8, 057.53 while the spill-over group needs a significant amount in the sum of ₦14, 113.54 to cross over the relative poverty line at cross 4 (case # 2). Comparatively, the margin of cross over between the two groups is slight at cross 1 versus 2 while it is wide at cross 3 (case #1) versus cross 4 (case #2). On the other hand, between the beneficiary and control groups, the poverty dominance of the latter is higher than that of the former as evident by case #1 versus case #2. Besides, poverty crossing value of the beneficiary group is ₦46296.82 against that of the control group

(₦53709.65). Noteworthy, the poverty crossing values of both groups were significant threshold; however, the marginal difference between the thresholds of the duo is mild. The NEAZDP has effectively reduced poverty compared to the spill-over and control groups, with beneficiaries requiring significantly less to cross the relative poverty line, indicating better poverty alleviation. To further enhance its impact, the programme should focus on deepening its interventions to address the remaining poverty gaps and reduce the disparities within the control group. In other words, the results indicate that while the NEAZDP has been somewhat effective, poverty remains more dominant in the spill-over group compared to the beneficiary group. The beneficiary group requires a smaller amount to move out of relative poverty compared to the spill-over group, but a larger amount compared to the control group. The control group faces higher poverty dominance overall. These findings suggest that the NEAZDP is moderately successful in reducing poverty but highlights the need for more targeted interventions to address the wider poverty gap and improve the situation of both spill-over and control groups.

Table 8: Poverty dominance between beneficiary vs. spill-over and control groups

Crossing	Value Of Z	Standard Error	t-statistic	Case

Case #2 = Before, Distribution #2 Dominates Distribution #1

The Role of NEAZDP on Multidimensional Poverty Status of the Beneficiary against the Spillover and Control Groups

A cursory review of the multidimensional poverty level showed that at the poverty threshold level (k=0.33), a proportion of 28.21% of the households in the beneficiary group were multidimensional poor against that of the spill-over (61.51%) and control (52.99%) groups as indicated by their respective head count ratio index (Table 9 and Figure 4a). Comparatively, the incidence of poverty is low among the beneficiaries compared to the non-beneficiary group: the states of acute poverty in the spill-over and control groups are higher than that of the

beneficiary group by 33.3 and 24.78% respectively. This suggests that the intervention has been effective in reducing poverty among beneficiaries. Besides, the average poor household of the beneficiary group is deprived of 36.64% of the weighted indicators against that of the spill-over and control groups respectively that is been deprived of 40.19 and 38.68% of the weighted indicators as evident by their respective intensity poverty index. Succinctly, the poor households in the beneficiary group experienced 10.34% deprivation out of the total potential deprivations that could be experienced compared to the poor households in the spill-over and control groups respectively that experienced deprived share proportions of 24.72 and 20.49% from the total potential deprivation as evident from their respective MPI (multidimensional poverty index).

Nevertheless, as evident by the MPG (multidimensional poverty gap) index, the average indicator-specific gap between haves and non-haves of the beneficiary group is 17.87% against that of the spill-over and control groups respectively that were 36.79 and 32.49%. By implication, if the poor households in the beneficiary, spill-over and control groups respectively becomes more deprived in the challenged indicator(s), poverty would surge by 17.87, 36.79 and 32.49%. Similarly, if the shortfall from the deprivation cutoff is reduced, the poverty levels of the beneficiary, spill-over and control groups respectively will go down by 17.87, 36.79 and 32.49%, even if a poor household remains poor. Besides, the average severity of the deprived indicator(s) for the beneficiary, spill-over and control groups were 11.34, 22.12 and 20% respectively as evident by their respective MPS (multidimensional poverty severity) indexes.

To sum-up, the share contribution of the beneficiary group to poverty in the study area is 17% against that of the spill-over (45%) and control (38%) groups. In the same vein, the share poverty population of the beneficiary group is 30.38% compared to that of the spill-over (34.68%) and control (34.94%) groups. Nevertheless, among the poor households in the beneficiary group, standard of living ranked first as the major deprived indicator, followed by empowerment and then environment as evident in the dimension-wise distribution (Figures 4b and 4c). Comparatively, the contribution of groups to poverty exceeds that of the groups' poverty population share (Figure 4d). By implication, it entails that there is no serious unequal distribution of poverty within the beneficiary group while the reverse is the case for the spill-over and control (non-beneficiary) groups bearing disproportionate share of poverty for each group. In addition, inequality in the poverty level of poor households across the targeted populations was low as evident by the inequality index value. However, according to Alkire *et al*.(2016), as reported by Sadiq and Bashir (2022); Sadiq *et al*.(2024a), a lower level of inequality among the poor or a drop in the degree of inequality among the poor does not always imply that poverty has decreased uniformly across demographic subgroups.

Noteworthy, the case of a severe poverty level (k=0.50) was not established across the targeted groups. Generally, it can be inferred that the NEAZDP beneficiaries in the study area experienced lower multidimensional poverty compared to spill-over and control groups, with lower incidence, intensity, and severity of poverty. Despite these improvements, challenges remain in specific dimensions like standard of living, empowerment, and environment. The program's success in reducing poverty shares and severity underscores its potential to alleviate poverty further if targeted indicators are addressed. Effective policy adjustments could enhance impact, potentially reducing poverty by up to 17.87% among beneficiaries. These findings

underscore the program's positive impact while emphasizing areas for continued improvement and focused intervention.

CONCLUSIONS AND RECOMMENDATIONS

The North East Arid Zone Development Programme (NEAZDP) has shown significant effectiveness in reducing poverty among beneficiaries in Yobe State. The study reveals a consistent decline in the proportion of beneficiaries below the poverty threshold over time, with a notable improvement observed until the third quarter phase of the program. The program has

successfully reduced the incidence, intensity, and severity of poverty among its participants, particularly in dimensions related to standard of living, empowerment, and environment. Despite improvements, challenges persist in specific dimensions of poverty, highlighting the need for targeted interventions. Inequality within the beneficiary group remains low, but disparities are evident between beneficiaries and non-beneficiaries, emphasizing the importance of equitable distribution and inclusive growth strategies. Consequently, the present study proffered the following recommendations for inclusivity and comprehensive growth among the beneficiaries in the study area:

- It is imperative for the programme to focus on addressing specific dimensions of poverty identified in the study, particularly improving access to quality education, healthcare, and sustainable livelihoods.
- The programme should strengthen environmental conservation efforts and promote sustainable agricultural practices to ensure long-term resilience and reduce vulnerability to climate risks.
- The programme should implement rigorous monitoring mechanisms to track poverty reduction indicators continuously and adjust programmes based on real-time data.
- The programme should integrate poverty alleviation strategies with broader development policies at local, regional, and national levels to ensure comprehensive and inclusive growth (i.e., inclusivity and equity in resource distribution).
- The programme is advised to invest in capacity-building initiatives to empower local communities and institutions to sustain poverty reduction efforts independently.

SÜT SIĞIRI BESLENMESİNDE PROTEİN OLMAYAN AZOT KAYNAKLARI

ÖZET

Süt sığırlarının beslenmesinde protein ihtiyacını karşılamak amacıyla, protein olmayan azotlu bileşiklerin alternatif protein kaynaklarının kullanımı yaygın bir uygulamadır. Üre ve amonyum tuzları gibi protein olmayan azot bileşikleri, rumendeki mikroorganizmalar tarafından değerlendirilebilir ve mikrobiyal protein sentezine katkı sağlayarak hayvanın protein gereksinimini karşılamada rol oynayabilir. Bu besleme stratejisi, özellikle yüksek maliyetli protein kaynaklarının yerine daha ekonomik bir alternatif sunması açısından avantajlıdır. Ancak belirli oranın üzerinde kullanılabilirliği ve rasyonda kullanılan yem hammaddeleri ile birlikte negatif etkilerinin de düşünülmesi gerekmektedir. Bu nedenlerle protein olmayan azot bileşikleri kullanımının bazı sınırlamaları ve riskleri de göz önünde bulundurulmalıdır. Benzer bir şekilde homojen karışmama, yanlış dozajlama veya dengesiz rasyonlar, rumende amonyak birikimine neden olarak kandaki amonyak oranının artması toksisiteye yol açabilir ve hayvan sağlığını olumsuz etkileyebilir. Ayrıca, süt verimi ve bileşimi üzerindeki etkileri üzerine de olumsuz etkileri, rasyonun diğer bileşenleri ve hayvanın fizyolojik durumu gibi çeşitli faktörlere bağlı olarak değişim göstermektedir. Çalışmamızda, süt sığırlarında yaygın olarak kullanılan NPN maddelerin kullanımının avantajları ve potansiyel riskleri ele alınacaktır.

Giriş

Süt sığırı beslenmesinde protein olmayan azot kaynakları, ruminantların beslenmesinde önemli bir yer tutmaktadır. Bu kaynaklar, genellikle üre ve amonyak gibi bileşenler şeklinde bulunur ve rumen mikroorganizmaları tarafından protein sentezi için kullanılır. Ruminantların beslenmesinde protein olmayan azot kaynaklarının kullanımı, hem ekonomik hem de çevresel sürdürülebilirlik açısından büyük avantajlar sunmaktadır. Özellikle, bu kaynaklar, yüksek protein içeriğine sahip yemlerin maliyetini düşürerek, çiftliklerin ekonomik verimliliğini artırabilir (Salo, 2018).

Üre, en yaygın kullanılan protein olmayan azot kaynağıdır. Ruminantların rasyonlarına eklenmesi, rumen mikroorganizmalarının amonyak üretimini artırarak, bu amonyağın mikroplar tarafından protein sentezinde kullanılmasını sağlar. Bu süreç, hayvanların beslenme verimliliğini artırmakta ve azotun çevreye salınımını azaltmaktadır. Bunun yanı sıra, yavaş salınımlı üre formülasyonları, hayvanların azot ihtiyacını karşılamak için etkili bir yöntem olarak öne çıkmaktadır (Huang ve ark., 2023).

Yapılan araştırmalara göre, süt inekleri için ürenin günlük alım miktarları genellikle 30 gram ile 90 gram arasında değişmektedir. Bu aralık, ineklerin genel protein gereksinimleri, rasyonun içerdiği ham protein seviyeleri ve beslenme stratejilerine bağlı olarak ayarlanabilir (Spek ve ark., 2012).

Üre eklenmiş rasyonların, özellikle yüksek protein içeriğine sahip besinlerle birleştirildiğinde, dikkatli bir şekilde formüle edilmesi önemlidir. %16'nın üzerinde ham protein içeren rasyonlarda, aşırı amonyak üretimini önlemek adına üre ilavesi dikkatle yapılmalıdır. Fazla üre kullanımı, ineklerde metabolik sorunlara yol açabileceği için, optimal düzeylerde tutulması önerilmektedir (Czajkowska ve ark., 2015).

Ayrıca, çeşitli bitkisel kaynaklar da protein olmayan azot kaynakları olarak kullanılabilir. Örneğin, bazı baklagiller ve yeşil otlar, doğal olarak yüksek azot içeriğine sahip olup, ruminantların beslenmesinde önemli bir rol oynamaktadır (Das ve ark., 2022). Bu tür kaynaklar, hem besin değerini artırmakta hem de çevresel etkileri azaltmaktadır. Bununla birlikte, bu kaynakların etkinliği, rasyonun genel dengesi ve enerji içeriği ile doğrudan ilişkilidir. Yetersiz enerji alımı, amonyak üretimini olumsuz etkileyebilir ve hayvan sağlığını tehdit edebilir (Cabrita ve ark., 2011).

Kapsüle üre kullanımı, süt sığırı rasyonlarında protein emilimini artırarak, süt verimi üzerinde olumlu bir etki yaratabilir. Yüksek diyet protein seviyelerinin süt üretimini artırmasına rağmen, aşırı kullanımının hayvanların üreme performansını olumsuz etkileyebileceğini belirtmektedir. Kapsüle üre, hayvanların protein ihtiyacını karşılamak için daha ekonomik bir çözüm olarak öne çıkmakta, böylece süt üretiminde verimliliği artırma fırsatı sunmaktadır (Kaygısız ve Şahin, 2023).

Süt sığırı beslenmesinde protein olmayan azot kaynakları, ekonomik ve çevresel açıdan önemli bir strateji sunmaktadır. Bu kaynakların doğru bir şekilde yönetilmesi, hayvan sağlığını ve verimliliğini artırırken, çevresel etkileri azaltma potansiyeli taşımaktadır. Protein olmayan azot kaynaklarının kullanımı, modern süt sığırcılığı uygulamalarında kritik bir unsur olarak değerlendirilmektedir (Vicente ve ark., 2021).

Protein kaynakları

Süt sığırlarının beslenmesinde kullanılan protein kaynakları, ineklerin laktasyon dönemindeki verimliliğin arttırılması ve genel sağlıklarını koruma açısından kritik bir rol oynamaktadır. Bu sağlıklı, rasyonların protein içeriği, ineklerin süt üretimi, besin büyümeleri üzerinde önemli etkileri vardır (Proškina ve Cerina, 2017).

Süt sığırı beslenmesinde kapsüle üre kullanımı, hayvanların enerji ve protein dengesinin sağlanması için önemli bir stratejidir. Kapsüle üre, protein kaynaklarının kalitesini artırmak ve hayvanların amino asit ihtiyaçlarını karşılamak amacıyla rasyonlara eklenmektedir. Ayrıca, kapsüle üre, doğrudan rumende protein kaynağı sağlarken, hayvanların metabolizmasını optimize etme potansiyeline sahiptir (Tüfenk ve Tapkı, 2023)

Soya fasulyesi küspesi (SBM) ve kanola küspesi gibi geleneksel protein kaynakları, süt inekleri için en yaygın kullanılan protein bileşenlerindendir. SBM'nin kanola unu ile değiştirilmesi, süt verimini ve protein çıkışını artırmada olumlu sonuçlar verir (Broderick ve ark., 2015).

Yonca (Medicago sativa) süt inekleri için yüksek kaliteli bir protein kaynağı olduğu belgelenmiştir. Yonca, yüksek besin değeri ve iyi sindirilebilirlik özellikleri ile ineklerin rasyonlarına dahil edilir. Bu da süt miktarını artırmaktadır. Diğer alternatif kaynaklar arasında mısır samanı ve baklagil bitkileri gibi yaşam açısından zengin kaynaklar bulunmaktadır. Baklagil bitkilerinin kullanımı, sütün katkı payının arttırılması, aynı zamanda besin maliyetlerini azaltma potansiyeline sahiptir (Chen ve ark., 2024).

Mikrobiyal protein, süt ineklerinin rasyonlarına önemli bir yer tutar ve genellikle toplam emilebilir protein miktarının %50 ila %80'ini sağlar. Mikrobiyal protein, rumende üretilen ve yüksek miktarda metiyonin ve lösin gibi sınırlayıcı aminoasitleri içeren bir protein kaynağıdır. Ruminal protein) ve rumen kaçak proteini oranlarının doğru dengelenmesi, mikrobiyal protein sentezini artırma ve azot dağılımını optimize etmektedir (Neal ve ark., 2014).

Beslenmede kullanılan diğer protein kaynakları arasında, hafif işlenmiş atık ürünler yer almaktadır. Bu tür kaynaklar genellikle maliyet etkinliği açısından avantaj sağlar. Örneğin, yaprak, soya ve baklagiller, yüksek düzeyde protein içerdikleri için süt ineklerinin rasyonlarında sıklıkla kullanılmaktadır (Ribeiro ve ark., 2018).

NPN maddeleri

Süt sığırları beslenmesinde protein olmayan azot (NPN) kaynakları, protein verimliliğini artırmak ve süt ineklerinin genel sağlığını desteklemek için önemlidir. Bu kaynaklar, ruminantlarda besin dönüşüm verimliliğini artırırken, bitkisel protein kaynaklarının eksikliğini de gidermektedir (Şen ve ark., 2021).

Üre, en yaygın NPN kaynaklarından biridir. Üre, ruminantlarda amonyağa dönüşerek mikroplar tarafından kullanılabilir ve bu sayede mikroorganizmalarda protein sentezine katkıda bulunabilir. Üre kullanımı, günlük rasyonun %1-2'si kadar olmalıdır. Amonyak oranı, rasyonla birlikte değişiklik gösterebilir; genellikle, rumendeki amonyak konsantrasyonu, rasyonların toplam azot içeriğine ve rumen sağlığına bağlıdır (Akınoğlu ve ark., 2024).

Nitratlar, süt sığırlarının beslenmesinde diğer bir NPN kaynağıdır. Rumendeki amonyak veya nitrit olarak kullanımı, mikroorganizmaların protein sentezini desteklemesine olanak tanır. Araştırmalar, yeşil bitkilerdeki nitrat içeriğinin çeşitlilik gösterdiğini ve bu durumun hayvanların nitrat alımını etkilemekte olduğunu ortaya koymaktadır. Amonyak seviyeleri, nitrattan amonyağa dönüşüm sırasında değişiklik gösterebilir. Nitrattan amonyağa dönüşüm oranı genelde %70-90 arasında değişmektedir (Koç ve Çufadar, 2023).

Bazı amino asit kaynakları da NPN yerine kullanılabilir. Örneğin, metiyonin ve lösin gibi sınırlayıcı amino asitlerin sağlanması, NPN kaynaklarıyla desteklenebilir. Bu içerikler genellikle amonyak oranlarına bağlı olarak değişkenlik gösterebilir. NPN'nin besin değeri, amonyak seviyesi ile doğrudan ilişkilidir. Ruminantların beslenmesinde, bu kaynakların amonyak seviyeleri genellikle rasyon değerlendirilirken dikkate alınmalıdır (Altay ve Sarıkanat, 2019).

Bazı bitkiler de NPN kaynağı olarak kullanılmaktadır. Örneğin, bazı baklagiller ve yeşil gübre bitkileri, doğal nitrifikasyon sürecine katkı sağlamakta ve besin kalitesini iyileştirmekte olan yüksek nitrik oksit içeriği ile dikkat çekmektedir. Bu bitkilerin azot kullanımı, besin maddelerinin rumende sindirimi sırasında önemli bir rol oynamaktadır (İgrek ve Şimşek, 2019).

Protein olmayan azot kullanımının olumlu yönleri

Süt sığırı beslenmesinde enerji ve amonyak oranlarının, sığırcılık işletmelerinin verimliliği ve süt kalitesi açısından kritik bir konudur. Amonyak, süt sığırlarının rumeninde protein metabolizmasının bir yan ürünü olarak oluşur ve yüksek düzeyleri hem hayvan sağlığını hem de üretkenliği olumsuz etkileyebilir. Amonyak, rumende aşırı biriktiğinde, hayvanların besin alımını ve sindirim işlevlerini aksatarak, metabolizma dengesizliklerine yol açabilir. Enerji dengesinin sağlanması sütün kalitesini artıracak ve de hayvan sağlığını koruyacaktır. Dolayısıyla, süt sığırları için geliştirilecek besleme stratejileri, enerji ve amonyak dengesinin sağlanmasını göz önünde bulundurmalıdır (Ece ve Avcı, 2018).

Protein olmayan azot kaynaklarının kullanımı hem ekonomik hem de çevresel açıdan önemli avantajlar sunmaktadır. Bu kaynaklar, genellikle üre ve amonyak gibi bileşenler şeklinde bulunur ve rumen mikroorganizmaları tarafından protein sentezi için kullanılır. Protein olmayan azot kaynaklarının en belirgin faydalarından biri, süt sığırlarının rasyonlarında toplam protein ihtiyacını karşılamada maliyet etkinliği sağlamasıdır. Yüksek protein içeriğine sahip yemlerin maliyetleri göz önüne alındığında, bu kaynakların kullanımı, çiftliklerin ekonomik verimliliğini artırabilir (Sinclair ve ark., 2014).

Protein olmayan azot kaynaklarının kullanımı, çevresel sürdürülebilirlik açısından da büyük önem taşımaktadır. Ruminantların rasyonlarında protein olmayan azot kaynaklarının eklenmesi, azotun daha verimli kullanılmasını sağlar ve böylece dışkı ve idrar yoluyla çevreye salınan azot miktarını azaltır. Bu durum, tarımsal faaliyetlerin çevresel etkilerini minimize etmek için kritik bir strateji olarak değerlendirilmektedir (Spek ve ark., 2013).

Rumendeki azot döngüsü, süt sığırlarının beslenmesinde kritik bir rol oynayan karmaşık bir süreçtir ve iki ana azot kaynağından oluşur: proteinli kaynaklar ve protein olmayan azot (NPN) kaynakları. Proteinli kaynaklar rumende mikroorganizmalar tarafından parçalandığında

amonyağa dönüşerek mikrobiyal protein sentezi için kullanılırken, NPN kaynağı olan üre ve amonyum da benzer şekilde işlev görür. Amonyak, mikroorganizmalar tarafından rumende kullanılarak protein sentezine katkıda bulunur, bu da süt üretimi için gerekli olan mikrobiyal proteinlerin oluşumunu artırır. Ancak, aşırı NPN kullanımı yüksek amonyak seviyelerine yol açarak süt yağ içeriğinde düşüşe neden olabilir, dolayısıyla dengeli bir azot yönetimi sağlamak süt kalitesini optimize etmek ve çevresel etkileri azaltmak açısından gereklidir. Sonuç olarak azot döngüsü, hem süt verimliliğini hem de sütün bileşim kalitesini artırmak için önemlidir ve bu döngünün doğru yönetimi, ruminantların genel beslenme verimliliğini belirleyici bir faktör olarak öne çıkmaktadır (Carvalho ve ark., 2011).

Protein alımının azaltılması, azotun dışkı ve idrar yoluyla kaybını azaltarak, çevresel kirliliği önleyebilir. Protein olmayan azot kaynaklarının bir diğer avantajı, rumen mikroorganizmalarının protein sentezini artırarak süt verimini desteklemesidir. Bu kaynaklar, rumen mikropları tarafından amonyağa dönüştürülerek, daha sonra mikroorganizmalar tarafından protein sentezinde kullanılabilir. Böylece, süt sığırlarının genel sağlık durumu ve süt üretim verimliliği artırılabilir. Bu tür kaynakların kullanımı, hayvanların beslenme verimliliğini artırarak, daha az yemle daha fazla süt üretimi sağlanmasına olanak tanır (Chiariotti ve ark., 2020).

Protein olmayan azot kullanımının olumsuz yönleri

Süt sığırı beslenmesinde protein olmayan azot kaynaklarının kullanımı, bazı olumsuz etkiler ve riskler içermektedir. Bu kaynakların en yaygın örneği olan üre, düşük maliyetli bir alternatif olmasına rağmen, dikkatli bir şekilde yönetilmediğinde hayvan sağlığı üzerinde olumsuz etkiler yaratabilir. Üre, hayvanların rumeninde amonyağa dönüşür ve mikroorganizmalar bunu protein yapmak için kullanır. Ancak çok fazla üre verilirse asidoza neden olur. Bu durum hayvanın sağlığını kötü etkiler ve süt verimini azaltır. (Cherdthong ve ark., 2019).

Protein olmayan azot kaynaklarının kullanımı, azot verimliliğini olumsuz etkileyebilir. Ruminantlar, rasyonlarından aldıkları azotun yalnızca %25-35'ini süt üretiminde kullanırken, geri kalan kısmı idrar ve dışkı yoluyla atılmaktadır. Bu durum, çevresel kirliliğe yol açmakta ve tarımsal faaliyetlerin sürdürülebilirliğini tehdit etmektedir. Özellikle, yüksek azot atılımı, su kaynaklarının nitrat ile kirlenmesine ve hava kalitesinin bozulmasına neden olabilir (Salami ve ark., 2020).

Ayrıca, protein olmayan azot kaynaklarının kullanımı, ruminantların beslenme dengesi üzerinde olumsuz etkiler yaratabilir. Bu kaynakların aşırı kullanımı, hayvanların enerji alımını olumsuz etkileyebilir ve bu da genel sağlık durumunu tehdit edebilir. Yetersiz enerji alımı, rumen mikroorganizmalarının sağlıklı bir şekilde çalışmasını engelleyebilir ve bu durum, amonyağın toksik seviyelere ulaşmasına neden olabilir (Araújo ve ark., 2020).

Protein olmayan azot kaynaklarının kullanımı, dikkatli bir şekilde yönetilmelidir. Süt sığırı beslenmesinde protein olmayan azot kaynaklarının kullanımı, bazı olumsuz etkiler ve riskler içermektedir. Bu kaynakların aşırı kullanımı, hayvan sağlığı, çevresel sürdürülebilirlik ve beslenme dengesi üzerinde olumsuz sonuçlar doğurabilir. Dolayısıyla, bu kaynakların dikkatli

bir şekilde yönetilmesi, modern süt sığırcılığı uygulamalarında kritik bir unsur olarak değerlendirilmektedir (Bell ve ark., 2011).

Araştırmalara göre, aşırı üre kullanımı, süt yağ içeriğinde azalmaya neden olabilir. Araştırmalara göre, üre ile beslenen ineklerde süt protein oranı artarken, süt yağ oranı genellikle düştüğü görülmektedir (Sarker ve ark., 2016).

Amonyum sülfat gibi diğer NPN kaynaklarının kullanımı da süt kalitesinde önemli rol oynar. Bu tür kaynaklar, süt verimliliği ve protein sentezini desteklemek için rumende amonyağın etkili bir şekilde kullanılmasına yardımcı olur. Bunun yanında, nitratlar rumende fermente edilerek amonyağa dönüşebilir, bu mikrobiyal protein sentezini destekleyerek süt kalitesinde artış sağlayabilir. Ancak bununla birlikte, aşırı nitrat tüketimi, sütten nitrat seviyelerinin yükselmesine neden olabileceğinden dikkatli kullanılmalıdır (Çavdar ve Kara, 2022).

Sonuç

Süt sığırı beslenmesinde protein olmayan azot kaynakları, hem olumlu hem de olumsuz yönleriyle dikkat çekmektedir. Bu kaynaklar, genellikle üre ve amonyak gibi bileşenler şeklinde bulunur ve ruminantların beslenmesinde önemli bir rol oynamaktadır. Protein olmayan azot kaynaklarının en önemli avantajlarından biri, maliyet etkinliğidir. Üre gibi bu kaynaklar, yüksek protein içeriğine sahip yemlerin maliyetlerini düşürerek, çiftliklerin ekonomik verimliliğini artırabilir (Sinclair ve ark., 2014).

Bu kaynaklar, rumen mikroorganizmaları tarafından protein sentezinde kullanılmakta ve böylece süt verimini artırmaktadır. Ruminantların rasyonlarında protein olmayan azot kaynaklarının eklenmesi, azotun daha verimli kullanılmasını sağlar ve çevresel etkileri azaltır. Örneğin, protein alımının azaltılması, azotun dışkı ve idrar yoluyla kaybını azaltarak çevresel kirliliği önleyebilir. Bunun yanı sıra, bu kaynaklar, ruminantların genel sağlık durumunu iyileştirerek, süt üretim verimliliğini artırma potansiyeline sahiptir (Kreišmane ve ark., 2021).

Ancak, protein olmayan azot kaynaklarının kullanımı bazı olumsuz etkiler de içermektedir. Aşırı miktarda üre kullanımı, rumen asidozuna yol açabilir ve bu durum, hayvanların genel sağlığını tehdit edebilir (Wang ve ark., 2022).

Ruminantlar, rasyonlarından aldıkları azotun yalnızca %25-35'ini süt üretiminde kullanırken, geri kalan kısmı idrar ve dışkı yoluyla atılmaktadır. Bu durum, çevresel kirliliğe yol açmakta ve tarımsal faaliyetlerin sürdürülebilirliğini tehdit etmektedir. Yüksek azot atılımı, su kaynaklarının nitrat ile kirlenmesine ve hava kalitesinin bozulmasına neden olabilir. Ayrıca, protein olmayan azot kaynaklarının aşırı kullanımı, hayvanların enerji alımını olumsuz etkileyebilir ve bu da genel sağlık durumunu tehdit edebilir (Rehman ve ark., 2020).

Sonuç olarak, süt sığırı beslenmesinde protein olmayan azot kaynaklarının kullanımı, hem ekonomik hem de çevresel açıdan önemli avantajlar sunarken, dikkatli bir şekilde yönetilmediğinde bazı olumsuz etkiler de yaratabilir. Bu kaynakların etkin bir şekilde yönetilmesi, modern süt sığırcılığı uygulamalarında kritik bir unsur olarak değerlendirilmektedir.

ABSTRACT

Food legumes, which play an important role in agricultural production in many countries around the world, are also traditional products of Turkish agriculture and are an economically important product group due to their contribution to employment and high export potential. Lentils (*Lens culinaris* Medik.) are one of the oldest plants with roots in the Near East and the Mediterranean region. Lentil seeds contain relatively high protein, carbohydrates and calories compared to other legumes and are the most preferred cultivated plant in many production regions due to their average high protein content and fast cooking properties. According to 2023 data in the world, Turkey ranks 4th after Canada, India and Australia. According to 2024 data in our country, green lentil production is mostly carried out in the provinces of Yozgat, Konya, Kırşehir, Çorum and Ankara. These five provinces meet approximately 92% of our country's green lentil production. Lentil farming in our country is carried out in two ways: large-grained green and smaller-grained red, which have different areas of use as human food. The most important phytopathological problems that limit lentil production in our country and cause yield reduction are root collar rot and wilt disease in lentils caused by soil-borne fungal agents. These cause growth retardation in plants, yellowing and drying and shedding of leaves, browning of roots and root collars, thinning of roots, decrease in the number of hairy roots and nodosity. Among these disease agents, Fusarium isolates are an important disease recorded everywhere lentils are grown. In surveys, the primary phytopathogenic agent that causes the increase in wilt and root collar disease is *Fusarium oxysporum* f. sp. *lentis* (Fol). It is known that the average loss due to lentil wilt and root rot disease is 10%, but it can reach up to 66%. Especially when a mild spring is followed by a dry, hot summer, wilt disease can cause the complete loss of the product. In this review, the symptoms, distribution in the world and in our country, and biology of the disease agent *Fusarium oxysporum* f. sp. *lentis*, which attacks the lentil plant, are presented in detail.

Keywords: *Fusarium oxysporum*, Disease cycle, *Lens culinaris*

MERCİMEKTE SOLGUNLUK VE KÖK BOĞAZ ÇÜRÜKLÜK HASTALIĞI: *Fusarium oxysporum* f. sp. *lentis*

ÖZET

Dünya genelinde birçok ülkenin tarımsal üretiminde önemli rol oynayan yemeklik tane baklagiller, Türk tarımının da geleneksel ürünlerinden olup istihdama katkısı ve yüksek ihracat potansiyeli nedeniyle ekonomik açıdan önemli bir ürün grubudur. Mercimek (*Lens culinaris* Medik.), kökeni Yakın Doğu ve Akdeniz bölgesine dayanan en eski bitkilerden biridir. Mercimek tohumu, diğer baklagillerle karşılaştırıldığında nispeten yüksek protein, karbonhidrat ve kalori içerir ve ortalama yüksek protein içeriği ve hızlı pişirilme özellikleri nedeniyle, birçok üretim bölgesinde en çok tercih edilen kültür bitkisidir. Dünyada 2023 yılı verilerine göre Türkiye; Kanada, Hindistan ve Avustralya'dan sonra 4. sırada yer almaktadır. Ülkemizde 2024 yılı verilerine göre yeşil mercimek üretimi en fazla Yozgat, Konya, Kırşehir, Çorum ve Ankara illerinde yapılmaktadır. Bu beş il ülkemiz yeşil mercimek üretiminin yaklaşık %92'sini karşılamaktadır. Ülkemizdeki mercimek tarımı; insan gıdası olarak farklı kullanım alanlarına sahip iri taneli yeşil ve daha küçük taneli kırmızı olmak üzere iki şekilde yapılmaktadır. Ülkemizde mercimek üretimini kısıtlayan ve verim düşüşüne sebep olan fitopatolojik sorunlardan en önemlisi toprak kökenli fungal etmenlerin neden olduğu mercimekte kök boğaz çürüklüğü ve solgunluk hastalığıdır. Bunlar bitkilerde gelişme geriliğine, yapraklarda sararma ve kuruyup dökülmelere, kök ve kök boğazında kahverengileşmeye, kökte incelmeye, saçak kök ve nodozite sayısında azalmalara neden olmaktadır. Bu hastalık etmenlerinden Fusarium izolatları , mercimeğin yetiştirildiği her yerde kaydedilen önemli bir hastalıktır. Yapılan sörveylerde solgunluk ve kök boğaz hastalığının artışının nedeni olarak *Fusarium oxysporum* f. sp. *lentis* (Fol)fungusunun birincil fitopatojenik etmen olduğu ön plana çıkmıştır. Mercimek solgunluk ve kök çürüklüğü hastalığından dolayı ortalama kaybın %10 olduğu, ancak %66'ya kadar ulaşabildiği bilinmektedir. Özellikle ılıman geçen ilkbaharı kuru, sıcak bir yaz mevsimi izlediğinde solgunluk hastalığı, ürünün tamamen yok olmasına neden olabilmektedir. Bu derleme kapsamında mercimek bitkisine arız olan *Fusarium oxysporum* f. sp. *lentis* hastalık etmeninin simptom, dünyada ve ülkemizdeki yayılışı, biyolojisi detaylı bir şekilde ortaya konulmuştur.

Anahtar Kelimeler: Fusarium oxysporum, Hastalık döngüsü, Lens culinaris

1. GİRİŞ

Fusarium oxysporum f.sp. *lentis* (Fol), mercimek (*Lens culinaris* Medik.) üretiminde ciddi ekonomik kayıplara yol açan Fusarium solgunluğu ve kök çürüklüğü hastalıklarının etmenidir (Bayaa ve ark., 1997; Erskine ve ark., 2009). Toprak ve tohum kökenli bir fungal patojen olan Fol, konukçusuz koşullarda sporlarını dormant halde uzun yıllar boyunca canlı tutabilme özelliğine sahiptir. Bu sporlar; enfekte toprak, bitki artıkları, kontamine tohumlar ile su, rüzgar, tarımsal ekipman, hayvan ve insan faaliyetleri aracılığıyla hızla yayılabilmektedir (Haware ve Nene, 1982).

Fol'un yüksek düzeyde adaptasyon kabiliyetine sahip olması, geniş bir konukçu spektrumunu enfekte edebilmesi, farklı toprak ve iklim koşullarına uyum sağlayabilmesi ve toprakta uzun süre varlığını sürdürebilmesi, bu etmeni istilacı nitelikte kılmaktadır (Jiménez-Díaz ve ark., 2015). Yeni bölgelere yerleştiği takdirde enfekte bitkilerde sararma, solma ve ölüm gibi belirtiler ortaya çıkmakta; bu durum bitki gelişimini ve verimi önemli ölçüde azaltmaktadır. Özellikle mercimeğin temel gıda ve ekonomik ürün olduğu bölgelerde bu patojenin yayılımı, hem gıda güvenliği hem de tarımsal ekonomi açısından ciddi bir tehdit oluşturmaktadır (Tullu ve ark., 2011).

Her ne kadar *F. oxysporum* f.sp. *lentis* hâlihazırda ISSG (Invasive Species Specialist Group) gibi küresel istilacı türler listesinde yer almıyor olsa da, bazı ülkelerde zararlı organizma olarak tanımlanmakta ve düzenleyici önlemler kapsamında değerlendirilmektedir. Örneğin, Kuzey Amerika ve Avustralya'nın bazı bölgelerinde bu etmenin yayılımını önlemeye yönelik katı bitki sağlığı kuralları uygulanmaktadır (Ozgonen ve ark., 2014). Dolayısıyla, patojenin istilacı doğası ve potansiyel ekonomik etkileri dikkate alındığında, yerel ve uluslararası düzeyde izlenmesi ve karantina önlemleriyle denetim altında tutulması büyük önem arz etmektedir.

Taksanomik sınıflandırma

Üst alem: Eukaryota

Alem: Fungi

Şube: Ascomycota

Alt şube: Pezizomycotina

Sınıf: Sordariomycetes

Alt sınıf: Hypocreomycetidae

Takım: Hypocreales

Familya: Nectriaceae

Cins: Fusarium

Tür: *Fusarium oxysporum* f.sp. *lentis*

Fusarium oxysporum içinde, forma specialis düzeyinin ötesinde, patojenin belirli mercimek çeşitlerine ya da direnç genlerine gösterdiği farklı tepkilere göre "ırk" (race) ve "patotip" (pathotype) düzeyinde alt sınıflandırmalar da yapılmıştır (Gordon ve Martyn, 1997). Bu tür alt gruplar, Hindistan, İran, Cezayir, Suriye ve ABD gibi ülkelerden izole edilen *F. oxysporum*

f.sp. *lentis* (Fol) örneklerinde tanımlanmıştır (Pouralibaba ve ark., 2016; Hiremani ve Dubey, 2018; Bugingo ve ark., 2024).

Mercimekte solgunluk hastalığı ile ilişkili olarak birden fazla Fusarium türü bildirilmiştir (Khare ve ark., 1979). Hastalığın etmeni olarak Hindistan'da ilk kez *Fusarium orthoceras* var. *lentis* tanımlanmış olup, bu tanımlama Vasudeva ve Srinivasan (1952) tarafından yapılmıştır. Daha sonra bu tür, Chattopadhyay ve Sengupta (1967) tarafından *Fusarium oxysporum* f.sp. *lentis* (Fol) olarak yeniden adlandırılmıştır.

Morfolojik Özellikler

Fusarium oxysporum f.sp. *lentis*, toprak kökenli bir fungal patojen olup mercimek bitkilerini enfekte eder ve yaşam döngüsü boyunca belirgin morfolojik özellikler sergiler. Patolojik tanımlamalar çoğunlukla laboratuvar kültürleri temelinde yapılmaktadır. Patates dekstroz agarı (PDA) üzerinde oldukça hızlı gelişim gösteren koloniler, genellikle 7–8 gün içerisinde 100 mm çapındaki petri kabını tamamen kaplayacak şekilde büyür. Koloniler, yaşa ve kültür koşullarına bağlı olarak zamanla hafif turuncu veya pembe bir ton alabilen yoğun beyaz havalı (aerial) miselyum oluşturur. Petri kabının alt yüzeyinden bakıldığında ise koloniler beyaz veya hafif sarı renkte görünür.

Patojenin yayılmasından esasen sorumlu olan birincil eşeysiz sporlar, mikrokonidilerdir. Bu sporlar bol miktarda üretilir, septasızdır (aseptat), böbrek şeklinden oval forma kadar değişken yapıdadır ve kısa monofiyal konidioforlar üzerinde yalancı başlıklar (false heads) halinde oluşurlar. Mikrokonidilerin boyutları genellikle 5–12 µm uzunluğunda ve 2–3.5 µm genişliğindedir (Nelson ve ark., 1983; Leslie ve Summerell, 2006).

Makrokonidiler ise daha az sıklıkla gözlemlenir ancak yarım konsantrasyondaki PDA, karanfil yaprağı agarı (CLA) veya patates dekstroz sıvı besiyerinde (potato dextrose broth) bol miktarda üretilebilir. Bu sporlar fusiform ya da hafif orak biçiminde (sickle-shaped), ince duvarlı, çok bölmeli (multiseptat) yapıda olup 20–35 µm uzunluğunda ve 3–4.5 µm genişliğindedir (Leslie ve Summerell, 2006; Bugingo, 2022).

Klamidosporlar, kalın duvarlı, küresel ya da yarı küresel yapıda olup, olumsuz çevresel koşullar altında patojenin toprak ve bitki artıkları içinde hayatta kalmasını sağlayan dayanıklı yapılardır. Kültür ortamında tekli ya da ikili halde bol miktarda oluşabilir; hem hifler içinde hem de makrokonidilerde gelişebilmektedir (Nelson ve ark., 1983).

Yayılım ve Giriş Riski

Mercimek solgunluğuna neden olan Fusarium kaynaklı hastalık, mercimek üretiminin yapıldığı tüm bölgelerde küresel ölçekte rapor edilmiştir (Furman ve ark., 2009). Bu patojenin, Amerika Birleşik Devletleri, Kanada, Hindistan, Türkiye ve Avustralya gibi birçok ülkede varlığı belgelenmiş olup, mercimek üretimi üzerinde yaygın ve önemli bir etkiye sahip olduğu gösterilmiştir.

Mercimekte Fusarium solgunluğuna neden olan etmen *Fusarium oxysporum* f.sp. *lentis* (Fol), ilk kez 1900'lü yılların başında Macaristan'da bildirilmiştir (Fleischmann, 1937). Ancak bu patojenin, mercimeğin anavatanı olarak da kabul edilen Akdeniz bölgesinde ortaya çıktığı yaygın biçimde kabul görmektedir. Bu hipotez, Türkiye, Suriye ve İspanya gibi Akdeniz havzasında yer alan mercimek üretim bölgelerinde patojenin yaygın olarak bulunmasıyla desteklenmektedir (Erskine ve ark., 1994; Bayaa ve ark., 1997). Söz konusu bölgeler, orta düzey sıcaklık ve nem gibi patojenin gelişimine elverişli çevresel koşullara sahip olup, patojen ile konukçusu arasında uzun süredir süregelen bir ortak evrimsel süreci işaret etmektedir.

F. oxysporum f.sp. *lentis*'in yayılımı, köken bölgesinin ötesine geçerek mercimek tarımının yapıldığı farklı coğrafyalara ulaşmıştır. Güney Asya'da, özellikle Hindistan ve Bangladeş, patojenin önemli ölçüde yayıldığı ülkeler arasında yer almakta olup, bu yayılımın kontamine tohum ve toprak hareketleri aracılığıyla gerçekleştiği düşünülmektedir (Gaur ve ark., 2010). Dünya genelinde en büyük mercimek üreticilerinden biri olan Hindistan'da, özellikle kuzey ve orta bölgelerde ciddi salgınlar bildirilmektedir. Kuzey Amerika'da ise patojen, Kanada'nın Saskatchewan ve Alberta eyaletlerinde ve ABD'nin Washington, Montana ve Kuzey Dakota eyaletlerinde rapor edilmiştir. Bu bölgelere girişin, kontamine tohum veya bitki materyali yoluyla gerçekleştiği öne sürülmektedir (Kaiser, 1992; Bugingo ve ark., 2024a). Kuzey Amerika'da hastalık, verim ve ürün kalitesi üzerinde olumsuz etkileri nedeniyle ekonomik olarak önemli bir bitki hastalığı hâline gelmiştir (Morrall ve Sheard, 1981; Wu ve ark., 2015). Avustralya'da ise patojenin Güney Avustralya ve Victoria gibi mercimek üretim bölgelerine kontamine tohum partileri ve toprak taşınımı aracılığıyla ulaştığı tahmin edilmektedir (Davidson ve ark., 2007). Günümüzde bu bölgelerde hastalık yerleşik hâle gelmiş olup, önemli ekonomik kayıplara neden olmaktadır.

Fusarium oxysporum f.sp. *lentis* (Fol), özellikle kontamine tohum, toprak ve tarım araçları aracılığıyla yeni alanlara yayılma riski taşır. Tohumla taşınma, ana yayılma yollarından biridir. Patojen, toprakta yıllarca hayatta kalabilir ve tarım makineleri, ekipmanlar veya su akışı gibi doğal güçlerle taşınan kontamine toprak aracılığıyla yayılabilir (Davidson ve ark., 2007). Kazara giriş, patojenin hayatta kalma yetenekleri ve yayılma yollarının çeşitliliği nedeniyle büyük endişelere yol açabilir, özellikle de patojenin bulunduğu bölgelerden mercimek tohumları veya tarım ekipmanları ithal eden alanlarda (Morrall ve Sheard, 1981). Posta yoluyla ve çevrimiçi tohum satışı yapan artan eğilim, fitosaniter önlemler yetersizse, ortaya çıkan bir risk olarak değerlendirilmektedir.

Şu anda, *F. oxysporum* f.sp. *lentis* birçok ülkede, özellikle Kanada ve Avustralya'da, girişini ve yerleşmesini engellemek amacıyla karantina zararlısı olarak listelenmiştir (Correl, 1991; Erskine ve Bayaa, 1996; Davidson ve ark., 2007; Wu ve ark., 2015).

Belirtiler ve Yaşam Döngüsü

Patojen, hem fide hem de olgun bitki evrelerini etkiler. Fide solgunluğu, aniden başlar, ardından yaprakların kuruması ve fide ölümüne yol açar. Bazı durumlarda, kökler sağlıklı görünür, ancak köklerin çoğalması ve nodül oluşumu azalır ve genellikle vasküler sistemde içsel renk değişikliği görülmez; ancak ksilem damarlarında kahverengi bir renk değişikliği

gözlemlenmiştir (Kumari ve ark., 2021). Olgun bitkilerde solgunluk belirtileri, çiçeklenme döneminden geç son bakla dolumuna kadar görülür ve etkilenen bitkinin üst yaprakçıklarının aniden sarkması, yaprakçıkların erken dökülme olmadan kapanması, soluk yeşil yapraklar ve ardından tüm bitkinin veya bireysel dalların solgunluğu ile karakterizedir. Orta bakla dolumundan geç bakla dolumuna kadar etkilenen bitkilerden alınan tohumlar genellikle buruşmuş olur (Beniwal ve ark., 1993).

Birincil inokulum, toprak ve/veya ürün kalıntılarındaki dayanıklı dinlenme sporları veya klamidosporlardan oluşur. Bu sporlar, tohum veya kök salgıları varlığında çimlenir ve fidelerin köklerine enfekte olur. Patojen, enfekte olmuş mercimek bitkilerinin kök sisteminde çoğalır, toprakta sekonder sporlar veya miselyum yoluyla bitkiden bitkiye yayılır ve sezon sonunda yeni klamidosporlar üretir. Kirlenmiş toprak ve organik madde, rüzgar ve su, tarım ekipmanları ve birçok diğer insan faaliyetleri ile yayılabilir.

Klamidosporlar, patojenin uzun süreli hayatta kalması için ana mantar yapılarıdır. Patojenin büyümesini etkileyen çeşitli faktörler araştırılmıştır (Vasudeva ve Srinivasan, 1952; Dhingrave ark., 1974; Khare, 1980; Saxena ve Khare, 1988; Erskineve ark., 1990).

Fungus büyümesi için optimum sıcaklık 22-27°C arasındadır. Düşük toprak nemi ve orta derecede yüksek toprak sıcaklıkları, semptomların ifade bulmasında anahtar faktörler gibi görünmektedir. Mercimek, kumlu tınlı topraklarda (%48) daha fazla zarar görmekte, kil topraklarda ise (%22) daha az zarar görmektedir ve toprak pH'ı 7.5'e kadar arttıkça bitki ölüm oranı artmaktadır, ancak bu seviyenin üzerinde azalmaktadır.

Epidemiyolojisi

Hastalık, ürünün erken büyüme evrelerinde (fide solması) Kasım ayında görülür ve bu durum, Aralık ve Ocak aylarında azalır. Çiçeklenme ve bakla doldurma aşamasında, Şubat ve Mart aylarında olgun bitki solması belirtileri ortaya çıkar (Vasudeva ve Srinivasan, 1952; Kannaiyan ve Nene, 1976). Suriye'de, solma yalnızca çiçeklenme ve bakla doldurma aşamasında (Nisan / Mayıs) görülmektedir. Hindistan'da, fide gelişim aşamasındaki sıcaklık yaklaşık 20°C iken, Suriye'de daha düşüktür ve bu, mantarın yavaş büyümesine neden olur (Erskineve ark., 1990). Bitki yaşı, mantar sporlarının çimlenmesini etkiler. Claudius ve Mehrotra (1973), 21 günlük fidelerin kök salgılarında, spor çimlenmesi üzerinde inhibe edici etkisi olan glisin ve fenilalanin bulunduğunu bulmuşlardır.

Ekonomik Etkisi

Fusarium solgunluğu, özellikle sıcak bir ilkbahar ve kuru, sıcak bir yazda tam verim kaybına yol açabilen önemli bir mercimek hastalığıdır (Izquierdo ve Morse, 1975; Bayaave ark., 1986; Agrawalve ark., 1993). Baraimer ve Izquierdo (1977), *F. oxysporum* enfeksiyonunun, test edilen çeşide bağlı olarak %25-95 arasında değişen bir oran gösterdiğini bulmuşlardır. Üreme büyümesi sırasında solgunluk insidansı, verim kaybı tahminleriyle ilişkilendirilmiş olup, kuzey Suriye'deki birim değişim başına tohum verimi kaybı %0,846 + 0,118 olarak tespit edilmiştir. Laboratuvar ortamında, hastalık reaksiyonu inokulum yoğunluğu ile pozitif bir korelasyon

göstermiştir (Erskine ve Bayaa, 1996). Saha koşullarında, inokulum yoğunluğu, duyarlı mercimeklerde hastalık insidansı ile ilişkilendirilmemiş olup, bu durum, hastalık insidansının inokulum yoğunluğundan tahmin edilmesi olasılığını ortadan kaldırmıştır.

Solgunluk, özellikle sıcak bir ilkbahar ve kuru, sıcak bir yazda tam verim kaybına yol açabilen önemli bir mercimek hastalığıdır (Izquierdo ve Morse, 1975; Bayaave ark., 1986; Agrawalve ark., 1993). Üreme büyümesi sırasında solgunluk insidansı, verim kaybı tahminleriyle ilişkilendirilmiş olup, kuzey Suriye'deki birim değişim başına tohum verimi kaybı %0,846 + 0,118 olarak tespit edilmiştir. Laboratuvar ortamında, hastalık reaksiyonu inokulum yoğunluğu ile pozitif bir korelasyon göstermiştir (Erskine ve Bayaa, 1996). Saha koşullarında, inokulum yoğunluğu, duyarlı mercimeklerde hastalık insidansı ile ilişkilendirilmemiş olup, bu durum, hastalık insidansının inokulum yoğunluğundan tahmin edilmesi olasılığını ortadan kaldırmıştır.

SONUÇ

Fusarium oxysporum f.sp. *lentis* (Fol) üzerine önemli ilerlemeler kaydedilmiş olsa da, hâlâ bazı bilgi eksiklikleri ve araştırma gereksinimleri bulunmaktadır. Bunların başında, farklı mercimek yetiştirme bölgelerinde Fol patojenlerinin genetik çeşitliliği ve popülasyon yapısı hakkındaki bilgilerin sınırlı olması gelir; bu özellikler patojenin virulansı ve uyum yeteneğini etkileyebilir.

Farklı mercimek genotipleri ile patojenin etkileşimini anlamaya yönelik daha fazla çalışmaya ihtiyaç vardır; özellikle dayanıklı çeşitlerin geliştirilmesi bağlamında bu araştırmalar önemlidir. Ayrıca, hastalık salgınlarını tetikleyen çevresel faktörler ile Fol'un farklı toprak tipleri ve iklimlerde uzun süreli hayatta kalma yeteneği hakkında da bilgiler yetersizdir ve bu konuda araştırmalara açıktır.

ABSTRACT

Legumes (Fabaceae) are one of the three main plant groups in human nutrition, along with cereals and oilseeds. 22% of the plant protein in human nutrition and 38% of the protein in animal nutrition in the world are provided by edible grain legumes. Lentils (*Lens culinaris* Medik) have an important place in human nutrition with the protein (20-30%) and minerals they contain, and in animal nutrition with their straw. Lentils, produced as grains, are a rich source of protein, vitamins and fiber, and also contain micronutrient elements such as iron, zinc and magnesium. The low yield of lentils is due to many agronomic, physiological and biological factors. The most important factors limiting lentil cultivation and yield are economic losses caused by diseases, pests and weeds. One of the main reasons for these losses is diseases caused by fungal plant pathogens. Among the soil pathogens in question, species belonging to the genera Fusarium, *Rhizoctonia*, *Botrytis*, *Macrophomina*, *Alternaria*, *Pythium*, *Phoma*, *Sclerotinia* and *Colletotorichum* frequently occur. Soil-borne root and root collar diseases in lentils vary depending on climate conditions, production techniques and soil structure. Fungal disease agents cause many symptoms in lentil plants such as damping-off, root and root collar rot, wilt, blight, leaf spot and seed rot. Fungal diseases cause a decrease in yield as a result of damage to roots, leaves, stems and pods as a result of infection of lentil plants. It is also known that these diseases cause a decrease in yield as well as deterioration in seed quality. It is quite difficult to combat soil pathogens, and mostly cultural measures, resistant variety cultivation, rotation and some fungicide applications can control the disease. Since there is no fully effective method in combating lentil root rot and wilt disease caused by soil-borne pathogens, it is quite difficult to combat. It is known that the success rate of applications such as soil solarization, induced resistance, adjustment of planting date and depth, use of plant extracts, use of disease-free and fungicide-treated seeds is limited. Although the use of resistant varieties is the most effective and economical method, the diversity of pathogenic species and their pathogenicity makes it difficult to control this disease. In our country, there is no licensed plant protection

product against soil pathogens that cause disease in lentils. In other countries, the effectiveness of different biological agents, plant extracts, biological agent-fungicide combinations and different active substances has been investigated in this regard and it has been determined that some biological agents and fungicides are effective. Within the scope of this review, studies on combating soil-borne pathogen species that attack lentil plants are presented in detail based on the literature.

Keywords: Biological control, Control, Fungicide, *Lens culinaris*, Soilborne

MERCİMEKTE SOLGUNLUK VE KÖK ÇÜRÜKLÜK HASTALIĞINA KARŞI MÜCADELE OLANAKLARI

ÖZET

Baklagiller (Fabaceae), insan beslenmesinde tahıllar ve yağlı tohumlarla birlikte 3 temel bitkisel gruptan birisidir. Dünyada insan beslenmesindeki bitkisel proteinin %22'si, hayvan beslenmesindeki proteinin de %38'i yemeklik tane baklagillerden sağlanmaktadır. Mercimek (*Lens culinaris* Medik), içerdiği protein (%20-30) ve mineral maddeler ile insan beslenmesinde ve samanı ile hayvan beslenmesinde önemli bir yer tutmaktadır. Tane olarak üretilen mercimek zengin bir protein, vitamin ve lif kaynağı olmakla beraber, aynı zamanda demir, çinko, magnezyum gibi mikro besin elementlerini de içermektedir. Mercimek veriminin düşük olması birçok agronomik, fizyolojik ve biyolojik faktörlerden kaynaklanmaktadır. Mercimek yetiştiriciliğini ve verimini sınırlayan en önemli faktörler, hastalık, zararlı ve yabancı otların neden olduğu ekonomik kayıplardır. Bu kayıpların temel sebeplerinden birisi, fungal bitki patojenlerinin oluşturduğu hastalıklardır. Söz konusu toprak patojenleri arasında *Fusarium, Rhizoctonia, Botrytis, Macrophomina, Alternaria, Pythium, Phoma, Sclerotinia* ve *Colletotorichum* cinsine bağlı türler sıklıkla ortaya çıkmaktadır. Mercimekte toprak kaynaklı kök ve kök boğazı hastalıkları iklim şartları, üretim teknikleri ve toprak yapısına bağlı olarak değişkenlik göstermektedir. Fungal hastalık etmenleri mercimek bitkisinde, çökerten, kök ve kök boğazı çürüklüğü, solgunluk, yanıklık, yaprak leke ve tohum çürüklüğü gibi birçok belirti oluştururlar. Fungal hastalıkların mercimek bitkilerini enfeksiyonu sonucu kök, yaprak, gövde ve baklalarda meydana gelen zarar sonucunda verimde azalmaya neden olmaktadır. Ayrıca bu hastalıkların verim azalmasının yanı sıra tohum kalitesinin bozulmasına da neden olduğu da bilinmektedir. Toprak patojenleri ile mücadele oldukça zor olup, daha çok kültürel önlemler, dayanıklı çeşit yetiştirme, münavebe ve bazı fungisit uygulamaları, hastalığı kontrol altına alabilmektedir. toprak kökenli patojenlerin neden olduğu mercimek kök çürüklüğü ve solgunluk hastalığı ile mücadelede tam olarak etkili bir yöntem olmadığından mücadelesi oldukça zordur. Toprak solarizasyonu, uyarılmış dayanıklılık, ekim tarihi ve derinliğinin ayarlanması, bitki ekstraktlarının kullanımı, hastalıktan ari ve fungusit uygulanmış tohum kullanımı gibi uygulamaların başarı oranının ise sınırlı olduğu bilinmektedir. Dayanıklı çeşit kullanımı en etkili ve ekonomik yöntem olmasına rağmen, patojen türler ve bunların patojenisitelerindeki çeşitlilik bu hastalığın kontrolünü güçleştirmektedir. Ülkemizde, mercimekte hastalık yapan toprak patojenlerine karşı, ruhsatlı bir bitki koruma ürünü bulunmamaktadır. Diğer ülkelerde bu konuda farklı biyolojik ajanlar, bitkisel ekstraktlar, biyolojik ajan-fungusit kombinasyonu ve farklı aktif maddelerin etkinlikleri araştırılmış ve bazı biyolojik ajanların ve fungisitlerin etkili olduğu belirlenmiştir. Bu derleme kapsamında mercimek bitkisine arız olan toprak kökenli patojen türleri ile mücadeleye yönelik çalışmalar literatür temel alınarak detaylı bir şekilde ortaya konulmuştur.

Anahtar Kelimeler: Biyolojik mücadele, Fungisit, *Lens culinaris*, Mücadele, Toprak kaynaklı

1. GİRİŞ

Mercimek (*Lens culinaris* Medikus subsp. *culinaris*), serin iklimde yetişen, diploid (2n = 2X = 14) ve kendi kendine döllenen bir baklagildir ve genom büyüklüğü yaklaşık olarak 4 Gbp'dır (Arumuganathan ve Earle, 1991). Yakın Doğu'da ortaya çıkan bu eski tarım bitkisi, hızla Akdeniz Havzası, Orta Asya ve daha sonra Yeni Dünya, özellikle Latin Amerika'ya yayılmıştır. Mercimek, yaklaşık 10.000 yıl önce evcilleştirilen en eski baklagillerden biridir (Ladizinsky, 1972; Cubero, 1981; Duke, 1981). Mercimek üretimi ve tüketimi 100'den fazla ülkede yapılmaktadır. Dünya genelindeki toplam mercimek üretimi, yaklaşık 4.8 milyon ton olup, bu üretim 4.5 milyon hektarlık bir alan üzerinde yapılmakta ve ortalama verim 0.11 t/ha'dır (FAO, 2015). Yetiştirilen *L. culinaris* subsp. *culinaris*, iki fizyo-morfolojik mercimek tipini içermektedir: küçük tohumlu (microsperma) ve büyük tohumlu (macrosperma) (Barulina, 1930). Mercimek, soğuk mevsim gıda baklagillerinin arasında nohut ile birlikte en besleyici baklagillerden biri olarak kabul edilmektedir. Mercimek, %57–60 karbonhidrat, %24–26 protein, %3.2 lif ve %1.3 lif içermektedir. Ayrıca, 100 g tohum başına 69 mg kalsiyum, 300 mg fosfor ve 7 mg demir içeren zengin bir mineral kaynağıdır (Ali ve Mishra, 2000; Erskine ve Sarker, 2004). Mercimek tohumu, sadece tahıl proteinlerinde düşük seviyelerde bulunan bir temel amino asit olan lizin içerir. Mercimek, genellikle kuru tohumlar olarak tüketilen ve yem olarak kullanılan değerli bir insan gıdası olup, genellikle toprak sağlığını zenginleştirme amacıyla tahıllardan sonra ekim nöbeti olarak yetiştirilir, çünkü azot bağlama yeteneği vardır (Duran ve ark., 2004). Güneydoğu Asya'da mercimek, çoğunlukla yağış sonrası kalan toprak neminden yararlanılarak kuru koşullarda yetişmektedir. Mercimek, ekim nöbetine dahil edildiğinde, biyolojik azot bağlama ve karbon tutma yoluyla toprak sağlığını iyileştirerek sonraki ekimlerin fayda sağlamasına yardımcı olabilir. Bitkiler tarafından bağlanan azot miktarı, 0 ila 192 kg toplam N/ha arasında değişmekte olup, ortalama 80 kg toplam N/ha'dır (Quinn, 2009). Bu azot bağlama tahmini, nohut ve kuru fasulye tarafından bağlanan miktarlara benzerlik göstermektedir.

1970'lerden bu yana, ulusal ve uluslararası mercimek programlarında fenolojik olarak adapte olmuş, strese dayanıklı ve yüksek verimli çeşitlerin geliştirilmesinde önemli başarılar elde edilmiştir (Sarker ve Erskine, 2006). Son 30 yıl içinde, farklı ulusal tarım sistemleri, Uluslararası Kurak Alan Tarımsal Araştırmalar Merkezi (ICARDA) tarafından geliştirilen genetik kaynaklardan 90'dan fazla geliştirilmiş çeşit yayımlamıştır (Sarker ve Erskine, 2006). Bu nedenle, bu derleme, hastalık yönetimindeki geçmiş başarıları, patojen çeşitliliğini ve Fusarium solgunluğunu yönetme konusundaki eksiklikleri inceleyerek mercimek üretiminin ve verimliliğinin artırılmasını hedeflemektedir.

Kimyasal mücadele

Dünyanın farklı bölgelerinde, *Fusarium oxysporum* f. sp. *lentis*'e (Fol) karşı çeşitli fungisitler test edilmiştir. Çalışmalar, sistemik fungisitlerin, hem petri kabı hem de saksı tohum uygulamalarında, sistemik olmayan fungisitlere kıyasla fungus miselyum gelişimini engellemede daha etkili olduğunu ortaya koymuştur.

Benomyl (%76,6) patojene karşı en olumlu sonuçları göstermiştir; bunu thiophanate-methyl (%73,0) takip etmiştir. Öte yandan, sistemik olmayan fungisitlerden captan (%67,8) ve dithane M-45 (%62,3), fungus büyümesini azaltmada sistemik fungisitlere göre daha az etkili bulunmuştur (Rafique ve ark., 2016). Buna karşılık, Kasyap ve arkadaşları (2008), captan ile uygulanan tedavinin fungus büyümesini %88,3 oranında azalttığını bildirmiştir (Kasyap ve ark., 2008).

Maheshwari ve arkadaşları (2008), Fol'e karşı yedi farklı fungisit maddesinin etkisini test etmiştir. Sonuçlar, carbendazim'in en etkili madde olduğunu (5,6 mm fungus büyümesi) ve bunu captan (9,9 mm) ile hexaconazole ve diniconazole'un takip ettiğini göstermiştir.

Fungisitlerin farklı konsantrasyonlarının etkilerini belirlemek için yapılan çeşitli çalışmalarda, en iyi fungus kontrolünün benomyl ile 100 ppm'de sağlandığı, ardından yine 100 ppm konsantrasyonda thiophanate-methyl'in geldiği rapor edilmiştir (Rafique ve ark., 2016; Maitlo ve ark., 2014). Ancak, Suriye'de yapılan bir çalışmada, benomyl-thiram ile tohum ilaçlamasının, Fusarium solgunluğu insidansını etkilemediği bildirilmiştir (Ahmed ve ark., 2002).

Biyolojik Mücadele

Biyolojik mücadele, toprak kaynaklı patojenlere karşı en iyi ve etkili yöntemlerden biri olarak bilinmektedir. Bu yöntemin pek çok avantajı vardır: çevre dostu, maliyet açısından uygun ve uzun süreli bitki koruması sağlar. *Pseudomonas, Trichoderma* ve *Streptomyces* gibi birçok fungus ve bakteri türü, mercimekte Fusarium solgunluğu üzerinde antagonist (baskılayıcı) etkiye sahiptir. Bunlar arasında Trichoderma türleri, toprak ve tohum kaynaklı hastalıklara karşı biyolojik kontrol ajanı olarak yoğun şekilde kullanılmaktadır (Rafique ve ark., 2016).

Bir çalışmada, *Gliocladium virens* + *Pseudomonas fluorescens* + carboxin ve *Bacillus subtilis* + carboxin + *Trichoderma harzianum* / *T. viride* / *G. virens* kombinasyonlarıyla yapılan tohum ilaçlamalarının, mercimekte Fusarium solgunluğu insidansını azaltmada daha etkili olduğu ortaya konmuştur (Shrestha ve ark., 1991; De ve Chaudhary, 1999).

Başka bir çalışmada, mercimek solgunluğuna neden olan yüksek virülanslı bir Fusarium izolatına karşı iki Trichoderma türü kullanılmıştır. Sonuçlar, *T. harzianum*'un toprak sulama yöntemiyle uygulandığında diğer izolatlara kıyasla solgunluk hastalığını kontrol etmede çok daha etkili olduğunu göstermiştir (Rafique ve ark., 2016).

Garkoti ve ark. (2013), "Pant L-639" adlı popüler mercimek çeşidinin *T. harzianum* + *Pseudomonas fluorescens* kombinasyonu ile uygulandığında hastalık insidansında önemli bir azalma ve maksimum tane verimi sağlandığını gözlemlemiştir (Garkoti ve ark., 2013).

Benzer şekilde, *T. harzianum* + *Serendipita vermifera* kombinasyonunun, bitki boyunun artışıyla birlikte hastalık şiddetini azalttığı bildirilmiştir (Dolatabadi ve ark., 2012). Aynı şekilde, başka bir çalışmada mercimekte Fusarium solgunluğuna karşı *Bacillus subtilis*'in formülasyonu ve uygulanma yöntemi değerlendirilmiş; glikoz, talk ve torf bazlı *B. subtilis* formülasyonlarıyla yapılan tohum uygulamalarının, doğrudan spor uygulamasına göre

Fusarium'a karşı biyolojik kontrol etkinliğini önemli ölçüde artırdığı ortaya koyulmuştur (El-Hassan ve Gowen, 2006).

Ayrıca, çeşitli çalışmalar biyolojik mücadele ajanlarının bakteri (Krause ve ark., 2003), fungus (Lazarovits ve ark., 2001) ve nematod (Akhtar ve Malik, 2000) gibi bitki patojenlerinin neden olduğu hastalık insidansını azaltmadaki önemini de kanıtlamıştır.

Kültürel uygulamalar

Kültürel mücadele genellikle ekim tarihi ve derinliği ile tarımsal uygulamaların düzenlenmesine bağlıdır (Altaf ve ark., 2014; Alemu ve Sinclair, 1979).

Yapılan çalışmalarda, ekimin geciktirilmesinin solgunluk hastalığı görülme oranını genellikle azalttığı, ancak erken ekime (Temmuz sonu) kıyasla geç ekimin düşük verime yol açtığı bildirilmiştir (Seid ve ark., 1992).

Uygun ekim tarihleri farklı üretim bölgelerine göre değişmektedir. Temiz tohum kullanımı ve fungisitli tohum ilaçlaması, bulaşık inokulum kaynaklarının azaltılmasına yardımcı olabilir. Çeşitli hastalıklardan korunmak için, tohumların doğru derinlikte (10–12 cm) ekilmesi önerilmektedir (Asrat, 2015).

Derin sürüm yapılmasının ve enfekte olmuş bitki artıklarının tarladan uzaklaştırılmasının, mercimeklerde Fusarium solgunluğu inokulum düzeyini azaltabileceğini belirtmiştir (Haware, 1968).

Toprak solarizasyonu da hastalık şiddetini azaltmanın başka bir yoludur (Chauhan ve ark., 1988).

Mercimek solgunluk hastalığının kontrolü için kimyasal düzenleyiciler (Mn ve Zn) kullanımı ve yaprak uygulamaları da önerilmektedir.

Bir çalışmada, mercimek tohumlarının ıslatılması sonrası 80 ppm konsantrasyonda Zn ve Mn tuzlarının uygulanmasının, solgunluk hastalığının kontrolünde umut verici sonuçlar verdiği bildirilmiştir (Mehrotra ve Claudius, 1973).

Fusarium solgunluğuna dayanıklı çeşitler

Hastalığın yönetiminde, çok sayıda genetik kaynak (kültive edilmiş çeşitler ve yabani akrabalar) üzerinde hastalıklı tarla koşullarında ve serada değerlendirme yapılabilmesi için güvenilir ve tekrarlanabilir hastalık tarama tekniklerinin geliştirilmesidir.

Çeşit dayanıklılığı, şu anda Uluslararası Kurak Alanlar Tarımsal Araştırma Merkezi'nde (ICARDA) yürütülen mercimek ıslah programlarının temel hedeflerinden biridir.

Fusarium solgunluğuna dayanıklı çeşitlerin belirlenmesi için, hem tarla koşullarında hem de kontrollü ortamda (sera ve laboratuvar) tarama yapılması önerilmektedir (Kraft ve ark., 1994; Alessandro ve ark., 2006). Bazı önemli dayanıklı çeşitler; Suriye: 'Idleb 2', 'Idleb 3', 'Idleb 4' ve 'Ebla 1',Lübnan: 'Talya 2', 'Rachayya' ve 'Hala', Türkiye: 'Fırat 87' ve 'Seyran 96',

Etiyopya: 'Adaa', 'Alemaya', 'Assano', 'Alemtena' ve 'Teshale, İran: 'Kimiya, Irak: 'IPA 98 olarak bulunmuştur (Choudhary ve ark., 2013).

Hindistan'da ise, ulusal program kapsamında şu çeşitler Fusarium solgunluğuna dayanıklı olarak tescil edilmiştir: 'L 4147', 'Pant L 406', 'Pant L 4', 'Pant L 639', 'Priya', 'Seri', 'JL 3', 'Noori' ve 'VL 507' (Pandya ve ark., 1980; Singh ve ark., 1994; Rahman ve ark., 2009).

Mercimekte Solgunluk Hastalığı İçin Kullanılan Genetik Materyaller ve Yabani Türlerin Önemi

Yabani türler, hastalık direnci için çok değerli bir kaynak oluşturmaktadır. Mercimeğin yabani genetik kaynakları, ICARDA'da biyotik ve abiyotik streslere karşı direnç açısından değerlendirilmiştir (ICARDA, 1992). Yabani mercimek (*L. culinaris* ssp. *orientalis*) ile kültive edilen formlar arasında yapılan melezlemeler, kurak koşullarda yüksek verimli seleksiyonların geliştirilmesini sağlamıştır. Benzer şekilde, beş tür/alt türü temsil eden 221 çeşit taranmış ve Türkiye'den ILWL 113 (*L. culinaris* ssp. *orientalis*) ile Suriye'den ILWL 138 (*L. ervoides*) çeşitlerinin dirençli olduğu bulunmuştur (Bayaa ve ark., 1992).

Hindistan'da, dört yabani tür/alt türü temsil eden 70 çeşit değerlendirilmiş ve her türde Fol direnci için gen kaynakları belirlenmiştir. Mercimeğin yabani erişimleri arasında; *L. culinaris* ssp. *orientalis* (ILWL76, 1), *L. odemensis* (ILWLs 35, 39, 153, 237, 300, 5), *L. ervoides* (ILWLs 40, 41, 42, 133, 204, 251, 258, 261, 271, 280, 299, 11), *L. nigricans* (ILWLs 22, 26, 31, 37, 38, 430, 6) hastalık direnci için önemli yabancı gen kaynakları sağlayabilir (Gupta ve Sharma, 2006).

Fusarium Solgunluğuna Karşı Direncin Genetiği

Mercimekte Fusarium solgunluğunu kontrol etmenin en ekonomik yolu, dirençli çeşitlerin geliştirilmesidir (Kumar ve ark., 2010).

Yeni ırkların evrimi ve birden fazla patotipin birlikte bulunması nedeniyle dirençli çeşitler geliştirmek zorlaşmaktadır. Bu nedenle, solgunluk direncinin kalıtımı ve genetiği hakkında bilgi sahibi olmak, dirençli veya orta derecede dirençli çeşitlerin geliştirilmesi açısından önemlidir.

Fusarium solgunluğuna karşı direnç genetiği üzerine yapılan çalışmalar, daha dirençli mercimek çeşitlerinin üretilmesine yardımcı olacaktır (Eujayl ve ark., 1998).

Dirençli veya orta derecede dirençli mercimek çeşitleri (OPL 58, DPL 61 ve DPL 62) solgunluk görülme oranını ve kök çürüklüğü şiddetini önemli ölçüde azaltmış ve tane verimini artırmıştır (Chaudhary ve Amarjit, 2002). Ancak, mercimekte solgunluk direncinin genetiği ve kalıtım modeli üzerine yapılan çalışmalar oldukça sınırlıdır.

Bir araştırmada, mercimekte Fusarium solgunluğuna karşı direncin beş bağımsız gen tarafından kontrol edildiğini bildirmiştir (Kamboj ve ark., 1990).

Diğer bir araştırmacı ise 'ILL 5588' çeşidinde solgunluk direncinin monogenik (tek genle kontrol edilen) bir kalıtıma sahip olduğunu tespit etmiş ve bu geni 'Fw' olarak adlandırmıştır. Allelizm testi üzerine yapılan bir çalışmada, PL 234, JL 446 ve PL 286 çeşitlerinde, sırasıyla direnç sağlayan ikişer adet çift gen ve tamamlayıcı genler tanımlanmıştır (Eujayl ve ark., 1998).

Stevenson ve ark. (1995), bitki kök salgılarının ve genotiplerdeki direnç farklarının, kök salgılarının miktarına ve bu salgıların antifungal bileşiklerine bağlı olduğunu açıklamıştır.

Bir diğer çalışma, kök salgılarının toprakta önemli miktarda organik madde, amino asitler ve şekerler saldığını ve amino asitlerin (glisin ve fenilalanin) patojenin sporlarının çimlenmesi üzerinde inhibe edici bir etkiye sahip olduğunu göstermektedir (Claudius ve Merhotka, 1973).

Iftikhar ve ark. (2005), solgunluk direncinde antifungal bileşiklerin varlığını ve rolünü analiz etmiştir. Sonuçlar, fenolik bileşiklerin solgunluk hastalığına karşı direnç sağlamada önemli bir rol oynadığını göstermiştir, çünkü sadece solgunluğa karşı dirençli hatlar bu bileşiği üretmiştir. Benzer şekilde, diğer bir çalışmada, hatların fitoaleksin üretme potansiyelinin, fungus enfeksiyonlarına karşı dirençlerini etkilediği bildirilmiştir (Mohammadi ve ark., 2012; Stevenson ve ark., 1997).

Mercimek Solgunluğu İçin Entegre Yönetim

İki veya daha fazla hastalık yönetim seçeneğinin entegrasyonu, bitkiler üzerinde etkili olan herhangi bir hastalığın etkisini azaltabilir. Bu stratejiyi seçmenin beklenen faydası, hastalığın sürdürülebilir ve etkili bir şekilde kontrol edilmesidir. Biyolojik kontrol ajanlarının kimyasal kontrol ile kombinasyonu, bazı toprak kaynaklı hastalıkların kontrolünde bir strateji olarak işe yarayabilir. Bu nedenle, bazı araştırmacılar, *Bacillus megaterium*'in carbendazim ile kombinasyonunu kullanmış, bu kombinasyonun Fusarium taç ve kök çürüklüğünün etkin bir şekilde kontrolünü sağladığını ortaya koymuşlardır (Omar ve ark., 2006). Benzer şekilde, toprak düzenleyiciler ve biyolojik kontrol ajanları, örneğin *Trichoderma* spp. kombinasyonunun, hastalık kontrolünü ve tarımsal verimliliği artırdığı gösterilmiştir (Slusarski ve ark., 2012).

Günümüzde, toprak özelliklerini iyileştirmek, bitki sağlığını ve verimi artırmak amacıyla organik düzenleyicilerin kullanımı yaygınlaşmıştır (Gamliel ve Katan, 2009).

SONUÇ

Patojeniteyi DNA teknikleriyle ilişkilendirmek için standart bir anaç farklılık setine de ihtiyaç duyulmaktadır. Patojene karşı direnç için sağlam bir tarama tekniği de gereklidir. Anaç-patojen etkileşimi üzerine yapılan çalışmaların eksikliği nedeniyle, yönetim hâlâ belirsizdir ve bu alanda ek araştırmalara ihtiyaç vardır.

Markör destekli seleksiyon (MAS), bitki genotiplerini istenen özellik kombinasyonu ile seçme verimliliğini ve etkinliğini artırmak için büyük fırsatlar sunmaktadır. Markör destekli seleksiyonla, hastalık olmadan ve bitkinin erken gelişim aşamalarında hastalık direnci değerlendirilebilir. Ancak, mercimek ıslah programlarında markörlerin rutin kullanımının

uygulanması şu anda çok sınırlıdır; bu nedenle, teknolojinin maliyet etkin kullanımı sağlamak için markörlerin ıslah programlarına entegrasyonu gereklidir.

Yakın akraba baklagillerle yapılan karşılaştırmalı genomik ve sintezi analizleri, mercimek genomu hakkındaki bilgiyi artırmada önemli bir rol oynayabilir.

İleri düzey genomik araçlar, örneğin transkriptom profilleme ve harita temelli gen klonlaması uygulayabilmek için daha rafine genetik materyallere ihtiyaç duyulmaktadır.

Solgunluk direnci ve kuraklık toleransı olan genetik materyaller, bu ikincisinin Fusarium enfeksiyonuna yatkın hale getirmesi nedeniyle önemli bir odak alanıdır. Anaç bitki direncinin yanı sıra, Fusarium solgunluğunun entegre yönetimi, birçok ülkede Fusarium solgunluğunun verim kaybını daraltmak için oldukça önemlidir.

ABSTRACT

The excessive use of chemical fertilizers leads to environmental problems by increasing CO_2 emissions and disrupting sustainable soil management, while also posing significant challenges to healthy food production. Therefore, the use of organic-based materials such as vermicompost in hydroponic systems is considered a promising alternative in terms of both sustainable agricultural practices and the production of healthy food. This study was conducted in a fully automated, geothermal-heated Venlo-type glass research greenhouse at Kırşehir Ahi Evran University, utilizing a hydroponic cultivation system. The aim of the research was to determine the effects of vermicompost application on plant growth in different lettuce (*Lactuca sativa* L.) cultivars grown with reduced nutrient solution levels. The plant materials used in the study were two lettuce cultivars: Kireve and Cherokee. The experimental treatments were as follows: (1) tap water only, (2) tap water + vermicompost, (3) 2 EC nutrient solution (dS m^{-1}), (4) 2 EC nutrient solution + vermicompost, (5) 1.5 EC nutrient solution + vermicompost, and (6) 1 EC nutrient solution + vermicompost. The plants were grown for 30 days in an aerated hydroponic system. After harvest, various morphological and physiological characteristics were evaluated, including leaf fresh and dry weight, root fresh and dry weight, head diameter, head height, number of leaves, leaf color parameters (L, a, b*), color saturation (chroma), hue angle, leaf chlorophyll a, chlorophyll b, total chlorophyll and total carotenoid contents, leaf sap EC and pH, soluble solid content, root length, root diameter, and root volume. According to the findings, the highest values for leaf and root fresh and dry weights were obtained from the treatment with 2 EC nutrient solution combined with vermicompost. It was observed that vermicompost application positively affected plant growth in both lettuce cultivars when applied with either tap water or different levels of nutrient solution. In conclusion, vermicompost application under hydroponic conditions not only promoted plant growth but

also contributed to reducing the use of chemical fertilizers, thereby lowering production costs. These results indicate that vermicompost can make a significant contribution to sustainable lettuce cultivation.

Keywords: Vermicompost, Lettuce, Hydroponic, Plant Growth

VERMİKOMPOST VE AZALTILMIŞ BESİN ÇÖZELTİSİ UYGULAMALARININ HİDROPONİK MARUL YETİŞTİRİCİLİĞİNDE BİTKİ GELİŞİMİ ÜZERİNE ETKİLERİNİN BELİRLENMESİ

ÖZET

Kimyasal gübrelerin aşırı kullanımı, CO_2 emisyonlarını arttırarak ve sürdürülebilir toprak yönetimini bozarak çevresel sorunlara yol açmanın yanı sıra, sağlıklı gıda üretimi açısından da önemli sorunlara sebep olmaktadır. Bu nedenle, vermikompost gibi organik kökenli maddelerin hidroponik sistemlerde kullanımı hem sürdürülebilir tarım uygulamaları hem de sağlıklı gıda üretimi açısından umut vadeden bir alternatif olarak değerlendirilmektedir. Bu çalışma, Kırşehir Ahi Evran Üniversitesi'ne ait tam otomasyonlu jeotermal ısıtmalı, venlo tip cam Ar-Ge serasında hidroponik yetiştirme tekniği kullanılarak yürütülmüştür. Araştırmanın amacı, vermikompost uygulamasının azaltılmış besin çözeltisi uygulanmış farklı marul (*Lactuca sativa* L.) çeşitlerinde bitki gelişimi üzerindeki etkilerini belirlemektir. Çalışmada bitkisel materyal olarak Kireve ve Cherokee marul çeşitleri kullanılmıştır. Denemede yapılan uygulamalar: (1) yalnızca çeşme suyu, (2) çeşme suyu + vermikompost, (3) 2 EC besin çözeltisi (dS/m) , (4) 2 EC besin çözeltisi + vermikompost, (5) 1.5 EC besin çözeltisi + vermikompost ve (6) 1 EC besin çözeltisi + vermikompost. Bitkiler, havalandırmalı durgun su kültüründe 30 gün boyunca yetiştirilmiştir. Hasat sonrası bitkilerde; yaprak taze ve kuru ağırlığı, kök taze ve kuru ağırlığı, baş çapı, baş boyu, yaprak sayısı, yaprak renk parametreleri (L*, a*, b*), renk doygunluğu (chroma), renk tonu (hue açısı), yaprak klorofil a, klorofil b, toplam klorofil ve toplam karotenoid içeriği, yaprak öz suyu EC, pH ve suda çözünür kuru madde miktarı, kök uzunluğu, çapı ve hacmi gibi çeşitli morfolojik ve fizyolojik özellikler belirlenmiştir. Elde edilen bulgulara göre, yaprak taze ve kuru ağırlığı ile kök taze ve kuru ağırlığı bakımından en yüksek değerler, 2 EC'lik besin çözeltisi + vermikompost uygulamasından elde edilmiştir. Vermikompost uygulamasının hem çeşme suyu hem de farklı dozlarda besin çözeltisi ile kullanıldığında her iki marul çeşidinde de bitki gelişimini olumlu yönde etkilediği belirlenmiştir. Sonuç olarak, su kültürü koşullarında vermikompost uygulaması hem bitki gelişimini teşvik etmekte hem de kimyasal gübre kullanımının azaltılmasına katkı sağlayarak maliyetleri düşürmektedir. Bu durum, sürdürülebilir marul yetiştiriciliği açısından vermikompostun önemli bir katkı sağlayabileceğini ortaya koymaktadır.

Anahtar Kelimeler: Vermikompost, Marul, Su Kültürü, Bitki Gelişimi

1.GİRİŞ

Marul (*Lactuca sativa* L.), Asteraceae familyasına ait yaprakları tüketilen ve serin iklim koşullarında yetiştirilen önemli bir sebze türüdür (Kim ve ark., 2016). Geniş kullanım alanına sahip olan bu bitki, özellikle taze tüketim amacıyla salatalarda tercih edilmekte olup, aynı zamanda çeşitli tıbbi alanlarda değerlendirilmektedir. Resmi olarak, marul grubunda Cos (Romanya), Butterhead, Leaf (Cutting), Stalk (veya Kuşkonmaz), Crisphead (Iceberg), Latin ve Oilseed olmak üzere yedi farklı tür vardır (Das ve Bhattacharjee, 2020). Üretim miktarları incelendiğinde Dünya'da 2023 verilerine göre toplam 28.084.971 ton marul üretimi yapılmıştır (FAO, 2023). Türkiye'de ise 602.848 ton marul üretimi yapılmıştır (TÜİK, 2023). Marul, %94-95 oranında zengin su içeriğine sahip ve kalorisi düşük bir sebzedir. Ayrıca polifenoller, karotenoidler ve klorofil gibi sağlık için yararları olan vitaminler, mineraller ve biyoaktif bileşiklerin mükemmel bir kaynağıdır (Yang ve ark., 2022). Marulda renk, şekil ve içerdiği besin maddelerinin farklılığı, tüketicinin satın alma tercihini etkileyen faktörlerdir (Mampholo ve ark., 2016).

Günümüzde artan nüfusla birlikte, gıda ihtiyacını karşılayabilmek amacıyla birim alandan elde edilen verimin artırılması zorunlu hale gelmiştir. Ancak bu üretim artışı gerekliliği, aynı zamanda tarımsal üretimde birim alanda daha fazla inorganik gübre kullanımını da gerekli kılmaktadır. Aşırı ve bilinçsiz inorganik gübre uygulamaları ise toprak ve su gibi doğal kaynakların kirlenmesine neden olmakta; bu durum hem çevresel bozulmalara yol açmakta, hem de insan sağlığı açısından ciddi riskler oluşturmaktadır (Adiloğlu ve ark., 2018). Ayrıca kimyasal gübrelerin aşırı kullanımı, CO_2 emisyonunun artmasına ve toprak bozulması gibi çevreyi etkileyen sorunları ortaya çıkarmaktadır (Manthiram ve Gribkoff, 2021). Diğer taraftan, artan nüfus ekolojik olarak istikrarlı gıda üretiminin genişletilmesi sorununu da beraberinde getirmektedir. Topraksız tarım, toprak bozulması, sınırlı su temini sorunlarını ele alma ve zararlıları ve hastalıkları azaltma kapasitesine sahiptir. Ayrıca tarımsal üretimde sürdürülebilirliği teşvik eden önemli bir çözüm yoludur (Sambo ve ark., 2019). Hidroponik tarım, toprak kullanımının yerine, bitkilerin gereksinim duyduğu mineral elementleri içeren besin çözeltisinin kullanıldığı alternatif bir üretim tekniğidir. Kalite özellikleri hasat öncesi ve sonrası uygulamalardan yoğun şekilde etkilenen yaprağı tüketilen sebzelerin yetiştiriciliğinde hidroponik sistemler yaygın olarak tercih edilmektedir (Resh, 2022). Daha da önemlisi, hidroponik sistemde yetiştirilen marul gibi sebzeler, fide gelişimi ve bitki büyümesi açısından yüksek düzeyde homojenlik göstermekte olup, bu durum ekim ve hasat zamanlarının tekdüze hale gelmesini sağlamaktadır (Gonnella ve ark., 2003). Her ne kadar hidroponik tarım, geleneksel topraklı üretime kıyasla modern ve kontrollü bir alternatif olarak değerlendirilse de, bu sistemde yaygın olarak kullanılan inorganik gübreler, çevresel sürdürülebilirlik ve gıda güvenliği açısından çeşitli zorlukları da beraberinde getirmektedir (De Castro ve ark., 2023). Bu bağlamda, solucan gübresi gibi sürdürülebilir kaynaklardan elde edilen organik besin maddelerini içeren hidroponik sistemlerin uygulanması, mevcut eksikliklerin giderilmesinde ve sağlıklı gıda üretimi açısından sürdürülebilir çözümler geliştirilmesinde önemli bir anahtar olarak öne çıkmaktadır (Tejada ve ark., 2010). Bu araştırmanın amacı, solucan gübresi (vermikompost) uygulamasının, azaltılmış düzeyde besin çözeltisi ile yetiştirilen farklı marul (*Lactuca sativa* L.) çeşitlerinde bitki gelişimi üzerine etkilerini belirlemektir.

2. MATERYAL VE YÖNTEM

2.1. Materyal

Denemede bitkisel materyal olarak Rijk Zwaan tohum şirketine ait Kireve (Orta yeşil renkli palamut yaprak marul çeşidi) ve Cherokee (Parlak üçlü kırmızı renge sahip batavia marul çeşidi) marul çeşitleri kullanılmıştır.

2.2. Metot

Deneme, Kırşehir Ahi Evran Üniversitesi'nin tam otomasyonlu (fan-ped soğutma, yüksek basınçlı sisleme, ısı perdesi, sirkülasyon fanı ve jeotermal ısıtmalı) venlo tipi cam Ar-Ge serasında yürütülmüştür. Tohumlar 2:1 oranında torf ve perlit karışımı doldurulmuş 128'lik insertlere 05/01/2025 tarihinde ekilmiştir. Fideler 4-5 gerçek yaprak aşamasına kadar serada rutin bakım işlemleri yapılarak yetiştirilmiştir. Dikim aşamasına gelen fideler 136 lt'lik besin solüsyonu doldurulmuş plastik saksılara 13/02/2025 tarihinde dikilmiştir. Saksıların üst yüzeyi kompozit levha ile kapatılmış ve bitkiler sıra arası ve sıra üzeri eşit ayarlanmış kompozit üzerindeki deliklere yerleştirilmiştir. Yetiştirme solüsyonu bir hava pompası ile düzenli olarak havalandırılmıştır. Bitkilerin yetiştirildiği besin solüsyonu içeriği; 1500 µM $Ca_2(NO_3)$, 750 µM K_2SO_4, 650 µM $MgSO_4$, 500 µM KH_2PO_4, 10 µM H_3BO_3, 0,5 µM $MnSO_4$, 0.5 µM $ZnSO_4$, 0.4 µM $CuSO_4$, 0.4 µM $MoNa_2O_4$ ve 80 µM Fe EDDHA içerecek şekilde hazırlanmıştır. Her bir saksıda 10 adet bitki yetiştirilmiştir. Dikimden sonra vermikompost uygulaması olan her saksıya sıvı vermikompostan 250 ml eklenmiştir. Deneme 12/03/2025 tarihinde sonlandırılmıştır. Çalışmadaki uygulamalar Tablo 1'de verilmiştir.

Tablo 1. Çeşme suyu, besin çözeltisi (dS/m) ve sıvı solucan gübresi uygulamaları.

Çeşme Suyu
Çeşme Suyu + Vermikompost
2 EC'lik Besin Çözeltisi
2 EC'lik Besin Çözeltisi + Vermikompost
1.5 EC'lik Besin Çözeltisi + Vermikompost
1 EC'lik Besin Çözeltisi + Vermikompost

2.3. Denemede Yapılan Ölçümler

Hasattan sonra kök ve yaprak taze ağırlıkları (g/bitki) 0.01 hassasiyetindeki dijital terazi ile belirlenmiştir. Kuru ağırlıkları belirlemek amacıyla kök ve yaprak örnekleri, sabit ağırlığa ulaşıncaya kadar 65°C'lik etüvde kurutulup ölçülmüştür. Baş boyu ve baş çapı cetvel (cm) ile ölçülmüştür. Gövde çapı ise kumpas (mm) ile ölçülmüştür. Yaprak rengi ise Konica Minolta CR 200 renkölçer ile L, a ve b değerleri olarak ölçülmüştür. L, siyah: 0'dan beyaz: 100'a olacak şekilde rengin açıklık veya koyuluğunu, a ve b ise L'ye dik bir renk düzleminde rengi

belirlemektedir. Yatay eksende pozitif a kırmızıyı, negatif a yeşili; dikey eksendeki pozitif b sarıyı ve negatif b ise maviyi göstermektedir. Ölçülen temel 3 renk parametresi kullanılarak, bitki örneklerinde kroma ve hue açısı değerleri de hesaplanmıştır (Iqdiam ve ark., 2018). Deneme sonunda her bir bitkideki yapraklar sayılarak adet olarak toplam yaprak sayısı tespit edilmiştir. Marul yapraklarından elde edilen suyun elektriksel iletkenlik (EC) ve pH değerleri, Extech marka EC ve pH ölçer cihazı kullanılarak belirlenmiştir. Suda çözünmüş katı madde miktarı (SÇKM) ise Hanna HI96801 model dijital refraktometre ile ölçülmüştür. Bitkilerin kök uzunluğu, kök taze ağırlığı kaydedildikten sonra, WinRHIZO (Win/Mac RHIZO Pro V. 2002c, Regent Instruments Inc., Kan Win/Mac RHIZO Pro V. 2002c Regent Instruments Inc., Québec, QC G1V 1V4, Kanada) yazılım programı kullanılarak ölçülmüştür. Yaprak pigment düzeyini belirlemek amacıyla her uygulama için yapraklardan 1.5 cm çapında diskler alınıp 3 ml, %80'lik aseton içerisinden homojenize edilerek 24 saat bekletildikten sonra UV-Vis spektrofotometre de 470 nm, 648.6 nm ve 664.2 nm dalga boylarında ölçümler yapılmıştır. Yaprak klorofil (a, b ve toplam klorofil) ve karotenoid içerikleri, Lichtenthaler (1987), tarafından açıklanan formüller kullanılarak spektrofotometrik yöntemle belirlenmistir.

2.4. İstatistik Analiz

Su kültürü çalışmasında bitkilerden elde edilen veriler, %5 anlamlılık düzeyinde Minitab Statistical Software 22 (United Kingdom) programı kullanılarak analiz edilmiştir. Verilerin değerlendirilmesinde tek yönlü varyans analizi (ANOVA) uygulanmış ve ortalamalar arasındaki farklar Duncan çoklu karşılaştırma testi ile belirlenmiştir.

3.BULGULAR

Farklı dozlarda besin solüsyonu ve vermikompost uygulanmış ortamlarda yetiştirilmiş 'Kireve' ve 'Cherokee' marul çeşitleri üzerine uygulamaların etkileri değerlendirilmiştir. Yaprak taze ve kuru ağırlığı bakımından en yüksek değer, 2 EC + vermikompost uygulanan 'Kireve' çeşidinde ölçülmüş; en düşük değer ise çeşme suyunda yetiştirilen aynı çeşitte tespit edilmiştir. Marul çeşitlerinde kök taze ağırlığı 36.67 ile 157.33 g arasında, kök kuru ağırlığının ise 5.45 ile 22.61 g arasında değiştiği belirlenmiştir (Tablo 2). Elde edilen veriler, önceki çalışmaların sonuçları ile uyumludur. Kibar (2018), marulda bitki yaş ve kuru ağırlığı bakımından vermikompost uygulamalarında, kontrol uygulamasına kıyasla daha yüksek değerler elde etmiştir. Benzer şekilde Papathanasiou ve ark. (2012), çalışmalarında bitkisel materyal olarak kullandıkları iki marul çeşidinin taze ağırlığının, vermikompost uygulamasında kontrol bitkilerinden daha yüksek olduğunu tespit etmişlerdir. Aynı zamanda tüm marul çeşitlerinde kök biyokütlesinin de vermikompost uygulaması ile artış gösterdiğini belirlemişlerdir.

Tablo 2. Farklı dozlarda besin solüsyonu ve vermikompost uygulanmış ortamlarda yetiştirilmiş 'Kireve' ve 'Cherokee' marul çeşitlerinde yaprak ve kök taze-kuru ağırlıkları üzerine etkileri

Çeşit	Uygulama	Yaprak Taze Ağırlığı (g)	Yaprak Kuru Ağırlığı (g)	Kök Taze Ağırlık (g)	Kök Kuru Ağırlık (g)
Kireve	Çeşme Suyu	8.87h	1.38h	36.67e	5.45e
Kireve	Çeşme suyu + Vermikompost	27.80g	4.11g	66.67de	10.24de
Kireve	2 EC Besin Çözeltisi	114.67bc	15.49bc	103.67bc	17.04bc
Kireve	2 EC Besin Çözeltisi +Vermikompost	148.57a	20.21a	157.33a	22.31a
Kireve	1.5 EC Besin Çözeltisi+Vermikompost	127.87b	17.34b	153.00a	22.61a
Kireve	1 EC Besin Çözeltisi +Vermikompost	91.03de	12.49de	117.00b	16.82bc
Cherokee	Çeşme Suyu	18.03gh	2.69gh	51.33de	10.20de
Cherokee	Çeşme suyu + Vermikompost	22.87gh	3.25gh	64.33de	10.15de
Cherokee	2 EC Besin Çözeltisi	90.87de	12.47de	116.67b	16.99bc

Cherokee	1.5 EC Besin Çözeltisi +Vermikompost	85.67e	11.68e	99.00bc	15.99bc
Cherokee	1 EC Besin Çözeltisi +Vermikompost	69.90f	9.59f	81.00cd	12.33cd
	p değeri	***	***	***	***

İncelenen parametreler sonucunda gövde çapı en yüksek 'Kireve' ve 'Cherokee' çeşitlerine uygulanan 2 EC besin çözeltisi ve 2 EC besin çözeltisi + vermikompost uygulamalarında belirlenirken, en düşük ise her iki çeşitte de çeşme suyunda yetiştirilen bitkilerde belirlenmiştir (Tablo 3). Baş boyu bakımından ise en yüksek değerler 'Kireve' çeşidine uygulanan sırasıyla; 1.5 EC + vermikompost ve 2 EC + vermikompost uygulamalarında ölçülmüştür (Şekil 1). Baş çapı, 11.50 ile 31.61 mm arasında değişmiştir. En yüksek yaprak sayısı 2 EC besin çözeltisi ve 2 EC + vermikompost uygulanan 'Kireve' çeşidinde saptanırken, en düşük değer ise çeşme suyu uygulanan 'Cherokee' çeşidinde saptanmıştır (Şekil 2). Kibar (2018), marulda bitki boyu 16.0-30.0 cm, bitki çapı 20.5-36.5 cm arasında değiştiğini tespit etmiştir. Gutiérrez-Miceli ve ark. (2007), çalışmalarında toprağa %33 (1/3) ve %25 (1/4) oranlarında uygulanan vermikompostun, domates bitkilerinde bitki boyu, gövde çapı ve bitki başına yaprak sayısı gibi büyüme parametrelerinde anlamlı artışlara neden olduğunu tespit etmişlerdir.

Tablo 3. Farklı dozlarda besin solüsyonu ve vermikompost uygulanmış ortamlarda yetiştirilmiş 'Kireve' ve 'Cherokee' marul çeşitlerinde gövde çapı, baş boyu, baş çapı ve yaprak sayısı üzerine etkileri

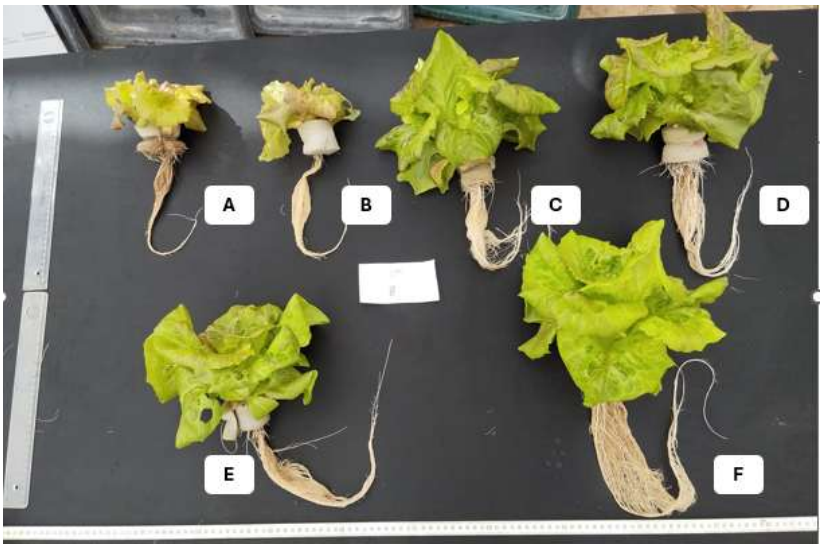
Şekil 1. Kireve marul çeşidine uygulanmış; çeşme suyu (A), çeşme suyu + vermikompost (B), 2 EC besin çözeltisi (C), 2 EC besin çözeltisi + vermikompost (D), 1.5 EC besin çözeltisi + vermikompost (E) ve 1 EC besin çözeltisi + vermikompost (F) görselleri.



Şekil 2. Cherokee marul çeşidine uygulanmış; çeşme suyu (A), çeşme suyu + vermikompost (B), 2 EC besin çözeltisi (C), 2 EC besin çözeltisi + vermikompost (D), 1.5 EC besin çözeltisi + vermikompost (E) ve 1 EC besin çözeltisi + vermikompost (F) görselleri.

Yaprak renginin açıklık-koyuluğunu ifade eden L değeri, 'Kireve' çeşidinde tüm uygulamalar arasında istatiksel olarak fark görülmezken, 'Cherokee' çeşidinde en yüksek L değeri çeşme suyu + vermikompost uygulamasında belirlenmiştir (Tablo 4). Yeşili ifade eden negatif a değeri ise en yüksek 2 EC besin çözeltisi uygulanan 'Kireve' çeşidinde tespit edilmiştir. Sarıyı ifade eden pozitif b değeri 23.19 ile 44.95 arasında değişmiştir. Chroma (renk canlılığı) açısından en yüksek değere 'Kireve' 2 EC (51.55) uygulamasında ölçülmüş, 'Cherokee' çeşitlerinde ise renk doygunluğu genel olarak daha düşük çıkmıştır. En düşük Chroma değerleri Cherokee 2 EC + Vermikompost (26.95) ve 'Cherokee' çeşme Suyu (28.73) uygulamalarında tespit edilmiştir. Hue açısı (renk tonu açısı) incelendiğinde ise en yüksek değer 'Cherokee' 2 EC + Vermikompost (120.49) ve 'Kireve' 1 EC + Vermikompost (120.07) uygulamalarında elde edilmiştir. Bu da renk yöneliminin yeşil-sarı arasında daha sarıya yakın olduğunu göstermektedir. Genel olarak değerlendirildiğinde, 'Kireve' çeşidinde EC ve vermikompost uygulamaları renk parametreleri açısından daha yüksek parlaklık, daha yeşil tonlar ve daha canlı renkler oluştururken, 'Cherokee' çeşidinde ise renk doygunluğu ve parlaklık seviyeleri daha düşük kalmıştır. Bu durum, uygulamaların sadece büyüme ve verim üzerinde değil, görsel kalite parametreleri üzerinde de etkili olduğunu göstermektedir (Tablo 4). Bulgularımıza benzer şekilde Korkmaz ve Akıncı (2023), çalışmalarında vermikompostun L, a ve b değerleri üzerine etkisi olduğunu bildirmişlerdir.

Tablo 4. Farklı dozlarda besin solüsyonu ve vermikompost uygulanmış ortamlarda yetiştirilmiş 'Kireve' ve 'Cherokee' marul çeşitlerinde yaprak rengi (L, a ve b), chroma açısı ve hue açısı üzerine etkileri

Uygulamaların 'Kireve've 'Cherokee' çeşitlerinde yaprak öz suyu elektriksel iletkenliği (EC), pH ve suda çözünür kuru madde (SÇKM) değerleri üzerine etkisi istatistiksel olarak anlamlı bulunmuştur ($p<0.05$) (Tablo 5). En yüksek EC değere 2 EC besin çözeltisi + vermikompost uygulanan 'Cherokee' çeşidinde belirlenmiştir. pH değeri 6.28 ile 4.80 arasında değiştiği belirlenmiştir. SÇKM miktarında en yüksek değere çeşme suyu + vermikompost ve çeşme suyu uygulanan 'Cherokee' çeşidinde tespit edilmiştir. Kibar (2018), marulda vermikompost uygulamasının SÇKM miktarının %2.20 ile %4.10 arasında değiştiğini bildirmiştir. Papathanasiou ve ark. (2012), çalışmalarında vermikompostun SÇKM içeriğini artırdığını bildirmişlerdir.

Tablo 5. Farklı dozlarda besin solüsyonu ve vermikompost uygulanmış ortamlarda yetiştirilmiş 'Kireve' ve 'Cherokee' marul çeşitlerinde EC, pH ve suda çözünür kuru madde (SÇKM) üzerine etkileri

İncelenen kök morfolojik özelliklerinden olan kök uzunluğu (cm), hacmi (cm^3) ve kök çapı (mm) parametrelerinde uygulamalar arasında istatistiksel olarak anlamlı fark tespit edilmiştir ($p<0.05$). En yüksek kök uzunluğu 2 EC besin çözeltisi + vermikompost uygulanan 'Kireve' ve 'Cherokee' çeşidinde tespit edilmiştir. En düşük kök hacmi çeşme suyu uygulanan 'Kireve' çeşidinde belirlenmiştir. En yüksek kök çapı ise 1.5 EC + vermikompost uygulanan (0.603 mm) 'Kireve' çeşidinde ölçülmüştür. Diğer uygulamalar arasında istatistiksel olarak farklılıklar gözlenmiş olsa da kök çap değerleri genellikle 0.42–0.60 mm aralığında değişmiştir. Genel olarak hem besin çözeltisi uygulamaları (EC) hem de vermikompost uygulaması, kök gelişimi üzerinde olumlu etkiler göstermiştir. Özellikle bu iki uygulamanın kombinasyonu hem uzunluk hem hacim hem de çap parametrelerinde en yüksek değerlere ulaşılmasını sağlamıştır (Tablo 6). Bhattacharya ve ark. (2025), vermikompost uygulamasının kök morfolojisi üzerine olumlu etkisi olduğunu bildirmişlerdir. Kılıç ve Saraçoğlu (2022), marul çeşitleri arasında en yüksek kök uzunluğunu vermikompost uygulanan Lollo Rosso çeşidinde, Iceberg çeşidinde ise vermikompost uygulamasının etkisi olmadığını bildirmişlerdir. Gutiérrez-Miceli ve ark. (2007) çalışmalarında vermikompostun domates bitkisinde kök uzunluğu ve hacmini artırdığını bildirmişlerdir.

Tablo 6. Farklı dozlarda besin solüsyonu ve vermikompost uygulanmış ortamlarda yetiştirilmiş 'Kireve' ve 'Cherokee' marul çeşitlerinde kök uzunluğu, kök hacmi ve kök çapı üzerine etkileri

Uygulamaların 'Kireve' ve 'Cherokee' çeşitleri üzerine etkisi bakımından incelenen pigment parametreleri sonucunda, Klorofil-a içeriği 0.031 ile 0.215 mg/g arasında değişmektedir. En yüksek klorofil-b değerleri 2 EC + vermikompost (0.130 mg/g) ve 1.5 EC + vermikompost (0.119 mg/g) uygulanan 'Cherokee' çeşidinde ölçülmüştür. En düşük klorofil-b değeri ise çeşme suyu uygulanan 'Kireve' çeşidinde (0.010 mg/g) tespit edilmiştir. Toplam klorofil miktarı (Ka+b) açısından değerlendirildiğinde, en yüksek değerin yine 'Cherokee' çeşidinde 1.5 EC + vermikompost uygulamasında (0.334 mg/g) olduğu belirlenmiştir. Toplam karotenoid miktarları ise 0.004 ile 0.046 mg/g arasında değişmiştir. Karotenoid içeriği bitki yetiştirme solüsyonunun EC içeriğinin artışı ile paralellik göstermektedir. Yapılan uygulamaların hem klorofil hem de karotenoid içeriklerini istatistiksel olarak anlamlı düzeyde etkilediği ve özellikle sıvı besin çözeltisi (EC) ile vermikompostun birlikte uygulanmasının pigment içeriğini artırdığı tespit edilmiştir ($p<0.001$). (Tablo 7). Bizim çalışmamıza benzer şekilde, Gutierrez-Miceli ve ark. (2007), vermikompost uygulamalarının domates bitkisinde klorofil ve karotenoid birikimini artırdığını belirtmişlerdir. Atiyeh ve ark. (2000), çalışmalarında vermikompost uygulanan bitkilerde klorofil içeriğini ve karotenoid sentezini anlamlı derecede arttığını bildirmişlerdir.

4. SONUÇLAR

Bu çalışmada, solucan gübresi (vermikompost) uygulamasının su kültürü (hidroponik) koşullarında iki farklı marul (*Lactuca sativa* L.) çeşidinde bitki gelişimi üzerindeki etkileri değerlendirilmiştir. Elde edilen bulgular, vermikompostun hem çeşme suyu hem de farklı dozlarda besin çözeltisi ile birlikte kullanıldığında bitki gelişimini olumlu yönde etkilediği belirlenmiştir. Özellikle bitki boyu, yaprak sayısı ile yaprak ve kök taze-kuru ağırlıkları gibi morfolojik parametrelerde anlamlı artışlar gözlemlenmiştir.

Araştırmanın sonuçları, vermikompostun içeriğinde yer alan organik madde ile mikro ve makro besin elementlerinin bitki beslenmesini destekleyici bir rol oynadığını ve gelişim üzerinde pozitif etkiler sağladığını göstermektedir. Ayrıca, vermikompost uygulamasının kimyasal gübre ihtiyacını azaltma potansiyeli hem üretim maliyetlerinin düşürülmesi hem de çevresel kirliliğin önlenmesi açısından önemli bir avantaj sunmaktadır. Bu durum, günümüzde giderek önem kazanan sürdürülebilir tarım arayışları bağlamında, vermikompostun hidroponik sistemlerde alternatif veya tamamlayıcı bir besin kaynağı olarak değerlendirilmesini mümkün kılmaktadır.

Sonuç olarak, vermikompostun su kültürü sistemlerinde kullanımı, yalnızca bitki gelişimini desteklemekle kalmayıp, aynı zamanda çevre dostu ve ekonomik üretim modellerine katkı sağlamaktadır. Gelecekte farklı bitki türleri ve çeşitli çevresel koşullarda yapılacak daha kapsamlı ve uzun süreli araştırmalar ile vermikompostun tarımsal üretimdeki potansiyeli daha ayrıntılı bir şekilde ortaya konulabilir. Böylece, sürdürülebilir tarım ilkeleri doğrultusunda organik girdilerin daha etkin ve verimli kullanımı teşvik edilebilecektir.

ABSTRACT

In addition to energy production, biogas plants provide added value through the organic matter-rich by-product generated at the end of the process, which can be used as fertilizer in agricultural production. This study was conducted in a fully automated, geothermal-heated, Venlo-type glass research greenhouse at Kırşehir Ahi Evran University, using a hydroponic cultivation system. In the study, the solid fraction obtained from biogas plants was subjected to a pre-treatment involving aerated soaking in water to facilitate the release of soluble nutrients. The resulting fertilizer tea was then used in hydroponic lettuce cultivation. The aim of the research was to determine the effects of biogas fertilizer tea application on plant growth in lettuce (*Lactuca sativa* L.) cultivars grown under reduced nutrient solution levels. The plant materials used in the study were two lettuce cultivars: Expedition and Cencibel. The experimental treatments were as follows: (1) tap water only, (2) tap water + biogas fertilizer tea, (3) 2 EC nutrient solution, (4) 2 EC nutrient solution + biogas fertilizer tea, (5) 1.5 EC nutrient solution + biogas fertilizer tea, and (6) 1 EC nutrient solution + biogas fertilizer tea. The plants were grown for 30 days in an aerated hydroponic system. After harvest, various morphological and physiological characteristics were evaluated, including leaf fresh and dry weight, root fresh and dry weight, head diameter, head height, number of leaves, leaf color parameters (L, a, b*), color saturation (chroma), hue angle, leaf chlorophyll a, chlorophyll b, total chlorophyll and total carotenoid contents, leaf sap EC and pH, soluble solid content, root length, root diameter, and root volume. According to the findings, the highest values for leaf and root fresh and dry weights, head diameter, and head height were obtained from the treatment involving 2 EC nutrient solution supplemented with biogas fertilizer tea. In conclusion, the use of biogas fertilizer tea in combination with a reduced nutrient solution had positive effects on the

morphological and physiological development of lettuce plants grown in a hydroponic system. This approach contributes to reducing fertilizer use and presents a promising alternative for organic production systems within the framework of sustainable agriculture.

Keywords: biogas fertilizer tea, lettuce, hydroponic, plant growth

AZALTILMIŞ BESİN ÇÖZELTİSİ İLE BİRLİKTE UYGULANAN BİYOGAZ TESİSLERİNDEN ELDE EDİLMİŞ KATI GÜBRE ÇAYININ SU KÜLTÜRÜNDE MARUL GELİŞİMİNE ETKİSİ

ÖZET

Biyogaz tesisleri enerji üretiminin yanı sıra, işleme sonunda ortaya çıkan organik maddece zengin tarımsal üretimde gübre olarak kullanılabilen atık ile de fayda sağlamaktadır. Bu çalışma, Kırşehir Ahi Evran Üniversitesi'ne ait tam otomasyonlu, jeotermal ısıtmalı Venlo tip cam Ar-Ge serasında, hidroponik yetiştirme sistemi kullanılarak yürütülmüştür. Bu çalışmada, biyogaz tesislerinden elde edilen katı faz materyalde bulunan çözünür besin elementlerinin suya geçişini sağlamak amacıyla havalandırmalı su ortamında ön işlem uygulanmıştır. Ön işlem sonucunda elde edilen katı gübre çayı, hidroponik sistemde marul yetiştiriciliğinde besin çözeltisi olarak değerlendirilmiştir. Çalışmanın amacı, katı gübre çayı uygulamasının, azaltılmış düzeyde besin çözeltisi verilen marul (*Lactuca sativa* L.) çeşitlerinde bitki gelişimi üzerindeki etkilerini belirlemektir. Araştırmada bitkisel materyal olarak Expedition ve Cencibel marul çeşitleri kullanılmıştır. Deneme konuları şunlardır: (1) yalnızca çeşme suyu, (2) çeşme suyu + katı gübre çayı, (3) 2 EC besin çözeltisi, (4) 2 EC besin çözeltisi + katı gübre çayı, (5) 1.5 EC besin çözeltisi + katı gübre çayı, (6) 1 EC besin çözeltisi + katı gübre çayı. Bitkiler, havalandırmalı durgun su kültüründe 30 gün süreyle yetiştirilmiştir. Hasat sonrası bitkilerde; yaprak taze ve kuru ağırlığı, kök taze ve kuru ağırlığı, baş çapı, baş boyu, yaprak sayısı, yaprak renk parametreleri (L, a, b*), renk doygunluğu (chroma), renk tonu (hue açısı), yaprak klorofil a, klorofil b, toplam klorofil ve toplam karotenoid içerikleri, yaprak öz suyu EC ve pH değeri ile suda çözünür kuru madde miktarı, kök uzunluğu, kök çapı ve kök hacmi gibi çeşitli morfolojik ve fizyolojik özellikler belirlenmiştir. Elde edilen bulgulara göre; yaprak ve kök taze-kuru ağırlıkları, baş çapı ve baş boyu bakımından en yüksek değerler, 2 EC'lik besin çözeltisine katı gübre çayının ilave edildiği uygulamadan elde edilmiştir. Sonuç olarak, katı gübre çayının azaltılmış düzeydeki besin çözeltisi ile birlikte kullanımı, hidroponik sistemde yetiştirilen marul bitkilerinin morfolojik ve fizyolojik gelişimi üzerinde olumlu etkiler göstermiştir. Bu uygulama, gübre kullanımının azaltılmasına katkı sağlamakta ve sürdürülebilir tarım kapsamında organik üretim sistemlerine yönelik önemli bir alternatif sunmaktadır.

Anahtar Kelimeler: biyogaz gübre çayı, marul, su kültürü, bitki gelişimi

1.GİRİŞ

Su kültürü (Hidroponik), bitki büyümesini desteklemek için bir besin çözeltisi ve yapay bir köklendirme substratı içeren topraksız bir tarım tekniğidir (Kumar ve Cho, 2014) Hidroponik sistemler çoğunlukla çevrenin kontrol edilebildiği ve bitkisel üretimin yıl boyunca gerçekleşebildiği seralarda kullanılır (Lee ve Lee, 2015) Bu koşullar altında, toprak kökenli hastalık zararlı riskleri azaldığı gibi infiltrasyonla ve evaporasyonla da kayıp olmadığı için su ve besin elementleri kullanım etkinliği bakımından toprakta yapılan yetiştiriciliğe göre üstün yönlerinden dolayı sürdürülebilir, çevreci ve daha verimli bir tarımsal üretim metodudur (Surendran ve ark., 2017; Tomasi ve ark., 2015).

Hidroponik sistemlerde organik gübrelerin kullanımı, inorganik gübrelerin yüksek maliyeti, kimyasallardan kaynaklı çevre kirliliği problemleri, halk sağlığı bilincinin artması ve birçok çiftçinin kimyasallardan sıvı organik gübrelere geçmesi nedeniyle tercih edilen bir alternatif haline gelmiştir. Ancak organik kökenli gübrelerle yetiştiricilikte inorganik gübrelerle yetiştirilenlere benzer bitki verimleri elde etmenin daha zor olması, besin çözeltilerini dengelemenin sorunlu olması ve çözeltilerin pH ve elektriksel iletkenliğinin (EC) önemli ölçüde dalgalanması nedeniyle bir zorluk olmaya devam etmektedir (Amir ve ark, 2022)

Biyogaz katı gübresi, hayvan gübresi ve bitkisel atıkların fermantasyonundan elde edilen biyogaz üretiminin bir yan ürünü olup, yaygın olarak bulunur ve ucuzdur. Birçok biyogaz işletmesinde aşırı miktarda biyogaz proses atıkları ortaya çıkmakta ve bu atıklar düzgün yönetilmezse yeni bir çevre sorunu haline gelmektedir (Nyord ve ark., 2012). Biyogaz katı gübresi bol miktarda organik madde, bitkilerin ihtiyaç duyduğu besin maddeleri ve bazı biyoaktif maddeler içerdiğinden genellikle doğrudan toprağa veya mineral gübrelerle birlikte organik gübre olarak uygulanır. Böylece çevre kirliliğinin önüne geçilirken, tarımsal verim artışı da sağlanmaktadır (Abubaker ve ark., 2012)

Hidroponik tarımda yetiştiriciliği yapılan en popüler türlerden biri maruldur (*Lactuca sativa* L.). Marul besleyici özelliği olmayan, düşük kalorili, fakat iştah açıcı özelliği sebebiyle, sofralarımızın vazgeçilemeyen bir salata sebzesidir. Terpenoidler, flavonoidler ve fenoller gibi sekonder metabolitlerin varlığı nedeniyle eski zamanlardan beri mide sorunları, iltihaplanma, ağrı ve idrar yolu enfeksiyonları dahil olmak üzere farklı rahatsızlıklar için bir ilaç olarak kullanılmıştır (Mulabagal ve ark., 2010). Bu yönüyle marul, fonksiyonel gıda olarak öne çıkmaktadır. Dünya marul üretimi 2023 verilerine göre toplam 28.084.971 ton, Türkiye üretimi ise 602.848 ton olarak gerçekleşmiştir (FAO, 2023; TÜİK, 2023). Fonksiyonel gıdaların öneminin anlaşılması, marula olan talebi artırmaktadır. Toprakta yetiştiricilikte marul üretim döngüsü yaklaşık 70 gün kadarken, hidroponik kültürde bu sürenin 30 güne düşmesi nedeniyle, örtü altında özellikle de su kültüründe marul yetiştiriciliği giderek yaygınlaşmaktadır.

Bu çalışmada, biyogaz tesislerinin proses atığı olan katı gübreden elde edilen çayın, su kültüründe yetiştirilen marulun verim ve kalitesi üzerine etkisi araştırılmıştır.

2. MATERYAL VE YÖNTEM

2.1. Materyal

Çalışmada Rijk Zwaan tohum şirketinin *Lactuca sativa* L. var. *crispa* türüne ait Cencibel (Koyu kırmızı (triple) renkli lollo rossa) ve Expedition (Küçük yapraklı, kıvırcık tip, yeşil renk) marul çeşitleri bitkisel materyal olarak kullanılmıştır.

2.2. Yöntem

Çalışma, Kırşehir Ahi Evran Üniversitesi'nin tam otomasyonlu (fan-ped soğutma, yüksek basınçlı sisleme, ısı perdesi, sirkülasyon fanı ve jeotermal ısıtmalı) venlo tipi cam Ar-Ge serasında yürütülmüştür. Tohumlar torf ve perlit (2:1) içeren yetiştirme ortamının doldurulduğu viyollere ekilmiştir (05/01/2025). Viyollerde 4-5 gerçek yaprak aşamasına gelen fidelerde kökler yıkanarak yetiştirme ortamından arındırılmış ve 136 lt'lik plastik saksılara besin solüsyonu doldurularak, saksı üzerine yerleştirilen sıra arası ve üzeri eşit ayarlanmış deliklere sahip kompozit levhalara sünger yardımıyla dikilmiştir (13/02/2025). Saksılara 9'ar adet fide dikilmiş ve besin solüsyonu hava pompası ile düzenli olarak havalandırılmıştır. Çalışmada her uygulama 3 tekerrürlü ve her tekerrürde 3 bitki bulunmaktadır. Standart besin solüsyonu (2 dS/m Hoagland çözeltisi), 1500 µM $Ca_2(NO_3)$, 750 µM K_2SO_4, 650 µM $MgSO_4$, 500 µM KH_2PO_4, 10 µM H_3BO_3, 0,5 µM $MnSO_4$, 0.5 µM $ZnSO_4$, 0.4 µM $CuSO_4$, 0.4 µM $MoNa_2O_4$ ve 80 µM Fe EDDHA içerecek şekilde hazırlanmıştır.

Çalışmada kullanılan biyogaz tesislerinden elde edilen katı proses atığı, en az bir yıl açık arazide kompostlanmıştır. Daha fazla nem, besin ve faydalı mikroorganizma içerdiği varsayılarak kompost yığınının alt tarafından 15 kg katı gübre alınmıştır. Plastik saksı içerisine konulan katı gübre üzerine, 100 lt su ve 200 ml melas eklenerek, yarım saatte bir 2 dk hava verilerek 3 gün demlenmeye bırakılmıştır. Elde edilen katı gübre çayının (KGÇ) EC düzeyi 4 dS/m olarak belirlenmiştir. Süzdürülerek katı fazdan ayrılan KGÇ (sıvı faz), azaltılmış çözelti uygulanan saksılara yirmişer litre eklenmiş ve KGÇ eklenen çözeltilerin EC düzeyini 0.5 dS/m kadar artırmıştır. Bir ayın sonunda hasat edilen (13/03/2025) marullarda morfolojik ve fizyolojik ölçümler yapılmıştır. Çalışmadaki uygulamalar; 1) Çeşme Suyu, 2) Çeşme Suyu + katı gübre çayı (KGÇ), 3) 2 EC'lik Besin Solüsyonu, 4) 2 EC'lik Besin Solüsyonu + KGÇ, 5) 1.5 EC'lik Besin Solüsyonu + KGÇ, 6) 1 EC'lik Besin Solüsyonu + KGÇ olmak üzere 6 konudan oluşmaktadır.

2.3. Denemede Yapılan Ölçümler

Hasattan sonra kök ve yaprak taze ve kuru ağırlıkları (g/bitki) 0.01 hassasiyetindeki dijital terazi ile belirlenmiştir. Kuru ağırlıkları belirlemek amacıyla kök ve yaprak örnekleri, sabit ağırlığa ulaşıncaya kadar 65°C'ye ayarlanmış etüvde kurutulduktan sonra tartılmıştır. Baş boyu ve çapı cetvel (cm) ile gövde çapı ise kumpas (mm) ile ölçülmüştür. Yaprak rengi ise Konica Minolta CR 200 renkölçer ile L, a ve b değerleri olarak belirlenmiştir. Ölçülen temel 3 renk parametresi (L, a, b) kullanılarak, bitki örneklerinde chroma ve hue açısı değerleri de hesaplanmıştır (Iqdiam ve ark., 2018). Hasat edilen marullarda yapraklar sayılarak toplam yaprak sayısı belirlenmiştir.

Bitkinin genelini temsil edecek şekilde seçilen yapraklardan katı meyve sebze sıkacağı yardımıyla çıkarılan bitki özsuyunda, elektriksel iletkenlik (EC) ve pH değerleri, Extech marka EC ve pH ölçer cihazı kullanılarak belirlenmiştir. Suda çözünmüş katı madde miktarı (SÇKM) ise Hanna HI96801 model dijital refraktometre ile ölçülmüştür. Bitkilerin kök uzunluğu, kök taze ağırlığı kaydedildikten sonra, WinRHIZO (Win/Mac RHIZO Pro V. 2002c, Regent Instruments Inc., Kan Win/Mac RHIZO Pro V. 2002c Regent Instruments Inc., Québec, QC G1V 1V4, Kanada) yazılım programı kullanılarak ölçülmüştür. Yaprak pigment düzeyini belirlemek amacıyla her uygulama için yapraklardan 1.5 cm çapında diskler alınıp 3 ml, %80'lik aseton içerisinde homojenize edilerek 24 saat bekletildikten sonra UV-Vis spektrofotometre de 470 nm, 648.6 nm ve 664.2 nm dalga boylarında ölçümler yapılmıştır. Yaprak klorofil (a, b ve toplam klorofil) ve karotenoid içerikleri, (Lichtenthaler, 1987), tarafından açıklanan formüller kullanılarak spektrofotometrik yöntemle belirlenmiştir.

2.4. İstatistiksel Analiz

Çalışmadan elde edilen veriler, %5 önem seviyesinde Minitab Statistical Software 22 (United Kingdom) programı kullanılarak analiz edilmiştir. Verilerin değerlendirilmesinde tek yönlü varyans analizi (ANOVA) uygulanmış ve ortalamalar arasındaki farklar Duncan çoklu karşılaştırma testi ile belirlenmiştir.

3.BULGULAR VE TARTIŞMA

Besin solüsyonu dozları ve katı gübre çayı uygulanmış ortamlarda yetiştirilen marul çeşitlerinde en yüksek yaprak taze ağırlığı 2 EC+KGÇ (124.20 g) uygulamasında yetiştirilen Expedition çeşidinde belirlenirken, en düşük ise yine aynı çeşitte çeşme suyu (6.20 g) uygulamasında belirlenmiştir (Tablo 1). Yaprak kuru ağırlıkları sonuçları, yaprak taze ağırlıkları sonuçları ile paralellik göstermektedir. En yüksek kök taze ve kuru ağırlığı, yaprak taze ve kuru ağırlık parametrelerinde olduğu gibi 2 EC+KGÇ uygulamasında Expedition çeşidinde elde edilmiştir. En düşük kök taze ve kuru ağırlık değerleri ise Cencibel çeşidinin çeşme suyu uygulamasında elde edilmiştir. Besin solüsyonu ve KGÇ uygulamasının, EC düzeyindeki artışa paralel olarak biyokütle artışı sağladığı görülmektedir. Hindi, tavuk ve inek gübresinden elde edilen gübre çaylarının hidroponik marul yetiştiriciliğinde etkilerini belirlemek amacıyla yapılan bir çalışmada, en yüksek yaprak taze ve kuru ağırlıklarının, hindi gübresi solüsyonunda (50 g/L) yetiştirilen marulda elde edildiği bunu Hoagland çözeltisinde yetiştirilen marulun izlediği belirtilmiştir (Tikasz ve ark., 2019). Tavuk gübresinden elde edilen sıvı gübrenin hidroponik sisteme entegre edilmesiyle oluşturulan bir marul denemesinde, yaprak taze ve kuru ağırlığı ile kök taze ve kuru ağırlığı en yüksek ticari besin solüsyonu ve tavuk gübresi çayının ayrı ayrı uygulandığı bitkilerden elde edilmiştir (Torres ve ark., 2024).

Tablo 8. Besin solüsyonu dozları ve katı gübre çayı uygulanmış ortamlarda yetiştirilmiş " Expedition ve Cencibel" marul çeşitlerinde yaprak ve kök taze-kuru ağırlıkları üzerine etkileri

Çeşit	Uygulama	Yaprak Taze Ağırlık (g)	Yaprak Kuru Ağırlık (g)	Kök Taze Ağırlık (g)	Kök Kuru Ağırlık (g)

***KGÇ:**Katı Gübre Çayı

Gövde çap ve boyu bakımından en düşük değerler her iki çeşitte de çeşme suyu uygulamalarında, en yüksek değerler ise 2 EC+KGÇ uygulanan Expedition ve Cencibel çeşitlerinde belirlenmiştir (Tablo 2). Her iki çeşitte de en az yaprak sayısı çeşme suyu uygulanan Cencibel (7.67 adet/bitki) ve Expedition (16.67 adet/bitki) çeşitlerinde elde edilmiştir. Expedition çeşidinde KGÇ eklenmesiyle, besin solüsyonu dozlarındaki azalışa rağmen yaprak sayısında kontrol grubuna kıyasla (2 EC) istatistiksel olarak fark tespit edilmemiştir. Uygulamalar arasındaki fark $p<0.001$ düzeyinde istatistiksel olarak önemlidir. Kök ve yaprak parametrelerinde olduğu gibi gövde çap ve boyu da besin solüsyonlarının EC düzeyi ile paralellik göstermiştir. Farklı hayvansal gübrelerden elde edilen gübre solüsyonlarının marul ve lahanada verim ve kalite üzerine etkilerini belirlemek amacıyla yapılan çalışmada marul için en yüksek ortalama yaprak sayısı, hindi gübresi (50 g/L) solüsyonunda belirlenmiş, (10.5 ± 0.4 yaprak/bitki), ardından en yüksek yaprak sayısı Hoagland solüsyonun da (7.3 ± 0.1 yaprak/bitki) belirlemişlerdir (Tikasz ve ark., 2019). Hidroponik marul üretiminde farklı dozlarda tavuk gübresi uygulamalarının (200 g, 300 g ve 400 g) incelendiği başka bir çalışmada, gübre oranının artırılmasının bitki verimini artırdığı belirtilmiştir (Wongkiew ve ark., 2021).

Tablo 9. Besin solüsyonu dozları ve katı gübre çayı uygulanmış ortamlarda yetiştirilmiş "Expedition ve Cencibel" marul çeşitlerinde gövde çap, boy ve yaprak sayısı üzerine etkileri

Çeşit	Uygulama	Gövde Çapı (cm)	Gövde Boyu (cm)	Yaprak Sayısı (adet/bitki)

Kök gelişim parametreleri bakımından çeşitler ve uygulamaların etkisi birlikte değerlendirildiğinde, en yüksek kök uzunluk, hacim ve çapı 2 EC+KGÇ uygulamasında Expedition çeşidinde (Şekil 1) belirlenmiştir (Tablo 3). Cencibel çeşidinde (Şekil 2) ise azaltılmış besin solüsyonuna KGÇ eklenmesi kök uzunluğu, hacmi ve çapını olumlu yönde etkilemiştir. Her iki çeşitte de en düşük kök parametreleri çeşme suyu uygulamasında belirlenmiştir. Uygulamalar arasındaki fark $p<0.01$ önem düzeyinde istatistiksel olarak önemlidir. Tavuk gübresinden elde edilen biyogaz işletmesi sıvı proses atıklarının hidroponik marul yetiştiriciliğinde etkilerini belirlemek amacıyla yapılan çalışmada standart Hoagland çözeltisine ek olarak sıvı biyogaz gübresinin de kullanılması kök yaş ve kuru ağırlığı ile kök uzunluk ve hacminde en yüksek değerlerin elde edilmesini sağlamıştır (Wang ve ark., 2019).

Tablo 10. Besin solüsyonu dozları ve katı gübre çayı uygulanmış ortamlarda yetiştirilmiş "Expedition ve Cencibel" marul çeşitlerinde kök uzunluğu, kök hacmi ve kök çapı üzerine etkileri

Yeşil yapraklı olarak tanımlanan Expedition çeşidi ve koyu kırmızı yapraklı olarak tanımlanan Cencibel çeşidi klorofil ve karotenoid bakımından incelendiğinde, en düşük klorofil a, klorofil

b ve toplam klorofil değeri çeşme suyu uygulanan Expedition çeşidinde, en düşük karotenoid değeri ise çeşme suyu uygulanan Cencibel çeşidinde belirlenmiştir (Tablo 5). En yüksek klorofil a değeri 2 EC çözelti+KGÇ uygulamasında Cencibel çeşidinde, en yüksek klorofil b ve toplam klorofil değeri 1.5 EC çözelti+KGÇ uygulamasında Expedition çeşidinde tespit edilmiştir. En yüksek toplam karotenoid içeriği de Expedition çeşidinde 2 EC'lik çözelti (kontrol) uygulamasında (0.059) belirlenmiştir. Uygulamalar arasındaki fark $p<0.001$ düzeyinde istatistiksel olarak önemlidir. Wang ve ark., (2019), tavuk gübresinden elde edilen biyogaz sıvı proses atığının hidroponik marul yetiştiriciliğinde etkisini araştırdıkları çalışmada, biyogaz sıvı gübresi ve mineral gübrenin birlikte kullanıldığı uygulamada marul yapraklarının renginin, Hoagland çözeltisi uygulanan bitkilere göre daha koyu olduğunu bildirmişlerdir. Ayrıca klorofil a ve toplam klorofil konsantrasyonlarının da diğer uygulamalardakilerden önemli ölçüde daha yüksek olduğunu belirtmişlerdir.

Tablo 12. Besin solüsyonu dozları ve katı gübre çayı uygulanmış ortamlarda yetiştirilmiş "Expedition ve Cencibel" marul çeşitlerinde klorofil-a, klorofil-b, toplam klorofil ve karotenoid üzerine etkileri

Yapraklardan elde edilen bitki özsuyunda yapılan ölçümler değerlendirildiğinde Expedition çeşidinde en düşük EC, pH ve SÇKM değerleri çeşme suyu uygulamasında elde edilmiştir (Tablo 6). Cencibel çeşidinde, en yüksek pH değeri çeşme suyu uygulamasında belirlenmiştir.

En düşük SÇKM değeri ise çeşme suyu ve 2 EC çözelti (kontrol) uygulamalarında Expedition çeşidinde belirlenmiştir. En yüksek EC değeri 2 EC çözelti (kontrol) uygulamasında Expedition çeşidinde, en yüksek pH değeri 2 EC çözelti (kontrol) uygulamasında Expedition çeşidinde ve 1.5 EC çözelti+KGÇ uygulamasında Cencibel çeşidinde, en yüksek SÇKM değeri 2 EC çözelti+KGÇ uygulamasında Cencibel çeşidinde belirlenmiştir. Uygulamaların EC, SÇKM ($p<0.01$) ve pH ($p<0.05$) üzerindeki etkisi istatistiksel olarak önemlidir. Sarkar ve ark., 2021, kokopit, çeltik kavuzu ve talaşın farklı oranlarından oluşan organik substratlarda yetiştirilen marulda pH'nın 6.04-6.38, SÇKM'nin ise %5.44-5.90 arasında değiştiğini bildirmişlerdir.

Tablo 13. Besin solüsyonu dozları ve katı gübre çayı uygulanmış ortamlarda yetiştirilmiş "Expedition ve Cencibel" marul çeşitlerinde EC, pH ve suda çözünür kuru madde (SÇKM) üzerine etkileri

4.SONUÇ VE ÖNERİLER

Bu çalışmada, durgun su kültüründe azaltılmış besin çözeltisine katı gübre çayının (KGÇ) ilavesinin iki marul çeşidinde (Cencibel RZ ve Expedition RZ) verim ve kalite üzerindeki etkileri araştırılmıştır. Elde edilen sonuçlar, KGÇ kullanımının her iki çeşidin biyokütle parametrelerini pozitif etkilemiştir.

Yaprak taze ve kuru ağırlıkları, kök taze ve kuru ağırlıkları, gövde çapı ve boyu gibi temel morfolojik parametreler, KGÇ ilavesi yapılan uygulamalarda çeşme suyu uygulamasına kıyasla anlamlı düzeyde artmıştır. Özellikle 2 EC Hoagland çözeltisi+KGÇ uygulaması Expedition çeşidinde en yüksek verim değerlerine ulaşılmasını sağlamıştır. Renk parametreleri

incelendiğinde, KGÇ kullanımının özellikle klorofil ve karotenoid içeriklerini artırarak yaprak renginin canlılığını olumlu etkilediği görülmüştür.

Bitki özsuyu analizleri sonucunda, EC, pH ve SÇKM değerlerinde KGÇ katkısının dengeli bir artış sağladığı, bu durumun da bitkilerin daha iyi beslenmesini ve metabolik aktivitelerini desteklediği anlaşılmaktadır.

Çalışmanın genel sonuçlarına göre, doğru oranda ve yöntemle uygulanan KGÇ, durgun su kültüründe marul yetiştiriciliğinde verim ve kaliteyi artırmak için etkili bir biyolojik girdi olarak değerlendirilebilir. Özellikle organik ve sürdürülebilir tarım uygulamalarının öneminin arttığı günümüzde, biyogaz tesislerinden elde edilen katı organik atıklar gibi yenilenebilir kaynakların bitkisel üretimde kullanılması hem çevresel etkileri azaltmakta hem de üretimde ekonomik avantajlar sağlamaktadır.

ABSTRACT

The field of gastronomy has witnessed a paradigm shift from a focus on mere taste and nutrition to a broader understanding of food as a multisensory experience. This review paper explores the expanding landscape of multisensory gastronomy, drawing upon insights from neuroscience, psychology, design, and culinary arts. It synthesizes existing literature on how visual presentation, olfactory cues, auditory stimuli, tactile sensations, and taste interact to shape the perception of food and enhance the dining experience. Emerging research in neurogastronomy and crossmodal perception reveals that sensory integration significantly influences not only how food is evaluated but also how it is remembered and emotionally processed. Techniques used in molecular gastronomy and avant-garde dining demonstrate how manipulating sensory elements can elevate food consumption into an immersive, artistic, and even therapeutic act. This paper examines various methodologies employed in recent studies, from experimental setups in controlled environments to real-world applications in high-end restaurants. Additionally, the review highlights the cultural and emotional dimensions of sensory dining, such as food memories, storytelling, and the role of atmosphere. Key contributions from leading chefs, designers, and researchers are discussed to illustrate how multisensory gastronomy is being used to evoke emotions, tell stories, and create meaning beyond the plate.

By analyzing interdisciplinary findings and identifying gaps in current research, this paper offers a comprehensive overview of how multisensory experiences are redefining modern gastronomy. It also discusses future directions and implications for culinary practice, hospitality design, and sensory studies.

Keywords: Multisensory Gastronomy, Neurogastronomy, Crossmodal Perception, Culinary Innovation, Sensory Integration, Molecular Gastronomy, Experiential Dining, Emotional Response, Food Aesthetics, Gastronomic Design, Culinary Storytelling, Dining Psychology

Introduction

Gastronomy, in its traditional form, has been largely confined to the domains of taste and nutrition, often evaluated by the flavors and nutritional value of the food consumed. For centuries, the primary concern of culinary traditions revolved around satisfying hunger and ensuring health, with taste emerging as a key marker of culinary excellence. However, the landscape of gastronomy has undergone a profound transformation in recent decades. Influenced by advancements in culinary arts, neuroscience, psychology, and sensory design, the perception of food has expanded far beyond the boundaries of the palate. Today, food is increasingly understood as a multisensory experience that engages all five senses—sight, smell, sound, touch, and taste—simultaneously, creating a holistic and immersive interaction between the diner and the dish.

This evolution signifies a broader cultural and scientific shift, recognizing that the act of eating is deeply rooted in perception, emotion, and memory. Visual aesthetics, olfactory signals, auditory cues, and tactile sensations interplay with gustatory signals to form a complete gastronomic experience. The way food is plated, the aroma that wafts from the kitchen, the textures that meet the fingertips and the mouth, and even the sounds of the dining environment—all contribute significantly to how food is perceived, evaluated, and remembered.

Multisensory gastronomy thus stands at the intersection of art and science, blending empirical research with creative experimentation. It reimagines the dining table as a stage where chefs become storytellers and sensory architects, crafting experiences that go beyond nourishment to evoke emotions, trigger memories, and forge meaningful connections. Food becomes not just sustenance, but a powerful medium of communication and sensory exploration, capable of eliciting joy, nostalgia, surprise, and wonder. This new understanding invites diners to engage more consciously with their meals, transforming ordinary consumption into an extraordinary, multi-dimensional event.

The Science of Multisensory Perception

The experience of food is far more intricate than a simple act of tasting. Emerging research in the fields of neurogastronomy and crossmodal perception underscores that eating is fundamentally a multisensory event, shaped by the complex interplay of various sensory modalities. Each sense contributes uniquely to how food is perceived, evaluated, and remembered, creating a dynamic and richly textured dining experience.

Visual presentation serves as the initial gateway to the dining experience. Before any bite is taken, the eye judges the meal, setting expectations that profoundly influence flavor perception. Studies have demonstrated that attributes such as color, shape, symmetry, and even the arrangement of food on a plate can significantly alter how we perceive taste and quality. For instance, vibrant colors may enhance the perceived freshness or sweetness of food, while aesthetically pleasing symmetrical designs may prime diners to expect a more enjoyable or "clean" taste. The psychology behind visual food aesthetics reveals that sight primes the brain to anticipate certain flavors, ultimately modulating the actual sensory experience.

Olfactory cues—the scents that emanate from food—are equally, if not more, critical to flavor perception. Research suggests that approximately 80% of what we describe as "taste" is actually smell. The aroma of a dish reaches the olfactory receptors even before tasting begins, activating neural pathways associated with memory and emotion. A whiff of fresh-baked bread or sizzling spices can evoke vivid memories, stimulate appetite, and set emotional tones for the meal. This intimate relationship between smell, memory, and emotion highlights the olfactory system's pivotal role in constructing rich and meaningful gastronomic experiences.

Auditory stimuli, although often overlooked, also exert a profound influence on the enjoyment of food. The crunch of a crisp apple, the sizzle of a steak, or the background music in a restaurant creates a sonic landscape that subtly shapes perception. Research in sonic seasoning—the study of how sound influences taste—demonstrates that certain types of sounds can enhance specific taste qualities. High-pitched sounds, for example, have been found to intensify sweetness, whereas lower-pitched sounds may amplify bitterness. The sound environment, whether it's lively chatter or curated music, can affect not only the flavors perceived but also the tempo of eating and the overall emotional tone of the meal.

Tactile sensations—encompassing both the textures experienced within the mouth (mouthfeel) and the textures of utensils or serving ware—further contribute to the multisensory dining experience. The creaminess of a sauce, the crispiness of a pastry, the roughness of a rustic plate, or the smoothness of fine porcelain all interact with the diner's somatosensory system, adding layers of information that influence overall perception. Tactile experiences can even alter how flavors are interpreted; for instance, a rough-textured plate may unconsciously prime the diner to perceive the food as heartier or more robust.

Finally, taste—while central—is rarely experienced in isolation. Basic tastes such as sweet, sour, salty, bitter, and umami are constantly modulated by the concurrent inputs from the other senses. A strawberry may taste sweeter if it looks vividly red, smells fragrant, and is accompanied by harmonious, pleasant music. This synchrony among sensory elements creates a holistic, integrated experience rather than a series of isolated sensory events.

Understanding the science of multisensory perception thus opens doors to new culinary innovations and more profound dining experiences. It reveals that what we eat is not simply assessed by the tongue, but by the entire body and mind, woven together in an intricate, multisensory dialogue.

Techniques and Innovations in Multisensory Dining

The evolution of modern gastronomy has been significantly shaped by pioneering movements such as molecular gastronomy and avant-garde dining, where chefs blend culinary artistry with scientific inquiry to craft profoundly novel experiences. These approaches deliberately manipulate the senses, challenging diners' expectations and enriching the emotional and cognitive dimensions of eating.

Molecular gastronomy, a term popularized by physicist Nicholas Kurti and chemist Hervé This, involves the application of scientific techniques to cooking processes, enabling unprecedented transformations in food texture, appearance, and flavor. Techniques like spherification—

encasing liquids within a thin gel membrane to resemble caviar—offer unexpected tactile sensations. Edible foams and airs, created through emulsification, concentrate aromas and flavors into delicate structures, allowing the diner to "taste" aromas in a more ethereal form. Similarly, the manipulation of temperature contrasts, such as serving a cold dish that visually appears hot, or vice versa, creates a surprising dissonance that heightens awareness and invites playful interaction with the food.

Interactive plating further exemplifies this philosophy by engaging diners not just as consumers but as participants. Dishes may require the diner to assemble components, pour sauces, or even engage with aromas released at the moment of serving. These practices amplify sensory involvement and foster a deeper emotional investment in the dining experience.

World-renowned restaurants like Heston Blumenthal's *The Fat Duck* and Grant Achatz's *Alinea* epitomize the application of crossmodal strategies in gastronomy. Blumenthal's use of audio, such as the iconic "Sound of the Sea" dish where diners listen to ocean waves while tasting seafood, demonstrates how sound can intensify flavor perception and transport diners emotionally to a coastal setting. Achatz, known for his theatrical presentations, incorporates elements such as edible balloons filled with helium, aromatic pillows that release scents during the meal, and ever-evolving plating styles that integrate sight, scent, sound, touch, and taste into a cohesive sensory narrative.

These innovations demonstrate that dining can transcend its traditional role of nourishment to become a fully immersive, experiential art form. Food is no longer merely consumed—it is experienced, contemplated, and emotionally resonated with. The use of scientific techniques in crafting multisensory experiences elevates the act of dining into a performative encounter, where memory, emotion, and sensation converge. In doing so, these techniques challenge diners to reconsider their relationship with food, encouraging greater mindfulness, curiosity, and joy.

Emotional and Cultural Dimensions

Food possesses an unparalleled ability to tap into human memory and emotion, acting as a conduit between the senses and the deeper layers of personal and collective experience. Multisensory dining strategically leverages these connections, creating experiences that evoke nostalgia, wonder, curiosity, comfort, or even playful confusion, thereby transforming meals into emotionally resonant journeys.

One of the most powerful aspects of multisensory dining is its ability to awaken food memories—emotionally charged recollections associated with taste, smell, or even the sound and texture of a particular dish. A single bite can transport a diner back to a childhood meal, a family gathering, or a long-forgotten cultural tradition. By deliberately designing dishes to trigger these responses—whether through familiar aromas, evocative textures, or storytelling elements—chefs can curate not just a meal, but a deeply personal emotional experience.

Culinary storytelling takes this a step further by using the plate as a narrative medium. Every component of the dish—its color palette, arrangement, aroma, accompanying sounds, and textures—contributes to a larger story arc, guiding the diner through emotional highs and lows. For instance, a course might start with bright, vibrant flavors evoking youthful joy, transition

into earthy, grounded tastes symbolizing maturity, and conclude with sweet, ethereal notes suggesting memory and nostalgia. In this approach, dining becomes akin to attending a theatrical performance or reading a novel—an immersive narrative that unfolds through the senses.

Beyond personal memories, cultural context plays a fundamental role in shaping multisensory gastronomic experiences. Sensory perception is not universal; it is deeply influenced by cultural norms, traditions, and collective histories. Rituals like the Japanese tea ceremony, the Indian festival meals served on banana leaves, or the communal breaking of bread in many Middle Eastern cultures demonstrate that multisensory integration has long been a cornerstone of gastronomy, even before the phenomenon was scientifically studied. These practices often integrate visual presentation, aroma, tactile elements (such as eating with hands), and communal sounds, crafting shared sensory experiences that reinforce cultural identity and community bonds.

In multicultural settings, multisensory dining also becomes a bridge for cross-cultural storytelling, allowing chefs to evoke and honor diverse traditions while inviting diners into new sensory worlds. Respectful fusion cuisine, thematic dining experiences, and reinterpretations of heritage dishes all serve as examples of how multisensory elements can be used to celebrate, preserve, or reimagine cultural narratives through food.

Thus, the emotional and cultural dimensions of multisensory gastronomy reveal that eating is not merely a biological act; it is a deeply human experience, rooted in memory, emotion, and shared cultural meanings. Recognizing and harnessing these dimensions allows culinary artists to create meals that nourish not just the body, but the soul.

Methodologies in Research

Research in multisensory gastronomy draws upon a wide range of interdisciplinary methodologies, combining techniques from psychology, neuroscience, sensory science, and design studies to unravel the complex interplay between the senses during eating experiences.

In controlled laboratory experiments, researchers often isolate individual sensory variables—such as color, aroma, texture, or sound—to observe their independent and combined effects on flavor perception, emotional responses, and memory formation. These studies frequently use blind or double-blind setups to minimize bias, presenting participants with systematically varied stimuli to gauge their subjective experiences. For example, participants might taste identical foods presented in different colored plates to assess how color influences perceived sweetness or freshness.

Simultaneously, real-world applications are crucial for understanding multisensory gastronomy in more naturalistic settings. Experiments conducted in restaurants, pop-up events, food festivals, and immersive dining installations offer rich insights into how sensory factors interact with environmental variables like lighting, social context, and ambient sound. These studies aim to replicate the complexity and dynamism of authentic dining scenarios, acknowledging that human sensory experiences are rarely isolated in everyday life.

Recent technological innovations have significantly enhanced the precision and depth of this research. Eye-tracking technology allows scientists to monitor diners' visual attention in real time, providing data on how plating design, color contrasts, and movement influence visual engagement and expectation. Neuroimaging techniques such as functional magnetic resonance imaging (fMRI) and electroencephalography (EEG) enable researchers to examine the brain's activity patterns during food consumption, revealing how multisensory integration occurs neurologically and how different sensory inputs evoke emotional or reward-related brain responses.

Additionally, wearable sensors—including skin conductance monitors, heart rate variability trackers, and portable EEG headsets—are increasingly employed to measure physiological markers of emotional arousal and engagement during meals. These devices allow for continuous, non-invasive monitoring, even in dynamic dining environments, thus bridging the gap between laboratory control and ecological validity.

Some studies also incorporate cross-disciplinary approaches, combining qualitative methods like interviews and ethnographic observation with quantitative measures. This mixed-methods strategy captures both the objective physiological and cognitive responses to food and the subjective, narrative experiences that diners articulate about their meals.

Through these diverse and evolving methodologies, researchers are uncovering nuanced insights into how the senses collaborate to shape not just the taste of food, but its emotional resonance, memorability, and cultural significance. As tools and techniques become more sophisticated, the future of multisensory gastronomy research promises even deeper explorations into the embodied, emotional, and social dimensions of eating.

Challenges and Future Directions

Despite the remarkable strides made in understanding and applying multisensory gastronomy, several significant challenges continue to shape the research and its practical applications.

One prominent limitation is the narrow cultural lens through which much of the current research has been conducted. A large proportion of experimental studies and avant-garde dining practices are rooted in Western culinary traditions, often overlooking the rich multisensory heritage embedded in global food cultures. Indigenous rituals, Asian dining customs, African communal eating traditions, and Latin American flavor layering, for instance, offer vast, largely untapped resources for understanding how multisensory dining has evolved differently across societies. Future research must aim for a more inclusive, global perspective, incorporating cross-cultural methodologies to avoid Eurocentric biases and to appreciate the full diversity of sensory dining practices worldwide.

Another critical challenge lies in individual variability. Sensory perception is highly subjective, influenced by a range of factors including genetic predispositions (such as supertasters versus non-tasters), psychological states (like mood and prior experiences), and cultural background (which shapes learned flavor preferences and expectations). These layers of variability make it difficult to design universal multisensory experiences that resonate equally with all individuals.

Understanding and addressing these individual differences remains a complex frontier for researchers and practitioners alike.

In terms of future directions, the field is ripe for interdisciplinary collaborations that bring together chefs, neuroscientists, psychologists, sensory designers, technologists, and even healthcare professionals. Such collaborations could yield a new generation of dining experiences that are not only more immersive but also personalized and purposeful.

For instance, emerging technologies like augmented reality (AR) and virtual reality (VR) offer fascinating possibilities for blending virtual and real gastronomic elements. Imagine dining scenarios where the visual environment shifts dynamically with the flavors on the plate, enhancing the emotional impact of the meal. AR overlays could simulate changing seasons, landscapes, or memories, enriching the narrative dimension of dining without altering the physical food itself.

Another promising avenue lies in personalized dining based on individual sensory profiles. By mapping a diner's sensory sensitivities, preferences, and emotional triggers, chefs could tailor meals that optimize pleasure, memory formation, or even therapeutic outcomes. This could revolutionize not just fine dining but also areas like elder care, mental health therapy, and nutritional interventions, where personalized sensory stimulation might improve appetite, mood, and overall well being.

Moreover, there is increasing interest in exploring the therapeutic applications of multisensory meals in healthcare settings. For patients suffering from conditions like depression, dementia, or sensory processing disorders, specially designed multisensory dining experiences could be used to stimulate memory recall, emotional engagement, and cognitive function. Early pilot studies in neurogastronomy suggest that food, when crafted as a multisensory therapy, can play a role in rehabilitation and emotional healing.

Finally, as sustainability becomes an urgent global concern, future multisensory gastronomy could also focus on sustainable innovation, finding ways to elevate the sensory appeal of plant-based, alternative, and upcycled foods to align environmental responsibility with sensory pleasure.

While challenges remain, the future of multisensory gastronomy is filled with immense possibilities—redefining dining not only as an art and science but also as a powerful tool for cultural storytelling, personalized wellness, and emotional connection.

Conclusion

Multisensory gastronomy is revolutionizing our understanding of food, transforming it from a mere act of sustenance into a rich, immersive experience that engages the mind, body, and emotions. No longer confined to taste alone, the act of eating now encompasses a symphony of sensory inputs—sight, smell, sound, touch, and flavor—that together create a deeply aesthetic and emotional journey. This evolution reflects a broader cultural and scientific recognition that dining is not just biological nourishment, but also a form of communication, storytelling, and artistic expression.

Drawing from disciplines such as neuroscience, psychology, design, and culinary innovation, multisensory gastronomy leverages our innate sensory interconnectedness to craft experiences that are more memorable, emotionally resonant, and psychologically impactful. Insights from neurogastronomy and crossmodal perception research have shown that the brain does not process each sensory input in isolation; rather, it weaves them together to form cohesive perceptions that can evoke powerful memories, alter emotional states, and shape expectations in profound ways.

This integrated understanding has empowered chefs, sensory designers, and researchers to move beyond traditional culinary techniques. By manipulating elements like color, aroma, texture, and sound, they are able to create meaningful, often transformative dining experiences. Whether it is a dish that evokes childhood nostalgia through familiar smells or a futuristic plating that challenges sensory expectations, multisensory dining elevates food into a medium capable of evoking wonder, curiosity, and emotional depth.

As we look toward the future, the field of multisensory gastronomy holds tremendous potential for further innovation. Technological advances such as augmented reality, personalized sensory profiling, and wearable biometric feedback promise to open new dimensions in dining, making it possible to tailor experiences to individual preferences, emotional needs, and even therapeutic goals. The expansion into healthcare, mental wellness, and sustainable gastronomy also indicates that the applications of multisensory dining extend far beyond luxury or novelty—they hold the potential to enhance quality of life on a broader societal scale.

However, realizing this future will require continued interdisciplinary collaboration and a commitment to inclusivity, ensuring that global culinary traditions, diverse sensory profiles, and ethical considerations are integrated into research and practice. By embracing a holistic, human-centered approach, multisensory gastronomy can continue to redefine not just how we eat, but how we connect with ourselves, with others, and with the world around us.

In essence, gastronomy is no longer confined to the plate; it has become a multisensory canvas—a space where science, art, culture, and emotion converge to create experiences that are as intellectually stimulating as they are sensorially delightful.
