ISPEC 17th INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

EVALUATION PROCESS and POLICIES

All applications have undergone double blind peer review process. In addition, each paper was accepted and the process of publishing in the book was carried out through editorial oversight. The published papers were presented and discussed at the meeting.

Full texts and abstracts published in accordance with the Symposium Policy have been prepared in accordance with ethical rules and APA standards. Authors of all papers are both ethically and legally responsible.

PARTICIPANTS COUNTRIES

Türkiye, Algeria, Azerbaijan, Croatia, Hungarian, India, Indonesia, Iran, Iraq, Kazakhstan, Kenya, Kyrgyzstan, Morocco, Nigeria, Pakistan, Romania, Uzbekistan,

TOTAL ACCEPTED ARTICLES: 204

The Number of Accepted Papers from Türkiye: 192
The Number of Accepted Full Papers from Other Countries: 222
The Number of Total Papers: 414

ISPEC 17th INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

CHAIRPERSONS OF THE ORGANIZING BOARD

Prof. Dr. Selahattin ÇINAR

Kırşehir Ahi Evran University

SYMPOSIUM COORDINATORS

Assoc. Prof. Dr. Seyithan SEYDOŞOĞLU

Siirt University

ISPEC 17th INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

ORGANIZING BOARD

- Prof. Dr. Rüştü HATİPOĞLU - Kırşehir Ahi Evran Üniversitesi
- Prof. Dr. İsa TELCİ - Isparta Uygulamalı Bilimler Üniversitesi
- Prof. Dr. Yaşar KARADAĞ - Muş Alparslan Üniversitesi
- Prof. Dr. Makbule ERDOĞDU - Kırşehir Ahi Evran Üniversitesi
- Prof. Dr. Mustafa KAN – Kırşehir Ahi Evran Üniversitesi
- Doç. Dr. Davut KELEŞ - Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğü
- Doç. Dr. İbrahim SAYGILI - Tokat Gaziosmanpaşa Üniversitesi
- Doç. Dr. Ramazan AYRANCI - Kırşehir Ahi Evran Üniversitesi
- Doç. Dr. Kadir AKAN - Kırşehir Ahi Evran Üniversitesi
- Doç. Dr. Ömer Süha USLU - Kahramanmaraş Sütçü İmam Üniversitesi
- Doç. Dr. Selma BOYACI - Kırşehir Ahi Evran Üniversitesi
- Doç. Dr. Hakan KIR - Kırşehir Ahi Evran Üniversitesi
- Doç. Dr. Ertuğrul KUL - Kırşehir Ahi Evran Üniversitesi
- Dr. Öğr. Üyesi Nurullah ACİR - Kırşehir Ahi Evran Üniversitesi
- Dr. Öğr. Üyesi Emine BİLGİNOĞLU - Kırşehir Ahi Evran Üniversitesi
- Dr. Öğr. Üyesi Ayşe Gül FİLİK - Kırşehir Ahi Evran Üniversitesi
- Dr. Öğr. Üyesi Gülden ÖZGÜNALTAY ERTUĞRUL - Kırşehir Ahi Evran Üniversitesi
- Arş. Gör. Alperen DONAT - Kırşehir Ahi Evran Üniversitesi
- Arş. Gör. Rabia GÜNDÜZ - Kırşehir Ahi Evran Üniversitesi

ISPEC 17th INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

SCIENCE AND ADVISORY BOARD

- Prof. Dr. Abdul GHAFOOR - University of Agriculture, Faisalabad, PAKİSTAN
- Prof. Dr. Abdul Ghani OLABI - University of Sharjah, BAE
- Prof. Dr. Abdul MOUAZEN - Universiteit Gent, BELÇİKA
- Prof. Dr. Abiodun OKUNOLA - Landmark University, NİJERYA
- Prof. Dr. Adel Salah KHATTAB - Tanta University, Tanta, MISIR
- Prof. Dr. Ahmet KAZANKAYA - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Ahmet ŞAHİN - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Ahmet TAMKOÇ - Selçuk Üniversitesi, TÜRKİYE
- Prof. Dr. Ali TOPAL - Selçuk Üniversitesi, TÜRKİYE
- Prof. Dr. Aman Ullah MALIK, Rector of the University of Faisalabad (TUF), PAKİSTAN
- Prof. Dr. Anıl ÇAY – Çanakkale Onsekiz Mart Üniversitesi, TÜRKİYE
- Prof. Dr. Arzu BERBER - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Atilla TAŞKIN - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Aziz ŞAHİN - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Bahadır SAYINCI - Bilecik Şeyh Edebali Üniversitesi, TÜRKİYE
- Prof. Dr. Bayram SADE - Selçuk Üniversitesi, TÜRKİYE
- Prof. Dr. Bedir TEKİNERDOĞAN - Chair of Information Technology, Wageningen University, HOLLANDA
- Prof. Dr. Caner KOÇ - Ankara Üniversitesi, TÜRKİYE
- Prof. Dr. Cengiz SANCAK - Ankara Üniversitesi, TÜRKİYE
- Prof. Dr. Emre ŞİRİN - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Ersin CAN - Hatay Mustafa Kemal Üniversitesi, TÜRKİYE
- Prof. Dr. Esvet AÇIKGÖZ - Uludağ Üniversitesi, TÜRKİYE
- Prof. Dr. Fahri SÖNMEZ - Tokat Gaziosmanpaşa Üniversitesi, TÜRKİYE
- Prof. Dr. Fahriye ERCAN - Kırşehir Ahi Evran Üniversitesi, TÜRKİYE
- Prof. Dr. Gamal EL AFANDI - Tuskegee University, AMERİKA BİRLEŞİK DEVLETLERİ
- Prof. Dr. Güngör YILMAZ - Yozgat Bozok Üniversitesi, TÜRKİYE

- Dr. Ayşegül SELIŞIK - FAO, TÜRKİYE
- Dr. Bobur TURSUNALIYEV - Semerkant Devlet Veterinerlik, Hayvancılık ve Biyoteknoloji Üniversitesi, ÖZBEKİSTAN
- Dr. Mehdi DEMİRCİ - Vergo Energy, TÜRKİYE
- Dr. Mesut KESER - ICARDA, TÜRKİYE
- Dr. Muhamad SYAIFUDIN, Shantou University, ÇİN
- Dr Parvathy SATHISH - Green In Future, SİNGAPUR
- Dr. Pooja BOHRA - ICAR-Central Island Agricultural Research Institute, HİNDİSTAN
- Dr. Redmond Ramin SHAMSHIRI - Leibniz Institute for Agricultural Engineering and Bioeconomy, ALMANYA

ISPEC 17th INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

April 25 - 27, 2025

Kırşehir, TÜRKİYE

SYMPOSIUM SCHEDULE

ISPEC 17th INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

April 25-27, 2025 / Kırşehir, Türkiye

Congress Program

Face-to-face and Online

https://us02web.zoom.us/j/83312871999?pwd=g4ucAKZNujEUMoF2RJ9QQjv0dykgxK.1

IMPORTANT, PLEASE READ CAREFULLY

- ✓ To be able to attend a meeting online, login via **https://zoom.us/join** site, enter ID "Meeting ID or Personal Link Name" and solidify the session.
- ✓ The Zoom application is free and no need to create an account.
- ✓ The Zoom application can be used without registration.
- ✓ The application works on tablets, phones and PCs.
- ✓ The participant must be connected to the session 5 minutes before the presentation time.
- ✓ All congress participants can connect live and listen to all sessions.
- ✓ Moderator is responsible for the presentation and scientific discussion (question-answer) section of the session.

Points to Take into Consideration - TECHNICAL INFORMATION

- ✓ Make sure your computer has a microphone and is working.
- ✓ You should be able to use screen sharing feature in Zoom.
- ✓ Attendance certificates will be sent to you as pdf at the end of the congress.
- ✓ Requests such as change of place and time will not be taken into consideration in the congress program

SPONSORS

FACE TO FACE SESSION / 25.04.2025	
HALL-1 / SESSION-1	Ahi Evran Kongre ve Kültür Merkezi
Ankara Time: 10:30-11:50	

HEAD OF SESSION: Prof. Dr. Sabri GÖKMEN

Authors	Affiliation	Presentation title
Rüştü HATİPOĞLU	*Kırşehir Ahi Evran University*	Growing genetically modified crops in the world and Türkiye
Metin TÜRKER Selma Nur TÜRKER AYDIN	*Ministry Of Agriculture and Forestry*	Historical development of land consolidation inheritance management and land banking practices in Türkiye
Selma Nur TÜRKER AYDIN Metin TÜRKER	*Ministry Of Agriculture and Forestry*	The effects of climate change on water and food crisis and measures to be taken
Selahattin ÇINAR	*Kırşehir Ahi Evran University*	Plant production planning and support in Türkiye
Bekir ENGÜRÜLÜ Oktay Nazmi ALKAN Mustafa KOPARAN Sevda YAZICI Hasan Cumhur SARISU	*Agricultural Insurance Pool Operation General Directorate Inc.*	The importance of agricultural insurance in climate change
Veysel GÜL Abdullah BEYAZ	*Kırşehir Ahi Evran Üniversitesi*	The strategic role of precision agricultural practices in climate change and their contribution to sustainable agricultural production

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025	
HALL-2 / SESSION-1	**Ahi Evran Kongre ve Kültür Merkezi**
	Ankara Time: 10:30-12:30

HEAD OF SESSION: Prof. Dr. Yaşar KARADAĞ

Authors	Affiliation	Presentation title
Melek KURT Rüştü HATİPOĞLU	*Kırşehir Ahi Evran University*	Effects of climate change on vegetation of grasslands
Mehmet ÖTEN Melike KÖSE Semih TOKAT	*Sakarya University of Applied Sciences*	Determination of allelopathic effects of sorghum (*Sorghum bicolor* L.) extract on common vetch (*Vicia sativa* L.)
Hasan Beytullah DÖNMEZ	*Çukurova University*	The effect of different salt concentrations on germination and seedling growth of perennial forage grasses
Osman YÜKSEL Hüseyin PALAZ	*Uşak University*	A study on determining some morphological and agricultural characteristics of scented grass (*Chrysopogon gryllus* (L.) Trin.)
Mustafa YILMAZ Mehmet ÖTEN Rahime CENGİZ Ferzat TURAN Melike KÖSE	*Sakarya University of Applied Sciences*	Determination of quality characteristics of corn (*Zea mays* L.) silage with different additives
Fazlı COŞKUN Yaşar KARADAĞ	*Necmettin Erbakan University*	Determination of weed and quality characteristics of some sorghum genotypes in Muş ecological conditions
Rahime CENGİZ Zehra YILDIZ	*Sakarya University of Applied Sciences*	Plant extraction methods: traditional and innovative techniques
Mustafa Alper SAVAŞ Selahattin ÇINAR	*Kırşehir Ahi Evran University*	Forage crop breeding studies in Turkey
Zahide Gül GÜRKAN Erdem GÜLÜMSER Uğur BAŞARAN	*Bilecik Şeyh Edebali University*	The effect of forage turnip leaf extracts on germination and seedling development of forage cowpea
Uğur BAŞARAN Erdem GÜLÜMSER	*Bilecik Şeyh Edebali University*	Reduction of greenhouse gas emissions in field crops production systems

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025

HALL-3 / SESSION-1 Ahi Evran Kongre ve Kültür Merkezi

Ankara Time: 10:30-12:30

HEAD OF SESSION: Prof. Dr. İsa TELCİ

Authors	Affiliation	Presentation title
İsa TELCİ Erman BEYZİ Biyolog YALÇIN Erdal KAYA Mustafa ER Ahu ALTINKUT UNCUOĞLU	*Isparta University of Applied Sciences*	Investigation of the yield and essential oil properties of menthol mint grown in different ecologies
Nimet KATAR Emine BİLGİNOĞLU Rabia GÜNDÜZ Duran KATAR	*Kırşehir Ahi Evran University*	Effects of different nitrogen doses on yield and quality characteristics of sage (*Salvia officinalis* L.) under the ecological conditions of Eskişehir
Nimet KATAR Emine BİLGİNOĞLU Rabia GÜNDÜZ Duran KATAR	*Kırşehir Ahi Evran University*	Effect of different nitrogen doses on yield and quality parameters of rosemary (*Rosmarinus officinalis* L.) plant in Eskişehir ecological conditions
Buşra ÖZDEMIR Sibel ULCAY Bahadır ALTUN	*Kırşehir Ahi Evran University*	A study on the investigation of morphological and anatomical characteristics of some ornamental plants geophysics distributed in Kırşehir region
Aysun ÖRÇÜN Lifer DOĞAN Ferzat TURAN	*Sakarya University of Applied Sciences*	Effect of glycine betaine priming application on germination and seedling development in safflower seeds under drought stress
Elanur DURSUN Aysun ÖRÇÜN Ferzat TURAN	*Sakarya University of Applied Sciences*	Investigation of the effects of chitosan priming on soybean (*Glycine max* L.) Seeds against salt stress
Ali ONARAN Mehmet Emin ÇALIŞKAN	*Niğde Ömer Halisdemir University*	Selection of drought tolerant potato (*Solanum tuberosum* L.) breeding lines in vitro conditions by morphological and multi-criteria analysis methods

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025

HALL-4 / SESSION-1 | **Ahi Evran Kongre ve Kültür Merkezi**

Ankara Time: 10:30-12:30

HEAD OF SESSION: Prof. Dr. Yaşar ERTÜRK

Authors	Affiliation	Presentation title
Sevil SAĞLAM YILMAZ	*Kırşehir Ahi Evran University*	Problems and solution suggestions encountered in micropropagation of walnut (*Juglans regia* L.)
Sevil SAĞLAM YILMAZ	*Kırşehir Ahi Evran University*	Agrobacterium-based transformation of cry 1c and cry 1cst genes into common bean (*Phaseolus vulgaris* L.)
Funda ÖZDEMİR DEĞİRMENCİ Asiye ULUĞ Uzuk KASYMOVA	*Kırşehir Ahi Evran University*	Genetic distinction between morphologically similar hexaploid and tetraploid wheat species
Tuana AKSOY Khalid Mahmood KHAVAR	*Yozgat Bozok University*	Genome dynamics of *Cannabis sativa* L. species
Tuana AKSOY Khalid Mahmood KHAVAR	*Yozgat Bozok University*	Identification of XY and XX sex chromosomes in Cannabis sativa L.
Betül Ayça DÖNMEZ Salih KAFKAS N. Ebru KAFKAS	*Kırşehir Ahi Evran University*	Use of anther culture in haploid plants production in strawberry
Betül Ayça DÖNMEZ Salih KAFKAS N. Ebru KAFKAS	*Kırşehir Ahi Evran University*	Physiological responses of strawberry plants to drought stress
Emre ŞİRİN Mehmet KURAN	*Kırşehir Ahi Evran University*	Determination of parthenogenetic activation capacity of bovine oocytes matured in vitro in culture media using royal jelly as a protein source
Ümmü TUĞLU Hasan BAYDAR	*Isparta University of Applied Sciences*	Development of sage varieties with tetraploid genome (tetra sage) by polyploidy breeding in medicinal and anatolian sage
Can ASLAN Ayşe Gül FİLİK	*Kırşehir Ahi Evran University*	The effect of *lactobacillus brevis* (MF098783) strain on the quality and aerobic stability of wheat forage silage
Ayşe Gül FİLİK Esin KIRAY Esra ŞİŞMAN	*Kırşehir Ahi Evran University*	Effectiveness of *lactobacillus plantarum* (MF098786) as a microbial inoculant in barley straw silages
Tareq HAMIJO Ilbilge OĞUZ N. Ebru KAFKAS	*Çukurova University*	Genetic basis of volatile compound production in strawberries: insights from QTL mapping and GWAS
Mikail YENİÇERİ Sena KARAKUŞ Gökhan FİLİK	*Kırşehir Ahi Evran University*	Efficacy of microbial inoculants in improving silage quality : millet (*Panicum miliaceum* L.)
Tuba TAŞ Esin KIRAY Gökhan FİLİK	*Kırşehir Ahi Evran University*	The effect of microbial inoculants on the silage quality and stability of unshredded Italian ryegrass (*Lolium multiflorum*)

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025

HALL-1 / SESSION-2 | **Ahi Evran Kongre ve Kültür Merkezi**

Ankara Time: 14:30-17:00

HEAD OF SESSION: Prof. Dr. Sultan KIYMAZ

Authors	Affiliation	Presentation title
Sultan KIYMAZ Serdar GENÇ Ebru ŞIRIN	*Kırşehir Ahi Evran University*	Determination of nitrate levels in well water: the case of Kirsehir province
Çayan ALKAN Mecit ÖZTÜRK	*Bilecik Şeyh Edebali University*	Agricultural water management planning: the case of Bilecik province
Cevat FİLİKCİ Tamer MARAKOĞLU	*Kırşehir Ahi Evran University*	Evaluation of reduced tillage practices in terms of conservation tillage technique
Ali BOLAT	*Adıyaman University*	Technical and economic comparison of spraying with unmanned aerial vehicles (UAVS) and field sprayers
Alper BOLAT Ergün ERTUĞRUL	*Türk Traktör*	The effect of combine harvester speed on grain loss during wheat harvest
Ismet Furkan GEZGIN	*Kırşehir Ahi Evran University*	Integration of artificial intelligence and agricultural machinery in plant protection technologies
Tamer YAVUZ Veysel GÜL Ömer ERTUĞRUL	*Kırşehir Ahi Evran University*	Monitoring early-stage crop emergence in oat fields using multispectral uav-based vegetation indices
Ahu Alev ABACI BAYAR	*Kırşehir Ahi Evran University*	An investigation of nutrition status in olive (*Olea europaea* L.) Gardens in Onikişubat (Kahramanmaraş) county based on soil and leaf analysis
Halil ERDEM Ibrahim SAYGILI Mazlum ERDEM	*Tokat Gaziosmanpasa University*	Heterosis effects on uptake and accumulation of zinc in barley
Fevziye Şüheda HEPŞEN TÜRKAY Murat ARSLAN	*Kırşehir Ahi Evran University*	From organic waste to fish feed: eisenia fetida biomass in biogas residue and olive mill wastewater by vermicomposting for agriculture and aquaculture nutrient integration
Mehmet OZTURK Anna CATES Lindsay PEASE	*University of Minnesota, USA*	Enhancing soil health and reducing wind erosion: cover crop strategies for sugarbeet systems in minnesota's fertile black soils

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025

HALL-2 / SESSION-2 | **Ahi Evran Kongre ve Kültür Merkezi**

Ankara Time: 14:30-17:00

HEAD OF SESSION: Prof. Dr. Rüştü HATİPOĞLU

Authors	Affiliation	Presentation title
Melek GÜMÜŞBAŞ Selma BOYACI	*Kırşehir Ahi Evran University*	Rooting of different chokeberry cultivars with hardwood cuttings
Selma BOYACI	*Kırşehir Ahi Evran University*	A significant problem in apple growing: pre-harvest fruit dropping
Ebru ŞİRİN Yaşar ERTÜRK	*Kırşehir Ahi Evran University*	Soil suitability map for walnut cultivation in Kırşehir: evaluation using the AHP method based on soilgrids data
Ebru ŞİRİN Yaşar ERTÜRK	*Kırşehir Ahi Evran University*	Carbon sequestration of fruit orchards and their role in sustainable agriculture
Fadimana ÖZEL Beyza HAFÇI Yaşar ERTÜRK	*Kırşehir Ahi Evran University*	Dwarfing mechanisms in temperate fruit trees
Sebahattin YILMAZ Yaşar AKÇA	*Kırşehir Ahi Evran University*	Tips for top-working of walnut trees
Beyza HAFÇI Yaşar ERTÜRK	*Kırşehir Ahi Evran University*	Evaluations on in vitro micropropagation of walnut
Yassir Ahmed HASSAN Josephine BIRUNGI	*Animal Production Research Centre, SUDAN*	Overview on genetic variability of casein protein genes in sudanese nubian goats
Yassir Ahmed HASSAN Josephine BIRUNGI Morris AGABA	*Animal Production Research Centre, SUDAN*	Phylogenetics of goat populations in Sudan
Yassir Ahmed HASSAN Mohammed Tageldin Iibrahim	*Animal Production Research Centre, SUDAN*	Conservation modelling of biodiversity for three sudanese cattle breeds (Butana, Ariashy and Nuba)
Cemal KURT Ömer Afşin ÇIL Hatice CANKESEN	*Çukurova University*	Peanut (*Arachis hypogaea* L.) cultivation and its importance in Türkiye

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025

HALL-3 / SESSION-2	Ahi Evran Kongre ve Kültür Merkezi
Ankara Time: 14:30-17:00	

HEAD OF SESSION: Prof. Dr. Mustafa KAN

Authors	Affiliation	Presentation title

Hikmet GÜNAL Miraç KILIÇ İsmail ÇELIK Mesut BUDAK	*Harran University*	Development and opportunities of carbon markets in Türkiye: current status and future perspectives
Tuğba GÜNGÖR ERTUĞRAL Işıl ERZİNCAN		Preparation and characterization of edible films based on corn zein
Büşra AVCI YURTDAŞ M. Akif IRMAK	*Kırşehir Ahi Evran University*	Evaluation of different surface textures in urban parks in terms of micro thermal comfort; case study of Erzurum olympic park

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

FACE TO FACE SESSION / 25.04.2025

HALL-5 / SESSION-2 | **Ahi Evran Kongre ve Kültür Merkezi**

Ankara Time: 14:30-17:00

HEAD OF SESSION: Prof. Dr. Sedat BOYACI

Authors	Affiliation	Presentation title
Gülten KAÇAR AVCI Halil TOKTAY Ramazan CANHİLAL	*Potato Research Institute*	Morphological diagnosis of golden cyst nematode (*Globodera rostochiensis* L.) populations in Niğde province
Gökhan DOĞAN Makbule ERDOĞDU Zeki AYTAÇ	*Kırşehir Ahi Evran University*	The powdery mildews of Yedigöller national park, Bolu province, Türkiye
Ali ENDES Bekir AKTAŞ Sevim ATMACA	*Yozgat Bozok University*	The symptomatology, epidemiology, ecology and management practices of *Rhynchosporium graminicola* as barley leaf blotch/scald pathogen
Ali ENDES Bekir AKTAŞ Sevim ATMACA	*Yozgat Bozok University*	Fusarium wilt and root rot on chickpea
Yusuf BAYAR Abdurrahman ONARAN Özlem BAHAR	*Kırşehir Ahi Evran University*	Comparative antifungal activity of methanol and hexane extracts of *Pteridium aquilinum* against *Monilinia fructigena*
Yusuf BAYAR Fatma KISA Melih Yılar Özlem BAHAR Abdurrahman ONARAN	*Kırşehir Ahi Evran University*	Comparative evaluation of leaf, flower, and seed extracts of vitex agnus-castus for antifungal activity against *fusarium oxysporum* species
Yasin Nazım ALPKENT Sibel ERTÜRK Selçuk ULUSOY Sait ERTÜRK	*Directorate of Plant Protection Central Research Institute*	Bioefficacy and chemical profiling of two essential oils against *Sitophilus granarius* L. (Coleoptera: Curculionidae)
Ahmet Emin YILDIRIM Erdal SERTKAYA Ibrahim Halil ELEKÇIOĞLU	*Hatay Mustafa Kemal University*	Determining plant parasitic nematodes and their population densities in important crop plants in Hatay province, Türkiye
Ahmet Emin YILDIRIM Erdal SERTKAYA Ibrahim Halil ELEKÇIOĞLU	*Hatay Mustafa Kemal University*	Survey studies on comparison of *tylenchulus semipenetrans* (cobb, 1913) (tylenchida: tylenchulidae) population levels according to rootstock, rootstock age and soil texture in Hatay, Türkiye
Sedat BOYACI	*Kırşehir Ahi University*	Evaluation of the effect of natural ventilation and cooling applications on indoor climate in a high tunnel greenhouse
Sedat BOYACI	*Kırşehir Ahi University*	Evaluation of the effects of insect nets used in ventilation openings in greenhouses on ventilation

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

ONLINE SESSION / 26.04.2025

HALL - 1 / SESSION - 1 | **ZOOM ID: 833 1287 1999 / PASSCODE: 252627**

Ankara Local Time: 10:00-12:00

HEAD OF SESSION: Prof. Dr. Mustafa KAN

Authors	Affiliation	Presentation title
Gülden Özgünaltay Ertuğrul Erkan Urkan Ikbal Aygün	*Kırşehir Ahi Evran University*	Innovative approaches in ergonomic risk assessment methods and occupational safety in agriculture
Gülden Özgünaltay Ertuğrul Erkan Urkan Ikbal Aygün	*Kırşehir Ahi Evran University*	Applicability and advantages of the 6s method in agriculture
Fatih Çalişkan Halil Özcan Özdemir Başar Altuntaş	*Kırşehir Ahi Evran University*	Knowledge and attitude levels of female consumers in Nevşehir province about the storage of bee products
Lütfi Eren Volkan Mehmet Çinar Aydın Ünay	*Aydın Adnan Menderes University*	Heat stress in cotton
Selcen Babaoğlu Aydaş Ayhan İbrahim Aysal Hikmet Türk Katırcıoğlu Kübra Erkan Türkmen Pınar Mursaloğlu Kaynar Orhan Canbolat	*Gazi University*	Investigation of existence of biogenic amin in siderophore-producing *Bacillus* sp.
Ece B. Kasapoğlu Uludamar Ali Endes Perihan Tuğçe Altiparmak I. Halil Elekcioğlu	*Çukurova University*	Effects of root rot fungus (*Fusarium oxysporum* f. sp. *ciceris*) and root lesion nematode (*Pratylenchus thornei*) on some chickpea varieties at different application times
Mehmet Selim Yildiz Abdulbaki Bilgiç Nuray Demir Adem Aksoy	*Ataturk University*	Green energy, sweet results: the impact of wind farms on honey production
Harun Furuncuoğlu Mehmet Öten	*Sakarya University of Applied Sciences*	The effect of fertiliser and bacteria applications on nitrogen and protein ratios in grass pea
Sümeyya Vuslat Dişkaya Salim Avcıoğlu Ece Börteçine Kasapoğlu Uludamar İbrahim Halil Elekcioğlu	*Çukurova University*	Investigation of biodiversity of nematodes (nematoda) in ali nihat gökyiğit botanical garden of Çukurova University
Sena Özbay	*Kırşehir Ahi Evran University*	Plant protein revolution for sustainable agriculture and rural development: opportunities and challenges
Ömer Şengül	*Bursa Uludag University*	Structural characteristics and problems of fattening sheep farms in Karacabey district

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

ONLINE SESSION / 26.04.2025

HALL - 2 / SESSION - 1 | **ZOOM ID: 833 1287 1999 / PASSCODE: 252627**

Ankara Local Time: 10:00-12:00

ABSTRACT

Cervical cancer remains a major global health concern with high morbidity and mortality rates. Natural products like brotowali (*Tinospora crispae* L.) offer promising alternatives due to their multi-targeted mechanisms and lower toxicity. This study integrates computational and experimental approaches to evaluate the anticancer potential of brotowali stem extracts. Network pharmacology and molecular docking were used to identify key bioactive compounds and predict their interactions with target proteins, revealing common targets between the disease and the compounds, particularly EGFR and ESR1, which play crucial roles in cervical cancer inhibition. The extraction process was optimized using the Box-Behnken Design (BBD), determining optimal conditions of 5.383 minutes extraction time, a 23.792 mL/g solvent-to-sample ratio, and 180.001 W microwave power. These conditions yielded a cytotoxic activity of 230.434 µg/mL and a total flavonoid content of 20.274 mg QE/g, with a desirability of 0.726. Response surface methodology (RSM) analysis was conducted on the BBD results using 3D visualization and contour plots, confirming that the applied equation followed a quadratic model with valid values. By combining in silico analysis with experimental validation, this study highlights the therapeutic potential of brotowali in cervical cancer treatment, underscores the importance of optimized extraction techniques, and suggests that its bioactive compounds have promising potential in combating cervical cancer.

ABSTRACT

Cardiovascular disease (CVD) remains a leading global health concern, often associated with excessive intake of saturated fatty acids (SFA), which contribute to elevated cholesterol levels and vascular obstruction. This study explores the role of Glycerol Monostearate (GMS) and Sorbitan Monostearate (SMS) in optimizing the lipid profile of low-saturated shortening, leveraging lipidomic and chemometric approaches. Experimental formulations included 5% and 10% GMS:SMS treatments with six ratio variations (100:0, 80:20, 60:40, 40:60, 20:80, and 0:100), each replicated three times. Lipid profiling was conducted using lipidomic analysis, free fatty acid quantification, peroxide value determination, and Gas Chromatography-Mass Spectrometry (GC-MS) for fatty acid composition. Chemometric techniques, including Principal Component Analysis (PCA) and Partial Least Squares-Discriminant Analysis (PLS-DA), facilitated data interpretation. Results indicated that in the 5% GMS:SMS treatment, the 100:0, 80:20, and 60:40 formulations exhibited superior stability based on free fatty acid and peroxide value assessments. Notably, lipidomic profiling identified the 80:20 ratio within the 5% treatment as the most favorable, featuring an increased proportion of unsaturated fatty acids and reduced SFA content. These findings suggest that GMS and SMS ratios can enhance the lipid profile of shortening, offering potential health benefits and improved product stability.

Keywords: Shortening, lipidomic analysis, low saturated fat, chemometric analysis.

HYDROCHAR FROM FISH WASTE AS AN EFFICIENT ADSORBENT FOR POLLUTANT REMOVAL: SYNTHESIS, CHARACTERIZATION, AND ADSORPTION MECHANISMS ANALYZED THROUGH DFT CALCULATIONS

ABSTRACT

This study explores the potential of hydrochar derived from fish waste as an efficient adsorbent for the removal of pollutants from aqueous solutions. Hydrochar, produced via hydrothermal carbonization (HTC) of fish waste, was characterized using various techniques such as FTIR, SEM, and BET surface area analysis to understand its structural properties and surface characteristics. Adsorption experiments were conducted to evaluate the efficiency of the hydrochar in removing heavy metals, organic dyes, and other contaminants. The results revealed that the hydrochar exhibited significant adsorption capacity, with optimal conditions determined for pollutant removal, including pH, contact time, and adsorbent dosage. The adsorption process followed the Langmuir isotherm model, indicating monolayer adsorption on a surface with a finite number of identical sites. Additionally, Density Functional Theory (DFT) calculations were employed to investigate the molecular interactions between the pollutants and the hydrochar surface. The DFT results provided a deeper understanding of the adsorption mechanisms, revealing the key role of functional groups in binding the pollutants. Thermodynamic studies showed that the adsorption process was spontaneous and exothermic, further supporting the viability of hydrochar as a cost-effective and sustainable material for environmental remediation. This study demonstrates the promising application of fish waste-derived hydrochar in water treatment, highlighting its potential as a green material for pollution control.

Keywords: Hydrochar, Fish Waste, Adsorption, Pollutant Removal, DFT Calculations, Water Treatment, Environmental Remediation.

ANTICANCER POTENTIAL OF EXTRACT AND FRACTION FROM BROTOWALI (TINOSPORA CRISPA) STEM AGAINST BREAST CANCER: CYTOTOXICITY, NETWORK PHARMACOLOGY, MOLECULAR DOCKING

ABSTRACT

Breast cancer continues to be a major health concern, requiring the exploration of alternative treatment strategies. Berberine, a bioactive alkaloid found in *Tinospora crispa*, has shown promising anticancer properties with previous studies reporting its cytotoxic activity against various cancer cell lines. This study aims to evaluate cytotoxic effects, network pharmacology, moleculaqr docking analysis, and antioxidant activity of extract and fraction from *T. crispa* against T47D breast cancer cells. The fractions were obtained through maceration using methanol, followed by acid-base fractionation. Cytotoxic activity was assessed using the MTT assay on the T47D cell, while antioxidant activity was evaluated using the radical DPPH scavenging activity and the IC_{50} values were determined. The results showed that the pH 9 fraction exhibited the strongest anticancer activity against T47D cells, with an IC_{50} of 172.27 ± 8.30 µg/mL, and the highest antioxidant activity, with an IC_{50} of 43.36 ± 0.08 µg/mL. To further explore its anticancer potential, a network pharmacology approach was employed to identify key molecular targets of brotowali-derived compounds. Network analysis revealed AKT1 as a critical target associated with breast cancer. Additionally, molecular docking studies demonstrated strong interactions between brotowali-derived compounds and AKT1, supporting their potential role in breast cancer inhibition. These findings provide insights into the anticancer mechanisms of brotowali and establish a foundation for future research on its therapeutic applications.

Keywords: *Tinospora crispa*, breast cancer, cytotoxic activity, antioxidant activity, bioinformatics

THE IMPORTANCE OF AGRICULTURAL INSURANCE IN CLIMATE CHANGE

ABSTRACT

Agricultural production is a sector that can be carried out under suitable climatic conditions. Due to climate change, fluctuations in temperature, irregularities in precipitation patterns, and increased incidence of extreme weather events are among the most significant global challenges facing agricultural production. Research indicates that natural events affecting production are expected to increase in both intensity and frequency. It is anticipated that natural events that restrict agricultural production due to climate change will directly or indirectly cause a decrease in income and a serious increase in production costs. Farmers need to take measures to prevent or mitigate risk factors that reduce production and cause income loss. For this reason, it is expected that producers' awareness of risks will increase every year and interest in agricultural insurance will increase .As of 2024, the ratio of Insurance Amount to Agricultural Gross Domestic Product (GDP) is 44.5%. The Turkiye Agricultural Insurance (TARSİM) system plays a critical role in protecting farmers against climate change risks and in ensuring the sustainability of production.

İKLİM DEĞİŞİKLİĞİNDE TARIM SİGORTASININ ÖNEMİ

ÖZET

Tarımsal üretim uygun iklim koşullarında gerçekleştirilebilen bir sektördür. İklim değişikliği nedeniyle sıcaklık dalgalanmaları, yağış rejiminde düzensizlikler ve ekstrem hava olaylarındaki artışlar; tarımsal üretimde, karşılaşılan en önemli küresel zorluklar arasında yer almaktadır. Yapılan araştırmalarda üretimi etkileyen doğa olaylarının, şiddetinde ve frekansında artış olacağı öngörülmektedir. İklim değişikliğine bağlı tarımsal üretimi kısıtlayıcı doğa olayları, doğrudan veya dolaylı olarak gelirlerin azalmasına ve üretim maliyetlerinde ciddi şekilde artışa neden olacağı öngörülmektedir. Çiftçilerin, üretimi azaltan ve gelir kaybına neden olan risk faktörlerini engelleyici veya azaltıcı tedbirler alması gerekmektedir. Bu nedenle üreticilerin her yıl risklere karşı farkındalığının artması ve tarım sigortasına olan ilginin yükselmesi beklenmektedir. 2024 yılı itibariyle Sigorta Bedelinin/ Tarımsal Gayri Safi Yurt İçi Hasılaya (TGSYH) oranı %44,5 dir. Türkiye'deki Tarım Sigortaları (TARSİM) sistemi, çiftçilerin iklim değişikliği risklerine karşı korunmasında ve üretimin sürdürülebilirliğinde kritik bir rol oynamaktadır.

ABSTRACT

Climate change has become one of the most critical factors affecting agricultural production. Extreme weather events, such as rising temperatures and irregular rainfall regimes, seriously threaten the sustainability of the agricultural sector. The agricultural sector accounts for approximately 24% of global greenhouse gas emissions, increasing the global carbon footprint. Precision agriculture practices reduce the adverse effects of climate change on agricultural production processes, increasing productivity and sustainability. This study examined the role of precision agriculture practices in combating climate change in terms of efficiency and sustainability.

Precision agriculture practices play a significant role not only in conserving water and energy but also in reducing greenhouse gas emissions. Studies have shown that precision irrigation systems reduce water use by up to 30%. Similarly, it has been determined that variable rate fertilization (VRA) practices reduce nitrogen oxide (N_2O) emissions by 20-30%. Recently, with the widespread use of artificial intelligence applications in agriculture, data analytics and optimizing planting processes have reduced yield losses by 25% and pesticide use by 40%. In terms of energy efficiency, GPS-supported tractor steering systems reduce fuel consumption by 10-15%, reducing fossil fuel use. Monitoring agricultural areas at the micro level with remote sensing technologies and unmanned aerial vehicles (UAVs) can optimize fertilizer and water consumption by up to 25%. Despite these benefits, various factors prevent precision agriculture practices from becoming widespread. High investment costs stand out as a significant limiting factor in accessing these technologies. The installation costs of precision agriculture equipment are, on average, 30% higher than traditional agriculture. In addition, the complexity of data collection and analysis processes makes it challenging to adopt these technologies, especially in small-scale agricultural enterprises.

As a result, precision agriculture technologies increase water and energy efficiency, reduce greenhouse gas emissions, and stand out as an effective tool in combating climate change by optimizing agricultural production processes. However, for these technologies to be adopted more widely, incentive mechanisms need to be strengthened, digital infrastructure needs to be developed, and raising farmers' awareness is essential. The acceleration of digital

transformation in agricultural production will increase the capacity and adaptation ability to produce sustainable solutions against the climate crisis.

HASSAS TARIM UYGULAMALARININ İKLİM DEĞİŞİKLİĞİNDEKİ STRATEJİK ROLÜ VE SÜRDÜRÜLEBİLİR TARIMSAL ÜRETİME KATKISI

ÖZET

İklim değişikliği tarımsal üretimi doğrudan etkileyen en önemli faktörlerden biri haline gelmiştir. Artan sıcaklıklar ve düzensiz yağış rejimleri gibi ekstrem hava olayları, tarım sektörünün sürdürülebilirliğini ciddi şekilde tehdit etmektedir. Tarım sektörü dünya genelindeki sera gazı emisyonlarının yaklaşık %24'ünü oluşturarak, küresel karbon ayak izinin artmasına neden olmaktadır. Hassas tarım uygulamaları iklim değişikliğinin tarımsal üretim süreci üzerindeki olumsuz etkilerini azaltarak verimliliği ve sürdürülebilirlik artırmaktadır. Bu çalışmada verimlilik ve sürdürülebilirlik bakımından hassas tarım uygulamalarının iklim değişikliğiyle mücadeledeki rolü incelenmiştir.

Hassas tarım uygulamaları, su ve enerji tasarrufunun yanı sıra sera gazı emisyonlarının azaltılmasında önemli rol oynar. Yapılan araştırmalar hassas sulama sistemlerinin su kullanımını %30'a kadar azalttığını ortaya koymaktadır. Benzer şekilde, değişken oranlı gübreleme (VRA) uygulamalarının azot oksit (N_2O) emisyonlarını %20-30 oranında azalttığı belirlenmiştir. Son zamanlarda tarımda yapay zeka uygulamalarının kullanımının yaygınlaşmasıyla birlikte veri analitiği ve ekim süreçlerini optimize ederek verim kayıplarını %25, pestisit kullanımını ise %40 oranında düşürmüştür. Enerji verimliliği açısından, GPS destekli traktör direksiyon sistemleri yakıt tüketimini %10-15 oranında azaltarak fosil yakıt kullanımını azaltır. Uzaktan algılama teknolojileri ve insansız hava araçları (İHA) ile tarımsal alanların mikro düzeyde izlenmesi gübre ve su tüketimini %25'e kadar optimize edebilir. Hassas tarım uygulamalarının bu faydalarına karşın yaygınlaşmasını engelleyen çeşitli faktörler bulunmaktadır. Yüksek yatırım maliyetleri bu teknolojilere erişimde önemli bir sınırlayıcı unsur olarak öne çıkmaktadır. Hassas tarım ekipmanlarının kurulum maliyetleri, geleneksel tarıma kıyasla ortalama %30 daha fazladır. Ayrıca veri toplama ve analiz süreçlerinin karmaşıklığı özellikle küçük ölçekli tarım işletmelerde bu teknolojilerin benimsenmesini zorlaştırmaktadır.

Sonuç olarak, hassas tarım teknolojileri su ve enerji verimliliğini artırırken, sera gazı emisyonlarını azaltmakta ve tarımsal üretim süreçlerini optimize ederek iklim değişikliğiyle mücadelede etkili bir araç olarak öne çıkmaktadır. Bununla birlikte bu teknolojilerin daha geniş çapta benimsenebilmesi için teşvik mekanizmalarının güçlendirilmesi, dijital altyapının geliştirilmesi ve çiftçilerin bilinçlendirilmesi gerekmektedir. Tarımsal üretimde dijital dönüşümün ivme kazanması, iklim krizine karşı sürdürülebilir çözümler üretme kapasitesini ve adaptasyon yeteneğini artıracaktır.

Anahtar Kelimeler: Hassas tarım, iklim değişikliği, sera gazı emisyonları, su yönetimi, karbon ayak izi, sürdürülebilir tarımsal üretim

A STUDY ON DETERMINING SOME MORPHOLOGICAL AND AGRICULTURAL CHARACTERISTICS OF SCENTED GRASS (Chrysopogon gryllus (L.) Trin.)

ABSTRACT

This study was conducted in 2024 in Uşak to determine some morphological and agricultural characteristics of the perennial, warm-climate grass species, *Chrysopogon gryllus* (L.) Trin., which naturally occurs in the rangelands of Uşak. As part of the study, measurements and observations were made on 15 plants, two years old and in the flowering stage, which were collected from the Budaklar Village rangeland in Uşak and planted in plots with a spacing of 70 x 50 cm.

According to the results determined in the study, the plant height of *Chrysopogon gryllus* ranged between 78.00 cm and 144.00 cm, the number of nodes ranged from 3.00 to 5.00 nodes/stem, and the internode length varied between 12.00 cm and 25.00 cm. The average stem thickness of the plants was 3.01 mm, while the number of stems per plant varied from 1 to 15 stems/plant. The average plant spread diameter was determined to be 36.51 cm. In the study, the green forage yield per plant ranged from 54.00 g to 148.80 g/plant, while hay yields ranged from 15.71 g to 48.29 g/plant. Regarding quality characteristics, the crude protein content ranged from 7.45% to 12.68%, while the NDF and ADF contents were found to be in the ranges of 66.20%-72.46% and 32.13%-35.81%, respectively. The average RFV of the plant was determined to be 83.97.

Keywords: *Chrysopogon gryllus* (L.) Trin., plant height, crude protein content, NDF, RFV

BUZAĞI OTUNUN (*Chrysopogon gryllus* (L.) Trin.) BAZI MORFOLOJİK VE TANIMSAL ÖZELLİKLERİNİN BELİRLENMESİ ÜZERİNE BİR ARAŞTIRMA

ÖZET

Bu çalışma, Uşak meralarında doğal halde yayılış gösteren, çok yıllık bir sıcak iklim buğdaygili olan buzağı otunun (*Chrysopogon gryllus* (L.) Trin.) bazı morfolojik ve tarımsal özelliklerinin belirlenmesi amacıyla 2024 yılında Uşak'ta yürütülmüştür. Çalışma kapsamında Uşak Merkez Budaklar Köyü merasından toplanarak 70 x 50 cm aralığındaki ocaklara dikilen, iki yaşında ve çiçeklenme dönemindeki 15 bitki üzerinde ölçüm ve gözlemler yapılmıştır.

Araştırmada belirlenen sonuçlara göre buzağı otunda bitki boyu 78.00 cm ile 144.00 cm arasında, boğum sayısı 3.00 ile 5.00 adet/sap arasında ve boğum uzunluğu 12.00 ile 25.00 cm arasında değişim göstermiştir. Bitkide ortalama sap kalınlığı 3.01 mm iken, bitki başına sap sayısı 1 ile 15 adet/bitki arasında farklılık göstermiştir. Buzağı otunda ortalama bitki yayılma çapı ise 36.51 cm olarak belirlenmiştir. Çalışmada buzağı otunun bitki başına yeşil ot verimi değerleri 54.00 g ile 148.80 g/bitki arasında değişirken kuru ot verimleri 15.71 g ile 48.29 g/bitki arasında değişim göstermiştir. Kalite özelliklerinden ham protein oranı %7.45 ile %12.68 arasında değişiklik gösterirken, NDF ve ADF oranları sırasıyla %66.20-%72.46 ve %32.13-%35.81 aralığında tespit edilmiş, bitkide ortalama RFV değeri ise 83.97 olarak tespit edilmiştir.

Anahtar Kelimeler: *Chrysopogon gryllus* (L.) Trin., bitki boyu, ham protein oranı, NDF, RFV

ABSTRACT

This study was conducted in 2023 at the Sakarya University of Applied Sciences, Agricultural Sciences and Technologies Education Application and Research Center, to determine the effects of different additives added to cobbed and cobless corn silage on their quality characteristics. The FAO 700 hybrid Kale corn variety was used in the study. The cobbed and cobless plants were prepared for silage, and these materials were silaged with four different additives: urea, barley chop, whey, and molasses. The research was conducted using a randomized complete block design with three replications. After the fermentation period, silages were evaluated using dry matter content and pH values to calculate Flieg scores, and physical analysis was performed using color, odor, and structure data, with DLG (Deutsche Landwirtschafts Gesellschaft) scoring to assess the silages' quality parameters. According to the findings, the lowest dry matter content of 32.5% was observed in the silages with cobless plants and whey, while the highest content of 45.5% was found in the cobbed silage with molasses. In terms of pH, the cobbed molasses mixture had the lowest value of 3.82, while the highest value of 5.59 was detected in the cobless urea mixture. According to the physical analysis and DLG scoring, all samples, except for the cobbed urea mixture, were generally

classified as medium to good, while according to Flieg scores, all applications, except for the cobbed urea and cobless urea mixtures, were classified as very good.

In the physical analysis, no positive effect of the additives added to the silages made from cobless plants was observed, whereas the findings derived from pH and dry matter values calculated using Flieg scoring revealed that additives such as molasses and urea had a significant positive effect on the pH value and dry matter content of corn silage. Additionally, all silages were observed to be of high quality, as indicated by Flieg scores.

Considering all these results, it can be said that, except for the urea application, additives had a positive effect on both cobbed and cobless silage quality.

Keywords: Corn, Silage, Additive, Silage quality

FARKLI KATKI MADDELERİ İLE YAPILAN MISIR (*Zea mays* L.) SİLAJININ KALİTE ÖZELLİKLERİNİN BELİRLENMESİ

ÖZET

Bu çalışma, koçanlı ve koçansız mısır silajına ilave edilen farklı katkı maddelerinin kalite özellikleri üzerindeki etkilerini belirlemek amacıyla, Sakarya Uygulamalı Bilimler Üniversitesi Tarım Bilimleri ve Teknolojileri Eğitimi Uygulama ve Araştırma Merkezi arazisinde 2023 yılında yürütülmüştür. Çalışmada, FAO 700 olum grubuna ait Kale mısır çeşidi kullanılmıştır. Koçanlı ve koçansız bitkiler, silaj yapılmak üzere hazırlanmış ve bu materyaller; üre, arpa kırması, peyniraltı suyu ve melâs gibi dört farklı katkı maddesi eklenerek silaj yapılmıştır. Araştırma, Tesadüf Blokları Deneme Deseni'ne göre üç tekerrürlü olarak yürütülmüştür. Fermantasyon süresi sonunda açılan silajlarda kuru madde oranı ve pH değerinden yararlanılarak Flieg puanları, renk, koku ve strüktür verilerinden yararlanılarak fiziksel analiz değerlendirmesi DLG (Deutsche Landwirtschafts Gesellschaft) puanlaması ile hesaplanarak, silajların kalite parametreleri ortaya konulmuştur. Elde edilen bulgulara göre, en düşük kuru madde oranı %32.5 ile koçansız peyniraltı suyu ilave edilen silajlarda, en yüksek ise %45.5 ile koçanlı melâs katkı maddeli silajlarda gözlemlenmiştir. pH değeri açısından ise; 3.82 ile koçanlı melas karışımı en düşük değere sahip olurken, koçansız üre karışımında en yüksek değer olan 5.59 tespit edilmiştir. Fiziksel analiz sonucu DLG puanlamasına göre, koçanlı üre karışımlı silaj hariç tüm örnekler genel olarak orta ve iyi sınıfta yer alırken, Flieg puanlarına göre, koçanlı üre katkılı ve koçansız üre katkılı silajlar hariç tüm uygulamalar çok iyi sınıfında değerlendirilmiştir.

Silaj fiziksel analiz sonucu yapılan değerlendirmede koçansız bitkilerden yapılan silajlara ilave edilen katkı maddelerinin olumlu etkisi görülmezken, pH ve kuru madde değerleri üzerinden hesaplanan ve silaj kalitesini belirlemede yararlanılan Flieg puanlamasında ise bulgular, melâs ve üre gibi katkı maddelerinin mısır silajının pH değeri ve kuru madde oranı üzerinde önemli olumlu etkiler sağladığını ortaya koymuştur. Ayrıca, Flieg puanları açısından tüm silajların yüksek kaliteli olduğu gözlemlenmiştir.

Tüm bu sonuçlar değerlendirildiğinde; katkı maddelerinden üre uygulaması hariç koçanlı ve koçansız silaj kalitesi üzerinde olumlu etki gösterdeği söylenebilir.

ABSTRACT

The research was carried out in Muş province in 2022. The aim of the research was to determine the grass yield and quality of the genotypes of 14 Sorghum and Sorghum Sudan grass hybrids and 4 candidate varieties (Akdarı, 26, Mataco, Talisman, Karaca Melez, 305, Uzun, Hulk, Gözde 80, E.Sumac, Rox, 310, Aldarı, Öğretmen Oğlu, 314, Leoti, Erdurmuş, Beydarı) in Muş Ecological conditions. The desaduff blocks were used in 3 replications according to the experimental design.

Plants; height 96.33-243.66 cm, single plant weight 868.33-2418.33 gr, dry matter yield 345.95-1057.18 kg per decare, crude protein ratio % 6.08-10.02

According to the research results in this study, while Leoti, Uzun and Beydarı varieties stand out in terms of quality; Gözde 80, Uzun and Mataco varieties stand out in terms of yield. In order to obtain a good yield in Muş and similar ecological conditions, it can be recommended to grow one of the Gözde 80, Uzun or Mataco varieties. When evaluated in terms of both yield and quality, it would be appropriate to use the Uzun variety, which is in high statistical groups.

Keywords: Grass yield, Silage, Sorghum

MUŞ EKOLOJİK KOŞULLARINDA BAZI SORGUM GENOTİPLERİNİN OT VE KALİTE ÖZELLİKLERİNİN BELİRLENMESİ

ÖZET

Araştırma 2022 yılında Muş ilinde yürütülmüştür. Araştırmada amaç Muş Ekolojik koşullarına bazı 14 Sorgum ve Sorgum Sudan otu melezi ile 4 adet çeşit adayında (Akdarı, 26, Mataco, Talisman, Karaca Melez, 305, Uzun, Hulk, Gözde 80, E.Sumac, Rox, 310, Aldarı, Öğretmen Oğlu, 314, Leoti, Erdurmuş, Beydarı) genotiplerinin ot verim ve kalitesi belirlenmesi amacıyla desadüf blokları deneme desenine göre 3 tekrarlı olarak yapılmıştır.

Bitkilerin; boyu 96,33-243,66 cm, tek bitki ağırlığı 868,33-2418,33 gr, kuru madde verimi dekara 345,95-1057,18 kg, ham protein oranı % 6,08-10,02

Bu çalışmada araştırma sonucuna göre kalite bakımından Leoti, Uzun ve Beydarı çeşitleri ön plana çıkarken; verim bakımından ise Gözde 80, Uzun ve Mataco çeşitleri ön plana çıkmıştır. Muş ve benzeri ekolojik koşullarda iyi bir verim elde etmek için Gözde 80, Uzun veya Mataco çeşitlerinden birinin yetiştirilmesi önerilebilir. Hem verim hem de kalite bakımından değerlendirildiğinde ise yüksek istatistiki gruplar içinde olan Uzun çeşidinin kullanılması elverişli olacaktır.

ABSTRACT

Plant extracts contain natural compounds widely used in the food, pharmaceutical, and cosmetic industries. The effective extraction of these compounds depends on the selected extraction method. Traditional methods include maceration, percolation, and Soxhlet extraction, while in recent years, environmentally friendly and high-efficiency techniques have been developed.

Modern extraction methods reduce solvent consumption while obtaining compounds with higher purity and biological activity. Supercritical fluid extraction (SFE) operates at low temperatures, preventing thermal degradation and preserving volatile compounds. Ultrasonic-assisted extraction (UAE) enhances solvent penetration by breaking down cell structures through sound waves, accelerating the process. Microwave-assisted extraction (MAE) helps selectively extract target compounds while providing energy savings. In recent years, innovative solvents such as deep eutectic solvents (DES) and ionic liquids (IL) have been introduced as alternatives to toxic organic solvents. These solvents are biodegradable and environmentally friendly, making them a crucial part of sustainable extraction processes. Additionally, enzyme-assisted extraction techniques allow for the natural breakdown of cell walls, leading to higher yields.

In our study, plant extraction was performed using the fruits and leaves of the chinaberry tree (*Melia azedarach*). The fruits were separated from their seeds and dried in an oven for 24 hours along with the leaves, followed by a grinding process. The leaf extract was prepared using ethanol, while the fruit extract was obtained using methanol. The extraction process was carried out in 50 mL Falcon tubes, with 10 parts plant material and 40 parts solvent. The mixtures were subjected to orbital shaking for 48 hours, and the solvents were evaporated at room temperature to obtain dried extracts. Finally, the dried extracts were dissolved in distilled water to form solutions.

The extraction method used in this study is a traditional solvent-based technique, which can be integrated with widely adopted modern approaches to enhance efficiency. This paper will examine the traditional and modern extraction methods used for obtaining bioactive compounds from plants.

BİTKİSEL EKSTRAKSİYON YÖNTEMLERİ: GELENEKSEL VE YENİLİKÇİ TEKNİKLER

ÖZET

Bitkisel ekstraktlar, gıda, ilaç ve kozmetik endüstrisinde yaygın olarak kullanılan doğal bileşikler içerir. Bu bileşiklerin etkin bir şekilde elde edilmesi, seçilen ekstraksiyon yöntemine bağlıdır. Geleneksel yöntemler arasında maserasyon, perkolasyon ve soxhlet ekstraksiyonu bulunurken, son yıllarda çevre dostu ve yüksek verimli yeni teknikler geliştirilmiştir.

Modern ekstraksiyon yöntemleri, çözgen tüketimini azaltarak daha yüksek saflıkta ve biyolojik aktiviteye sahip bileşiklerin elde edilmesini sağlamaktadır. Süperkritik akışkan ekstraksiyonu (SFE), düşük sıcaklıkta çalışarak termal bozulmayı önler ve özellikle uçucu bileşiklerin korunmasını sağlar. Ultrasonik destekli ekstraksiyon (UAE), ses dalgalarının hücre yapısını parçalama etkisiyle çözgen penetrasyonunu artırarak süreci hızlandırır. Mikrodalga destekli ekstraksiyon (MAE) ise hedef bileşiklerin seçici olarak elde edilmesine yardımcı olurken enerji tasarrufu da sağlar. Son yıllarda derin ötektik çözücüler (DES) ve iyonik sıvılar (IL) gibi yenilikçi çözücüler kullanılarak, toksik organik çözücülere alternatif geliştirilmiştir. Bu çözücüler biyolojik olarak parçalanabilir ve çevre dostu olmaları nedeniyle sürdürülebilir ekstraksiyon süreçlerinde önemli bir yer edinmektedir. Ayrıca, enzim destekli ekstraksiyon teknikleri, hücre duvarlarının doğal yollarla parçalanmasını sağlayarak daha yüksek verim elde edilmesini mümkün kılmaktadır.

Yapmış olduğumuz bir çalışmada, tesbih ağacı meyveleri ve yaprakları kullanılarak bitkisel ekstraksiyon işlemi gerçekleştirilmiştir. Meyveler, çekirdeklerinden ayrılarak yapraklarla birlikte 24 saat etüvde kurutulmuş, ardından öğütme işlemi uygulanmıştır. Yaprak ekstraktı, etanol ile; meyve ekstraktı ise metanol ile hazırlanmış olup, 50 ml'lik Falcon tüplerinde 10 birim bitki materyali ve 40 birim çözücü oranında ekstrakte edilmiştir. Karışımlar 48 saat orbital shaker cihazında çalkalanarak ekstraksiyon süreci tamamlanmış, ardından çözücüler oda sıcaklığında uçurularak ekstraktlar kurutulmuştur. Son olarak, kuruyan ekstraktlar saf su ile çözelti haline getirilmiştir.

Bu çalışmada kullanılan ekstraksiyon yöntemi, geleneksel çözücü bazlı ekstraksiyon tekniklerinden biri olup, günümüzde yaygın olarak tercih edilen modern yaklaşımlarla entegre edilerek daha verimli hale getirilebilir. Bu bildiride, bitkisel biyoaktif bileşiklerin çıkarılmasında kullanılan geleneksel ve modern ekstraksiyon yöntemleri incelenecektir.

ABSTRACT

This study aims to determine the herbage and essential oil yield potentials of high-menthol clones (YLV-M46, Abure, Arven-1, and Arven-2) in three different ecological regions (Isparta, Kayseri, and Yalova) and to evaluate the effects of ecological variations on these yields. The plants used in the study were selected from clones with high menthol content based on previous research. Field studies in different ecological regions were carried out using a randomized block design. After planting, the water needs of the plants were met through a drip irrigation system, and weed control was performed manually. The plants were harvested at the flowering stage. In the study, fresh and dry herbage yields as well as essential oil ratios were determined depending on ecological conditions. Essential oils were isolated using the hydro-distillation method with a Clevenger apparatus. According to the research results, the highest yields were obtained in the Yalova due to the vegetation period. The highest yield was recorded for the YLV-M46 clone in Yalova, with fresh and dry herbage yields of 3,170 kg/da and 396 kg/da, respectively. Due to its high leaf proportion, the highest dry leaf yield was obtained from the Abure. The highest essential oil content with 6% was from Arven-1, which also had the highest essential oil yield with 25.98 L/da. Based on the first-year results, it was determined that the

Yalova ecology is more suitable for the cultivation of menthol mint. Additionally, among the clones examined, Arven-1 was found to be promising for national essential oil production to meet Turkey's demand.

Keywords: Mint, *Mentha arvensis*, menthol yield, essential oil

FARKLI EKOLOJILERDE YETIŞTIRILEN MENTOL NANESININ VERIM VE UÇUCU YAĞ ÖZELLIKLERININ ARAŞTIRILMASI*

ÖZET

Bu çalışmada, mentol oranı yüksek klonların (YLV-M46, Abure, Arven-1 ve Arven-2) üç farklı ekolojide (Isparta, Kayseri ve Yalova) herba ve uçucu yağ verim potansiyelleri ile ekolojik farklılıkların bu verimler üzerindeki etkilerinin belirlenmesi amaçlanmıştır. Çalışmada kullanılan bitkiler, önceki araştırmalardan seçilmiş, yüksek mentol oranına sahip klonlardan oluşmaktadır. Ekolojilerde yürütülen tarla denemeleri, tesadüf blokları deneme desenine göre planlanmıştır. Bitkilerin su ihtiyacı damla sulama sistemiyle karşılanmış, yabancı ot mücadelesi ise elle yapılmıştır. Bitkiler çiçeklenme dönemine ulaştığında hasat edilmiştir. Çalışma kapsamında, ekolojik koşullara bağlı olarak taze ve kuru herba verimleri ile uçucu yağ oranları belirlenmiştir. Uçucu yağ oranları hidro-distilasyon yöntemiyle analiz edilmiştir. Araştırma sonuçlarına göre, uzun vejetasyon süresi nedeniyle en yüksek verimler Yalova lokasyonunda elde edilmiştir. En yüksek verim, Yalova ikliminde YLV-M46 klonundan alınmış olup, bu klonda taze ve kuru herba verimleri sırasıyla 3.170 kg/da ve 396 kg/da olarak belirlenmiştir. Yaprak oranının yüksek olması nedeniyle, en yüksek kuru yaprak verimi Abure klonunda kaydedilmiştir. Çalışmada, uçucu yağ oranının en yüksek değeri %6 ile Arven-1 klonunda tespit edilmiş olup, aynı klonda 25,98 L/da ile en yüksek uçucu yağ verimi elde edilmiştir. Çalışmanın ilk yılı verilerine göre, sıcak iklime sahip Yalova ekolojisinin mentol nanesi yetiştiriciliği için daha uygun olduğu belirlenmiştir. Ayrıca, incelenen klonlar arasında Arven-1 klonunun, Türkiye'nin ihtiyaç duyduğu uçucu yağın yerli üretimi açısından ümit vaat ettiği sonucuna ulaşılmıştır.

Anahtar Kelimeler: Nane, *Mentha arvensis*, mentol verimi, uçucu yağ

SELECTION OF DROUGHT TOLERANT POTATO (SOLANUM TUBEROSUM *L.*) BREEDING LINES *IN VITRO* CONDITIONS BY MORPHOLOGICAL AND MULTI-CRITERIA ANALYSIS METHODS

ABSTRACT

Potato (*Solanum tuberosum* L.) is a major field crop highly susceptible to drought stress and is anticipated to be significantly affected by the increasing threat of drought associated with climate change. In this context, the present study aimed to evaluate the morphological responses of 17 different potato genotypes under in vitro drought conditions simulated by adding PEG-6000 (Polyethylene Glycol) to the standard MS-0 (Murashige and Skoog) medium. The drought tolerance levels of these genotypes were compared using various analytical approaches.

The experimental material consisted of breeding lines and commercial cultivars developed by Niğde Ömer Halisdemir University and the Potato Research Institute Directorate, along with breeding lines obtained from the International Potato Center (CIP). The study was carried out in the Tissue Culture Laboratory of the Potato Research Institute, following a factorial experimental design with four replications. The evaluated morphological parameters included root length, shoot length, total fresh weight (TFW), and total dry weight (TDW) of the plants.

Based on TDW values, classical drought stress indices such as the Drought Tolerance Index (DTI) and the Drought Susceptibility Index (DSI) were calculated. In addition, modern decision support methodologies offering multi dimensional assessment namely, Multi-Criteria Decision Making (MCDM) methods TOPSIS and VIKOR were also employed. According to the DTI results, genotypes exhibiting the least biomass reduction under drought stress and maintaining high performance were identified. Specifically, CIP37, KONSUL, and NAHITA stood out with high DTI scores, suggesting strong drought tolerance. The findings from the VIKOR analysis were consistent with these results, with CIP37 being identified as the closest genotype to the ideal solution, having the lowest VIKOR score. Similarly, KONSUL and NAHITA ranked second and third, respectively, due to their robust drought tolerance and balanced stress response profiles.

Overall, the integration of classical indices (DTI, DSI) with modern MCDM methods (TOPSIS, VIKOR) provided a more comprehensive and reliable approach for genotype evaluation in

breeding programs. Based on the combined results of all analyses, CIP37, KONSUL, NAHITA, and MUT655 were recommended as promising genetic materials for further selection studies.

KURAKLIĞA TOLERANSLI PATATES (SOLANUM TUBEROSUM *L.*) ISLAH HATLARININ *IN VITRO* KOŞULLARDA MORFOFİZYOLOJİK VE ÇOK KRİTERLİ ANALİZ YÖNTEMLERİYLE SELEKSİYONU

ÖZET

Patates (*Solanum tuberosum* L.), kuraklık stresine karşı duyarlılığı yüksek olan önemli bir tarla bitkisidir ve iklim değişikliğine bağlı olarak artan kuraklık tehdidinden ciddi şekilde etkilenmesi beklenmektedir. Bu bağlamda yapılan çalışmada, standart MS-0 (Murashige and Skoog) ortamına PEG-6000 (Polietilen Glikol) eklenerek oluşturulan in vitro kuraklık koşullarında, 17 farklı patates genotipinin morfolojik tepkileri değerlendirilmiş ve kuraklığa tolerans düzeyleri farklı analiz yöntemleriyle karşılaştırılmıştır.

Denemede, Niğde Ömer Halisdemir Üniversitesi ve Patates Araştırma Enstitüsü Müdürlüğü tarafından geliştirilen ıslah hatları ve ticari çeşitler kullanılmıştır. Ayrıca International Potato Center (CIP)'dan temin edilen ıslah hatları da kullanılmıştır. Çalışma, dört tekerrürlü olarak faktöriyel deneme desenine göre Patates Araştırma Enstitüsü Müdürlüğü Doku Kültürü Laboratuvarı'nda yürütülmüştür. Değerlendirilen morfolojik parametreler; kök uzunluğu, sürgün uzunluğu, bitki toplam yaş ağırlığı (BTYA) ve bitki toplam kuru ağırlığı (BTKA) olmuştur.

Çalışmada, bitki toplam kuru ağırlığı (BTKA) verileri esas alınarak klasik stres indekslerinden Kuraklık Tolerans İndeksi (KTI) ve Kuraklık Hassasiyet İndeksi (KHI) hesaplanmıştır. Bunun yanı sıra, karar destek süreçlerinde çok boyutlu değerlendirme imkânı sunan modern yaklaşımlar kapsamında Çok Kriterli Karar Verme (ÇKKV) yöntemlerinden TOPSIS ve VIKOR analizleri de uygulanmıştır. KTI analizleri doğrultusunda, kuraklık uygulaması altında ağırlık kaybı minimum düzeyde kalan ve stres koşullarında iyi sonuç veren genotipler ön plana çıkmıştır. Bu bağlamda, özellikle CIP37, KONSUL ve NAHİTA genotipleri yüksek KTI değerleri ile dikkat çekmiş ve kuraklık stresine karşı en toleranslı materyaller arasında yer almıştır. VIKOR analizi sonuçları da bu bulguları destekler nitelikte olup, tüm kriterler dikkate alındığında CIP37 genotipi en düşük VIKOR skoruna sahip olarak ideal çözüme en yakın genotip olarak belirlenmiştir. Aynı analizde, KONSUL ve NAHİTA genotipleri sırasıyla ikinci ve üçüncü sırada yer alarak güçlü kuraklık toleransı ve dengeli stres yanıt profilleri ile öne çıkmıştır.

Sonuçlar, klasik indeksler (KTI, KHI) ile Çok Kriterli Karar Verme (TOPSIS, VIKOR) yöntemlerinin birlikte kullanılmasının, ıslah programlarında daha güvenilir ve çok boyutlu seleksiyon stratejileri geliştirilmesine olanak sunduğunu göstermektedir. Yürütülen tüm analizler neticesinde CIP37, KONSUL, NAHİTA ve MUT655 genotipleri, ileri seleksiyon çalışmaları için umut vaat eden materyaller olarak önerilmektedir.

AGROBACTERIUM-BASED TRANSFORMATION OF CRY 1C AND CRY 1CST GENES INTO COMMON BEAN (*Phaseolus vulgaris* L.)

Prof. Dr. Sevil SAĞLAM YILMAZ
Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi
saglamsevil@gmail.com
ORCID NO: 0000-0003-1302-9147

ABSTRACT

Common bean (*Phaseolus vulgaris* L.), a major food and plant protein source worldwide, is an important food grain legume plant that is used for both human and animal consumption and also enriches the soil with nitrogen. However, the bean seed beetle, *Acanthoscelides obtectus* Say., is a species that causes devastating damage to beans, chickpeas, black-eyed peas and beans in Türkiye and worldwide. Therefore, it causes significant annual losses in bean yield and economic burden. Therefore, this study aimed to investigate the introduction and integration of Cry 1C and Cry 1CST genes from the synthetic Cry gene family into the bean genome and to evaluate their effects on bean seed beetle infestation by producing and characterizing stable transgenic beans expressing Cry 1C and Cry 1CST genes. Transgenic bean plants containing the Cry 1C gene were treated with bean seed beetle under controlled field conditions and it was observed that all insects that ate the plants died. In addition, bean seed beetle larvae were given transgenic leaves in petri dishes, and all larvae that fed on the leaves died and their survival rates were found to be zero. These findings show that the transgenic lines demonstrated their resistance to bean seed beetle pests. In addition to bioassay analyses, histochemical GUS analysis, classical PCR, real time PCR and ELISA analyses proved that T-DNA integration occurred in both bean varieties. These results, together with possible changes to be made in the Biosafety Law in Türkiye, will enable the commercial use of transgenic bean varieties carrying the Cry 1C and Cry 1CST genes in the fight against Coleoptera.

Keywords: Common bean, *Agrobacterium tumefaciens*, bean seed beetle, Cry 1C gene, Cry1CST gene

FASULYE (*Phaseolus vulgaris* L.) BİTKİSİNE AGROBACTERİUMA DAYALI CRY 1C ve CRY 1CST GENLERİNİN TRANSFORMASYONU

ÖZET

Dünya çapında temel bir gıda ve bitkisel protein kaynağı olan fasulye (*Phaseolus vulgaris*), hem insan hem de hayvan tüketiminde kullanılmasının yanında ayrıca toprağı azotça zenginleştiren önemli bir yemeklik tane baklagil bitkisidir. Ancak, fasulye tohum böceği, *Acanthoscelides obtectus* Say., dünya genelinde ve Türkiye'de başta fasulye olmak üzere nohut, mürdümük ve börülcede yıkıcı zararlara sebep olan bir türdür. Bu sebeple de fasulye veriminde ve ekonomik yükte önemli yıllık kayıplara yol açmaktadır. Bu nedenle, bu çalışma, sentetik Cry gen ailesinden olan Cry 1C ve Cry 1CST genlerinin fasulye genomuna girişi ve entegrasyonunu araştırmayı ve Cry 1C ve Cry 1CST genlerini ifade eden stabil transgenik fasulyeleri üreterek ve karakterize ederek fasulye tohum böceği istilası üzerindeki etkisini değerlendirmeyi amaçlamıştır. Cry 1C geni aktarılmış transgenik fasulye bitkileri kontrollü tarla koşullarında fasulye tohum böceği ile muamele edilmiş ve bitkileri yiyen tüm böceklerin öldüğü gözlemlenmiştir. Ayrıca fasulye tohum böceği larvalarına petri kabı içinde transgenik yapraklar verilmiş, yapraklarla beslenen larvaların da tamamının öldüğü, hayatta kalma oranlarının sıfır olduğu sonucuna varılmıştır. Bu bulgular, transgenik hatların fasulye tohum böceği zararlılarına karşı dayanıklılıklarını ortaya koyduğunu göstermektedir. Biyoassay analizlerinin yanısıra Histokimyasal GUS analizi, Klasik PCR, Real Time PCR ve ELISA analizleri ile de T-DNA entegrasyonunun, heriki fasulye çeşidinde de gerçekleştiği kanıtlanmıştır. Bu sonuçlar, Türkiye'de Biyogüvenlik Kanununda yapılacak olası değişikliklerle birlikte Cry 1C ve Cry 1CST genlerini taşıyan transgenik fasulye çeşitlerinin Coleoptera zararlılarıyla mücadelesinde ticari kullanıma olanak sunacaktır.

Anahtar Kelimeler: Fasulye, *Agrobacterium tumefaciens,* fasulye tohum böceği, Cry 1C geni, Cry1CST geni

PROBLEMS AND SOLUTION SUGGESTIONS ENCOUNTERED IN MICROPROPAGATION OF WALNUT (*Juglans regia* L.)

Prof. Dr. Sevil SAĞLAM YILMAZ
Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi
saglamsevil@gmail.com
ORCID NO: 0000-0003-1302-9147

ABSTRACT

Walnut (*Juglans regia* L.) is an important hard-shelled fruit species with economic importance. It originates from Central Asia and Iran, but is currently grown in many countries such as Europe, America, Türkiye and China. Türkiye is one of the leading countries in the world in terms of production. Its use in the nuts and food industry is quite common. Its wood is also used in furniture, coatings and works of art. Due to its omega-3 content, it supports heart and brain health and is a food with an antioxidant effect that helps balance blood sugar and cholesterol levels. The walnut plant is one of the stubborn species in *in vitro* microculture. Plant tissue culture is an extremely advantageous method in mass-scale plant propagation. There is increasing interest in the application of tissue culture techniques in areas such as breeding, propagation, production of disease-free plants, rejuvenation of old varieties, development of clones suitable for abiotic and biotic stresses, production of disease-free plants, protection of genetic resources, genetic transformation, etc. *In vitro* micropropagation is now a tissue culture method used in many plants, including walnut, to develop new varieties on a large scale in a relatively short time. Despite the many advantages of the micropropagation technique in walnut, it has not reached the desired popularity due to many application difficulties/problems. There are various limitations such as microbial contamination, secretion of phenolics from cultured explants, accumulation of toxic compounds in the medium, low regeneration rate, necessity/difficulty and long time to develop genotype-specific micropropagation protocols, vitrification in shoots, thin shoots in tissue cultured products, reduced productivity in subcultures, *in vitro* rooting, high production cost, difficulties encountered in acclimatization and emergence of some variants in micropropagated populations. There are many reasons behind these problems that still await solutions. This study aims to explain some of the problems encountered during commercial scale *in vitro* micropropagation of walnut plants and solution proposals to overcome these problems. Although some problems have been largely solved by some researchers in some laboratories and countries, some limitations still prevent this technique from being used safely and efficiently in clonal rootstock production programs for walnut. This situation necessitates the continuation of intensive research on what these obstacles are and how they can be solved.

Keywords: Walnut, clonal propagation, contamination, darkening, vitrification

CEVİZ (*Juglans regia* L.)'İN MİKROÇOĞALTIMINDA KARŞILAŞILAN SORUNLAR ve ÇÖZÜM ÖNERİLERİ

ÖZET

Ceviz (*Juglans regia* L.) ekonomik öneme sahip önemli bir sert kabuklu meyve türüdür. Orta Asya ve İran kökenlidir, ancak günümüzde Avrupa, Amerika, Türkiye ve Çin gibi birçok ülkede yetiştirilmektedir. Türkiye; üretim açısından dünyada önde gelen ülkelerden biridir. Kuruyemiş ve gıda sanayisinde kullanımı oldukça yaygındır. Ayrıca ahşabı da mobilya, kaplama ve sanat eserlerinde kullanılmaktadır. Omega-3 içeriğinden dolayı kalp ve beyin sağlığını desteklemekte, kan şekeri ve kolesterol seviyelerini dengelemeye yardımcı olan antioksidan etkisine sahip bir besindir. Ceviz bitkisi *in vitro* mikroğaltımlarda inatçı türlerden biridir. Bitki doku kültürü, kitlesel ölçekte bitki çoğaltımlarında son derece avantajlı bir yöntemdir. Doku kültürü tekniklerine ıslah, çoğaltma, hastalıksız bitkilerin üretimi, eski çeşitlerin gençleştirilmesi, abiyotik ve biyotik streslere uygun klonların geliştirilmesi, hastalıksız bitkilerin üretimi, genetik kaynakların korunması, genetik transformasyon vb. alanlarda uygulanmasına yönelik ilgi artmaktadır. *In vitro* mikroçoğaltım artık ceviz de dahil olmak üzere birçok bitkide nispeten daha kısa sürede büyük ölçekte yeni çeşitlerin geliştirilmesi amacıyla kullanılan bir doku kültürü yöntemidir. Cevizde mikroçoğaltım tekniğinin pekçok avantajlarına rağmen, pekçok da uygulama zorluklarından/problemlerden dolayı istenilen popülerliğe ulaşamamıştır. Mikrobiyal kontaminasyon, kültürlenmiş eksplantlardan fenoliklerin salgılanması, toksik bileşiklerin ortamda birikmesi, düşük rejenerasyon oranı, genotipe özel mikroçoğaltım protokollerinin geliştirilmesinin zorunluluğu/zorluğu ve uzun zaman alması, sürgünlerde camlaşma (vitrifikasyon), doku kültüründe yetiştirilen ürünlerde ince sürgünler, alt kültürlerde azalan verimlilik, *in vitro* köklenme, yüksek üretim maliyeti, aklimatizasyonda karşılaşılan zorluklar ve mikroçoğaltılmış popülasyonda bazı varyantların ortaya çıkması gibi çeşitli kısıtlamalar vardır. Bu sorunların arkasında hala çözüm bekleyen birçok neden vardır. Bu çalışma, ceviz bitkisinin ticari ölçekte *in vitro* mikroçoğaltılması sırasında karşılaşılan bazı sorunları ve bu sorunları aşmaya yönelik çözüm önerilerini açıklamayı amaçlamıştır. Bazı sorunlar artık önemli ölçüde kimi araştırıcılarca kimi laboratuvar ve ülkelerde çözülmüşse de, bazı kısıtlamalar hala bu tekniğin cevizin klonal anaç üretim programında güvenli ve verimli bir şekilde kullanılmasına engel olmaktadır. Bu durum, bu engellerin neler olduğu ve nasıl çözülebileceklerine dair yoğun araştırmaların devamını zorunlu kılmaktadır.

Anahtar Kelimeler: Ceviz, klonal çoğaltım, kontaminasyon, kararma, vitrifikasyon

GENETIC DISTINCTION BETWEEN MORPHOLOGICALLY SIMILAR HEXAPLOID AND TETRAPLOID WHEAT SPECIES

ABSTRACT

Wheat is one of the most widely cultivated and economically significant agricultural crops worldwide. Although *Triticum aestivum* (bread wheat) has a hexaploid chromosome structure and *Triticum durum* (durum wheat) is tetraploid, distinguishing these two species based on morphological characteristics is challenging. In this study, we examined the genetic differences between *Triticum aestivum* and *Triticum durum* by analyzing nuclear gene regions, including 26S rDNA, the intergenic spacer (IGS), the XDuPw167 microsatellite locus, and the *Glu-1* gene regions. Our findings revealed distinct variations in the IGS region, confirming the hexaploid nature of *Triticum aestivum* and the tetraploid structure of *Triticum durum*. The analysis of 26S rDNA and the *Glu-1* gene regions identified species-specific nucleotide differences. The XDuPw167 microsatellite locus exhibited significant polymorphism in terms of repeat number for hekzaploid and tetaploid wheat species. This study highlights the role of genetic analysis in accurately distinguishing morphologically similar wheat species and underscores the importance of understanding wheat genetics to support sustainable agricultural practices.

Keywords: *Triticum aestivum*, *Triticum durum*, Hexaploid, Polymorphism, Tetraploid

MORFOLOJİK OLARAK BENZER HEKZAPLOİD VE TETRAPLOİD BUĞDAY TÜRLERİNİN GENETİK AYRIMI

ÖZET

Buğday, dünya genelinde en yaygın yetiştirilen ve ekonomik açıdan en önemli tarım ürünlerinden biridir. *Triticum aestivum* (ekmeklik buğday) hekzaploid, *Triticum durum* (makarnalık buğday) ise tetraploid kromozom yapısına sahip olmasına rağmen, bu iki türü morfolojik olarak ayırt etmek oldukça güçtür. Bu çalışmada, *Triticum aestivu*m ve *Triticum durum* türleri arasındaki genetik farklılıklar, 26S rDNA, intergenik spacer (IGS), XDuPw167 mikrosatellit lokusu ve Glu-1 gen bölgeleri analiz edilerek incelenmiştir. Elde edilen veriler, IGS bölgesindeki belirgin farklılıkların *Triticum aestivum*'un hekzaploid, *Triticum durum*'un ise tetraploid yapısını doğruladığını göstermiştir. 26S rDNA ve Glu-1 gen bölgelerinin analizinde türler arasında spesifik nükleotid farklılıkları tespit edilmiştir. XDuPw167 mikrosatellit lokusu ise tekrar sayıları açısından hekzaploid ve tetraploid buğday türleri açısından önemli düzeyde polimorfizm sergilemiştir. Bu çalışma, morfolojik olarak benzerlik gösteren buğday türlerinin genetik analiz yoluyla güvenilir şekilde ayrılabileceğini ortaya koymakta ve tarımsal sürdürülebilirliği desteklemek amacıyla buğday genetiğinin daha iyi anlaşılmasının önemini vurgulamaktadır.

Anahtar Kelimeler: *Triticum aestivum*, *Triticum durum*, Hekzaploid, Polimorfizm, Tetraploid

DEVELOPMENT OF SAGE VARIETIES WITH TETRAPLOID GENOME (TETRA SAGE) BY POLYPLOIDY BREEDING IN MEDICINAL AND ANATOLIAN SAGE

ABSTRACT

Sage (Salvia spp.) is a medicinal and aromatic plant of high economic value due to the secondary metabolites it contains. All of the wild collected and cultivated sage species and cultivars are diploid and there is no polyploid species and cultivars obtained naturally or artificially and commercialised yet. In this study, it was aimed to obtain autotetraploid (2n = 4x = 28) plants by applying different concentrations (0, 125, 250 and 500 ppm) of colchicine, a mitotic spindle strand inhibitor, to the seeds and cotyledonal growth tips of common sage (Salvia officinalis L. var. Elif, 2n = 2x = 14) and Anatolian sage (Salvia fruticosa L. var. Karık, 2n = 2x = 14).

Autotetraploid plants produced by colchicine induction are very important breeding materials as well as providing opportunities to obtain higher amounts of medicine, pharmacy, cosmetics and functional food raw materials. With polyploidy, organs such as leaves, flowers, fruits and seeds become larger, the number of stomata and chloroplasts and the amount of secondary metabolites increase. These results indicate that autotetraploid plants are of great economic importance with their potential to produce larger plants and more secondary metabolites compared to diploids.

In this study, phenological, morphological, anatomical (epidermis, trichome, stomata, chloroplast, pollen counts and measurements), cytological (chromosome counts and nuclear DNA content), agricultural (herb and leaf yields), quality (essential oil content) of diploid and tetraploid genotypes of both species, phenolic matter content, GC/MS essential oil components, HPLC phenolic matter components) and antiradical and antioxidant activities (ABST, β-carotene linoleic acid, CUPRAC, DPPH, Phosphomolybdanium and FRAP) were determined and in vitro micropropagation of the diploids were started.

Keywords: *Salvia*, Polyploidy Breeding, Colchicine, Diploid, Autotetraploid.

TIBBİ VE ANADOLU ADAÇAYINDA POLİPLOİDİ ISLAHI İLE TETRAPLOİD GENOMLU ADAÇAYI ÇEŞİTLERİNİN (TETRA SAGE) GELİŞTİRİLMESİ

ÖZET

Adaçayı (*Salvia* spp.), içerdiği sekonder metabolitler nedeniyle ekonomik değeri oldukça yüksek olan bir tıbbi ve aromatik bitkidir. Yabani olarak toplanan ve kültürü yapılan adaçayı tür ve çeşitlerinin tamamı diploid olup, henüz doğal veya yapay olarak elde edilerek ticarileştirilmiş bir poliploid türü ve çeşidi yoktur. Bu araştırmada, tıbbi adaçayı (*Salvia officinalis* L. var. Elif, 2n = 2x = 14) ve Anadolu adaçayının (*Salvia fruticosa* L. var. Karık, 2n = 2x = 14) tohumlarına ve kotiledonal büyüme uçlarına mitoz iğ iplikçiği inhibitörü olan kolhisinin farklı konsantrasyonları (0, 125, 250 ve 500 ppm) uygulanarak autotetraploid (2n = 4x = 28) seviyede bitkiler elde etmek hedeflenmiştir.

Kolhisin indüksiyonu ile meydana getirilmiş olan autotetraploid formdaki bitkiler oldukça önemli ıslah materyalleri olmalarının yanı sıra tıp, eczacılık, kozmetik ve fonksiyonel gıda hammaddelerinin daha yüksek miktarlarda elde edilme olanakları da sunmaktadır. Poliploidy ile birlikte yaprak, çiçek, meyve ve tohum gibi organlarda irileşme, stoma ve kloroplast sayılarında ve sekonder metabolitlerin miktarında artışlar olmaktadır. Bu sonuçlar, diploidlerle kıyaslandıklarında autotetraploid bitkilerin, daha büyük bitkiler ve daha fazla sekonder metabolit üretimini mümkün kılma potansiyelleri ile ekonomik açıdan büyük önem taşıdıklarını göstermektedir**.**

Bu araştırmada her iki türe ait diploid ve tetraploid genomlu genotiplerin fenolojik, morfolojik anatomik (epidermis, trikom, stoma, kloroplast, polen sayımları ve ölçümleri), sitolojik (kromozom sayımı ve çekirdek DNA miktarı), tarımsal (drog herba ve yaprak verimleri), kalite (uçucu yağ içeriği, fenolik madde içeriği, GC/MS uçucu yağ bileşenleri, HPLC fenolik madde bileşenleri) ile antiradikal ve antioksidan aktiviteleri (ABST, β-karoten linoleik asit, CUPRAC, DPPH, Fosfomolibdanyum ve FRAP) belirlenmiş, diploidlerinden üstün bulunanların *in vitro* mikroçoğaltımlarına başlanmıştır.

Anahtar Kelimeler: *Salvia*, Poliploidi Islahı, Kolhisin, Diploid, Autotetraploid.

THE EFFECT OF *LACTOBACILLUS BREVIS* (MF098783) STRAIN ON THE QUALITY AND AEROBIC STABILITY OF WHEAT FORAGE SILAGE

ABSTRACT

This study aimed to investigate the potential use of the *Lactobacillus brevis* (LB) MF098783 strain, isolated from natural sources, as a microbial inoculant in wheat (*Triticum aestivum*) forage silage. The main objectives were to evaluate whether this lactic acid bacterium could enhance silage fermentation when applied at appropriate population densities, and to assess its effects on the chemical and microbiological quality of silage, as well as its contribution to aerobic stability. The experimental design consisted of four groups: a control group (TA) and three treatment groups inoculated with *L. brevis* strains (TALB10^6, TALB10^8, and TALB10^9). Wheat forage was harvested during the milk stage of maturity, packed into 2-liter vacuum-sealed polyethylene bags in eight replicates per group, and allowed to ferment under laboratory conditions for 60 days. Upon completion of the fermentation period, physical, chemical, microbiological, and aerobic stability analyses were performed. Statistically significant differences in pH values were observed among the groups (60.56, 4.73, 4.90, and 4.86, respectively). Increasing bacterial inoculant levels resulted in a notable reduction in yeast populations during the aerobic exposure period, and no mold development was detected in the treated silages. In conclusion, inoculation with the *Lactobacillus brevis* strain contributed to the suppression of undesirable microorganisms and yeasts, thereby improving both the quality and aerobic stability of wheat forage silage. These results suggest that *L. brevis* may offer a promising biotechnological approach for enhancing silage preservation.

Keywords: Aerobic stability, silage microbiology, *Lactobacillus brevis*, *Triticum aestivum* forage

LACTOBACILLUS BREVIS (MF098783) SUŞUNUN BUĞDAY HASILI SILAJININ KALITESI VE AEORBIK STABILITESI ÜZERINE ETKISI

ÖZET

Bu çalışma, buğday (*Triticum aestivum*) hasılında *Lactobacillus brevis* (LB) MF098783 suşunun mikrobiyel inokulant olarak kullanım olanaklarını araştırmayı amaçlamaktadır. Araştırmada, bu laktik asit bakterisinin uygun popülasyon yoğunluğunda silaj fermantasyonunu olumlu yönde etkileyip etkilemediği, silajın kimyasal ve mikrobiyolojik kalitesine olan etkisi ile aerobik stabilite süresine katkısı değerlendirilmiştir. Çalışma dört farklı gruptan meydana gelmektedir. Gruplar kontrol grubu (TA), *Lactobacillus brevis* TALB10^{6}, TALB10^{8} ve TALB10^{9}'dir. Süt olum döneminde hasat edilen buğday hasılı, 8 tekerrürlü olarak 2 litrelik vakumlu torbalara konulmuş ve laboratuvar koşullarında 60 gün süreyle fermentasyona bırakılmıştır. Fermentasyon süreci sonunda fiziksel, kimyasal, mikrobiyolojik ve aerobik stabilite analizleri gerçekleştirilmiştir. pH değerleri gruplar arasında istatistiksel olarak anlamlı farklılık göstermiştir (sırasıyla: 60.56, 4.73, 4.90 ve 4.86). Kullanılan bakteri dozunun artışıyla birlikte aerobik stabilite sürecinde maya popülasyonlarında azalma gözlenmiş, silaj örneklerinde küf gelişimi saptanmamıştır. Sonuç olarak, *Lactobacillus brevis* suşunun buğday hasılı silajına inokulasyonu, istenmeyen mikroorganizma ve maya gelişimini sınırlayarak silaj kalitesinin ve aerobik stabilitenin artırılmasında potansiyel bir biyolojik katkı sunmaktadır.

Anahtar Kelimeler: Aerobik stabilite, silaj mikrobiyolojisi, *Lactobacillus brevis*, *Triticum aestivum hasılı*

DETERMINATION OF NITRATE LEVELS IN WELL WATER: THE CASE OF KIRSEHIR PROVINCE

ABSTRACT

Water is essential to survive and groundwater plays an important role in supplying water to rural areas. Over time, however, groundwater quality has deteriorated due to anthropogenic activities such as agricultural run-off, excessive fertiliser use and industrial pollution. In particular, high nitrate levels in groundwater raise concerns about whether the water is safe to drink. The aim of this research is to determine the nitrate content of well water used for irrigation purposes in the agricultural areas of Kırşehir region, to evaluate the suitability of this well water for agricultural irrigation, and to analyse the effect of precipitation and evaporation patterns and nitrate pollution levels. Well water was sampled seasonally in January, April, July and October from 2015-2019. The analysis results were evaluated within the framework of the Regulation on protection of waters against nitrate pollution from agricultural sources. In addition, Geographic Information Systems and Inverse Weighted Distance interpolation were used to model the spatial distribution of nitrate pollution at different points in the region. The study integrated multi-site groundwater nitrate data with meteorological data including annual precipitation and evapotranspiration. The study identifies areas at risk of groundwater quality degradation. It also highlights the importance of sustainable water management practices. It also highlights the importance of the consideration of climatic factors such as rainfall and evaporation in water quality assessments.

KUYU SULARINDAKI NITRAT DEĞERLERININ BELIRLENMESI: KIRŞEHIR İLI ÖRNEĞI

ÖZET

Su, yaşamı sürdürebilmek için hayati öneme sahip bir kaynaktır ve yer altı suyu, kırsal bölgelerdeki su temini için önemli bir rol oynamaktadır. Ancak zamanla tarımsal akış, aşırı gübre kullanımı ve endüstriyel kirlilik gibi insan kaynaklı faaliyetler yer altı suyu kalitesinin düşmesine neden olmuştur. Özellikle, yer altı suyunda yüksek nitrat seviyeleri, suyun tüketim için güvenli olup olmadığı konusunda endişelere yol açmaktadır. Bu araştırma, Kırşehir bölgesinde tarımsal faaliyetlerin yapıldığı bölgelerde, sulama amaçlı kullanılan kuyu sularındaki nitrat içeriklerinin belirlenmesi, bu kuyu sularının tarımsal sulama açısından uygun olup olmadığının değerlendirilmesi, nitrat kirliliği seviyelerinin yanı sıra yağış ve buharlaşma desenlerinin etkisini analiz etmeyi amaçlamaktadır. Kuyu su örnekleri 2015-2019 yılları arasında, her yıl mevsimsel olarak Ocak, Nisan, Temmuz, Ekim aylarında alınmıştır. Analiz sonuçları, Tarımsal Kaynaklı Nitrat Kirliliğine Karşı Suların Korunması Yönetmeliği kapsamında değerlendirilmiştir. Ayrıca, Coğrafi Bilgi Sistemleri (CBS) ve Ters Ağırlıklı Mesafe (IDW) enterpolasyonu kullanılarak bölgedeki farklı noktalarda nitrat kirliliğinin mekansal dağılımı modellenmiştir. Çalışma, birden fazla izleme noktasından elde edilen yer altı suyu nitrat verilerini, yıllık yağış ve buharlaşma oranları gibi meteorolojik verilerle entegre etmiştir. Bu çalışma, yer altı suyu kalitesinin bozulma riski taşıyan bölgeleri vurgulayarak sürdürülebilir su yönetimi uygulamalarının önemini ortaya koymaktadır. Ayrıca, su kalitesi değerlendirmelerinde yağış ve buharlaşma gibi iklimsel faktörlerin dikkate alınmasının önemini vurgulamaktadır.

ABSTRACT

This study was conducted to determine the effects of operating combine harvesters at different forward speeds on grain losses during wheat harvesting. Reducing harvest losses is of great importance in increasing efficiency in agricultural production. Operating combine harvesters at inappropriate speeds may lead to overloading of the threshing and cleaning systems, which in turn can significantly increase grain losses. In this context, field trials were carried out during the 2024 wheat harvest season at the Aksu Research Farm of Akdeniz University, Faculty of Agriculture, located in Antalya, Türkiye. The trials were conducted on a 3-hectare wheat field where the combine harvester was operated at three different forward speeds: 4.4 km/h, 5.5 km/h, and 6.4 km/h. At each speed level, grains lose through the sieves, and from the straw walkers were collected and weighed to calculate the grain loss percentage. The data obtained indicated that grain loss increased significantly with increasing forward speed. The lowest loss was observed at 4.4 km/h, while the highest was recorded at 6.4 km/h. These findings highlight the importance of operating combine harvesters at optimal speeds to enhance harvesting efficiency and minimize economic losses.

Keywords: Combine Harvester, Wheat Harvesting, Grain Loss, Harvesting Efficiency

BİÇERDÖVER İLERLEME HIZININ, BUĞDAY HASADINDA DANE KAYBI ÜZERİNE ETKİSİ

ÖZET

Bu çalışmada, biçerdöverlerin farklı ilerleme hızlarında çalıştırılmasının buğday hasadında meydana gelen dane kayıpları üzerindeki etkilerini belirlemek amacıyla gerçekleştirilmiştir. Tarımsal üretimde hasat kayıplarının azaltılması, verimliliğin artırılması açısından büyük önem arzetmektedir. Biçerdöverlerin uygun olmayan hızda çalıştırlması, özellikle harmanlama ve temizleme sistemlerinin kapasitesinin üzerine çıkmasına neden olmakta bu da dane kaybını artırabilmektedir. Bu kapsamda, 2024 yılı buğday hasat sezonunda Antalya Akdeniz Üniversitesi, Ziraat Fakültesi Aksu Çiftliğinde 3 ha alanda buğday hasadında, biçerdöver üç farklı ilerleme hızında (4.4 km/h, 5.5 km/h ve 6.4 km/h) çalıştırılmıştır. Her hız seviyesinde, tabla arkasında, eleklerden ve sarsaklardan yere düşen daneler toplanarak tartılmış ve dane kaybı oranları hesaplanmıştır. Elde edilen veriler, hasat hızı arttıkça dane kaybının da anlamlı bir şekilde yüseldiğini göstermiştir. En düşük kayıp oranı 4.4 km/h hızda, en yüksek kayıp ise 6.4 km/h hızda gözlemlenmiştir. Bu bulgular, biçerdöverin optimum hızda çalıştırılmasının hem hasat verimliliğini artırmak hem de ekonomik kayıpları en aza indirmek açısından öneme sahip olduğunu ortaya koymaktadır.

Anahtar Kelimeler: Biçerdöver, Buğday Hasadı, Dane Kaybı, Hasat Verimliliği

HETEROSIS EFFECTS ON UPTAKE VE ACCUMULATION OF ZINC IN BARLEY

ABSTRACT

Increasing zinc content of crops has attracted plant breeders only to produce more nutritious food but also to develop high yielding plants for zinc-deficient soils. The most convenient and environmentally friendly way to increase zinc content in zinc-deficient and zinc-sufficient agricultural soils is genetic improvement.

The present study investigated the effect of heterosis on Zn uptake, Zn accumulation and zinc deficiency tolerance in barley. Cultivars Tokak 157/37 and Baronesse, which differed in tolerance to zinc deficiency, zinc uptake and zinc accumulation in grain, and F1 derived from these cultivars were used as plant material. Genotypes were cultured hydroponically in zinc-deficient and zinc-sufficient conditions until two different stages, spike appearance and physiological maturity. Shoot, root and grain yields, zinc concentration, zinc content, plant height and zinc deficiency symptom were determined in the genotypes.

Zinc deficiency caused a decrease in all other characters except root yield. Under zinc deficient conditions, F1 produced 27% more shoot and 25% more roots, 54% less root zinc concentration, 25% less grains and 6% weaker grains than the high parent. In other characters, F1 had similar values to the high parent.

Under zinc-sufficient conditions, F1 produced 35% more shoots, 18% more shoot zinc content and 52% more grain than the high parent. However, root zinc concentration decreased by 54%, root zinc content by 47%, shoot zinc concentration by 13%, grain weight by 11%, grain zinc concentration by 12% and grain zinc content by 21% in F1 compared to high parent. Other traits of F1 showed similar values with the higher parent.

The results show that heterosis improves the translocation of zinc. The increased grain numbers due to higher performance by heterosis resulted in a slight decrease in grain zinc content compared to the high parent due to the dilution effect. Finally, the tolerance to zinc deficiency, zinc uptake and zinc accumulation in the grain can be improved by heterosis.

Key words: Grain zinc content, *Hordeum vulgare*, Hybrid, Zn,

ARPADA HETEROSİSİN ÇİNKO ALIMI VE BİRİKİMİNE ETKİSİ

ÖZET

Kültür bitkilerinin çinko içeriğini artırmak daha besleyici gıdalar üretmek yanında çinko eksik tarım alanları için yüksek verimli bitkiler geliştirmek için bitki ıslahçılarının fazlasıyla dikkatini çekmektedir. Çinko eksik ve yeterli tarım topraklarında çinko içeriğini artırmanın en pratik ve çevre dostu yolu genetik kazanımlardır.

Bu araştırmada arpada heterosisin Zn alımına, Zn birikimine ve çinko eksikliği toleransına etkisi incelenmiştir. Çinko eksikliğine tolerans ve çinko alımı ve tanede çinko birikimi bakımından farklılıklar gösteren Tokak 157/37 ve Baronesse çeşitleri ve bunlardan üretilen F1 bitki materyali olarak kullanılmıştır. Genotipler başaklanma ve olgunlaşma olmak üzere iki farklı döneme kadar çinko eksik ve çinko yeterli su kültüründe incelenmiştir. Genotiplerde yeşil aksam, kök ve tane verimleri, çinko içeriği, çinko konsantrasyonu, bitki boyu ve çinko eksikliği semptomu belirlenmiştir.

Çinko eksikliği kök verimi dışında diğer incelenen bütün karakterlerin azalmasına neden olmuştur. Çinko eksik şartlarda F1 yüksek ebeveyne göre %27 daha fazla yeşil aksam ve %25 daha fazla kök üretirken, %54 daha az kök çinko konsantrasyonu, %25 daha az tane ve %6 daha hafif taneler üretmiştir. Diğer karakterlerde F1'de yüksek ebeveyne benzer değerler belirlenmiştir.

Çinko yeterli koşullarda, F1 bitkileri, yüksek ebeveynine göre %35 daha fazla yeşil aksam, %18 daha fazla yeşil aksam çinko içeriği ve %52 daha fazla tane üretmiştir. Ancak, kök çinko konsantrasyonu %54, kök çinko içeriği %47, yeşil aksam çinko konsantrasyonu %13, tane ağırlığı %11, tane çinko konsantrasyonu %12 ve tane çinko içeriği %21 oranında azalma göstermiştir. F1'in diğer özellikleri ise yüksek ebeveynle benzer değerler sergilemiştir.

Sonuçlar heterosis çinkonun translokasyonunu geliştirdiğini göstermektedir. Heterosis ile ortaya çıkan daha yüksek performans sayesinde artan tane sayıları, seyrelme etkisinden dolayı tane çinko içeriğinin yüksek ebeveyne göre bir miktar düşmesine neden olmuştur. Son olarak çinko eksikliğine toleransı, çinko alımı ve tanede çinko birikiminin heterosis sayesinde geliştirilebileceğini göstermektedir.

Anahtar kelimeler: Hibrit, *Hordeum vulgare*, Tane çinko içeriği Zn,

ENHANCING SOIL HEALTH AND REDUCING WIND EROSION: COVER CROP STRATEGIES FOR SUGARBEET SYSTEMS IN MINNESOTA'S FERTILE BLACK SOILS

ABSTRACT

Maintaining the sustainability of Minnesota's black soils (United States) is crucial, especially given the significant economic role of the sugar beet industry and the negative effects of intensive heavy machinery use, which degrades soil and increases erosion. This study, conducted through both station and on-farm trials from 2022 to 2024, evaluated the impact of cover crops on wind erosion, sugar beet yield, and overall soil health.

The station experiment, conducted in Crookston, MN, tested four treatments on 7 m x 12 m plots with six replications each: interseeded mustard and rye, a control treatment, and fall-planted rye. In contrast, the on-farm trials were carried out in Polk and Renville counties—areas with differing weather patterns and erosion conditions—and each site was divided into rye and control treatments. Monthly sediment collection was performed using nine BSNE samplers per treatment, while soil samples were taken from the 0–20 cm depth before planting the next crop in the on-farm experiments.

Results from the station experiment showed that interseeded cover crops did not significantly affect sugar beet yield or quality and no statistical difference between treatments for soil health metrics was observed. However, the on-farm trials revealed that winter rye had a more pronounced effect on soil health. Principal Component Analysis of soil properties indicated no significant treatment differences in the station experiment, suggesting that factors such as soil pH at the Renville site and temperature fluctuations across both sites had a more substantial influence on soil health.

Furthermore, rye proved effective in reducing horizontal mass flux, particularly when well-established. Increased temperature was correlated with higher erosion rates, and over 80% of the total sediment flux occurred under the no cover crop treatment. Notably, approximately 75% of the sediment flux was measured at heights between 0 and 15 cm, indicating that rye is especially effective at preventing wind erosion when it fully covers the soil surface and reaches a height of 15 cm.

Keywords: Sugar beet, black soil, wind erosion, soil health, sugar beet yield and quality

TOPRAK SAĞLIĞINI ARTIRMA VE RÜZGAR EROZYONUNU AZALTMA: MINNESOTA'NIN VERİMLİ SİYAH TOPRAKLARINDA ŞEKER PANCARI SİSTEMLERİ İÇİN ÖRTÜ BİTKİSİ STRATEJİLERİ

ÖZET

Minnesota'nın siyah topraklarının (Birleşik Devletler) sürdürülebilirliğinin korunması, özellikle şeker pancarı endüstrisinin önemli ekonomik rolü ve ağır makinelerin yoğun kullanımının toprak bozunmasına ve erozyonun artmasına yol açan olumsuz etkileri göz önüne alındığında kritik öneme sahiptir. Bu çalışma, 2022'den 2024'e kadar gerçekleştirilen istasyon ve arazi denemeleri yoluyla, örtü bitkilerinin rüzgar erozyonu, şeker pancarı verimi ve genel toprak sağlığı üzerindeki etkisini değerlendirmiştir.

Crookston, MN'de gerçekleştirilen istasyon çalışmasında, 6 tekrarlı 7 m x 12 m parseller üzerinde; şeker pancarı sıraları arasına hardal ve çavdar, ve şeker pancarı hasadı sonrası sonbaharda ekilen çavdar olmak üzere, control ile birlikte dört farklı uygulama gerçekleştirilmiştir. Buna karşın, farklı hava koşulları ve erozyon durumlarına sahip olan Polk ve Renville bölgelerinde arazi denemeleri yapılmış ve her bölge çavdar ve kontrol uygulamaları olarak ayrılmıştır. Her bir uygulama için dokuz sediment toplayıcı kullanılarak aylık sediment örnekleri toplanmış, aynı zamanda saha denemelerinde takip eden ekim öncesi 0–20 cm derinliğinden toprak numuneleri alınmıştır.

İstasyon deneyinden elde edilen sonuçlar, sıra arası örtü bitkilerinin şeker pancarı verimi ya da kalitesi üzerinde anlamlı bir etkisi olmadığını ve toprak sağlığı metrikleri açısından uygulamalar arasında istatistiksel bir farkın gözlenmediğini göstermiştir. Ancak, arazi denemeleri, kış çavdarının toprak sağlığı üzerinde daha belirgin bir etki yarattığını ortaya koymuştur. Toprak özelliklerinin Temel Bileşen Analizi ile incelenmesi, istasyon deneyinde anlamlı bir uygulama farkı olmadığına işaret etmiş olup, Renville bölgesinde toprak pH'ı ve her iki alanda da sıcaklık dalgalanmalarının toprak sağlığı üzerinde daha belirgin bir etkiye sahip olduğunu göstermiştir.

Ayrıca, toprak üzerinde iyi bir çavdar örtüsü, yatay sediment akışını azaltmada etkili olmuştur. Artan sıcaklık, daha yüksek erozyon oranları ile ilişkili bulunmuş ve toplam sediment taşınımının %80'inden fazlası örtü bitkisi kullanılmayan uygulamalar altında gerçekleşmiştir. Özellikle, sediment taşınımının yaklaşık %75'i yerden 0 ila 15 cm yükseklik arasında ölçülmüş olup, bu durum çavdarın toprak yüzeyini tamamen kaplayıp 15 cm yüksekliğe ulaştığında rüzgar erozyonunu önlemede özellikle etkili olduğunu göstermektedir.

Anahtar Kelimeler: Şeker pancarı, siyah toprak, rüzgar erozyonu, toprak sağlığı, şeker pancarı verimi ve kalitesi

ROOTING OF DIFFERENT CHOKEBERRY CULTIVARS WITH HARDWOOD CUTTINGS

ABSTRACT

This study was carried out in the Department of Horticulture, Faculty of Agriculture, Kırşehir Ahi Evran University, in order to determine the effects of different IBA doses on rooting of different aronia cultivars with hardwood cuttings. Hardwood cuttings of chokeberry cultivars; Nero, Viking, Aron, Galicjanka and Katya were used in the study. The cuttings were dipped in control, 1500 and 3000 ppm IBA solution and planted in bottom-heated perlite: peat medium with three replications. In the cuttings taken on November 24, 2024 and kept in the medium for ninety days; live cutting rate (number), callus formation rate (%), rooting rate (%), average root number (number), average root thickness (mm) and average root length (cm) were evaluated. At the end of the study, the highest rooting rate was found in the Katya cultivar, and the lowest rooting rate was found in the Galicjanka cultivar.

Keywords: chokeberry, propagation by cuttings, IBA

FARKLI ARONYA ÇEŞİTLERİNİN ODUN ÇELİKLERİ İLE KÖKLENDİRİLMESİ

ÖZET

Bu çalışma, farklı IBA dozlarının, farklı aronya çeşitlerinin odun çelikleri ile köklenmeleri üzerine etkilerini belirlemek amacıyla Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Bahçe Bitkileri Bölümünde yürütülmüştür. Çalışmada Aronyanın; Nero, Viking, Aron, Galicjanka ve Katya çeşitlerine ait odun çelikleri kullanılmıştır. Alınan çelikler, kontrol, 1500 ve 3000 ppm IBA solüsyonuna batırılıp, alttan ısıtmalı perlit:torf ortamına üç tekerrürlü olarak dikilmiştir. 24 Kasım 2024 tarihinde alınan ve ortamda doksan gün süreyle bekletilen çeliklerde; canlı çelik oranı (adet), kallus oluşum oranı (%), köklenme oranı (%), ortalama kök sayısı (adet), ortalama kök kalınlığı (mm) ve ortalama kök uzunluğu (cm) değerlendirilmiştir. Çalışma sonunda en yüksek köklenme oranı Katya çeşidinde, en düşük köklenme oranı Galicjanka çeşidinde bulunmuştur.

Anahtar Kelimeler: aronya, çelikle çoğaltma, IBA

TIPS FOR TOP-WORKING OF WALNUT TREES

Dr. Öğr. Üyesi Sebahattin YILMAZ

ABSTRACT

Top-working can be used in fruit trees to replace varieties that exhibit undesirable characteristics during their productive period and to repair damaged trees. In Türkiye, top-working is widely used to convert walnut trees from seedling origin and former cultivars that yield low and frequently damaged by spring frosts in their growing locations into new productive, late-leafing, and early harvest cultivars with superior nut quality. In recent years, the topworking of walnut trees has become common in many other countries with similar walnut production facilities and growing risks. Topworking of walnut trees by using new cultivars has increased the yield and quality of unproductive trees, thereby improving the profitability of orchards and making significant contributions to the incomes of orchard owners. Besides, existing walnut trees have facilitated the development of new skilled labor capable of grafting, generated additional employment in the fruit sector, and, most importantly, led to a rapid increase in walnut production quantity at the national level.

Topworking in walnuts dates back many years and has been chiefly carried out by applying the cleft grafting technique on the main branches of the trees. Recent research and experiments with different grafting techniques have revealed that the most suitable grafting technique for the topworking of walnuts is the bark grafting technique, which is applied with various modifications. In top-working practices, not only the grafting technique but also the preparatory steps before grafting, post-grafting maintenance, and other complementary applications are crucial to achieving the desired consequences. During the top-working process of walnut trees, performers may encounter many unexpected situations and must make numerous decisions following the grafting.

In this study, valuable information and practical tips have been provided based on the results of applied research, the experiences of grafting experts, and our own experiences. The main topics covered include the proper preparation of trees before grafting, the possible ways of applying grafts on trees, the collection and appropriate storage of graft scions, the implementation of the grafting technique, the maintenance of the graft union, and the emerging shoots from buds, the management of suckers from limbs, trunk, and base, and additional practices that may be applied in subsequent years. It is considered that the information presented will help meet the informational needs of those planning to perform top-working in walnut trees, enabling them to act more consciously and systematically, gain a long-term perspective, reduce potential

uncertainties, and develop realistic expectations about the outcomes they may achieve. Furthermore, it is also expected to reduce misinformation on the subject.

Keywords: Walnut, Top-working, bark grafting, cleft grafting, Chandler

CEVİZ AĞAÇLARINDA ÇEŞİT DEĞİŞTİRME AŞILARI İÇİN İPUÇLARI

ÖZET

Çeşit değiştirme, meyve ağaçlarında, verim döneminde istenmeyen özellikler gösteren çeşitlerin değiştirilmesi ve zararlanmış ağaçların onarılması için kullanılabilmektedir. Türkiye'de, büyük çoğunlukla düşük verim veren ve yetiştirildikleri ekolojilerde ilkbahar donlarından sıklıkla zarar gören eski ceviz çeşitlerinin verimli, geç uyanan, erken hasat edilen ve yüksek meyve kalitesine sahip yeni yabancı çeşitlere dönüştürülmesi için yaygın olarak uygulanmaktadır. Günümüzde, dünyanın benzer ceviz üretim geçmişine ve üretim risklerine sahip birçok ülkesinde de yaygın olarak ceviz ağaçlarında çeşit değişimi yapılmaktadır. Cevizlerde yapılan çeşit değiştirme aşıları, eski verimsiz ağaçlardan elde edilen verimin ve ürün kalitesinin artmasını sağlayarak bahçelerin karlılığını artırmış ve ceviz üreticilerinin ekonomilerine ciddi katkılarda bulunmuştur. Öte yandan, mevcut ceviz ağaçlarımız aşılama yapabilen yeni bir işgücü kitlesinin yetişmesine imkân sağlamış, meyvecilik sektöründe ilave istihdam oluşturmuş ve en önemlisi ceviz üretimimizin ülke düzeyinde hızlı bir şekilde artmasına neden olmuştur.

Çeşit değiştirme aşılarının cevizlerde kullanımı uzun yıllar öncesine dayanmakta olup büyük çoğunlukla ağaçların ana dallarına yarma aşı tekniğinin uygulanması şeklinde yapılagelmiştir. Son yıllarda yürütülen araştırmalar ve farklı aşı tekniklerinin denenmesi sonucunda, cevizlerde çeşit değişimi için en iyi aşılama metodunun çeşitli modifikasyonlarla yapılan kabuk altı aşı tekniği olduğu ortaya çıkarılmıştır. Çeşit değiştirme uygulamalarında sadece aşılama tekniği değil aşılama öncesi hazırlık ve sonrasındaki bakım işlemleri ile diğer tamamlayıcı uygulamalar da istenen sonuca ulaşmak açısından önemlidir. Ceviz ağaçlarının çeşit değiştirilmesi sürecinde uygulayıcılar çok farklı beklenmedik durumlarla karşılaşabilmekte ve aşılama sonrasında farklı konularla ilgili çok sayıda karar verilmesi gerekmektedir.

Bu çalışmada; yürütülen uygulamalı araştırmaların sonuçlarına, aşı ustalarının tecrübelerine ve tarafımızdan yapılan çeşit değiştirme aşılarından elde edilen tecrübeye dayalı olarak faydalı olabilecek bilgiler ve kullanışlı ipuçları verilmiştir. Aşı öncesi ağaçların uygun şekilde hazırlanması, aşıların ağaçlarda uygulanabileceği şekiller, aşı kalemlerinin alınması ve uygun koşullarda muhafazası, aşı tekniğinin uygulanması, aşı bölgesinin ve aşılardan gelişen sürgünlerin bakımı, ağaçlardan çıkan dal, gövde ve dip sürgünlerinin yönetilmesi ve ilerleyen yıllarda ağaçlarda yapılabilecek ilave uygulamalar bilgi verilen ana konulardır. Sunulan bu bilgilerin, cevizlerde çeşit değiştirme aşısı yapacak kişilerin uygulama öncesi bilgi ihtiyaçlarını karşılayarak daha bilinçli ve planlı hareket etmelerini sağlayacağı, uzun vadeli bakış açısı kazandıracağı, yaşayabilecekleri tereddütleri azaltacağı ve elde edilebilecekleri sonuçlar hakkında öngörü sahibi olmalarına yardımcı olacağı değerlendirilmektedir. Ayrıca, konu hakkındaki bilgi kirliliğinin azaltılmasında katkı sağlayacağı beklenmektedir.

Anahtar Kelimeler: Ceviz, Çeşit değiştirme aşısı, kabuk altı aşı, yarma aşı, Chandler

GENETIC POLYMORPHISMS AND DIVERSITY CHARACTERISTICS AT MILK PROTEIN GENES FOR THE *HAMARI* DESERT SHEEP IN SUDAN

ABSTRACT

The aim of this study was to determine allele and genotype frequencies and shed light on diversity characteristics at five milk protein loci namely, α-Lactalbumin (*LAA*), αS1-Casein (*CSN1S1*), β-Casein (*CSN2*), β-Lactaglobulin (*LGB*) and αS2-Casein (*CSN1S2)*, in *Hamari* Desert sheep ecotype of Western Sudan. The study was carried out on 63 (sixty-three) milk samples taken at random. The milk proteins genes under the study were genotyped with polyacrylamide gel electrophoresis (PAGE) under acidic conditions and using isoelectric focusing (IEF) techniques to extract the genotypes. The *Hamari* sheep is a protype export sheep to Middle East and Gulf livestock markets. It has been kept for their combined efficiency (meat and milk). The Hamari sheep population studied were monomorphic with one genetic variant (A = 1.000) for *LAA* locus. In particular, the genetic variant C at the *CSN1S1* locus occurred with high frequency (C=0.905) in Hamari sheep. Variant A is 'absent' in Hamari (A = 0) and D presents with a very low frequency (D = 0.007). A new varied termed X has been exhibited by *CSN1S1*, with minor frequency of 0.064.Phenotyping using Polyacrylamide Gel Electrophoresis-Isoelectric Focussing (PAGE-IEF) technique of the CSN2 locus showed that the genetic variant B were predominant, had high frequency (B = 0.429) than did variant A (0.365) and C (0.206). The *LGB* locus showed two alleles, A with high frequency of (0.857) and B with frequency of (0.143). *CSN1S2* locus for Hamari sheep in this study codifying three variants (A = 0.183), (B = 0.444) and (C = 0.373). According to Hardy-Weinberg equilibrium, Hamari sheep was in genetic equilibrium at the locus *CSN2* and *LAA* ($P < 0.05$).

The overall mean of diversity characteristics (Observed (H_o) and Expected (H_E) of homozygosity and heterozygosity were reported as: (H_o = 0.806 ± 0.240 and H_E = 0.653 ± 0.279) with *CSN1S1* and *LGB* loci scored the highest homozygoity .For heterozygosity (H_o = 0.194 ± 0.240 and H_E = 0.347 ± 0.279) with *CSN1S2* scored the highest heterozygosity

The information on the genotypic structure and diversity characteristics in Hamari sheep Desert ecotype could be exploited in future using specific breeding programme aimed at conserving biodiversity or select animals for the production of both meat and typical milk products in the Sudan.

OVERVIEW ON GENETIC VARIABILITY of CASEIN PROTEIN GENES in SUDANESE NUBIAN GOATS

ABSTRACT

MILK and dairy products are very important in African diet because of their health promoting and organoleptic properties. In many developing countries, goat breeding has a key role in livestock production. What makes goat so popular is their ability to provide high quality food under diverse climatic conditions and resilience to extreme and capricious environments. In the last years, the interest concerning caprine milk has been increasing; also to find a new exploitation for local goats to contribute to food security and human health worldwide in order promote the goat dairy products as well. That being so, the purpose of this study was to genetically characterize goat milk caseins protein genes in Sudanese Nubian dairy goats. The electrophoretic pattern of milk samples of Sudanese Nubian goats revealed the presence of four major of caseins variants, i.e. as1-casein (CSN1S1), as2-casein (CSN1S2), B-casein (CSN2) and kappa-casein (CSN3). Five αs1-casein alleles: CSN1S1A, CSN1S1B, CSN1S1E, CSN1S1F, CSN1S1O were identified in this study. The predominant allele of as1-casein locus was CSN1S1B, with a frequency of 0.662 whereas the frequency of CSN1S1F and CSN1S1O allele was 0.050 for both. The αs2-casein and β-casein loci shows a new electrophoretic pattern termed (X) with a frequency of 0.013 and 0.002 on for both loci.

The production of quality goat milk through professional breeding programs can be rewarding, profitable, pleasant and successful. Human had to give more importance to their health and nutritional situation with increasing environmental pollution and stress in their life. So, recently goat is watched as being genetic resources demand for functional food i.e. food that has positive effects on the health.

ABSTRACT

Molecular Analysis of mitochondrial DNA (mtDNA) was carried out using 125 (Taggar), 38 (Desert), 38 (Boer), 27 (Nubian) and 23 (Kalahari Red) goats randomly sampled from population bred in Sudan. As an initial step, to investigate the genetic structure of the five population s mentioned, for the first time in country. Apart from estimating genetic diversities, phylogenetic analysis, to elucidate, maternal lineages, relationships with Asiatic goats. The hypervariable (D-Loop) region of mtDNA (1200 bp) sequenced from 71 individuals, represented 61 haplotypes (40 for Taggar, 10 for Kalahari Red, 8 for Desert, 7 for Boer and 3 from the Nubian. Polymorphism of D-Loop fragment was high with haplotype diversities of 0.994 ± 0.04. Maximum-likehood tree constructed with 68 haplotypes and 22 reference haplotypes representing 6 haplogroups Worldwide, revealed that: 7 individuals that from the Taggar population belong to haplogroup B, 4 individuals that from Desert population belong to haplogroup G, whereas the remaining 67 individuals are belong to haplogroup A. So goats found in Sudan are only from A, B and G haplogroups.

We find evidence for population structure and novel lineages in goats bred in Sudan and cannot reconcile the genetic diversity found within the major lineage with domestication starting 10,000 years ago from a single mtDNA ancestor. Thus, the information obtained is strategic to sustainable utilization and conservation of the goat genetic resources at the national level.

CONSERVATION MODELLING of BIODIVERSITY for THREE SUDANESE CATTLE BREEDS (BUTANA, ARIASHY and NUBA)

Dr.Yassir Ahmed HASSAN
Animal Production Research Centre, Department of AnGR, Kuku, Sudan.
Email. butana43@yahoo.com

Mohammed Tageldin Iibrahim
Sudan University for Science & Technology, Faculty of Animal Prod.Technology,Department of Animal Breeding & Genetics, Kuku, Sudan.
Email. mohdtageldin@hotmail.com

ABSTRACT

Methods of biodiversity conservation are reported and a applied to three major Sudanese cattle breeds (Araishy, Butana and Nuba Mountain). It was estimated that about half of the breeds and half of today's genetic diversity between breeds would be lost within 50 years. Based on a survey and literature review, costs and effects of four conservation models were assed: Herd Books with promotion of the breed (HB), in situ conservation with sire rotation (IS), Cryoconservation of semen (CC) and in situ plus Cryoconservation (IC). Conservation modeling involving strongly breeders and giving them part of the responsibility for the conservation of the breed reduce endangerment. In this case breeders were not just potential sellers of animals for a conservation programme, but they participated actively in the program (e.g. take decisions) and took over part of the responsibility for the success of the program. It was shown that allocation of resources to only a subset of breeds is optimal.

AN INVESTIGATION OF THE CURRENT SITUATION OF FOREST VILLAGERS: THE CASE OF GÖKSUN DISTRICT IN KAHRAMANMARAŞ PROVINCE

ABSTRACT

This study was conducted to reveal the socio-economic structure and current situation of forest villagers living in the Kahramanmaraş province. The research was carried out in the Göksun district of Kahramanmaraş with 62 forest villagers through face-to-face surveys in April and May 2023. The study analyzed the villagers' demographic characteristics, sources of income, income level derived from forest products, participation in agricultural and livestock activities, social security status, and the main economic and social issues they face. Descriptive statistics were used in the data analysis. The results of the study showed that the forest villagers have an average of 10.23 cattle, 17.44 small ruminants, 55.55 poultry, and 13.87 beehives. It was found that 53.2% of the villagers were very satisfied with being forest villagers, 53.2% were moderately satisfied with the state's forestry policies, and 51.6% were moderately satisfied with the state's attention to the problems of forest villagers. 79% of the surveyed villagers occasionally went hunting, with wild boar (95.2%), rabbit (90.3%), and partridge (75.8%) being the most commonly hunted animals. 54.3% of the forest villagers reported having problems with the Forestry Operations Directorate regarding firewood procurement, 24.3% with grazing, 20% with land ownership, and 1.4% with hunting. 46.8% of the villagers stated that their relationship with the Forestry Operations Directorate was normal, while 24.2% reported it was bad. The villagers strongly agreed that when laws and regulations are being prepared, the demands of the villagers should be considered (4.65), that the forest-village relationship should be improved (4.56), that villagers should be provided with information about forestry (4.56), and that the staff's relations with the public should be improved (4.56). This study will

contribute to the development of policy suggestions aimed at improving the living standards of forest villagers. It is particularly recommended to encourage cooperatives, education, and support programs to increase income diversification.

Keywords: Forest villagers, socio-economic structure, income sources, forestry activities, Kahramanmaraş

ORMAN KÖYLÜLERİNİN MEVCUT DURUMLARININ İNCELENMESİ: KAHRAMANAMARAŞ İLİ GÖKSUN İLÇESİ ÖRNEĞİ

ÖZET

Bu çalışma, Kahramanmaraş ilinde yaşayan orman köylülerinin sosyo-ekonomik yapılarını ve mevcut durumlarını ortaya koymak amacıyla gerçekleştirilmiştir. Çalışma, Kahramanmaraş ilinin Göksun ilçesinde yaşayan 62 orman köylüsü ile 2023 yılı Nisan – Mayıs aylarında yüz yüze anket yöntemi kullanılarak yürütülmüştür. Çalışmada, köylülerin demografik özellikleri, gelir kaynakları, orman ürünlerinden elde edilen gelir düzeyi, tarım ve hayvancılık faaliyetlerine katılımı, sosyal güvence durumları ve karşılaştıkları temel ekonomik ve sosyal sorunlar analiz edilmiştir. Verilerin analizinde tanımlayıcı istatistiklerden yararlanılmıştır. Çalışma sonucunda orman köylülerinin ortalama 10.23 adet büyükbaş hayvanının, 17.44 adet küçükbaş hayvanının, 55.55 adet kanatlı hayvanının, 13.87 adet arılı kovanının bulunduğu belirlenmiştir. Köylülerin %53.2'si orman köylüsü olmaktan çok memnun olduğunu, %53.2'si devletin ormancılık politikalarından, %51.6'sı ise devletin orman köylülerinin sorunlarıyla ilgilenme durumundan orta derecede memnun olduklarını bildirmişlerdir. Anket yapılan orman köylülerinin %79'u ara sıra ava gittiklerini, en çok domuz (%95.2), tavşan (%90,3) ve keklik (%75,8) avladıklarını belirtmişlerdir. Orman köylülerinin %54,3'ü odun temini, %24.3'ü otlatma, %20'si mülkiyet, %1.4'ü ise avlanma konusunda Orman İşletme Müdürlüğü ile sorun yaşadığını bildirmiştir. Köylülerin %46,8'i Orman İşletme Müdürlüğü ile ilişkisinin normal olduğunu, %24.2'si ise ilişkisinin kötü olduğunu bildirmiştir. Köylüler, Orman İşletme Müdürlüğü ile sorun yaşanmaması için kanun ve yasalar hazırlanırken köylülerin isteklerinin dikkate alınması gerektiğine (4.65), orman – köylü ilişkilerinin iyileştirilmesi gerektiğine (4.56), köylülere ormancılık ile ilgili bilgi verilmesi gerektiğine (4.56) ve personelin halk ile ilişkilerinin iyileştirilmesi gerektiğine (4.56) kesinlikle katıldıklarını bildirmişlerdir. Bu çalışma, orman köylülerinin yaşam standartlarını yükseltmeye yönelik politika önerilerinin geliştirilmesine katkı sağlayacaktır. Özellikle gelir çeşitliliğini artırmaya yönelik kooperatifleşme, eğitim ve destek programlarının teşvik edilmesi önerilmektedir.

Anahtar Kelimeler: Orman köylüleri, sosyo-ekonomik yapı, gelir kaynakları, ormancılık faaliyetleri, Kahramanmaraş

ANALYSIS OF THE STRUCTURAL CHARACTERISTICS OF BROILER FARMS IN BALIKESIR PROVINCE

ABSTRACT

Broiler farming makes significant contributions to the livestock sector due to advantages such as the rapid growth of animals, low production costs, reduced need for breeding space, and continuous market demand. This study aims to determine the socio-demographic characteristics of broiler producers and reveal the structural features of broiler farms in Balıkesir province. For this purpose, a survey was conducted with 71 broiler producers in Balıkesir in August 2023. Descriptive statistics and frequency tables were used in the analysis of the data. According to the results, the producers carry out an average of 5.88 production cycles per year. The average live weight per bird sent for slaughter in the past year was 2.73 kg, the feed conversion ratio was 1.62, and the mortality rate was found to be 3.94%. At the beginning of a production cycle, an average of 16.84 chicks per square meter are placed in a poultry house. Producers reported that they send their chickens for slaughter at an average of 43.93 days old and that they have an average of 18.83 days between two production cycles. In the surveyed region, the average size of a farm was determined to be 1,570.98 m². The average pad area of the poultry houses was 45.83 m², with an average of 4.61 fans, 8.61 tunnel fans, and 98.79 shutters. On average, the farms had 3.44 rows of feeders and 5.19 rows of drinkers. Nearly all broiler producers (97.18%) reported using nipple drinkers with drippers, and 92.96% stated that they used rice husk as bedding material. Among the producers, 85.92% preferred stoves for heating, 50.70% used coal as a fuel type, 97.18% utilized pad ventilation systems, and 90.14% used well water. Additionally, 76.06% of the producers reported not insulating their poultry houses, 46.48% used sandwich panels and another 46.48% used asbestos cement sheets as roofing material, and 73.24% used bricks as the wall material. This study is expected to serve as a resource for

strategic decisions aimed at effectively guiding broiler production potential, improving existing practices in the sector, and enhancing animal health and production processes.

Keywords: Balıkesir, broiler chicken, broiler production, poultry farming, feed conversion ratio

BALIKESİR İLİNDEKİ BROYLER İŞLETMELERİNİN YAPISAL ÖZELLİKLERİNİN ANALİZİ

ÖZET

Broyler yetiştiriciliği, hayvanların hızlı büyümesi, düşük maliyetli olması, daha az yetiştirme alanına ihtiyaç duyulması ve sürekli pazar talebinin olması gibi avantajlardan dolayı hayvancılık sektörüne önemli katkılar sağlamaktadır. Bu çalışmada Balıkesir ilinde broyler üretimi yapan işletmelerin sosyo-demografik özelliklerinin belirlenmesi ve işletmelerin yapısal özelliklerinin ortaya konulması amaçlanmıştır. Bu amaç doğrultusunda 2023 yılının ağustos ayında Balıkesir ilinde 71 broyler üreticisi ile anket çalışması yapılmıştır. Verilerin analizinde tanımlayıcı istatistikler ve frekans tablolarından yararlanılmıştır. Analiz sonucunda üreticilerin yıllık ortalama 5.88 devre üretim yaptıkları, son bir yıl içerisinde kesime gönderilen hayvan başı ortalama canlı ağırlığın 2.73 kg olduğu, yem dönüşüm oranının 1.62, ölüm oranının ise %3.94 olduğu belirlenmiştir. Dönem başında bir kümeste m^2'ye ortalama 16.84 adet civciv bırakılmaktadır. Üreticiler, yetiştirdiği tavukları kesime ortalama 43.93 günlükken gönderdiklerini, iki üretim dönemi arasında ortalama 18.83 gün devre arası verdiklerini bildirmişlerdir. Anket yapılan bölgede işletme genişliği ortalama 1570.98 m^2 olarak belirlenmiştir. Kümeslerin ped alanı genişliği ortalama 45.83 m^2, minimum fan sayısı 4.61 adet, tünel fan sayısı 8.61 adet, klape sayısı ise ortalama 98.79 adettir. Anket yapılan bölgedeki işletmelerde ortalama 3.44 sıra yemlik ve 5.19 sıra suluk bulunmaktadır. Broyler üreticilerinin tamamına yakını (%97.18) damlalıklı nipel suluk kullandığını, altlık materyali olarak çeltik kavuzu (%92.96) kullandıklarını bildirmişlerdir. Üreticilerin %85.92'si işletmelerinde ısıtma yöntemi olarak soba tercih ettiğini, %50.70'i yakıt türü olarak kömür kullandığını, %97.18'i havalandırma olarak ped kullandığını ve %90.14'ü kuyu suyu kullandığını bildirmişlerdir. Üreticilerin %76.06'sı kümeslerde mantolama yapmadığını, %46.48'i çatı malzemesi olarak sandeviç panel, %46.48'i ise atermit kullandığını, %73.24'ü duvar malzemesi olarak tuğla kullandığını ifade etmiştir. Bu çalışma ile broyler üretim potansiyelinin etkin bir şekilde yönlendirilmesi, sektördeki mevcut uygulamaların daha verimli hale getirilmesi, hayvan sağlığı ve üretim süreçlerinin iyileştirilmesi gibi stratejik kararlar için kaynak teşkil edeceği düşünülmektedir.

Anahtar kelimeler: Balıkesir, etlik piliç, broyler üretimi, kümes hayvancılığı, yem dönüşüm oranı

THE HIGHER ORGANIZATION IN COOPERATIVES IN TÜRKIYE

Doç. Dr.Ertuğrul GÜREŞCİ
Kırşehir Ahi Evran Üniversitesi, İİBF, İşletme Bölümü, Kooperatifçilik ABD
ertugrul.guresci@ahievran.edu.tr
ORCID NO: 0000-0002-0977-7233

ABSTRACT

Cooperatives have played an important role in the economic and social development of societies, especially after the Industrial Revolution. Many socio-economic conditions such as the monopolization of capital, the disruption of the production and supply chain, excessive profit expectations and imperfect competition conditions are effective in the emergence and development of cooperatives. This movement, which was founded in 1844 under the leadership of Robert Owen and is, considered the beginning of modern cooperatives, spread to Western Europe in a short time and later manifested itself in various ways all over the world. The Homeland Funds, founded in 1863 under the leadership of Mithat Pasha during the Ottoman period, is considered the first cooperative in the western sense in Turkey. The Homeland Funds was established as a type of agricultural credit cooperative, but Turkish cooperatives experienced their original and important development after the Republic. It was an expected and desired application that the first development efforts of Turkey, a country where approximately 75% of the population lived in agriculture in the early years of the Republic, were also aimed at the agricultural sector. It is accepted that the agricultural sector has some of its own characteristics, that this sector is special and important, and that the approaches to solving its problems have some of its own characteristics. It can be said that cooperatives, which establish a commercial partnership system based on mutual assistance, solidarity and cooperation, are quite suitable for the agricultural sector due to their sociological structure and are an effective organization in solving the problems of this sector. One of the areas where cooperatives are most widespread and effective in Turkey is the agricultural sector, and the existence of agricultural producer unions and chambers in this sector supports the organized structure in the agricultural sector. Cooperatives in the agricultural sector in Turkey continue their activities within the scope of the Cooperatives Law No. 1163, the law on agricultural credit cooperatives and the laws on agricultural sales cooperatives. These laws create a legal infrastructure for a higher organization in the form of the Union, Central Union and the Turkish National Cooperatives Association (TURKEY COOP). The higher organization is evaluated both as a strong structure for Turkish cooperatives and as a very positive aspect for a democratic cooperative management. In this study, it is aimed to evaluate and compare the current situation of the upper organization of agricultural cooperatives in Turkey within the framework of the specified cooperative legislation.

Keywords: Union, cooperative, central union organization, agriculture.

TÜRKİYE'DE TARIMSAL AMAÇLI KOOPERATİFLERDE ÜST ÖRGÜTLENME

ÖZET

Kooperatifler özellikle Sanayi Devrimi sonrası toplumların, ekonomik ve sosyal kalkınmalarında önemli bir role sahip olmuştur. Sermayenin tekelleşmesi, üretim ve tedarik zincirinin bozulması, aşırı kar beklentisi ve aksak rekabet koşulları gibi birçok sosyo-ekonomik koşul, kooperatifleşmenin ortaya çıkması ve gelişmesinde etkili olmaktadır. 1844 yılında Robert Owen'in öncülüğünde kurulan ve modern kooperatifçiliğinde başlangıcı sayılan bu hareket, kısa sürede özelikle batı Avrupa'ya yayılmış ve sonradan tüm dünyada çeşitli şekillerde kendisini göstermiştir. Osmanlı döneminde 1863 yılında Mithat Paşa'nın öncülüğünde kurulan Memleket Sandıkları Türkiye'deki batılı anlamdaki ilk kooperatif olarak kabul edilmektedir. Memleket Sandıkları, bir tür tarımsal kredi kooperatifi olarak tesis edilmiş ancak Türk kooperatifçiliği aslı ve önemli gelişmesini Cumhuriyet sonrası yaşamıştır. Cumhuriyetin ilk yıllarında nüfusun yaklaşık %75'inin tarımda yaşadığı bir ülke olan Türkiye'nin ilk kalkınma çabalarının da tarımsal kesime yönelik olması beklenen ve istenen bir uygulama olmuştur. Tarım sektörünün kendisine has bir takım özellikleri, bu sektörün özel ve önemli olduğunu ve sorunlarının çözümündeki yaklaşımların da kendisine özgü bir takım özellikler taşıdığı kabul edilmektedir. Karşılıklı yardımlaşma, dayanışma ve işbirliğine dayalı ticari bir ortaklık sistem kuran kooperatiflerin, sosyolojik yapısı itibari ile tarım sektörü için oldukça uygun ve bu sektörün sorunlarının çözümünde de etkili bir organizasyon olduğu söylenebilir. Türkiye'de kooperatifleşmenin en yaygın ve etkin olduğu alanlardan birisi de tarım sektörü olup bu sektörde tarımsal üretici birlikleri ve odaların da varlığı, tarım sektöründe ki örgütlü yapıyı destekler niteliktedir. Türkiye'de tarım sektöründe ki kooperatifler, 1163 sayılı Kooperatifler Kanunu, tarım kredi kooperatifleri ile ilgili kanun ve tarım satış kooperatifleri ile ilgili kanunlar kapsamında faaliyetlerine devam etmektedir. Bu yasalar, kooperatifler için Birlik, Merkez Birliği ve Türkiye Millî Kooperatifler Bilirliği (TÜRKİYE KOOP) şeklinde bir üst örgütlenmeye yasal altyapı oluşturmaktadır. Üst örgütlenme, Türk kooperatifçiliği için hem güçlü bir yapılanma hem de demokratik bir kooperatifçilik yönetimi için de oldukça olumlu yönde değerlendirilmektedir. Bu çalışmada, Türkiye'de ki tarımsal amaçlı kooperatiflerin üst örgütlenmesinin mevcut durumu belirtilen kooperatif mevzuatları çerçevesinde değerlendirilmesi ve mukayese edilmesi amaçlanmıştır.

Anahtar Kelimeler: Birlik, kooperatif, merkez birliği örgüt, tarım.

A PROPOSED METHOD TO MEASURE THE IMPACT OF THE GEOGRAPHIC REGISTRATION MARK FOR KAMAN NUTS ON PRODUCTION: NOMINAL GROUP TECHNIQUE

Öğr. Gör. Dr. Hüseyin ATAŞ,
Adıyaman Üniversitesi, Sosyal Bilimler Meslek Yüksekokulu
hatas@adiyaman.edu.tr
ORCID NO: 0000-0003-3201-7360

ABSTRACT

Kırşehir is one of the most important centers of grain production in the Central Anatolia Region, known as the "breadbasket" of Türkiye. While the share of agriculture, forestry and fisheries in Türkiye's total GDP is 5% according to data from 2021, this share was around 16% in Kırşehir. Agricultural activities in Kırşehir such as plant and animal production have an important share in the city's economy. Although Kırşehir is an important center of grain production, the Kaman walnut, the only product with a geographical registration mark, also contributes significantly to the city's economy.

An application was submitted to the Turkish Patent and Trademark Office in 2019 for the Kaman walnut, one of Kırşehir's most important agricultural production resources, and the application for registration as a “designation of origin” was accepted in 2020. Kaman walnut, the only agricultural product of Kırşehir with a geographical registration mark, was registered as a geographical indication of the ”designation of origin" type, all or the most important characteristics of which are due to natural and human elements belonging to a specific geographical area. The suitability of Kaman district for walnut production is cited as one of the factors that make investment in agriculture in Kırşehir attractive by the Agricultural Investor Consultancy Office, which is affiliated to the Ministry of Agriculture and Forestry.

Taking the data on walnut trees and walnut production in Kaman district as a reference, it is noticeable that there was a radical change in 2019, when the application for GI registration was made. In Kaman, the number of walnut trees of fruiting age in 2018 was 63,250, the number of walnut trees of non-fruiting age was 161,854 and the total walnut production was 468 tons. In 2019, the number of trees of fruit-bearing age rose to 199,207, while the number of trees of non-fruit-bearing age fell to 45,460. The production volume was 468 tons in 2018, 1,296 tons in 2019 and 2,431 tons in 2024. The ratio between the number of trees of fruit-bearing age, which indicates productivity, and the production volume was as follows 2018: 7, 2019: 7, 2020: 9, 2021: 9, 2022: 10, 2023: 11, 2024: 11.

In this study, the contribution of Kaman walnut to the city's economy after obtaining the geographical indication, the impact on production volume and new production investment, the adequacy of agricultural support and the problems in the production processes are analyzed using the Nominal Group Technique (NGT) method conducted with producers and industry experts. NGT can also be defined as ‘an ad hoc group process for identifying the elements of a problem situation, defining the elements of a solution program, and establishing priorities’ (Scott & Deadrick, 1982). NGT has been widely used in agricultural research in recent years. Jeffreys (2006) argues that NGT is a proven method for evaluating organic farming and agri-environmental policy. Some of the studies in which NGT has been used in agricultural research

are as follows: (Bammer et al, 2022; Hugé et al, 2022; Santiago-Brown et al, 2015; Jeffreys, 2006; Motsenbocker & Hinson, 2003). The use of NGT is also quite common in the fields of ecology and conservation. Some of the studies that have been conducted using NGT in this field are as follows: (Hugé and Mukherjee, 2018; Waas et al, 2014; Robinson and Shepard, 2011; Strager and Rosenberger, 2006; Jacobson, Gape, Sweeting and Stein, 2005); (Motsenbocker and Hinson, 2003).

It is expected that the results of the study will highlight the problems in the production processes of Kaman walnut, which is an important production item for the urban economy, offer suggestions for solutions and can serve as data for determining the economic impact of registering a geographical indication and determining the appropriate agricultural policy.

Keywords: Kaman nut, geographical indication, nominal group technique, agricultural production

KAMAN CEVİZİ COĞRAFİ TESCİL İŞARETİNİN ÜRETİME ETKİSİNİN ÖLÇÜMÜ ÜZERİNE BİR YÖNTEM ÖNERİSİ: NOMİNAL GRUP TEKNİĞİ

ÖZET

Türkiye'nin "tahıl ambarı" olarak anılan İç Anadolu Bölgesi'nin önemli tahıl üretim merkezlerinden birisi Kırşehir'dir. 2021 verilerine göre Türkiye'nin toplam GSYİH değeri içerisinde tarım, ormancılık ve balıkçılık sektörünün payı %5 iken Kırşehir'de bu oran %16 dolaylarında gerçekleşmiştir. Bitkisel ve hayvansal üretim olarak Kırşehir'de tarımsal faaliyetler kent ekonomisi içerisinde önemli bir paya sahiptir. Kırşehir önemli bir tahıl üretim merkezi olsa da coğrafi tescil işaretine sahip tek ürünü olan Kaman cevizinin de kent ekonomisine katkısı toplam içerisinde önemli bir oranda yer almaktadır.

Kırşehir'in en önemli tarımsal üretim kalemlerinden birisi olan Kaman Cevizi için Türk Patent ve Marka Kurumu'na 2019'da başvurulmuş, 2020'de "menşe adı" olarak tescil başvurusu kabul edilmiştir. Kırşehir'in coğrafi tescil işaretine sahip tek tarımsal ürünü olan Kaman Cevizi, tüm veya esas nitelikleri belirli bir coğrafi alana ait doğal ve beşeri unsurlardan kaynaklanan coğrafi işaret türü "menşe adı" olarak tescil almıştır. Kaman ilçesinin ceviz üretimine uygunluğu, Tarım ve Orman Bakanlığı'na bağlı Tarımsal Yatırımcı Danışma Ofisi tarafından Kırşehir'de tarıma yatırım yapmayı cazip kılan unsurlardan birisi olarak ifade edilmektedir.

Kaman ilçesindeki ceviz ağaçları ve ceviz üretim verileri referans alındığında coğrafi işaret tescil başvurusunun yapıldığı 2019'da radikal bir değişim olduğu dikkat çekmektedir. Kaman'da 2018'de meyve veren yaşta ceviz ağacı sayısı 63.250, meyve vermeyen yaşta ceviz ağacı sayısı 161.854 ve toplam ceviz üretimi de 468 ton olarak gerçekleşmiştir. 2019'da meyve veren yaşta ağaç sayısı 199.207'ye yükselirken, meyve vermeyen yaşta ağaç sayısı ise 45.460'a düşmüştür. Üretim miktarı da 2018'de 468 ton iken 2019'da 1.296 ton, 2024'te 2.431 tona ulaşmıştır. Verimliliği ifade eden meyve veren yaşta ağaç sayısının üretim miktarına oranı ise yıllara göre şu şekilde gerçekleşmiştir; 2018:7, 2019:7, 2020:9, 2021:9, 2022:10, 2023:11, 2024:11.

Bu çalışmada; Kaman Cevizi'nin coğrafi işaret aldıktan sonra kent ekonomisine katkısı, üretim miktarına ve yapılan yeni üretim yatırımlarına etkisi, tarımsal desteklemelerin yeterliliği, üretim süreçlerinde yaşanan problemler üreticiler ve sektörel uzmanlarla gerçekleştirilecek olan Nominal Grup Tekniği (NGT) yöntemiyle analiz edilecektir. NGT *'bir problem durumunun unsurlarını tanımlamak, bir çözüm programının unsurlarını tanımlamak ve öncelikleri belirlemek için özel amaçlı bir grup süreci'* olarak da tanımlanabilmektedir (Scott & Deadrick, 1982). NGT son yıllarda tarımsal araştırmalarda sıkça kullanılmaktadır. Jeffreys (2006), NGT'nin organik tarım ve tarım-çevre politikalarının değerlendirilmesinde etkinliği kanıtlanmış bir yöntem olduğunu savunmaktadır. NGT'nin tarımsal araştırmalardaki kullanımını içeren çalışmalardan bazıları şu şekildedir; (Bammer vd., 2022; Hugé vd., 2022; Santiago-Brown vd., 2015; Jeffreys, 2006; Motsenbocker & Hinson, 2003). NGT'nin ekoloji ve koruma alanlarında kullanımı da oldukça yaygındır.. Bu alanda NGT ile gerçekleştirilen bazı çalışmalar şu şekildedir; (Hugé ve Mukherjee, 2018; Waas vd., 2014; Robinson ve Shepard, 2011; Strager ve Rosenberger, 2006; Jacobson, Gape, Sweeting ve Stein, 2005); (Motsenbocker ve Hinson, 2003).

Çalışmanın sonuçlarının, kent ekonomisi için önemli bir üretim kalemi olan Kaman cevizine yönelik üretim süreçlerinde yaşanan problemleri ortaya koyması, çözüm önerileri sunabilmesi

ve coğrafi işaret tescilinin ekonomik etkilerinin tespit edilerek ilgili tarımsal politikaların belirlenmesi için veri niteliği taşıyabileceği değerlendirilmektedir.

Anahtar Kelimeler: Kaman cevizi, coğrafi işaret, nominal grup tekniği, tarımsal üretim

EVALUATION OF GEOGRAPHICALLY INDICATION PRODUCTS IN TERMS OF RURAL TOURISM: RECOMMENDATIONS ON MİLAS DISTRICT OF MUĞLA PROVINCE

ABSTRACT

Geographically indicated products are among the most important tools in the development of rural tourism. Geographically indicated products play an important role in terms of preserving local values on site, sustainability of cultural heritage and transferring them from generation to generation. Geographically indicated products can also be considered as a strategic step towards cities becoming brands. Geographically indicated products for food have significant contributions to the development of gastronomy tourism, which is a part of rural tourism. Indeed, it is seen that the development of rural tourism is faster in places that are rich in gastronomy. Rural tourism provides employment to the region where it is located and has an important income diversification feature. It is also an important driving force in terms of increasing the tendency of young people to stay in rural areas.

Muğla province has 36 geographical indications, 14 of which belong to Milas district. Milas has the first Turkish olive oil, Milas olive oil and Milas oil olives, which are among Turkey's 31 products with EU geographical indications. Muğla province's EU geographical indication products are produced in Milas. With all these features, Milas is among the leading places in terms of geographical indications both in Turkey and in Muğla province. With this feature, it creates significant added value in the promotion and economy of the country. At the same time, the successful examples of rural tourism in Milas allow for the inclusion of geographically indicated products in rural tourism. Milas's geographically indicated products, olives and olive oil, local dishes and hand-woven carpets, as well as having a wide range of products, enable the diversification of rural tourism activities. In this study, the current status of geographically indicated products in Milas' rural tourism will be revealed first, and then a roadmap will be determined by considering suggestions for increasing the future contributions of geographically indicated products. The results obtained from the study are considered important in terms of setting an example and providing guidance for places that want to take steps and progress in this direction.

Keywords: geographical indication, rural, tourism, economy, Milas, Muğla

COĞRAFİ İŞARETLİ ÜRÜNLERİN KIRSAL TURİZM AÇISINDAN DEĞERLENDİRİLMESİ: MUĞLA İLİ MİLAS İLÇESİ ÜZERİNE ÖNERİLER

ÖZET

Kırsal turizmin geliştirilmesinde coğrafi işaretli ürünler en önemli araçlar arasında yer almaktadır. Coğrafi işaretli ürünler yerel değerlerin yerinde korunması, kültürel mirasın sürdürülebilirliği ve nesilden nesile aktarımı açısından önemli roller üstlenmektedir. Coğrafi işaretli ürünler aynı zamanda şehirlerin marka olma yolunda stratejik bir adım olarak nitelendirilebilir. Gıdaya yönelik olan coğrafi işaretli ürünlerin kırsal turizmin bir parçası olan gastronomi turizmin gelişimine önemli katkıları bulunmaktadır. Nitekim gastronomik açıdan zengin olan yerlerde kırsal turizmin gelişiminin daha hızlı olduğu görülmektedir. Kırsal turizm bulunduğu yöreye istihdam sağlamasının yanında önemli bir gelir çeşitlendirici özelliğine sahiptir. Ayrıca özellikle kırsal alanda gençlerin kalma eğilimini artırması açısından önemli bir itici güçtür.

Muğla ili 36 adet coğrafi işarete sahip olup bunun 14 adeti Milas ilçesine aittir. Milas Türkiye'nin AB coğrafi işaretli 31 ürünü arasında yer alan ilk Türk zeytinyağı olan Milas zeytinyağı ve Milas yağlı zeytinine sahiptir. Muğla ilinin AB coğrafi işaretli ürünleri Milas'ta üretilmektedir. Tüm bu özellikleri ile Milas coğrafi işaret konusunda gerek Türkiye'de gerekse Muğla ilinde önde gelen yerler arasındadır. Bu özelliği ile ülke tanıtımı ve ekonomisinde önemli bir katma değer yaratmaktadır. Aynı zamanda Milas'ta kırsal turizmin başarılı örneklerinin görülmesi coğrafi işaretli ürünlerin kırsal turizm içinde yer almasına olanak sağlamaktadır. Milas'ın coğrafi işaretli ürünleri olan zeytin ve zeytinyağı, yöresel yemekler ve el dokuması halıları ile geniş bir ürün yelpazesine sahip olması kırsal turizm faaliyetlerinin çeşitlendirilmesine olanak sağlamaktadır. Bu çalışmada Milas'ın kırsal turizmine coğrafi işaretli ürünlerin öncelikle mevcut durumu ortaya konacak, daha sonra coğrafi işaretli ürünlerin gelecekteki katkılarının artırılmasına ilişkin öneriler ele alınarak bir yol haritası belirlenecektir. Ele alınan çalışmadan elde edilen sonuçların bu yönde adım atıp ilerlemek isteyen yerlere örnek teşkil edip rehber olabilmesi açısından önemli görülmektedir.

Anahtar kelimeler: coğrafi işaret, kırsal, turizm, ekonomi, Milas, Muğla.

IMPORTANCE OF SOFT SKILLS IN PROFESSIONAL COMMUNICATION OF ENGINEERING STUDENTS

Isroilova Dildora Muxtorovna

ABSTRACT

Since the language learning is relatively connected with the study of culture, a language learner should develop intercultural competence skills in order to use the target language appropriately in different contexts. Developing learners' soft skills improves their cross cultural and professional communication, specifically in the field of ESP. The purpose of this presentation is to provide the guidelines for developing soft skills through language learning for engineering students.

Summary

Technology has already become a part of our life and its influence is much more than ever. However, having extensive knowledge of technology and technical skills is not adequate for engineering professionals. Soft skills are also equally vital as technical abilities. They help engineering professionals to maintain an interpersonal connection with their employers, colleagues and clients. These professionals should interact with others in the course of work, which requires collaboration and communication skills. Having soft skills and intercultural competence facilitates a good collaboration and performance. Acquiring soft skills requires making accurate judgments, paying attentive attention on the issue. However, digital technology is making it challenging to decide accurately on the issue. On the other hand, it helps learners to develop their critical thinking skills because of accessibility of huge amount of information. This has led to new approach to language learning and teaching and new beliefs about pedagogies. To achieve the goal the presenter will suggest and explain the manual "English for cross cultural and professional communication" in the following steps: a) the overview of the manual; b) the subject areas and methods to apply CLIL methods for engineering students; c) the main topic covered in the manual; d) analysis of the principles of engineering psychology and language teaching; e) some illustrations and examples from the manual. Attendees will have clear perception on the guidelines to develop intercultural competence and soft skills of engineering students through language teaching.

THE EFFECTS OF DIETARY TARHANA SUPPLEMENTATION TO QUAIL RATION ON EGG PRODUCTION AND EGG QUALITY CRITERIA

ABSTRACT

The aim of this study was to determine the effects of dietary tarhana supplementation as a probiotic source at different doses on egg yield parameters and egg quality characteristics in Japanese quails. Japanese quails were used at the age of 10 weeks. The experiment lasted 56 days. The quails were divided into 3 groups and 8 replicates and 96 Japanese quails were used in the study. Treatment groups; 1) The control group, 2) T1 (0.25% Tarhana added feed), 3) T2 (0.50% Tarhana added feed). The experiment was conducted in cimuka brand laying quail cages with 60 x 35 x 97 cm dimensions. Feed consumption and feed conversion ratio were calculated by weekly. The eggs were collected daily and weighed. Egg analyzes were performed on Tuesdays and eggs collected every Monday were weighed and kept for one day and internal and external quality characteristics were determined. At the end of the study, it was determined that dietary tarhana suplementation in different doses did not affect the egg yield, feed consumption and feed utilization rate, internal and external quality characteristics of the eggs. It was determined that adding 0.5% tarhana supplementation increased the roche color scale value (Yellow value) compared to the control group and adding 1% tarhana decreased the fracture resistance. As a result, it was determined that addition of 0.5% tarhana can be used to increase egg yellow color without affecting egg performance.

Keywords: Quail, tarhana, egg quality

YUMURTACI BILDIRCIN RASYONUNA TARHANA İLAVESİNİN YUMURTA VERİMİ VE KALİTE KRİTERLERİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışmanın amacı, büyütme yemine probiyotik kaynağı olarak farklı dozlarda tarhana ilavesinin Japon bıldırcınlarında yumurta verim parametreleri ve yumurta kalite özellikleri üzerine etkilerini belirlemektir. Denemede 10 haftalık yaşta yumurtacı Japon bıldırcınları kullanılmıştır. Deneme 56 gün sürmüştür. Denemede bıldırcınlar 3 gruba ayrılarak her grupta 8 tekerrür olacak şekilde yerleştirilmişlerdir. Çalışmada 96 adet Japon bıldırcını kullanılmıştır. Muamele grupları; 1) Kontrol grubu, 2) T1 (%0.25 Tarhana ilaveli yem), 3) T2 (%0.50 Tarhana ilaveli yem) olarak ayarlanmıştır. Deneme 60 x 35 x 97 cm boyutlarında nipel suluklu cimuka marka yumurtacı bıldırcın kafeslerinde yürütülmüştür. Yem tüketimleri ve yemden yararlanma oranları haftalık tartımlarla hesaplanmıştır. Yumurtalar günlük toplanmış ve tartılmıştır. Yumurta analizleri Salı günleri yapılmış ve her pazartesi toplanan yumurtalar tartılarak 1 gün süreyle bekletilmiş ve iç dış kalite özellikleri belirlenmiştir. Çalışma sonunda yeme farklı dozlarda tarhana ilavesinin % yumurta verimi, yem tüketimi ve yemden yararlanma oranını, yumurta iç ve dış kalite özelliklerini etkilemediği belirlenmiştir. % 0,5 tarhana ilavesinin roche renk skala değerini (Sarı değeri) kontrol grubuna göre arttırdığı %1 düzeyinde tarhana ilavesinin kırılma direncini düşürdüğü belirlenmiştir. Sonuç olarak %0,5 tarhana ilavesinin yumurta performansını etkilemeksizin yumurta sarı rengini arttırmak için kullanılabileceği belirlenmiştir

Anahtar Kelimeler: Bıldırcın, tarhana, yumurta kalitesi

PREPARATION AND CHARACTERIZATION OF EDIBLE FILMS BASED ON CORN ZEIN

ABSTRACT

In terms of evaluating food waste and producing healthy packaging materials, zein protein-based edible coating materials have become popular in recent years. According to 2020 data, 1.102.164 tons of corn are produced in the world. Protein-based films and coatings are better than polysaccharide-based films and coatings in terms of being a barrier against oxygen, carbon dioxide and lipids and mechanical properties. Zein, one of the four different groups of corn protein fractions, can be used in food packaging, drug coatings and biomedical applications with its hydrophobic structure and biodegradability. Edible films and coatings can provide barrier properties against moisture, gas and oil migration in food preservation. This structure, which can retain volatile compounds, can be made functional by adding antioxidants, food additives and antimicrobial substances. While hydrocolloids (protein and polysaccharide) and lipids are mainly used in the preparation of edible films, it is also possible to benefit from composite films obtained from their combinations. In addition to sensory properties (transparent, tasteless and odorless), a good quality edible film is expected to have barrier properties (moisture and oxygen permeability), be stable against physical and biochemical reactions that may occur between the food and the film and/or the atmosphere and the film, be reliable in terms of health, environmentally friendly and low cost. Protein molecules during the formation of zein films determine the mechanical, water resistance and barrier properties of the film. Glycerol, a hydroscopic molecule, is frequently used in edible film production to eliminate film brittleness. In this study, protein films were produced from %85 pure corn zein in ethyl alcohol medium for the preparation of edible food packaging material and 99% pure glycerol was added to give the film a flexible structure. The films were characterized by SEM (Scanning Electron Microscopy) and TGA (Thermogravimetric analysis) and the obtained films were applied to food examples such as candy and dried figs.

Keywords: Zein, film, edible packaging, food safety

MISIR ZEİNİ ESASLI YENİLEBİLİR FİLMLERİN HAZIRLANMASI VE KARAKTERİZASYONU

ÖZET

Gıda atıklarının değerlendirmesi ve sağlıklı ambalaj materyali üretiminde zein proteini esaslı yenilebilir kaplama malzemeleri son yıllarda popüler hale gelmiştir. 2020 verilerine göre dünyada 1.102.164 ton mısır üretilmektedir. Protein bazlı film ve kaplamalar ise oksijen, karbondioksit ve lipitlere karşı bariyer olma ve mekanik özellikler bakımından polisakkarit bazlı film ve kaplamalara kıyasla daha iyidir. Mısır protein fraksiyonlarının dört farklı grubundan biri olan zein hidrofobik yapısı ve biyobozunurluk özelliği ile gıda ambalajı, ilaç kaplamaları ve biyomedikal uygulamalarda kullanılabilir. Yenilebilir film ve kaplamalar gıda muhafazasında nem, gaz ve yağ migrasyonuna karşı bariyer özellik gösterebilmektedir. Uçucu bileşiklerin tutulmasını sağlayabilen bu yapı antioksidan, gıda katkı maddesi ve antimikrobiyal madde eklenerek fonksiyonel hale getirilebilir. Yenilebilir filmlerin hazırlanmasında temelde hidrokolloidler (protein ve polisakkarit) ve lipitler kullanılırken, bunların kombinasyonlarından elde edilen kompozit filmlerden de yararlanmak mümkündür. İyi kaliteye sahip yenilebilir bir filmin; duyusal özellikleri (şeffaf, tatsız ve kokusuz) yanında bariyer özellikleri (nem, oksijen geçirgenlikleri), gıda ile film ve/veya atmosfer ile film arasında gerçekleşebilecek fiziksel ve biyokimyasal reaksiyonlara karşı kararlı yapıda olması, sağlık açısından güvenilir, çevreyle dost ve düşük maliyetli olması beklenen özellikleridir. Zein filmlerinin oluşumu sırasında protein molekülleri filmin mekanik, suya dayanıklılık ve bariyer özelliklerini belirler. Hidroskopik bir molekül olan gliserol ise yenilebilir film üretiminde film kırılganlığını gidermek için sıkça kullanılır. Bu çalışmada, yenilebilir gıda ambalaj malzemesi hazırlanması amacıyla etil alkol ortamında %85 saflıkta mısır zeininden protein film üretildi ve filmin esnek yapı kazanması için %99 saflıkta gliserol eklendi. Elde edilen fimler SEM (Taramalı Elektron Mikroskobu) ve TGA (Thermogravimetrik analiz) ile karakterize edilerek şeker ve kuru incir gibi gıda örneklerine uygulandı.

Anahtar kelimeler: Zein, film, yenilebilir ambalaj, gıda güvenliği

EVALUATION OF DIFFERENT SURFACE TEXTURES IN URBAN PARKS IN TERMS OF MICRO THERMAL COMFORT; CASE STUDY OF ERZURUM OLYMPIC PARK

ABSTRACT

Climate change is considered one of the biggest problems our world faces, and today, this change is occurring much more rapidly compared to natural processes. Cities around the world are combating the negative effects that arise due to increasing temperatures. Green areas are of great importance in terms of their quantity, size and characteristics in combating the urban heat island effect that results from intensive urbanization. Urban parks, which are a part of green areas and an important microclimate zone, influence temperature formation, thermal comfort and urban life quality through the plant and structural materials they contain, surface coatings and area usage decisions.

In this study, the Olympic Park, located on an area of approximately 25 ha in Erzurum, was examined. The park, which has a closed area of 2200 m², includes entertainment and recreation areas, an amusement park, an artificial pond, cafes, children's playgrounds, walking paths, seating areas, sports facilities and picnic areas. The park, which is intensively used in terms of accessibility and size, has different surface textures (water, asphalt, concrete, wood, travertine, grass, woodland, soil, rubber, etc.). The aim of the study is to examine the effects of these surface textures on micro thermal comfort in response to climate changes, which are one of the most significant problems of our time. At the same time, the study aims to collect data that can serve as a resource for design studies within the scope of the landscape architecture discipline. In this context, the development and changes in the usage areas of Olympic Park over time have been examined. In this process, Landsat satellite data from July, when the park was most intensively used and temperatures reached the highest levels, were used. To examine the effects of the change in ground surface temperatures of the usage areas over the years on micro thermal comfort values, July data from the years 2009, 2013 and 2024 were utilized. These data were obtained from Landsat 5 and Landsat 8 satellite images provided by the USGS (United States Geological Survey). Using ArcMap 10.5 software, Land Surface Temperature (LST) maps were created through various transformations applied to the thermal bands of the satellite images, and the micro thermal comfort values, which change over the years, were determined for the park’s usage areas and its surrounding environment.

As a result of the study, data from 2009 were compared with those from 2013 and 2024. The effects of structural and surface changes within the park on micro thermal comfort were examined. The results indicate that these structural and surface modifications significantly affect land surface temperatures, and that water elements, particularly large water bodies such as artificial ponds, play a crucial role in regulating environmental temperatures.

KENT PARKI İÇERİSİNDEKİ FARKLI YÜZEY DOKULARININ MİKRO TERMAL KONFOR AÇISINDAN DEĞERLENDİRİLMESİ; ERZURUM OLİMPİYAT PARKI ÖRNEĞİ

ÖZET

İklim değişikliği dünyamızın karşılaştığı en büyük sorunlardan biri olarak kabul edilmektedir ve günümüzde bu değişim doğal süreçlere kıyasla çok hızlı gerçekleşmektedir. Tüm dünyada kentler artan sıcaklıklar sonucunda meydana gelen olumsuzluklarla mücadele etmektedir. Yoğun kentleşme sonucu meydana gelen kentsel ısı adası ile mücadele konusunda yeşil alanlar; miktarı, büyüklüğü ve özellikleri açısından büyük öneme sahiptir. Yeşil alanların bir parçası ve önemli bir mikro iklim alanı olan kent parkları bulundurdukları bitkisel ve yapısal materyaller ile yüzey kaplamaları ve alan kullanım kararları sayesinde sıcaklık oluşumu, termal konfor ve kentsel yaşam kalitesi üzerinde etkili olmaktadır.

Bu çalışmada, Erzurum'da bulunan yaklaşık 25 ha alan üzerinde yer alan Olimpiyat Parkı incelenmiştir. Park, 2200 m² kapalı alana sahip olup; eğlence ve dinlenme alanları, lunapark, yapay gölet, kafeler, çocuk oyun alanları, gezinti alanları, oturma bölgeleri, spor ve piknik alanlarını içermektedir. Erişilebilirlik ve büyüklük açısından rekreasyonel kullanımın yoğun olduğu parkta, farklı yüzey dokuları (su, asfalt, beton, ahşap, traverten, çim, ağaçlık, toprak, kauçuk vb.) bulunmaktadır. Çalışmanın amacı, bu yüzey dokularının, günümüzün en önemli sorunlarından biri olan iklimsel değişikliklere karşı mikro termal konfor üzerindeki etkilerini incelemektir. Aynı zamanda peyzaj mimarlığı meslek disiplini kapsamında tasarım çalışmalarına kaynak oluşturabilecek verilerin elde edilmesi hedeflenmiştir. Bu doğrultuda, Olimpiyat Parkı'ndaki kullanım alanlarının zaman içerisindeki gelişimi ve değişimi ele alınmıştır. Bu süreçte, parkın kullanım açısından en yoğun olduğu ve sıcaklıkların en yüksek seviyeye ulaştığı Temmuz ayına ait Landsat uydu verileri kullanılmıştır. Kullanım alanlarının yer yüzey sıcaklıklarının yıllara göre değişiminin mikro termal konfor değerlerine etkisini incelemek amacıyla, 2009, 2013 ve 2024 yıllarına ait Temmuz ayı verileri kullanılmıştır. Bu veriler USGS (United States Geological Survey)'den alınan Landsat 5 ve Landsat 8 uydu görüntülerinden elde edilmiştir. ArcMap10.5 yazılımında, uydu görüntülerinin termal bantlarından yapılan çeşitli dönüşümlerle Yer Yüzey Sıcaklık Haritaları oluşturulmuş ve parkın kullanım alanlarında ve çevresinde, yıllara göre değişen mikro termal konfor değerleri belirlenmiştir.

Çalışma sonucunda, 2009 yılına ait veriler ile 2013 ve 2024 yılına ait veriler karşılaştırılmış, parktaki yapısal ve yüzey kaplama değişikliklerinin mikro termal konfor üzerindeki etkileri incelenmiştir. Elde edilen veriler, parkın yapısal ve yüzeysel değişikliklerinin yer yüzey sıcaklıkları üzerinde önemli bir etkisi olduğunu ve su öğelerinin, özellikle yapay gölet gibi büyük su yüzeylerinin, çevresel sıcaklıkları dengelemede önemli bir rol oynadığını göstermektedir.

Anahtar Kelimeler: Mikro Termal Konfor, Termal Uydu Bantları, Kent Parkları.

DETERMINING PLANT PARASITIC NEMATODES AND THEIR POPULATION DENSITIES IN IMPORTANT CROP PLANTS IN HATAY PROVINCE, TÜRKİYE

ABSTRACT

Surveys were carried out between 2017-2021 in areas where important cultivated plants were grown in Hatay province. Soil samples (104) were taken in vineyard, pepper, wheat, tomato, corn, cotton, stone fruit and olive areas relating the production pattern of Hatay province. Motile nematodes in the soil samples were isolated by the modified Baermann method. The isolated nematodes were fixed in glycerin and 11 species of plant parasitic nematodes belonging to 3 orders, 10 families and 11 genera were identified. Aphelenchoides sp. and *Aphelenchus avenae* from the order Aphelenchida; *Ditylenchus* sp., *Heterodera latipons*, *Meloidogyne incognita*, *M. javanica*, *Merlinius brevidens*, *M. microdorus*, *Paratylenchus sp.*, *Pratylenchus neglectus*, *P. thornei*, *Rotylenchulus macrosomus* and *Tylenchulus semipenetrans* from the order Tylenchida; *Xiphinema pachtaicum* from the order Dorylaimida were identified. Further studies are needed to investigate pest status, economic threshold and alternative management strategies for these plant parasitic nematodes.

Keywords: Hatay, Plant Parasitic Nematode

HATAY İLİNDE ÖNEMLİ KÜLTÜR BİTKİLERİNDE BULUNAN BİTKİ PARAZİTİ NEMATODLARIN VE POPÜLASYON YOĞUNLUKLARININ BELİRLENMESİ

ÖZET

Hatay ilinin üretim desenini yansıtacak şekilde bağ, biber, buğday, domates, mısır, pamuk, taş çekirdekli ve zeytin alanlarından 2017-2021 yılları arasında gerçekleştirilen arazi çıkışlarında 104 toprak örneği alınmıştır. Alınan toprak örneklerindeki hareketli nematodlar modifiye Baermann yöntemi ile izole edilmiştir. İzole edilen nematodlar gliserin içine fikse edilmiş ve 3 takım, 10 familya, 11 cinse ait 11 tür bitki paraziti nematod belirlenmiştir. Aphelenchida takımına ait *Aphelenchoides* sp. ve *Aphelenchus avenae*; Tylenchida takımına ait *Ditylenchus* sp., *Heterodera latipons, Meloidogyne incognita, M. javanica, Merlinius brevidens, M. microdorus, Paratylenchus sp., Pratylenchus neglectus, P. thornei, Rotylenchulus macrosomus* ve *Tylenchulus semipenetrans*; Dorylaimida takımına ait *Xiphinema pachtaicum* türleri tespit edilmiştir. Teşhis edilen nematodların zarar düzeyleri, ekonomik zarar eşikleri, bu nematodlarla farklı mücadele yöntemlerin araştırılması hem Hatay hem de ülkemiz tarımı ve buna bağlı olarak ekonomisi açısından önem arz etmektedir.

Anahtar Kelimeler: Hatay, Bitki Paraziti Nematod

SURVEY STUDIES ON COMPARISON OF *TYLENCHULUS SEMIPENETRANS* (COBB, 1913) (TYLENCHIDA: TYLENCHULIDAE) POPULATION LEVELS ACCORDING TO ROOTSTOCK, ROOTSTOCK AGE AND SOIL TEXTURE IN HATAY, TÜRKİYE

ABSTRACT

In previous studies, the presence of *Tylenchulus semipenetrans* in citrus fields of Hatay province was determined, and in this consecutive study, it was investigated whether the rootstock, rootstock age and soil texture had an effect on *T. semipenetrans* population levels. Field studies were carried out in April 2021 and 107 soil samples were taken. Sour orange and Volkameriana rootstocks were found to be supporting higher population levels, Carizzo rootstock was found to be having less and C35 rootstock was found to have intermediate population levels between these two groups. It was observed that as the rootstock age increased, the citrus nematode population also increased. It was also noted that the soil texture had no effect on the citrus nematode population.

Keywords: Hatay, Citrus Nematode, Rootstock, Soil

HATAY İLİNDE *TYLENCHULUS SEMIPENETRANS* (COBB, 1913) (TYLENCHIDA: TYLENCHULIDAE) POPÜLASYON SEVİYELERİNİN ANAÇ, ANAÇ YAŞI VE TOPRAK BÜNYESİNE GÖRE KARŞILAŞTIRILMASI ÜZERİNE SURVEY ÇALIŞMALARI

ÖZET

Daha önce yapılan çalışmalarda, Hatay ili turunçgil alanlarında *Tylenchulus semipenetrans* varlığı belirlenmiş, ardışık yapılan bu çalışma ile *T. semipenetrans* popülasyon seviyelerine anaç, anaç yaşı ve toprak bünyesinin etkisinin olup olmadığı araştırılmıştır. Arazi çalışmaları 2021 yılı Nisan ayında gerçekleştirilmiş ve 107 toprak örneği alınmıştır. Turunç ve Volkameriana anaçlarında turunçgil nematodu popülasyonlarının daha yüksek, Carizzo anacında ise bu iki anaca göre daha düşük seviyelerde, C35 anacında ise bu iki grup arasında kaldığı, anaç yaşı arttıkça turunçgil nematod popülasyonunun da arttığı gözlenmiştir. Toprak bünyesinin turunçgil nematod popülasyonuna bir etkisinin olmadığı gözlenmiştir.

Anahtar Kelimeler: Hatay, Turunçgil Nematodu, Anaç, Toprak

INNOVATIVE APPROACHES IN ERGONOMIC RISK ASSESSMENT METHODS AND OCCUPATIONAL SAFETY IN AGRICULTURE

ABSTRACT

The agricultural sector is an area where workers are exposed to high levels of physical and mental stress, resulting in significant ergonomic risks. These risks contribute to musculoskeletal disorders (MSDs), which affect workers' health and reduce work efficiency. Identifying and mitigating ergonomic risks is essential both to protect workers' health and to improve agricultural productivity. In this context, ergonomic risk assessment methods, agricultural mechanisation and innovative engineering solutions play a critical role in ensuring occupational safety.

Traditional ergonomic assessment tools such as ALLA (Agricultural Lower Limb Assessment), REBA (Rapid Entire Body Assessment) and RULA (Rapid Upper Limb Assessment) analyse workers' postures to identify potential risks. Agricultural mechanisation is a key factor in reducing ergonomic risks, as modern agricultural machinery helps to minimise manual labour and physical strain on workers. However, existing agricultural equipment needs to be further optimised to improve ergonomic efficiency. This is where TRIZ (Theory of Inventive Problem Solving) offers a systematic approach to optimising agricultural machinery and developing innovative designs that reduce the physical workload of workers.

In addition, artificial intelligence (AI)-based ergonomic assessment systems provide faster and more accurate analysis than traditional methods, enabling real-time assessment of working conditions. Integrating TRIZ with AI technologies can lead to more innovative and ergonomic solutions in agricultural mechanisation.

This study is directly aligned with the United Nations Sustainable Development Goals (SDGs). Under Goal 3 (Health and well-being), reducing ergonomic risks helps protect the health of agricultural workers and prevent occupational diseases. In relation to Goal 8 (Decent work and economic growth), agricultural mechanisation, AI-assisted ergonomic analysis and the TRIZ approach contribute to improving occupational safety and promoting more sustainable and

efficient working environments. From the perspective of Goal 9 (Industry, Innovation and Infrastructure), TRIZ-driven innovative solutions support technological progress and efficiency in agricultural production.

In this context, the effective use of ergonomic assessment methods, the integration of agricultural mechanisation and innovative approaches such as TRIZ play a crucial role in protecting workers' health and increasing productivity. The combination of AI-based assessment tools with TRIZ-based solutions is expected to make a significant contribution to the development of sustainable and ergonomic working conditions in agriculture.

TARIMDA ERGONOMİK RİSK DEĞERLENDİRME YÖNTEMLERİNDE YENİLİKÇİ YAKLAŞIMLAR VE İŞ GÜVENLİĞİ

ÖZET

Tarım sektörü, çalışanların fiziksel ve psikolojik stres altında olduğu, ergonomik risklerin yüksek olduğu bir alandır. Bu riskler, kas-iskelet sistemi rahatsızlıklarına (MSD) yol açarak işçilerin sağlığını olumsuz etkilemekte ve iş verimliliğini düşürmektedir. Ergonomik risklerin belirlenmesi ve azaltılması, hem çalışan sağlığını korumak hem de tarımsal üretkenliği artırmak için kritik öneme sahiptir. Bu kapsamda, ergonomik risk değerlendirme yöntemleri, tarımsal mekanizasyon ve yenilikçi mühendislik çözümleri iş güvenliğini sağlamada önemli rol oynamaktadır.

ALLA (Agricultural Lower Limb Assessment), REBA (Rapid Entire Body Assessment) ve RULA (Rapid Upper Limb Assessment) gibi geleneksel ergonomik değerlendirme araçları, tarım işçilerinin vücut duruşlarını analiz ederek potansiyel riskleri tespit etmektedir. Tarımsal mekanizasyon, ergonomik risklerin azaltılmasında kritik bir faktördür; modern tarım makinelerinin kullanımı, manuel iş yükünü azaltarak çalışanların fiziksel zorlanmalarını en aza indirmektedir. Ancak, mevcut tarımsal ekipmanların ergonomik açıdan daha verimli hale getirilmesi gerekmektedir. Bu noktada, TRIZ (Yenilikçi Problem Çözme Teorisi), tarımsal makinelerin ergonomik olarak optimize edilmesi ve işçilerin fiziksel yükünü azaltan yenilikçi tasarımlar geliştirilmesi için önemli bir yaklaşım sunmaktadır.

Bununla birlikte, yapay zekâ (AI) tabanlı ergonomik değerlendirme sistemleri, geleneksel yöntemlere kıyasla daha hızlı ve doğru analizler sunarak işçilerin çalışma koşullarını gerçek zamanlı olarak değerlendirme imkânı sağlamaktadır. TRIZ ile yapay zekâ teknolojilerinin entegrasyonu, tarımsal mekanizasyonda daha inovatif ve ergonomik çözümler üretmeye olanak tanıyabilir.

Bu çalışma, BM Sürdürülebilir Kalkınma Hedefleri (SKH) ile doğrudan ilişkilendirilebilir. Hedef 3 (Sağlık ve Kaliteli Yaşam) kapsamında, ergonomik risklerin azaltılması, tarım işçilerinin sağlığını koruyarak meslek hastalıklarını önlemeye katkı sağlar. Hedef 8 (İnsana Yakışır İş ve Ekonomik Büyüme) ile bağlantılı olarak, tarımsal mekanizasyon, yapay zekâ destekli ergonomik analizler ve TRIZ yaklaşımı, iş güvenliğini artırarak daha sürdürülebilir ve verimli çalışma ortamları oluşturulmasına yardımcı olmaktadır. Hedef 9 (Sanayi, Yenilikçilik ve Altyapı) açısından ise, TRIZ odaklı yenilikçi çözümler, tarımsal üretimde teknolojik gelişimi ve verimliliği desteklemektedir.

Bu bağlamda, tarım sektöründe ergonomik değerlendirme yöntemlerinin etkin kullanımı, tarımsal mekanizasyonun entegrasyonu ve TRIZ gibi yenilikçi yaklaşımlar, çalışan sağlığını koruyarak iş verimliliğini artırmaktadır. Yapay zekâ destekli değerlendirme araçlarının TRIZ tabanlı çözümlerle birleştirilmesi, tarımda sürdürülebilir ve ergonomik çalışma koşullarının oluşturulmasına önemli katkılar sağlayacağı düşünülmektedir.

Anahtar Kelimeler: Ergonomik Risk Değerlendirme, Tarım İş Güvenliği, Yapay Zekâ Destekli Ergonomi, Tarımsal Mekanizasyon ve Ergonomi

THE RELATIONSHIP BETWEEN CULTURAL ROUTES AND RURAL DEVELOPMENT IN TÜRKİYE

Arş. Gör. Dr. Miray Kalaycı
Akdeniz Üniversitesi, Ziraat Fakültesi, Tarım Ekonomisi Bölümü
miraykalayci@akdeniz.edu.tr
ORCID NO: 0000-0001-7731-8525

ABSTRACT

Turkey, with its rich historical, cultural, and natural heritage, holds significant potential in terms of cultural routes. The Lycian Way, Turkey's first long-distance hiking trail, extends approximately 760 kilometers from Fethiye to Antalya. In addition to this, there are nearly 30 officially registered cultural routes across the country. These routes allow visitors the opportunity to explore various cultural and natural areas in different regions of Turkey. In recent years, due to urbanization, the COVID-19 pandemic, and changing holiday preferences, interest in nature and rural areas has increased significantly.

Although Turkey generates considerable income from tourism, the impact of this income on rural development remains limited. Alternative forms of tourism, such as cultural routes, hiking trails, and rural tourism, have the potential to enhance economic activity in rural areas. Cultural routes, particularly through hiking activities, promote rural tourism and stimulate local economies. Travelers who follow these routes contribute to regional development by staying in rural areas, consuming local products, and engaging with local communities. Furthermore, the development of cultural routes revitalizes sectors such as agriculture, handicrafts, and small-scale enterprises in rural areas, thus supporting regional development.

In order for rural tourism to contribute more effectively to sustainable development, it is essential to increase infrastructure investments, ensure the active involvement of local communities in the formation of cultural routes, and promote these routes more effectively to broader audiences. This study evaluates the impacts of cultural routes on rural development in Turkey and presents recommendations for sustainable tourism.

Keywords: Cultural Routes, Rural Development, Rural Tourism

TÜRKIYE'DE KÜLTÜR ROTALARI İLE KIRSAL KALKINMA ARASINDAKI İLİŞKİ

ÖZET

Türkiye, zengin tarihi, kültürel ve doğal mirasıyla, kültür rotaları açısından büyük bir potansiyele sahiptir. Türkiye'nin ilk doğa yürüyüşü rotası olan Likya Yolu, Fethiye'den Antalya'ya kadar uzanan ve yaklaşık 760 kilometreyi bulan bir rotadır. Bunun yanı sıra, ülkemizde 30'a yakın tescilli kültür rotası bulunmaktadır. Bu rotalar, ziyaretçilere ülkenin farklı bölgelerindeki kültürel ve doğal alanları keşfetme imkanı sunmaktadır. Son yıllarda kentleşme, COVID-19 pandemisi ve değişen tatil tercihleri nedeniyle doğa ve kırsal alanlara yönelik ilgi artmıştır.

Türkiye turizm açısından önemli bir gelir elde etmesine rağmen bu gelirin kırsal kalkınmaya etkisi sınırlıdır. Kültür rotaları, doğa yürüyüşleri ve kırsal turizm gibi alternatif turizm türleri, kırsal alanlardaki ekonomik hareketliliği artırma potansiyeline sahiptir Kültür rotaları, özellikle doğa yürüyüşü etkinlikleri aracılığıyla kırsal turizmi teşvik etmekte ve yerel ekonomiyi canlandırmaktadır. Bu rotaları takip eden gezginler, kırsal bölgelerde konaklayarak, yöresel ürünleri tüketerek ve yerel halkla etkileşime girerek bölgesel kalkınmaya katkı sunmaktadır. Ayrıca, kültür rotalarının gelişmesi, kırsal alanlarda tarım, el sanatları ve küçük ölçekli işletmeler gibi sektörleri canlandırarak bölgesel kalkınmaya katkı sağlamaktadır.

Kırsal turizmin sürdürülebilir kalkınmaya daha etkin katkı sağlayabilmesi için altyapı yatırımlarının artırılması, kültür rotalarının oluşum sürecinde, yerel halkın katkılarının önemli bir rol oynaması ve oluşturulan rotaların daha geniş kitlelere etkili bir şekilde tanıtılması gerekmektedir. Bu çalışmada, Türkiye'deki kültür rotalarının kırsal kalkınmaya etkileri değerlendirilerek, sürdürülebilir turizm için öneriler sunulmuştur.

ABSTRACT

Bacillus species can exhibit probiotic properties through their spores and metabolites (enzymes, antimicrobial substances, siderophores, etc.) they produce. Recently, soil isolate probiotics with high siderophore production and siderophore-producing probiotic applications have attracted considerable attention. The presence of biogenic amines is particularly important as an indicator of food spoilage as well as their toxic effects on human health. It is observed that the content of biogenic amines such as histamine, putrescine, cadaverine, and tyramine in probiotic products has increased. In this study, it was aimed to determine whether biogenic amine production, which is an important parameter in terms of GRAS criteria, is present in Bacillus subtilis subsp. inaquosorum DY5 strain and Bacillus pumilus 441 strain. In particular, biogenic

amine measurements were determined before and after the treatment of soil isolate strains with CuSO4, which is a widely used organic pesticide in agriculture, and whether there was any change in the investigated strains. For this purpose, measurements were carried out with LC-MS Q-TOF device, which is one of the most sensitive analysis methods and preferred for the determination of trace amounts of analytes. Tyramine, putrescine, cadaverine, histamine, phenylethylamine were studied in the samples with the analysis method created in the LC-MS Q-TOF system. MS operating mode was applied in the range of 30-1200 Dalton and 2 GHz Extended Dynamic Range. C18 (2.1 mm x 50 mm x 1.7 µm) column was used for chromatographic separation. Data evaluation was made via the software program of the device. LC-MS Q-TOF was preferred to analyze components at very low concentrations to verify molecular structure and to examine complex samples. As a result, no amount of biogenic amines was found within the detection limits in samples prepared under acidic and basic conditions. In the light of these data obtained, it was predicted that soil isolates found to have probiotic properties may have the potential to be used as probiotics, especially since they do not produce biogenic amines, which are not GRAS in terms of soil probiotics but are criteria for human health.

This study was supported by Gazi University BAP Unit with the project coded FGA-2023-7867.

Keywords: Biogenic amine, Siderophore, LC-MS

SİDEROFOR ÜRETEN PROBİYOTİK ÖZELLİKLİ *Bacillus sp.*'de BİYOJENİK AMİN VARLIĞININ ARAŞTIRILMASI

ÖZET

Bacillus türleri, sporları ve ürettikleri metabolitleri (enzim, antimikrobiyal madde, siderofor vs.) aracılığıyla probiyotik özellikler gösterebilmektedir. Son zamanlarda siderofor üretimi yüksek toprak izolatı probiyotikler, siderofor üreten probiyotik uygulamaları açısından oldukça dikkat çekicidir. Biyojen aminlerin varlığı özellikle gıda bozulmasının göstergesi olması yanında insan sağlığına toksik etkilerinin bulunması bakımından önemlidir. Probiyotik ürünlerdeki histamin, putresin, kadeverin, tiramin gibi biyojen aminlerin içeriğinin arttığı görülmektedir. Bu çalışmada, *Bacillus subtilis* subsp. *inaquosorum* DY5 suşu ve *Bacillus pumilus* 441 suşunda GRAS kriterleri açısından önemli bir parametre olan biyojenik amin üretiminin olup olmadığının tespiti hedeflenmiştir. Özellikle toprak izolatı suşlarının tarımda yaygın kullanılan organik pestisit bordo bulamacının içeriğinde yer alan $CuSO_4$'ın muamelesi öncesinde ve sonrasında biyojenik amin ölçümlerinin yapılarak araştırılan suşlarda herhangi bir değişimin olup olmadığı incelenmiştir. Bu amaçla eser miktardaki analitlerin tayini için tercih edilen ve en hassas analiz yöntemlerden biri olan LC-MS Q-TOF cihazı ile ölçümler gerçekleştirilmiştir. LC-MS Q-TOF sisteminde oluşturulan analiz metodu ile numunelerde tiramin, putresin, kadaverin, histamin, feniletilamin çalışılmıştır. MS çalışma modu olarak 30-1200 Dalton aralığında ve 2 GHz Extended Dynamic Range uygulanmıştır. Kromatografik ayrım için C18 (2.1mm x 50 mm x 1.7 µm) kolon kullanılmıştır. Veri değerlendirmesini cihazın yazılım programı üzerinden yapılmıştır. LC-MS Q-TOF, çok düşük konsantrasyonlardaki bileşenleri analiz ederek moleküler yapı doğrulaması yapmak ve kompleks numuneleri incelemek için tercih edilmiştir. Sonuç olarak asidik ve bazik koşullarda hazırlanan örneklerde tespit limitleri dahilinde biyojenik aminlere ilişkin bir miktar bulunamamıştır. Elde edilen bu veriler ışığında probiyotik özellikleri olduğu tespit edilen toprak izolatlarında, özellikle toprak probiyotiği kriterleri açısından GRAS olmayan ancak insan sağlığı için önemli bir kriter olan biyojen amin üretiminin bulunmamasıyla, probiyotik olarak kullanım potansiyelinin olabileceği öngörülmüştür.

Bu çalışmamız Gazi Üniversitesi BAP Birimi tarafından FGA-2023-7867 kodlu proje ile desteklenmiştir.

Anahtar Kelimeler: Biyojenik amin, Siderofor,LC-MS

ABSTRACT

Nematodes are organisms that have an important place among soil organisms as bioindicators in the ecosystem with their biodiversity and population densities. Nematodes interact with living and non-living factors in the soil and are one of the indicators of biodiversity in the soil ecosystem. Therefore, assessing nematode diversity in terrestrial habitats has been adopted as a common research method. In this purpose, the potential effects of plant species on soil nematode diversity were investigated by examining the nematode communities found in the rhizospheres of 24 different plant species from 14 families in different seasons in 2024-2025 at the Ali Nihat GÖKYİĞİT Botanical Garden of Çukurova University. This approach provides important contributions to habitat-based assessment of plant-nematode relationships. The nematode fauna identified in this study consisted of 21 families and 36 genera belonging to 8 orders. Plant parasites were represented by 9 families and 14 genera belonging to 2 orders (Tylenchida and Dorylaimida); bacterivores by 7 families and 17 genera belonging to 3 orders (Rhabditida, Monhysterida and Araeolaimida); fungivores by 3 genera belonging to 2 orders (Aphelenchida and Tylenchida); predators by 2 genera belonging to 1 order (Dorylaimida). The proportion of plant parasitic and free-living nematodes in the fauna was 29.62% and 70.37%, respectively. Among the free-living nematodes found in the soil samples, *Cephalobus* genus belonging to Cephalobidae family was found at the highest rate and the highest population density was found in Lavender (*Lavandula amustifolia*) plant with 506 individuals. Among the fungivorous nematodes, the genus *Aphelenchoides* was the most common genus and the highest population density with 265 individuals was found on Balkaymak (*Helichrysum italicum*).

Among the plant parasitic nematodes, *Paratylenchus* and *Tylenchus* were the most common genera and the highest population densities were found in the rhizosphere of calendula (*Calendula officinalis*) and safflower (*Carthamus tinctorius*) plants, respectively. Predatory nematodes had the lowest population in the sampling and constituted 6.5% of the total population. Among these nematodes, the genus *Dorylaimus* with 227 individuals was found in the highest population in yellow patience (*Aloe vera*) plant.

Keywords: Nematode fauna, biodiversity, Cephalobidae, plant parasitic nematodes

ÇUKUROVA ÜNİVERSİTESİ ALİ NİHAT GÖKYİĞİT BOTANİK BAHÇESİ'NDE NEMATODLARIN (NEMATODA) BİYOÇEŞİTLİLİĞİNİN ARAŞTIRILMASI

ÖZET

Nematodlar, biyolojik çeşitlilikleri ve popülasyon yoğunlukları ile bulundukları ekosistemde bioindikatör olarak toprak canlıları arasında önemli bir yere sahip olan organizmalardır. Nematodlar, topraktaki canlı ve cansız etkenlerle etkileşim halinde olup toprak ekosisteminde biyoçeşitliliğin göstergelerinden biri konumundadır. Bu nedenle karasal habitatlardaki nematod çeşitliliğini değerlendirmek yaygın bir araştırma yöntemi olarak benimsenmiştir. Bu amaçla, Çukurova üniversitesi Ali Nihat GÖKYİĞİT Botanik Bahçesi'nde 2024-2025 yıllarında farklı mevsimlerde, 14 familyadan 24 farklı bitki türünün rizosferlerinde bulunan nematod topluluklarını familya ve cins düzeyinde incelenerek, bitki türlerinin toprak nematod çeşitliliği üzerindeki potansiyel etkileri araştırılmıştır. Bu yaklaşım, bitki-nematod ilişkilerinin habitat bazlı değerlendirilmesine önemli katkılar sağlamaktadır. Bu çalışmada tespit edilen nematod faunası 8 takıma ait 21 familya ve 36 cinsten oluşmuştur. Bitki parazitleri 2 takıma (Tylenchida ve Dorylaimida) ait 9 familya 14 cins ile; bakterivorlar 3 takıma (Rhabditida, Monhysterida ve Araeolaimida) ait 7 familya ve 17 cins ile; fungivorlar 2 takıma ait (Aphelenchida ve Tylenchida) ait 3 cins ile; predatörler 1 takıma (Dorylaimida) ait 2 cins ile temsil edilmişlerdir. Faunada bitki paraziti ve serbest yaşayan nematodların oranı sırasıyla % 29,62 ve % 70,37 olarak gerçekleşmiştir. İncelenen toprak örneklerinde bulunan serbest yaşan nematodlar içerisinde Cephalobidae familyasına ait *Cephalobus* cinsi en yüksek oranda bulunmuş olup, popülasyon yoğunluğu da 506 birey ile en yüksek Lavanta (*Lavandula amustifolia*) bitkisinde saptanmıştır. Fungivor nematodlar içerisinde *Aphelenchoides* cinsinin en yaygın cins olduğu ve 265 birey ile en yüksek popülasyonu Balkaymak (*Helichrysum italicum*) bitkisinde oluşturduğu belirlenmiştir. Bitki paraziti nematodlarda en yüksek bulunma oranı ise sırasıyla *Paratylenchus* ve *Tylenchus* cinsine ait olup en yüksek popülasyon yoğunluklarına Aynısafa (*Calendula officinalis*) ve Aspir (*Carthamus tinctorius*) bitkilerinin rizosferinde rastlanmıştır. Predatör nematodlar ise örneklemelerde en düşük popülasyona sahip olup toplam popülasyonun %6,5' unu oluşturmuştur. Bu nematodlar içerisinde *Dorylaimus* cinsi 227 birey ile Sarı sabır (*Aloe vera*) bitkisinde en yüksek popülasyonda saptanmıştır.

Anahtar Kelimeler: Nematod faunası, biyoçeşitlilik, Cephalobidae, bitki paraziti nematodlar

EFFECTS OF ROOT ROT FUNGUS (*Fusarium oxysporum* f. sp. *ciceris*) AND ROOT LESION NEMATODE (*Pratylenchus thornei*) ON SOME CHICKPEA VARIETIES AT DIFFERENT APPLICATION TIMES

ABSTRACT

Chickpeas (*Cicer arietinum* L.) are considered to be a nutritious cool season legume that plays a key role in global food security. This is due to the fact that they constitute a significant source of food protein. However, its production is significantly affected by several biotic agents, including the root lesion nematode (*Pratylenchus thornei*) and the crown rot fungus (*Fusarium oxysporum* f. sp. *ciceris*: Foc). These nematodes and diseases can have significant impacts either individually or synergistically through complex interactions. This study is designed to investigate the interaction between *P. thornei* and Foc in resistant and susceptible six different chickpea genotypes and how their simultaneous presence at different times may influence disease severity and nematode populations. Application of *P. thornei* prior to the inoculation of Foc isolate resulted in a considerable increase in disease severity in all varieties. This research has shown that the time of inoculation of Foc isolates is critical. The highest disease severity recorded was 92.9% in Akline 82 when Foc was applied one week after *P. thornei* inoculation. While the disease severity was 2.4% when only Foc was present, it increased to 92.9% in the Foc application 1 week after *P. thornei*. The MR value of the resistant Akline 82 variety was observed to be 2.2 in the absence of *P. thornei*, 7.7 when the disease was present, and 6.4 when the disease was applied one week later. In this application and simultaneous application an increase in MR values was generally observed on the varieties. The present study has shown that in order to develop effective integrated disease management strategies, it is essential to understand the etiology and epidemiology of complex disease interactions on chickpea. This study was supported by a project of Tübitak 122O889.

Keywords: *Cicer arietinum*, multiplication rate, simultaneous application, wilting

STRUCTURAL CHARACTERISTICS AND PROBLEMS OF FATTENING SHEEP FARMS IN KARACABEY DISTRICT

Dr. Öğr. Üyesi Ömer ŞENGÜL,
Bursa Uludağ Üniversitesi, Ziraat Fakültesi
omersengul@uludag.edu.tr
ORCID NO: 0000-0001-5078-2002

ABSTRACT

This study aims to determine some structural features and breeding practices in fattening sheep farms in Karacabey district of Bursa province and to identify the problems encountered in these issues. The material of the study consists of survey data conducted with the owners of 76 fattening sheep farms in Karacabey district in 2025. In the surveyed farms, in addition to the socio-economic characteristics of the farm owners, breeds of sheep raised in the farms, number of mother sheep, care and feeding of mothers and lambs, feeding methods, lamb production, roughage supply, roughage used, silage production, grazing on pasture, fattening period, marketing and frequently encountered diseases were examined.

According to the results obtained; it was determined that the average age of the business owners was 49.26, 44.7% of them were primary school graduates and 15.8% of them were university graduates and they had been doing sheep breeding for an average of 25.6 years. It was determined that the average land size of the examined businesses was 169.36. In the businesses surveyed, the average number of mother rams and sheep was determined as 141.4. The vast majority of the sheep raised in the businesses were Karacabey Merino and the rate in all businesses was calculated as 79.9%. The average ages for disposal of mother rams and sheep in the businesses were found as 4.88 and 6.93 years, respectively. The business owners announced that they obtained an average of 173.75 lambs per year. The mortality rate of lambs from weaning to weaning was determined as 9.11%. The average weaning age of the lambs was 3.78 months and the average fattening period applied was determined as 4.82 months. At the end of fattening, the live weight of the lambs was calculated as 48.33 kg.

It was observed that 56.6% of the enterprises used concentrated feed and 43.4% did not. It was determined that 78.9% of the enterprise owners fed their animals twice a day. In terms of silage use, it was determined that 72.4% of the enterprises did not use silage and 27.6% used it. The rate of enterprises that made silage was found to be 15.8%. It was determined that 93.5% of the enterprise owners took their sheep to pasture and 57.9% kept their animals in pasture all year round. The rate of those receiving feed support in the examined enterprises was determined to be 15.8%. The enterprise owners stated that they saw high feed costs, shepherd problem, high medicine-treatment expenses, roughage problem, insufficient support and pasture problem as the most important problems.

As a result, it is important to carry out studies to solve these problems in the examined fattening sheep farms in terms of care-feeding, utilization of feed support, silage production and use, lamb deaths and diseases.

Keywords: Karacabey, sheep breeding, farm owners, care-feeding practices, lamb fattening, grazing on pasture, marketing.

KARACABEY İLÇESINDE BESİ KOYUNCULUĞU YAPAN İŞLETMELERIN YAPISAL ÖZELLİKLERİ VE SORUNLARI

ÖZET

Bu çalışmada, Bursa ilinin Karacabey ilçesinde besi koyunculuğu yapan işletmelerdeki bazı yapısal özelliklerin ve yetiştiricilik konularındaki uygulamaların belirlenmesi ve bu konularla ilgili karşılaşılan sorunların saptanması amaçlanmıştır. Çalışmanın materyalini, 2025 yılında Karacabey ilçesinde yetiştiricilik yapan 76 adet besi koyunculuğu işletmesinin sahipleri ile yapılan anket verileri oluşturmuştur. Anket yapılan işletmelerde, işletme sahiplerinin sosyo-ekonomik özelliklerinin yanı sıra, işletmelerde yetiştirilen koyunların ırkları, anaç koyun sayıları, anaç ve kuzuların bakım ve beslenmesi, yemleme şekilleri, kuzu üretimi, kaba yem temini, kullanılan kaba yemler, silaj üretimi, mera durumu, besi süresi, pazarlama, desteklemeler ve sık karşılaşılan hastalıklar konuları incelenmiştir.

Elde edilen sonuçlara göre; işletme sahiplerinin ortalama yaşlarının 49.26 olduğu, %44.7'sinin ilkokul ve %15.8'inin üniversite mezunu olduğu ve ortalama 25.6 yıldan beri koyunculuk yaptıkları belirlenmiştir. İncelenen işletmelerin arazi büyüklüklerinin ortalama 169.36 da olduğu saptanmıştır. Anket yapılan işletmelerde, anaç koç ve koyun varlığı ortalama 141.4 adet olarak belirlenmiştir. İşletmelerde yetiştirilen koyun varlığının çok büyük bir kısmı Karacabey Merinosu olup, tüm işletmelerdeki oranı %79.9 olarak hesaplanmıştır. İşletmelerde anaç koç ve koyunları elden çıkarma yaşları ortalama olarak sırasıyla; 4.88 ve 6.93 yaş olarak bulunmuştur.

İşletme sahipleri yılda ortalama 173.75 adet kuzu elde ettiklerini açıklamışlardır. Kuzuların sütten kesime kadar ölüm oranları %9.11 olarak saptanmıştır. Kuzuların ortalama sütten kesim yaşı 3.78 ay olup, uygulanan besi süresi ortalama 4.82 ay olarak belirlenmiştir. Besi sonunda kuzuların canlı ağırlıklar 48.33 kg olarak hesaplanmıştır.

İşletmelerin %56.6'sının kesif yem kullandığı, %43.4'ünün ise kullanmadığı görülmüştür. İşletme sahiplerini %78.9'unun hayvanları günde 2 kez yemlediği belirlenmiştir. Silaj kullanımı bakımından, işletmelerin %72.4'ünün silaj kullanmadığı, %27.6'sının ise kullandığı saptanmıştır. Silaj yapan işletmelerin oranı ise %15.8 olarak bulunmuştur. İşletme sahiplerinin %93.5'inin koyunlarını meraya çıkardıkları, %57.9'unun ise hayvanlarını yıl boyu merada tutuğu belirlenmiştir. İncelenen işletmelerde yem desteği alanların oranı %15.8 olarak tespit edilmiştir. İşletme sahipleri, en önemli sorunlar olarak, yüksek yem maliyetleri, çoban sorunu, ilaç-tedavi giderlerinin yüksekliği, kaba yem sorunu, yetersiz destekler ve mera sorununu gördüklerini beyan etmişlerdir.

Sonuç olarak, incelenen besi koyunculuğu işletmelerinde, uygulanan bakım-besleme, yem desteğinden yararlanma, silaj üretimi ve kullanımı, kuzu ölümleri ve hastalıklar konusunda bazı eksikliklerin olduğu, işletmelerin karlılığının arttırılması açısından söz konusu sorunların çözülmesine yönelik çalışmaların yapılması önemlidir.

Anahtar Kelimeler: Karacabey, koyun yetiştiriciliği, işletme sahipleri, bakım- yemleme uygulamaları, kuzu besisi, mera durumu, pazarlama.

SPATIAL ANALYSIS OF THE IMPACT OF FERTILIZER USE PRACTICES ON NITRATE POLLUTION IN COTTON FARMING USING REMOTE SENSING TECHNIQUES: THE CASE OF HARRAN PLAIN

ABSTRACT

This study was conducted to determine the impact of fertilizer use practices on nitrate pollution in the Harran Plain, one of Turkey's most important cotton production regions. Using remote sensing and Geographic Information System (GIS) techniques, the spatial distribution of fertilizer applications was analyzed, and the environmental effects of excessive fertilization were evaluated.

As part of the research, surveys were conducted with approximately 400 farmers to assess fertilizer use habits (both base and top fertilizing) in agricultural lands where cotton is grown. The surveys examined in detail farmers' fertilizer preferences, application times, the amounts of nitrogen fertilizers used, and fertilization methods. The GPS coordinates of farmers' fields were recorded, and soil samples were collected from designated points before cotton planting for nitrate analysis. Laboratory analyses determined soil nitrate levels, which were then evaluated in relation to fertilization practices.

For this study, conducted during the 2024 cotton production season, Sentinel-2 satellite data from August 2024 was utilized to determine the relationship between cropping patterns and fertilization. Cotton cultivation areas were mapped using satellite images, and the overall fertilizer use distribution was spatially assessed by integrating GPS coordinates of selected areas with farmers' fertilization practices.

Using ArcGIS software, fertilizer application rates, soil nitrate levels, and remote sensing data from farmers' fields were integrated to identify areas of excessive fertilization. The study results revealed that there was an average difference of 15 kg/da between the recommended nitrogen fertilizer amount for cotton production and the actual amount applied by farmers, significantly increasing nitrate pollution.

The findings provide scientific contributions to the development of sustainable agricultural policies, highlighting the need for regional management strategies to optimize fertilization practices and mitigate environmental impacts.

PAMUK TARIMINDA GÜBRE KULLANIM ALIŞKANLIKLARININ NİTRAT KİRLİLİĞİNE ETKİSİNİN UZAKTAN ALGILAMA TEKNİKLERİ İLE ALANSAL ANALİZİ: HARRAN OVASI ÖRNEĞİ

ÖZET

Bu çalışma, Türkiye'nin en önemli pamuk üretim bölgelerinden biri olan Harran Ovası'nda, gübre kullanım alışkanlıklarının nitrat kirliliğine etkisini belirlemek amacıyla yürütülmüştür. Çalışmada, uzaktan algılama ve Coğrafi Bilgi Sistemleri (CBS) teknikleri kullanılarak, gübre uygulamalarının mekânsal dağılımı analiz edilmiş ve aşırı gübreleme kaynaklı çevresel etkiler değerlendirilmiştir.

Araştırma kapsamında, pamuk ekilen tarım alanlarını temsil edecek şekilde yaklaşık 400 çiftçi ile gübre kullanımı (taban ve üst gübre) alışkanlıklarını belirlemek amacıyla anketler gerçekleştirilmiştir. Anketlerde, çiftçilerin gübre tercihi, uygulama zamanları, kullanılan azotlu gübre miktarları ve gübreleme yöntemleri detaylı bir şekilde incelenmiştir. Çiftçi tarlalarının GPS koordinatları kaydedilmiş ve nitrat analizi için pamuk ekim öncesinde belirlenen noktalardan toprak örnekleri alınmıştır. Laboratuvar analizleri sonucunda toprak nitrat seviyeleri belirlenerek gübreleme uygulamaları ile ilişkileri değerlendirilmiştir.

2024 yılı pamuk üretim sezonunda gerçekleştirilen bu çalışma kapsamında, ürün deseni ile gübreleme arasındaki ilişkinin belirlenmesi ve çiftçi uygulamalarının uzaktan algılama verileri ile karşılaştırılması için 2024 yılı Ağustos ayına ait Sentinel-2 uydu verileri kullanılmıştır. Uydu görüntüleri ile pamuk ekim alanları haritalanmış, çiftçilerin gübre kullanım alışkanlıklarını analiz etmek amacıyla belirlenen alanlara ait GPS koordinatlarıyla entegre edilerek genel gübre kullanım dağılımı mekânsal olarak değerlendirilmiştir.

ArcGIS yazılımı kullanılarak çiftçi tarlalarındaki gübre kullanım miktarı, toprak nitrat seviyesi ve uzaktan algılama verileri bütünleştirilerek aşırı gübreleme alanları tespit edilmiştir. Çalışma sonuçlarına göre, pamuk üretiminde önerilen azotlu gübre miktarı ile çiftçilerin uyguladığı miktar arasında ortalama 15 kg/da fark olduğu ve bu aşırı kullanımın nitrat kirliliğini önemli ölçüde artırdığı belirlenmiştir. Elde edilen bulgular, sürdürülebilir tarım politikalarının oluşturulmasına bilimsel katkı sağlamakta olup, gübreleme stratejilerinin optimize edilmesi ve çevresel etkilerin azaltılması için bölgesel yönetim stratejilerinin geliştirilmesi gerektiğini ortaya koymaktadır.

ABSTRACT

It is commonly known that land is a basic natural resource, which supports lives through agriculture, where superposition of agricultural lands for other uses, especially for urbanization is great concern. Therefore, this study aim is to investigate causes and consequences of agricultural land conversion Pakistan. The country is select as a study, because agricultural land parcels are being greatly converting to residential areas in Pakistan as compared to the other countries. it is also intent to draw the attention of policy makers towards this issue, while sharing a recent experience. Both primary and secondary data sources will be use in this research. The primary data will be collecting through questionnaires, first from the local respondents (accused residents/farmer) in the study area, and second from professional/experts (real estate agents/valuers and physical planner). The data will also be collect through Arial-views and treated through geographic informative system (GIS). While, secondary data will be collect from economic survey of Pakistan, Pakistan bureau of statistics, government offices and websites, UN population division, magazines, daily press and from NGOs and offices. From the Arial-views show that agricultural lands are being considerably decreasing in last four decades. Similarly, on average every respondent has sold about more than four acres of agricultural land in last 10 years. Additionally, the study describes that three types of conflicts (proprietorship, distribution/fragmentation, and encroachment) have influenced the respondent's personal lives, such as; threat to life, lower property values, loss of income, abundance of land. Therefore, Institutional framework with good governance is a need to create or strengthen coherence between land regulatory institutions with powers and capacity to regulate land conversions system. On the other hand, local population needed to be educated regarding agricultural land conversion, through public participation, management and development policy seminars, to ensure sustainable agricultural developed.

ABSTRACT

Tempe, a traditional Indonesian fermented soybean product, is celebrated for its rich bioactive profile, including peptides and isoflavones, which impart significant health benefits. In this

study, we investigated the microbial dynamics and metabolomic changes that drive isoflavone transformation in tempe produced from black and yellow soybeans. Two fermentation strategies were compared: a commercial Raprima™ starter culture and a co-culture of *Rhizopus oligosporus* and *R. stolonifer*. Metabolomic analysis using LC-HRMS revealed that co-culture fermentation notably increased the levels of bioactive aglycones such as genistein, daidzein, and glycitein, thereby enhancing isoflavone bioavailability and antioxidant capacity. Metagenomic profiling indicated that *Proteobacteria* (78%) and *Firmicutes* (18%) dominated the bacterial communities, with distinct microbial shifts observed between fermentation methods. Specifically, co-culture fermentation enriched genera such as Stenotrophomonas, while Raprima™ favored Acinetobacter. The fungal community was predominantly composed of Mucoromycota (92%), with *Rhizopus arrhizus* strongly associated with enzymatic hydrolysis of isoflavone glycosides. Statistical correlations demonstrated significant relationships between microbial taxa and metabolite intensities, confirming the role of microbial synergy in isoflavone conversion. Although yellow soybeans yielded higher total isoflavone content, black soybeans exhibited superior genistein levels and greater adaptability to tropical conditions. These findings underscore the impact of fermentation method and substrate selection on tempe's nutritional quality, supporting its development as a sustainable, functional food that leverages local resources and microbial interactions for improved health benefits. Advanced metabolomic and metagenomic analyses reveal the intricate interplay among soybean composition, fermentation conditions, and microbial communities, providing a basis for optimizing tempe production with superior nutritional and functional attributes.

Keyword: tempe, metabolomics, metagenomics, soybean, fermentation.

THE IMPACT OF RENEWABLE ENERGY IMPLEMENTATION ON RURAL ECONOMIC GROWTH

Syarifah Huswatun Miswar, S.Ag, LLM,

ORCID NO: 0009-0005-7619-0343

ABSTRACT

The use of renewable energy has become an important strategy to promote sustainable development, especially in rural areas which rural areas usually have more natural resources, but limited human resources. This research explores the impact of renewable energy implementation on economic growth in rural areas, focusing on how access to clean energy solutions-such as solar, wind, and biogas-can stimulate economic activity, increase productivity, and improve people's lives. By analyzing various case studies and reviewing existing literature, the research highlights the direct and indirect economic benefits of renewable energy, including job creation, increased agricultural productivity, and reduced energy costs as considering safety factors. The research findings show that the adoption of renewable energy not only helps address the issue of energy poverty, but also stimulates the local economy by empowering small industries, improving health and education services, and encouraging entrepreneurship. However, challenges such as high initial investment costs, lack of technical expertise, and inadequate policies remain significant barriers and need to be addressed as soon as possible. This study concludes that targeted interventions, including public-private partnerships, capacity-building programs, and supportive policies, are critical to maximizing the economic potential of renewable energy in rural areas. The results provide valuable insights for policymakers, development practitioners, and stakeholders seeking to achieve sustainable rural development through renewable energy integration.

ABSTRACT

Kazakhstan is one of the world's leading producers of high-quality wheat. Therefore, controlling biotic and abiotic stresses affecting wheat yield and quality is critical to Kazakhstan's wheat production. Leaf rust (*Puccinia triticina*) is widespread in wheat-growing areas of Kazakhstan and limits yield and quality to varying degrees. This research aimed to determine the yield response of 75 wheat lines to leaf rust under natural epidemic conditions at the Almaty site in the 2022-2023 growing season. Phenological control and analysis of biomass index indicators were also carried out. The test materials were sown by hand in 6 rows at 2.5-3.0 g of seed per row. The research was carried out using a randomized block design with three replications. Susceptible control varieties were scored 90S-100S, and the results were reliable. The evaluations were carried out between 5 and 16 June 2023. As a result of the study, it was observed that five materials were in the resistant group (CI; 0.1-5). The plant height of 8 test materials was measured to be 1.40 cm longer. Six materials matured early compared to the control. Twenty-nine test materials had the highest plant biomass index compared to the control. It was found that materials resistant to leaf rust reactions with 1.40 cm shorter plant height and high biomass can be registered or used as genitors in leaf rust resistance breeding programs.

ABSTRACT

Wheat is a critical economic and strategic crop for Kazakhstan, with an annual production of 17–18 million tonnes, of which 8 million are exported to Europe, the Middle East, and Arab countries. However, wheat production is significantly hindered by common bunt, a disease caused by *Tilletia* species, poses a global challenge. Although seed treatment with fungicides is a common practice to control this disease, it carries environmental and human health risks and increases production costs.

This study aimed to investigate the bunt reactions and yield potential of 75 bread wheat lines under artificial epidemic conditions caused by *Tilletia caries* (D.C.) Tul. during the Almaty research site's 2022–2023 growing season. The experimental material consisted of seeds prepared in paper envelopes, each containing 4–5 grams of seed inoculated with bunt spores at a concentration of 0.5%. Bunt reactions were assessed by counting the number of diseased and total spikes for each genotype and calculating the bunt infection rate (%). The susceptible control genotypes exhibited bunt infection rates of 90–100%, confirming the reliability of the experimental results.

The study was conducted using a randomized block design with three replications. Yield-related traits evaluated included plant height, main spike length, number of spikes per central spike, number of grains per spike, grain weight per spike, and 1000-grain weight. Among the 75 wheat lines tested, 16 lines demonstrated resistance to common bunt. These resistant lines also exhibited superior yield characteristics compared to the other genotypes.

The findings suggest that the resistant and high-yielding lines identified in this study have the potential to be registered and utilized as parental lines in breeding programs aimed at developing tillage-resistant wheat varieties.

ABSTRACT

In this paper, we explore the properties and importance of a lifetime distribution so called type I half-logistic Exponentiated Inverse Lomax. We investigate some of its mathematical and statistical properties such as the explicit form of the ordinary moments, moment generating function, conditional moments, Bonferroni and Lorenz curves, mean deviations, residual life and reversed residual functions, Shannon entropy and Renyi entropy. The maximum likelihood method is used to estimate the model parameters. Finally, we illustrate the importance and applicability of the model by the study by application to wind data.

Keywords: Type I half logistic exponentiated inverse Lomax distribution, moment generating function, moments, maximum likelihood estimate.

HEALTH AND DISEASE IMPLICATIONS OF SORGHUM IRRIGATED WITH TRICKLING FILTER-TREATED WASTEWATER IN NORTH AFRICA'S SEMI-ARID REGIONS

ABSTRACT

The goal of this work was to investigate the effect of treated wastewater irrigation on the physiological and agronomic properties of *sorgham area major source human food and are an excellent source of all essential nutrients like protein ,carbohydrates, fat, minerals,and bioactive compounds*. An experimental reuse study was performed using raw (RWW) and treated urban wastewater (TWW) by Trickling Filter (TF) process to irrigate Millet in comparison to well water (WW) as a control over a period of 5 months. The water quality was determined for irrigation based on sodium adsorption ratio (SAR), sodium percentage (Na %) and residual sodium carbonate (RSC) indicating that all treatments were suitable for irrigation purposes. In this study, we also assessed the agro-physiological and biochemical proprieties of the crops. Hence, the highest productivity of sorgham and leaf area were obtained in response to irrigation with RWW and TWW compared to WW; while macro-elements (TP, TKN, and K) were also affected in millet irrigated with RWW compared to TWW and WW. However, the plants irrigated with well water accumulate more Ca, Na, and Mg than those irrigated with RWW and TWW. All the crops irrigated with three water treatments showed a relatively similar concentration of micro-nutriments. The prevalence of total chlorophyll content in the plants increased with well water irrigation. Nevertheless, the biochemical parameters (protein and sugar content) were adversely affected in millet irrigated with RWW as compared to TWW and WW. Moreover, the use of treated urban wastewater improves the physicochemical properties and fertility of the soil compared to well water and enhances crop productivity.

Keywords: *Millet;* irrigation; treated wastewater reuse; physiological proprieties; Trickling Filter.

Pearl millet also known as Bachna or IRNY, is one of the four most important cereals (rice, maize, sorghum and millets) grown in tropical semi-arid regions of the world primarily in Africa and Asia. Our aim is to review the potential health benefits of pearl millet., libraries,

PubMed and other web sources. Pearl millet is rich in several nutrients as well as non-nutrients such as phenols. It has high energy, has less starch, high fiber (1.2g/100g, most of which is insoluble), 8-15 times greater α-amylase activity as compared to wheat, has low glycemic index (55) and is gluten free. The protein content ranges from 8 to 19% and it is low in lysine, tryptophan, threonine and the sulfur-containing amino acids. The energy of millet is greater than sorghum and nearly equal to that of brown rice because the lipid content is generally higher (3 to 6%). Pearl millet can be recommended in the treatment of celiac diseases, constipation and several non-communicable diseases. Nutritional studies on the population living in the pearl millet belts of the world and clinical trials on the impact of pearl millet in specific disease conditions are needed

Le millet perlé, également connu sous le nom de Bachna ou IRNY, est l'une des quatre céréales les plus importantes (riz, maïs, sorgho et millets) cultivées dans les régions tropicales semi-arides du monde, principalement en Afrique et en Asie. Notre objectif est de passer en revue les avantages potentiels du millet perlé pour la santé, en consultant des bibliothèques, PubMed et d'autres sources Internet. Le millet perlé est riche en plusieurs nutriments ainsi qu'en non-nutriments tels que les phénols. Il est très énergétique, contient moins d'amidon, beaucoup de fibres (1,2 g/100 g, dont la plupart sont insolubles), une activité α-amylase 8 à 15 fois supérieure à celle du blé, un faible indice glycémique (55) et ne contient pas de gluten. La teneur en protéines varie de 8 à 19 % et le millet est pauvre en lysine, tryptophane, thréonine et acides aminés soufrés. L'énergie du millet est supérieure à celle du sorgho et presque égale à celle du riz brun car la teneur en lipides est généralement plus élevée (3 à 6 %). Le millet perlé peut être recommandé dans le traitement des maladies cœliaques, de la constipation et de plusieurs maladies non transmissibles. Des études nutritionnelles sur la population vivant dans les ceintures de millet perlé du monde et des essais cliniques sur l'impact du millet perlé dans des conditions pathologiques spécifiques sont nécessaires.

EFFECT OF ENVIRONMENTAL FACTORS ON HEAVY METAL IN SEAWEED: A BIBLIOMETRIC ANALYSIS OF 20 YEARS OF RESEARCH PUBLICATIONS

ABSTRACT

Heavy metal accumulation in seaweed is significantly influenced by environmental factors such as salinity, temperature, pH, and anthropogenic activities. Understanding how these factors interact with seaweed physiology is crucial for evaluating the ecological risks and potential applications of seaweed in environmental monitoring and bioremediation. Despite increasing scientific interest in this topic, no bibliometric study has systematically mapped the evolution of research in this area. This study presents a bibliometric analysis of literature published between 2005 and 2024, retrieved from the Web of Science Core Collection. Using VOSviewer and Biblioshiny, the analysis explores co-occurrence of keywords, collaboration networks, and thematic development over time. The study focuses on research involving key terms such as salinity, temperature, pH, anthropogenic, seaweed, macroalgae, and heavy metals. Preliminary findings indicate growing interest in the role of environmental stressors on metal uptake mechanisms in macroalgae, with emerging themes related to climate change, pollution, and sustainable bioremediation. This work provides insight into current research hotspots and future directions, offering a foundation for deeper ecological studies and applied research in marine environmental management.

Keywords: Seaweed, macroalgae, heavy metals, environmental factors, climate changes.

CROP FARMERS' KNOWLEDGE OF E-BANKING IN ENUGU EAST SENATORIAL ZONE OF ENUGU STATE, NIGERIA

ABSTRACT

The study assessed crop farmers' knowledge of e-banking in Enugu East Senatorial Zone of Enugu state, Nigeria. Data was collected from sixty crop farmers through the use of a structured interview schedule. Analysis of the data was done using frequency, percentage, mean and standard deviation. Results show that the majority (73%) of the respondents had a high knowledge of e-banking. Also, data show that the most frequently used ICT for transactions amongst the respondents was the debit card (75.0%). The study further revealed that the crop farmers' show more positive satisfaction with the cashless policy including: security and protection of funds ($\overline{x}$=3.20), ease of usage ($\overline{x}$=3.00), quick access to finances ($\overline{x}$=2.95), mobile banking reliability ($\overline{x}$=2.90), mobile network availability ($\overline{x}$=2.87), support and assistance by financial institution ($\overline{x}$=2.63), reduction in the cost of access to funds ($\overline{x}$=2.62), convenient environment for farmers ($\overline{x}$=2.53). There is need for more sensitization of farmers on the gains of using e-banking technologies for seamless daily farm transaction by actors including government. Such sensitization and possible subsidization of cost of the technologies by government would help them to access and use more of such technologies.

ABSTRACT

Pulses are an essential source of vegetable protein, contributing significantly to food security and sustainable agriculture. Despite their increasing demand and high market value, pulses cultivation in Pakistan remains limited, leading to a growing reliance on imports. This study aims to identify the constraints faced by farmers in pulses production in Faisalabad (Sadar), Pakistan. A structured survey was conducted with 124 farmers, selected through proportionate random sampling. Data were collected through interviews and analyzed using the Statistical Package for Social Sciences (SPSS). The findings reveal multiple barriers to pulses cultivation. High fertilizer costs (mean=4.38) ranked as the most significant constraint, followed by middleman monopoly (mean=4.32), lack of farmer interest (mean=4.23), high pesticide costs (mean=4.02) and expensive irrigation (mean=3.98). Other challenges included limited technical knowledge of pulses production (mean=3.75), poor extension services, lack of government policies and inadequate access to certified seeds (mean=2.08). Farmers mainly relied on fellow farmers (mean=4.03) and pesticide agents (mean=3.80) for agricultural information, reflecting gaps in the role of extension workers. Due to small landholdings, many farmers preferred cultivating staple crops such as wheat, rice and maize to maximize profits, further limiting pulse production. To address these challenges, the study suggests the need for government intervention in the form of targeted extension programs, awareness campaigns, subsidized input provision and enhanced access to improved pulse varieties. Additionally, fair pricing mechanisms, training programs for both farmers and extension staff and better market linkages

should be implemented to incentivize pulses cultivation. Strengthening extension services and ensuring equal access to resources can help reduce import dependency and promote sustainable agricultural practices in Pakistan.

ABSTRACT

Maja fruit (*Aegle marmelos*) is rich in nutrients and bioactive compounds. However, its hard outer shell and bitter taste when unripe make it underutilized in the food industry. Additionally, its seeds, which are often discarded as waste, contain essential vitamins and fatty acids. This study aims to develop an innovative vegetarian ice cream formulation using maja fruit pulp and seed extract as a cow's milk substitute while evaluating its sensory, physicochemical, and bioactive properties. The ice cream was made using five different formulations, varying the amounts of maja seed extract, maja fruit pulp, soy milk, coconut milk, and palm sugar. Cow's milk was used as the control. The results show that the formulated vegetarian ice cream was well-accepted by consumers and exhibited significant functional properties, with antioxidant activity exceeding 50% and antihyperglycemic activity over 90%. The total phenolic content exceeded 100 mg GAE/100 g, highlighting its potential as a functional food. Furthermore, the product meets the Indonesian National Standard (SNI 01-3717-1995) for total soluble solids, fat content, and protein content in ice cream.

Keywords: Antioxidant, *Aegle marmelos*, vegetarian ice cream

ADAPTATION STRATEGIES TO FUEL SUBSIDY REMOVAL AMONG FARMERS IN NSUKKA AGRICULTURAL ZONE, ENUGU STATE, NIGERIA

Okoro, John Chukwuma
Department of Agricultural Extension,
University of Nigeria, Nsukka.
chukwuma.okoro@unn.edu.ng
ORCID NO: 0000000215851006

ABSTRACT

The study assessed the adaptation strategies to fuel subsidy removal among farmers in Nsukka agricultural zone, Enugu State, Nigeria. A multistage sampling procedure was used to select 60 farmers used for the study. Data collected were analyzed using frequencies, percentages, mean scores and factor analysis. The findings show that all (100%) of the respondents reported an increase in operational costs due to the removal of fuel subsidies, highlighting significant impacts of this policy on farmers. The effects of fuel subsidy removal on farmers' livelihood were majorly on farmers inability to purchase farm inputs, reduction in labour force, reduction in crop and livestock productivity and increased crop diversification due to fuel subsidy removal. Also, the major adaptation strategies to the effects of fuel subsidy removal by the farmers were resorting to the use of organic farming methods, reduction of farm size to manage production costs and increased focus on high value crops. However, the major factors that constrain farmers from adapting to the effects of fuel subsidy removal were lack of community support for adaptation strategies and lack of processing activities for value addition. The study concluded that there is a need for policymakers to develop strategies that support farmers in adapting to the effects of fuel subsidy removal and therefore recommend that policies should be developed and implemented to support farmers in adapting to the effects of fuel subsidy removal, such as providing subsidies for farm inputs and equipment, provide training and extension services to farmers on sustainable agricultural practices, farm resilience strategies, and farm development diversification strategies.

Keywords: adaptation strategies, fuel subsidy removal, farmers in Nsukka

EFFECTS OF FUEL SUBSIDY REMOVAL ON HOUSEHOLD FOOD CONSUMPTION AND DIETARY PATTERNS OF FARMERS IN ENUGU EZIKE AGRICULTURAL ZONE, ENUGU STATE, NIGERIA

Okoro, John Chukwuma
Department of Agricultural Extension,
University of Nigeria, Nsukka.
chukwuma.okoro@unn.edu.ng
ORCID NO: 0000000215851006

ABSTRACT

The study assessed the effects of fuel subsidy removal on household food consumptions and dietary pattern of farmers in Enugu ezike Agricultural Zone, Enugu state, Nigeria. Specifically, the study sought to: ascertain the effects of fuel subsidy removal on the farmers' food consumption and dietary patterns, ascertain the effects of fuel subsidy removal in farming practices and ascertain copying strategies employed by the respondents in cushioning the effects of fuel subsidy removal. A multistage sampling procedure was used to select 60 farmers used for the study. Data collected were analyzed using frequency, percentage, mean, standard deviation and factor analysis. The major effects of fuel subsidy removal on the farmers were: preparing meals at home than buying outside ($\bar{x}$=3.65), forming of a community buying group to purchase food in bulk ($\bar{x}$=3.52). The effects of fuel subsidy removal on farmers farming practices were majorly on environmental sustainability, behavioral adjustment and adaptive effects. The effects of fuel subsidy removal on household food consumption and dietary pattern were majorly on economic, nutritional and socio-economic effects. The coping strategies used in cushioning the effects of fuel subsidy removal were distress-based coping strategies, financial coping strategies and resilience-based coping strategies. The study concluded that the fuel subsidy removal has led to reduced food availability, increased food prices and reduced dietary diversity, ultimately exacerbating food insecurities among farmers. The study recommended that government should monitor and evaluate the impacts of fuel subsidy removal on farmers and adjust it policies and should implement policies that support farmers' food security and livelihood.

ABSTRACT

In the Midrex unit of the Goharzamin Mining and Industrial Company, located in Kerman Province, the top gas fuel stream, which is produced by the increased gas volume from the cracking of natural gas in the reformer tubes, plays a significant role in the operation of the reformer unit. This gas is enriched with natural gas every hour to meet the required thermal value for the reformer unit to reach optimal temperatures. However, due to the high carbon dioxide and water content in the top gas fuel stream, using it in the reformer burners causes several operational issues, including reduced heating value and process efficiency, corrosion of pipeline, increased natural gas consumption, and an increased carbon footprint. This research focuses on evaluating the impact of removing carbon dioxide and water from the top gas fuel stream on the reformer unit's energy efficiency and overall process optimization. By eliminating carbon dioxide and water content, the combustion energy of the top gas fuel stream significantly increases, reducing the amount of natural gas required for the reformer's operation and improving process efficiency. Additionally, in this paper Aspen HYSYS software was utilized to evaluate and simulate the heat duty transferred to the reformer across six scenarios with varying conditions for the top gas fuel stream. These scenarios include the removal of water and carbon dioxide from the top gas fuel stream, as well as changes in the amount of natural gas added to the top gas fuel stream. In this study, the amount of natural gas saved, the reduction in carbon dioxide emissions, the amount of water removed from the top gas fuel stream, and the revenue generated from the sale of carbon dioxide and water removed from the top gas fuel stream have been evaluated and documented. This study also investigates the environmental benefits of removing carbon dioxide, which can be captured and sold for various applications.

Additionally, this process helps reduce the carbon footprint, a critical factor in addressing global warming and complying with future environmental regulations.

Keywords: Top Gas Fuel, Carbon Dioxide, Water, Natural Gas, Aspen HYSYS.

SUBSTITUTION OF BEACH WELL INTAKE TECHNOLOGY FOR OPEN INTAKE TECHNOLOGY AS SEAWATER INTAKE FOR REVERSE OSMOSIS DESALINATION PLANT

ABSTRACT

In the city of Bandar Abbas, within the Hormozgan Steel Company, reverse osmosis (RO) desalination plant plays a crucial role in supporting industrial water needs. This study focused on improving the energy efficiency and performance of the RO desalination plant through equipment upgrades and system modifications. One key innovation introduced in this study was the use of beach well intake technology, which provide an alternative to conventional open intake technology. Beach well technology draw seawater from beneath the seabed, filtering it naturally through sand and subsurface layers. This modification significantly enhances the quality of the intake water, reducing the risk of membrane fouling caused by pollutants, marine organisms, and sediments commonly encountered in open intakes technology. This research involves assessing the operational performance of the RO plant both before and after the modification. Results indicated significant improvements in energy efficiency, with reductions in operational costs and maintenance requirements. Additionally, the natural filtration provided by the beach well intake technology lowered the need for extensive pre-treatment, resulting in reduced chemical usage and energy consumption. Furthermore, this study highlighted the environmental benefits of this system, including less impact on marine life, improved water quality, and lower visual and acoustic disruptions at the coastline. These findings also support

the feasibility of adopting beach well intake technology as a sustainable and cost-effective alternative to traditional open intake technology. This research also aligns with international environmental standards and agreements, such as the Convention on Biological Diversity (CBD) and the European Union's Water Framework Directive (WFD), emphasizing on the reduction of environmental impacts in desalination plants. Overall, this study demonstrates the potential for beach well technology to optimize desalination plant operations while promoting sustainability and reducing ecological footprints. In this paper, the key indices for the substitution of beach well technology with open water intake technology for the RO desalination plant in Bandar Abbas are provided and documented, including investment volume required, cost reduction, operation duration, internal rate of return (IRR), net present value (NPV), and both normal and adjusted payback periods.

ABSTRACT

The increasing need for diverse and sustainable resources, coupled with growing interest in the bioactive potential of traditionally used plants, necessitates the exploration of novel applications for agricultural species. This study employs a network pharmacology approach to elucidate a potential new dimension for *Mimosa pudica*, an agriculturally relevant plant, by investigating its anticancer properties against luminal-type breast cancer. Bioactive compounds identified from *M. pudica* were subjected to in silico analysis using SwissADME and SwissTargetPrediction to assess their drug-likeness and predict potential protein targets. Gene expression analysis utilizing UALCAN was conducted to identify differentially expressed genes in luminal-type breast cancer. Protein-protein interaction (PPI) network construction and visualization were performed using Cytoscape to delineate interactions between target proteins and identify key hub nodes. Molecular docking simulations evaluated the binding affinity of selected ligands, including apigenin, galangin, kaempferol, diosmetin, and chrysin, to proteins implicated in cell cycle regulation. The analysis revealed that *M. pudica* harbors diverse bioactive compounds with putative anticancer properties. Identified target proteins, encompassing AURKA, AURKB, CA12, CDK1, ERBB2, ESR1, KIF11, KMO, MIF, MMP1, MMP9, NEK2, PLK1, PTK6, SQLE, TOP2A, TYMP, and TYMS, are involved in critical cellular processes associated with cancer progression, including cell cycle regulation, DNA metabolism, growth factor signaling, angiogenesis, metastasis, and invasion. Notably, the ligands exhibited strong binding affinities to AURKA and CDK1, pivotal cell cycle regulators, with binding energies ranging from -7.6 to -8.9 kcal/mol. These findings offer valuable mechanistic insights into the potential of *M. pudica* beyond its traditional uses, underscoring its

potential as a promising source of therapeutic agents for the treatment of luminal-type breast cancer and highlighting the broader value that agricultural resources can offer to human health.

ABSTRACT

Growing consumer demand and rising government attention to the development of horticultural crops has significantly contributed to the expansion of potato area and production in Pakistan. Expansion in the processing industry have also contributed to increasing consumption of potato products. Furthermore, potato is the cheapest source of carbohydrates, vitamins, minerals, and proteins. This study uses field survey data collected from Sahiwal, Okara and Depalpur (major potato producing areas in Punjab province, Pakistan) to quantify the roles of various stakeholders (Farmers, Commission Agents, Wholesalers, Retailers and Consumers) in potato value chain. Study findings shows that majority of the farmers use their own savings to meet cost of production of potato crop and some also borrowed from Aarthi. Benefit-Cost Ratio for all the three varieties of potato crop is greater than one which indicates that farmers are making profit from investment on potato crop. Price fluctuation and exploitation by middleman are the major issues farmers facing while marketing their produce. Majority of commission agents had their personal investment in business, some also borrowed from informal (friends, relatives etc.) and formal sources such as banks. Most of the surveyed commission agents also provide finances to farmers. On ana average commission agent charges 4 percent commission from both sellers and buyers. Majority of wholesalers uses their personal capital in business, and some also borrowed formal banks as well. They earn reasonable profit from their business. Retailers use both personal capital and borrow money from banks for their business. Retailers earn Rs.5-10/kg from sale of potato crop to consumers. At farm level, there is need to ensure good quality seed and other inputs. Subsidies are not reaching to farmers. Farmers are being exploited by market intermediaries. To save losses at sowing and harvesting time proper farm machinery is a major constraint. Market committee collects the fee but does not provide proper facilities at marketplace. There is need of electronic auction and mandi.

ABSTRACT

The paper provides an impact analysis of interventions undertaken in one of the case studies in Punjab where Representative Agricultural Pathways (RAPs) based analysis were carried out. The Punjab- based analysis benefited from more elaborate data that were gathered in the field.

For the case study community in Punjab, the main interventions were:

- Promoting cultivation of water-saving 'low delta' crops, notably mung bean.
- Use of bed and furrow water saving technologies.
- Improving soil health by applying organic matter.

A total of 154 farmers were interviewed. The number of mung bean adopters were 76 while non-adopters were 78 from the same area. Data gathered were analyzed using statistical and econometric techniques. The Data Envelopment Analysis (DEA) technique was used to calculate technical efficiency of inputs, while the Tobit model was used to identify the major factors affecting efficiency of mung bean growers. The results show that adopters of low delta crops had a relatively higher average year of schooling compared with non-adopters. Among efficient growers of mung bean, the returns per month were higher as compared with cotton and maize. The Tobit model results showed that education and experience had a positive impact on technical efficiency, while non-availability of high yielding seed, non-availability of machinery, and volatility in selling prices had a negative impact. It is recommended that awareness among farmers should be enhanced for the adoption of new technologies and innovations.

cerenbalsak@gmail.com
ORCID NO: 0000-0002-2326-7520

ABSTRACT

Lettuce mosaic virus (LMV) belongs to the genus *Potyvirus* within the family *Potyviridae*. It is transmitted by seed and aphids in a non-persistent manner by *Myzus persicae* and *Macrosiphum euphorbiae*. To date, several studies conducted in different regions have declared that LMV is a widespread pathogen across the country and negatively affects lettuce production. In this study, newly obtained LMV isolates from the Eastern Mediterranean region of Turkey were analyzed with global LMV isolates to provide detailed insights into their genetic diversity and population structure. To investigate the prevalence of LMV, 105 leaf samples were collected from lettuce plants displaying virus-like symptoms. The surveys were conducted in Adana, Osmaniye, Hatay, and Kahramanmaraş in 2024-2025. As a result of the RT-PCR analysis, 26 out of 105 lettuce samples were found to be infected with LMV. The LMV infection rates were determined as 33.3%, 15%, 28%, and 20% in the provinces of Adana, Osmaniye, Hatay, and Kahramanmaraş, respectively. Ten LMV isolates selected based on their geographical origin, and their coat protein gene were amplified using specific primers by RT-PCR, then cloned, and sequenced. As a result of in pairwise comparisons, it was determined that the isolates show identities more than 96% at the nucleotide levels. A BLASTn and BLASTx analysis revealed that isolates share more than 89% nucleotide identity and over 92% amino acid identity with other LMV isolates in GenBank. The genetic diversity and population structure of LMV were examined by analysis of the coat protein gene of 45 isolates. As a result of the analyses, thirty-seven haplotypes were identified, and the haplotype diversity and nucleotide diversity (π) were 0.98 and 0.038 respectively. Furthermore, DataMonkey-based analysis indicated that the genome of the LMV population is being driven by negative selection as the average dN/dS ratio of the LMV genome remained <1 i.e., dN/dS= 0.13.

Keywords: LMV, RT-PCR, genetic diversity

KILIF PROTEİN GEN BÖLGESİNE GÖRE MARUL MOZAİK VİRÜSÜNÜN GENETİK ÇEŞİTLİLİĞİ VE POPÜLASYON YAPISI

ÖZET

Marul mozaik virüsü *Potyviridae* familyasında olup, *Potyvirus* cinsine aittir. Virüs tohumla ve yaprakbitleriyle (*Myzus persicae* ve *Macrosiphum euphorbiae*) non-persistent olarak taşınmaktadır. Bugüne kadar farklı bölgelerde yapılan çeşitli çalışmalar, marul mozaik virüsünün ülke genelinde yaygın bir patojen olduğunu ve marul üretimini olumsuz etkilediğini bildirilmiştir. Bu çalışmada, Türkiye'nin Doğu Akdeniz bölgesinden yeni elde edilen LMV izolatları, küresel LMV izolatlarıyla birlikte analiz edilerek genetik çeşitlilikleri ve popülasyon yapıları hakkında ayrıntılı bilgiler sağlanmıştır. Saha çalışmaları Adana, Osmaniye, Hatay ve Kahramanmaraş illerinde 2024–2025 yıllarında gerçekleştirilmiştir. LMV'nin yaygınlığını araştırmak için, virüs benzeri simptom gösteren marul bitkilerinden 105 yaprak örneği toplanmıştır. RT-PCR analizi sonucunda, 105 marul örneğinin 26'sının LMV ile enfekteli olduğu tespit edilmiştir. LMV enfeksiyon oranı Adana, Osmaniye, Hatay ve Kahramanmaraş illerinde sırasıyla %33.3, 15, 28, 20 olarak belirlenmiştir. Coğrafi orijinlerine göre seçilen 10 LMV izolatın kılıf protein genleri, spesifik primerler kullanılarak RT-PCR ile çoğaltılmış, ardından klonlanmış ve sekanslanmıştır. İkili dizi karşılaştırmaları sonucunda, izolatların kendi aralarındaki nükleotid benzerliğinin %96'dan fazla olduğu belirlenmiştir. BLASTn ve BLASTx analizleri ise, izolatların gen bankasındaki LMV izolatlarıyla %89'un üzerinde nükleotid benzerliği ve %92'nin üzerinde amino asit benzerliği gösterdiğini ortaya koymuştur. LMV'nin genetik çeşitliliği ve popülasyon yapısı, toplam 45 izolatın (bu çalışmadan elde edilen 10 izolat ve gen bankasındaki 35 izolat) kılıf proteini geninin analizi ile incelenmiştir. Analizler sonucunda, 37 haplotip tespit edilmiş olup, haplotip çeşitliliği ve nükleotid çeşitliliği (π) sırasıyla 0.98 ve 0.038 olarak bulunmuştur. Ayrıca, DataMonkey tabanlı analiz, LMV popülasyonunun dN/dS oranı 0.13 olarak belirlenmiş olup, popülasyonun negatif seçilim etkisinde olduğunu göstermiştir.

Anahtar Kelimeler: LMV, RT-PCR, genetik çeşitlilik

EFFECT OF PLANT DENSITY AND SHADING TREATMENTS ON BROAD BEAN (*Vicia faba* L.) YIELD

ABSTRACT

In this study, the effects of different plant densities and different shading intensities on the yield and yield-related parameters of broad bean (Vicia faba L.) were investigated. The research was carried out in the Field Crops Research and Application area of Dicle University, Faculty of Agriculture, during the 2022 crop growing season. Three broad bean varieties, namely Emiralem, Kuşadası and Sorgun, were used as material in the study. For plant density applications, planting densities of 10 plant/m2 and 20 plant/m2 were used, while shading applications at 0% (control group), 40%, 75% and 95% intensities were used for shading applications. The experiment was carried out according to the split-plot experimental design in randomized blocks with three replications. In the study, plant height, number of pods per plant, pod weight per plant, number of grains per pod, number of grains per plant and grain yield parameters were examined. According to the analysis results, the effects of variety, plant density and shading on all parameters except number of grains per pod were found to be statistically significant. When plant density and shading applications were evaluated in the study, the highest grain yield was determined in Emiralem (181.5 kg/da) variety at a density of 20 plants/m2 and in Sorgun (183.5 kg/da) variety under 40% shading, respectively. While plant densities did not affect grain number per pod and grain number per plant, shade treatments had a significant effect. The highest grain number per pod was obtained from 75% shade treatment in the Sorgun variety, and the highest grain number per plant was obtained from 40% application in the Emiralem variety. Intensive shading conditions increased plant height but caused weak development of plant stems. As a result, it was determined that moderately shaded and unshaded plants had higher performance compared to intensely shaded plants in terms of pod number, grain per plant and grain yield. It is thought that considering shade intensities in future studies will be effective in achieving the desired performance in broad bean cultivation.

Keywords: *Vicia faba*, faba bean, shading, density, yield.

BİTKİ SIKLIĞI VE GÖLGELEME UYGULAMALARININ BAKLA (*Vicia faba L.*) VERİMİNE ETKİSİ

ÖZET

Bu araştırmada, farklı bitki sıklıkları ve farklı yoğunluktaki gölgeleme uygulamalarının bakla (*Vicia faba* L.) bitkisinin verim ve verimle ilişkili parametreleri üzerine etkisi araştırılmıştır. Araştırma 2022 yılı ürün yetiştirme sezonunda Dicle Üniversitesi Ziraat Fakültesi Tarla Bitkileri Araştırma ve Uygulama alanında yürütülmüştür. Çalışmada Emiralem, Kuşadası ve Sorgun olmak üzere üç bakla çeşidi materyal olarak kullanılmıştır. Bitki sıklığı uygulamaları için 10 bitki/m^2 ve 20 bitki/m^2 ekim sıklıkları, gölgeleme uygulamaları için ise %0 (kontrol grubu), %40, %75 ve %95 yoğunluktaki gölgeleme uygulamaları kullanılmıştır. Deneme, tesadüf bloklarında bölünen bölünmüş parseller deneme desenine göre üç tekrarlamalı olarak yürütülmüştür. Araştırmada bitki boyu, bitkide bakla sayısı, bitkide bakla ağırlığı, baklada tane sayısı, bitkide tane sayısı ve tane verimi parametreleri incelenmiştir. Analiz sonuçlarına göre çeşit, bitki sıklığı ve gölgelemenin baklada tane sayısı hariç diğer tüm parametrelere etkisi istatistiki olarak önemli bulunmuştur. Araştırmada bitki sıklığı ve gölgeleme uygulamaları değerlendirildiğinde; en yüksek tane verimi sırasıyla 20 bitki/m^2 sıklığında Emiralem (181,5 kg/da) çeşidinde ve %40 gölgeleme altındaki Sorgun (183,5 kg/da) çeşidinde saptanmıştır. Baklada tane sayısı ve bitkide tane sayısı üzerine bitki sıklıklarının etkisi olmazken, gölge uygulamalarının önemli etkisi olmuştur. En yüksek baklada tane sayısı Sorgun çeşidinde %75 gölge uygulamasından, en yüksek bitkide tane sayısı ise Emiralem çeşidinde %40 uygulamasından elde edilmiştir. Yoğun gölgeleme koşulları bitki boyunu artırmış ancak bitki saplarının zayıf gelişmesine neden olmuştur. Sonuç olarak orta derecede gölgelenen ve gölgelenmeyen bitkilerin, yoğun gölgelenen bitkilere göre bakla sayısı, bitki başına tane ve tane verimi bakımından yüksek performansa sahip olduğu tespit edilmiştir. Gelecekte yapılacak çalışmalarda gölge yoğunluklarının dikkate alınmasının bakla yetiştiriciliğinde istenen performansın yakalanmasında etkili olacağı düşünülmektedir.

Anahtar Kelimeler: *Vicia faba*, faba bean, gölgeleme, sıklık, verim.

INVESTIGATION OF GROWTH AND DEVELOPMENT OF BEAN (*Vicia faba* L.) IN DIFFERENT PLANT DENSITIES AND SHADE TREATMENTS

Ümit ACAY[1*], Behiye Tuba BİÇER[2]

[1]Bingöl Üniversitesi, Gıda Tarım ve Hayvancılık Meslek Yüksekokulu, Bingöl, Türkiye.

ABSTRACT

In this study, the effects of different plant densities and different intensities of shading applications on the growth of broad bean (*Vicia faba* L.) were investigated. The research was carried out in the 2022 crop growing season at the Field Crops Research and Application area of Dicle University Faculty of Agriculture. Three broad bean varieties, Emiralem, Kuşadası and Sorgun, were used as material in the study. For plant density applications, planting densities of 10 plants/m^2 and 20 plants/m^2 were used, and for shading applications, shading applications at 0% (control group), 40%, 75% and 95% intensities were used. The experiment was carried out according to the split-plot design divided in randomized blocks with three replications. In the study, leaf area, leaf area index, leaf assimilation rate, relative leaf area and specific leaf area parameters were examined. The effects of varieties and applications on the parameters examined in the study were found to be significant. The highest values in the Sorgun variety were obtained at 10 plants/m^2 plant density in leaf area during full flowering and pod binding periods. Leaf area index showed the highest value in 10 plant/m^2 (1.53 m^2) and 20 plant/m^2 (1.25 m^2) plant densities and 75% shade treatments (2.98 m2) in samples taken on the 60th day. Leaf assimilation rate showed a stable course from the 32nd day to the 60th day for 10 plant/m^2 and 20 plant/m^2 plant densities, but showed a negative decreasing course after the 60th day with 10 plant/m^2 plant density. Leaf area ratio gave a higher value in the 75% shade treatment (37.05 cm/d) compared to the open field and other shade treatments in samples taken on the 67th day. Relative leaf area showed a regular decreasing course in the two plant densities and shade treatments and decreased as plant age progressed. Specific leaf area varied between 180.0 cm^2 g^{-1} and 155.0 cm^2 g^{-1}, and specific leaf area decreased as the number of days progressed regardless of plant densities. In addition, all shade treatments showed a decrease in specific leaf area. As a result, considering that open field conditions will reveal some stress factors in the plant, it is inevitable that shade treatments will be effective in plant growth.

Keywords: Faba bean, leaf area, specific leaf area, relative leaf area, leaf area ratio.

FARKLI BİTKİ SIKLIKLARI VE GÖLGE UYGULAMALARINDA BAKLANIN (*Vicia faba* L.) BÜYÜME VE GELİŞİMİNİN İNCELENMESİ

ÖZET

Bu araştırmada, farklı bitki sıklıkları ve farklı yoğunluktaki gölgeleme uygulamalarının bakla (*Vicia faba* L.) bitkisinin büyümesine etkisi araştırılmıştır. Araştırma 2022 yılı ürün yetiştirme sezonunda Dicle Üniversitesi Ziraat Fakültesi Tarla Bitkileri Araştırma ve Uygulama alanında yürütülmüştür. Çalışmada Emiralem, Kuşadası ve Sorgun olmak üzere üç bakla çeşidi materyal olarak kullanılmıştır. Bitki sıklığı uygulamaları için 10 bitki/m^2 ve 20 bitki/m^2 ekim sıklıkları, gölgeleme uygulamaları için ise %0 (kontrol grubu), %40, %75 ve %95 yoğunluktaki gölgeleme uygulamaları kullanılmıştır. Deneme, tesadüf bloklarında bölünen bölünmüş parseller deneme desenine göre üç tekrarlamalı olarak yürütülmüştür. Araştırmada yaprak alanı, yaprak alan indeksi, yaprak asimilasyon oranı, nispi yaprak alanı ve spesifik yaprak alanı parametreleri incelenmiştir. Araştırmada incelenen parametreler üzerine çeşit ve uygulamaların etkisi önemli bulunmuştur. Yaprak alanı 10 bitki/m^2 bitki sıkılığında tam çiçeklenme ve bakla bağlama dönemlerinde en yüksek değerleri Sorgun çeşidinde vermiştir. Yaprak alan indeksi 60. Günde alınan örneklerde 10 bitki/m^2 (1.53 m^2) ve 20 bitki/m^2 (1.25 m^2) bitki sıklıkları ve %75 gölge uygulamalarında (2,98 m^2) en yüksek değeri göstermiştir. Yaprak asimilasyon oranı 10 bitki/m^2 ve 20 bitki/m^2 bitki sıklıkları için 32. günden 60. güne kadar stabil bir seyir göstermiş, ancak 10 bitki/m^2 bitki sıklığı 60. günden sonra negatif yönde azalan bir seyir göstermiştir. Yaprak alanı oranı 67. günde alınan örneklerde %75 gölge uygulaması (37,05 cm/g) açık alan ve diğer gölge uygulamalarına oranla yüksek değer vermiştir. Nispi yaprak alanı iki bitki sıklığında ve gölge uygulamalarında düzenli bir azalma seyri göstermiş ve bitki yaşı ilerledikçe azalmıştır. Spesifik yaprak alanı 180,0 cm^2 g^{-1} ile 155,0 cm^2 g^{-1} arasında değişmiş, bitki sıklıklarına bağlı olmaksızın gün sayısı ilerledikçe spesifik yaprak alanı azalmıştır. Ayrıca tüm gölge uygulamalarında da spesifik yaprak alanı azalış göstermiştir. Sonuç olarak, açık saha koşullarının bitkide bazı stres faktörlerini ortaya çıkaracağı göz önünde bulundurulduğunda gölge uygulamalarının bitki büyümesinde etkili olması kaçınılmazdır.

Anahtar Kelimeler: Faba bean, yaprak alanı, spesifik yaprak alanı, nispi yaprak alanı, yaprak alan oranı.

STUDY OF TURKISH SUGAR INDUSTRY AND SUGAR POLICIES BETWEEN 1923-1956

ABSTRACT

Sugar beet is a versatile product with possibilities and uses that go far beyond sweetening products. When harvested under the right conditions and at the right time, sugar beets consist of 18-20% sugar, 75% water and the rest proteins, polysaccharides, minerals and fibers. Uses of sugar beet: as part of a balanced diet in many varieties, in the production of animal feed, in the use of its water for production purposes, in the use of beet leaves left in the field after harvesting as green manure, in the use of molasses for the yeast industry and alcohol, in the production of bioethanol as an alternative to fossil fuels, in the production of biomethane for injection into the general gas grid, in the production of bioplastics for sustainability, in the use of carbonated lime in production as fertilizer. Among the resolutions of the Economic Congress, which was held in Izmir between February 17 and March 4, 1923 and attended by people from various sectors, to promote the establishment of sugar factories in our country was the need to "grow beets in our country, establish sugar factories and expand the method of rotation in agriculture and thus improve and increase our livestock and grain." In 1951, the government aimed to expand the Turkish sugar industry. With the sugar industry expansion program prepared in this direction, 11 new sugar factories were opened between 1953 and 1956, making 1956 a historic year for the Turkish sugar industry.

1923-1956 YILLARI ARASI TÜRKIYE ŞEKER SANAYII VE ŞEKER POLİTİKALARI İNCELEMESİ

ÖZET

Şeker pancarı, ürünlerin tatlandırılmasının çok ötesine geçen yeteneklere ve kullanım alanlarına sahip çok yönlü bir üründür. Şeker pancarı, uygun koşullarda ve doğru zamanda hasat edildiğinde, %18-20 oranında şeker, %75 oranında su ve kalan kısmında da proteinler, polisakkaritler, mineraller ve liflerden oluşmaktadır. Şeker pancarının kullanım alanları; dengeli beslenmenin bir parçası olarak birçok çeşitte, hayvan yemi üretiminde, içeriğindeki suyun üretim amaçlı kullanımında, hasattan sonra tarlada kalan pancar yapraklarının yeşil gübre olarak kullanımı, melasın maya endüstrisi ve alkol için kullanımı, fosil yakıtlara alternatif olarak biyoetanol üretimi, genel gaz şebekesine tedarik için biyometan üretimi, sürdürülebilirlik için biyoplastik üretimi, üretimde kullanılan karbonatlı kirecin gübre olarak kullanılmasıdır. Ülkemizde şeker fabrikalarının kuruluşunun teşvik edilmesi ile ilgili olarak 17 Şubat – 4 Mart 1923 tarihleri arasında İzmir'de düzenlenen ve farklı sektörlerden kişilerin katılımıyla gerçekleştirilen İktisat Kongresi'nin kararları arasında yer alan "Memleketimizde pancar yetiştirilerek, şeker fabrikaları tesis ve ziraatta münavebe usulünün tevsii ve bu suretle hayvanatımızın ve hububatımızın ıslah ve çoğaltılması" zaruriyeti ortaya konmuştur. 1951 yılında hükümet tarafından Türkiye şeker sanayinin genişletilmesi amaçlanmış ve bu doğrultuda hazırlanan Şeker Sanayi Tevsi Programı ile 1953 ve 1956 yılları arasında açılan 11 yeni şeker fabrikası ile 1956 yılı Türkiye şeker sanayisi için tarihi bir yıl olmuştur.

ABSTRACT

The aim of this study is to analyse different image processing techniques and yield components comparatively to reveal their usability in bread wheat (*T. avestium.* L) breeding and to determine how different image processing techniques and agronomic elements affect grain yield.

In the study, yield elements such as plant height, number of grains per spike, 1000 grain weight, grain yield were discussed by using image processing techniques such as NDVI (provides information about plant biomass and chlorophyll), CM1000 (chlorophyll meter) and thermal camera (measures plant canopy temperature), and their effects on varieties and the superiority of varieties over each other in terms of these measurements and the effect of these measurements on grain yield were investigated.

As a result of the research, the highest grain yields of bread wheat genotypes were found in lines 11 and 4, 694.75 kg/da and 583 kg/da, respectively, and these lines were determined to be the lines that gave the best results in terms of both yield and image processing elements. These prominent lines also showed good performance in terms of protein, hectolitre and sedimentation. According to the results obtained in the study, a negative and significant relationship was found between image processing elements and yield and grain yield and quality elements such as protein and sedimentation. A significant and positive relationship was found between hectoliter and yield with NDVI, CM1000, thermal camera measurements.

The results obtained in this study will contribute to the wheat breeding program carried out by transferring them to practice.

As a result of this study, lines numbered 11 and 4 stood out as the lines with the highest performance and were determined as lines with high hopes for registration. In addition, the use of image processing techniques such as NDVI, CM1000, thermal camera and quality elements

such as 1000 grain weight, hectoliter weight, protein BM will increase the success of breeding studies.

Keywords: Bread wheat, image processing techniques, yield and quality elements, breeding, grain yield

FARKLI GÖRÜNTÜ İŞLEME TEKNİKLERİ VE VERİM UNSURLARININ BUĞDAY (*T. AVESTIUM L.*) ISLAHINDA KARŞILAŞTIRMALI OLARAK KULLANILABİLİRLİĞİ

ÖZET

Bu çalışmanın amacı farklı görüntü işleme tekniklerini ve verim unsurlarını analiz ederek karşılaştırmalı olarak ekmeklik buğday (*T. avestium.* L) ıslahında kullanılabilirliğini ortaya koymak ve farklı görüntü işleme teknikleriyle agronomik unsurların tane verimi üzerine nasıl etki ettiğini belirlemektir.

Çalışmada NDVI (bitki biomass'i ve klorofil hakkında bilgi sağlar), CM1000 (klorofil ölçer) ve termal kamera (bitki örtü sıcaklığını ölçer) gibi görüntü işleme teknikleri kullanılarak bitki boyu, başakta tane sayısı, 1000 tane ağırlığı, tane verimi gibi verim unsurları ele alınmış olup, bunların çeşitler üzerindeki etkileri ve bu ölçümler açısından çeşitlerin birbirine olan üstünlüğü ve bu ölçümlerin tane verimine etkisi araştırılmıştır.

Araştırma sonucunda ekmeklik buğday genotiplerinin tane verimleri bakımından en yüksek tane verimi sırasıyla 11 ve 4 numaralı hatlar olup 694,75kg/da ve 583kg/da bulunmuş ve bu hatlar gerek verim gerekse görüntü işleme unsurları açısından en iyi sonuçları veren hatlar olarak belirlenmiştir. Öne çıkan bu hatlar protein, hektolitre ve sedimentasyon yönünden de iyi bir performans göstermiştir.

Çalışmada elde edilen sonuçlara göre görüntü işleme unsurlarıyla verim ve tane verimi ile protein, sedimentasyon gibi kalite unsurları arasında negatif ve önemli ilişki bulunmuştur. NDVI, CM1000, termal kamera ölçümleriyle hektolitre ile verim arasında önemli ve pozitif ilişki tespit edilmiştir.

Bu çalışmada elde edilen sonuçların uygulama aktarılması ile yürütülen buğday ıslah programına katkı sağlayacaktır.

Bu çalışmanın sonucunda 11 ve 4 numaralı hatlar en fazla performansa sahip hatlar olarak öne çıkmış ve tescil konusunda ümit var hatlar olarak belirlenmiştir. Ayrıca NDVI, CM1000, termal kamera gibi görüntü işleme teknikleri 1000 tane ağırlığı, hektolitre ağırlığı, protein BM gibi unsurların kullanımı gibi kalite unsurlarının kullanımı ıslah çalışmalarının başarısını arttıracaktır.

Anahtar Kelimeler: Ekmeklik buğday, görüntü işleme teknikleri, verim ve kalite unsurları, ıslah, tane verimi

MOLECULAR DOCKING ANALYSIS OF BIOACTIVE COMPOUNDS FROM ASPARAGUS OFFICINALIS REVEALS POTENTIAL ANTIDIABETIC INTERACTIONS WITH HUMAN PROTEINS

Youssef Arif, Mohamed Bouhrim, Ahmed Arif , Mustapha Boulghallat, Fatiha Chigr , Ahmed Ait Chaoui

Biological Engineering Laboratory, Faculty of Science and Technology. Sulatan Moulay Slimane University, Béni Mellal. Morocco. Email : youssef.arif@usms.ma

ABSTRACT

The The present study investigates the antidiabetic potential of phytochemicals derived from Asparagus officinalis through molecular docking analyses using AutoDock Vina. The objective was to evaluate the binding affinity and interaction dynamics of major bioactive compounds—saponins, quercetin, and kaempferol with key human proteins implicated in diabetes pathophysiology, including β-glucosidase, NR4A1 nuclear receptor, and GLUT4. Compounds were selected based on their prevalence in A. officinalis and known or suspected antidiabetic mechanisms. Protein structures were retrieved from the Protein Data Bank (PDB codes: 1OGS for β-glucosidase, 2QW4 for NR4A1, 7WSM for GLUT4), and ligand structures were sourced from PubChem[1]. Docking simulations were conducted with a focus on binding energy, root-mean-square deviation (RMSD), and ligand-protein conformational stability. Among the compounds tested, saponins demonstrated the strongest binding affinity to β-glucosidase with a ΔG of −13.2 kcal/mol, suggesting potent inhibitory activity that may delay carbohydrate digestion and absorption . Quercetin and kaempferol exhibited moderate to strong affinities with their respective targets, reflecting mechanisms such as GLUT4 activation, inhibition of intestinal glucose absorption, and enhanced insulin sensitivity[2].

inhibits α-glucosidase and DPP-IV; kaempferol activates AMPK and enhances GLUT4-mediated uptake. The observed binding affinities and predicted interactions reinforce the therapeutic relevance of A. officinalis phytochemicals in diabetes management. This study lays the groundwork for future in vivo studies and clinical trials. The findings underscore the promise of Asparagus officinalis as a source of natural compounds for the development of plant-based antidiabetic therapeutics.

Compound	Target Protein	PDB Code	Best Affinity (kcal/mol)	Key Effect
Saponins	β-glucosidase	1OGS	−13.2	Enhanced β-cell function
Quercetin	NR4A1 ligand domain	2QW4	−9.7	Insulin secretion & glucose uptake
Kaempferol	GLUT4 transporter	7WSM	−8.9	Promotes GLUT4 translocation & uptake

Table 1: Binding Affinities and Targets

ABSTRACT

The accumulation of trace metals in agricultural soils represents a serious environmental and public health concern, particularly in intensively cultivated areas. This study examines the extent of soil contamination, its spatial distribution, and the associated ecological and human health risks in the irrigated agricultural area of Beni Moussa, Morocco. A total of 67 surface soil samples were collected and analyzed for key physicochemical parameters, as well as for concentrations of cadmium (Cd), copper (Cu), lead (Pb), zinc (Zn), chromium (Cr), nickel (Ni), and arsenic (As), using ICP-AES and ICP-MS techniques.

To assess the severity of contamination, several indices were applied, including the geo-accumulation index (Igeo), enrichment factor (EF), contamination factor (CF), and pollution load index (PLI). The results show that 94.02% of the samples exhibit PLI values greater than 1, indicating substantial metal accumulation—particularly for Ni and As, which displayed the highest enrichment levels.

Ecological risk assessment (RI) suggests low to moderate potential risks, with contamination hotspots identified near Afourer, Sidi Jaber, and Ouled Ayyad. Human health risk analysis indicates that ingestion is the primary exposure pathway, with children being particularly vulnerable. While most elements present low non-carcinogenic risks (HI < 1), nickel may pose a concern for adults. Moreover, Cr, As, and Ni have potential carcinogenic effects, particularly in children.

These findings underscore the urgent need to implement sustainable soil management practices, regulate agrochemical inputs and wastewater reuse, and establish long-term monitoring programs. Further research is recommended to develop effective mitigation strategies aimed at preserving soil quality and minimizing exposure risks.

EVALUATION ON THE THERAPEUTIC EFFICACY OF GREEN SYNTHESISED COPPER OXIDE NANOPARTICLES FROM *GRACILARIA Sp*

AROCKIA ALLFER NATHAN
M- M Tech Biotechnology Rajalakshmi Engineering College, Chennai

Dr: T. R. POORANI
Assistant Professor, Rajalakshmi Engineering College, Chennai

ABSTRACT

The increasing interest in nanotechnology for cancer therapy has led to the exploration of green synthesis methods for producing biocompatible copper oxide nanoparticles. This study evaluates the therapeutic efficacy of copper oxide nanoparticles synthesized using an eco-friendly approach from *Gracilaria Sp*, a marine red algae. The synthesis of copper oxide nanoparticles is characterize by UV-Vis spectroscopy, Dynamic light scattering (DLS) Zeta potential, X-ray diffraction (XRD), scanning electron microscopy (SEM), and Fourier-transform infrared (FTIR) analysis. Further, proceeded towards anti-oxidant & anti- cancer activities. This study suggests that copper oxide nanoparticles synthesized from *Gracilaria Sp* exhibit strong potential as an effective therapeutic agent for cancer treatment, offering a sustainable and green alternative to conventional nanoparticle synthesis methods.

Keywords: Green synthesis, copper oxide nanoparticles, *Gracilaria Sp* cancer therapy

PRECISION AGRICULTURE: A POSSIBLE BEDROCK ON WHICH NIGERIA PAST GLORY IN CASHEW PRODUCTION CAN BE REBUILT/RESTORED

ABSTRACT

Cashew (*Anarcardium occidentales*) is currently one of agricultural commodity of interest in the country due to its contribution to the nation's gross domestic product (GDP) and its high foreign exchange gain. Within the Nigeria states, cashew trees are cultivated in almost all of the six geo-political zones. Currently, its cultivation has spread to about 27 states of the country accounting for more than 60% local production. In the past, Nigeria's annual raw cashew nut yield was reported to surpass that of Cote d'Ivoire (the current best producer) that happens to be her close competitor as at the dawn of the millennium especially during the first decade of the millennia (within the years 2000-2010) due to a lot of factors. However, After the year 2010, especially during the following decade i.e within the years (2011-2020), due to fewer land area, lack of governmental organizations' involvement in cashew value chain, gap in government policies, lack of support and aid from government at all levels, difficulty in land acquisition and as well as pests and diseases, Cote D'Ivoire soon surpassed Nigeria in nut production in due course as a result of their ability to act on the weakness leading to the downfall of Nigeria in cashew production. For Nigeria to restore her past glory precision agriculture could be the possible bedrock of restoration. Precision agriculture is a system of agriculture that involves the adoption of advanced technology such as drones, GPS, blockchain, AI, satellite imaging, sensors, IoTs, e.t.c to collect data on weather patterns, soil conditions and crop health, while such data can be used by various stakeholders to make informed decision that will increase the yield of cashew nut in the country. Precision agriculture could help in early detection of pests and diseases outbreaks, reduce waste, help farmers and other stakeholders make informed decisions on crop management e.t.c. However, its adoption will require careful plannings, trainings, and huge investments (by government and NGOs) in order to make it accessible, acceptable and avoidable for smallholding farmers.

ABSTRACT

Introduction and Purpose: *Salmonella* contamination of fresh produce, including watermelon, poses a significant public health concern. This study aimed to investigate the presence and characteristics of *Salmonella* isolates in watermelon, soil and water samples obtained from agricultural sources.

Materials and Methods: A total of 1450 watermelon samples were collected from different farms in Bejaia and subjected to microbiological analysis. *Salmonella* spp. were isolated using standard culture methods and confirmed by molecular techniques. The isolates were further characterized for antimicrobial susceptibility, serotype determination, and genetic relatedness using whole genome sequencing.

Results: The results revealed the presence of *Salmonella* in 19% of the total samples, indicating a potential risk of foodborne illness associated with watermelon consumption. Antimicrobial susceptibility testing demonstrated varying resistance patterns among the isolates. Serotyping revealed diverse *Salmonella* serotypes, suggesting multiple contamination sources. Molecular analysis indicated genetic diversity among the isolates, with some strains showing close relatedness to clinical isolates.

Discussion and Conclusion: These findings underscore the importance of implementing stringent food safety measures throughout the vegetables production and distribution chain to mitigate the risk of *Salmonella* contamination and subsequent foodborne outbreaks.

Keywords: *Salmonella*, antimicrobial resistance, watermelon, agricultural environments, genotypic characterization, food safety

ABSTRACT

Protein, classified as a macronutrient and the only source of amino acids, can have a wide range of benefits by breaking down into its components, i.e., peptides and amino-acids, which are called hydrolysates. These bioactive compounds are inactive within the protein structure but can be released by enzymatic hydrolysis, fermentation, and gastrointestinal digestion.

Different protease enzymes are used to break down the intramolecular bonds of proteins . After the interaction of proteins and enzymes, the outcome contains a complex mixture of peptides consist of different amino acid sequences, composition, length with different chemical and biological properties that can pose various types of bioactivities in the body and food systems. The hydrolysis of proteins leads to increased bioactivities because the functional peptide sequences are released, and large, low-bioavailable molecules (proteins) change into smaller compounds (peptides) with lower weight, improved functionality, and greater bioavailability, with added value to the initial compound.

Various protein sources, including wheat, quinoa, fish and fish by-products, insects, soybean, milk, egg, etc., are explored for their ability to produce bioactive peptides through enzymatic hydrolysis. These peptides exhibit numerous biological activities, such as anti-hypertensive, anticancer, antioxidant, anti-obesity, cholesterol-lowering, hypoglycemic, anti-inflammatory, and immunomodulatory effects. Furthermore, these peptides contribute in functional properties such as improved solubility, foaming capacity, and emulsification which are valuable in food technology and development of functional foods.

This review will discusses the potential of diverse protein sources, from traditional animal proteins to innovative plant-based proteins, in showing nutraceutical benefits and promoting

health and food applications, with a focus on enzymatic hydrolysis as a key process for enhancing bioavailability and functionality.

ABSTRACT

Plants were always a part of the everyday life of the man, because he uses it to look after itself for a long time. Medicinal plants were used during centuries as remedies for the human diseases because they contain components of therapeutic value. Oil is located in various parts of plants (flowers, sheets, barks, wood, fruits, seeds … etc.), for the obtaining of these gasolines there are several variable techniques.

Essential Oil content bioactive molecules, exhibiting a multiple biological activities. Within the framework of the valuation of the Algerian botanical species, and considering the therapeutic virtues which represents Lamiacees, we were interested in the extraction of *Origanum vulgare*L essential oil, coming from the region of Blida, Medea, Khemis Miliana, M'sila in Algeria.

A study Physico-chemical, biological : the test of antibacterial activity, so antioxydant activity and the molecular identification of the compositions by the technique of GC-MS on essential oil *Rosmarinus officinalis*. The yield obtained from leaves. This yield is in accordance with the standards recommended international. The composition of the essential oil was analyzed by chromatography in gas phase GC-MS. The obtained results show that the essential oil of Rosemary has a big antioxidizing activity. The study of the antibacterial power by the method of distribution of records (disks), essential oil showed an activity moderated against *E coli* , Staphylococcus and Pseudomonas, Klebsiella. In food systems, antioxidants are useful in retarding lipid oxidation and protect during storage.

ABSTRACT

Oil palm and its products is a multi-adaptable tree crop with almost all parts having economic value and useful for everyday livelihood. The fruit leads vegetable oils produced globally, accounting for one-quarter of global consumption and approximately 60% of international trade in vegetable oils. The participation of women in oil palm production cannot be underemphasized couple with the profitability for economic value. The information were elicited carefully from 155 respondents using structural interview schedule and analysed with descriptive statistics. The Gross margin profits is ₦257,400, therefore the gross ratio is 0.50 which signifies that for every 1 naira invested, a profit of 50 k is profited. The regression revealed that there was significant difference between Age (t= 0.158), farm size (0.16) at 5%, also Experience (0.199) at 10 % and their profits from oil palm fruits production in the study area. Therefore, Government and private organizations are encouraged to invest in capacity building of oil palm fruits production for optimum productivity.

ABSTRACT

The present wok is a comparative study between two volatil oils extracted from two cupressus species which consisted on Arizona cypress and common cypress that grown in the north of Algeria. The oils were respectively obtained by submitting each plant material to hydrodistillation method. The volatile oils were characterized through their aspects, colours, odours, and some of their physico-chemical properties (pH, miscibility in ethanol, density, refractive index, Fourier-transform infrared spectroscopic analysis). The results show that both Arizona and common cypress volatile oils are limpid and mobile liquids which have characteristic odours. Arizona cypress extract is pale yellow however common cypress oil is pale yellow to transparent. Arizona cypress oil is less acidic and more miscible in ethanol than common cypress extract. Also, Arizona cypress oil has slightly higher density and refractive index in comparison to common cypress oil. Attenuated total reflectance-Fourier transform infrared spectroscopy identified the presence of alcohols, aldehydes, ketones, alkanes, esters and aromatics in the chemical composition of Arizona cypress oil. It is also showed the presence alkanes, alkenes, alcohols, esters, ethers, esters, ketones and aromatics in common cypress extract. These findings indicate that the two local cupressus volatil oils have good qualities and similarities in their properties. They constitute interesting natural products that may use in food, pharmaceuticals and cosmetics.

Keywords: volatile oil, cupressus species, comparative study, organoleptic properties, physico-chemical characteristics.

ASSESSMENT OF CLIMATE CHANGE EFFECTS AND ADAPTATION PRACTICES AMONG CEREALS CROP FARMERS IN BWARI AREA COUNCIL FCT, ABUJA, NIGERIA

ABSTRACT

The study assessed farmers' awareness of climate change and adaptation practices among cereals crop farmers in Bwari Area Council F.C.T. Abuja. Five (5) wards were purposively selected using multistage sampling procedures. Eighty (80) cereals crop farmers were selected for the study and the data obtained was analyzed using descriptive statistics. The result revealed that farmers in the study area were young and active with mean age of 33 years. 91.25% of the farmers were male and married. The cereals crop farmers in the study area were educated. The mean household size was 9 persons; the mean farm size was 1ha and 48.75% of the land acquired by inheritance. The mean annual income was ₦10,500: 00k. The study revealed further that the farmers were aware of climate change with 62.5% awareness. The adaptation practices adopted by the farmers were early planting 28%, early maturing crop 27% and using resistance varieties 11%. The causes of climate change according to this study were: deforestation (35.00%), human activities (33.75%) and overgrazing (23.75%). The constraints to adaptation practices includes: lack of capital (36.25%), lack of adequate information (12.50%), lack of extension agents (15.0%) and lack of access to adaptation practices (31.25%). Farmers should endeavor to form cooperative societies to access credit facilities, Government should organize training and workshops on climate change adaptation practices and Government should control the removal of trees and provide rangeland for livestock were offered as recommendations.

Prishtina, 10000, Republic of Kosova
{Arleta Rifati-Nixha, arleta.rifati@uni-pr.edu}

ABSTRACT

Acacia honey is a unifloral honey produced by bees fed on acacia flowers. It is transparent to light yellow with a mild taste and floral fragrance.

The high-quality acacia honey is assessed based on both physical-chemical parameters.

Measuring honey quality standards is important to confirm its authenticity, ensure safety, and maintain its nutritional value, which helps protect consumer health and support the reputation of producers.

The aim of this paper is to compare changes in the quality analysis based on properties such as the determination of proline, the determination of flavonoids and specific rotation through a polarimeter, in three samples of acacia honey, from the region of Kosovo, North Macedonia and Croatia.

Proline is an indicator of honey quality and adulteration when it falls below a certain value. For its determination, we have prepared honey solutions, and nynhidrin solution. The other necessary reagents are HCOOH 98% and 2-propanol. To perform the measurements, we used the UV-Vis spectrophotometer, and the spectrophotometric measurements were taken at a wavelength of 510nm.

For the determination of flavonoids, we have prepared honey solutions, and 2% solution of $AlCl_3$. Measurements were performed using a UV-Vis spectrophotometer at 430nm.

For the dermination of specific rotation throught polarimeter, we have prepared honey solutions, then we added solutions Carrez I and Carrez II. We filtered it and used the filtrate.

Our results align with standard norms, demonstrating good quality and reliability of the honey.

Keywords: acacia honey, proline, flavonoids, specific rotation, spectrophotometer, polarimeter honey quality.

EVALUATION OF FRUIT JUICE QUALITY THROUGH CHEMICAL AND PHYSICAL ANALYSIS

Alejna Rashiti, Malsore Hysenaj, Arleta Rifati-Nixha

Chemistry Department, Faculty of Mathematical & Natural Sciences, University of Prishtina, Prishtina, 10000, Republic of Kosovo
(Arleta Rifati-Nixha, arleta.rifati@uni-pr.edu)

ABSTRACT

Fruit juices are rich in vitamins, minerals, and antioxidants, and they play an important role in maintaining health. They are known for their high content of healthy substances that help strengthen the immune system and improve metabolism. The preparation of fruit juices starts with selecting pre-washed fruits, which are then squeezed to extract the juice.

This study aims to evaluate the quality and chemical composition of juices. The study focuses on analyzing four fruit juices, specifically multivitamin juice and apple juice, purchased from different regions of Kosovo. Various laboratory methods were used in the conducted analyses to identify the chemical composition of the juices. The use of UV-VIS spectrophotometry enabled the measurement of vitamin A content, while thin-layer chromatography (TLC) was used to identify preservatives. Additionally, specific analyses were conducted to detect the presence of saponins using appropriate laboratory methods. Moreover, conductivity measurements were performed to assess the presence of electrolytes and ash content, as well as the analysis of mineral salts. These analyses allow us to identify the nutritional quality of juices and assess their safety. The results showed that the juices contained important health components, but some also contained preservatives that could affect the quality and safety of the product. This study has contributed to expanding knowledge about the fruit juice industry in Kosovo.

Keywords: fruit juices, vitamin A, preservatives, UV-VIS spectrophotometry, thin-layer Chromatography (TLC), health, laboratory analysis.

STUDY OF THE CHEMICAL COMPOSITION OF *Fumaria parviflora* FROM THREE REGIONS OF MOROCCO

Salma Makdouf[1*], Karima El Bouqdaoui[1,3], Abdelhakim El Makssoudi[2], Mounia Cherki[1]

* salmamakdouf1822@gmail.com

ABSTRACT

Fumaria parviflora, known vernacularly in Morocco as "nar lbarda", is a green, herbaceous, annual plant that grows in wheat fields, plains and low hills. An ubiquitous species, it can be found in Europe, Africa, America, Australia and, most importantly, India, Pakistan and Iran. In traditional medicine, it has been used to cure numerous illnesses and infections such as diabetes, digestive disorders, eczema, burns, fever, flu, headaches and toothaches, intoxication, hepatobiliary dysfunction, blood disorders, urinary diseases and male infertility. Our aim is to carry out a comparative study of the chemical composition of *F. parviflora* harvested in three different Moroccan regions (Casablanca, El Jadida and Khouribga).

Moisture, lipids, carbohydrates, proteins, minerals and pigments were determined by standard methods. Secondary metabolites were assessed by screening.

Our results show that the macronutrients and secondary metabolites of the plant vary according to the harvesting region. The F. parviflora sample from Casablanca had the highest fat content compared with those from El Jadida and Khouribga (6.49 ± 0.135% VS 4.1 ± 0.133% and 4.65 ± 0.144% respectively), while all three samples had equivalent protein and carbohydrate values. Polyphenols, saponins and tannins were detected qualitatively in F. parviflora samples from all three regions, while flavonoids were only detected in those from El Jadida and Khouribga. We can therefore conclude that environmental conditions in each region probably influence the chemical composition of *F. parviflora*.

Key words: *Fumaria parviflora, comparative study, chemical composition, screening.*

AWARENESS AND UNDERSTANDING OF ORGANIC FOOD AMONG THE MOROCCAN POPULATION

ABSTRACT

In recent decades, shifts in food production and consumption patterns have emerged, impacting significantly the food system and having repercussions on both the environment and health. These changes are largely driven by an increased food production to meet the needs for food security and global population growth. This surge in production has, in turn, influenced people's eating habits, enhancing food availability and improving food security. All these changes are also causing negative environmental consequences such as the depletion of natural resources, deforestation, biodiversity loss, pollution, climate change, water scarcity, and air quality degradation, among others. At the same time, unsustainable food consumption exacerbates these imbalances in terms of both quantity and quality, intensifying the effects during and after the COVID-19 health crisis on human health and environmental sustainability. In this context, organic agriculture emerges as a promising alternative to promote sustainable food consumption. This paper aims to assess Moroccans' perception of organic agriculture through an online questionnaire, to which 423 participants responded.The results reports that 81.7% of survey respondents consumed organic foods for reasons mainly related to their benefits on health environment, 85.5% claimed the high cost as reason for not eating them. The study revealed also a confusion of organic products with local products in a large part of the participants (66.3%). In conclusion, Moroccan population perceives organic food superior to conventionally grown products in terms of quality or taste. However, the consumption of organic products is still modest or even low among the population. The data from this study indicate that although the development of organic agriculture is still insufficient in Morocco, it appears to be a promising approach for sustainable food consumption.

Keywords: Organic food; local food; consumption; perception.

SIMULATION AND EVALUATION OF THE IMPACT OF REMOVING CARBON DIOXIDE AND WATER FROM THE TOP GAS FUEL STREAM EXITING THE TOP GAS SCRUBBER IN MIDREX UNIT OF THE GOHAR ZAMIN MINING AND INDUSTRIAL COMPANY

ABSTRACT

In the Midrex unit of the Gohar Zamin Mining and Industrial Company, located in Kerman Province, the top gas fuel stream, which is produced by the increased gas volume from the cracking of natural gas in the reformer tubes, plays a significant role in the operation of the reformer unit. This gas is enriched with natural gas every hour to meet the required thermal value for the reformer unit to reach optimal temperatures. However, due to the high carbon dioxide and water content in the top gas fuel stream, using it in the reformer burners causes several operational issues, including reduced heating value and process efficiency, corrosion of pipeline, increased natural gas consumption, and an increased carbon footprint.

This research focuses on evaluating the impact of removing carbon dioxide and water from the top gas fuel stream on the reformer unit's energy efficiency and overall process optimization. By eliminating carbon dioxide and water content, the combustion energy of the top gas fuel stream significantly increases, reducing the amount of natural gas required for the reformer's operation and improving process efficiency. Additionally, in this paper Aspen HYSYS software was utilized to evaluate and simulate the heat duty transferred to the reformer across six scenarios with varying conditions for the top gas fuel stream. These scenarios include the removal of water and carbon dioxide from the top gas fuel stream, as well as changes in the amount of natural gas added to the top gas fuel stream.

In this study, the amount of natural gas saved, the reduction in carbon dioxide emissions, the amount of water removed from the top gas fuel stream, and the revenue generated from the sale of carbon dioxide and water removed from the top gas fuel stream have been evaluated and documented. This study also investigates the environmental benefits of removing carbon dioxide, which can be captured and sold for various applications. Additionally, this process

helps reduce the carbon footprint, a critical factor in addressing global warming and complying with future environmental regulations.

ABSTRACT

In the city of Bandar Abbas, within the Hormozgan Steel Company, reverse osmosis (RO) desalination plant plays a crucial role in supporting industrial water needs. This study focused on improving the energy efficiency and performance of the RO desalination plant through equipment upgrades and system modifications. One key innovation introduced in this study was the use of beach well intake technology, which provide an alternative to conventional open intake technology. Beach well technology draw seawater from beneath the seabed, filtering it naturally through sand and subsurface layers. This modification significantly enhances the quality of the intake water, reducing the risk of membrane fouling caused by pollutants, marine organisms, and sediments commonly encountered in open intakes technology. This research involves assessing the operational performance of the RO plant both before and after the modification. Results indicated significant improvements in energy efficiency, with reductions in operational costs and maintenance requirements. Additionally, the natural filtration provided by the beach well intake technology lowered the need for extensive pre-treatment, resulting in reduced chemical usage and energy consumption. Furthermore, this study highlighted the environmental benefits of this system, including less impact on marine life, improved water quality, and lower visual and acoustic disruptions at the coastline. These findings also support the feasibility of adopting beach well intake technology as a sustainable and cost-effective alternative to traditional open intake technology. This research also aligns with international

environmental standards and agreements, such as the Convention on Biological Diversity (CBD) and the European Union's Water Framework Directive (WFD), emphasizing on the reduction of environmental impacts in desalination plants. Overall, this study demonstrates the potential for beach well technology to optimize desalination plant operations while promoting sustainability and reducing ecological footprints. In this paper, the key indices for the substitution of beach well technology with open water intake technology for the RO desalination plant in Bandar Abbas are provided and documented, including investment volume required, cost reduction, operation duration, internal rate of return (IRR), net present value (NPV), and both normal and adjusted payback periods.

ABSTRACT

Protein, classified as a macronutrient and the only source of amino acids, can have a wide range of benefits by breaking down into its components, i.e., peptides and amino-acids, which are called hydrolysates. These bioactive compounds are inactive within the protein structure but can be released by enzymatic hydrolysis, fermentation, and gastrointestinal digestion.

Different protease enzymes are used to break down the intramolecular bonds of proteins . After the interaction of proteins and enzymes, the outcome contains a complex mixture of peptides consist of different amino acid sequences, composition, length with different chemical and biological properties that can pose various types of bioactivities in the body and food systems. The hydrolysis of proteins leads to increased bioactivities because the functional peptide sequences are released, and large, low-bioavailable molecules (proteins) change into smaller compounds (peptides) with lower weight, improved functionality, and greater bioavailability, with added value to the initial compound.

Various protein sources, including wheat, quinoa, fish and fish by-products, insects, soybean, milk, egg, etc., are explored for their ability to produce bioactive peptides through enzymatic hydrolysis. These peptides exhibit numerous biological activities, such as anti-hypertensive, anticancer, antioxidant, anti-obesity, cholesterol-lowering, hypoglycemic, anti-inflammatory, and immunomodulatory effects. Furthermore, these peptides contribute in functional properties such as improved solubility, foaming capacity, and emulsification which are valuable in food technology and development of functional foods.

This review will discusses the potential of diverse protein sources, from traditional animal proteins to innovative plant-based proteins, in showing nutraceutical benefits and promoting health and food applications, with a focus on enzymatic hydrolysis as a key process for enhancing bioavailability and functionality.

PRICE VOLATILITY OF RICE PRODUCTION IN NIGERIA (AN APPRAISAL OF RICE PRODUCTION IN KEBBI STATE)

Prof. Babayemi, A.W, Dr. G. I. Onwuka, Musa Abdulrahman, Sumayya Jibril and B. Shehu

KEBBI STATE UNIVERSITY OF SCIENCE AND TECHNOLOGY, ALIERO

ABSTRACT

This study examines rice price volatility in Kebbi State, Nigeria, focusing on WACOT, LABANA, and RAYHAN using data from January 2010 to February 2024. Statistical and econometric methods, including descriptive analysis, unit root tests, and GARCH-type models, are employed to assess volatility dynamics. Descriptive statistics show WACOT has the highest mean price (19,961.8) and standard deviation (12,653.8), indicating the greatest volatility. LABANA follows with a mean of 19,229.9 and standard deviation of 12,199.0, while RAYHAN exhibits the lowest mean (3,733.3) and standard deviation (12,002.7). Skewness and kurtosis suggest WACOT and LABANA have a higher likelihood of extreme price fluctuations. Graphical analysis highlights volatility spikes from late 2023 to early 2024. Correlograms and unit root tests confirm non-stationarity, necessitating first differencing. Post-differencing analysis establishes stationarity with stable mean and variance. GARCH-type models identify FIGARCH (1,d,1) as optimal for WACOT and LABANA, while ARFIMA (1,1,1) is best for RAYHAN. The FIGARCH model for WACOT shows the highest volatility persistence ($\alpha + \beta = 0.996$) and moderate negative asymmetry ($\Upsilon = -0.252$). LABANA's FIGARCH model exhibits strong asymmetry ($\Upsilon = -0.607$) and persistent volatility ($\alpha + \beta = 0.951$). RAYHAN's ARFIMA model reveals long memory effects ($\alpha + \beta = 0.917$) and moderate asymmetry ($\Upsilon = -0.324$). WACOT has the highest volatility, while LABANA shows the strongest asymmetry. The findings emphasize the need for effective risk management strategies in Kebbi State's rice market. This study provides critical insights for policymakers and stakeholders seeking to mitigate price volatility risks.

ABSTRACT

The study assessed crop farmers' knowledge of e-banking in Enugu East Senatorial Zone of Enugu state, Nigeria. Data was collected from sixty crop farmers through the use of a structured interview schedule. Analysis of the data was done using frequency, percentage, mean and standard deviation. Results show that the majority (73%) of the respondents had a high knowledge of e-banking. Also, data show that the most frequently used ICT for transactions amongst the respondents was the debit card (75.0%). The study further revealed that the crop farmers' show more positive satisfaction with the cashless policy including: security and protection of funds ($\overline{x}$=3.20), ease of usage ($\overline{x}$=3.00), quick access to finances ($\overline{x}$=2.95), mobile banking reliability ($\overline{x}$=2.90), mobile network availability ($\overline{x}$=2.87), support and assistance by financial institution ($\overline{x}$=2.63), reduction in the cost of access to funds ($\overline{x}$=2.62), convenient environment for farmers ($\overline{x}$=2.53). There is need for more sensitization of farmers on the gains of using e-banking technologies for seamless daily farm transaction by actors including government. Such sensitization and possible subsidization of cost of the technologies by government would help them to access and use more of such technologies.

ABSTRACT

Rice paper is a thin sheet made from rice commonly used for wrapping other foodstuffs. Rice paper manufacturing technology can help increase product diversification from rice. However, rice paper still lacks elasticity after rehydration and has a short shelf life. Citronella essential oil contains monoterpene as the hydrophobic component that can be used to improve the characteristics of rice paper. The use of citronella essential oil can increase the utility and functional value of food products. This study aimed to determine the effect of citronella essential oil addition at various concentrations on rice paper's physicochemical and mechanical characteristics. The research method used was an experimental method using One Way Analysis of Variance (ANOVA) and Duncan's further test. The results showed that the best treatment was found in the sample by adding 1.5% (v/w) citronella essential oil. The addition of citronella essential oil concentration had a significant effect on the characteristics of rice paper on moisture content, water activity, rehydration power, color a*, color b*, tensile strength, elongation, and hedonic quality (color, texture, aroma, taste). This study provides important insights into optimizing rice paper formulations for various food product applications. Rice paper could be an alternative plastic for more sustainable food packaging.

ABSTRACT

Nutrient deficiencies, particularly nitrogen (N), phosphorus (P), and potassium (K), significantly impact rice growth and yield. Early and accurate identification of these deficiencies is essential for precision agriculture and effective crop management. This study presents a **deep learning-based automated classification model** that leverages a **spatial attention mechanism** to enhance feature extraction and improve deficiency detection in rice leaves. The model is built on a convolutional neural network (CNN) framework, integrating spatial attention to focus on critical regions of the leaf images, improving classification accuracy.

A carefully curated dataset of rice leaf images categorized into N, P, and K deficiency classes was used for training and evaluation. The dataset was preprocessed using **normalization, data augmentation, and the Synthetic Minority Over-sampling Technique (SMOTE)** to improve model generalization and address class imbalance. Experimental results demonstrate that the **spatial attention-enhanced CNN achieved an accuracy of 96.3%, a precision of 95.7%, recall of 94.8%, and an F1-score of 95.2%**, significantly outperforming conventional CNN models and traditional machine learning classifiers. The **AUC-ROC scores for deficiency classification were 0.98**, confirming the model's high discriminating power.

This study highlights the potential of deep learning with spatial attention as a **robust tool for real-time crop health monitoring**, enabling **early intervention and optimized fertilizer application**. Future work will explore multi-modal approaches by incorporating hyper-spectral imaging and environmental data for further improvements.

ABSTRACT

Food is always being a necessity of life as it's not a matter of greed or taste. Food waste is defined as the portion of digestible food that is not consumed and contains material for human consumption that is subsequently lost, polluted, degraded, or discarded. It has been noticed there is an enormous amount of food available, which has led to an increase in food waste behavior by all individuals but in recent years technological advancement has been incurred. This research aims to understand young consumer perception about the food waste and to analyze dynamics which affects the young consumer attitude towards food waste. We will propose an integrated theoretical framework that considers social, behavioral, psychological, and economic factors. As a basis for this framework, could be used structural equation modelling (SEM) and logistic regression approaches for estimating how socio-psychological drivers influence young consumers' attitude towards minimizing food losses. The primary data will be collected from three districts of South Punjab as Multan, Bahawalpur and Khanewal using stratified random sampling technique with equal allocation. The targeted people are students of universities of given districts. This study aims to identify local priorities and knowledge bases, facilitating the development of appropriate and viable solutions that enhance the subjective well-being of consumers. By understanding the specific context and needs of the community, the research seeks to ensure that pragmatic interventions are both relevant and effective.

Keywords: Young consumers, food waste reduction, subjective well-being, pragmatic interventions

GENÇ TÜKETİCİLERİN GIDA ATIKLARININ AZALTILMASINA YÖNELİK TUTUMLARININ ARAŞTIRILMASI: ÖNEMLİ GÖRÜŞLER VE ÖĞRENİLEN DERSLER

ÖZET

Yiyecek, açgözlülük veya tat meselesi olmadığı için her zaman hayatın bir gerekliliği olmuştur. Yiyecek israfı, tüketilmeyen ve daha sonra kaybolan, kirlenen, bozulan veya atılan insan tüketimi için malzeme içeren sindirilebilir yiyecek kısmı olarak tanımlanır. Tüm bireylerde yiyecek israfı davranışında artışa yol açan muazzam miktarda yiyecek olduğu fark edildi, ancak son yıllarda teknolojik ilerleme kaydedildi. Bu araştırma, genç tüketicilerin yiyecek israfı hakkındaki algısını anlamak ve genç tüketicilerin yiyecek israfına karşı tutumunu etkileyen dinamikleri analiz etmeyi amaçlamaktadır. Sosyal, davranışsal, psikolojik ve ekonomik faktörleri dikkate alan entegre bir teorik çerçeve önereceğiz. Bu çerçevenin temeli olarak, sosyo-psikolojik faktörlerin genç tüketicilerin yiyecek kayıplarını en aza indirme tutumunu nasıl etkilediğini tahmin etmek için yapısal denklem modellemesi (SEM) ve lojistik regresyon yaklaşımları kullanılabilir. Birincil veriler, eşit tahsisle tabakalı rastgele örnekleme tekniği kullanılarak Güney Pencap'ın Multan, Bahawalpur ve Khanewal olmak üzere üç bölgesinden toplanacaktır. Hedeflenen kişiler, belirli ilçelerdeki üniversitelerin öğrencileridir. Bu çalışma, yerel öncelikleri ve bilgi tabanlarını belirleyerek tüketicilerin öznel refahını artıran uygun ve uygulanabilir çözümlerin geliştirilmesini kolaylaştırmayı amaçlamaktadır. Araştırma, toplumun özel bağlamını ve ihtiyaçlarını anlayarak, pragmatik müdahalelerin hem alakalı hem de etkili olmasını sağlamayı amaçlamaktadır.

Anahtar Kelimeler: Genç tüketiciler, gıda israfının azaltılması, öznel refah, pragmatik müdahaleler

PATHOLOGICAL FINDINGS OF LAMB MORTALITY DUE TO HIGH DOSE DRUG USAGE

Doç. Dr. Turan YAMAN
Van Yüzüncü Yıl Üniversitesi, Veteriner Fakültesi, Patoloji Anabilim Dalı
turanyaman@yyu.edu.tr
ORCID ID: 0000-0001-8811-9775

ABSTRACT

This study aims to present the macroscopic and histopathological findings obtained from the tissues of three lambs subjected to necropsy following deaths caused by high-dose drug usage. It was noted that sudden death cases were observed in the lambs of the herd after the administration of certain drugs. A detailed examination revealed that the recommended safe dose limit per kilogram, as specified in the drug's prospectus, had been significantly exceeded. As a result, a comprehensive systemic necropsy examination was performed on the three lambs.

Macroscopic examination showed that the abomasum (stomach) was among the most affected organs. When the abdominal cavity was opened, severe and widespread congestion in the serosa of the abomasum was noted. The macroscopic examination also revealed severe congestion and hemorrhages in the abomasal mucosa. The liver was macroscopically highly affected and appeared pale yellow. Kidneys, which were pale and soft in consistency, were also recorded as another significantly affected organ.

Histopathological examination of the liver revealed severe and widespread coagulative necrosis of hepatocytes, indicating acute liver toxicity. Other findings included congestion in blood vessels, cholestasis, and destruction of bile duct epithelium. In the kidneys, hydropic degeneration of tubular epithelial cells, and atrophy and destruction of glomeruli were detected.

In conclusion, severe damage and toxic effects were observed in vital organs such as the stomach, liver, and kidneys due to high-dose drug usage. The findings of this study provide important information regarding the potential toxic effects of high-dose drugs on lambs, highlighting points that veterinarians should consider in clinical practice. Additionally, it was concluded that safer dosage protocols should be developed to prevent such toxic incidents.

Keywords: High dose drug, necropsy, histopathology

YÜKSEK DOZ İLAÇ KULLANIMINA BAĞLI KUZU ÖLÜMÜNDE PATOLOJİK BULGULAR

ÖZET

Bu çalışma, kliniğimizde yüksek doz ilaç kullanımına bağlı ölümler sonrasında nekropsileri yapılan üç kuzunun dokularından elde edilen makroskobik ve histopatolojik bulguları sunmayı amaçlamaktadır. Sürüdeki kuzularda, belirli ilaç uygulamasının ardından ani ölüm vakaları gözlemlendiği belirtildi. Ayrıntılı inceleme, ilaç prospektüsünde belirtilen kilogram başına önerilen güvenli doz sınırının önemli miktarda aşıldığı ortaya koydu. Bunun üzerine üç kuzuda kapsamlı sistemik nekropsi incelemesi gerçekleştirildi.

Makroskobik inceleme, abomazumun (mide) etkilenen organların başında geldiğini gösterdi. Karın boşluğu açıldığında abomazumun serozasında şiddetli ve yaygın konjesyon kaydedildi. Makroskobik inceleme ayrıca abomazum mukozasında şiddetli konjesyon ve kanamalar olduğunu ortaya koydu. Karaciğer makroksobik olarak oldukça etkilenmiş durumdaydı ve açık sarı renkteydi. Solgun ve kıvamları yumuşak olan böbreklerin de önemli derecede etkilenen bir diğer organ olduğu kaydedildi.

Karaciğerin histopatolojik incelemesi, akut karaciğer toksisitesinin göstergesi olan hepatositlerin şiddetli ve yaygın koagulasyon nekrozu bulgularını ortaya koydu. Damarlarda konjesyon, kolestazis ve safra kanalı epitelinde destrüksiyon kaydedilen diğer bulgulardı. Böbreklerde ise tubul epitel hücrelerinde hidropik dejenerasyon ve glomeruluslarda atrofi ve yıkım tespit edildi.

Sonuç olarak, yüksek doz ilaç kullanımına bağlı olarak mide, karaciğer ve böbrek gibi vital organlarda ciddi hasar ve toksik etkiler gözlemlendi. Bu çalışmanın bulguları, yüksek doz ilaçların kuzular üzerinde potansiyel toksik etkileri hakkında önemli bilgiler sunmakta olup, veteriner hekimler için klinik uygulamalarda dikkat edilmesi gereken noktaları vurgulamaktadır. Ayrıca, bu tür toksik olayların önlenmesi amacıyla daha güvenli dozaj protokollerinin geliştirilmesi gerektiği sonucuna varılmıştır.

Anahtar Kelimeler: Yüksek doz ilaç, nekropsi, histopatoloji

FACTORS AFFECTING CONSUMERS' GREEN PRODUCT PREFERENCES: THE CASE OF KIRŞEHİR PROVINCE

ABSTRACT

This study aims to identify the factors influencing green product consumption preferences among consumers residing in the central district of Kırşehir Province, in terms of various demographic characteristics. Data were collected from 581 participants through questionnaire and analyzed using descriptive statistics, frequency tables, and Chi-square tests. Findings revealed that 87.8% of the respondents reported consuming green products (female = 267; male = 314). Results from the Chi-square analysis indicated that marital status, level of education, presence of chronic illness, and awareness of environmentally friendly products were statistically significantly associated with green product consumption ($p < 0.05$). Participants commonly defined green products as those with restricted use of chemicals and hormones and cited this attribute as a primary reason for their preference. The majority of respondents stated that green products differ from organic products and reported the internet as their main source of information. Most participants stated that they typically accessed green products at local bazaars, with fruits and vegetables, as well as grains and legumes, being the most frequently consumed product groups. The results indicate that, according to consumer opinions, the most significant barriers to purchasing green products are price, difficulties in access, and consumption habits. In response to a question regarding factors that could potentially increase green product consumption, the majority of participants selected “raising consumer awareness” and “reasonable pricing” as the most influential options. The results contribute to businesses and policy makers in developing strategies to raise consumer awareness and facilitate access to green products, with the aim of disseminating sustainable consumption behaviors and increasing environmental awareness.

TÜKETİCİLERİN YEŞİL ÜRÜN TERCİHLERİNİ ETKİLYEN FAKTÖRLER: KIRŞEHİR İLİ ÖRNEĞİ

ÖZET

Bu çalışmada, Kırşehir İli Merkez İlçe'de ikamet eden tüketicilerin yeşil ürün tüketim tercihlerine etki eden faktörlerin çeşitli demografik özellikler bakımından belirlenmesi amaçlanmıştır. Araştırma kapsamında, 581 katılımcıdan anket yoluyla elde edilen veriler tanımlayıcı istatistikler, frekans tabloları ve Ki-Kare analizi kullanılarak değerlendirilmiştir. Katılımcıların %87.8'inin yeşil ürün kullandığı belirlenmiştir (Kadın=267, erkek= 314). Ki-Kare analizi bulguları; medeni durum, eğitim düzeyi, kronik hastalık varlığı ve çevre dostu ürün farkındalığı değişkenlerinin yeşil ürün tüketimiyle istatistiksel olarak anlamlı bir ilişkiye sahip olduğunu ortaya koymaktadır ($p<0.05$). Tüketiciler yeşil ürünleri, ilaç ve hormon kullanımının sınırlandığı ürünler olarak tanımlamış ve tercih sebebi olarak belirtmişlerdir. Tüketicilerin büyük çoğunluğu yeşil ürünler ile organik ürünler arasında fark olduğunu düşünmekte olup, bu ürünler hakkında bilgiye en çok internet aracılığıyla ulaştıklarını ifade etmişlerdir. Yeşil ürünlere sıklıkla semt pazarlarında ulaştıklarını belirten katılımcıların en çok tükettikleri ürün gruplarının meyve-sebze ile tahıl ve baklagiller olduğu saptanmıştır. Bulgular; tüketici görüşlerinde yeşil ürünlerin satın alınmamasında rol oynayan en önemli faktörün fiyat, ürün teminine ilişkin zorluklar ve alışkanlıklar olduğunu göstermektedir. Bunun yanı sıra, yeşil ürün tüketiminin artırılmasında etkili olabilecek faktörlere ilişkin yöneltilen soruda, katılımcıların büyük çoğunluğu 'tüketicilerin bilinçlendirilmesi' ve 'fiyatların makul seviyelerde olması' yönünde görüş bildirmişlerdir. Araştırma sonuçları, sürdürülebilir tüketim davranışlarının yaygınlaştırılması ve çevresel farkındalığın artırılması amacıyla, tüketicilerin bilinçlendirilmesi ve yeşil ürünlere erişimin kolaylaştırılmasına yönelik stratejiler geliştirilmesinde işletmelere ve politika yapıcılara katkı sunmaktadır.

ABSTRACT

Hemp plant (*Cannabis sativa*) is an annual herb with significant potential across various industries, including medicine, food, and manufacturing. For many years, the plant's psychoactive properties, particularly due to tetrahydrocannabinol (THC), led to widespread bans on cultivation, limiting research and applications. However, recent changes in regulations have opened the door for broader cultivation and research, particularly in industrial and medicinal uses. This shift has sparked growing interest in improving the plant's agronomic traits using molecular breeding techniques. Molecular breeding heavily relies on genetic markers to enhance desirable traits, which are crucial for efficient breeding programs and for distinguishing between different *C. sativa* genotypes. One such marker is the *clpP* gene, which encodes a key subunit of the *clpP* protease complex, an ATP-dependent protease involved in protein regulation within plant cells. The *clpP* gene has been identified as a hotspot in many plant genomes, although its specific content may vary between species. This study analyzed the *clpP* gene in *C. sativa* to identify microsatellites, which are highly variable DNA regions useful as molecular markers. Microsatellites are ideal for genetic studies due to their high polymorphism and ease of detection. These markers can be employed for marker-assisted breeding, genetic diversity assessments, and precise genotype identification. The findings from this research provide valuable insights into the genetic structure of *C. sativa*, offering promising avenues for future research aimed at enhancing hemp cultivation. The identification of microsatellite markers linked to the *clpP* gene presents an opportunity to improve breeding strategies and optimize the agronomic and medicinal traits of hemp, contributing to the continued expansion of the hemp industry. The study also highlights the potential for applying these findings to other plant species with similar genetic characteristics, broadening the scope of molecular breeding applications.

CANNABIS SATIVA BİTKİSİNDE CLPP GENİNİN MİKROSATELİT ANALİZİ

ÖZET

Kenevir bitkisi (*Cannabis sativa*), tıp, gıda ve üretim gibi çeşitli endüstrilerde önemli bir potansiyele sahip yıllık otsu bir bitkidir. Uzun yıllar boyunca, bitkinin psikoaktif özellikleri, özellikle tetrahidrokannabinol (THC) nedeniyle, yetiştiriciliği yasaklanmış ve araştırmalar ile uygulamalar sınırlanmıştır. Ancak, son yıllarda düzenlemelerdeki değişiklikler, özellikle sanayi ve tıbbi kullanımlar alanında daha geniş bir yetiştiriciliğe ve araştırmaya kapı açmıştır. Bu değişim, bitkinin tarımsal özelliklerini moleküler ıslah teknikleriyle geliştirme konusunda artan bir ilgiye yol açmıştır. Moleküler ıslah, istenilen özelliklerin geliştirilmesinde genetik markörlere büyük ölçüde dayanır; bu markörler, verimli ıslah programları için ve farklı *C. sativa* genotiplerini ayırt etmek için hayati önem taşır. Bu markörlerden biri, bitki hücrelerinde protein düzenlemesinde rol oynayan, ATP-bağımlı bir proteaz olan *clpP* proteaz kompleksinin ana alt birimini kodlayan *clpP* genidir. *ClpP* geni, birçok bitki genomunda önemli bir bölge olarak tanımlanmış olup, türler arasında bu bölgenin içeriği farklılık gösterebilir. Bu çalışma, *C. sativa*'nın *clpP* genini analiz ederek, moleküler markör olarak kullanılabilecek yüksek varyasyona sahip DNA bölgeleri olan mikrosatellitleri belirlemiştir. Mikrosatellitler, yüksek polimorfizmleri ve kolay tespit edilmeleri nedeniyle genetik çalışmalar için ideal işaretçiler olarak kabul edilir. Bu işaretçiler, markör yardımlı ıslah, genetik çeşitlilik değerlendirmeleri ve kesin genotip tanımlamaları için kullanılabilir. Bu araştırmanın bulguları, *C. sativa*'nın genetik yapısına dair değerli bilgiler sunmakta ve kenevir yetiştiriciliğini geliştirmeyi hedefleyen gelecekteki araştırmalar için umut verici yollar açmaktadır. *ClpP* geni ile ilişkilendirilen mikrosatellit markörlerin tanımlanması, ıslah stratejilerini geliştirme ve kenevirin tarımsal ve tıbbi özelliklerini optimize etme fırsatı sunarak kenevir endüstrisinin sürekli genişlemesine katkıda bulunacaktır. Çalışma ayrıca, bu bulguların benzer genetik özelliklere sahip diğer bitki türlerine uygulanma potansiyelini vurgulamakta ve moleküler ıslah uygulamalarının kapsamını genişletmektedir.

ABSTRACT

Barley is a widely utilized cereal grain in poultry farming due to its low cost and easy availability. However, the performance decline observed in poultry fed with barley-based diets remained unexplained for many years. It was later determined that this negative performance was caused by β-glucans present in barley. Consequently, under certain farming conditions where intensive barley usage is necessary, enzyme supplementation becomes essential to mitigate the adverse effects of β-glucans. Compared to other cereal grains, barley contains lower levels of phytate, which reduces phosphorus bioavailability. However, the presence of anti-nutritional factors such as β-glucans and phytic acid requires careful consideration, particularly in poultry feeding, as they limit the digestibility and efficiency of barley in the diet. Various modifications can enhance barley's usability, especially in the feeding of large poultry species such as turkeys and geese, by facilitating its utilization as both a concentrated feed and a forage source. Additionally, the potential of barley as a high-quality roughage source when grown in a hydroponic environment requires further evaluation. The effects of different modifications—such as the use of dry barley grains in rations, soaking, germination, and cultivation for grazing—on β-glucan and phytic acid content have been a subject of interest. This study investigates the impact of specific modifications on the β-glucan and phytic acid composition of barley. The modifications were compared to a control group consisting of untreated barley grains. The experimental treatments included (1) Control (no treatment applied), (2) Soaking, (3) Hydroponic germination, and (4) Pasture cultivation. Significant changes in β-glucan and phytic acid levels were observed in barley subjected to different treatments. Structural modifications were particularly evident in barley grown in soil and hydroponically germinated barley, with notable reductions in β-glucan (0.69–0.82 g/100g) and phytic acid levels (0.03–1.37 mg/g).

Keywords: barley pasture, soaked barley grain, hydroponic barley, β-glucan, phytic acid

ARPADAKİ ANTİ-BESİNSEL FAKTÖRLERİN AZALTILMASINA YÖNELİK MODİFİKASYONLARIN ETKİNLİĞİ ÜZERİNE BİR ARAŞTIRMA

ÖZET

Arpa, kanatlı besisinde, ucuz olması ve kolay bulunması gibi nedenlerden dolayı yoğun bir şekilde kullanılan bir tahıldır. Arpanın kanatlı rasyonlarında yoğun bir şekilde kullanıldığında sebep olduğu performans düşüklüğünün yıllarca sebebi bilinememişti. Bu olumsuz performansın arpadaki ***β-glukan***'lar dan kaynaklandığı ortaya çıkarılmıştır. Bu nedenle yoğun arpa kullanımını zorunlu kılan bazı yetiştirme şartlarında enzim kullanımı ***β-glukan'***ların olumsuz etkisini elimine etmek için zorunludur. Diğer tahıl danelerine kıyasla arpadaki fosfordan yararlanmayı azaltan bağlı form olan fitat düzeyinin daha düşük olması arpayı bu açıdan diğer tahıllar kadar sorunlu yapmamaktadır. Ancak özellikle kanatlı besisinde arpanın kullanımını kısıtlayan ve sindirimde olumsuzluklara sebep olan bu gibi anti nutrisyonel faktörlerin (***β-glukan*** ve fitik asit gibi) üzerinde dikkatle durmak gerekmektedir. Bazı modifikasyonlar ile arpanın kullanılabilirliğinin artırılması özellikle hindi ve kaz gibi büyük kanatlı besisinde, arpanın hem kesif yem hem de bir mera otu kaynağı olarak değerlendirilmesini geliştirebilir. Ayrıca topraksız ortamda tek yıllık olan arpanın çimlendirilmek suretiyle iyi bir kaba yem kaynağı olup olmadığı değerlendirilmesi mümkündür. Çeşitli modifikasyonların, örneğin kuru arpa tanesinin rasyonda kullanımı, ıslatma, çimlendirme ve otlatma amacıyla ekiminin, arpanın ***β-glukan*** ve fitik asit içeriği üzerindeki etkileri ilgi konusu olmuştur. Bu çalışma, arpaya uygulanan belirli modifikasyonların ***β-glukan*** ve fitik asit içeriği üzerindeki etkilerini araştırmaktadır. Bu modifikasyonlar, kontrol grubu olan işlenmemiş arpa tanelerinden elde edilen sonuçlarla karşılaştırılmıştır. Çalışmada arpa tanelerine uygulanan işlemler şunlardır: (1) Kontrol (taneye herhangi bir işlem uygulanmamıştır), (2) Islatma, (3) Çimlendirme (hidroponik) ve (4) Arpa merası oluşturma. Farklı modifikasyonlara maruz kalan arpanın ***β-glukan*** ve fitik asit seviyelerinde önemli değişiklikler gözlemlenmiştir. Toprakta yetiştirilen ve hidroponik olarak çimlendirilen arpada önemli yapısal değişiklikler meydana gelmiştir. Bu arpa türlerinde sırasıyla ***β-glukan*** (0.69–0.82 g/100g) ve fitik asit seviyeleri (0.03–1.37 mg/g) önemli ölçüde azalmıştır.

Anahtar kelimeler: arpa merası, ıslak arpa danesi, hidroponik arpa, β-glukan, fitik asit

THE EFFECT OF SEED COATING APPLICATION ON YIELD AND QUALITY IN FIELD CROPS

ABSTRACT

Seed is the basic building block of crop production and the most important input that directly affects agricultural productivity and product quality. It constitutes the most basic and vital input for the continuity of agriculture and the vital cycle. Approximately 90% of agricultural production for food production is carried out using seeds. For this reason, the role of seed in the agricultural sector is of primary importance. Achieving high yield and quality product targets in field crops depends not only on the use of genetically superior seeds, but also on the ability of these seeds to germinate and develop healthily under appropriate environmental conditions. However, seeds may suffer losses during germination and emergence stages due to heterogeneity in genetic structure, environmental stress factors and soil-borne diseases. One of the most effective methods developed to reduce these losses and improve seed performance is seed coating technology.

Seed coating is the process of applying protective and supportive substances on the seed with adhesives. This application offers many advantages such as increasing germination and emergence rates, facilitating the sowing process, protecting the seed against pests and diseases and ensuring more regular plant growth. This technology, which has two basic methods, film coating and pellet coating, gives effective results especially in the treatment of small and irregularly shaped seeds.

In this study, the effects of seed coating on germination performance, seedling quality, seed saving potential and final crop yield in field crops were evaluated. The findings of the study show that seed coating applications both increase agricultural production efficiency and significantly reduce losses during the seedling stage.

As a result, seed coating technology stands out as an innovative application that improves seed quality and optimizes the production process in line with sustainable agriculture goals.

Keywords: Seed, Pellet Coating, Film Coating, Agriculture

TARLA BİTKİLERİNDE TOHUM KAPLAMA UYGULAMASININ VERİM VE KALİTEYE ETKİSİ

ÖZET

Tohum, bitkisel üretimin temel yapı taşı olup, tarımsal verimliliği ve ürün kalitesini doğrudan etkileyen en önemli girdidir. Tarımın ve yaşamsal döngünün devamlılığı için en temel ve hayati girdiyi teşkil etmektedir. Gıda üretimi amaçlı yapılan tarımsal üretimin yaklaşık olarak %90'ı tohum kullanılarak gerçekleştirilmektedir. Bu nedenledir ki tarım sektöründe tohumun rolü birincil öneme sahiptir. Tarla bitkilerinde yüksek verim ve kaliteli ürün hedeflerine ulaşmak, yalnızca genetik olarak üstün tohumların kullanımına değil; aynı zamanda bu tohumların uygun çevre koşullarında sağlıklı bir biçimde çimlenip gelişebilmesine bağlıdır. Ancak tohumlar; genetik yapıdaki heterojenlik, çevresel stres faktörleri ve toprak kaynaklı hastalıklar gibi nedenlerle çimlenme ve çıkış aşamalarında kayıplara uğrayabilmektedir. Bu kayıpları azaltmak ve tohum performansını artırmak amacıyla geliştirilen en etkili yöntemlerden biri tohum kaplama teknolojisidir.

Tohum kaplama, tohumun üzerine koruyucu ve destekleyici maddelerin yapıştırıcılarla uygulanması sürecidir. Bu uygulama; çimlenme ve çıkış oranlarını artırmak, ekim işlemini kolaylaştırmak, tohumu zararlılara ve hastalıklara karşı korumak ve daha düzenli bitki gelişimi sağlamak gibi birçok avantaj sunmaktadır. Film kaplama ve pellet kaplama olmak üzere iki temel yöntemi bulunan bu teknoloji, özellikle küçük ve düzensiz şekilli tohumların işlenmesinde etkin sonuçlar vermektedir.

Bu çalışmada, tarla bitkilerinde tohum kaplama uygulamasının çimlenme performansı, fide kalitesi, tohumdan tasarruf sağlama potansiyeli ve nihai ürün verimi üzerindeki etkileri değerlendirilmiştir. Araştırma bulguları, tohum kaplama uygulamalarının hem tarımsal üretim verimliliğini artırdığını hem de fide dönemindeki kayıpları önemli ölçüde azalttığını göstermektedir.

Sonuç olarak, tohum kaplama teknolojisi; sürdürülebilir tarım hedefleri doğrultusunda, tohum kalitesini artıran ve üretim sürecini optimize eden yenilikçi bir uygulama olarak öne çıkmaktadır.

ABSTRACT

Plastics have become an integral part of daily life thanks to their easy processability, durability, lightness and low cost. In the food industry, they are widely used especially in packaging and transportation processes due to their advantages. However, when these plastics are exposed to environmental impacts, they decompose into small particles called microplastics and mix into nature.

Microplastics (MP) are synthetic polymer particles with a diameter of less than 5 mm and have attracted attention as one of the important components of environmental pollution in the world in recent years. The transfer of microplastics into the food chain poses a great risk, especially for human health. The presence of these pollutants has been detected in many foodstuffs such as seafood, drinking water, table salt, sugar, dairy products, fruits and vegetables. In addition, plastic packaging, food processing, packaging methods and agricultural activities also cause contamination of food with microplastics. The possible effects of microplastics on human health are currently being intensively researched. It has been determined that these particles can be taken into the body through the digestive system, overcome the intestinal barrier, mix with the circulatory system and cause toxic effects at the cellular level. It is thought that the heavy metals and toxic chemicals carried by microplastics may cause endocrine system disorders, immune system weakening, neurotoxicity, hormonal disorders and even health problems such as cancer.

As a result of recent studies, it has been determined that microplastics have become a global threat to both the environment and human health. It is of great importance to develop methods to contaminate the food chain, examine the factors affecting contamination, and determine their amounts in foods. In this study, the ways in which microplastics contaminate food, the presence of microplastics in food, the methods used to detect them in food, and the potential effects of these contaminants on human health will be discussed.

Keywords: Microplastics, food safety, human health, toxicity, environmental contaminants, analysis methods.

GIDALARDA MİKROPLASTİK KİRLİLİĞİ VE BU KİRLİLİĞİN İNSAN SAĞLIĞI ÜZERİNE ETKİLERİ

ÖZET

Plastikler, kolay işlenebilirliği, dayanıklılığı, hafifliği ve düşük maliyeti gibi özellikleri sayesinde günlük yaşamın ayrılmaz bir parçası haline gelmiştir. Gıda sektöründe ise özellikle ambalajlama ve taşıma süreçlerinde sağladığı avantajlar nedeniyle yaygın olarak kullanılmaktadır. Ancak, bu plastikler çevresel etkilere maruz kaldıklarında, mikroplastik adı verilen küçük parçacıklara ayrışarak doğaya karışmaktadır.

Mikroplastikler (MP), çapı 5 mm'den küçük olan sentetik polimer parçacıklarıdır ve son yıllarda dünyada çevre kirliliğinin önemli bileşenlerinden biri olarak dikkat çekmektedir. Mikroplastiklerin besin zincirine geçişi, özellikle insan sağlığı açısından büyük bir risk oluşturmaktadır. Deniz ürünleri, içme suyu, sofralık tuz, şeker, süt ürünleri, meyve ve sebzeler gibi birçok gıda maddesinde bu kirleticilerin varlığı tespit edilmiştir. Ayrıca, plastik ambalajlar, gıda işleme süreçleri, ambalajlama yöntemleri ve tarımsal faaliyetler de gıdaların mikroplastik ile kontaminasyonuna neden olmaktadır. Mikroplastiklerin insan sağlığı üzerindeki olası etkileri, günümüzde yoğun bir şekilde araştırılmaktadır. Bu partiküllerin sindirim sistemi yoluyla vücuda alınarak bağırsak bariyerini aşabileceği, dolaşım sistemine karışarak hücresel düzeyde toksik etkilere yol açabileceği tespit edilmiştir. Mikroplastiklerin taşıdığı ağır metallerin ve toksik kimyasalların endokrin sistem bozukluklarına, bağışıklık sistemi zayıflamasına, nörotoksisiteye, hormonal bozukluklara ve hatta kanser gibi sağlık sorunlarına neden olabileceği düşünülmektedir.

Son yapılan çalışmalar neticesinde hem çevre hem de insan sağlığı için küresel bir tehdit haline geldiği tespit edilen Mikroplastiklerin besin zincirine kontamine olması, kontaminasyonu etkileyen faktörlerin incelenmesi ve gıdalardaki miktarlarının belirlenmesi için yöntemlerin geliştirilmesi büyük önem arz etmektedir. Bu çalışmada, mikroplastiklerin gıdalara bulaşma yolları, gıdalarda mikroplastik varlığı, gıdalarda tespitinde kullanılan yöntemler ve bu kirleticilerin insan sağlığı üzerindeki potansiyel etkileri ele alınacaktır.

Anahtar Kelimeler: Mikroplastik, gıda güvenliği, insan sağlığı, toksisite, çevresel kirleticiler, analiz yöntemleri.

THE EFFECT OF USE OF PHOSPHORUS FERTILIZERS WITH ORGANIC MATERIALS ON THE PHOSPHORUS CONTENT OF CORN PLANT GROWING IN DIFFERENT SOILS pH

ABSTRACT

This study aimed to determine the effects of phosphorus fertilizers (Triple Super Phosphate (TSP) and Ground Phosphate Rock) and various organic materials (Biochar, Vermicompost and Farmyard Manure) applied to soils with different pH on phosphorus (P) uptake by maize plants. The experiment was conducted as a pot experiment under greenhouse conditions in three different soil conditions: acidic (pH = 5.2), neutral (pH = 6.9) and basic (pH = 8.0). The results of the experiment showed that both fertilizer type and soil reaction had significant effects on the phosphorus content of maize plants. In acidic soil, the highest phosphorus content was observed in the combination of Ground Phosphate Rock + Biochar with 0.426%. The highest phosphorus content was observed in TSP + Vermicompost (0.340%) in neutral soil and Ground Phosphate Rock + Vermicompost (0.313%) in basic soil. The control group gave the lowest P contents in all soils with different pH (0.197-0.210%), indicating that phosphorus uptake increased with organic material application. Solubility properties of fertilizers, the effect of organic materials on soil properties and pH-dependent phosphorus uptake are thought to be the main reasons for the differences between treatments. TSP increased uptake especially under neutral soil conditions due to its high solubility, whereas ground Phosphate Rock increased phosphorus uptake under acidic and basic conditions when used with organic materials despite its low solubility. The fact that vermicompost increases phosphorus solubility through microbial life and organic acid release supports this conclusion. The use of phosphorus fertilizers in combination with suitable organic materials offers an effective strategy to increase plant phosphorus uptake, especially under very high and low pH conditions. The use of organic materials, especially the potential to increase the usefulness of phosphate rocks, is very important in making fertilization more efficient and increasing sustainability.

Keywords: Phosphorus, pH, Corn, Phosphorus Fertilizer, Organic Material

FOSFORLU GÜBRELERIN ORGANIK MATERYALLERLE BIRLIKTE KULLANIMININ FARKLI pH'YA SAHIP TOPRAKLARDA MISIR BİTKİSİNİN FOSFOR İÇERİKLERİNE ETKİSİ

ÖZET

Bu çalışma, farklı pH'ya sahip topraklara uygulanan fosforlu gübrelerin (Triple Süper Fosfat (TSP) ve Öğütülmüş Fosfat Kayası) ve çeşitli organik materyallerin (Biochar, Vermikompost ve Çiftlik Gübresi) birlikte kullanımının mısır bitkisinin fosfor (P) alımı üzerindeki etkilerini belirlemeyi amaçlamıştır. Deneme, asidik (pH = 5.2), nötr (pH = 6.9) ve bazik (pH = 8.0) olmak üzere üç farklı toprak koşulunda sera koşullarında saksı denemesin şeklinde yürütülmüştür. Deneme sonunda elde edilen bulgular, hem gübre tipi hem de toprak reaksiyonunun mısır bitkisinin fosfor içeriği üzerinde belirgin etkiler yarattığını göstermiştir. Asidik toprakta en yüksek fosfor içeriği %0,426 ile Öğütülmüş Fosfat Kayası + Biochar kombinasyonunda gözlenmiştir. Nötr toprakta TSP + Solucan Gübresi (%0,340) ve bazik toprakta Öğütülmüş Fosfat Kayası + Solucan Gübresi (%0,313) uygulamalarında fosfor içeriğinin en yüksek çıktığı görülmüştür. Farklı pH'ya sahip toprakların hepsinde kontrol grubu en düşük P içeriklerini vermiştir (%0,197–0,210), bu da fosfor alımının organik materyal uygulamasıyla artığını ortaya koymaktadır. Uygulamalar arasındaki farklılıkların temel nedenleri olarak gübrelerin çözünürlük özellikleri, organik materyallerin toprak özelliklerine etkisi ve pH'ya bağlı fosforun alınabilirliği düşünülmektedir. TSP'nin yüksek çözünürlüğü sayesinde özellikle nötr toprak koşullarında alımı artmış, buna karşın öğütülmüş fosfat kayası düşük çözünürlüğüne rağmen organik materyallerle birlikte kullanıldığında asidik ve bazik koşullarda fosfor alımını artırmıştır. Vermikompostun mikrobiyal yaşam ve organik asit salınımı ile fosfor çözünürlüğünü artırması bu sonucu desteklemektedir. Fosforlu gübrelerin uygun organik materyallerle birlikte kullanılması, özellikle çok yüksek ve düşük pH koşullarında bitkinin fosfor alımını arttırmak için etkili bir strateji sunmaktadır. Organik materyallerin kullanımı özellikle fosfat kayalarının yarayışlılığını artırma potansiyeli, gübrelemenin daha etkin yapılması ve sürdürülebilirliğin arttırılması konusunda oldukça önemlidir.

A GENERAL OVERVIEW OF THE STINGER STRUCTURE AND POISON SECRETION IN HONEYBEES

Prof. Dr. Meral AYDENİZÖZ
Kırıkkale Üniversitesi, Veteriner Fakültesi, Parazitoloji Anabilim Dalı 71450
Kırıkkale/Türkiye
meralaydenizoz@kku.edu.tr
ORCID NO: 0000-0002-1270-772x

ABSTRACT

Throughout human history, bees and humans have continued to be together. Honey bees produce various products important for human nutrition and play an important role in the pollination of plants. This report provides information about bee stings and their venom. Queen bees and worker bees, which are female members of the bee family except for male bees, have a sting on the last tergite of their abdomens. The structure of the sting found in the queen bee is flat and is used only to kill rival queen candidates, and since the sting does not remain in the skin, the queen bee continues her normal life. In contrast, the stings of worker bees are surrounded by irregular backward notches, and when they sting living beings in danger, the acid and alkaline poison secretion glands attached to the sting remain there, and since their intestines come out together, the worker bee dies. After death, the poison secretion glands remaining in the skin continue to contract and inject the poison into the skin. For this reason, the bee's sting should be removed immediately after the sting. Local swelling, edema and redness that we call local occur in bee stings. When it stings in respiratory areas such as the nostrils, tongue, pharynx, and larynx, the swelling that will occur will prevent breathing and cause the creature to die. The general symptoms that occur when bee venom spreads throughout the body are difficulty breathing, redness in the eyes, increased pulse, and fever up to 40 degrees. The mixing of bee venom with the blood causes allergic and even anaphylactic symptoms that can lead to death.

In order to protect yourself from bee stings, you should not disturb the bees. A mask should be worn when entering the apiary. Strong, irritating odors should be avoided, and dark and woolen clothes should not be worn. The entrance and exit of bees to the hive should not be prevented.

In the treatment of bee stings, ice should be applied to the area stung by the bee. Adrenaline should be used against systemic reactions. In the case of anaphylactic shock, adrenaline should be administered intravenously. Coramin, Cardiazol and Caffeine should be given to support the heart. Antihistamines should be used against allergic reactions.

Bee venom treatment, known as apitherapy, is also performed. It is used especially in inflammatory rheumatism and Multiple Sclerosis (MS) patients. It is used in medicine as an alternative treatment for nervous system diseases, cardiovascular disorders, menstrual pain, joint pain, strengthening the immune system, hormonal disorders, varicose veins and hypertension diseases.

Keywords: Honey Bee, Needle Structure, Venom Secretory Glands, Protection, Treatment, Apitherapy

BAL ARILARINDA İĞNE YAPISI VE ZEHİR SALGISINA GENEL BİR BAKIŞ

ÖZET

İnsanlık tarihi boyunca arılarla insanların birlikteliği devam etmiştir. Bal arıları insan beslenmesinde önemli çeşitli ürünleri üretmekte ve bitkilerin polinasyonunda önemli rol almaktadır. Bu bildiride, arı sokması ve zehirleri hakkında bilgi verilmiştir. Arı ailesi bireylerinden erkek arı hariç dişi olan kraliçe arı ve işçi arıların abdomenlerinin son tergitinde iğne mevcuttur. Kraliçe arıda bulunan iğnenin yapısı düz olup sadece rakip ana arı adaylarını öldürmek için kullanılmakta, iğne deride kalmadan geri çektiği için ana arı normal yaşamına devam etmektedir. Buna karşın işçi arıların iğnelerinin üzeri düzensiz geriye dönük çentiklerle çevrili olup, tehlike durumunda canlıları soktuğunda, iğneye bağlı asit ve alkalen zehir salgı bezleri ile birlikte orada kalmakta, beraberinde bağırsakları da dışarı çıktığından işçi arı ölmektedir. Öldükten sonra deride kalan zehir salgı bezleri kontraksiyonuna devam ederek zehri deriye zerk etmektedir. Bu nedenledir ki arının iğnesi sokmadan hemen sonra çıkarılmalıdır.

Arı sokmalarında lokal dediğimiz şişlik, ödem ve kızarıklıklar şekillenmektedir. Burun delikleri, dil, farenks, larenks gibi solunumla ilgili yerlerden soktuğunda oluşacak şişlik solunumu engelleyeceğinden canlının ölmesine sebep olmaktadır. Arı zehrinin tüm vücuda dağılmasıyla oluşan genel semptomlar olarak nefes almada zorluk, gözlerde kızarıklık, nabız artışı, 40 dereceye varan ateş şekillenmektedir. Arı zehrinin kana karışması alerjik hatta ölüme varan anafilaktik semptomlara sebep olmaktadır.

Arı sokmalarından korunmak için arıları rahatsız etmemek gerekir. Arılığa girerken maske takılmalıdır. Ağır irkiltici kokulardan kaçınılmalı, koyu renk ve yünlü kıyafetler giyilmemelidir. Arıların kovana giriş ve çıkışları engellenmemelidir.

Arı sokmalarında tedavide, arının soktuğu bölgeye buz uygulaması yapılmalıdır. Sistemik reaksiyonlara karşı adrenalin kullanılmalıdır. Anafilaktik şok durumunda adrenalin damar içi uygulanmalıdır. Kalbi desteklemek için de Coramin, Kardiazol ve Kafein verilmelidir. Alerjik reaksiyonlara karşı antihistaminikler kullanılmalıdır.

Apiterapi olarak bilinen arı zehri tedavisi de yapılmaktadır. Özellikle iltihaplı romatizmada ve Multipl Skleroz (MS) hastalarında kullanılmaktadır. Sinir sistemi hastalıkları, kalp damar rahatsızlıkları, menstrual ağrılar, eklem ağrıları, bağışıklık sisteminin güçlendirilmesi, hormonal rahatsızlıklar, varis ve hipertansiyon hastalıklarında alternatif tedavi olarak tıpta yer almaktadır.

Anahtar Kelimeler: Bal Arısı, İğne Yapısı, Zehir Salgı Bezleri, Korunma, Tedavi, Apiterapi

DETERMINANTS OF COMPLIANCE BEHAVIOR OF FARMERS TOWARDS AGRICULTURAL TAXATION IN PUNJAB

ABSTRACT

Taxes are the primary means of generating revenue in the world. Pakistan lags well behind other countries when it comes to taxation of individual income, especially income from agriculture. Agricultural taxes have been implemented; however, compliance with tax laws and collection is poor. Since farmers' compliance behavior affects agricultural income tax, the agriculture tax's generated revenues have been insufficient, and the tax's base of collection is limited. Tax compliance is a major concern, especially in developing nations where governments seek ways to increase tax-collecting efficiency to finance their budgets. Agriculture tax is collected from an inadequate base, and its revenues have been insufficient because the compliance behavior of farmers affects agricultural income tax. This study aims to identify factors of tax compliance that affect agriculture taxation in Punjab, Pakistan, by using binary logistic regression. The cluster sampling was used to collect data from 557 farmers. The study's findings show that education, tax knowledge, satisfied tax authorities, and low levels of crime and conflict positively affect tax compliance. On the other hand, government waste taxes and poor agriculture services have statistically negative effects on tax compliance. Moreover, tax authorities should take steps to improve tax compliance rates.

Keywords: Compliance behavior, agriculture taxation, logit model, tax authorities

EVALUATION OF THE ANTI-INFLAMMATORY AND ANTI-HEMOLYTIC POTENTIAL OF POLYPHENOLIC COMPONENTS OF COMMON MALLOW (*Malva sylvestris*)

Hamza Belkhodja, Abderrahmane Remil, Fatima Zohra Labbaci, Djilali Bouhadi, Asmaa Belmimoun, Khadidja Sidelarbi

[1]Department of Biology, Faculty of Nature and Life Sciences, University of Mustapha Stambouli, Mascara, Algeria.

ABSTRACT

This work aims at the assessement of anti-inflammatory and anti-hemolytic effect of *Malva sylvestris*. The anti-inflammatory potential was evaluated by the inhibition of protein denaturation method. It was followed by the study of anti-hemolytic potential, based on two methods (haemolysis by hydrogen peroxide (H2O2) and by hypotonic haemolysis). The macerated aqueous extract of *M. sylvestris* (250 µg/ml) exhibited the highest inhibition percentage of BSA denaturation compared to other extracts but it appeared to be slightly lower than the drug diclofenac sodium (80.97±1.23%). On the other hand, the macerated aqueous extract showed more protective power against haemolysis (93.42±3.45%). While it was almost similar to the percentage recorded for ascorbic acid (93.68±3.21%). For the second method, it was observed that the decocted acetone extract of *M. sylvestris* showed a rate of haemolysis inhibition which was the highest (98.09±1.26%) but that it remained slightly lower than aspirin (98.77±0.44%). All of these results showed that *M. sylvestris* extracts have interesting anti-inflammatory and anti-haemolytic potential and therefore have considerable interest as an alternative treatment against inflammatory mechanisms.

Keywords: Anti-hemolytic, Anti-inflammatory, *Malva sylvestris*, Polyphenols.

ANALYSIS AND DESIGN OF G + 5 FLOORS APARTMENT BUILDING

Subhashish Dey
Department of Civil Engineering, Gudlavalleru Engineering College, Andhra Pradesh, India
Email id.: subhasdey633@gmail.com

ABSTRACT

Our main aim to complete a G+5 Floor Apartment building is to ensure that the structure is safe against all possible loading conditions and to full fill the function for which they have built. Safety requirements must be met so that the structure is able to serve its purpose with the maintain cost. Detailed planning of the structure usually comes from several studies made by town planners, investors, users, architects, and other engineers. On that, a structural engineer has the main influence on the overall structural design and an architect is involved in aesthetic details. For the design of the structure, the dead load, live load seismic and wind load are considered. The analysis and design for the structure done by using software package STAAD PRO. In this Apartment construction, we are going to adopted limit state method of analysis and design the structure. The design is confirmation with IS456-2000.the analysis of one frame is worked out manually and simultaneously it has been checked using STAAD PRO. Therefore, an attempt has been made to present the G+5 Apartment for residential purpose in the upcoming busy city of Vijayawada. The Apartment consisting of five storey's the structure is design based on the theory of Limit State Method which provides adequate strength, serviceability, and durability besides economy

ABSTRACT

This study was designed to investigate the antioxidant and antibacterial effect of the aqueous and ethanolic extracts from *Thymus hirtus subsp. algeriensis*. leaves. The preparation of the aqueous and ethanolic extracts and evaluating the antioxidant effect by the means of two methods: DPPH radical-scavenging assay and the ß-carotene–linoleic acid assay as well as testing the antibacterial effect by the disk diffusion method.

The results of this study showed that the aqueous and ethanolic extracts showed antioxidant activity with a percent of antioxidant activity up to 88.13 % in the ß-carotene-linoleic acid assay while in the DPPH radical-scavenging assay the ethanolic extract of *Thymus hirtus subsp. algeriensis* displayed highest anti-radicalar power (0.170). But on the antibacterial effect, all the extracts of leaves plants exerted an inhibiting effect on the pathogenic bacteria with diameters of the zones of inhibition going up to 16.00 ± 00.00 mm.

The overall results suggested that the *Thymus hirtus subsp. algeriensis* leaves showed an antioxidant and antibacterial effect due to the presence of active biomolecules such as phenolic compounds and flavonoids.

Keywords: Antioxidant effect, Antibacterial effect, Plants extracts, *Thymus hirtus subsp. algeriensis*.

ASSESSMENTS OF PHYTOPHARMACEUTICALS WITH THERAPEUTIC POTENTIALS IN HEALTH MANAGEMENT

Alexander Idoko[1,2], Parker Joshua Elijah[2], Njoku Obioma Uzoma[2]

Oral presentation

ABSTRACT

Global health emphasizes a broad, multidisciplinary approach to understanding emerging health challenges, considering social, cultural, economic and environmental factors that underlie health inequities. Health encompasses medical conditions such as hypertension, diabetes, and infectious diseases or congenital anomalies. The continents around the world are endowed with several biodiversity. For instance, Africa is known to have the richest biodiversity in the world, with an avalanche of many food plants used as herbs, health foods and for pharmaco-therapeutic purposes in the forest and associated flora and fauna. Phytopharmaceuticals are plant-derived (phytochemicals) compounds with pharmacological activities. They make up a good part of drugs made from plant-based molecules as opposed to synthetics. Thus, the need to access some phytopharmaceuticals with therapeutic potentials in health management. These phytopharmaceuticals span from laboratory investigations involving several methods such as solvents extraction, thin layer or paper chromatography for fractionation of bioactive molecules, and characterization using high performance liquid chromatography (HPLC) analysis of some plants. *In vitro* phytopharmaceuticals investigation of some plants in albino Wistar rats investigated include flavonoids from *Bryophyllum pinnatum*, lime juice, honey and *Jatropha Tanjorensis* leaf possessing anti-conjunctivitis, hypoglycemic, hypolipidemic, and anti-obesity activities, alkaloids from *Jatropha Tanjorensis* leaf possessing anti-inflammatory and hematinic activities, tannin from *Vernonia amygdalina* (bitter leaf) and bee bread with antidiabetic and hypoglycemic activities, dihydrophenantherene from *Khaya Senegalensis* stem bark with hypoglycemic and anti-diabetic activities, 3-nitrophthalic acid, and coumarine from *Alstonia boonei* stem bark with antimalarial activity, f*lacourtia indica* leaf, stem bark and fruit with hypoglycemic, hepatoprotective, hematinic and gluco-stabilizing activities, *Phaseolus Vulgaris* (Kidney Bean Seeds), and *Vigna unguiculata* (Black-eyed Bean Seeds) possessing renal protection and practically non-toxic at LD_{50} greater than 5000mg/kg in albino Wistar rats. In conclusion, phytopharmaceuticals in plant largely work by targeting specific receptors, interrupting disease pathways, and disrupting pathogenic life cycles.

NOVEL INTELLIGENT NAKED-EYE FOOD PACKAGING PH-SENSITIVE AND FLUORESCENT SULFUR, NITROGEN-CARBON DOTS BIOSENSORS FOR TOMATO SPOILAGE DETECTION INCLUDING DFT AND MOLECULAR DOCKING CHARACTERIZATION

Hebat-Allah S. Tohamy*
Cellulose and Paper Department, National Research Centre, 33 El Bohouth Str., P.O. 12622, Dokki Giza, Egypt.
Corresponding author*: hebasarhan89@yahoo.com

ABSTRACT

Tomatoes are susceptible to microbial spoilage, leading to significant economic losses. This study investigates the microbial quality of different tomato grades and introduces a novel approach to monitor tomato spoilage. Carboxymethyl cellulose (CMC) films incorporated with sulfur and nitrogen-doped carbon dots (SN–CDs) were developed as pH-sensitive colorimetric sensors for tomatoes. The SN–CDs, derived from red onion peel waste (OPW), exhibited excellent fluorescence properties and antimicrobial activity XPS analysis confirmed the successful synthesis of SN–CDs with incorporated N and S. The incorporation of OPW significantly reduced the Young's modulus of the CMC hydrogel film, likely due to structural disruptions and increased free volume within the film. The color of the prepared colorimetric sensors was changed after tomato spoilage which means the effectiveness of these films in the tomato spoilage detection by naked eye. It exhibited pH-sensitivity because of the presence of flavonoids,.The color of flavonoids is influenced by pH, shifting from yellow in acidic conditions to orange in neutral and red in alkaline environments due to structural changes, including protonation and deprotonation. This pH sensitivity allows for visual indication of pH changes, as demonstrated by the CMC-SN-CDs3 film, which turns yellow in acidic conditions and red in alkaline conditions. The CMC-SN–CDs films displayed a distinct color change in response to pH variations, enabling visual detection of tomato spoilage. The films also demonstrated antimicrobial properties, inhibiting the growth of foodborne pathogens. This innovative approach provides a rapid, non-invasive, and cost-effective method for monitoring tomato freshness and quality, reducing food waste and ensuring food safety. DFT calculations and molecular docking studies further support the findings of this research.

Keywords: Flavonoids, Visual naked-eye biosensor, Bacterial detection, pH-sensing, Sulfur, nitrogen doped carbon dots, Food packaging.

WASTE TO WEALTH: INSIGHTS FROM THE CASSAVA PEEL VALUE CHAIN MANAGEMENT IN SOUTHWESTERN NIGERIA

Salami Mercy Funke[1*]; Akinola Abdulbaaki Bolaji[1]; Adepoju Rukayat Adekemi[1]; Onuche Sandra Ikoojo[1]

ABSTRACT

The Cassava peel value chain can contribute significantly to the bio-economy of Nigeria. However, the cassava peel value chain is weak and there is a paucity of information about the value chain actors. We thus analyzed the profitability of participating in the cassava peel value chain and examined the constraints faced by these actors using descriptive statistics, Semantic differential scale, gross margin analysis, and Ordinary Least Square regression analysis. The study relied on primary data obtained from 438 cassava peel value chain actors randomly selected from three States in Southwestern Nigeria. Our result reveals that the majority of the cassava peel actors are peelers, 183 (41.78%), and local processors, 190 (43.37) who rely mainly on traditional processing methods. The actors realize an average monthly gross margin of ₦54, 641 ($ 54.83). The monthly expenditure. monthly income, education, and household size of actors are the drivers of profitability (P value, 0.05). The instability of cassava prices, inadequate access to credit facilities, and the high cost of hiring labour are the pressing constraints faced by the actors. Efforts should be geared towards the stabilization of cassava prices as well as the offering credit facilities to enhance overall productivity of the cassava value chain.

Keywords: cassava peel, value chain, waste, profitability

FUSARIUM WILT OF A TOMATO: A REVIEW

AJIWE, S.T., [*1] ILUYEMI, C. A.,[2] OBISESAN, B. A.,[1] AND AFOLABI, I.D.[1]

ABSTRACT

Tomato is one of the most significant commercial crops. All across the world, tomatoes are grown commercially. This crop has higher chances of disease attack. One of the most significant diseases of tomato crops is *Fusarium* wilt, which is caused by *Fusarium oxysporum* f sp. *lycopersici*. Tomato yield is greatly reduced by this disease. The pathogen *Fusarium oxysporum* f sp. *lycopersici* is a soil borne pathogen and can transmit disease through soil in tomato plants. This fungus firstly enters the vascular plant tissues of the roots through the soil, where it causes wilting of the plant and eventually causes the plant death. The major symptoms of Fusarium wilt include plant wilting, discolouration of the lower leaves, and drying of the leaves. The use of suitable management approaches is essential in field and greenhouse settings to prevent Fusarium wilt. This review paper provides a comprehensive overview of the main diseases of tomato crop that is *Fusarium* wilt, its symptoms, cause of infection, disease development, life cycle of the pathogen, disease epidemiology, disease ecology and novel methods in the control of the pathogen.

The study of *Fusarium* wilt is very important mainly in the tomato crop because it causes great loss in the commercial production of tomato crop.

Keywords: Crop, disease, Fusarium, infection, tomato, wilting and pathogen.

NUTRITIONAL VALUE OF SOME RARE VARIETIES OF DATES FROM SOUTHERN ALGERIA

ABSTRACT

This study was conducted to determine the morphological and physicochemical parameters necessary to characterize the different stages of maturation (Tamr) of seven varieties of dates with varying consistencies: Amrane, Tamdjouhert, Tezerza, Takrbouchet, Tantbouchet, Tenisin, and Tanselit.

The research found that soft and semi-soft dates are dark in color, tender in texture, and fragrant in taste. These two classes of dates differ in several physicochemical factors, some of which significantly affect the characterization of the fruit.

The study highlighted an interesting variability among the seven varieties of dates: Amrane, Tamdjouhert, Tezerza, Takrbouchet, Tantbouchet, Tenisin, and Tanselit. Our work identified various morphological, physicochemical, and biochemical characteristics of the dates, including weight, dimensions, water content, pH, electrical conductivity, ash content, titratable acidity, reducing sugars, mineral elements, and total sugar levels.

The weight of the dates studied ranged from 5.68 to 15.01 grams, while the weight of the pulp varied from 4.79 to 9.25 grams. The length of the dates was between 18.84 and 50.30 mm, and the diameter ranged from 11.72 to 25.32 mm. The water content was between 17.66% and 22.74%, and the pH values, which were slightly acidic, ranged from 5.01 to 6.21. Electrical conductivity ranged from 0.00 to 9.00, titratable acidity was low (0.02%–0.89%), total sugar levels ranged from 29.16% to 57.03%, reducing sugar content varied from 51.86% to 77.62%, and potassium (K+) content ranged from 770.97 to 1070.36.

Overall, the determination of the nutritional value of the studied date varieties, which have different characteristics, was based on biometric analysis. This analysis showed that the length and weight of the dates and stones varied considerably among the varieties. Similarly, the physicochemical and biochemical analyses confirmed this variability.

According to the analyses conducted, the varieties Tanselit, Amrane, and Takrbouchet stand out from the others due to their favorable characteristics across all studied parameters, followed by Tamdjouhert and Tantbouchet in the second position. In contrast, Tezerza and Tenisin exhibited less favorable characteristics in three of the studied parameters.

The importance of these analyses lies in their ability to enable quality control of dates based on their degree of maturity, using not only classical morphological criteria but also biochemical criteria. This evaluation provides a comprehensive understanding of the morphological (weight and size), nutritional (sugar content, mineral elements), and functional values of the dates.

Keywords: date palm, rare varieties, arid region, nutritional value, valorization.

CONTEMPORARY APPROACHES IN ANIMAL BREEDING AND THEIR IMPACT ON SUSTAINABLE AGRICULTURE

Dio Samudra
UIN KH. Abdurrahman Wahid, Pekalongan, Indonesia
Email: diosamudra77@gmail.com

ABSTRACT

Agriculture and animal breeding are vital sectors that contribute significantly to the global food supply chain and rural economies. The development of sustainable agricultural practices integrated with advanced veterinary science has become increasingly important to ensure livestock health, productivity, and welfare. This study aims to analyze contemporary approaches in animal breeding techniques and their impact on agricultural sustainability. Emphasis is placed on genetic selection, nutritional management, and disease prevention strategies to enhance animal performance and resilience. The research employs a multidisciplinary methodology combining field surveys, laboratory analyses, and statistical modeling to provide a comprehensive overview of the current trends and challenges in the sector. The findings indicate that integrated management practices significantly improve productivity and animal welfare, while also contributing to environmental conservation. Furthermore, the role of veterinary interventions in mitigating disease outbreaks and enhancing reproductive efficiency is highlighted as a critical factor for successful breeding programs. This paper underscores the necessity for continuous innovation, capacity building, and policy support to promote the adoption of best practices among farmers and breeders. In conclusion, the synergistic relationship between agriculture, animal breeding, and veterinary science holds the key to achieving sustainable food systems and rural development. Future research should focus on emerging technologies such as genomic selection and precision farming to further optimize production systems. This study provides valuable insights for policymakers, researchers, and practitioners aiming to advance sustainable agricultural and animal breeding practices.

LAND, WATER AND BORDERS: THE GEOPOLITICAL CONTEST OVER AGRİCULTURAL RESOURCES IN SOUTH ASIA

Md.Mizanur Rahman
Research Fellow
Department of Political Science
Institution: Gopalganj Science and Technology University, Bangladesh.
Email: mizan1999.baura@gmail.com

ABSTRACT

South Asia, home to nearly a quarter of the world's population, faces an intensifying struggle over agricultural resources driven by the intertwined dynamics of land scarcity, water insecurity, and contested borders. This research explores the geopolitical contest surrounding agricultural resources in the region, focusing on how land and water have become tools of both cooperation and conflict among South Asian states. Employing a mixed-method approach, the study combines qualitative case studies with quantitative data analysis to provide a holistic understanding of the issue. Qualitatively, the research examines key bilateral and multilateral tensions involving India, Pakistan, Bangladesh, Nepal, and China such as disputes over the Indus Waters Treaty, the Teesta River, and borderlands in Ladakh and the Siliguri Corridor. Through document analysis, elite interviews, and media discourse, the study uncovers how political narratives, historical grievances, and regional ambitions shape the geopolitics of agriculture. Quantitatively, the study utilizes satellite imagery, hydrological data, and agricultural productivity statistics from 2000 to 2024 to map changes in land use, irrigation patterns, and crop yields. Correlation and regression analyses assess the impact of transboundary water flows, land acquisition, and climate variability on food security and rural livelihoods. Findings indicate a growing interdependence among South Asian countries on shared natural resources, yet increasing politicization of resource access exacerbates mistrust and strategic competition. The paper concludes by advocating for regional frameworks that prioritize sustainable agricultural practices, equitable resource sharing, and conflict-sensitive policies. By integrating geopolitical analysis with empirical data, this study contributes to the broader discourse on resource governance, climate resilience, and regional stability in South Asia offering timely policy insights in an era of environmental and political uncertainty.

RECOMBINANT DNA TECHNOLOGY AS TOOL FOR THE PRODUCTION OF POULTRY FEED ENZYMES

Prof. Dr. Muhammad Tayyab
Institute of Biochemistry and Biotechnology, University of Veterinary and Animal Sciences, Lahore, Pakistan
Presenting Author*
Email: muhammad.tayyab@uvas.edu.pk

ABSTRACT

Poultry sector is one of the major established industries of Pakistan that is committed to provide valuable meat to our community. Phytases, cellulases, xylanases and proteases are the main enzymes being added in the poultry feed. The addition of these enzymes is important because their addition in feed put a positive impact on the growth of poultry bird. Phytases are responsible for the availability of free phosphorus while the xylanases and cellulases are responsible for the availability of monomeric absorbable sugars for the growth of bird whereas proteases also involve for the improvement of digestion of proteins. In the absence of these enzymes the phytate, cellulose and xylan are not being digested by the poultry bird and these components of feed simply pass through the digestive track and are removed from the body with manure and contribute in environmental pollution.

In the current study the phytase, cellulase and xylanase genes from hyper-thermophilic bacterium were amplified by using the PCR and ligated into the cloning vector pTZ57R/T. These vectors were transferred in the *E.coli* DH5α cells. The expression of phytase, cellulase and xylanase genes were analyzed in *E.coli* BL21CodonPlus cells with the help of pET expression system. Recombinant proteins were purified through different chromatographic techniques and their molecular masses were determined through SDS-PAGE. Recombinant proteins were characterized. The locally produced recombinant enzymes were utilized for supplementation of poultry feed to examine their effect on the growth of poultry birds. The supplementation of poultry feed with locally produced enzymes showed significant growth enhancing effect on poultry birds and improved the feed uptake and feed conversion ratio.

Keywords: Poultry enzymes, Recombinant proteins, hyper-thermophilic bacterium

INVESTIGATING THE ROLE OF BACILLUS SUBTILIS BIOPRIMING TO ENHANCES SALT-STRESS TOLERANCE IN SOYBEAN VARIETIES

Anam Hameed
MNS-University of Agriculture, Multan.,
Inst. of Plant Breeding and Biotechnology
anamhameed027@gmail.com

ABSTRACT

Crop growth and productivity are highly important in the agricultural sector, and salt stress is a major challenge for the germination and survival of salt-sensitive crops. Biopriming is a promising solution for mitigating the negative effects of salt stress. To evaluate the effects of *B. subtilis* biopriming, a bacterial suspension was prepared, and seeds of the different varieties were soaked in the suspension for 4 hours in darkness. Compared with wild type, the germination percentage of the seeds bioprimed by *B. subtilis* but not stressed improved by 7% in both varieties. In contrast, the T4 and T5 treatments (*B. subtilis* primed and challenged with salt stress) resulted in 11% and 19% (in the salt-tolerant variety) and 35% and 34% (in the salt-sensitive variety) improvement in the percentage of germination compared with that of nonbioprimed salt-stressed seeds (T1 and T2). Similarly, *B. subtilis* bioprimed salt-stressed plants (T4 and T5) presented increases (4% and 10%) in terms of root length and number of nodes (18% and 20%) in the salt-tolerant variety, whereas 26% and 9% increases in root length and 34% and 35% increases in the number of nodes were recorded in the salt-sensitive variety compared with those in the salt-stressed nonbioprimed plants (T1 and T2). Additionally, the salt-tolerant variety treated with *B. subtilis* and salt-stressed plants presented 50% and 35% increases, whereas the sensitive variety presented 29% and 63% increases in SOD activity. POD activity was shown to be increased by 22% and 15% in the salt-tolerant variety, and 21% and 13% increases were observed in the salt-sensitive variety compared with the nonbiotrimed salt-stressed (T1 and T2) plants. In contrast, *B. subtilis* bioprimed salt-stressed plants (T4 and T5) presented 15% and 33% decreases in the Na^+/K^+ ratio, respectively, in the salt-tolerant variety but 12% to 48% in the salt-sensitive variety in comparison with nonbioprimed salt-stressed (T1 and T2) plants. The relative gene expression of *GmSOS1* was shown to be upregulated by up to 33% in the salt-tolerant variety and 32% in the salt-sensitive variety in the *B. subtilis* bioprimed salt-stressed plants compared with the nonbioprimed salt-stressed plants. Taken together, our results show that seed biopriming with *Bacillus subtilis* could be an effective solution for improving plant stress tolerance by activating plant defense mechanisms and salt stress tolerance pathways at the molecular level and may be adopted by farmers in the future.

SILICON-MEDIATED MITIGATION OF CLIMATE CHANGE IMPACTS ON WHEAT PRODUCTION IN MENA: PHYSIOLOGICAL AND AGRONOMIC INSIGHTS

Akbar Soliemanzadeh
Soil and Water Research Department, Hormozgan Agricultural and Natural Resources Research and Education Center, AREEO. Bandar Abbas, Iran.
Email: asoliemanzadeh@yahoo.com, a.soliemanzadeh@areeo.ac.ir

ABSTRACT

Wheat (Triticum aestivum L.) is a cornerstone of human nutrition and health, particularly in the Middle East and North Africa (MENA) region, where it plays a crucial role in sustaining livelihoods and ensuring food security. However, climate change poses significant threats to wheat production through escalating heat, drought, and salinity stresses. These abiotic stressors reduce wheat yields by impairing physiological processes and triggering defense mechanisms that compromise plant growth and productivity. This study explores the role of silicon (Si) as a mitigating agent against these climate-induced challenges. By applying Si at optimal rates, timing (aligned with wheat phenology), sources (e.g., potassium silicate vs. nano-Si), and methods (fertigation or foliar spray), we observed notable improvements in wheat resilience. Silicon supplementation enhanced water use efficiency, enabling plants to better cope with drought, while also bolstering physiological responses such as photosynthesis, antioxidant activity, and nutrient uptake under heat and salinity stress. These adaptations collectively minimized yield losses and strengthened the plant's defense mechanisms. Our findings highlight the agronomic and physiological insights into Si-mediated stress alleviation, offering a promising strategy for sustaining wheat production in MENA amid worsening climate conditions. This approach could serve as a scalable, practical solution to safeguard food security in vulnerable regions facing similar environmental pressures.

YOUTH AS CATALYSTS FOR AGRICULTURAL TRANSFORMATION IN THE DIGITAL ERA

ABSTRACT

The digital era presents unprecedented opportunities to revolutionize agriculture and attract a new generation of young farmers. With access to emerging technologies such as precision farming, artificial intelligence, drones, remote sensing, mobile-based advisory platforms, and digital marketplaces, today's youth have the potential to lead a transformation in agricultural practices. This paper explores the dynamic role of youth as key drivers of digital innovation in agriculture, examining how their digital literacy, entrepreneurial mindset, and adaptability can reshape the sector for improved productivity, sustainability, and profitability. Using a mixed-method approach that includes surveys and case studies from various regions, the study highlights successful youth-led Agri-initiatives that leverage technology to address challenges such as low yields, labor shortages, and market inefficiencies. The findings reveal that while digital tools are increasingly accessible, gaps in training, awareness, infrastructure, and policy support continue to hinder full-scale adoption. However, youth who are digitally empowered are more likely to engage in agri-business ventures, adopt climate-resilient technologies, and promote sustainable farming methods. The paper concludes by emphasizing the need for youth-centered agricultural policies, digital skill development programs, and inclusive innovation platforms to harness the full potential of young change makers. Encouraging youth participation not only ensures the modernization of agriculture but also contributes to rural development, food security, and job creation in the agricultural value chain. As digital natives, youth are uniquely positioned to act as catalysts for agricultural transformation.

ABSTRACT

The United Nations' 2030 Agenda for Sustainable Development addresses the importance of food security and nutrition, while acknowledging the role of sustainable agriculture in ending hunger, achieving food security, and promoting healthy nutrition for all people worldwide. On the one hand, the Organization for Economic Co-operation and Development focuses on analyzing the linkages between the sustainable agriculture practices and the specific Global Goals, and, on the other hand, the Food and Agriculture Organization of the United Nations emphasis that biotechnology represents an impressive promising tool in creating sustainable agriculture for improving soil health, enhancing nutrient cycling, and ensuring environmental sustainability. These days, navigating the agricultural biotechnology sector tackles innovation for inclusive and resilient food production by revolutionizing production for sustainable growth, while offering science-driven solutions for building sustainable food systems. The research draws on the advantages of biotechnology in supporting biodiversity and sustainable agriculture. Likewise, it stresses some concerns and risks raised by the development and applications of biotechnology. The literature review section presents the outcomes highlighted by important international organizations in their recently published reports centered on biotechnology for Sustainable Development Goals, while examining the potential of eco-friendly farming techniques and the interdisciplinary efforts to integrate biological sciences with environmental and technological solutions targeting sustainable long-term solutions. Several case studies are displayed in order to promote various innovative approaches for agricultural biotechnology based on developing strategies for pollution mitigation, resource recovery, and ecosystem restoration. Results show the necessity of the holistic systems approach and the synergies between harnessing biological systems and processes in agriculture, while addressing economic profitability, social equity, and environmental conservation and preservation.

A CRITICAL ANALYSIS OF THE ROLE OF WOMEN IN AGRICULTURE AND ANIMAL WELFARE IN RELATION TO THE SUSTAINABILITY OF RURAL FOOD SYSTEMS

Mr. Satish Kumar Singh [LL.M.; Qualified UGC NET & JRF]
Research Scholar, Department of Law, Central University of Punjab, India.
Email Id: skcupb001@gmail.com

ABSTRACT

Women represent a substantial segment of the global agricultural workforce, yet they consistently face systemic barriers that hinder their full participation and recognition in the agriculture and animal welfare sectors. These challenges include limited access to land ownership, financial services, education, and technology-critical components for enhancing productivity and sustainability in rural food systems. In many regions, entrenched cultural norms and discriminatory policies further exacerbate these disparities, restricting women's agency and decision-making capacities within their communities. Despite these obstacles, women's contributions are indispensable to the advancement of sustainable agricultural practices and the assurance of food security. Their active involvement in agroecology, biodiversity preservation, and the implementation of climate-resilient farming techniques has been pivotal in fostering environmental sustainability. Furthermore, women's participation in animal husbandry is crucial for maintaining animal welfare standards and augmenting livestock productivity. By integrating traditional knowledge with innovative practices, women have effectively managed livestock health and contributed to the diversification of rural economies. Nevertheless, their contributions frequently remain undervalued and underreported, leading to a lack of targeted support and resources. Addressing these gender disparities necessitates the implementation of policies that promote equitable access to resources, education, and decision-making platforms for women. Empowering women in agriculture and animal welfare not only enhances the resilience and sustainability of rural food systems but also drives broader socio-economic development. Recognizing and supporting women's roles in these sectors is imperative for achieving global food security and sustainable development goals.

ABSTRACT

Algeria has a chronic shortage of milk and dairy products, mainly due to poor livestock feed in terms of quantity and quality. The aim of this study was therefore to investigate the influence of feeding green alfalfa and hay on the production and physical and chemical composition of milk. Twelve Pie noire dairy cows were allocated for the experiment. The experiment consisted of two periods of four weeks each, during which green alfalfa was compared with two control diets based on green barley and green sorghum, while a diet based on alfalfa hay was compared with a diet based on alfalfa hay. The results show that the introduction of alfalfa green at the budding stage and as hay in the ration of dairy cows resulted in a significant increase in milk production, protein content, non-fat dry matter and milk density compared with the other control diets, while no significant increase was recorded for the other physico-chemical parameters of the milk (fat content, lactose content, acidity and freezing point). At the flowering stage, milk production and physico-chemical parameters did not increase significantly.

Prof. Dr. Mubashir Mehndi
Chairman, Department of Agribusiness and Entrepreneurship Development, Muhammad Nawaz Sharif University of Agriculture, Multan, Pakistan,
Mubashir.mehndi@mnsuam.edu.pk

ABSTRACT

Entrepreneurship is an important driver of economic development, innovation, economic competition, and social mobility in societies, particularly in rural areas. Women business owners are regarded as successful due to their intense drive and capacity for efficient economic growth. However, women are tied up with strong social and cultural norms, which may hinder them from achieving their aim to be entrepreneurs. This study investigated women's intention to engage in entrepreneurial activities by analyzing their intention in the light of social capital theory. For this purpose, data was collected from 120 rural women of Punjab province through a purposive sampling technique. Quantitative techniques guided the key factors affecting rural women in generating new businesses, which were further explored using the order probit model to assess the direct impact of social capital on women's entrepreneurial intentions at the community's wider level. The results showed that Participation in the local community (PLC) and feeling of trust and safety (FTS) have significantly increased the intention of rural women. The findings suggested that entrepreneurship programs in rural communities can be successful and more effective if the development agencies focus on neighborhood connection along with friend and family support.

POTATOES, PEPPER, LAMB, TOMATO: TURKISH COMPONENTS OF HUNGARIAN GASTRONOMY AS PARTS OF THE MULTICULTURAL HERITAGE

dr. Sándor Földvári,
Debrecen University, Baltic Studies Lecturer, Hungary
alexfoldvari@gmail.com
ORCID NO: 0000-0002-7825-0531

ABSTRACT

The great Turkish sultan Süleyman the Magnificent captured Buda, the capital city in 1541, and Hungary since that time was partitioned into three parts: the Turkish occupation in the central part, growing more and more, and the tiny Hungarian Kingdom in the West and North, being a province of the Habsburg Empire, and Transylvania in the East, being a vassal state of the Ottoman Turkish Empire, ruled by the Princes of Transylvania. Ottoman Turks contributed much to the cultural heritage: we Hungarians eat potatoes, cultivate wonderful roses, and visit wellness baths in five-hundred-year-old Turkish buildings (such as in Budapest and Eger), that have remained for us as the valuable Turkish cultural heritage. (Papp, 2018) The Hungarian archaeologist Győző Gerő excavated more than a hundred Turkish buildings in Hungary and restored some of them, which are still working as baths or a small mosque as a türbe of Gül Baba in Buda. (Gerő, 1980) The Turkish State awarded him in the last part of the 20th century for his great, lifelong work on the Turkish cultural heritage in Hungary. (Dávid, 2016)

The background principle of this paper is, that the Turkish cultural heritage became an organic part of the Hungarian culture, such as the baths at medical waters, the rose motifs in the folk-tales rose gardens around the houses, as well as potatoes in the Hungarian foods, and still other elements of the built and intellectual heritage. We aim to pay attention to the multiculturality of the Hungarians and any nation and emphasize the Turkish contribution.

Tomato, poppy, and eggplant are also of Turkish origin. But what is especially important in Hungarian culture: Hungarian wine grapes are called Hungarian characteristics, and today's nationalist Hungarians are proud that American California grapes were brought to California by Hungarian immigrants. However, grape culture was developed by the Turks in the Hungarian Plain, which is the Turkish occupation zone. They did not make wine from it, they brought sweet white grape varieties to Hungary.

Corresponding author: hamdanianasse@gmail.com

ABSTRACT

This study examines the impact of deficient irrigation and high temperatures on the levels of growth, production and physico-chemical quality of the plum cultivar 'Angelino' (*Prunus salicina* L). The study was conducted in the field of the National Agricultural Research Institute (INRA) experimental estate at 'Ain Taoujdate'. Two stress treatments were applied, namely a drought stress (DS) level of 50% of crop evapotranspiration (ETc), and exposure to a heat stress (HS) of 2.5°C, were compared with on-demand irrigation (100% of ETc) not under thermal stress, during the fruit development period from the fruit set stage until harvest time. Observations were made on various traits that could be stress descriptors, including fruit yield, certain vegetative growth characteristics including shoot length, number of leaves and leaf area, as well as physiological characteristics such as stomatal characteristics, leaf proline, cuticular wax and chlorophyll a and b pigment content, with some chemical and biochemical components of plum quality. The results obtained showed that the effect of drought and heat stress reduced plum productivity by a general average of 61%, vegetative growth also declined by 49% and physiological characteristics decreased by 48% except proline and cuticular wax, although the taste quality of plums has been improved thanks to increases in the content of sugars, amino acids and polyphenols. This illustrates the need for agriculture in the study area to adapt to the conditions imposed and predicted by climate change in terms of water resources and high temperatures.

Keywords: *Prunus salicina* L, Drought stress, Temperature, Production, Growth, Quality.

ACCESS AND USE OF INFORMATION AND COMMUNICATION TECHNOLOGY AMONG RICE FARMERS IN ISHIELU, EBONYI STATE, NIGERIA

Izuogu, C.U[1]., Okonwe, P.N[2]., Njoku, L.C[3]., Olaolu, M.O[4]., Ibrahim-Olesin, S[5]., Umeh, N.E[6]., Agou, G.D[7]., Iroegbu, S.C[8]

[8] Department of Soil Science, Faculty of Agriculture, Alex Ekwueme Federal University, Ndufu Alike, Ebonyi State

ABSTRACT

The study assessed the use of information and communication technology among rice farmers in Ishielu, Ebonyi State, Nigeria. Multistage sampling procedure was used to select a hundred and twenty respondents for the study. Data were analysed with frequencies, mean scores and regression analysis. Results show that 63.3% of the respondents were above 30 years with 22.2% not having formal education. The main sources of agricultural information were mass media (67%), extension services (34%), and fellow farmers (32%). Majority of the respondents (66.72%) had access to information and communication technology. Factors that influenced rice farmers access to information communication technology include education, income, membership of cooperative society and extension contact. Some of the challenges of accessing information and communication technology include high cost (73.4%), low level of digital literacy (67.3%), inadequate access to power supply (54.8%), and high cost of maintenance of ICT tools (48.7%). The study concludes that rice farmers have adopted ICTs and recommends that government should subsidize the cost of ICT and improving power supply in the rural areas.

Keywords: Mass media, extension contact, power supply.

DYEING OF COTTON WITH REACTIVE DYES USING MICROWAVE TREATMENTS

Shahid Adeel*[1], Shumaila Kiran[1], Muhammad Aamir[1], Muhammad Kamran[1], Farwa Khalid[1]

1 Department of Applied Chemistry, Government College University Faisalabad, 38000, Faisalabad Pakistan
Presenter Email: shahidadeel@gcuf.edu.pk (Shahid Adeel)

ABSTRACT

Sustainable textile is the demand of global community. The study has been concerned with the utilization of radiation as sustainable tool for dyeing of cotton with reactive dye. Dyeing parameters were assessed and shades made were evaluated as per ISO standards. The study findings show that if cotton treated for 6 min is used to dye with reactive dye of 7pH at 80 ℃ for 50 min, than good shade are found. Colourfastness ratings have been improved if shades are made at selected condition. It is informed that these MW-rays have potential to improve the dyeing of fabrics with dyes.

THE LEGAL DIMENSIONS OF FOOD SECURITY IN THE CONTEXT OF AGRICULTURAL DEVELOPMENT POLICY: A CRITICAL ANALYSIS OF REGULATORY APPROACHES AND GOVERNANCE MECHANISMS

Mr. Satish Kumar Singh [LL.M.; Qualified UGC NET & JRF]

Research Scholar, Department of Law, Central University of Punjab, India.
Email Id: skcupb001@gmail.com

ABSTRACT

Food security constitutes a fundamental objective within global development agendas, particularly in regions where agricultural sustainability, economic resilience, and legal governance are intricately connected. As agricultural development policies adapt to the challenges posed by population growth, climate change, and resource scarcity, the legal framework underpinning these policies plays a crucial role in fostering equitable and resilient food systems. This study undertakes a critical analysis of the legal dimensions of food security within the context of agricultural development policy, with a particular focus on how regulatory structures and governance mechanisms facilitate or impede the realization of the right to adequate food. Employing an interdisciplinary legal methodology, the study examines international, national and regional legal instruments, including soft law mechanisms, constitutional provisions, statutory regulations, and institutional mandates. Particular emphasis is placed on the extent to which food security objectives are embedded in agricultural legislation, land tenure regimes, investment laws, and environmental governance. The study further evaluates the coherence, effectiveness, and accountability of institutional frameworks responsible for implementing food security measures. Comparative case studies from both developed and developing economies are utilized to illuminate diverse regulatory approaches, identify normative and institutional gaps, and highlight best practices. The findings reveal an urgent need for comprehensive legal frameworks that integrate food security within broader development strategies, while simultaneously advancing social equity, environmental sustainability, and human rights compliance. Ultimately, the research advocates for a rights-based and participatory legal paradigm, reframing food security not merely as a policy aspiration but as a legally enforceable entitlement grounded in both international and domestic legal obligations.

ABSTRACT

In protected cultivation systems, a wide range of pest species adversely affect crop quality and yield, either directly or indirectly. Globally, insect-related crop losses in greenhouse production are estimated to reach approximately 40%, while in Turkey, this figure is around 35%. To date, seven major thrips species have been identified as key contributors to yield losses in greenhouse environments. Among these, *Frankliniella occidentalis* (Western flower thrips) is recognized as one of the most economically significant species, infesting over 600 plant species, including both ornamental and horticultural crops, in greenhouse and open-field conditions. *F. occidentalis* causes both direct and indirect damage to host plants. Direct damage is associated with the pest feeding on young leaves, flowers, and fruits, resulting in leaf curling, discoloration, and fruit deformation. Indirect damage arises from its capacity to act as a vector

for plant viruses, leading to substantial economic losses. In some instances, the presence of this pest necessitates the destruction of entire crops to prevent further viral transmission. Owing to its adaptability to a wide host range, rapid life cycle, high reproductive capacity, and ability to develop resistance to synthetic chemical insecticides, *F. occidentalis* has become a pervasive and resilient pest in modern agriculture. Chemical insecticides remain the predominant method employed for the management of *F. occidentalis*. However, their indiscriminate and excessive use has contributed to resistance development and the suppression of natural enemies. While chemical agents can effectively suppress pest populations, the implementation of rotation strategies is recommended to mitigate resistance development. The excessive and unconscious use of chemical methods in the control of harmful organisms in cultivated plants has caused serious adverse effects on human, animal, and environmental health. This situation has led producers to seek alternative and environmentally friendly methods. In this context, biological control methods have come to the forefront, and the use of biological agents such as predatory insects, entomopathogenic fungi (EPF), entomopathogenic nematodes (EPN), and plant growth-promoting rhizobacteria (PGPR) has become increasingly widespread. The combined use of these agents within the framework of integrated pest management strategies plays a significant role in the effective and sustainable control of pests. This review investigates the potential use of entomopathogenic agents as environmentally sustainable alternatives to chemical control methods for the management of the Western Flower Thrips (*Frankliniella occidentalis*), and evaluates current strategies based on recent findings in the scientific literature.

BATI ÇİÇEK TRİPSİ (*Frankliniella occidentalis*) ZARARLISINA KARŞI SÜRDÜRÜLEBİLİR VE ÇEVRE DOSTU MÜCADELE YÖNTEMLERİ

ÖZET

Örtü altı tarımda, ürün kalitesini ve verimini doğrudan veya dolaylı olarak olumsuz yönde etkileyen pek çok zararlı bulunmaktadır. Örtü altı tarım alanlarında böcekler nedeniyle meydana gelen ürün kaybı, dünya genelinde %40 seviyelerindeyken, Türkiye'de bu oran %35 civarındadır. Bugüne kadar, örtü altı tarım alanlarında ürün kaybına neden olan yedi önemli trips zararlısı tespit edilmiştir. Bu zararlılardan biri, hem seralarda hem de açık alanlarda, süs bitkileri ve bahçe bitkileri dahil olmak üzere 600'den fazla bitki türüne zarar veren *Frankliniella occidentalis* (Batı çiçek tripsi) türüdür. *F. occidentalis*, bitkiler üzerinde doğrudan ve dolaylı zararlar yaratmaktadır. Doğrudan zarar, bitkilerin genç yapraklarını, çiçeklerini ve meyvelerini emerek beslenmesiyle başlar. Bu beslenme sonucu bitkilerde yaprak bükülmeleri, renk değişiklikleri ve meyve deformasyonları gözlemlenir. Dolaylı zarar ise, bu zararlının bitki virüslerini taşıması nedeniyle önemli ekonomik kayıplara yol açmasıdır. *F. occidentalis*'in varlığı, tarımda büyük ekonomik kayıplara yol açmakta olup, virüsün yayılmasını önlemek amacıyla bazen tüm mahsullerin imha edilmesi gerekmektedir. Bu zararlı, geniş bir bitki yelpazesinde uyum sağlayabilen ve dünya çapında birçok üründe zarar veren bir türdür. Kısa yaşam döngüsü, yüksek üreme potansiyeli, geniş konak bitki yelpazesi ve sentetik kimyasal insektisitlere karşı direnç geliştirme yeteneği gibi faktörler, *F. occidentalis*'i tarım alanlarında önemli bir zararlı hâline getirmiştir. Bu zararlıyla mücadelede en yaygın yöntem kimyasal insektisitlerin kullanımıdır. Ancak, bu insektisitlerin yanlış ve aşırı kullanımı, zararlının direnç kazanmasına ve doğal düşmanlarının zarar görmesine neden olabilmektedir. Kimyasal insektisitler, zararlı popülasyonlarını kontrol altına almada etkili olabilse de, direnç gelişimini önlemek amacıyla bu ürünlerin dönüşümlü kullanımının tercih edilmesi önerilmektedir. Kültür bitkilerinde zararlı organizmalarla mücadelede kimyasal yöntemlerin aşırı ve bilinçsiz kullanımı, insan, hayvan ve çevre sağlığı üzerinde ciddi olumsuz etkilere neden olmaktadır. Bu durum, üreticileri alternatif ve çevre dostu yöntemlere yönlendirmiştir. Bu sebeple özellikle biyolojik mücadele yöntemleri ön plana çıkmakta; predatör böcekler, entomopatojenik mantarlar (EPF), entomopatojen nematodlar (EPN) ve bitki büyümesini teşvik eden rizobakteriler (PGPR) gibi biyolojik ajanların kullanımı giderek yaygınlaşmaktadır. Bu ajanların entegre mücadele stratejileri kapsamında birlikte kullanımı ise, zararlıların etkin ve sürdürülebilir bir şekilde kontrol altına alınmasında önemli bir rol oynamaktadır. Bu derlemede, Batı Çiçek Tripsi (*Frankliniella occidentalis*) ile mücadelede çevre sağlığı ve doğal dengenin korunması amacıyla kimyasal mücadeleye alternatif olabilecek entomopatojenlerin kullanım yöntemleri incelenmiş ve güncel literatür bulguları ışığında değerlendirilmiştir.

ABSTRACT

Hydroponics is a modern agricultural method where plants are cultivated without soil, using nutrient-rich solutions. In such systems, precise control of environmental conditions is essential for optimal plant growth and productivity. Sensor technologies have become a fundamental component in enhancing automation and efficiency in hydroponic applications.

By integrating sensors, key parameters such as pH, EC (Electrical Conductivity), temperature, humidity, light intensity, and water level can be continuously monitored, allowing for real-time feedback and adjustments. For instance, pH sensors measure the acidity or alkalinity of the nutrient solution, which affects nutrient uptake, while EC sensors evaluate ion concentration to maintain appropriate nutrient levels. Temperature and humidity sensors help manage plant stress, and light sensors optimize the amount of light required for effective photosynthesis. Water level sensors assist in managing the reservoir system efficiently.

These data are processed via microcontroller platforms such as ESP32, Arduino, and Raspberry Pi, which enable the automatic control of components like pumps, lights, fans, and valves. Programming environments such as Arduino IDE, Python, and Node-RED are commonly used for developing control logic. With the integration of Internet of Things (IoT) technologies, remote monitoring is made possible via Wi-Fi and MQTT protocols, while cloud-based data logging and real-time alert systems (e.g., SMS, email, mobile notifications) enhance system responsiveness.

Advanced implementations now include artificial intelligence and machine learning for decision support and irrigation optimization, aiming to improve energy and resource efficiency. Nevertheless, reliable operation depends on regular maintenance and calibration of sensors—especially pH and EC sensors—which must be cleaned and calibrated periodically. Redundant sensor setups are also recommended to ensure data integrity.

In conclusion, sensor-based hydroponic systems not only boost productivity but also contribute to sustainable agricultural practices. These systems are scalable and can be applied across a wide range of production levels, from small-scale setups to large commercial farms. Integrating data-driven technologies into agriculture paves the way for the future of "smart and sustainable farming."

Keywords: Hydroponics, Sensor Technology, IoT-based Agriculture

HİDROPONİK SİSTEMLERDE SENSÖR TEKNOLOJİLERİ VE KONTROL YAPILARI

ÖZET

Hidroponik, bitkilerin toprak kullanılmadan, doğrudan besin çözeltisi ile beslendiği modern bir tarım yöntemidir. Bu yöntemde çevresel koşulların hassas biçimde kontrol edilmesi, bitki gelişimi ve verimliliği açısından kritik öneme sahiptir. Sensör teknolojileri, hidroponik sistemlerin otomasyonunu ve verimliliğini artırmak amacıyla temel bir yapı taşı haline gelmiştir.

Sensör kullanımı sayesinde pH, EC (Elektriksel İletkenlik), sıcaklık, nem, ışık ve su seviyesi gibi parametreler sürekli olarak izlenebilmekte; bu da çevresel değişkenlere anında tepki verilmesini mümkün kılmaktadır. Örneğin, pH sensörleri bitki besinlerinin emilimini etkileyen asit-baz dengesini ölçerken, EC sensörleri çözeltideki iyon yoğunluğunu belirleyerek doğru besin seviyesinin korunmasına yardımcı olur. Sıcaklık ve nem sensörleri, bitkilerin stres düzeylerini kontrol altında tutarken; ışık sensörleri, fotosentez için gerekli olan ışık miktarını optimize etmekte kullanılır. Su seviyesi sensörleri ise rezervuar yönetimini destekler.

Bu veriler, mikrodenetleyici platformlar (ESP32, Arduino, Raspberry Pi) aracılığıyla işlenmekte ve pompa, ışık, fan ya da valf gibi sistem bileşenlerinin otomatik olarak kontrol edilmesini sağlamaktadır. Programlama dilleri ve platformları olarak Arduino IDE, Python ve Node-RED gibi araçlar yaygın şekilde kullanılmaktadır. IoT (Nesnelerin İnterneti) teknolojileri sayesinde bu sistemler Wi-Fi ve Bluetooth gibi protokollerle uzaktan izlenebilir, bulut tabanlı veri kaydı yapılabilir ve anlık bildirim sistemleri oluşturulabilir.

İleri düzey uygulamalarda yapay zeka ve makine öğrenmesi, karar destek sistemleri ve sulama optimizasyon algoritmalarıyla entegre edilerek enerji ve kaynak verimliliği artırılmaktadır. Ancak bu teknolojilerin etkin çalışabilmesi için sensörlerin düzenli bakım ve kalibrasyonu büyük önem taşır. Özellikle pH ve EC sensörlerinin doğru veri üretebilmesi için periyodik kalibrasyon, temizlik ve gerektiğinde yedekli sistem önerilmektedir.

Sonuç olarak, sensör destekli hidroponik sistemler yalnızca üretim verimliliğini değil, aynı zamanda sürdürülebilirliği de artırmaktadır. Bu yapı küçük ölçekli bireysel uygulamalardan büyük endüstriyel seralara kadar geniş bir yelpazede uygulanabilir. Veriye dayalı karar mekanizmalarının tarıma entegrasyonu, geleceğin "bilinçli ve teknoloji destekli" üretim modellerinin temelini oluşturmaktadır.

Anahtar Kelimeler: Hidroponik Tarım, Sensör Teknolojileri, Nesnelerin İnterneti (IoT) Tabanlı Tarım.

A STUDY ON THE USE OF CANNED AND FROZEN AGRICULTURAL PRODUCTS

ABSTRACT

The ever-renewing and developing technology has changed the habits of societies over time and shaped their cultures. After the industrial revolution, it has been observed that the nutritional habits of individuals and families have changed rapidly with the acceleration of women's participation in economic activities. Variables such as individual habits, attitudes, beliefs and values, age, education, income, marital status are factors that affect individuals' nutritional habits. In addition to these social demographic factors, factors such as easy to cook, delicious, easy to find, quality products, and low price are among the reasons why consumers prefer various food products when purchasing food. Canned and frozen foods have become a visible part of our lives in the age we live in, as they can be prepared both at home and purchased from markets. The aim of this study is to understand the principles of a number of food preservation methods, the superior and deficient aspects of frozen food products, the importance of packaging and environmentally friendly packaging techniques, the details of the production processes of frozen and canned products produced with developing technology, and the perspective of women working in our country on these foods. This study was found to be worth examining in terms of the fact that there are very few studies in our country that reveal the consumption demands, awareness levels, tendencies and consumption patterns of working women for these foods. In this study, which was conducted using the survey method on 211 working women in the city center of Kırşehir, the important finding determined within the scope of the study was that the participants found frozen foods superior to canned products in terms of nutritional content and first-day freshness (67.8%). As a result, ease of use, nutritional value and freshness stand out among the basic factors affecting the frozen food preferences of working women in our study. It was also found that working women preferred frozen foods more in their cooked and frozen forms.

Keywords: Frozen food, canned food, working woman.

KONSERVE VE DONDURULMUŞ TARIM ÜRÜNLERİNİN KULLANIMINA YÖNELİK BİR İNCELEME[1]

ÖZET

Her geçen gün yenilenen ve gelişen teknoloji toplumların alışkanlıklarını zamanla değiştirerek kültürlerine yön vermiştir. Sanayi devriminden sonran kadınların ekonomik faaliyetlere katılımının hızlanması birlikte bireylerin ve ailelerin de beslenme alışkanlıklarının hızla değiştiği gözlemlenmiştir. Bireysel alışkanlıklar, tutumlar, inançlar ve değerler, yaş, eğitim, gelir, medeni durum gibi değişkenler bireylerin beslenme şekline etki eden faktörlerdir. Gıda satın alırken bu sosyal demografik faktörlerin yanı sıra, pişirmesi kolay, lezzetli, bulunması kolay, kaliteli ürün, düşük fiyat gibi etkenler de tüketicilerin çeşitli gıda ürünlerini tercih nedenleri arasındadır. Konserve ve dondurulmuş gıdalar, hem evde hazırlanabilmesi hem de marketlerden satın alınabilmesi nedeniyle içinde bulunduğumuz çağda gözle görülür şekilde hayatımızın bir parçası haline gelmiştir. Bu çalışmanın amacı bir dizi gıda muhafaza yöntemlerinin prensiplerini, dondurulmuş gıda ürünlerinin üstün ve eksik yönlerini, ambalajlamanın önemini ve çevre dostu ambalajlama tekniklerini anlamak, gelişen teknoloji ile üretilen dondurulmuş ve konserve ürünlerin üretim süreçlerinin detaylarını ve ülkemizde çalışan kadınların bu gıdalara bakış açısını ortaya koymaktır. Bu çalışma, ülkemizde çalışan kadınların bu gıdalara olan tüketim talepleri, bilinç düzeyleri, eğilimleri ve tüketim desenlerini ortaya koyan pek az çalışma bulunması bakımından incelenmeye değer bulunmuştur. Kırşehir İli Merkezinde 211 çalışan kadın üzerinde anket yöntemi kullanılarak gerçekleştirilen bu çalışmada, katılımcıların dondurulmuş gıdaları besin içeriği ve ilk günkü tazelik açısından konserve ürünlere göre daha üstün bulmaları (%67,8) çalışma kapsamında belirlenen önemli bulgu olmuştur. Sonuç olarak, çalışmamızda çalışan kadınların dondurulmuş gıda tercihlerini etkileyen temel etmenler arasında kullanım kolaylığı, besin değeri ve tazelik öne çıkmaktadır. Ayrıca çalışan kadınların dondurulmuş gıdaları pişirilmiş ve dondurulmuş haliyle daha çok tercih ettiği bulunmuştur.

Anahtar Kelimeler: Dondurulmuş gıda, konserve, çalışan kadın.

ABSTRACT

This study aims to develop a new vineyard post design that can solve structural problems such as tilting and bending of vineyard posts, which are frequently encountered in vineyards. The wooden, concrete and conventional steel poles used in existing systems deform over time due to tensile forces applied to the wires and wind loads, negatively affecting the vineyard yield and the life of the system. As a solution to this problem, a special pole design made of high strength HX340LAD+Z galvanised steel material with U profile and multiple bends was developed.

In the design, a 52x55 mm profile with a total of 10 bends and 12 mm long ear structures inclined inwards by 60° at the edge ends was preferred. This structure both increases the cross-sectional strength and increases the resistance against wind and wire loads. The pole is 2200 mm long and designed to be used as the main supporting element in the vineyard rows.

On three sides of the pole, there are 8 mm diameter holes placed every 100 mm intervals. Thanks to this arrangement, the vine wires can be positioned flexibly according to the desired height and can be adapted to different vineyard layouts. Adjustability makes it possible to easily adapt the system to the development needs of different grape varieties and offers functional advantages to the user.

In the part that is buried in the soil, thanks to the flag-shaped sheet metal attachments welded to the middle of the two sides, it can be stuck into the ground to a depth of 300 mm without the need for excavation and concrete pouring. This structure provides significant convenience in the assembly process in terms of both labour and time.

The proposed vineyard post design has been developed in such a way that it can be produced by pulling it through the roll forming line, which is widely used in the industry. This production method offers a great advantage in terms of both cost and production efficiency with its high precision, reproducible and suitable for mass production. In addition, thanks to roll forming technology, complex bending geometries in the profile can be obtained with high quality.

As a result of the engineering analyses and structural evaluations, it has been determined that the proposed new pole model shows higher performance in terms of leaning and bending resistance compared to conventional tie poles. Developed to be compatible with T and Y type trellis systems, this pole contributes to the long-lasting and durable survival of the vineyard

system in open areas, harsh climatic conditions and sloping terrains. The galvanised steel structure used increases corrosion resistance, allowing the system to offer long-term protection against outdoor conditions.

As a result, this new vineyard post design aims to eliminate the structural weaknesses seen in existing applications, can be produced on the roll forming line, easy to assemble, height adjustable, long-lasting and suitable for field conditions.

Keywords: Vineyard Post Design, Roll Forming, Structural Reinforcement, Corrosion Resistance

ROLLFORM PROSESİYLE SERİ ÜRETİME UYGUN, YAPISAL OLARAK GÜÇLENDİRİLMİŞ BİR BAĞ DİREĞİ TASARIMI

ÖZET

Bu çalışma, üzüm bağlarında sıklıkla karşılaşılan bağ direklerinin yatması ve eğilmesi gibi yapısal sorunlara çözüm getirebilecek yeni bir bağ direği tasarımının geliştirilmesini amaçlamaktadır. Mevcut sistemlerde kullanılan ahşap, beton ve klasik çelik direkler zamanla tellere uygulanan çekme kuvvetleri ve rüzgar yükleri nedeniyle deformasyona uğrayarak bağ verimini ve sistemin ömrünü olumsuz etkilemektedir. Bu probleme çözüm olarak, yüksek mukavemetli HX340LAD+Z galvanizli çelik malzemeden üretilmiş, U profilli ve çok bükümlü özel bir direk tasarımı geliştirilmiştir.

Tasarımda, 52x55 mm ebatlarında, toplamda 10 adet büküm içeren ve kenar uçlarında içe doğru 60° eğimli, 12 mm uzunluğunda kulak yapıları bulunan bir profil tercih edilmiştir. Bu yapı, hem enkesit dayanımını artırmakta hem de rüzgar ve tel yüklerine karşı direnci yükseltmektedir. Direk, 2200 mm uzunluğunda olup, bağ sıralarında ana taşıyıcı eleman olarak kullanılmak üzere tasarlanmıştır.

Direğin üç kenarında, her 100 mm aralıklarla yerleştirilmiş 8 mm çaplı delikler bulunmaktadır. Bu düzenleme sayesinde, bağ telleri istenilen yüksekliğe göre esnek bir şekilde konumlandırılabilmekte ve farklı bağ düzenlerine uyum sağlanabilmektedir. Ayarlanabilirlik özelliği, özellikle farklı üzüm türlerinin gelişim ihtiyaçlarına göre sistemin kolaylıkla adapte edilebilmesini mümkün kılmakta, kullanıcıya işlevsel avantajlar sunmaktadır.

Toprağa gömülen kısmında, iki kenarın ortasına kaynakla birleştirilen bayrak formlu sac eklentiler sayesinde, kazı ve beton dökme işlemlerine gerek kalmaksızın 300 mm derinliğe kadar zemine saplanarak stabil bir duruş sağlanmaktadır. Bu yapı, hem işçilik hem de zaman açısından montaj sürecinde ciddi kolaylık sağlamaktadır.

Önerilen bağ direği tasarımı, sanayide yaygın olarak kullanılan rollform hattı üzerinden çekilerek üretilebilecek şekilde geliştirilmiştir. Bu üretim yöntemi, yüksek hassasiyetli, tekrarlanabilir ve seri üretime uygun yapısıyla hem maliyet hem de üretim verimliliği açısından büyük avantaj sunmaktadır. Ayrıca, rollform teknolojisi sayesinde profildeki karmaşık büküm geometrileri yüksek kalite ile elde edilebilmektedir.

Yapılan mühendislik analizleri ve yapısal değerlendirmeler sonucunda, önerilen yeni direk modelinin yatma ve eğilme direnci açısından geleneksel bağ direklerine göre daha yüksek performans gösterdiği tespit edilmiştir. T ve Y tipi kafes sistemleri ile uyumlu olacak şekilde geliştirilen bu direk, açık alanlarda, sert iklim koşullarında ve eğimli arazilerde bağ sisteminin uzun ömürlü ve dayanıklı şekilde ayakta kalmasına katkı sağlamaktadır. Kullanılan galvanizli çelik yapı, korozyona karşı dayanımı artırarak sistemin dış ortam koşullarına karşı uzun süreli koruma sunmasına olanak tanımaktadır.

Sonuç olarak, bu yeni bağ direği tasarımı, mevcut uygulamalarda görülen yapısal zayıflıkları ortadan kaldırmayı hedefleyen, rollform hattında üretilebilen, montajı kolay, yükseklik ayarlanabilir, uzun ömürlü ve saha koşullarına uygun bir çözüm olarak modern bağcılık sistemlerine katkı sağlayacak niteliktedir.

ABSTRACT

The problems posed by global climate change mean that the problems caused by regional climate change are becoming even more prominent. While agricultural land and water resources are directly affected, both pollution and salinization problems are reaching the highest levels. Salinity, to which plants in agriculture are most exposed, is one of the most important abiotic stress problems. This problem significantly reduces yield in agricultural production and deteriorates quality.

In this study, salicylic acid (SA) and proline (P) doses (K= pure water, SA=1.5 mM, P= 0.5 mM) were applied to spinach (Spinacia oleracea L.) plants grown under stress conditions caused by different salinity of irrigation water (0.58 dS/m, 1dS/m, 3dS/m, 7dS/m and 10 dS/m) together with the control (K). For this purpose, the changes in some leaf morphological characteristics of spinach plants were investigated. In the study, the number of leaves increased with increasing salinity. However, the application of proline from growth regulators increased the number of leaves, while the application of salicylic acid decreased it. Apart from this, morphological characteristics decreased with increasing salinity, except at a salinity of 1dS/m. While the highest plant height was observed at a salinity of 1dS/m when salicylic acid was applied, the lowest plant height was observed at a salinity of 10dS/m in the control.

As a result, salinity stress is quite effective in altering leaf morphology. When this change exceeds the threshold of the plants, the plants are negatively affected, while up to the threshold the plants are positively affected by this mild stress. Although growth regulators generally have a positive effect on plant growth and development, salicylic acid (1.5 mM) gave the best results, especially at low salinity. Therefore, growth regulators at appropriate doses in agricultural areas where stress conditions prevail and in plants exposed to stress are an important proposed solution for sustainable agricultural activities.

Keywords: abiotic stress, salinity, growth regulators, morphology, spinach

TUZ STRESİ ALTINDA YETİŞTİRİLEN ISPANAK BİTKİSİNDE *(SPİNACİA OLERACEA L.)* BÜYÜME DÜZENLEYİCİLERİN YAPRAK MORFOLOJİSİNE ETKİSİ

ÖZET

Küresel iklim değişiminin getirdiği sorunlar, bölgesel iklim değişikliğinden kaynaklanan sorunların daha şiddetli görülmesine sebep olmaktadır. Tarımsal alanlar ve su kaynakları doğrudan etkilenirken, hem kirlilik hem de tuzluluk sorunları en üst düzeye çıkmaktadır. Tarımda bitkilerin en çok maruz kaldığı tuzluluk en önemli abiyotik stres sorunları arasında yer almaktadır. Bu sorun tarımsal üretimde verimi önemli derecede düşürüken kaliteyi bozmaktadır.

Bu çalışmada, farklı sulama suyu tuzluluğu (0,58 dS/m, 1dS/m, 3dS/m, 7dS/m ve 10 dS/m) ile oluşturulan stres koşullarında yetiştirilen ıspanak *(Spinacia oleracea L.)* bitkisine, kontrol (K) ile birlikte salisilik asit (SA) ve prolin (P) dozları (K= saf su, SA=1,5 mM, P= 0,5 mM) uygulanmıştır. Bu amaçla; ıspanak bitkisine ait bazı yaprak morfolojik özelliklerindeki değişimler incelenmiştir. Çalışmada, yaprak sayısı artan tuzluluk düzeyi ile artış göstermiştir. Bununla beraber, büyüme düzenleyicilerden prolin uygulaması yaprak sayısını artırırken salisilik asit uygulaması azaltmıştır. Bunun dışında, morfolojik özellikler 1dS/m tuzluluk düzeyi hariç, tuzluluk seviyesi arttıkça azalmıştır. En yüksek bitki boyu 1dS/m tuzluluk düzeyindeki salisilik asit uygulamasında görülürken, en düşük bitki boyu 10dS/m tuzluluk düzeyindeki kontrol konusunda tespit edilmiştir.

Sonuç olarak, tuzluluk stresi yaprak morfolojisinin değişiminde oldukça etkilidir. Bu değişim bitkilerin eşik değerini aştığında, bitkiler olumsuz etkilenirken eşik değerine kadar bitkiler bu hafif stresten olumlu etkilenmektedir. Ayrıca büyüme düzenleyiciler, genel olarak bitkinin büyüme ve gelişiminde pozitif etki göstersede salisilik asit (1.5 mM) özellikle düşük tuzluluk koşullarında en iyi sonucu vermiştir. Bunun için, stress koşullarının yaşandığı tarımsal alanlarda ve strese maruz kalan bitkilerde uygun dozlarda kullanılacak büyüme düzenleyiciler, sürdürülebilir tarımsal faaliyetler açısından önemli bir çözüm önerisi olmaktadır.

ABSTRACT

This study investigated how improper storage and improper application of barn manure, which is very important for agriculture, affects agriculture and human health.

Traditional agricultural techniques, which began with mankind's transition from hunting and gathering to production, are still valid today. The most important of these is the use of the feces of the animals they feed as "barn manure".

Soil is constantly active because it contains microorganisms and is a source of nutrients for the plants growing on it. Microorganism activities are important for the organic matter content of the soil. Plant nutrients are constantly changing as long as agriculture is carried out or with the effect of rainfall and sunlight. For this reason, soil analysis results are very important for agricultural lands. In this context, barn manure is of great importance both in terms of the organic matter content of the soil and in completing the missing plant nutrients.

In land reclamation works, barn manure is the most effective and correct application method for small farmers to large farmers, from traditional agricultural techniques to organic agricultural practices. However, there are some points to be considered when storing and applying barn manure. If these conditions are not taken into account, barn manure becomes more harmful than beneficial.

This study evaluated how barn manure, instead of being left to rot properly until ready for use, is harmful to villagers and children when it is stored in piles in village squares; how leaving it to burn uncovered and applying it to the field while it is wet threatens the health of the people living in the village; and how wet applied barn manure damages the field from a sociological, health, economic and agricultural perspective.

Key words: Barn manure, Van region, Organic matter

AHIR GÜBRESİNİN YANLIŞ DEPOLANMASININ VE UYGULANMASININ OLUMSUZ ETKİLERİ

ÖZET

Bu çalışmada, tarım için çok önemli olan ahır gübresinin yanlış depolanmasının ve yanlış uygulanmasının tarımı ve insan sağlığını nasıl etkilediği araştırılmıştır.

İnsanoğlunun avcılık ve toplayıcılıktan üretime geçmesiyle başlayan geleneksel tarım teknikleri günümüzde hala geçerliliğini korumaktadır. Bunların en önemlisi de besledikleri hayvanların dışkılarının "ahır gübresi" olarak kullanılmasıdır.

Toprak, içerisinde barındırdığı mikroorganizmalar ve üzerinde yetişen bitkilere besin kaynağı olması sebebiyle sürekli aktiftir. Mikroorganizma faaliyetleri toprağın organik madde içeriği için önemlidir. Bitki besin maddeleri ise tarım yapıldığı sürece veya yağışlarla ve güneş ışınlarının etkisiyle sürekli değişkenlik gösterir. Bu sebeple toprak analiz sonuçları tarım arazileri için çok önemlidir. Bu bağlamda, hem toprağın organik madde içeriği açısından hem de eksik bitki besin maddelerinin tamamlanması açısından ahır gübresinin önemi büyüktür.

Arazi ıslah çalışmalarında, küçük çiftçiden büyük çiftçiye, geleneksel tarım tekniklerinden organik tarım uygulamalarına kadar ahır gübresi en etkili ve doğru uygulama şeklidir. Ancak ahır gübresinin depolanmasından uygulanmasında dikkat edilmesi gereken hususlar vardır. Eğer bu şartlar dikkate alınmazsa ahır gübresi faydadan ziyade zarara dönüşmektedir.

Bu çalışma ile ahır gübreleri kullanıma hazır hale gelene kadar doğru bir şekilde çürümeye bırakılmayıp, köy meydanlarında yığılmalar şeklinde depolanmasının hem köylüye, çocuklara nasıl zarar verdiği; üstü açık yanmaya bırakılmalarının, yaş iken tarlaya uygulamalarının hem köyde yaşayan insanların sağlığını nasıl tehdit ettiği, hemde yaş uygulanan ahır gübrelerinin tarlaya nasıl zarar verdiği sosyolojik, sağlık, ekonomik ve tarımsal açıdan değerlendirilmiştir.

Anahtar Kelimeler: Ahır gübresi, Van bölgesi, Organik madde

DETERMINATION OF HERBAGE YIELD AND QUALITY CHARACTERISTICS OF SOME SOYBEAN VARIETIES IN MAIN CROP CONDITIONS UNDER TOKAT CONDITIONS

ABSTRACT

This research was carried out to determine the herbage yield and quality characteristics of some soybean cultivars under main crop conditions in Tokat-Kazova conditions in the field of Tokat Gaziosmanpaşa University Agricultural Research and Application Centre between 2021-2022. The study was carried out according to the randomized complete block experimental design with three replications. Adasoy, Cinsoy Mersoy, Nazlıcan, Türksoy, Umut 2002, Yemsoy and Yeşilsoy soya varieties were used as plant material in the study. Soybean plants were harvested at the R6 stage (in one of the last four nodes on the main stem, the seed is filled in the pod and is green in colour). In the study, plant height, stem diameter, branch number, leaf ratio, forage yield, dry matter yield, crude protein content, crude protein yield, ADF and NDF contents were determined.

According to the results of the two-year research, it was determined that Adasoy and Yesilsoy varieties can be grown if high herbage yield is desired to be obtained from soya bean as a main crop in Tokat-Kazova conditions, and Umut 2002 and Mersoy varieties can be grown if quality herbage is desired to be obtained.

Keywords: Soybean, Variety, Hay Yield, Crude Protein Yield, ADF content, NDF content

TOKAT KOŞULLARINDA ANA ÜRÜN ŞARTLARINDA BAZI SOYA FASULYESİ ÇEŞİTLERİNİN OT VERİM VE KALİTE ÖZELLİKLERİNİN BELİRLENMESİ

ÖZET

Bu araştırma, Tokat-Kazova koşullarında ana ürün olarak bazı soya fasulyesi çeşitlerinin ot verimi ve kalite özelliklerini belirlemek amacıyla, Tokat Gaziosmanpaşa Üniversitesi Tarımsal Araştırma ve Uygulama Merkezi'nin arazisinde 2021-2022 yılları arasında yürütülmüştür. Çalışma Tesadüf Blokları Deneme Desenine göre üç tekerrürlü olarak yapılmıştır. Çalışmada bitki materyali olarak; Adasoy, Cinsoy Mersoy, Nazlıcan, Türksoy, Umut 2002, Yemsoy ve Yeşilsoy soya çeşitleri kullanılmıştır. Denemede biçimler soya fasulyesi çeşitleri R6 (ana sap üzerindeki son dört boğumdan birinde, tohumun bakla içinde dolgunlaştığı ve yeşil renkli olduğu evre) dönemine ulaştığında yapılmıştır. Araştırmada bitki boyu, sap kalınlığı, yan dal sayısı, yaprak oranı, yeşil ot verimi, kuru madde verimi, ham protein oranı, ham protein verimi, ADF ve NDF oranları tespit edilmiştir.

İki yıllık araştırma sonuçlarına göre, Tokat-Kazova koşullarında ana ürün olarak soya fasulyesinde yüksek ot verimi elde edilmek isteniyorsa Adasoy ve Yeşilsoy çeşitlerinin; kaliteli ot elde edilmek isteniyorsa da Umut 2002 ve Mersoy çeşitlerinin yetiştirilebileceği belirlenmiştir.

Anahtar Kelimeler: Soya Fasulyesi, Çeşit, Ot Verimi, Ham Protein Verimi, ADF Oranı, NDF Oranı

ASSESSMENT OF SOIL QUALITY IN VINEYARD AREAS USING A FUZZY LOGIC-BASED DECISION SUPPORT SYSTEM: A CASE STUDY FROM KIRŞEHİR

ABSTRACT

This study aims to evaluate the quality of soil samples collected from vineyard areas in the Kırşehir province through a fuzzy logic-based decision support system. The research utilized a dataset comprising 40 observations obtained from 20 distinct vineyards. Both physical (texture, lime content, organic matter, salinity, soil reaction) and chemical parameters (available phosphorus [P], extractable iron [Fe], manganese [Mn], copper [Cu], zinc [Zn], potassium [K], calcium [Ca], and magnesium [Mg]) were considered in the assessment of soil quality. The soils in the study area were found to be mildly alkaline (mean pH 8.12), with low organic matter content (mean 1.09%) and a high lime concentration (mean 16%). Additionally, the levels of available P, Ca, Mn and Zn were identified as insufficient. In the modelling phase, the input variables were fuzzified using triangular membership functions. The inference process was carried out using the Mamdani method, while the defuzzification stage employed the centroid method. The fuzzy rule base was constructed based on expert knowledge. The model produced a soil quality index for each observation, obtaining for the classification of vineyard areas according to their nutritional status. To assess the agreement between the model outputs and expert evaluations, the Kappa statistic was employed. All analyses were conducted in the MATLAB R2024b environment using the Fuzzy Logic Toolbox. The findings demonstrate that fuzzy logic offers a robust and effective decision support framework for monitoring and managing sustainable soil fertility in viticultural practices.

Keywords: Fuzzy Logic, Kırşehir, Soil Quality, Vineyard.

BULANIK MANTIK TABANLI KARAR DESTEK SİSTEMİ İLE BAĞ ALANLARINDA TOPRAK KALİTESİNİN DEĞERLENDİRMESİ: KIRŞEHİR ÖRNEĞİ

ÖZET

Bu çalışmada, bulanık mantık tabanlı karar destek sistemi ile Kırşehir ilindeki bağ alanlarından alınan toprak örneklerine ilişkin kalite değerlendirilmesi amaçlanmıştır. Araştırma kapsamında, 20 farklı üzüm bağına ait toplam 40 gözlemden oluşan veri seti kullanılmıştır. Toprak kalitesinin değerlendirilmesine yönelik fiziksel (tekstür, kireç, organik madde, tuzluluk, toprak reaksiyonu) ve kimyasal (yarayışlı fosfor (P), alınabilir demir (Fe), mangan (Mn), bakır (Cu), çinko (Zn), potasyum (K), kalsiyum (Ca), magnezyum (Mg)) parametreler ele alınmıştır. Hafif alkalin (ortalama pH 8.12) olan alan topraklarının organik madde içeriğinin düşük (ortalama %1.09) ve fazla kireçli (ortalama %16) olduğu, yarayışlı P, alınabilir Ca, Mn ve Zn düzeylerinin düşük seviyede olduğu bulunmuştur. Modelleme sürecinde; bulanıklaştırma aşamasında sistem girdileri üçgen üyelik fonksiyonları ile bulanıklaştırılmış, çıkarım aşamasında Mamdani yöntemi uygulanmış ve durulaştırma centroid yöntemiyle gerçekleştirilmiştir. Bulanık kural tabanı uzman bilgisine dayalı oluşturulmuştur. Model çıktısında her gözlem için toprak kalite indeksleri elde edilerek, bağ alanlarının beslenme durumlarına ilişkin kalite sınıfları elde edilmiştir. Model çıktılarının uzman görüşleri ile tutarlılığını test etmek amacıyla Kappa istatistiği kullanılmıştır. Analizler MATLAB R 2024b (Matrix Laboratory) ortamında bulanık mantık araç kutusu (Fuzzy Logic Tool Box) kullanılarak analiz edilmiştir. Sonuçlar, bulanık mantığın, bağcılıkta sürdürülebilir toprak verimliliğinin izlenmesi ve yönetiminde etkili bir karar destek aracı olarak kullanılabileceğini göstermektedir.

Anahtar Kelimeler: Bulanık Mantık, Kırşehir, Toprak Kalitesi, Üzüm Bağı.

ANALYSIS OF MILK MARKETING PREFERENCES OF DAIRY CATTLE PRODUCERS IN VAN PROVINCE BY ANALYTICAL HIERARCHY PROCESS*

ABSTRACT

This study aims at determining the marketing preferences of dairy cattle producers of the raw milk in Van Province. The main material of the study is the original data collected from the Tuşba, Muradiye and Gevaş districts of Van by the questionnaire for the production period of 2019 from 178 dairy cattle producers. The sampling volume was determined using proportional sampling method. The Analytical Hierarchy Process (AHP) was used in determining the priorities for producers' milk marketing preferences. AHP model was developed by Saaty in 1977, which is generally used for solving decision-making problems. Descriptive statistics were also used for some variables.

Descriptive statistics revealed that the average age, average dairy cattle experience period, average number of cows, and average share of dairy cattle in total income were 47.33 years, 25.92 years, 8.33 heads and 59.63%, respectively. The average annual milk production per farm was 8910 kg. The Analytical Hierarchy Process analyses showed that in terms of the raw milk marketing preferences of the producers, the quality production was the most preferred criterion by the majority of the producers (0.51) followed by the reasonable price (0.25) and high quantity production (0.23) criteria. On the other hand, as regards of all criteria, it was determined that national firms were preferred the most (0.36), followed by local dairy firms (0.28), union or cooperative firms (0.25) and street dairy sellers (0.11), respectively. Our impression during the survey was that the producers sold the milk mainly to national firms because they received the sale price in cash or in a very short term. Therefore, we suggest that

the confidence to the local firms boosted among the producers so that the milk sales could be increased to local firms and thus contribute to the economic development of the region.

Keywords: AHP, Marketing, Dairy cattle farms, Milk, Van.

VAN İLİNDEKİ SÜT SIĞIRCILIĞI İŞLETMELERİNİN SÜT PAZARLAMA TERCİHLERİNİN ANALİTİK HİYERARŞİ SÜRECİ İLE ANALİZİ*

ÖZET

Bu çalışmanın amacı, Van ilinde bulunan süt sığırcılığı işletmelerinin ürettikleri çiğ sütü pazarlama tercihlerinin belirlenmesidir. Araştırmanın ana materyalini, Van ilinde süt sığırcılığı işletmelerinin yoğun olarak bulunduğu Tuşba, Muradiye ve Gevaş ilçelerinden oransal örnekleme yöntemiyle belirlenmiş 2019 yılı üretim dönemine ilişkin olarak 178 süt sığırcılığı işletmesinden anket yöntemiyle toplanan orijinal veriler oluşturmaktadır. Çiftçilerin süt pazarlama tercihlerine yönelik önceliklerin belirlenmesinde, 1977'de Saaty tarafından bir model olarak geliştirilerek karar verme problemlerinin çözümünde kullanılan Analitik Hiyerarşi Süreci'nden (AHP) yararlanılmıştır. Yanı sıra, çiftçi ve işletmelere ait bazı tanımlayıcı istatistiklerin belirlenmesinde oran ve ortalamalardan yararlanılmıştır.

Araştırmada üreticilerin ortalama yaşının 47.33, ortalama süt sığırcılığı deneyim süresinin 25.92 yıl, ortalama inek sayısının 8.33 baş, toplam gelirleri içinde süt sığırcılığının payının ortalama %59.63 olduğu belirlenmiştir. İşletme başına yıllık süt üretimi ortalama 8910 kg olarak hesaplanmıştır. AHP analiz sonuçlarına göre; çiftçilerin çiğ süt pazarlama tercihleri bakımından kriterler incelendiğinde, kaliteli üretimin çiftçilerin büyük bir çoğunluğu tarafından en çok tercih edilen kriter olduğu (0.51), bunu uygun fiyat (0.25) ve yüksek miktarda üretim (0.23) kriterlerinin izlediği belirlenmiştir. Tüm kriterler açısından çiftçilerin süt pazarlama tercihleri analiz edildiğinde, en çok ulusal firmaların tercih edildiği (0.36) bunu sırasıyla yerel mandıra (0.28), birlik veya kooperatif (0.25) ve sokak sütçüsünün (0.11) takip ettiği tespit edilmiştir. Saha çalışması sırasında edinilen izlenime göre yöre çiftçilerinin süt satışı için ulusal firmaları tercih etmelerinin sebebi süt satış bedellerini peşin veya çok kısa vadede alabiliyor olmalarıdır. Eğer, çiftçilerin yöredeki yerel firmalara olan güveni arttırılabilirse yörede üretilen sütün yine yörede değerlendirilmesi ve böylelikle araştırma yöresinin ekonomik açıdan gelişmesine katkı sağlanabilir.

Anahtar Kelimeler: AHP, Pazarlama, Süt sığırcılığı, Süt, Van.

***:** Bu bildiri Van Yüzüncü Yıl Üniversitesi BAP birimi tarafından desteklenen FBA-2018-6414 nolu projeden türetilmiştir.

FALL ARMYWORM (*SPODOPTERA FRUGIPERDA*) IN CENTRAL ASIA: AN EMERGING THREAT

ABSTRACT

The fall armyworm (*Spodoptera frugiperda*) is an invasive and highly destructive pest insect, native to the tropical and subtropical regions of the Americas. It has a wide host range, feeding on over 80 plant species including economically important crops such as maize, rice, sorghum, millet, sugarcane, cotton, and a variety of vegetables. Due to its high mobility and rapid reproductive cycle, *S. frugiperda* has demonstrated a remarkable capacity for global spread, with recent expansion into South and Central Asian countries.

In Central Asia, the fall armyworm was observed for the first time in 2021 from maize fields in Northern Kyrgyzstan. This detection marked not only its initial occurrence in the Kyrgyz Republic but also in the entire Central Asian region. Field surveys were conducted to assess the pest's distribution and infestation intensity. In each field, 100 maize plants were inspected, and high infestation rates were observed, indicating the pest's strong establishment potential under local agro-climatic conditions.

To further monitor the population dynamics of *S. frugiperda*, pheromone traps were installed during the 2024 summer season at three separate maize-growing localities in Chuy Province. The monitoring revealed two distinct population peaks, which suggest multiple generations per growing season. These findings highlight the urgent need for integrated pest management strategies in the region.

Given the pest's capacity for rapid spread and its significant economic impact, *S. frugiperda* poses a major threat to agriculture in Central Asia. Immediate attention is required to mitigate crop losses and develop region-specific monitoring and control programs.

Keywords: *Spodoptera frugiperda*, Maize, Kyrgyzstan

MISIR ÇİZGİLİ YAPRAK KURDU (*SPODOPTERA FRUGİPERDA*) ORTA ASYA'DA YENİ BİR TEHDİT

ÖZET

Mısır çizgili yaprak kurdu (*Spodoptera frugiperda*), Amerika kıtasının tropikal ve subtropikal bölgelerine özgü, istilacı ve son derece yıkıcı bir zararlıdır. Mısır, pirinç, sorgum, darı, şeker kamışı, pamuk ve çeşitli sebzeler gibi ekonomik açıdan önemli bitkiler de dahil olmak üzere 80'den fazla bitki türüyle beslenebilmektedir. Yüksek hareket kabiliyeti ve hızlı üreme döngüsü sayesinde *S. frugiperda*, son yıllarda Güney ve Orta Asya ülkelerine kadar yayılarak küresel ölçekte dikkat çekici bir yayılma yeteneği sergilemiştir.

Orta Asya'da mısır çizgili yaprak kurdu ilk kez 2021 yılında Kırgızistan'ın kuzeyindeki mısır tarlalarında gözlemlenmiştir. Bu durum yalnızca Kırgızistan'da değil, tüm Orta Asya bölgesinde bu zararlının ilk tespiti olmuştur. Zararlının yayılışı ve bulaşma yoğunluğunu belirlemek amacıyla yapılan arazi taramalarında her bir tarlada 100 mısır bitkisi incelenmiş ve yüksek bulaşma oranları kaydedilmiştir. Bu durum, zararlının yerel iklim koşullarında güçlü bir şekilde yerleşme potansiyeline sahip olduğunu göstermektedir.

S. frugiperda'nın popülasyon dalgalanmasını izlemek amacıyla 2024 yaz döneminde Çüy Bölgesi'nde üç farklı mısır tarlasına feromon tuzakları yerleştirilmiştir. Popülasyon takibi çalışmaları, zararlının sezon boyunca iki belirgin popülasyon zirvesine sahip olduğunu ortaya koymuştur. Bu durum, bölgede birden fazla neslin geliştiğini göstermekte ve entegre zararlı yönetimi stratejilerinin acilen uygulanması gerektiğine işaret etmektedir.

Hızlı yayılma kapasitesi ve ciddi ekonomik etkisi göz önüne alındığında, *S. frugiperda* Orta Asya tarımı için büyük bir tehdit oluşturmaktadır. Ürün kayıplarını en aza indirmek ve bölgeye özgü mücadele programları geliştirmek için acil önlemler alınması gerekmektedir.

Anahtar Kelimeler: *Spodoptera frugiperda*, Mısır, Kırgızistan

SPATIAL ANALYSIS OF KONYA – CİHANBEYLİ LIVESTOCK ENTERPRISES AND DETERMINATION OF ENVIRONMENTAL POLLUTION POTENTIAL

ABSTRACT

In recent years, the rapid growth of the global population has necessitated an increase in agricultural production efficiency to ensure adequate and balanced nutrition. However, intensive agricultural practices aimed at boosting yield have led to significant environmental pollution. The increasing impacts of climate change have further intensified pressure on natural resources. In particular, the uncontrolled storage of wastes generated by livestock farms poses a serious pollution threat to the natural environment, especially to water resources.This study aims to evaluate the spatial distribution and characteristics of livestock enterprises in the Cihanbeyli district of Konya Province and to assess their potential contributions to environmental pollution, with a specific focus on nitrate contamination. A structured questionnaire was administered to 144 livestock enterprises identified within the study area. To determine the extent of environmental pollution associated with livestock farming, annual average nitrate concentrations measured in groundwater wells were obtained from the Department of Agricultural Environment and Natural Resources Protection under the General Directorate of Agricultural Reform, Ministry of Agriculture and Forestry of the Republic of Türkiye. Based on the collected data, the relationship between livestock activities and pollution was analyzed with respect to soil structure, topography, climate, and water resources. For the purpose of consistent field analysis and accurate interpretation of data, the study area was divided into three regions—Gölyazı, Karabağ, and Taşpınar—based on selected distinguishing features.Findings revealed that none of the livestock enterprises in the study area employed any formal waste management systems. Although the annual average nitrate concentration in groundwater generally remained below the threshold value of 50 mg/L, seasonal fluctuations—especially those influenced by rainfall and irrigation practices—may lead to increased levels. This highlights the urgent need for the implementation of effective waste management practices, particularly for livestock-origin waste, in order to protect environmental quality.As an outcome of this study, a waste management system model was proposed as an alternative solution to mitigate environmental damage caused by livestock enterprises in the region. Furthermore, it is recommended that producers in the area be introduced to the *Nitrate Pollution Control Regulation* (Resmi Gazete, No. 29779, dated 23.07.2016) and the *Code of Good*

Agricultural Practices (Resmi Gazete, No. 29976, dated 11.02.2017) through targeted training programs, where correct implementation methods can be demonstrated. These efforts will contribute significantly to the sustainability of both livestock production and environmental health in the region.

KONYA – CİHANBEYLİ HAYVANCILIK İŞLETMELERİNİN MEKÂNSAL ANALİZİ VE ÇEVRE KİRLİLİĞİ POTANSİYELİNİN DEĞERLENDİRİLMESİ

ÖZET

Günümüzde, dünya nüfusunun hızla artmasına bağlı olarak nüfusun dengeli ve yeterli beslenebilmesi için tarım sektöründe de üretimde verim artışı zorunlu hale gelmiştir. Verim artışı için yapılan yoğun uygulamalar sonucunda çevre kirliliği oluşmaktadır. İklim değişikliğinin günümüzde iyice hissedilir bir hal alan olumsuz etkileri ile birlikte doğal kaynaklar üzerindeki baskı iyice artmıştır. Özellikle hayvancılık işletmelerindeki ortaya çıkan atıkların kontrolsüz koşullarda depolanması, başta su kaynakları olmak üzere doğal çevre için ciddi bir kirletici yük oluşturmaktadır. Bu çalışmada, Konya İli Cihanbeyli ilçesindeki hayvancılık işletmelerinin, araştırma alanı üzerindeki konum özelliklerinin değerlendirilmesi ve bu işletmelerin özellikle nitrat kaynaklı çevre kirliliğine olan etkilerinin belirlenmesi amaçlanmıştır. Araştırma alanında belirlenen 144 adet hayvancılık işletmesinde öncelikle anket çalışması yürütülmüştür. Araştırma alanında hayvancılıktan kaynaklanan çevre kirliliği potansiyelinin belirlenebilmesi için, T.C. Tarım ve Orman Bakanlığı Tarım Reformu Genel Müdürlüğü Tarımsal Çevre ve Doğal Kaynakları Koruma Daire Başkanlığı'ndan alanda bulunan kuyulardan ölçülen nitrat seviyelerine ilişkin yıllık ortalama değerler temin edilmiştir. Elde edilen veriler yardımıyla hayvancılık işletmelerinin toprak, topoğrafya, iklimsel ve su kaynakları bakımlarından kirlenmeye etkileri belirlenmeye çalışılmıştır. Elde edilen verilerin doğru yorumlanabilmesi ve arazi çalışmalarının homojen yürütülebilmesi için araştırma alanındaki işletmeler, belirlenen bazı özellikleri bakımından Gölyazı, Karabağ ve Taşpınar olmak üzere üç gruba ayrılmıştır. Araştırma alanındaki işletmelerin tamamında herhangi bir atık yönetim sistemi mevcut değildir. Araştırma alanı çevresindeki kuyulardan alınan nitrat seviyelerine ilişkin verilerin yıllık ortalama değer olarak 50 mg/L'nin altında kaldığı ancak bu seviyelerin yılın farklı dönemlerinde, yağışa ve suların sulamada kullanılmasına bağlı olarak daha yüksek seviyelere erişebileceği düşünülmektedir. Bu durum, bölgede özellikle de hayvansal kaynaklı atık yönetiminin büyük bir hassasiyetle uygulanması gerektiğini göstermektedir. Araştırma sonucunda, bölgedeki hayvancılık işletmeleri için çevreye verilen zararı en aza indirgeyecek biçimde atık yönetim sistemi modeli bir alternatif uygulama olarak sunulmuştur. Nitrat Yönetmeliği (23.07.2016 tarihli ve 29779 sayılı T.C. Resmî Gazete) ve İyi Tarım Uygulamaları Kodu (11.02.2017 tarihli ve 29976 sayılı T.C. Resmî Gazete), bölgedeki hayvancılık işletmelerine verilecek eğitimlerle tanıtılmalı, doğru uygulamalar üreticilere gösterilmelidir. Bu çalışmalarla, araştırma alanında gerek hayvancılık işletmelerinin gerekse sağlıklı bir çevrenin sürdürülebilirliği için önemli bir adım atılmış olacaktır.

Anahtar Kelimeler: Mekânsal analiz, Nitrat, Çevre kirliliği, Hayvancılık, Atık yönetimi

NOUVEAUX CATALYSEURS STABLES ET RÉGÉNÉRABLES À BASE DE SCHİSTES BİTUMİNEUX MAROCAİNS POUR LA RÉACTİON DE PROTECTİON DES ALDÉHYDES

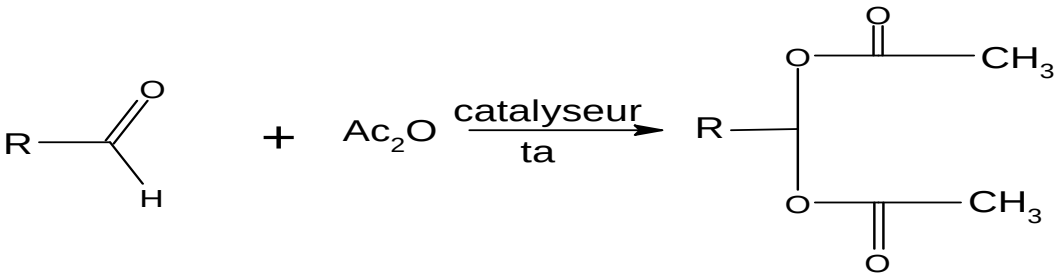
ABSTRACT

La protection des groupes carbonyles joue un rôle important dans la synthèse organique multi-étapes des produits naturels complexes. La protection des aldéhydes sous forme d'acylals, d'acétals ou de dithioacétals est l'une des transformations plus importantes au cours de la synthèse multi-étapes. De nombreuses méthodes sont disponibles pour la synthèse de 1,1-diacétates à partir d'aldéhydes et d'anhydride acétique. Bien que certaines de ces méthodes offrent un rendement plus élevé de diacétates correspondants, la majorité souffre d'un ou plusieurs inconvénients tels que des conditions acides dures, de longs temps de réaction, le besoin d'un catalyseur coûteux et une quantité stœchiométrique ou excessive de réactifs [1].

Dans ce travail, nous avons élaboré un nouveau catalyseur hétérogène, stable et régénérable à base de schiste bitumineux (**SB**) et nous l'avons utilisé dans la protection des aldéhydes aromatiques par l'anhydride acétique (schéma).



Mots clés : Schiste bitumineux, aldéhydes, amines , matériau stable, catalyse hétérogène.

ABSTRACT

Earthworms play an essential role in terrestrial ecosystems, enhancing soil structure and fertility while serving as indicators of environmental health. In 2024, a study was conducted to assess their diversity and distribution in the western Algerian region, focusing on two locations: Beni saf (S1), an agricultural area, and Keroum (S2), an orchard zone. Sampling in May used 40x40 cm squares with a depth of 30 cm for manual collection, alongside soil physico-chemical analysis. Results showed a pH of 7.2 and conductivity of 1500 µS/cm in S1, while S2 had a pH of 8.6 and conductivity of 830 µS/cm. Both stations exhibited low moisture, below 17%, indicating arid conditions. At S1, 18 juveniles, 12 sub-adults, and 9 adults were recorded, with average sizes of 2.9 ± 0.8 cm, 4.7 ± 0.5 cm, and 6.3 ± 1.7 cm. At S2, 6 juveniles, 4 sub-adults, and 3 adults were identified, with average sizes of 2.1 ± 0.7 cm, 3.9 ± 0.4 cm, and 5.9 ± 1.4 cm. Juvenile density was 40.5 ± 29.5 ind/m² in S1 and 16.2 ± 3.7 ind/m² in S2, with sub-adult density at 30.1 ± 18.2 ind/m² in S1 and 7.5 ± 1.2 ind/m² in S2, while adult density was 34.5 ± 16.2 ind/m² in S1 and 6.0 ± 0.6 ind/m² in S2. Biomass measurements showed juvenile values of 5.6 ± 4.1 g/m² for S1 and 1.5 ± 0.4 g/m² for S2, sub-adults at 24.8 ± 8.5 g/m² in S1 and 1.4 ± 0.3 g/m² in S2, and adults at 24.8 ± 8.5 g/m² in S1 and 3.1 ± 1.1 g/m² in S2. These findings revealed notable differences in soil properties and earthworm populations between the stations. Species identified included Apporectodea trapezoides (anecic), Apporectodea rosea (epigeic), and an unidentified Amynthas species, emphasizing the need for further taxonomic research on their ecological roles and contributions to soil fertility.

Keywords: Temouchent, earthworms, distribution, *Apporectodea rosea*, *Apporectodea trapezoids.*

RELATIONSHIP BETWEEN ORGANIC FOOD CONSUMPTION AND ATTENTION PERFORMANCE IN A SAMPLE OF MOROCCAN PRIMARY SCHOOL STUDENTS FROM KHEMISSET

Mohcin Elkhatir, Ismail Louragli, Abdechahid Loukili, Youssef Aboussaleh

ABSTRACT

In last decades, as in other countries, Moroccan diet have known great changes involving foods artificial foods and fast food. This study aims to systematically assess associations between organic food consumption and cognition in sample of school children.

The study sample included data of 210 school students aging 10–13 years-old, from three elementary school cohorts. We measured all consumed foods including main meals, biscuits, chemicals and life styles. The measured cognitive domains were attention memory (d2R test) and working (N-Back task). We used two statistical approaches to assess associations between organic foods and child cognition: the exposome-wide association study (ExWAS) considering each consumed food independently, and the deletion-substitution-addition algorithm (DSA) considering all exposures simultaneously to build a general model. The results show that child organic food intake was associated with higher fluid intelligence (attention) scores (beta = 1.18; 95% CI = 0.50, 1.87) and higher working memory (N-Back) scores (0.23; 0.05, 0.41), and child fast food intake (−1.25; −2.10, −0.40) was associated with lower attention and memory scores. However, the rural origin that reflect high physical activity.

This first comprehensive study of childhood nutrition risk factors suggests that unfavourable child diet, including low organic food consumption adversely and cross-sectionally associate with cognitive function. Unexpected associations were also observed and maybe due to confounding and reverse causality.

Key words: organic food, cognitive function, d2R test, adolescents, Morocco.

PRODUCTIVE AND EFFECTIVELY SUSTAINABLE AGRICULTURE THROUGH AI

ABSTRACT

Artificial Intelligence (AI) is revolutionizing agriculture by offering innovative solutions to enhance productivity, sustainability, and efficiency. AI-driven technologies such as machine learning, computer vision, and robotics are being increasingly integrated into agricultural practices to tackle challenges such as climate change, resource scarcity, and labor shortages. Key applications include precision farming, where AI analyzes soil conditions, weather patterns, and crop health to optimize irrigation, fertilization, and pest control. AI-powered drones and sensors enable real-time monitoring of crops, ensuring timely interventions to improve yields and reduce environmental impact. Autonomous machinery, such as harvesters and tractors, is improving labor efficiency while reducing operational costs. Additionally, AI-based decision support systems are empowering farmers with predictive analytics to make data-driven decisions, improving crop management and reducing waste. Overall, AI is driving the transformation of agriculture into a more data-centric, efficient, and sustainable industry, with the potential to meet the growing global food demand while minimizing environmental footprints.

Artificial Intelligence (AI) is revolutionizing agriculture by introducing advanced technologies that enhance productivity, sustainability, and efficiency across various farming practices. Recent developments have demonstrated AI's potential in transforming traditional agricultural methods. This paper will highlight the methods to achieve the AI based precision farming and crop management, automated irrigation systems, agricultural robotics, disease and pest

detection, livestock monitoring, supply chain optimization, climate change mitigation and decision support systems.

ABSTRACT

Chia (Salvia hispanica) is annual herbaceous plant belongs to the Lamiacae family, it is a biannually plant; it is considered a pseudo-cereal that has purple and white flowers ending in ting oval seeds ranging in size varying from 1 to 2 mm, it contains a significant amount of vitamins, minerals, protein, fiber and antioxidants . This type of seed is also a good source of omega-3 (α-linolenic acid), which makes it beneficial in a healthy human diet. Its benefits also include lowering blood cholesterol, triglycerides and prevention from diabetes and anti-cancer properties

this plant is gaining attention as a vital component of the world's food and nutrition security.

The introduction of new crops with high nutritional value into Morocco agriculture sustainable could help to combat food and nutritional insecurity, in order to maximize productivity, it is

crucial to determine the best dates for sowing by adjusting ontogenesis (the chronology of phenological stages) to the ideal environmental conditions.

Present study was carried out in rural commune Mnasra, Kenitra, Morocco. for examines chia's adaptability and tested for different sowing dates (from Mars to Mai): (12thMars, 02nd April ,23rd April,14th Mai and 28th Mai), and their effect on plant growth is evaluated. The results show a significant effect of sowing dates on plant phenology and yield. Photoperiod, temperature and wind speed are the main environmental factors explaining the variation in terms of crop growth and development between sowing dates. can be highly productive (above 1300-1500 kg ha-1) when sown between 14 and 28 May.

Keywords: Chia (Salvia hispanica)**,** sowing dates, plant phenology, harvests, Morocco agriculture sustainable.

ABSTRACT

Strawberries are widely celebrated for their flavor, yet consumers often report noticeable differences in taste quality. This study examines the key factors contributing to these variations, focusing on strawberry variety and ripeness. Initial findings highlight that sugar content, a critical determinant of sweetness, varies significantly between varieties. For instance, the Sabrina variety demonstrates higher sweetness levels, reaching up to 10.10% sugar content toward the end of the season, compared to the Fortuna variety, which typically does not exceed 9.14%. Harvest timing emerges as a significant factor influencing these differences. Additionally, ripeness affects other important quality traits such as acidity, texture, and aroma. As strawberries ripen, acidity and firmness progressively decline, while their aroma becomes most pronounced during the final stages of maturation. These insights enhance our understanding of the sensory characteristics of strawberries and underscore the importance of variety selection and ripeness in optimizing flavor quality.

Keywords:. Strawberries, variety, quality, sugar, acidity, sensory

Methodology

This study dives into the interplay between strawberry variety and ripeness in determining taste quality, with a particular focus on two widely cultivated varieties: Sabrina [1] and Fortuna [2]. The research aims to provide a detailed understanding of how these factors shape sensory characteristics and physicochemical properties, contributing to the overall flavor profile of strawberries. A total of five representative samples will be collected from farm-sourced strawberries and analyzed in the controlled environment of the Frulact company laboratory. To ensure data accuracy, only strawberries meeting specific criteria will be selected—fruits must be uniform in size, exhibit proper coloration indicative of maturity, and be free from deformities, bruises, or signs of disease.

The methodology integrates both sensory and physicochemical analyses to provide a holistic evaluation of taste quality. Sensory assessments will involve trained panelists evaluating visual appearance, aroma, and taste differences between the two varieties at varying stages of ripeness (ripe and partially ripe). These analyses will offer insights into how subjective perceptions of quality change with ripeness.

Physicochemical tests, on the other hand, will objectively quantify key quality indicators such as pH, sugar content (measured in degrees Brix), and firmness. In the laboratory, juice samples from the selected strawberries will be analyzed using advanced instruments. A pH meter will measure acidity levels, while a refractometer will determine sugar content, reflecting sweetness. Firmness, an indicator of texture and structural integrity, will be measured using a penetrometer, allowing the study to track how texture evolves during the ripening process.

To further enhance reliability, the study will control external factors such as storage conditions, temperature, and humidity. These controls aim to eliminate external variability, ensuring that the observed differences in taste quality are attributable solely to the variety and ripeness of the strawberries.

This approach offers a detailed analysis of strawberry flavor, emphasizing the importance of variety selection and harvesting practices. The findings aim to guide growers and producers in improving strawberry quality, with Figure 1 summarizing key factors linking sensory attributes to measurable properties.

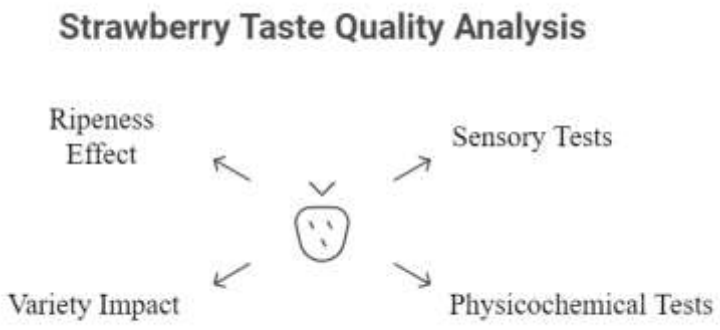

Figure 1. Factors Influencing Strawberry Taste Quality

ABSTRACT

The accumulation of trace metals in agricultural soils represents a serious environmental and public health concern, particularly in intensively cultivated areas. This study examines the extent of soil contamination, its spatial distribution, and the associated ecological and human health risks in the irrigated agricultural area of Beni Moussa, Morocco. A total of 67 surface soil samples were collected and analyzed for key physicochemical parameters, as well as for concentrations of cadmium (Cd), copper (Cu), lead (Pb), zinc (Zn), chromium (Cr), nickel (Ni), and arsenic (As), using ICP-AES and ICP-MS techniques.

To assess the severity of contamination, several indices were applied, including the geo-accumulation index (Igeo), enrichment factor (EF), contamination factor (CF), and pollution load index (PLI). The results show that 94.02% of the samples exhibit PLI values greater than 1, indicating substantial metal accumulation—particularly for Ni and As, which displayed the highest enrichment levels.

Ecological risk assessment (RI) suggests low to moderate potential risks, with contamination hotspots identified near Afourer, Sidi Jaber, and Ouled Ayyad. Human health risk analysis indicates that ingestion is the primary exposure pathway, with children being particularly vulnerable. While most elements present low non-carcinogenic risks (HI < 1), nickel may pose a concern for adults. Moreover, Cr, As, and Ni have potential carcinogenic effects, particularly in children.

These findings underscore the urgent need to implement sustainable soil management practices, regulate agrochemical inputs and wastewater reuse, and establish long-term monitoring programs. Further research is recommended to develop effective mitigation strategies aimed at preserving soil quality and minimizing exposure risks.

ABSTRACT

Microplastic (MP) pollution, primarily driven by human activities, has emerged as a growing global environmental concern. During agricultural practices, substantial amounts of plastic residues are left in the fields, which gradually break down into microplastics - plastic particles smaller than 5 mm in diameter. These MPs significantly alter the physicochemical properties of soil, affecting porosity, enzymatic and microbial activity, plant growth, and crop yield. Due to their widespread presence, large surface area, and hydrophobic nature, MPs also act as carriers for harmful substances such as plasticizers, polycyclic aromatic hydrocarbons (PAHs), antibiotics, and potentially toxic elements (PTEs). They can migrate deep into the soil, potentially contaminating groundwater. This review explores the adverse impacts of MPs on soil ecosystems, including microbial communities, enzyme functions, plant and animal health, and agricultural productivity, while offering insight into the broader environmental implications of MP contamination.

ABSTRACT

Environmental concerns and food safety challenges have prompted individuals to seek improved packaging alternatives. Conventional food packaging, although providing fundamental protection, has disadvantages such as being non-biodegradable and utilizing non-renewable resources. Intelligent packaging, enhanced by artificial intelligence, is the optimal option for augmenting the quality, sustainability, and safety of food products. The study seeks to explore ways AI can transform food packaging through real-time tracking, freshness detection, and supply chain tracing. The utilization of AI technologies such as deep learning and computer vision to evaluate food quality enables the quantification of food freshness through the assessment of color, texture, and microbial proliferation. The integration of IoT enhances the real-time surveillance of food goods within packaging materials. Blockchain technology guarantees customer responsibility via traceability and transparency. Moreover, features like QR codes on items and RFID chips enable shoppers to examine the products in depth, hence enhancing interaction. Nonetheless, substantial implementation costs, inadequate sensitivity of current sensors, and compliance-related concerns impede widespread use. In summary, integrating AI and smart packaging into the food sector may ensure food safety, extend food shelf life, and reduce food waste, all of which pave the way for the creation of a sustainable future. Research and development must be done to overcome current constraints in order to guarantee widespread use.

ABSTRACT

Potato *(Solanum tuberosum)* is the cash crop of Pakistan. After wheat, rice, and maize as high-yielding cash crops, potatoes have become popular in Pakistan. Potato production reached 7.94 million tons in 2022–2023 over an area of around 0.330 million hectares. The nation, which produces the ninth-most potatoes worldwide, has experienced a more than 35 percent increase in production over the previous three years, going from 5.87 million tons in 2020–21 to an expected 8.01 million tons in 2022–2023. This production level represents a 31.8 percent target exceeding a 1.9 percent growth over the previous year. Agriculture is produced under contract when a buyer and farm producer have a written agreement to that effect Credit facilities and marketing resources are the two factors that influence non-contract potato producers the most. 120 farmers will provide the information and data, which will be gathered on a primary basis. Using a straightforward random sampling procedure, 60 farmers will be chosen as contractors and 60 will be non-contractors and small land holders. The data will be analyzed using descriptive statistics of a Cobb Douglas production function. This study can aid in the formulation of decisions and policy initiatives in Multan City to benefit the city's contract farmers who grow potatoes.

ABSTRACT

Food waste is a growing global concern, with severe consequences on the environment, culture and economy. Efforts are required to minimize waste at source and promote food waste reduction behavior, which activate norms and values or reinforce the individual attitude for the prevention of resources loss. For this reason, empirical investigation is required to understand the psychological and psychographic factors, which may activate or reinforce norms and attitudes about food waste reduction intentions. In this study, data from 400 respondents collected from the university students of Multan city to look into how psychographic and psychological factors affect consumers' intentions and shape their behavior to use sustainable food waste management practices. Moreover, relationship between religious value, compassion, personal norms, egostic value, utilitarian value, environmental concern and moral attitude toward food waste reduction intentions are examined. To analyze the casual relationship among variables Structural equation modelling technique employed to analyze data. The finding of this study helped in the formulation of robust policy recommendations and initiatives with the goal of lowering waste of food in Pakistan.

Keywords: Food waste, Psychographic factors, Management practices, Consumer behavior, Religion, Pakistan

A SYNERGISTIC MODELING AND EXPERIMENTAL APPROACH FOR SELF-PROPELLED SEEDERS DESIGN

ABSTRACT

In the current era by increasing emphasis on sustainable agriculture and energy-efficient field operations, accurate estimation of draft force has become essential for the design and optimization of tillage and planting machinery, particularly self-propelled seeders. This study presents an integrated methodology that combines Discrete Element Method (DEM) simulations, ASABE-based theoretical modeling, and field validation to estimate draft force under various operational conditions. DEM simulations, employing the Hysteretic Spring contact model, revealed that the maximum normal force required to pull a single seeder unit reached approximately 2100 N, corresponding to a power requirement of around 3.7 hp for a five-row planter system (excluding frame load). Theoretical estimations based on ASABE standards, using data from three different implement types (A, B, and C) across operational depths of 2 to 5 cm, indicated a maximum draft power requirement of about 4.12 hp. Field experiments conducted using a dynamometer further validated these models, with measured draft force peaking at 4.3 hp for the five-seeder configuration. The DEM results showed close alignment with both theoretical and field data, although slight deviations were observed due to real-world factors such as soil moisture, field terrain, and border effects. These variations underscore the importance of empirical validation in draft force estimation. Overall, the strong correlation among DEM, theoretical, and experimental results confirms the robustness of the integrated approach, supporting the design of energy-efficient agricultural implements and advancing the precision and sustainability of modern farming systems.

Keywords: Draft force estimation, Discrete Element Method (DEM), ASABE standards, self-propelled seeder, precision agriculture.

THE FEASIBILITY STUDY OF REPLACING HALOXYLON WITH NITREBUSH IN DESERTIFICATION OPERATIONS

Mohammad Hossein Banakar*[1], Amir Parnian[1], Mohammad Javad Babaie Zarch[1], Rostam Yazdani Biuki[1]

[1] Faculty member, National Salinity Research Center, Agricultural Research, Education and Extension Organization, Yazd, Iran
* corresponding-author mh_banakar@yahoo.com

ABSTRACT

Haloxylon is a genus of small trees or shrubs with a thick trunk and many branches. This plant is one of the valuable plants resistant to drought stress, which grows mainly in sandy habitats to stop the wind picking up the sands and spreading them through the atmosphere. Although Haloxylon has a great value in desert areas to control soil erosion, the yellowing of the hills has been observed and the problem has been spread to a large extent. Therefore, it is necessary to investigate the possibility of replacing other suitable species that exist in Iran's natural resources, especially in desert areas, while maintaining and managing the restored areas in the future policies. One of these plants is Nitrebush (*Nitraria schoberi*), which is a halophyte shrub with a wide spread canopy. This may be important in the prevention of soil erosion. Nitrebush is mainly spread in the desert areas on the edge of the existing playas with high underground water table. Nitrebush is considered as a key species for salty desert areas, which create green cover in salty areas and provides the ground for stabilization the sands adjacent to salt marsh. Collecting the sands next to the branches of Nitrebush leads to the creation of roots from the stem that are in contact with the soil, and finally provides the basis for plant multiplication at the base of the bush. Due to its high tolerance to salt stress and high ability to produce new roots from the stems, they have the ability to spread on the soil surface and produce enough forage for livestock's. it also creates a suitable green space. In this research, the high salt tolerance of Nitrebush in the natural habitat was investigated and it was found that the lush and green plants of Nitrebush continued to grow at a salinity limit of 97 dS/m at a depth of 0-30 cm and a salinity limit of 35 dS/m at a depth of 60-90 cm. One of the limitations of Nitrebush is the low germination and establishment of seeds under salinity stress. To overcome this limitation, different methods of accelerating germination including cold, acid, wet and drying treatments were studied, among which the five times wet treatment and drying of the seeds before planting showed more germinated seeds and vigor seedlings.

ABSTRACT

Agriculture, being the mainstay of the economy, ensures the livelihood of millions of people in Pakistan. Punjab and Sindh are the major crop-producing provinces of Pakistan. Replacing cotton with other crops like sugarcane, maize and rice has increased over the last two decades in cotton-producing areas of these provinces. Many studies have explored the technical efficiency of the cotton growers. However, no one has explored the technical efficiency of the farms in multi-output systems. This research will evaluate the production efficiency of multi-output agricultural farms in cotton-growing areas of Pakistan by keeping in view the farm size. This study will use the Directional distance function (DDF) by employing the data collected under the RASTA project, namely: Impact of Major Agricultural Policies on Cotton Production in Pakistan. The possible outcome may find in which direction the small, medium, & large farms should lead them to enhance their efficiency. Furthermore, this research will help to enhance resource use efficiency (SGD 12: Responsible Production) and suggest policies to enhance farmers' livelihood (SDG 1: Zero Poverty).

Keywords: efficiency of the cotton growers, Directional distance function (DDF), (SGD 12: Responsible Production), (SDG 1: Zero Poverty)..

RESEARCH ON THE INFLUENCE OF FOLIAR CLEAN FERTILIZERS APPLIED TO MAIZE AND SUNFLOWERS UNDER CURRENT CLIMATE CHANGE CONDITIONS

ABSTRACT

Under current climate change conditions, with increasingly longer periods of soil drought and atmospheric heat, agricultural technologies must be adapted by using slow-absorbing liquid fertilizers. ADVAGREEN is a company based in Belgium, currently one of the major distributors of slow-release liquid nitrogen fertilizers, called Clean Fertilizer, certified in accordance with environmental protection regulations. In 2024, at the Agricultural Development Research Station of Braila, Romania, several clean fertilizers were tested, in different doses, on maize and sunflower, which proved an increase in production from 19.9% to 38.5% in maize, and from 5.9% to 17.7% in sunflower, compared to the standard fertilized control.

Keywords: drought; maize; sunflower; clean fertilizers; yield

IMPACT OF FARM SERVICES AND AGRONOMIC PRACTICES ON COTTON YIELD

Zainab Khan

ABSTRACT

Cotton, often referred to as 'white gold,' is a cornerstone of Pakistan's economy, contributing significantly to livelihoods and exports. Recently, cotton yields have dropped by factors such as climate change, pest infestations, outdated farming practices, poor seed quality, soil degradation, and competition from more profitable crops like sugarcane. This study will investigate the impact of farm services and modern agronomic practices on improving cotton yield and sustainability in Pakistan. Using a quantitative approach, data collected from farmers across Punjab, Sindh, and Baluchistan through a structured digital questionnaire. Propensity Score Matching (PSM) will be employed to compare farmers with and without access to farm services and advanced practices. Key variables include cotton yield, access to farm services (extension services, subsidies on fertilizers ,seed and on machinery, irrigation ,weather information) and adoption of agronomic practices (seed quality, fertilizers, pest control). The study aims to identify critical factors influencing productivity and sustainability, addressing gaps in existing research by focusing on the role of farm services and modern techniques. Findings are expected to inform policies and practices that enhance cotton yield, promote climate-resilient farming, and support rural development, ultimately contributing to Pakistan's sustainable agricultural growth.

ABSTRACT

The swift convergence of biotechnology and artificial intelligence (AI) yields transformative breakthroughs, but also introduces substantial risks to human health, environmental sustainability, and global security. The integration of AI in cutting-edge biotechnologies, such as gene editing and synthetic biology, poses distinct challenges, including unforeseen outcomes, biosecurity vulnerabilities, and complex ethical considerations. To navigate these intricacies, a comprehensive framework merging scientific expertise, policy guidance, and ethical principles is essential. By emphasizing proactive biorisk management, stakeholders can optimize the benefits of biotechnology and AI while minimizing adverse consequences, ultimately promoting sustainable development, public well-being, and responsible innovation. The article attempts to raise the conversation around biorisk leadership, highlighting its essential significance in ensuring breakthroughs in science, averting accidents, and reducing adverse environmental impacts. By taking a preventive strategy, scientists, politicians, policy makers, and stakeholders can reduce the potential biosecurity and biosafety risks, safeguard human well-being, advance animal welfare and environmental sustainability, ensure regulatory compliance, foster a culture of responsibility and ethical innovation, and increase public trust. We provide actionable recommendations for effective biorisk management using expert analysis, real-world examples, and evidence-based case studies, fostering open conversation and interdisciplinary collaboration among scientists, policymakers, industry leaders, and ethics experts. The audience will gain a better understanding of proactive biorisk management imperatives, as well as increased knowledge of emerging biorisks, practical insights for incorporating biorisk considerations into research design, and strategies for effective interdisciplinary collaboration to address complex challenges, and eventually encourage environmentally conscious innovation that is ethically sound and meets safety standards.

Keywords: Biotechnology, Artificial Intelligence, Biorisk Management, Biosecurity, Ethical Considerations, Public Engagement, Sustainable Development.

VALORIZATION OF A WHEY BY-PRODUCT AND RESEARCH INTO LACTIC ACID BACTERIA ISOLATED FROM WHEY

AMROUCHE Zoheir [1], El Hadi Djamel[2], Laribi Habchi Hassiba[2]

4- Biological Department, Faculty of Science of the nature and the life, University of Khemis Miliana -Algeria.
Zoheir.amrouche@yahoo.fr

5- Functional analysis of chemical process laboratory. Chemistry department, University of Blida 1-Algeria.

ABSTRACT

The rejection of whey, considered as a dairy by-product rich in nutrients, in the effluents constitutes an enormous economic loss. Summary this work aims at the valorization of whey in different fields. We carried out physic-chemical, microbiological and sensory analyzes to determine the quality of the finished product.

Lactic acid bacteria have acquired a great importance by their presence in the food industry and this for a long time.

The isolation of lactic acid strains from five whey samples from the ARIBBE dairy in the country of Ain-Defla, allowed us to obtain 05 Gram positive and catalase negative strains.

Lactic bacteria have been an effective means of bio-preservation of many food products for thousands of years, thanks to their metabolism. However, their role has extended to other sectors, such as the clinical environment thanks to their antimicrobial power.

Among the metabolites of lactic acid bacteria, antimicrobial substances called bacteriocins are effective and highly sought after antimicrobial bimolecular for various applications, thus making it possible to overcome resistance problems.

Keywords: whey, lactic acid bacteria, antimicrobial power.

EFFECTS OF DIFFERENT NITROGEN DOSES ON FORAGE YIELD AND YIELD COMPONENTS IN SWEET SORGHUM [*SORGHUM BICOLOR* VAR. *SACCHARATUM* (L.) MOENCH] GENOTYPES

ABSTRACT

The study aimed to determine the forage production potentials of different sweet sorghum genotypes under Bursa conditions as a second crop. The field experiments were conducted in Bursa Uludag University, Faculty of Agriculture, Agricultural Application and Research Center in 2020-2021. The experimental design was a randomized complete block with three replications. Three different sweet sorghum genotypes (Erdurmuş, Uzun varieties, and M81-E line) and four nitrogen doses (0, 75 125, 175 kg ha^{-1}) were used in this research. Some parameters such as plant height, stem diameter, leaf number, leaf and stem ratio, forage yield, and dry matter yield of sweet sorghum were investigated in the experiment. The three sweet sorghum genotypes studied showed varied range values between; plant height 262-288 cm, stem diameter 19.2-24.8 mm, leaf ratio 11.5%-14.4%, stem ratio 85.6%-88.5%, forage yield 28.6-56.2 t ha^{-1}, and dry matter yield 7.8-15.7 t ha^{-1} respectively. According to the research results obtained in the second crop conditions; it can be recommended to grow the M81-E genotype using a nitrogen dose of 175 kg ha^{-1} in terms of high forage and dry matter yields.

Keywords: Sweet Sorghum, Forage Yield, Nitrogen Doses

FARKLI AZOT DOZLARININ ŞEKER SORGUM [*SORGHUM BICOLOR* VAR. *SACCHARATUM* (L.) MOENCH] GENOTİPLERİNDE YEM VERİMİ VE VERİM KOMPONENTLERİ ÜZERİNDEKİ ETKİLERİ

ÖZET

Bu çalışma, Bursa ekolojik koşullarında ikinci ürün olarak yetiştirilen farklı şeker sorgum genotiplerinde yem bitkisi üretim potansiyellerinin belirlenmesi amacıyla yürütülmüştür. Tarla denemeleri Bursa Uludağ Üniversitesi Ziraat Fakültesi Tarımsal Uygulama ve Araştırma Merkezi'nde 2020-2021 yıllarında, tesadüf blokları deneme desenine göre üç tekerrürlü olarak yürütülmüştür. Çalışmada üç farklı şeker sorgum genotipi (Erdurmuş, Uzun ve M81-E) ve dört farklı azot dozu (0, 75 125, 175 kg ha^{-1}) kullanılmıştır. Araştırmada bitki boyu, sap çapı, yaprak oranı, sap oranı, yeşil ot ve kuru ot verim parametreleri incelenmiştir. İncelenen üç farklı şeker sorgum genotipinde; bitki boyu 262-288 cm, gövde çapı 19.2-24.8 mm, yaprak oranı %11.5-14.4, sap oranı 85.6-88.5 mm, yeşil ot verimi 28.6-56.2 t ha^{-1} ve kuru ot verimi 7.8-15.7 t ha^{-1} arasında değişmiştir. İkinci ürün koşullarında elde edilen araştırma sonuçlarına göre; yeşil ot ve kuru ot verimlerinin yüksek olması açısından M81-E genotipinin 175 kg ha^{-1} azot dozu kullanılarak yetiştirilmesi önerilebilir.

Anahtar Kelimeler: Şeker Sorgum, Yem Verimi, Azot Dozları

PROMOTING SUSTAINABLE AGRICULTURE PRACTICES THROUGH WHEAT-PEA INTERCROPPING: DETERMINING IDEAL RATIOS AND HARVEST STAGES FOR ENHANCED YIELD

ABSTRACT

The present study investigated the agronomic performance of wheat (Triticum aestivum L.) and pea (Pisum sativum L.) under different seed mixture ratios and harvesting stages, aiming to determine optimal conditions for maximizing yield and supporting sustainable intercropping. The experiment involved five seed combinations (100% wheat, 75% wheat–25% pea, 50% wheat–50% pea, 25% wheat–75% pea, and 100% pea) and three harvesting stages (start of pea flowering, 50% pea flowering, and 100% pea flowering). Key parameters measured included plant height, green yield, and dry yield for both crops.

Results revealed significant effects ($p < 0.01$) of both seed ratio and harvest stage on most traits. The highest wheat green yield was recorded in 100% wheat at the second harvest (2992.7 kg/da), while maximum pea green yield was achieved in 100% pea plots at the first harvest (2565.6 kg/da). Dry matter accumulation increased with delayed harvesting, with peak wheat dry yield at 1129.2 kg/da (100% wheat, 3rd harvest) and maximum pea dry yield at 551.7 kg/da (100% pea, 1st harvest). The 50–50 mixture notably enhanced plant height in both species (wheat: 82.6 cm; pea: 143.5 cm), suggesting beneficial early vegetative interaction, though yield was generally reduced due to interspecific competition.

These findings suggest that wheat thrives with lower pea ratios, especially when harvested later, while pea benefits from higher mixture dominance and earlier harvest. Strategic management of crop ratio and timing can significantly improve biomass yields and intercropping efficiency.

Keywords: Wheat, pea, intercropping, harvest timing, forage yield

BUĞDAY-BEZELYE KARIŞIK EKİMİ İLE SÜRDÜRÜLEBİLİR TARIM UYGULAMALARI: YÜKSEK VERİM İÇİN İDEAL ORANLARIN VE HASAT ZAMANLARININ BELİRLENMESİ

ÖZET

Bu çalışma, buğday (*Triticum aestivum* L.) ve bezelye (*Pisum sativum* L.) bitkilerinin farklı karışım oranları ve hasat dönemlerine göre agronomik performansını inceleyerek, verimi maksimize eden ve sürdürülebilir tarımı destekleyen en uygun koşulları belirlemeyi amaçlamıştır. Denemede beş farklı karışım oranı (100% buğday, 75% buğday–25% bezelye, 50% buğday–50% bezelye, 25% buğday–75% bezelye, 100% bezelye) ve üç farklı hasat dönemi (bezelye çiçeklenmesinin başlangıcı, %50 çiçeklenme ve %100 çiçeklenme dönemleri) değerlendirilmiştir. Ölçülen özellikler bitki boyu, yeşil ve kuru ot verimidir.

Sonuçlar, hem karışım oranı hem de hasat döneminin çoğu parametre üzerinde anlamlı etkiye sahip olduğunu göstermiştir ($p < 0.01$). En yüksek buğday yeşil ot verimi, ikinci hasatta 100% buğday parsellerinde elde edilmiştir (2992.7 kg/da). En yüksek bezelye yeşil ot verimi ise ilk hasatta 100% bezelye parsellerinde kaydedilmiştir (2565.6 kg/da). Kuru ot verimi geç hasatlarda artmış, maksimum buğday kuru ot verimi 3. hasatta (1129.2 kg/da), en yüksek bezelye kuru ot verimi ise 1. hasatta (551.7 kg/da) gözlenmiştir. 50–50 karışım oranı, her iki türde de bitki boyunu artırmış (buğday: 82.6 cm; bezelye: 143.5 cm), ancak verimde genel bir düşüş yaşanmıştır; bu da türler arası rekabetin etkisini ortaya koymaktadır.

Sonuç olarak, buğday düşük bezelye oranlarında ve geç hasatla daha verimli olurken, bezelye yüksek karışım oranlarında ve erken hasatta daha yüksek verim göstermektedir. Buğday-bezelye karışım oranı ve hasat zamanının doğru yönetimi, verim ve sistemin sürdürülebilirliği açısından büyük önem taşımaktadır.

Anahtar Kelimeler: Buğday, bezelye, karışık ekim, hasat zamanı, ot verimi

DETERMINATION OF THE EFFECT OF AMINO ACID APPLICATION ON SOME MORPHOLOGICAL CHARACTERISTICS IN BEANS (*Phaseolus vulgaris* L.) APPLIED WITH DIFFERENT DOSES OF HERBICIDE

nkayan@ogu.edu.tr
ORCID NO: 0000-0001-7505-0959

ABSTRACT

Herbicide application is a method that can be easily applied and gives immediate results, and therefore is highly preferred by farmers. Amino acids provide resistance to stress conditions such as high temperature, low humidity, frost, insect damage, hail damage, and flooding. Herbicides are sometimes mistakenly applied in high doses by farmers. Reducing high-dose herbicide damage by applying amino acids is a method tried by farmers in recent years. The aim of this study was to investigate the effects of amino acid application on some morphological characteristics in beans due to treated with different doses of herbicide.

The experiment was designed as factorial arrangement in the randomized plots design with three replications in controlled conditions. The effect of three amino acid application [control (none amino acid) amino acid after 3 days and amino acid after 6 days] and 5 herbicide doses [control (recommended dosage), half the recommended dose, twice the recommended dose, three times the recommended dose and four times the recommended dose] were investigated.

Main branch diameter, seedling height, root length, leaf number and leaf area characteristics were examined in the study. The differences between amino acid treatments were statistically significant in all of the investigated charecters. Herbiside treatments and amino acid x herbicide treatments interactions were statistically significant only in root length charecter.

When the herbicide dose increases, decreases in values were observed in all of the characters. The lowest values were determined when four times the recommended dose was applied.

Plants were stressed with herbicide applications. No increase was detected in the main branch diameter and seedling length of the plants with the amino acid applied afterwards. However,

[2] Bu çalışma Fahreddin Ataman'ın Yüksek Lisans tez çalışmasının bir parçasıdır.

amino acid after 3 days application increased root length, leaf number and leaf area. Amino acid application has given positive results in these characters. Amino acid after 6 days application, no positive effect was observed in all of the investigated characteristics.

In the study, it was concluded that if an overdose occurs in herbicide use, the damage to the plants can be prevented to some extent by applying amino acids within 3 days without delay.

Key Words: Bean, herbicide, amino acid, morphological characters

FARKLI DOZLARDA HERBİSİT UYGULANMIŞ FASULYE (*Phaseolus vulgaris* L.) BİTKİSİNDE AMİNOASİT UYGULAMASININ BAZI MORFOLOJİK ÖZELLİKLER ÜZERİNE ETKİSİNİN BELİRLENMESİ

ÖZET

Tarımsal savaş yöntemleri içerisinde yer alan kimyasal savaş kolay uygulanabilirliği ve sonucunun hemen alınabilmesi gibi çeşitli avantajları sebebiyle üreticiler tarafından en çok tercih edilen yöntemlerden biridir. Amino asitler yüksek sıcaklık, düşük nem, don, böcek zararı, dolu zararı, sel gibi, ürün kalitesini ve miktarını azaltan, bitki metabolizmasını üzerinde olumsuz bir etkiye sahip stres koşullarına direnç sağlar. Yabancı otlarla mücadelede kullanılan herbisitler çiftçiler tarafından zaman zaman yanlışlıkla yüksek dozda uygulanmaktadır. Yüksek dozda herbisitten zarar gören bitkilere aminoasit uygulayarak stresi ortadan kaldırmaya çalışma son yıllarda çiftçiler tarafından denenen bir yöntemdir. Bu çalışmada; farklı dozlarda herbisit uygulanan fasulyede farklı zamanlarda uygulanan aminoasidin bazı morfolojik özellikler üzerine etkilerini incelenmek amaçlanmıştır.

Deneme kontrollü koşullarda ve tesadüf parsellerinde faktöriyel deneme desenine göre 3 tekrarlamalı olarak kurulmuştur. Araştırmada 3 aminoasit uygulaması [kontrol (aminoasit uygulaması yok), 3 gün sonra aminoasit uygulaması ve 6 gün sonra aminoasit uygulaması] ile 5 herbisit dozu [kontrol (tavsiye edilen doz), tavsiye edilen dozun yarısı, tavsiye edilen dozun iki katı, tavsiye edilen dozun üç kat ve tavsiye edilen dozun dört katı] denenmiştir.

Araştırmada ana dal çapı, fide boyu, kök uzunluğu, yaprak sayısı ve yaprak alanı özellikleri incelenmiştir. İncelenen tüm özelliklerde aminoasit uygulamaları arasındaki farklar istatistiki anlamda önemliyken, herbisit uygulamaları ve aminoasit x herbisit uygulamaları interaksiyonu sadece kök uzunluğu özelliğinde istatistiki anlamda önemli bulunmuştur.

İncelenen tüm özelliklerde uygulanan herbisitin dozu arttıkça değerlerde düşüşler görülmüştür. En düşük değerler tavsiye edilen dozun dört katı uygulandığında belirlenmiştir.

Herbisit uygulamaları ile bitkiler strese girmiş ve sonrasında uygulanan aminoasit ile bitkilerin ana dal çapı ve fide boylarında bir artış saptanmamıştır. Bu özelliklerde herbisitler daha etkili olmuştur. Ancak 3 gün sonra aminoasit uygulaması ile kök uzunluğu, yaprak sayısı ve yaprak alanı artmıştır. Bu özelliklerde aminoasit uygulaması olumlu sonuçlar vermiştir. 6 gün sonra aminoasit uygulamanın incelenen tüm özelliklerde olumlu bir etkisi görülmemiştir.

Yapılan bu araştırmada; herhangi bir nedenden ötürü herbisit kullanımında doz aşımı meydana gelirse çok geç kalmadan 3 gün içerisinde aminoasit uygulaması ile bitkilerde meydana gelen zararın bir noktaya kadar engellenebileceği sonucuna ulaşılmıştır.

Anahtar Kelimeler: fasulye, herbisit, amino asit, morfolojik özellikler

BUCKWHEAT: ITS ORIGIN, COMPOSITION AND HEALTH IMPORTANCE

Dr. Dilara ASLAN BAKKALBAŞI
dildara79@gmail.com
ORCID NO: 0000-0001-8056-6925

ABSTRACT

Buckwheat, an Asian-origin plant belonging to the Polygonaceae family, is an annual species known as a pseudo-cereal. Common buckwheat (Fagopyrum esculentum Moench) and Tatar buckwheat (Fagopyrum tataricum Gaerth) are the most widely cultivated buckwheat species as a food source.

Buckwheat is used in bread, pasta, bakery products and various traditional dishes. Especially foods such as "soba" in Japan, "kasha" in Russia, "naengmyeon" in Korea and "pizzoccheri" in the northern regions of Italy are widely consumed. Starch is a main component of buckwheat grain and constitutes 55-75% of the grain. Due to its resistant starch content, buckwheat has a low glycemic index and plays an important role in the diet of diabetics by helping regulate blood sugar levels. The protein content of buckwheat grain varies between 8.5 and 19%, depending on the variety. It contains essential amino acids such as lysine, threonine, and tryptophan. Buckwheat protein has high nutritional quality due to its balanced amino acid profile. Buckwheat is classified as a gluten-free product. Therefore, it is an excellent alternative for celiac disease. Buckwheat grain contains 7.0-10.7% total fat, the majority of which consists of unsaturated fatty acids. It is richer in B and E vitamins compared to cereals such as rice, corn, and wheat. Buckwheat exhibits antioxidant, antitumor, antidiabetic, and antibacterial properties due to its rich composition. In addition to its health benefits, buckwheat is considered as an allergen food and several researches are conducted to eliminate its allergenic properties.

Interest in buckwheat is increasing in our country due to its high nutritional properties. It is recommended that this plant, which is newly cultivated in Turkey, should be promoted more and its production should be increased due to the beneficial properties for human health. In this study, the origin, composition, and health effects of buckwheat are reviewed.

Keywords: Buckwheat, Celiac, Chemical Composition, Health Effects

KARABUĞDAY: KÖKENİ, BİLEŞİMİ VE SAĞLIK AÇISINDAN ÖNEMİ

ÖZET

Asya kökenli bir bitki olan karabuğday, Polygonaceae familyasına ait, pseudo tahıl olarak bilinen tek yıllık bir bitkidir. Yaygın karabuğday (Fagopyrum esculentum Moench) ve Tatar karabuğdayı (Fagopyrum tataricum Gaerth) gıda kaynağı olarak en çok yetiştirilen karabuğday türleridir.

Karabuğday, ekmek, makarna, unlu mamuller ve çeşitli geleneksel yemeklerde kullanılmaktadır. Özellikle Japonya'da "soba", Rusya'da "kasha", Kore'de "naengmyeon", İtalya'nın kuzey bölgelerinde "pizzoccheri" gibi yiyecekler oldukça yaygın olarak tüketilmektedir. Karabuğday tanesinin esas bileşeni olan nişastanın tanedeki oranı %55-75 arasında değişmektedir. İçerdiği yüksek miktardaki dirençli nişasta sayesinde karabuğday glisemik indeksi düşük gıdadır ve kan şekerini düzenlediği için şeker hastalarının diyetinde önemli bir yere sahiptir. Karabuğday tanesinin protein içeriği çeşide bağlı olarak %8.5-19 arasında değişmektedir. Lisin, treonin, triptofan gibi elzem aminoasitleri içermesi ve dengeli bir aminoasit dağılımına sahip olması nedeniyle karabuğday proteini yüksek besin kalitesine sahiptir. Karabuğday gluten bulundurmayan bir ürün olarak tanımlanmaktadır ve özellikle çölyak hastaları için iyi bir alternatiftir. Karabuğday tanesi toplam %7.0-10.7 oranında yağ içermekte olup bu yağın büyük çoğunluğu doymamış yağ asitlerinden oluşmaktadır. Karabuğday tanesi B grubu ve E vitaminleri açısından pirinç, mısır ve buğday gibi tahıllardan daha zengindir. Sahip olduğu zengin içeriği sayesinde karabuğdayın antioksidan, antitümör, antidiyabetik ve antibakteriyel etkileri bulunduğu bildirilmiştir. Sağlık açısından yararlarının yanında karabuğday alerjen gıdalardan biri olarak kabul edilmekte ve bu özelliğinin giderilmesi için çeşitli çalışmalar yapılmaktadır.

Yüksek besleyici özelliği nedeniyle karabuğdaya olan ilgi ülkemizde de giderek artmaktadır. Türkiye'de tarımı yeni yapılmaya başlanan bu bitkinin, besleyici ve sağlığa faydalı özellikleri nedeni ile daha fazla tanıtılması ve üretiminin arttırılması önerilmektedir. Bu çalışmada karabuğdayın kökeni, bileşimi ve sağlık üzerine olan etkileri derlenmiştir.

Anahtar Kelimeler: Bileşim, Çölyak, Karabuğday, Kimyasal, Sağlık Etkileri

VEGETABLE SEED DISEASES IN KYRGYZSTAN AND THEIR CONTROL

Yrd. Doç. Dr. Saikal BOBUSHOVA
Kyrgyz Turkish Unıversıty Manas
saykal.bobusheva@manas.edu.kg
ORCID NO: 0000-0002-5823-0541

ABSTRACT

Vegetable growing is one of the key sectors of agriculture in Kyrgyzstan. Vegetable crops not only possess high nutritional value, but also serve as a primary source of vitamins, minerals, carbohydrates, pectins, organic acids, essential oils, and phytoncides.

Over 80% of infectious plant diseases are caused by fungal organisms, with seeds acting as a major vector for their spread. It is estimated that more than 30% of crop pathogens are seed-borne, with some studies suggesting that this number exceeds 60%.

In this study, the pathogenic and saprophytic microflora of vegetable seeds officially registered in Kyrgyzstan were identified. To achieve this, the mycological and bacterial composition of the seeds was analyzed using several methods: visual inspection, the roll method, and cultivation on nutrient media. Biological control methods were then applied to manage bacterial and fungal infections.

The results of the phytopathological survey revealed the presence of 15 fungal species, including representatives of the genera *Mucor*, *Cladosporium*, and *Penicillium*. Additionally, three bacterial species were identified: *Xanthomonas* spp., *Erwinia carotovora*, and *Xanthomonas campestris* pv. *vesicatoria*. The study demonstrated that both internal and external phytopathogens were present in nearly all examined seed samples. Notably, fungi from the genus *Aspergillus* were detected in all types of vegetable seeds. These included *Aspergillus niger*, *Aspergillus terreus*, *Aspergillus flavus*, and *Aspergillus fumigatus*.

The *Streptomyces alfalfae* strain CI-4 was found to be effective in protecting the seed coat from infection, particularly at a concentration of 1×10^6 spores per milliliter.

Keywords: seed infection, *Streptomyces* bioagents, plant protection

WATER CONSUMPTION PATTERN OF KONKAN KANYAL GOATS FED FINGER MILLET STRAW SUPPLEMENTED WITH VARYING LEVELS OF DRIED POULTRY DROPPING BASED DIETS

Dr. Abdulwaheed Adeyemi Bello
Department of Animal Health and Production Technology, College of Agriculture, Mokwa, P.M.B 109, Niger State, Nigeria

ORCID NO: 0000-0002-5355-1039

ABSTRACT

This study was conducted to estimate the water intake of Konkan Kanyal goats fed finger millet straw supplemented with varying levels of dried poultry droppings-based diet. Thirty Konkan Kanyal goats aged above 12 months weighing 14.00-14.67 kg were used in a randomized block design (RBD) experiment. The experimental goats were randomly assigned to five treatments (TI-T5). T1 were goats fed with 0% dried poultry droppings-based diets (DPDBD), T2 were fed with 20% dried poultry droppings-based diets (DPDBD), T3 were fed with 40% dried poultry droppings-based diets (DPDBD), T4 were fed with 60% dried poultry droppings-based diets (DPDBD), T5 were fed with 80% dried poultry droppings-based diets (DPDBD. Water was offered at 5L goats-1 daily. Water and feed refusal were recorded on a daily basis before feeding in the morning. Feed and faeces samples were analyzed for proximate constituents. Live weight changes were also measured. The results revealed that treatment groups supplemented with dried poultry droppings-based diets had superior water intake compared to the control group. Daily water intake of the experimental goats was 1.4, 2.2, 3.5, 2.7, and 1.7 L head-1, respectively. Konkan Kanyal goats fed finger millet straw supplemented with varying levels of dried poultry dropping based diets requires up to 3.5L of water head-1 day-1 for optimum utilization of the feed.

Keywords: Crop residue, Goats, Poultry litters, Water intake.

ECONOMIC RETURNS OF RABI CROPS IN PUNJAB: STRATEGIES FOR ENHANCING FARM INCOME

ABSTRACT

Agriculture plays a pivotal role in the socio-economic fabric of Pakistan, and the province of Punjab stands as the agricultural heartland of the country. The rabi season, encompassing the winter months, is of paramount importance in the agricultural calendar, contributing significantly to the overall agricultural output. Understanding the economic dynamics of Rabi crops in Punjab is crucial for policy formulation, resource allocation, and sustainable agricultural development. The methodology involves a systematic collection of primary data through surveys and interviews with farmers of Sahiwal division, that includes three districts Sahiwal, Okara and Pakpattan. Various economic indicators such as cost of production, yield per acre, market prices, and income generated are meticulously examined to gauge the financial viability and sustainability of Rabi crops cultivation in the region. Benefit cost ratio of respective crops was calculated in order to find strategic efficiency, comparative advantage, and the level of government interventions in production. The BCR calculated for wheat was 0.85, 0.84 for maize, 1.28 for potato, 0.80 for canola and for 1.62 Tobacco. Tobacco is identified as most profitable crop following potato in place. Wheat, maize and canola are having positive gross margins but negative net returns indicating high fixed costs. High land rent is a factor responsible for negative net returns as wheat, maize and canola are having BCR 1.69, 1.20 and 1.48 respectively without land rent, but the main cause responsible for negative net returns are low output prices of these crops this year. Logistic regression model was used to analyze the factors that affects crop diversification in the region, i.e. to identify the factors that affect the crop diversification decisions of the farmer. Land holding is the only factor that affects diversification decision of farmers. Moreover, a constraint analysis was done on Likert scale to find out the constraints that farmers were facing in production i.e. agronomic, environmental and market constraints. Most critical issues identified are the lack of support price or procurement guarantees, the high input costs, poor seed quality and yield variability. Policy recommendations were derived from these findings, emphasizing the ways to increase crop diversification, improving input access, enhancing irrigation infrastructure, strengthening pest and disease management, ensuring price stability, promoting financial inclusion, and investing in climate-resilient agriculture and research. The study underscores the need for targeted policy

interventions to address the multifaceted challenges facing Punjab's agricultural sector while capitalizing on the promising opportunities for sustainable development. By implementing these recommendations, policymakers can foster an enabling environment for inclusive growth, improved livelihoods, and enhanced food security in the region.

ABSTRACT

Extending the shelf life of mango fruits is crucial to ensure year-round market availability and support long-distance transportation without compromising fruit quality. Mango (*Mangifera indica* L. cv. Amrapali), being a climacteric fruit, undergoes rapid ripening and senescence, which significantly limits its storability. This study aimed to evaluate the influence of selected preharvest interventions, including nutrient sprays and fruit bagging, on the postharvest quality and physiological behavior of mango fruits stored under ambient conditions (25 ± 3 ºC and 80–85% RH). The treatments comprised bagging alone, 2% calcium chloride ($CaCl_2$), 1.5% potassium sulfate (K_2SO_4), and a combined treatment of 2% $CaCl_2$ + 1.5% K_2SO_4 with bagging. Fruits were analyzed at 0, 4, 8, 12, and 16 days of storage for key quality parameters such as weight loss, fruit firmness, pH, total soluble solids (TSS), ascorbic acid, total sugar, carotenoid content, total phenolics, DPPH radical scavenging activity, ethylene production, respiration rate, and enzymatic activities including polyphenol oxidase (PPO), catalase (CAT), and peroxidase (POD). The combined application of 2% $CaCl_2$ + 1.5% K_2SO_4 with bagging was found to be the most effective, resulting in reduced physiological deterioration, delayed ripening, better peel and pulp color, enhanced antioxidant content, and significantly lower decay incidence compared to untreated fruits. These findings highlight the potential of integrating nutrient sprays with physical protection techniques like bagging to improve the postharvest quality and extend the shelf life of mango fruits in ambient storage conditions.

ENGINEERING THE FUTURE OF FARMING: CHEMICAL INNOVATIONS FOR SUSTAINABLE AGRICULTURE

Dr. Ghanshyam Barman
Head and Associate Professor
Chemical Engineering
Vidhyadeep Institute of Engineering and Technology
Vidhyadeep University, Surat
Gujarat, India
Email id: gbarmannitr@gmail.com
ORCID NO.: 0000-0002-2611-0801

ABSTRACT

The intersection of agriculture and chemical engineering holds transformative potential for addressing global challenges such as food security, resource efficiency, and environmental sustainability. This abstract explores innovative applications of chemical engineering principles to revolutionize agricultural practices, focusing on precision farming, agrochemical optimization, waste valorization, and renewable energy integration.

Key Focus Areas:

Smart Agrochemicals:

Development of nanocarriers and controlled-release fertilizers/pesticides to enhance nutrient uptake and reduce environmental runoff.

Green synthesis of biodegradable agrochemicals using plant-based or microbial feedstocks.

Agricultural Waste Valorization:

Conversion of crop residues, manure, and food waste into biofuels (e.g., biogas, bioethanol), biochar, or platform chemicals via pyrolysis, anaerobic digestion, and enzymatic hydrolysis.

Integration of biorefineries to create circular economies in rural areas.

Precision Agriculture Technologies:

IoT-enabled sensors and AI-driven analytics for real-time monitoring of soil health, moisture, and crop stress.

Chemical engineering solutions for water-efficient irrigation (e.g., hydrogels, membrane filtration).

Sustainable Food Processing:

Energy-efficient drying, extraction, and preservation techniques (e.g., supercritical CO_2 extraction, membrane separation) to minimize post-harvest losses.

Novel food packaging materials (e.g., edible films, antimicrobial coatings) to extend shelf life.

Renewable Energy in Farming:

Solar/wind-powered on-farm biofuel production and ammonia synthesis for fertilizers.

Electrochemical reduction of nitrogen to reduce reliance on Haber-Bosch process.

Challenges and Innovations:

Scalability: Bridging lab-scale innovations to field applications.

Policy Support: Aligning with SDG 2 (Zero Hunger) and SDG 12 (Responsible Consumption).

Farmer Adoption: Cost-effective and user-friendly technologies for smallholder farms.

Conclusion:

The synergy of chemical engineering and agriculture can drive a paradigm shift toward resource-efficient, low-carbon food and energy systems. Future research must prioritize collaborative frameworks involving engineers, agronomists, and policymakers to scale solutions globally.

ABSTRACT

Climate change is the global environmental problem which effects agricultural productivity, natural ecosystem and human health. Pakistan is among the countries which are facing unpredictable weather patterns like high temperature and low precipitation. Climate change has adversely affected on the yield of citrus fruit in Sargodha, Pakistan. Increase in temperature lead to drop in citrus production. similarly, low and high rain fall reduce the juice content and fruit quality respectively. Additionally, severe drought conditions can lower tree productivity and necessitate irrigation for the production of citrus and other crops. The objective of the study was to investigate the climatic impacts on growth and yield of citrus fruit in addition to socio economic characteristics of citrus growers in Sargodha district. The present research utilized the primary data and stratified random sampling technique was used to collect the data from district Sargodha. A sample of 100 citrus growers were selected for the study. A well-structured questionnaire was employed to collect the relevant data. collected data was analyzed using Statistical Package for Social Sciences (SPSS). The main findings of the study showed that citrus orchards were more sensitive towards temperature. Extremely high temperature altered the fruit growth pattern and yield. while the rain fall showed positive effect on citrus yield and production. Similarly, socio-economics factors like age, education, family size and farming experience fluctuate the yield of citrus. This study can help policymakers to design better policies which can improve farmers perceptions, and motivate them to enhance the yield of citrus in Sargodha.

ABSTRACT

Opuntia cactus is a horticultural crop, which is extensively used as food for humans and feed for animals in many countries of the world. This crop has widely adapted to different parts of Tunisia and is an integral part of the culture and economy of arid and semi-arid zones of the country. Recently, to fulfil the demand for large-scale cultivation in a short period by rapid mass multiplication, organogenesis and embryogenesis experiments were conducted with the aim of developing a protocol for *in vitro* propagation of local cactus from areole explants and *in vitro* selection of cactus for salinity tolerance and resistance. For the first experiment, a reliable strategy was followed for micropropagation of *Opuntia ficus-indica* (L.) and *Opuntia robusta* L. cactus pear in the presence of the growth regulators, 6-benzylaminopurin (BAP) and metatopolin (mT), at four different concentrations (0.5, 1, 2 and 3 mg/l) and via callogenesis with 2,4-D and picloram at 2, 4, 6 and 8 mg/l. Results of the first experiment revealed that best values of shoot evolution for the 2 cactus species was recorded on media supplemented with BAP, mainly. Media with mT lead to vitroplants with less quality. *Opuntia robusta* vitroplantlets show better evolution results than *Opuntia ficus-indica* vitroplantlets. In the second experiment, large and compact calli were initiated on MS medium enriched with 2 and 4 mg/l picloram. For salinity stress tolerance, a decreasing pattern in number and quality of cactus shoots and calli were observed with increasing salinity levels and widely affected at 8 and 10 g/l NaCl. On media with 2, 4 and 6 g/l of NaCl, plantlets show a normal morphologic evolution indicating that cactus can tolerate relatively high salinity levels.

Keywords: Opuntia cactus, mT, *in vitro* propagation, NaCl, salinity stress.

ROLE OF SOCIAL SUPPORT FOR SUSTAINABLE RURAL FOOD SECURITY IN COVID-19 PANDEMIC

ABSTRACT

Food security is the most debatable topic for the last few decades. It plays a very effective role in the economic condition of a country. Food insecurity is the cause of many problems in the health and medical field. Social support plays a very important role in decreasing malnutrition if it is provided according to the needs of people especially during the pandemic of Covid-19. The initiative was taken by the Pakistani government in the form of the 'Ehsaas Emergency program' plays a vital role in decreasing food insecurity and provides brief information about the relationship between food security and social support. To find the relationship between food security and social support and support given by the government we collected data from 246 rural households from district Jhang and Multan. We collected data using the Dietary Intake Assessment questionnaire, USDA questionnaire, and MSPS scale. We also use a self-generated questionnaire to investigate the role of the 'Ehsaas emergency program' on food security and the financial needs of people. We used Propensity Score Matching (PSM) to find the role of social support in the sustainability of food security. The results of propensity score matching show that there is a strong relationship between social support and food security. Education, family size, age of household head, income, gender, and distance from cities has negative impacts on food security. It is concluded that social support programs are necessary for sustainable food security.

ABSTRACT

Living standards refer to the quality of life and material comfort of individuals and society. Punjab being most densely populated province of Pakistan has a highly differentiated society in terms of living standards. Clear differences can be observed among the urban Punjab and rural Punjab. Agriculture remains the only source of income for the bulk of the rural population although. Majority of the rural population in Punjab are small land holders. These small farmers are mostly poor and have lower levels of living standard. The lower levels of living standard among small farmers obstructs the growth of agriculture in Punjab. Therefore, agricultural production remains insufficient in quantity or inferior in quality which leads to poor agricultural production in Punjab. This poverty of agricultural production leads to lesser earnings. This study investigates the relationship between the living standards of small farmers and poverty of agriculture in rural Punjab, Pakistan. Primary data was collected from 250 small farmers in 5 districts of Punjab. Binary Logistic Regression analysis was used to analyze the relationship between the various indicators of living standard and agricultural poverty. The study found an inverse relationship between agricultural poverty and living standard of the small farmers. The results revealed that the per capita income of the family, participation of the female, infrastructure, agriculture mechanization and utilization of agricultural credit may reduce the occurrence of agricultural poverty. Therefore, measures should be taken to improve off-farm employment, infrastructure and credit system.

Keywords: Small farmers, Living standard, Agricultural poverty.

PERFORMANCE OF SOME ANISE GENOTYPES UNDER TOKAT ECOLOGICAL CONDITIONS

ORCID NO: 0000-0003-4554-2148

ABSTRACT

The study aimed to determine the performance of some anise genotypes under Tokat's ecological conditions. The research was conducted during the 2023 growing season in Tokat-Kazova ecological conditions according to the Randomized Complete Block Design with three replications. Materials consisted of 10 different populations collected from various regions of Turkey and three registered varieties. The study evaluated findings regarding emergence time, flowering time, maturation time, plant height, number of branches per plant, number of fruiting branches per plant, number of umbels per plant, number of fruits per umbel, seed yield per plant, thousand-seed weight, seed yield, essential oil ratio, and essential oil yield. Among the examined traits, thousand-seed weight was found to be statistically insignificant, whereas all other parameters were determined to be highly significant ($p<0.01$). Emergence time ranged from 30-33 days, flowering time from 65-71 days, and maturation time from 97-102 days. Plant height varied from 57.60 to 69.53 cm, branch number per plant from 4.50 to 6.70, fruiting branch number per plant from 3.90 to 5.90, number of umbels per plant from 4.20 to 7.90, fruits per umbel from 367.97 to 698.87, seed yield per plant from 0.89 to 2.59 g, thousand-seed weight from 2.07 to 2.66 g, seed yield per decare from 28.00 to 67.00 kg/da, essential oil ratio from 1.62% to 2.59%, and essential oil yield from 0.46 to 1.51 l/da. The population from Syria exhibited the highest seed yield (67.00 kg/da) and essential oil yield (1.51 l/da). According to the study results, the Syrian population and Altın 8 variety stood out in terms of seed and oil yield.

BAZI ANASON GENOTİPLERİNİN TOKAT EKOLOJİK ŞARTLARINDAKİ PERFORMANSLARI

ÖZET

Araştırmada, Tokat ekolojik koşullarında bazı anason genotiplerinin performanslarının belirlenmesi amaçlanmıştır. Çalışma 2023 yılı yetiştirme döneminde Tokat- Kazova ekolojik şartlarında Tesadüf Blokları Deneme Desenine göre 3 tekerrürlü olarak yürütülmüştür. Materyal olarak Türkiye'nin çeşitli bölgelerinden toplanan 10 adet farklı popülasyon ve 3 adet tescilli çeşit kullanılmıştır. Araştırmada çıkış süresi, çiçeklenme süresi, olgunlaşma süresi, bitki boyu, bitkide dal sayısı, bitkide meyve dal sayısı, bitkide şemsiye sayısı, şemsiyedeki meyve sayısı, bitki başına tohum verimi, bin tane ağırlığı, tohum verimi, uçucu yağ oranı ve uçucu yağ verimine ait bulgular değerlendirilmiştir. İncelenen özelliklerden bin tane ağırlığı istatistiki olarak önemsiz bulunurken diğer tüm parametrelerin ise çok önemli ($p<0.01$) olduğu tespit edilmiştir. Çıkış süresi 30-33 gün, çiçeklenme süresi 65-71 gün ve olgunlaşma süresi 97-102 gün arasında değişmiştir. Bitki boyu 57.60-69.53 cm, dal sayısı 4.50-6.70 adet/bitki, meyve dal sayısı 3.90-5.90 adet/bitki, bitkide şemsiye sayısı 4.20-7.90 adet/bitki, şemsiyedeki meyve sayısı 367.97-698.87 adet, bitki başına tohum verimi 0.89-2.59 g, bin tane ağırlığı 2.07-2.66 g, dekara tohum verimi 28.00-67.00 kg/da, uçucu yağ oranı %1.62-2.59 ve uçucu yağ verimi 0.46-1.51 l/da arasında bulunmuştur. En yüksek dekara tohum verimi (67.00 kg/da) ve uçucu yağ verimine (1.51 l/da) sahip popülasyon Suriye'dir. Çalışma sonuçlarına göre; tohum ve yağ verimi bakımından Suriye popülasyonu ve Altın 8 çeşidi öne çıkmıştır.

ABSTRACT

Successful seed production depends on identifying a suitable environment for the species and proper agronomic practices.

This research was carried out for three years between 2023 and 2024 to determine seed yield and some yield characteristics of different row spacing and seeding rates in crested wheatgrass

(*Agropyron cristatum* (L.) Gaertn.) under Tokat ecological conditions. The field trials were carried out under non-irrigated conditions at a medium-high (599 m) altitude between 40° 18'latitude and 36° 34' longitude in the experimental fields of the Central Black Sea Transitional Zone Agricultural Research Institute. Crested wheatgrass (*Agropyron cristatum* L) 'Geçit 1' variety registered by the Institute was used as plant material. The field trials were established according to the 'Split Plots Experimental Design in Randomized Complete Blocks' with three replications. Different row spacings (30, 45, 60 and 75 cm) were used in the main plot and seed rates (10, 20, 30 and 40 kg ha-1) were used in the sub-plots.

In this study, for seed yield components yield traits including plant height, fertile tillers per square meter (FTD), seed yield per plant, thousand -seed weight (TSW)and seed yield(SY) were investigated.

An increase in yield was achieved by increasing the row spacing and seed sowing rate; however, a decrease in yield was observed when the optimum density was exceeded (75 cm and 40 kg ha -1). The seed production different row spacing (except thousand seed weight) and seed quantity applications had a high level of statistical significance ($p<.0001$) on the examined parameters. Seed yield was influenced significantly row spacing, seeding rate and the interactions of and row spacings and seeding rate, but was not affected by experiment year.

According to the results of the research, seeding rate of 20 or 30 kg ha -1 and a row spacing of no wider than 45 cm proffered adequate for seed production in this research location and in similar ecological regions.

Keywords: Crested wheatgrass, row spacing, seeding rate, thousand -seed weight, seed yield

TÜRKİYE TOKAT BÖLGESİNDE SIRA ARALIĞI VE TOHUM EKIM ORANI UYGULAMASININ OTLAK AYRIĞI (*AGROPYRON CRISTATUM* L. GAERTN.) TOHUM VERIMI VE BAZI VERIM BILEŞENLERI ÜZERINDEKI ETKILERI

ÖZET

Başarılı tohumu üretimi, türler için uygun bir ortamın ve uygun tarımsal uygulamaların belirlenmesine bağlıdır.

Bu araştırma, Tokat ekolojik koşullarında farklı sıra arası ve tohum miktarlarının otlak ayrığı (*Agropyron cristatum* (L.) Gaertn.) tohum verimi ve bazı verim özelliklerine etkisinin belirlenmesi amacıyla 2022-2024 yılları arasında üç yıl süre ile yürütülmüştür. Tarla denemeleri Orta Karadeniz Geçit Kuşağı Tarımsal Araştırma Enstitüsü deneme alanlarında 40° 18' enlem ve 36° 34' boylamları arasında, orta-yüksek (599 m) rakımda sulanmayan koşullar altında gerçekleştirilmiştir. Enstitü tarafından tescil ettirilen otlak ayrığı (*Agropyron cristatum* L) "Geçit 1" çeşidi bitki materyali olarak kullanılmıştır. Arazi denemeleri "Tesadüf Bloklarında Bölünmüş Parseller Deneme Desenine" göre üç tekerrürlü olarak kurulmuştur. Farklı sıra aralıkları (30, 45, 60 ve 75 cm) ana parselde, tohum miktarları (1.0, 2.0, 3.0 ve 4,0 kg/da) alt parsellerde yer almıştır. Bu çalışmada, tohum verimi bileşenleri için bitki boyu, metrekare başına verimli kardeş (FTD), bitki başına tohum verimi, bin tohum ağırlığı (TSW) ve tohum verimi (SY) parametreleri incelenmiştir.

Sıra aralığı ve tohum ekim oranının artırılması ile incelenen parametrelerde artış sağlanmış; ancak optimum yoğunluğun üzerine çıkıldığında (75 cm ve 4,0 kg/da) azalma eğiliminde olduğu görülmüştür.

Tohum üretiminde farklı sıra aralığı (bin tohum ağırlığı hariç) ve tohum miktarı uygulamalarının incelenen parametrelere etkisi yüksek düzeyde istatistiksel anlamlı (p<,0001) olmuştur.

Tohum verimi, sıra aralığı, tohum ekim oranı ve sıra aralıkları ile ekim oranının etkileşimlerinden önemli ölçüde etkilenmiştir, ancak deneme yılından etkilenmemiştir.

Araştırma sonuçlarına göre, bu araştırma lokasyonunda ve benzer ekolojik bölgelerde tohum üretimi için 2,0 veya 3,0 kg /da tohum oranı ve 45 cm'den geniş olmayan sıra aralığının yeterli olduğu görülmektedir.

Anahtar Kelimeler: Otlak ayrığı, sıra aralığı, tohum miktarı, 1000 tane ağırlığı, tohum verimi

INFLUENCE OF PLANT GROWTH REGULATORS ON *IN-VITRO* SHOOT REGENERATION IN GINGER (*Zingiber officinale* Rosc.)

ABSTRACT

Ginger (*Zingiber officinale* Rosc.) is a valuable medicinal and spice crop that belongs to the family Zingiberaceae. Rhizomes are the commercially valuable part of the plant, and it is widely used in the food, pharmaceutical, and cosmetic industries. Due to the richness of various phenolic compounds such as gingerol, shogaol, and zingerone, ginger possesses multiple biological activities, including antioxidant, anti-inflammatory, antimicrobial, anticancer, antidiabetic, antinausea, and antiemetic effects. Typically, once the plant has blossomed, the rhizomes are mature enough for harvesting, usually in about 8 to 10 months from sprouting.Conventional propagation method which is primarily by rhizomes is insufficient to satisfy the increasing demand for high-quality planting materials due to slow growth rates, low propagation efficiency, vulnerability to diseases, and seasonal dependency. This research aimed to develop an efficient *in-vitro* protocol to enhance the mass production of a variety of ginger, namely Chinese ginger, ensuring the year round availability of disease-free planting materials. Sprouting rhizome buds were surface sterilized using fungicide (Thiram 30% (W/W)) followed by 70% ethanol and 30% Clorox (commercial bleach) for 15 minutes twice. Solid Murashige and Skoog (MS) medium was used as a basal medium, with variations in hormonal combinations, BAP (6-Benzylaminopurine)(1.0, 2.0, 3.0, 4.0, 5.0 mg/L) and NAA (1-Naphthaleneacetic acid) (0, 0.25, 0.5 mg/L) to regenerate shoots. The highest shoot multiplication was achieved on a medium supplemented with 2 mg/L BAP and 0.25 mg/L NAA, while the greatest shoot elongation was observed with 5 mg/L BAP and 0 mg/L NAA. Spontaneous rooting occurred in some treatments, with the highest root number recorded on a medium containing 5 mg/L BAP and 0.25 mg/L NAA. In conclusion, the results of this study

provide an efficient and reproducible in-vitro propagation protocol, which has the potential to address the challenges of traditional propagation and can be utilized for large-scale ginger production using rhizome buds.

ABSTRACT

The article highlights the problem of inefficient management of peatland land resources of Ukraine. The necessity of transition to scientifically based, ecologically safe approaches, renaturalization of degraded territories and optimization of their use is considered. The importance of differentiating the areas of use of peatland lands is emphasized, based on the assessment of their productive, ecological and social functions. Each individual peatland massif, in accordance with its genetic nature and location in the landscape, has certain useful functions that should be used to the maximum extent. Attention is drawn to the processes of depletion and loss of the powerful water, carbon and nitrogen fertility potential of drained peatlands under conditions of intensive agriculture. It is noted that there is a need to renaturalize (rehabilitate) a significant part of drained peat bogs that have undergone degradation with the introduction of marsh culture on these lands, which involves secondary watering (boiling) of drained bog massifs and growing hydrophilic vegetation. As for environmentally more stable cultivated humus-peat, ash-rich soils with high potential fertility, it is advisable to leave them in the agricultural land fund. For such soils, there is a wide range of environmental protection uses, thanks to environmentally sound methods of land reclamation and justified agro-technological techniques. Ways to solve the problem of effective management of peat bogs are proposed. The authors emphasize the importance of differentiating the directions of peatland use, legislative regulation and the implementation of projects aimed at reducing greenhouse gas emissions for the preservation and restoration of ecosystems.

Keywords: peat bog lands; drained peatlands; renaturalization

STUDIES ON MEDICINAL APPLICATIONS OF TANNINS

[1]Ahmed Attahiru, [1]Abubakar Umar Birnin-Yauri and [2]Bashar Attahiru

ABSTRACT

Tannins are known for their astringent properties, have various medicinal applications. There are different types of tannins, including hydrolyzable and condensed tannins, each with unique properties and potential applications. The aim of this study was to investigate on medicinal applications of tannins. Medicinal applications of tannins in traditional and potential uses includes Gastrointestinal Issues such as Diarrhea and Intestinal Bleeding: Tannins' astringent nature helps constrict tissues, potentially stopping diarrhea and internal bleeding, Hemorrhoids: Tannins have been used to treat hemorrhoids due to their ability to reduce inflammation and constrict tissues and Ulcers and Gastritis: Some tannins may act as a protective coating for the gastrointestinal tract, potentially aiding in the treatment of ulcers and gastritis. Antimicrobial and Antiseptic Properties such as Skin Irritations and Wounds: Topical application of tannins can help remove skin irritants, reduce inflammation, and even aid in the treatment of burns and wounds due to their anti-hemorrhagic and antiseptic properties and Bactericidal Action: Tannins can react irreversibly with bacterial proteins, disrupting their function and potentially leading to their inactivation. Antioxidant and Anti-Inflammatory Effects such as Free Radical Scavenging: Tannins possess antioxidant properties, helping to protect against cellular damage caused by free radicals and Anti-Inflammatory: Some tannins exhibit anti-inflammatory effects, potentially beneficial in treating various conditions. Nutraceuticals and Pharmaceuticals: Tannins are being explored as potential components in nutraceuticals and pharmaceuticals, leveraging their diverse pharmacological properties. They are considered an indispensable component with external and internal effects in a variety of nutraceuticals, pharmaceuticals, and medicinal preparations. Other Potential Applications are Anticancer Properties, Neurodegenerative Diseases, Antipyretic and Anthelmintic, Cardiovascular Health and Diabetes and Obesity. The medicinal properties of tannins can vary depending on the plant source and the concentration of tannins present. More research is needed to fully understand the mechanisms of action and potential benefits of tannins in various medical applications.

Keywords: Tannins, Medicinal Application, Astringent Properties, Anti-Inflammatory.

EXPLORING ALTERNATIVE SOLUTIONS TO RICE GROWERS' CHALLENGES THROUGH MIXED-METHOD APPROACHES

ABSTRACT

Agriculture play a vital role as a backbone in the economic sector of Pakistan. Rice crop is not only used just for eating purpose as well as used by products in the various forms. Rice growers faced various complications regarding to developing of yields. High costs of contributions of agribusiness items, increment of diesel costs, lack of electrical energy and minimum information about most recent systems of raising yield were the essential production issues looking by the producers. In Asia eighty percent of total fresh water is consume for rice production. Rice requires more water than the other field crops which are widely grown. It is estimated of 24-30% of freshwater resource in world are used by rice. The study was conducted in Tehsil Sheikhupura, five union councils Butter, Jatri Kohna, Kot Sondha, Farooqabad and Easherke were selected randomly. Focus groups and interview schedules with rice growers were used to gather data. The analysis was conducted using SPSS and content analysis techniques, study found that the majority of farmers experienced water scarcity, unaware of advanced production technology and faced challenges such pesticide adulteration, high labor costs and expensive harvesting machinery. Additionally, market access challenges due to middlemen exploitation were significant. To address these issues, recommendations include the provision of resistant seed varieties, prevention of input adulteration, fair crop pricing, improved market linkages, government-subsidized solar-powered tube wells, easy loan access,

construction of storage facilities, and digitalization of land records. Policy interventions focusing on farmer welfare are crucial for sustainable rice production.

zeyneb.ladouali@crtaa.dz
Centre de Recherche en Technologies Agro-Alimentaires, Route de Targa Ouzemmour, Campus Universitaire, Bejaia 06000, Algeria

ABSTRACT

Animal nutrition is a key factor in the physiology of milk biosynthesis, influencing both its quantity and quality. The composition of the diet affects the biochemical and microbiological characteristics of milk, which in turn determine its nutritional value and technological properties. This study examines the impact of different feeding practices on milk production in cows, sheep, and goats in Algeria. By analyzing the relationship between diet composition, environmental factors, and milk quality, this research aims to identify strategies for optimizing dairy production while maintaining high nutritional and hygienic standards. The results will contribute to improv feeding practices adapted to local farming conditions.

Keywords: Animal nutrition, milk biosynthesis, milk quality, biochemical composition, microbiological properties, environmental factors.

POISONOUS SPONTANEOUS PLANTS AS SOURCES OF TRADITIONAL AND MODERN MEDICINES IN BISKRA, SOUTH ALGERIA-NOTH AFRICA

DEGHICHE DIAB N[1]., BOUCIF A[2]., ABBAS S[1].

1. Scientific and Technical Research Center on Arid Regions PoBox 1682 Rp, Biskra, Algeria.
2. Biological Sciences Department, Mohamed Khider University, BP 145 RP, Biskra, Algeria

ABSTRACT

Since antiquity, humanity has used medicinal plants to treat and cure various diseases. Today, plants continue to play a crucial role in the field of healing worldwide. In objectif to examinate the significance use of poisonous spontaneous plants as sources of traditional medicinal plants in arid conditions our study was carried out in Northern Africa South Algeria at the Biskra region. The obtained results indicated a significant use of poisonous spontaneous plants in preparing bio drugs. The study also highlights the great ecological diversity of the Biskra region, with species adapted to different environments. The survey on the use of toxic plants in traditional medicine in Biskra shows that the majority of respondents (65%) are between 30 and 60 years old, with women (59%) being more involved than men (41%). Most live on the outskirts of Biskra (62%), and university graduates (36%) are the most knowledgeable about medicinal plants. The main sources of information are family (49%) and herbalists (20%). Among the most commonly used plants are Citrullus colocynthis, Ruta chalepensis, and Thapsia garganica. The used plants are primarily used to treat digestive (20%) and dermatological (20%) disorders. The leaves are the most commonly used parts (38%), with common preparations, decoctions (33%) and powders (29%). The majority of remedies are administered orally (54%). In terms of toxicity, digestive effects are the most frequent (30%), followed by dermatological, neurological, and renal toxicities (15%). Plants may contain both beneficial and toxic compounds, making preparations risky.

ABSTRACT

The agricultural policy adopted by the Algerian state and the programs and privileges it has allocated since independence aim to achieve food security by increasing the area of agricultural land.

The increase and diversification of agricultural production in both plant and animal sectors, using new means and methods for optimal land exploitation, has yielded significant results, especially in desert areas that have experienced considerable agricultural dynamics due to their share of reclamation and agricultural development programs. It has become an agricultural hub by recently achieving a significant production of crops and livestock.

Through this study, we aim to highlight the role of agricultural policies and land reclamation in developing livestock in desert areas, especially in Wadi Souf, which has known in recent years a continuous increase as a result of the policy adopted by the state in this field. This is by allocating large financial credits to farmers to increase their animal wealth and products, as the valley state is the main driver of the livestock market in the southeast, especially sheep and goats compared to the rest of the livestock, in addition to camel breeding.

Keywords: livestock, desert agriculture, agricultural policies, agricultural sector.

COMPARATIVE IMPACT OF MONOCOT AND DICOT INVASIVE PLANT SPECIES ON WILDLIFE: ASSESSING HABITAT DISRUPTIONS AND BIODIVERSITY LOSS

ABSTRACT

Aggressive colonizers that outcompete native vegetation are known as invasive plant species, and they cause habitat degradation and biodiversity loss. They pose a serious ecological hazard because of their capacity to change the chemistry of soil, destabilize food webs, and alter geomorphological structures. Although invasive species have a general effect on ecosystems, little is known about how monocot and dicot invasive plants differ from one another. The contrasting effects of invasive monocot and dicot species on wildlife, habitat stability, and ecosystem functioning are examined in this paper. To obtain worldwide information on invasive plant species and their ecological effects, a thorough search of Google Scholar was undertaken. To guarantee a thorough examination, key terms including "invasive plant species", "wildlife impact", "ecosystem disruption", and "habitat restoration" were employed. Priority was given to studies that examined changes in plant communities, the availability of nutrients for herbivores, predators, and decomposers, as well as the introduction of new species as a result of invasions. The collected data was synthesized to compare the impact of monocot and dicot invasive plants and evaluate their effects on biodiversity and ecosystem stability. According to research, dicot invasive species cause more ecological disturbance than monocots because of their aggressive growth habits and capacity to supplant native plants. Lantana camara, Chromolaena odorata, and Prosopis juliflora are examples of species that drastically change habitat structures and decrease species diversity. This review highlights how invasive plants reshape ecosystems and emphasizes the need for further research on their long-term ecological consequences.

Keywords: Invasive plant species, Ecosystem disruption, Biodiversity loss, Habitat degradation

REAL-TIME HERD MONITORING WITH UNMANNED AERIAL VEHICLES: A THERMAL IMAGING APPROACH

ABSTRACT

The object of this study is grazing livestock. The aim of the study is to conduct herd monitoring using data collected with a thermal imaging camera. For the observation of animal behavior, the drone Parrot ANAFI Thermal was used, enabling real-time monitoring. The study was conducted across ten farms.

One of the most important parameters during drone flights was the flight altitude, which had to be optimized to ensure the collection of detailed data in the shortest possible time. During the study, the behavior of the livestock herd was assessed.

Summarizing the observation results, it was found that in most cases, animals can be photographed from an altitude of 20 meters, as this does not cause significant stress. Although red deer showed some reaction to the drone flying at this height (mainly turning their heads), they did not flee, stop feeding or drinking, or become scattered.

The results of the study indicated that an altitude of 50 meters provides optimal monitoring conditions: a sufficiently large area is covered, and the resolution of the data meets the requirements for analysis. At higher altitudes, image detail decreases; however, if the aim is to detect the presence and location of a herd of ungulates, the level of detail is sufficient. For sheep monitoring, a flight altitude not exceeding 50 meters is recommended. Differences in the thermal image signatures and shapes of individual animals may be used during nighttime monitoring to locate lost animals or to identify the number of adult individuals and offspring.

EVALUATION OF PROXIMATE AND SENSORY PROPERTIES OF BREAKFAST CEREALS FROM BLENDS OF OAT, SWEET POTATO AND MALTED AFRICAN YAM BEAN

Onyekwelu, Chinyere Nkemakonam[1] and Alagbu Ogochukwu Philomina[2]

[1,2]Department of Food Technology, Federal Polytechnic, Oko, Anambra State, Nigeria.
E-mail: chykems@gmail.com

ABSTRACT

The aim of this study was to determine the sensory and proximate evaluation of breakfast cereals produced from blends of oat, sweet potato and malted Africa yam bean flour..Breakfast cereal sample were produced by mixing the:se composite flours with sugar, water and salt after which they were dried in an electric oven. Four samples were generated by mixing the oat,sweet potato and malted African yam bean flours in the ratio of 100:0::0, 50:50:0, 50:38:12 and 46:40: 14 to which were coded as BC1, BC2, BC3, and BC4 respectively. The results showed proximate composition ranged from Moisture 7.11to .06%, Crude protein 11.49t o10.35%, Fat 12.49 to 10.35%, Crude fiber 0.51 to 6.50%, Ash 0.59to 0.90%, Carbohydrate 67.81-68.69%, and Energy 429.57 to392.69%.The result of sensory evaluation showed that sample BC1 (100% oat) was most accepted by the paralists in all the sensory attributes of colour (8.20) taste (7.80), mouth feel (7.70) flavour (7.80) and overall acceptability (7.90). Commercialization of these product will increase potential of nutritional and acceptable breakfast cereal from blends of oat, sweet potato and Africa yam bean in the world market.

Key Words: Breakfast cereals, Oat, Sweet Potato, Malted African Yam Beam

PHARMACOLOGICAL EVALUATION OF *FICUS BENGHALENSIS* LATEX IN RHEUMATOID ARTHRITIS MANAGEMENT

ABSTRACT

Rheumatoid arthritis (RA) is a long-term inflammatory condition that causes joint pain, stiffness, and swelling. It can greatly impact daily life and, if untreated, may lead to joint damage. Current treatments for RA can help manage symptoms but often come with side effects. As a effect, there is growing interest in using natural remedies for safer and more effective treatment options. *Ficus benghalensis*, commonly known as the Indian banyan tree, has been used in traditional medicine for its healing properties. Its latex is believed to have anti-inflammatory and immune-supporting effects. This abstract focuses on understanding how the latex of *Ficus benghalensis* might help in managing the symptoms of rheumatoid arthritis. Findings suggest that the latex may help reduce joint swelling, improve movement, and lower inflammation. It appears to work by calming the immune system and decreasing substances in the body that cause inflammation. These effects support the traditional use of the plant and highlight its potential role in arthritis care. This plant-based approach could offer a gentler alternative for people looking to manage rheumatoid arthritis with fewer side effects. The abstract supports the traditional use of *Ficus benghalensis* latex and highlights its potential as a natural therapeutic agent for RA, likely due to its bioactive constituents possessing anti-inflammatory and immunosuppressive effects. Further research is recommended to isolate and characterize the active compounds responsible for its efficacy and to evaluate its safety profile in clinical settings.

ROLE OF HORTICULTURE IN PROMOTING ENVIRONMENTAL SUSTAINABILITY

Ali Ahmad
(ORCID: 0009-0009-5596-509X)
Institute of Horticultural Sciences, University of Agriculture, Faisalabad, Pakistan
Email: aliahmad16afmj@gmail.com

ABSTRACT

Horticulture plays a pivotal role in promoting environmental sustainability by contributing to ecological balance, enhancing biodiversity, and mitigating the adverse effects of climate change. As a branch of agriculture concerned with the cultivation of fruits, vegetables, flowers, and ornamental plants, horticulture integrates sustainable practices that help conserve natural resources and reduce environmental degradation. The adoption of eco-friendly techniques such as organic farming, integrated pest management (IPM), and precision irrigation not only improves crop productivity but also minimizes the overuse of chemical fertilizers and pesticides, leading to healthier ecosystems. Urban horticulture, including rooftop gardening and vertical farming, further supports green infrastructure development, improves air quality, and reduces the urban heat island effect. Moreover, horticultural landscapes contribute to carbon sequestration, soil stabilization, and water conservation, fostering climate-resilient environments. Community gardening and horticultural education also raise awareness about sustainable living practices and encourage public participation in environmental stewardship. Furthermore, the development of climate-resilient plant varieties through biotechnology enhances adaptability to environmental stresses, ensuring food security while preserving ecological integrity. Overall, horticulture is a dynamic and multifaceted tool that aligns with the goals of sustainable development by harmonizing agricultural productivity with environmental preservation. By integrating horticultural strategies into national and global environmental policies, societies can advance toward a more sustainable and resilient future.

ABSTRACT

The urgent need for the development and discovery of new inhibitors targeting survivin (BIRC5), recognized as one of the most tightly regulated genes in tumor cells, underscores the current research focus. Survivin serves as a specific cancer biomarker and represents a promising target for anticancer medications. This study outlines the design methodology employed for crafting a series of novel and selective survivin inhibitors, drawing inspiration from the hydroxyquinoline framework of our previously documented lead compound, MX-106.

Our investigation identifies nine compounds projected to demonstrate heightened inhibitory potential compared to the most potent member within the studied set. In vitro assays confirmed the effectiveness of these compounds in impeding the proliferation of MDA-MB-435 breast cancer cells. Furthermore, the metabolic stability of these compounds surpassed that of the most active molecule within the test set.

Employing 2D-QSAR methods encompassing multiple linear regression (MLR), multiple nonlinear regression (MNR), and artificial neural networks (ANN), alongside molecular dynamics, molecular docking, and ADMET properties evaluation, we assessed the viability of 31 hydroxyquinoline scaffold derivatives of MX-106 as selective survivin inhibitors. Molecular docking simulations were conducted to gauge the stability of compound C24, revealing the establishment of multiple hydrogen bonds with diverse residues. A subsequent 100-ns molecular dynamics simulation affirmed its sustained stability over the entire duration, indicating their potential suitability for further drug development endeavors.

Building upon the insights garnered from molecular modeling outcomes, we devised nine innovative compounds (Pred1, Pred2, Pred3, Pred4, Pred5, Pred6, Pred7, Pred8, and Pred9), anticipated by MLR models to exhibit potent survivin inhibitory activity. We advocate for a comprehensive evaluation of the ADMET properties of these newly proposed compounds, positioning them as promising candidates for pioneering anticancer agents targeting survivin inhibition akin to MX-106.

Keywords: QSAR, tumor cells, Molecular Docking, Molecular dynamic, ADMET properties, selective survivin inhibitors, cancer, MX-106 hydroxyquinoline scaffold.

ENTREPRENEURSHIP IN FLORICULTURE: TURNING PASSION INTO PROFIT

ABSTRACT
Floriculture, a dynamic sector of horticulture, has emerged as a lucrative avenue for entrepreneurship, particularly for individuals with a passion for flowers and ornamental plants. This paper explores the entrepreneurial potential within floriculture by analyzing how personal interest can be transformed into a profitable and sustainable business venture. The study delves into key components such as market trends, consumer preferences, value addition, and innovative marketing strategies, particularly in regions where floriculture is underdeveloped yet holds significant potential. With increasing demand for fresh flowers, potted plants, and floral arrangements across domestic and international markets, floriculture presents opportunities for both small-scale growers and commercial enterprises. The research highlights the importance of business planning, supply chain management, and quality control in building a competitive floriculture enterprise. Additionally, it investigates the role of technology, including greenhouse management, e-commerce, and digital marketing, in enhancing productivity and market reach. Case studies of successful floriculture entrepreneurs illustrate practical approaches to overcoming challenges such as climate variability, perishability of products, and fluctuating market prices. The paper also emphasizes government support programs, training initiatives, and cooperative models that can empower aspiring floriculture entrepreneurs. Ultimately, the study concludes that a blend of horticultural expertise, business acumen, and strategic innovation can enable passionate individuals to turn floriculture into a thriving entrepreneurial endeavor, contributing to economic development, rural employment, and environmental sustainability.

ABSTRACT
Tuberose (*Polianthes tuberosa*), a bulbous ornamental plant belonging to the family Asparagaceae, is esteemed for its aesthetically pleasing appearance, long-lasting flowers, and rich, sweet fragrance. Native to Mexico, this plant has gained global prominence, particularly in tropical and subtropical regions, where it is cultivated extensively for use in ornamental gardening, the cut flower industry, and perfumery. The horticultural importance of tuberose lies in its multifaceted applications ranging from floral arrangements and landscape architecture to extraction of essential oils used in high-value perfumes and aromatherapy products. This abstract delves into the comprehensive horticultural aspects of tuberose, including its morphological features, optimal growing conditions, propagation techniques (such as bulb division and tissue culture), and pest and disease management. It also addresses the plant's phenological behavior, varietal improvement, and post-harvest handling practices that affect flower quality and marketability. Furthermore, the economic potential of tuberose in both domestic and international markets is highlighted, along with its cultural and ceremonial relevance in several regions. Recent advances in biotechnology and breeding have opened new avenues for enhancing flower yield, disease resistance, and fragrance quality. As the demand for natural floral products increases, tuberose emerges as a vital crop in sustainable floriculture systems. This paper aims to provide a consolidated understanding of the horticultural significance of tuberose and promote its wider adoption in commercial and ornamental horticulture.

MSc. Bahrije DOBRA
Arditë KARAXHA

ABSTRACT

This study uses the "Green Test ECO 5 F-ANMEZ" instrument to measure the amount of nitrate ions (NO3-) in fruits and vegetables in Kosovo cities including Prishtina and Gracanica. In order to assess physical and chemical characteristics, such as pH, sugar content, and nitrate levels, in ten distinct plant products, the monitoring was conducted for approximately a month at six sampling locations at nearby marketplaces and warehouses. The purpose of our study is to assess how storage conditions affect the physico-chemical and organoleptic characteristics of fruits and vegetables. With the exception of a few instances of high nitrate levels in fruits like melons and other vegetables, our data demonstrated that nitrate concentrations in the majority of samples were within the allowed limits.

Additionally, by tracking changes in pH, sugar content, and structure over time, our study assessed how refrigeration affected the way fruits and vegetables were stored. Overall, our research indicates that the majority of products satisfy WHO-established local and worldwide quality criteria, and that handling and storage practices are critical to preserving the safety and quality of these agricultural products.

Keywords: refrigeration, pH, nitrate concentration, nitrate ions, fruits and vegetables, Prishtina, Gracanica, Green Test ECO 5 F-ANMEZ, and food quality requirements.

ABSTRACT

To address the rapidly growing use of probiotics in animal agriculture, this review discusses the effect of probiotics on animal growth and development, immune response, and productivity. Several benefits have been associated with the use of probiotics in farm animals, such as improved growth and feed efficiency, reduced mortality, and enhanced product quality. While the mechanisms through which probiotics induce their beneficial effects are not well understood, their role in modifying the gastrointestinal microbiota is believed to be the main mechanism. The use of probiotics in fresh and fermented meat products has been also shown to reduce pathogenic and spoilage microorganisms and improve sensory characteristics. Although many benefits have been associated with the use of probiotics, their effectiveness in improving animal performance and product quality is highly variable. Factors that dictate such variability are dependent on the probiotic strain being utilized and its stability during storage and administration/inoculation, frequency and dosage, nutritional and health status as well as age of the host animal. The utilization of probiotics in animal husbandry has garnered significant attention as a natural and effective strategy to enhance production performance and meat quality. This review synthesizes current research on the impact of probiotics on various livestock, including poultry, swine, and cattle. Probiotics, which are live microorganisms that confer health benefits to the host, have been shown to improve growth rates, feed conversion ratios, and overall health status of animals. Furthermore, they contribute to enhanced meat quality by influencing factors such as muscle composition, fat content, and oxidative stability. Mechanistically, probiotics exert their effects through modulation of gut microbiota, enhancement of nutrient absorption, and stimulation of the immune system. Studies also indicate a reduction in the incidence of diseases and a decrease in the need for antibiotic growth promoters, addressing concerns over antibiotic resistance. Despite promising results, variability in outcomes suggests that probiotic efficacy is influenced by factors such as strain specificity, dosage, and administration methods. Future research should focus on finding more effective probiotic strains for the desired use and identifying the optimum dose, administration time, delivery method, and mechanism of action for each strain/host. This review highlights the

potential of probiotics as a sustainable approach to improve animal performance and meat quality, contributing to more efficient and health-conscious animal agriculture.

Keywords: probiotic; gut microbiota; immune response; growth; efficiency; meat quality

IDENTIFICATION ANALYSIS OF BIOACTIVE CONSTITUENTS OF A MEDICINAL PLANT "*Sedum villosum* L" by UHPLC-DAD-HRSM

Amel ZITOUNI[1,2], Nassira GHEMBAZA[1,2], Nabila BELYAGOUBI-BENHAMMOU[1,2], Faiza IlYAS[1] .

1Department of Agri-food, faculty of Science and Technology, University of Ain Temouchent , ALGERIA;

[2]Laboratory of Natural Products, Department of Biology, Faculty of Natural and Life Sciences, Earth and Universe, University Abou- Bekr Belkaïd, 13000 Tlemcen, ALGERIA.

ABSTRACT

Several studies have shown that phytochemical compounds in medicinal plants protect against free-radical reactions, so their active ingredients are used as raw materials for medicinal chemistry modifications. Among these plants, we have chosen *Sedum villosum*, whose scientific research has confirmed that its phenolic compounds have antibacterial, antifungal and antioxidant activity.

In the present study, we are interested, to separate and identify two glycosyl the flavones from *Sedum villosum* L, family Crassulaceae collected in the flowering phase in Lakhdar Oued, village of Tlemcen (Algeria). The crude methanolic extract of the flowers part was fractionated on column chromatography, and eluted with dichloromethane/methanol each time with increasing polarity of methanol; 24 fractions were separated. One of these fractions named F16 showed more antioxidant activity to scavenge DPPH free radical with percentage inhibition of 94.849 %. F16 was separated by thin-layer chromatography (TLC) to give 10 compounds. We were chosen the sub-fractions F16.8, which has antioxidant activity of 77.02 %, provided two major molecules of glycosyl the flavones, analysed by ultra-high performance liquid chromatography coupled to mass spectrometry (UHPLC-DAD-HRSM).

Compound 1 was identified as 7, 3'-dihydroxyflavone-5-O-dihexosyl-4'-O-deoxyhexose and compound 2 was 7, 3'-dihydroxyflavone-5-O-hexose- 4'-O-deoxyhexose.

ABSTRACT

Natural lakes are a strategic reservoir for water resources and are also a bank for species in aquatic environments. Macroinvertebrates are considered the best bioindicators and reflect the state of these lakes. The objective of the current study was to inventory the aquatic macro-invertebrates of Lake Sidi Boudaroua Ouazzane, Morocco.

The observations under the microscope and the identification of species using identification keys have provided a clear idea of the trophic state of the environment. From the results of these analyses, we were able to build a results matrix. On this, descriptive statistical analyses were applied with the SPSS analysis software. These results show that a distribution of species has made it possible to highlight a seasonal temporal variation. A number of 237 individuals collected in the 3 sampling sites distributed in 11 orders, 22 families, and 26 genera testify to a good diversity of the Lac Sidi Boudaroua. The most abundant family is the Scarabaeidae (Coleoptera).

The biodiversity of macroinvertebrates reflects a significant floristic richness in the case of macrophytes and phytoplankton. Further taxonomic studies of all the biodiversity would make this site a real zoological and botanical garden that would attract not only researchers but also tourists and investors.

Keywords: Biodiversity, survey, macroinvertebrates, Sidi Boudaroua lake, Morocco

PHYSICOCHEMICAL CHARACTERIZATION OF THE WATER OF SIDI BOUDAROUA LAKE, OUEZZANE, MOROCCO: TOWARDS EXPLANATION OF BIODIVERSITY OF LAKE

Khalid Doumi[1*], Miloud Chakit[2], Adil Doumi[2] , Younes Yassine[1], Driss Belghyti[1]

ABSTRACT

A lake is an aquatic system in permanent exchange with the external environment on which it depends. The study aimed to determine the physicochemical characteristics of the Lake Sidi Boudaroua water for evaluating its impact on the biodiversity of this lake.

Seasonal sampling campaigns were organized during the year 2020 at the Sidi Boudaroua water body. The first was in January, the second in April, the third in July, and the fourth in September. Measurements of some physicochemical parameters were made in situ (pH, electrical conductivity, turbidity and dissolved oxygen). Anion contents (HCO_3^- and Cl^-) and cation contents (Ca^{2+}, Mg^{2+}, Na^+, and K^+) were measured. Four samples of sediments were collected for analyses of granulometry, organic matter and carbonate content.

The waters of the water body are weakly alkaline (average pH is 8.59) and moderately mineralized (average electrical conductivity is 1339 µs/cm). Cation levels reveal a high concentration of sodium (258.4 mg/L) and calcium (131.3 mg/L) and low concentrations of magnesium (20.80 mg/L) and potassium (6.82 mg/L). Anion levels show high values for chlorine (195.82 mg/L) and bicarbonates (134.55 mg/L). The Boudaroua water is well oxygenated (dissolved oxygen content is 8.12 mg/L on average) and weakly turbid (average turbidity is 7.38 NTU). The geochemical analysis generally reveals for all sites fairly low contents of organic matter and carbonates and high contents of minerals.

The Sidi Boudaroua water lake constitutes an interesting hydrological basin characterized by a facies of calcium-chloro-sodium bicarbonate. The chemical analyses show a variation related to seasonal climatic influence.

Key words : Sidi Boudaroua water, Biological quality, Physicochemistry, Ouezzane, Morocco.

ABSTRACT

ADAM-17, a protein disintegrin and metalloprotease domain-containing enzyme, also known as TACE (Tumor necrosis factor-alpha converting enzyme), plays a essential role in cleaving the Pro-Leu-Ala-Gln-Ala-/-Val-Arg-Ser-Ser-Ser sequence in the membrane-bound precursor of tumor necrosis factor alpha (TNF-alpha). In genomics and biotechnology, identifying the most harmful missense variants of ADAM-17 is critical for understanding its role in disease processes. To achieve this, we used a genomics approach with tools like Zinc Finger Nucleases, SIFT, PROVEAN, CRISPR-Cas9, MUpro, PyMol, Microarrays, and Swiss-Model. These tools analyze amino acid substitutions and predict their effects on protein structure and function. Zinc Finger Nucleases edit specific DNA sequences by targeting and modifying them using engineered proteins. SIFT and PROVEAN assess the functional impact of missense mutations, while CRISPR-Cas9 precisely edits DNA by cutting at specific sites for gene modification or correction.Microarrays analyze gene expression and detect genetic variations across many sequences simultaneously. MUpro predicts protein stability changes, and PyMol enables molecular visualization. Swiss-Model generates 3D protein models to assess structural changes. From the missense variants collected from the Ensembl database, seven non-synonymous single nucleotide polymorphisms (nsSNPs) were identified as high-risk and pathogenic by all prediction algorithms. These variants showed significant deleterious effects on the stability, structure, and function of ADAM-17, indicating their direct role in disease development. Further efforts are needed to fully explore the implications of these variants in genomics and disease mechanisms.

ABSTRACT

Manufacturing, processing, and distribution technology advancements determine the modern food industry. The demand for high-quality food among customers has changed due to changes in lifestyle and increased income. As people's knowledge of healthy eating and nutrition has grown, it is now crucial to implement strict quality control, value addition, and consumer appeal in food items. This study looks at the variables affecting willingness to pay (WTP) and consumer preferences for value-added fish products. Hence, the study objectives are to examine consumer preferences for value-added fish products based on cultural and socioeconomic features and to estimate the willingness to pay for value-added fish products. The representative sample size will be 400. A simple random sampling technique will be employed for data collection, and the primary data will be gathered through questionnaires from one district of South Punjab, Muzaffargarh. District Muzaffargarh is the greatest fish-producing district in South Punjab, which accounts for 43% of the region's overall fish production. A binary logistic regression will investigate the determinants of consumer preferences for value-added fish products. Either the Contingent valuation model (CVM) or the Tobit regression model will be used to estimate the willingness to pay.

Keywords: Consumer preferences, Cultural and Socioeconomic features, value addition, and Willingness to pay

ASSESSING FARMERS' WILLINGNESS TO ADOPT AND FUTURE DEMAND FOR HYBRID WHEAT VARITIES IN PUNJAB, PAKISTAN

ABSTRACT

Wheat is a vital crop in Pakistan that makes a substantial contribution to both the economy and food security. Wheat yield is still low and stagnant in Pakistan. There is a need to introduce hybrid wheat varieties that give a higher yield than conventional varieties. The global experience of the adoption of hybrid wheat reflects mixed results. Predominantly, hybrid wheat could not be adopted on a large scale for many reasons. There is a need to work on the adoption and demand of hybrid wheat in Pakistan. This study aims to estimate future demand for hybrid wheat varieties, analyze farmers' willingness to adopt hybrid wheat varieties, and also identify the factors affecting the adoption of hybrid wheat. The data of 240 farmers will be collected from three divisions; Multan, Faisalabad, and Bahawalpur using surveys and statistical models. The purposive sampling technique, the multinomial Probit model, and the Discrete Choice Experiment will be used. A factor analysis will also be used to identify the barriers in the adoption of hybrid wheat. The findings will help the government and seed producers to create effective marketing, pricing, and support plans.

ABSTRACT

Microwave radiation is gaining fame due to it cost effective nature in textile. In this study reactive green 6 dye has been used to dye cotton before and after MW rays. Dyeing variables selected were used to make the shades. It has been found that cotton and dye solution, if radiated for 2 min. high yield upto 25.19 K/S has been found. The radiated cotton if used to dye with dye bath of 10 *p*H having 2 g/100mL of salt at 80 °C for 30 min, excellent yield is found with good to excellent colorfastness. It is concluded that MW rays have potential to improve dyeing of cotton for various dyes.

ABSTRACT

The corrosion is one of the pathologies leading to the degradation of structures; it is at the origin of a large number of additional costs linked to the maintenance of these buildings. It is therefore important to adopt a preventive logic by trying to inhibit the effects of this disease, thus delaying the aging of these structures.

The aim of this work is to bring the different techniques for applying green corrosion inhibitors in reinforced concrete, which can help to assess or detect corrosion in order to minimize the damage caused by this pathology.

Two modes of corrosion inhibition are often used, either in the form of admixtures mixed with the mixing water or with the mass of fresh concrete, or on concrete hardened by surface impregnation techniques (migration inhibitors).

The introduction of corrosion inhibitors is based on the nature of these products, chemical or green, so that, we have cited the methods of extraction of green inhibitors through works in the literature.

ABSTRACT

This study investigated the effects of symbiotic fungi (Trichoderma harzianum and Epicoccum nigrum) on enhancing salinity tolerance in the medicinal plant licorice (Glycyrrhiza glabra L.). Salt-tolerant fungal strains were initially selected and formulated using vermiculite, compost, and sawdust as carriers. A pot experiment was then conducted under four salinity levels (0, 5, 10, and 15 dS/m). Results demonstrated that T. harzianum exhibited robust growth even at 2.14% sodium chloride concentration. While salinity stress significantly affected all measured parameters, fungal inoculation - particularly with E. nigrum - significantly improved plant height at 5 dS/m and increased root dry weight. These findings suggest that fungal treatments could serve as an effective biological approach to enhance salt stress tolerance in licorice cultivation.

ABSTRACT

This study was conducted to investigate the effects of different salinity stress levels on propagation methods of the medicinal plant licorice (Glycyrrhiza glabra L.) at the Sadough Research Farm of the National Salinity Research Center over three growing seasons (2020–2023). The experiment was arranged as a split-plot in a randomized complete block design with three replications, incorporating four irrigation water salinity levels (2, 4, 8, and 12 dS/m) and three propagation methods (seed, seedling, and root cuttings). The evaluated parameters included establishment percentage, plant height, and dry weight of aerial parts and roots. Results indicated that salinity significantly influenced all measured traits, whereas propagation method only affected plant height and establishment percentage. The highest plant height was recorded at 2 dS/m salinity, with no significant difference among propagation methods. At 4 dS/m, seed propagation yielded the tallest plants (44.66 cm). Under 8 dS/m salinity, root cuttings exhibited the lowest height, showing 31% and 36% reductions compared to seedling and seed propagation, respectively. At 12 dS/m, all propagation methods resulted in minimal plant height. The highest establishment rates were observed in seed propagation at 2 and 4 dS/m (77% and 66%, respectively) and in root cuttings at 8 and 12 dS/m (63% and 60%, respectively). In conclusion, root propagation proved more effective under high salinity, while seed propagation was optimal at lower salinity levels for licorice cultivation.

Keywords: Transplanting, vegetative propagation, rhizome propagation.

CONSTRAINTS, CAPACITIES, AND STRATEGIES FOR DEVELOPING THE CULTIVATION OF MEDICINAL PLANTS USING SALINE WATER AND SOIL RESOURCES

Rostam Yazdani Biouki[1], Mohammad Hadi Rad[2]

ABSTRACT

The quantitative and qualitative shortage of water resources and the need to create new job opportunities in Iran have made the utilization of saline water and soil resources essential. Reported research on the cultivation of medicinal plants under saline conditions is very limited, while considerable diversity in the germplasm of medicinal plants in terms of salinity tolerance has been documented. On the other hand, some reports indicate that with increasing salinity stress up to a certain level, yield decreases, but in some cases, the essential oil quality of certain medicinal plants improves. The importance of halophytes, especially medicinal halophytes, and their role in the economic exploitation of these resources is undeniable. Therefore, in this publication, while considering the advantages and capacities for developing the cultivation of medicinal plants, the constraints and challenges, strategies, and potentials of medicinal halophytes have been examined. Promising medicinal halophytes have also been identified. Among the studied species, 10 medicinal plants—**Peganum harmala (wild rue), Seidlitzia rosmarinus (ashnan), Alhagi maurorum (camelthorn), Portulaca oleracea (purslane), Rubia tinctorum (madder), Suaeda fruticosa (shrubby seablite), Glycyrrhiza glabra (licorice), Halocnemum strobilaceum (saltwort), Nitraria schoberi (nitre bush), and Capparis spinosa (caper)**—were selected due to their high salinity tolerance and classification as highly resistant species. These plants can be utilized to exploit saline water and soil resources in the country.

ABSTRACT

Here we present a theoretical study of non-fullerene electron acceptor-based thiophene (P1-P6) derivatives for organic solar cells using density functional theory (DFT) and time-dependent density functional theory (TD-DFT) [1]. In particular, we investigate the molecular electrostatic potential, boundary molecular orbitals, global reactivity descriptors and optical characteristics of the designed molecules. We conclude that all designed molecules exhibit low band gaps and excellent optical properties. Using PTB7-Th as an electron donor, we investigate the photovoltaic characteristics of the acceptors. As a result, the designed molecules exhibit high charge conduction capacity and efficient electron transport from PTB7-Th to the designed acceptors. The results obtained encourage researchers to study such compounds in the laboratory, which would improve the efficiency of non-fullerene organic solar cells [2].

This study was carried out in order to determine the power efficiency of the photovoltaic power plant by comparing the energy performance achieved during an unfavorable annual period over four consecutive years. The results obtained demonstrate the benefits of using photovoltaic panels to provide farmers with affordable electricity.

ABSTRACT

Depending on climatic conditions and forest-forming species, the plant litter decomposition in forests occurs at different rates. The recycling process of plant residue by invertebrates is associated with the vital activity of saprophages, which are about 70-80% of the total number of soil-inhabiting invertebrates.

The importance of animals in the decomposition of plant remains can be reduced to the following points:

- Passing plant tissues through their intestines, soil inhabitants activate both the vital activity of microorganisms and their physical and chemical effects.
- Using their enzymes and enzymes secreted by symbiotic organisms, invertebrates decompose some of the carbohydrates and other cellular inclusions, releasing lignin, which is in complex compounds with cellulose;
- One of the products of protein metabolism in many invertebrates is ammonia. In the intestines of soil-dwelling animals, condensation of lignin with ammonia occurs, which is of great importance for accelerating humification processes;
- In the digestion process in the intestines of soil inhabitants, partial mineralization of plant residues and in some groups - partial humification were noted;

- By vertically migrating in the soil, animals bring plant remains into the deep soil horizons and mix organic and mineral particles. Animal movements improve soil aeration, which stimulates aerobic processes of decomposition of organic material.

The activity of soil animals is closely related to the activity of soil microflora, and the functions of these groups are often intertwined. In many cases, soil inhabitants consume plant residues that have already been processed by microorganisms. At the same time, saprophagous excrements provide a favorable environment for bacteria and fungi, and in the soil, they are centers of microbial activity.

The study was made in the framework of the Project "Healthy Soil for Food Safety" [FR-23-268] and was supported by the Shota Rustaveli National Science Foundation of Georgia.

ABSTRACT

African catfish (*Clarias gariepinus*) is a fish species of significant economic importance worldwide. Its propagation technology is based on artificial induced propagation using various hormonal preparations. In regions with less developed infrastructure, the appropriate storage of these preparations, as well as the collected sperm until use, is often challenging. The ovarian lavage/insemination method offers the possibility to store sperm for a short time obtained from a donor male within the ovary of a recipient female prior to ovulation, while the same pituitary gland of the donor can be used to prepare a suspension for hormonal treatment of the female. Our aims were to investigate the effects of treatment with a hormonal suspension prepared from freshly collected African catfish pituitary on the ovulation of females, and the feasibility of combining hormonal induction with fresh pituitary and the insemination propagation method. In this experimental cycle, three experiments were conducted. In the first experiment, the effects of intramuscular hormonal induction using freshly collected pituitary combined with insemination on the reproductive traits of the females were compared to those induced by intramuscular administration of Ovopel™ (mGnRHa + metoclopramide). In the second and third experiments, ovarian treatment with sperm mixed with freshly homogenized pituitary was compared to both the intramuscular administration of fresh pituitary followed by insemination and the intramuscular treatment with Ovopel™. According to our results, the intramuscular administration of fresh pituitary extract combined with the insemination method can be an effective tool of the induced propagation of African catfish. The experiments demonstrated that the reproductive physiological condition of the donor individual providing the pituitary fundamentally determines the success of propagation using this method.

HEALTH BENEFITS AND NUTRITIONAL COMPOSITION OF GREEN PEAS

Dr. Muhammad Imran
Associate Professor, Department of Food Science, Faculty of Life Sciences, Government College University, Faisalabad, Pakistan
imran@gcuf.edu.pk

ABSTRACT

Green Peas since thousands of years have been considered as a key ingredient in multiple food preparation, salad dressing and cooking products. Green Peas have various varieties and almost all are considered versatile, nutritious, and healthy. Green Peas provide good source of protein, calories, vitamins, carbohydrates, dietary fiber, minerals, sugars and fat contents. Green Peas possessed low cholesterol, saturated fat, and salt. They are a good source of vitamin A, vitamin C, vitamin B6, vitamin K, folate, magnesium, thiamin, and manganese. Peas as fresh, canned, frozen, or dried form contain many health benefits. Green Peas stabilizes blood sugar levels, improves gut health, reduces the risk of cancer and protects against heart disease. Overall, Green Peas are good alternative source of protein and iron, especially in a plant-based diets.

ABSTRACT

Olive mill pomace (OMP), the semi-solid residue from olive oil production, presents a major environmental concern due to its high volume and phytotoxicity, including phenolic compounds and organic acids. This study evaluates a composting strategy to valorize OMP using bioreactor-based aerobic composting. Three bioreactors were tested with different mixtures: (1) straw + OMP, (2) urea + OMP, and (3) manure + OMP. The composting process was monitored over 60 days, with parameters such as temperature, moisture content, oxygen levels, and phenolic content tracked regularly. Bioreactor 3 (manure + OMP) demonstrated the most efficient composting profile, reaching thermophilic temperatures above 60°C within the first 5 days and sustaining them for over 10 days, ensuring effective pathogen reduction. Moisture content was maintained between 50–60%, while oxygen levels remained above 15%,

supporting aerobic microbial activity. A significant reduction in phenolic content (over 65%) was observed in Bioreactor 3, indicating detoxification of phytotoxic compounds. Nutrient analysis of the final compost showed increased nitrogen and organic carbon levels, confirming its potential as a soil amendment. The results affirm that co-composting OMP with suitable nitrogen-rich materials in controlled bioreactor conditions can convert a problematic agro-industrial waste into a valuable, nutrient-rich organic fertilizer. This aligns with sustainable waste management practices and supports circular bioeconomy initiatives in Mediterranean olive-producing regions.

ABSTRACT

Olive oil production generates large quantities of waste, mainly pomace and wastewater, posing serious environmental risks if not managed properly. This study examines the genotoxic, morpho-physiological and biochemical impact of olive pomace filtrate on hydroponically grown broad bean plant (Vicia faba). LC-MS/MS analysis identified over 20 phenolic compounds, with hydroxytyrosol (321.48 mg/l), verbascoside (86.49 mg/l) and vanillic acid (23.84 mg/l) being the most abundant. Exposure to increasing doses of pomace filtrate significantly reduced fresh and dry shoot and root biomass by 80% at high doses (20% v/v), as well as a reduction in photosynthetic pigments, carotenoids and relative water content. Conversely, increased application increased malondialdehyde (MDA) levels and the accumulation of sugars (sucrose, fructose and inulin) and 12 free amino acids. Microscopically, doses above 10% lowered the mitotic index, inhibited root cell division, and caused chromosomal abnormalities, including chromosome adhesion, fragmentation, delayed and damaged chromosomes, c-mitoses and micronuclei. These findings underscore the importance of treating olive production waste before environmental discharge or agricultural use.

Keywords: Olive pomace; Broad bean; Phenolic compounds; Genotoxicity; Free amino acids

SCREENING OF RHIZOSPHERIC ACTINOBACTERIA FROM PINE FOREST, CHAKRATA, UTTARAKHAND FOR PLANT GROWTH PROMOTION AND FUNGAL PATHOGEN BIOCONTROL POTENTIAL

Pooja Kapoor[1,2], Pooja Joshi[1,2], Vipin Parkash[2] and Manoj Pal[1]

1. Graphic Era (Deemed to be University), Department of Microbiology, Dehradun – 248 802, Uttarakhand, India

ABSTRACT

Actinobacteria are well known for their ability to promote plant growth and actively suppress fungal growth and infection in plants. This study aims to isolate and characterize Actinobacteria from rhizospheric soil samples collected from virgin Pine forests of Chakrata, Uttarakhand, India. Selective media, including Starch casein agar, Malt yeast agar and Actinobacteria isolation agar, amended with antibiotics and antifungal agents were used for isolation. Chemical and heat pretreatments were applied to enhance selectivity. A total of 15 morphologically distinct Actinobacteria were isolated. Preliminary screening based on colony morphology, Gram staining, and biochemical profiling confirmed the isolates as *Streptomyces* spp. *In vitro* tests such as Indole acetic acid production, Siderophore production, Ammonia production and Phosphate solubilization were performed to evaluate the plant growth promoting traits. The isolates were further evaluated for their antagonistic activity against phytopathogenic fungi of *Pinus roxburghii*. These findings highlight that the rhizospheric region of Pine species of Chakrata Pine forest is a reposing habitat for Actinobacteria having promising plant growth promoting traits with biocontrol potential. Future studies will involve greenhouse trials to evaluate their efficacy in growth promotion and suppressing fungal diseases in *Pinus roxburghii* and other economically important forestry species.

Keywords: Actinobacteria, antagonistic activity, disease management, forest soil microbiome, *Pinus roxburghii*, plant growth promotion

SCALE INSECT INFESTATION IN CITRUS ORCHARDS: A CASE STUDY FROM AÏN TÉMOUCHENT

ZOUBIR Souad[1], ILIAS Faiza[1,2], ZITOUNI Amel[3]

[1] Laboratory of Applied Hydrology and Environment, Faculty of Science and Technology, University of Ain Temouchent, Ain Temouchent 46000, Algeria
[2] Laboratory of Applied Genetics in Agriculture, Ecology and Public Health (GenApAgiE), Department of Biology, University of Tlemcen, Tlemcen 13000, Algeria
[3] Faculty of Science and Technology, University of Ain Temouchent, Ain Temouchent 46000, Algeria

ABSTRACT

This study, conducted in the Aïn Témouchent region of Algeria across three citrus orchards, aimed to assess the diversity and abundance of scale insects. The results revealed the presence of two species: *Parlatoria ziziphi* and *Planococcus citri*, belonging to the families Diaspididae and Pseudococcidae, respectively. The family Diaspididae was dominant in terms of species representation.

The findings indicate that *Parlatoria ziziphi* (Diaspididae) was the most prevalent species across the three citrus plots. Factors such as parasitism, predation, and natural mortality were found to play key roles in regulating scale insect populations.

Analysis of the infestation pattern showed that these pests were primarily active on the leaves, especially the upper surfaces, rather than on the branches. In terms of location, scale insects exhibited a strong preference for the first two orchards studied.

Keywords: Citrus, leaves, infestation, orchard

PESTICIDES AND THE GLOBAL ECONOMY: AGRICULTURAL AND ENVIRONMENTAL CHALLENGES AND SUSTAINABLE PERSPECTIVES

BENHOULA Mohammed[1], MECHIAH Fahima[1], LADOUALI Zeyneb[1], INOURI Ahlam[1], BOUCHEMAL Amina[1], MAGHLAOUI Zobeida[1], BOUCHERBA Nawel[1], MADI Nassim[1]

ABSTRACT

The global economy is profoundly influenced by the use of pesticides, which play a crucial role in agricultural productivity but also raise environmental and health challenges. On the one hand, these chemicals make it possible to increase crop yields, thereby reducing pest-related losses and supporting food security in the face of growing demand. On the other hand, their excessive use leads to soil and water pollution, loss of biodiversity and risks to human health, particularly in developing countries where regulations are less strict. The global pesticide market, dominated by a few multinationals, is worth several billion dollars, reflecting their economic importance. However, pressure for sustainable alternatives, such as organic farming and integrated pest management, is growing, forcing governments and industries to rethink their practices. Striking a balance between economic profitability and environmental sustainability remains a major challenge for the future of global agriculture.

Keywords: Pesticides, agricultural economics, pollution, food safety, sustainable agriculture.

MOLECULAR ANALYSIS OF CYST NEMATODE SPECIES IN THE MAIN POTATO PRODUCTION AREAS OF BLIDA PROVINCE, NORTHERN ALGERIA

ABSTRACT

Potato cyst nematodes (PCNs) *Globodera pallida* and *G. rostochiensis* present the most damaging species to potato culture. These parasites become a harmful potential in several important potato production localities in Algeria. The aim of this study was to estimate the infestation degree, the density of cysts, and the molecular identification of PCNs from three localities of Blida "El affroun" Mouzaîa and "Meftah" regions in northern of Algeria. Cysts were extracted by using the Fenwick method from soil samples collected in each location. Extracted cysts were stored dry in tubes for molecular characterisation (Specific PCR., ITS-rDNA, *cytb* gene mtDNA and sequencing). Potato cyst nematodes were found in one out of three localities sampled in Blida province with a prevalence of 33.33%. The average density of PCNs was 2.4 cysts/100 cm^3 of soil, and the infestation degree was 12.19 juveniles and eggs per 100 cm^3 of soil. Whereas, both areas of El afroun and Mouzaîa localities were free from PCNs. Molecular identification revealed that *G. pallida* occurred mainly in the infested surveyed area. The phylogenetic association with the European populations indicated that Algerian populations of PCN were probably introduced from Europe by infested seed-potato.

Keywords: *cytb* gene mtDNA, *Globodera pallida, ITS* rDNA, sequencing, specific PCR.

AGRO-MORPHOLOGICAL CHARACTERIZATION OF 17 LENTIL VARIETIES (LENS CULINARIS MEDIK) GROWN IN NORTH MOROCCO.

ABSTRACT

Although lentils (Lens culinaris Medik) are an essential legume in Morocco, appreciated for its nutritional benefits and its role in sustainable agriculture, its productivity remains low, with average yields below 1.5 tons per hectare, due to major challenges including the use of low-performance varieties, climate change (recurrent drought and high temperatures), soil degradation and fungal disease pressure. This study focuses on the agro-morphological characterization of 17 lentil varieties ABDA (L 593153-16), BEKRIA, BICHETTE (ILL 5562), ZARIA (L8635), HAMRIA (FLIP 87-48L), Chakkouf, Extra, L 24, ABOA, JAMAAT SHAIM, BELUGA, ANICIA, CLARA grown in the Mnasra region, Morocco, in order to assess their agronomic performance, morphological traits and adaptation to local

as well as the nutritional quality of the varieties for sustainable agriculture. Parameters measured in our field experiment include emergence time, vegetative phase duration, plant height, number of pods per plant, number of seeds per plant, 100-seed weight, seed yield and disease resistance.

The aim is to identify the best-performing varieties that are best adapted to local conditions, in order to provide recommendations to farmers and policy-makers for improving lentil productivity in Morocco. The results show variability between varieties, with Chakkouf ,Jamaat Shaim and Beluga lentils standing out for their by their rapid emergence, short vegetative phase and high yield, while Bekria is less suitable due to its sensitivity to drought. The study highlights the importance of selecting adapted varieties to improve the productivity and resilience of lentil crops in Morocco. lentil crops in Morocco.

ABSTRACT

Psychoactive substances (PAS) are substances that affect an individual's psyche by altering their neuropsychological functioning. They can disrupt the central nervous system's operations or stimulate immune system activity. Generally, these substances can be divided into those that have a calming effect, such as cannabis or opioids like tramadol, and those that have a stimulating effect, like tobacco, which is considered a stimulant of the central nervous system (CNS). The effects of these substances can vary depending on the dose consumed.

The objective of our study was to examine the effects of smoking and other psychoactive substances (PAS) on the immune system, specifically focusing on mental and biological changes. The study aimed to analyze the relationship between the degree of dependence on psychostimulants and antidepressants and their effects on bodily functions, and to determine the high-risk group for developing addiction and an inflammatory syndrome (IS) based on the age of initiation of smoking (starting tobacco use in childhood [9-13 years], adolescence [14-18 years], or adulthood [19-41 years]).

A self-assessment questionnaire was administered to 100 smoking subjects to gather data on the patient's demographic characteristics (age, age of smoking initiation, risk factors, etc.), mental health status (depression, anxiety, stress), and an analytical blood study on several hematological inflammatory parameters (White Blood Cells (WBC), Hemoglobin (HB), C-Reactive Protein (CRP), Erythrocyte Sedimentation Rate (ESR)). All the data were extracted from patient records and medical files used by the Boukhadra Intermediate Addiction Care Center (CISA).

In this study, we found a strong relationship between the level of nicotine and psychoactive substance (PAS) dependence and changes in both mental and biological aspects. We suggest a high risk of personal vulnerability and a sociocultural environment for individuals with a strong cigarette addiction, particularly those who started smoking during adolescence. The inflammatory profile appears to be an interesting biomarker to consider during PAS withdrawal.

Keywords: Psychoactive substances, tobacco, dependence, inflammatory parameters.

DIVERSITY AND VALORIZATION OF CITRUS FRUITS IN ALGERIA: TOWARDS RESPONSIBLE GROWTH

ABSTRACT

The cultivation of citrus fruits occupies a strategic place in the agricultural and agri-food sector in Algeria. It represents one of the main fruit production, with various varieties such as oranges, clementines, lemons and grapefruits. These varieties grown mainly in the north of the country (Blida, Chlef, Mostaganem, Mitidja, Skikda....) represent not only a valuable agricultural heritage but also a major economic growth potential. However, in the face of global environmental and economic challenges, it is necessary to improve cultivation techniques, promote sustainable practices and enhance their products (juices, essential oils, jams). This also means developing export markets and implementing policies that promote quality and innovation in the citrus sector.

Keywords: Citrus, production, varieties, challenges, innovation, Algeria.

BACTERIAL AND SEROLOGICAL SURVEY STUDY ON PATIENTS WITH TONSILITIS INTRODUCTION

Prof.Dr.Hawraa Abdulameer Ali AL-Dahhan[1] , Zahraa Ghaleb Taleb[2] , Muhamed Hussain[3] ,Hasan Slim Zarir [4]

Pathological Analyses Department / College of Science/ University of Kufa/Iraq
Hawraa.aldahan@uokufa.edu.iq

ABSTRACT

Background: Tonsillitis is a prevalent upper respiratory tract infection, often linked to *Group A Streptococcus (GAS)*. The evaluation of inflammatory markers such as Antistreptolysin O Titer (ASOT), C-Reactive Protein (CRP), and Erythrocyte Sedimentation Rate (ESR) plays a crucial role in diagnosing GAS infections and identifying potential complications, including rheumatic fever.**Objectives:** This study aimed to assess the levels of ASOT, CRP, and ESR in patients diagnosed with tonsillitis, investigate their variations across different age groups and genders, and determine their clinical significance. Additionally, the study sought to identify the most common bacterial pathogens associated with tonsillitis cases.**Methods:** A total of 80 patients with clinically confirmed tonsillitis were included in the study. Throat swabs were collected for bacterial culture and identification, while blood samples were analyzed for ASOT, CRP, and ESR levels. Statistical analysis was conducted using One-Way ANOVA followed by Tukey's post-hoc test to compare biomarker levels among different patient groups.**Results:**Children aged 1-10 years had significantly higher ASOT levels compared to adults ($p = 0.021$), suggesting frequent exposure to GAS infections in younger populations.CRP and ESR levels declined with increasing age, indicating a stronger inflammatory response in children compared to adults.No statistically significant gender-based differences were found in ASOT, CRP, or ESR levels ($p > 0.05$).*Streptococcus pyogenes* was the most frequently isolated bacterial species (55%), followed by *Staphylococcus aureus* (18%) and *Haemophilus influenzae* (12%).**Conclusion:** The findings of this study emphasize the clinical value of ASOT, CRP, and ESR in diagnosing GAS infections and assessing inflammation severity in tonsillitis patients. ASOT remains a reliable marker of past GAS exposure, while CRP and ESR serve as useful indicators for distinguishing bacterial from viral infections. Early diagnosis and timely antibiotic treatment can help prevent serious complications such as rheumatic fever. Future research should focus on investigating genetic and environmental influences on immune responses in patients with recurrent tonsillitis.

Keywords: Tonsillitis, *Streptococcus pyogenes*, ASOT, CRP, ESR, Rheumatic Fever, Inflammatory Markers, Bacterial Infections.

ROLE OF ESSENTIAL OILS IN IMPROVING THE QUALITY OF BEEHIVE PRODUCTS: TOWARDS SUSTAINABLE BEEKEEPING IN SUPPORT OF AGRICULTURE

ABSTRACT :

In the context of a transition towards more sustainable and biodiversity-friendly agriculture, beekeeping plays a key role not only through the production of honey, propolis, and royal jelly, but also through its impact on crop pollination. However, the health of bee colonies remains seriously threatened by the intensive use of pesticides, pathogens, and environmental disturbances. In response to these challenges, essential oils (EOs) are emerging as a promising natural alternative.

Several studies have shown that certain EOs, such as those from thyme, eucalyptus, or rosemary, have beneficial effects: they act against pathogens (*Varroa destructor*, *Nosema spp.*), strengthen the bees' immune system, and improve the physicochemical quality of honey and other hive products.

Beyond colony protection, the rational use of EOs is part of an agroecological approach that enhances the positive interactions between beekeeping and agriculture. By improving the resilience of beehives and the quality of beekeeping products, these practices contribute to food security, the development of local value chains, and the promotion of more sustainable farming systems.

Keywords : Essential oils, sustainable beekeeping, hive products, agriculture, bee health, agroecology.

STIMULATING THE DEVELOPMENT OF THE SPRING WHEAT ROOT SYSTEM AS A WAY TO ELIMINATE THE NEGATIVE IMPACT OF OVERDENSITY SOIL

ABSTRACT

In today's climate change conditions and intensive anthropogenic load on soils, ensuring increased crop productivity is extremely relevant for the agro-industrial sector not only in Ukraine but throughout the world. Due to a large number of technological operations, the soil undergoes physical degradation, which leads to poor plant development and reduced yields. One of the elements of the technology for growing crops on soils with unfavorable physical properties can be the selection of varieties that are most adapted to unfavorable parameters and the use of growth stimulants that help increase the efficiency of plant use of nutrients and the development of their root system.

The aim of our research was to study the effect of seed inoculation with growth stimulants on the development of the root system of spring wheat varieties of different intensity under the conditions of its cultivation on soils with an overdensity sub-seed layer**.** The study was conducted in a model laboratory experiment according to the following scheme: control (soil structure density > 1.3 g/cm^3, without seed inoculation); option 1 (soil structure density > 1.3 g/cm^3, seed inoculation with the biostimulant "Azotofit"); option 2 (soil density > 1.3 g/cm^3, seed inoculation with the growth stimulator "Vympel"). The studied spring wheat varieties are the intensive variety Moisa and the semi-

intensive variety Xanthiia. The experiment maintained an optimal level of moisture – 75 % of the lowest moisture capacity. The studies were conducted until the plants had 4 leaves. The soil is typical low-humus chernozem.

Research has shown that seed inoculation with a growth stimulant is an effective means of improving the development of the plant root system, which develops in an overdensity soil layer. It was found that the treatment of spring wheat seeds contributed to an increase in root length, depending on the variant by 2 – 12 %. The increase in the length of spring wheat roots when treated with Azotofit and Vympel growth stimulants for the intensive variety was 6 % and 12 %, respectively, and for the semi-intensive variety - by 2 % and 6 % compared to the control.

Pre-sowing treatment of spring wheat seeds contributed to an increase in root diameter from 3 to 32 % depending on the variety grown. Thus, for the intensive variety, when seeds were inoculated with the growth stimulator Azotophyte, the increase in diameter was observed by 22 %, and in the variant with Vympel by 32 % compared to the control. For plants of the semi-intensive variety of spring wheat, significantly lower increases in root diameter were noted, which amounted to only 3 % compared to the control.

A tendency to increase the biological yield of spring wheat was noted when seeds were inoculated with growth stimulants. When grown on overdensity soils, plants of the intensive variety of spring wheat, compared to the semi-intensive variety, were more adaptive and had a better response to cultivation. The greatest increase in yield was found in the variant with seed treatment with the growth stimulant Vympel when growing the intensive variety, which was 69 %, and with Azotophyt 20 % compared to the control. The increase in variants with the cultivation of the semi-intensive variety of spring wheat with seed inoculation with Vympel is 5 %, and for the variant with Azotophyt – 8 %.

Therefore, one of the ways to improve the development of the spring wheat root system in overdensity soil layer can be to inoculate seeds with growth stimulants, which contributed to the improvement of the root system parameters and the subsequent increase in biological yield.

Keywords: soil, density, growth stimulator, agricultural crop, variety.

PHYTOCHEMICAL COMPOSITION, NUTRITIONAL SIGNIFICANCE AND UTILIZATION OF VARIOUS LEAVES IN POULTRY NURITION; A REVIEW

Awobona E. O.,[1] Olatunji H.T.[2] and Adebayo R. A. [3]

[1, 2, 3] Animal Production Department, School of Food Science and Agricultural Technology, Federal University of Technology Minna.

ABSTRACT

This review examines the agricultural, phytochemical, and medicinal aspects of six herbs commonly used in various culinary and medicinal practices: curry leaf (*Murraya koenigii*), basil (*Ocimum basilicum*), lemon grass (*Cymbopogon citratus*), fenugreek leaf (*Trigonella foenum-graecum*) nutmeg (*Myristica fragrans Houtt*), and bay (*Laurus nobilis L*). Each herb possesses unique characteristics and active compounds that contribute to its flavor, aroma, and potential health benefits. Curry leaf, native to India, Bangladesh, and Sri Lanka, is rich in phytochemicals such as flavonoids, alkaloids, and saponins. Basil, widely cultivated in Europe and the USA, contains various phytochemicals including estragole, eugenol, and linalool, which contribute to its aromatic flavor and potential health benefits. Lemon grass, native to Asia, is abundant in volatile compounds like citral and phenolic compounds such as caffeic acid, exhibiting antimicrobial and antioxidant properties. Fenugreek leaf, originating from the Mediterranean region, contains flavonoids, alkaloids, and saponins, offering potential benefits for digestive health and blood sugar regulation. These herbs play versatile roles in culinary practices, adding flavor and aroma to dishes such as curries, soups, and beverages. Moreover, they have been used in traditional medicine for their various health benefits, including anti-inflammatory, antimicrobial, and digestive properties. Additionally, the inclusion of these herbs in poultry diets may enhance growth performance, support immune function, and reduce stress in poultry production.

NANOPARTICLE (NANOCURCUMIN) AND CURCUMIN; A REVIEW ON THEIR EFFECT ON POULTRY, RABBIT AND SWINE PRODUCTION

Olatunji H.T.,[1] Awobona E. O.[2]
[1, 2] Animal Production Department, School of Food Science and Agricultural Technology, Federal University of Technology Minna.

ABSTRACT

Nanotechnology a rapidly developing scientific discipline, that has extensive application in the medical sciences. Its applications in monogastric animal nutrition are, however, limited. Studies on curcumin and curcumin nanoparticles as pharmaceutics in animal nutrition have been conducted. Nevertheless, research has indicated that the use of curcumin or turmeric powder has little effect on the health of animals because of its limited bioavailability, which may be caused by its rapid metabolism, poor absorption, and rapid excretion from the body. These factors necessitate the use of refined curcumin formulations. Through the use of biodegradable and biocompatible nanoparticle forms, curcumin nanoparticles a recently developed area of nanobiotechnology may have positive impacts on monogastric animal health, growth performance, antimicrobial, anti-inflammatory, and neuroprotective effects. In order to emphasize the possible use of curcumin and curcumin nanoparticles in the field of monogastric animal production, this review was conducted. We think the review offers a clear perspective on how curcumin and curcumin nanoparticles will develop in the future and how they might be used in monogastric farm animal production.

DETERMINATION OF THE LEVEL OF SOME FAT-SOLUBLE VITAMINS AND WATER-SOLUBLE VITAMINS IN FARM CHICKEN, TURKEY, AND DUCK EGGS

[1]Adulsamiu Inuwa Bello., [2]Tela, Aminu H., [3]Maryam Muhammad Sodangi

[1,3]University Putra Malaysia.
[2]Department of Chemistry, Yobe State University Damaturu, Nigeria.
Abdulsamiuinuwa23@gmail.com

ABSTRACT

This study investigates the concentrations of fat-soluble (Vitamins A and E) and water-soluble (Vitamin B6 and C) vitamins in the egg yolks and whites of farm chicken, turkey, and duck eggs. The primary objective was to provide a comprehensive evaluation of their nutritional value, with a focus on vitamin content and associated health benefits. Egg samples were sourced from local markets in Damaturu, Yobe State, Nigeria, and analyzed using High-Performance Liquid Chromatography (HPLC) for precise quantification. The results revealed significant variations in vitamin concentrations among the different egg types. Duck eggs exhibited the highest levels of fat-soluble vitamins, with sample DWB (duck egg) recording the highest concentration of Vitamin A (254.6 µg/g) and Vitamin E (0.85 mg/g), surpassing those found in chicken and turkey eggs. Chicken eggs, particularly sample CWA, showed considerable Vitamin A content (194.8 µg/g), while turkey eggs contained lower concentrations of Vitamins A (ranging from 91.9 to 128.3 µg/g) and E (0.31 to 0.43 mg/g). Water-soluble Vitamin B6 was present in all samples but in relatively low amounts, with duck eggs again demonstrating the highest concentration (0.15 mg/g in sample DWB). Notably, Vitamin C was not detected in any of the egg samples analyzed, confirming that poultry eggs are generally poor sources of this water-soluble vitamin. The findings of this study highlight the superior nutritional profile of duck eggs, particularly as rich dietary sources of fat-soluble vitamins (A and E) and comparatively higher levels of Vitamin B6. These findings offer valuable insights for consumers seeking to enhance their vitamin intake through dietary choices and provide useful information for the poultry industry in product development and nutritional marketing. Furthermore, the absence of Vitamin C across all egg types reinforces the need to complement egg consumption with other dietary sources of this vitamin for balanced nutrition.

VALORIZATION OF LOCAL POMEGRANATE: A STRATEGIC PATH TO EFFICIENT RESILIENCE

BOURENINE KAHINA, NAIT KACI-BOUDIAF MALIKA, SAADOUN NORIA

Natural Resources Laboratory, Faculty of Biological Sciences and Agronomic Sciences, Mouloud Mammeri University, Tizi-Ouzou, Algeria.
Kahina.bourenine@ummto.dz

ABSTRACT

In the context of global change, characterized by climate disruptions, desertification, and biodiversity loss, the valorization of local varieties of pomegranate (*Punica granatum* L.) emerges as a strategic lever for sustainable rural development in Algeria's arid regions. These landraces, well-adapted to extreme edaphoclimatic conditions, constitute a valuable genetic resource, offering resilience against water scarcity and erratic rainfall patterns. Their cultivation not only enhances food and nutritional security for rural communities but also contributes to local economic empowerment through the valorization of derived products, such as juices, syrups, and medicinal extracts. Furthermore, their integration into sustainable agroecosystems supports the conservation of agrobiodiversity and helps mitigate rural exodus. Thus, promoting local pomegranate varieties aligns with agroecological and territorial development approaches, which are essential to address the multifaceted challenges posed by global environmental and socio-economic changes in Algeria's arid zones.

Keywords: *Punica granatum* L., local cultivar, resilient agroecosystems, arid region, sustainable rural development.

EFFICACY OF Iron MICRONUTRIENT ON FUSARIUM WILT (*Fusarium oxysporium* f.sp *lycopersici)* AND YIELD OF TOMATO (*Solanum lycopersicum* L)

Ajiwe, S.T *.,[1] Lawal, I.T.[2]., Ganiyu, C.P., Adeniyi, R. and Oluwasanmi, F. A.[1]

[1]Department of Crop and Animal Science, Ajayi Crowther University, Oyo, Nigeria.

ABSTRACT

Fusarium oxysporum is a serious pathogen that causes Fusarium wilt in tomato. Iron (Fe) micronutrient has been reported to have fungicidal effect in the control of plant pathogens. In 2024, field experiments were conducted during the wet and dry seasons at the Teaching and Research Farm of Ajayi Crowther University in Oyo, Nigeria to determine the efficacy of iron micronutrient on *Fusarium* wilt and fruit yield of tomato. The experiment was a 2 x 5 factorial experiment fitted into Randomized Complete Block Design with three replicates. The treatments consisted of two tomato varieties (Roma and Royal VF), Fe, with three concentrations (1.0, 1.5 and 2.0 ml/L) and Carbendazim, a synthetic fungicide, was used as positive control. The treatments were applied using soil drenching. The untreated plots served as control. Results showed that Roma VF treated with 1.0 ml/L Fe micronutrient in both wet and dry seasons had the lowest (1.00 and 0.00 %, respectively) disease incidence and produced significantly higher yields (20.5 tons/ha and 19.5 tons/ha) respectively in both wet and dry seasons. The study concluded that application of Fe micronutrient at 1.0 ml/L significantly reduced *Fusarium* wilt and increased the fruit yield of tomato and hereby recommended for farmers to control plant fungal diseases

Keywords: Tomato, *Fusarium oxysporum*, fungicidal, iron micronutrient.

KNOEVENAGEL REACTION CATALYZED BY APATITE AND SODIUM-MODIFIED APATITE: A FAST, EFFICIENT, AND SUSTAINABLE APPROACH

Ayoub. LAMTITA ,,Bahija. MOUNIR, Fathallaah. BAZI

[a]Laboratory of analytical and molecular chemistry(LCAM). Faculty of Sciences Ben M'Sik. Hassan II University of Casablanca. Morocco
* Email of the author: ayoublamtitaa@gmail.com

ABSTRACT

Knoevenagel reaction is a key method for forming carbon-carbon bonds, widely used in the synthesis of bioactive compounds and functional materials. In this study, we explored the efficiency of apatite and sodium-modified apatite as catalysts for the Knoevenagel reaction at room temperature and under solvent-free conditions. Due to its porous structure and surface properties, apatite provides an excellent catalytic support. The introduction of sodium enhances catalytic activity by modifying the surface acidity and basicity[1]

Experimental results show a high yield, reaching optimal values in a relatively short reaction time, demonstrating the efficiency of these catalysts. Moreover, apatite and sodium-modified apatite can be easily recovered and reused without significant loss of activity, making them a sustainable and economically viable alternative for environmentally friendly organic reactions.

ABSTRACT

Rising global demands on food systems together with environmental systems and rural survival require immediate design strategies which foster countryside transformation. This article documents how agri-architecture presents itself as an innovative method for developing agricultural properties which foster multiple benefits between sustainability and agricultural growth with ecological adaptability together with traditional heritage protection. The investigation of Agrotopia in Belgium and Jianamani Visitor Center in China serves this study to explain how architectural designs boost both local food systems and maximize resources and enable local communities to gain power. Through design that combines multiple functions and renewable resources the research demonstrates how built structures develop agroecological connections. The paper establishes an academic link between architectural practice and agricultural concerns and rural planning to build a resilient community development approach built upon spatial creativity and ecological preservation. The study feeds into an increasing body of knowledge about rural design potential to tackle sustainable challenges in the twenty-first century.

Keywords: Agri-architecture; Sustainable agriculture; Rural development; Productive landscapes; Ecological design.

AGRICULTURAL HUBS: DESIGNING SPACES FOR FOOD PROCESSING, STORAGE, AND DISTRIBUTION

ABSTRACT

Aging global concerns about food security, climate change and urbanization have led to architectural design of agricultural hubs becoming an essential answer for food system support. The research analyzes how combined spatial organization enhances the efficiency of food production and warehousing and movement operations within facilities which benefit both metropolitan and rural populations. This research examines three critical agricultural complexes Agripolis in Italy together with FoodPort in the United States and AgriNEST in India to discover operational efficient and sustainable community-centered design approaches. They establish modular approaches and renewable energy frameworks and circular economy operations together with agro-education as main components for developing sustainable food infrastructure. The study confirms how architectural design promotes flexible food networks which unite diverse users with nature-based solutions. This paper establishes a guide to creating agricultural centers that handle present-day food system operational and economic barriers while fostering sustainability principles.

Keywords: Agricultural Hubs; Food Processing Architecture; Food Storage Design; Distribution Logistics; Agri-Tech Infrastructure.

ARCHITECTURE FOR AGRICULTURAL JUSTICE: SPATIAL EQUITY IN THE DESIGN OF FOOD-PRODUCING COMMUNITIES

ABSTRACT

The paper analyzes how architectural design creates just and equal agricultural spaces by studying their essential part in building balanced food-producing areas. Architecture serves as an influential tool to deal with systemic food access issues that result from growing urbanization together with worsening socio-economic divisions. The study analyzes several projects such as the Edible Schoolyard Project in Berkeley together with Agropolis in Paris and Mukuru Slum Upgrading Project in Nairobi by examining how various space-based interventions support food education and empower vulnerable communities while making them resilient. Through its analysis this research shows that food-system integration into cities requires planning based on rights and partnerships between communities and policy-conforming architectural approaches. Multi-functional inclusive spaces serve as a platform for architects to reach dual goals of sustainability and social equality in food production systems. Architecture demonstrates the potential for defining significant changes in food systems which requires us to adopt a complete transformation of design theory in modern urban planning approaches.

Keywords: Agricultural Justice; Spatial Equity; Urban Agriculture; Participatory Design; Food-Producing Communities.

DESIGNING THE PRODUCTIVE COUNTRYSIDE: ARCHITECTURAL APPROACHES TO SUSTAINABLE AGRICULTURE

ABSTRACT

The combination of architecture with agriculture stands as an essential tool for promoting sustainable rural improvement because global problems continue to worsen. The paper studies how architectural design frameworks create sustainable productive environments along with ecological balance for rural territories. The research examines international projects consisting of Les Grands Voisins in France, Bujira Cultural Center in Rwanda and Songyang County in China through which the study recognizes three principal architectural techniques that comprise adaptive reuse, bioclimatic design and vernacular preservation. The strategic solutions provide evidence about how mixed-use environments create environments that support food security and maintain cultural heritage together with social cohesion. A new rural planning model is proposed by the article which transforms architecture into a dual instrument for farming productivity support while generating social empowerment and helping the environment. This research moves forward regenerative design principles through its presentation of an all-encompassing approach to design the productive rural landscape.

Keywords: Sustainable Architecture; Productive Countryside; Rural Development; Bioclimatic Design; Agro-architecture.

HYBRID LANDSCAPES: ARCHITECTURE AT THE INTERSECTION OF FARMING, ECOLOGY, AND COMMUNITY

ABSTRACT

Cities face an urgent need for comprehensive redesign because urban dwellers grow rapidly while environmental problems become more severe between ecological systems and living spaces and urban infrastructure. The analysis studies how living landscapes enable agriculture and housing and infrastructure to unite through well-designed sustainable methods. The paper investigates spatial planning effects through an interdisciplinary approach that analyzes the Agrotopia Rooftop Greenhouse, Edible Schoolyard in New Orleans as well as Sunqiao Urban Agricultural District in Shanghai. The research implements a qualitative study design which includes spatial studies and policy assessment to identify vital design principles and implementation tools. The analysis reveals that mixed-use green areas accomplish climate cooling while improving both ecosystem diversity and community interaction and social equality. The research design introduces architectural mediation between buildings and ecology to create sustainable urban development models which can be reproduced.

Keywords: Hybrid Landscapes; Sustainable Architecture; Urban Agriculture; Ecological Design; Green Infrastructure.

LIVING LANDSCAPES: INTEGRATING AGRICULTURE, HOUSING, AND INFRASTRUCTURE THROUGH DESIGN

ABSTRACT

The expansion of urban populations combined with worsening environmental conditions creates an essential chance to develop new urban planning methods which unite agriculture with housing and infrastructure. The article unveils the design framework Living Landscapes which unifies natural systems with built structures to create cities that are sustainable resilient and oriented toward communities. The article investigates food security alongside climate resilience and social relations in urban areas by studying three international examples namely Serenbe (USA), R-Urban (France) and Songdo (South Korea). The study confirms that inclusive design methods together with resource recycling technologies and intelligent systems help develop city areas into operational ecological systems. Optimal policy structures together with inter-sectorial institutional partnerships enable the expansion of urban food production models throughout different urban systems. The article promotes urban infrastructure transformation by advocating to treat urban agriculture as an essential element instead of a supplemental feature.

Keywords: Living Landscapes; Urban Agriculture; Sustainable Urban Design; Integrated Infrastructure; Agrihoods.

ABSTRACT

Our work consists of implementing manufacturing processes for composite membranes based on local materials: bentonite clay and activated carbon (CA), with a view to their use for the treatment of industrial effluents and natural waters. These discharges present quite important pollution indicators that do not meet the Algerian norm or the OMS. The membrane support was developed by mixing the activated carbon and the clay first followed by the binder then the gelling agent and lastly the organic plasticizer. It is noted that all composite parts sintered at 500°C with a CA percentage of 5wt. % and addition of solvent at 50% were retained, because their appearance is homogeneous, and does not present any cracks. MEB analysis showed that the membrane type is an ion exchange in the presence of clay and activated carbon especially in the percentage of 5 wt. % of CA. The result of the IR analysis shows us that the absorption values of the wave number before and after treatment by our membranes are different; hence the peaks which indicate the existence of effluents are shown after treatment by the effluent.

Key words: Effluents, ultrafiltartion, membrane system, composite materials.

IMPACT OF TECHNOLOGY ADOPTION ON COTTON PRODUCTION IN DISTRICT SIBBI

Abdul Rehman[1], Arqam Iqbal[1]*, Mudassar Yasin, Sami ullah[1], Abd-Ur-Rehman[1]

ABSTRACT

Cotton as a cash crop is grown in more than 80 countries and is termed as 'white gold'. It is a widely cultivated profitable fiber crop and a major source for national economic development. However, its importance has been neglected over the past few decades due to losses in production and profitability. In the current scenario, technology adoption appears to be a viable solution to minimize production loss, enhance quality, and ensure sustainability. By examining the adoption of technological practices in cotton farming and its subsequent impact on production outcomes, this study contributes to a deeper understanding of the dynamics between technology, agriculture, and rural development in District Sibi, Balochistan. The data was collected through a comprehensive approach, employing face-to-face interviews conducted via simple random sampling to gather primary data from 120 farmers. The main analytical technique utilized in this research is propensity score matching (PSM). This technique allows for Arobust assessment of the causal relationship between technology adoption and cotton production by minimizing selection bias. Results of the analysis show that technology adopters have a significant influence on cotton production, increasing yields by up to 38% compared to conventional practice adopters. This study is at the top of the policy agenda, as it identifies the challenges faced by farmers in the study area. These challenges can only be overcome by improving farmers' access to technology and through proper policy interventions.

Keywords: Cotton, Technology Adoption, PSM, Sibi

ECONOMIC AND SUSTAINABILITY ANALYSIS OF COTTON; A COMPARISON OF CLIMATE RESILIENT PRACTICES AND CONVETIONAL PRACTICES IN MULTAN

Anisa Abdul Rehman[1], Arqam Iqbal[1]*, Mudassar Yasin[2], Sami Ullah[1], Ali Imran[3]

ABSTRACT

Cotton production is a critical component of Pakistan's agricultural economy, particularly in regions like Multan, where it serves as a major cash crop. However, conventional cotton farming practices often lead to environmental degradation, high input costs, and vulnerability to climate change. This study conducts a comprehensive economic and sustainability analysis of cotton production in Multan, comparing climate-resilient practices (such as drought-resistant varieties, precision irrigation, integrated pest management, and organic farming) with conventional practices (reliance on synthetic fertilizers, pesticides, and flood irrigation). This study used benefit-cost analysis to understand how climate-resilient practices (such as drought-resistant varieties, precision irrigation, integrated pest management, and organic farming) beneficial with conventional practices (reliance on synthetic fertilizers, pesticides, and flood irrigation). The key findings indicated that climate-resilient practices impact on water consumption, input costs, and improve soil health, though initial adoption but still barriers exist. The findings suggested that subsidies for sustainable technologies, farmer training programs, and incentives for transitioning to eco-friendly practices will play a pivotal role in upscalling the adoption and enhance economic resilience and environmental sustainability in Pakistan's cotton sector.

ABSTRACT

Fermented foods, shaped by microbial activity, offer a wide spectrum of applications ranging from nutritional enhancement and therapeutic benefits to innovations in food technology. Rich in bioactive substances such as probiotics and peptides, they support immune system efficiency, metabolic balance, and gut health. Additionally, fermentation increases food quality, prolongs its shelf life, and supports both artisanal methods and industrial applications.

With a focus on their applicability in addressing modern issues like food security, sustainability, and antibiotic resistance, this presentation provides a succinct introduction to fermented foods and explore their growing potential in interdisciplinary sciences.

Keywors : Fermentation, functional food, agrifood system, microbes, resilience

PESTICIDAL EFFICACY OF *Nerium oleander* LEAF EXTRACT ON THE SURVIVAL OF *Pachnoda interrupta* (Sorghum Chafer) UNDER FIELD AND LABORATORY CONDITIONS

Bate, Garba Barde
Department of Environmental Management and Toxicology, Federal University Dutse, Jigawa State, Nigeria
bategarba@yahoo.com

ABSTRACT

Pachnoda interrupta is a damaging pest of sorghum and other cereals that leads to complete crop losses, the management of which relies heavily on chemical pesticides. This pest was exposed to *Nerium oleander* leaf extract under field and laboratory conditions to determine its pesticidal effect. Healthy mature *N. oleander* leaves were collected in a paper bag while adult Sorghum chafers were collected by handpicking and kept in plastic jars which allowed ventilation and prevented escape as they were acclimatized for three days. The leaves were rinsed with distilled water, air dried and grinded with an electric grinder. Maceration extraction was conducted, the extract was strained through a filter paper and distilled water was used to prepare four different concentrations (10, 20, 30, and 40%) to which ten insects were exposed both in the field and laboratory while a control group was treated solely with distilled water and probit analysis was conducted. The constituent compounds of the extract were identified using gas chromatography–mass spectrometry (GC–MS). Bioassay results showed no mortality in the control group, the lowest mortality was 20% in the 10% and the highest was 80% in the 40% extract treatment with the LC_{50} being 231.77 mg/l. The knock down effects in field experiment was zero in the control and 10% treatment while it was highest (11) in 40% treatment. Bioactive compounds identified were cardiac glycosides including oleandrin, neriin, folinerin, digitoxigenin etc. *Nerium oleander* extracts are strongly recommended for standardization and use as biopesticide against *Pachnoda interrupta.*

Keywords: *Pachnoda interrupta; Nerium oleander;* Maceration; Biopesticide; LC_{50}; Knock down effect

EVALUATION OF SOIL MANAGEMENT WITH VARIOUS INSECTICIDES IN CONTROLLING THE OVERWINTERING STAGES OF THE MEDITERRANEAN FRUIT FLY

ABSTRACT

Mediterranean fruit fly, Ceratitis capitata(Wiedemann) (Diptera: Tephritidae), is the globe's most significant pest of horticulture since it has a wide host range and is economically as well as trade-destruction able. Since the harmful effects of pesticides on human beings, the ecosystem, beneficial insects, and the huge cost incurred in repeated spraying, the current study was conducted to evaluate the application of various insecticides through soil drenching to control the larval and pupal stages of this insect. With an ideal use of its biological susceptibility, the objective was to limit the population of the pest during transitional phase in next year and thereby reduce frequent spraying of the trees. Under the present study, efficacy of three insecticides abamectin benzoate, deltamethrin 10%, and fipronil with two concentrations of 1 g/L and 0.5 g/L were subjected to test using them by mode of soil drenching upon infested larvae of Mediterranean fruit fly on soil. The results indicated that all treatments significantly reduced the emergence of flies; however, the 1 g/L concentration of deltamethrin completely eliminated the emergence of flies from the soil. Therefore, it can be concluded that soil drenching after the last capture of adult insects, as part of the winter management of this pest, can effectively reduce the fly population and significantly decrease damage. Additionally, deltamethrin 10% is identified as a highly suitable option for increasing the mortality rate of this pest's pupae in the soil.

Keywords: Abamectin Benzoate, Deltamethrin 10%, Mediterranean Fruit Fly, Fipronil

ABSTRACT

This study examines the sociodemographic factors influencing speciesist attitudes among EU citizens toward companion and farm animals. By analyzing these factors, we explore how moral inconsistencies arise in the treatment of different animal species. Using recently conducted open-access data from the Eurobarometer survey on attitudes toward animal welfare, we compared responses to questions about the perceived need for improved welfare for both farm and companion animals. Logistic regression analyses were employed to assess the impact of sociodemographic variables on speciesist attitudes. The findings reveal that approximately two-thirds of EU citizens do not differentiate between the welfare needs of companion and farm animals. Among the remaining one-third who do discriminate, further analysis identified notable disparities in attitudes. Of this group, two-thirds (representing two-ninths of the overall population) support improved conditions for farm animals, while one-third (one-ninth overall) prioritize companion animal welfare. Key sociodemographic factors shaping these attitudes include education, age, income, residence (urban vs. rural), and political orientation. Citizens with lower education and income levels, those living in rural areas, and individuals identifying politically with the right are more likely to favor companion animals over farm animals in terms of welfare. In rural communities, a more utilitarian perspective often prevails due to economic reliance on farm animals; however, stronger human-animal bonds can also lead to increased concern for animal welfare. Theories such as Social Dominance Orientation (SDO) may help explain these tendencies. These findings underscore the importance of policy measures aimed at promoting consistent animal welfare standards across species. Educational initiatives that

raise awareness about speciesism, along with advocacy efforts, can encourage more ethical consumer choices and support for policy reform. Bridging moral inconsistencies in the treatment of animals is essential for developing more humane and sustainable approaches to animal welfare

Keywords: Animal welfare, Companion animals, EU Citizens, Farm animals, sociodemographic, Speciesism

LARGE-SCALE IRRIGATION REVOLUTION: USE OF MACHINE LEARNING FOR SUSTAINABLE WATER MANAGEMENT

ABSTRACT

One of the many issues facing modern agriculture is the effective use of water in vast agricultural areas. Although irrigation is an essential part of this management, it can be challenging to optimize due to cultural norms and weather patterns.

In this work, we suggest a unique machine learning-based method for optimizing large-scale agricultural irrigation. In order to more accurately forecast the underwater requirements of aquatic species, we employ machine learning algorithms to analyse vast amounts of meteorological, soil, and cultural data.

Our study's results show how well our machine learning-based irrigation technology works to maximize water utilization in sizable agricultural areas. Our system can minimize water wastage by dynamically modifying irrigation schedules to accommodate the distinct requirements of various cultures through the use of real-time data and prediction algorithms.

This study showed how artificial intelligence, especially machine learning, has the potential to improve water management and revolutionize agriculture. In addition to increasing their productivity and profitability, farmers that employ creative techniques like ours can help ensure that water resources are used more sustainably, which will help to solve the problems of environmental sustainability and food security.

ABSTRACT

Globalization impacts sustainable agriculture both positively and negatively, offering opportunities for market access and technology transfer, but also posing challenges like increased competition, environmental degradation, and vulnerability to market fluctuations, especially for small-scale farmers. For decades, the world has produced most of its food through industrial agriculture. Industrial agriculture is characterized by large farms growing the same crop every year using quantities of chemical fertilizers and pesticides damaging to our soil, air, water, and climate. The internal working of this system guarantees that it won't last because it is built to degrade the resources it depends on. The solution to this problem is Sustainable agriculture. Sustainable agriculture aims to meet the present world's food and clothing needs without compromising the future generation's ability to meet their own needs. This type of agriculture seeks to sustain communities, farmers, and resources by encouraging farming practices that are environmentally good and simultaneously profitable. Sustainable agriculture is:

a. **Socially supportive:** It enhances the quality of life of farmers, farming families, and farming communities.

b. **Ecologically sound:** It preserves the resources needed to sustain the world.

AI IN AGRICULTURE — THE FUTURE OF FARMING

ABSTRACT

The growth of the global population, which is projected to reach 10 billion by 2050, is placing significant pressure on the agricultural sector to increase crop production and maximize yields. To address looming food shortages, two potential approaches have emerged: expanding land use and adopting large-scale farming, or embracing innovative practices and leveraging technological advancements to enhance productivity on existing farmland. Pushed by many obstacles to achieving desired farming productivity — limited land holdings, labor shortages, climate change, environmental issues, and diminishing soil fertility, to name a few, — the modern agricultural landscape is evolving, branching out in various innovative directions. Farming has certainly come a long way since hand plows or horse-drawn machinery. Each season brings new technologies designed to improve efficiency and capitalize on the harvest. However, both individual farmers and global agribusinesses often miss out on the opportunities that artificial intelligence in agriculture can offer to their farming methods. At Intellias, we've worked with the agricultural sector for over 20 years, successfully implementing real-life technological solutions. Our focus has been on developing innovative systems for quality control, traceability, compliance practices, and more. Now, we will dive deeper into how new technologies can help your farming business move forward.

Until recently, using the words AI and agriculture in the same sentence may have seemed like a strange combination. After all, agriculture has been the backbone of human civilization for millennia, providing sustenance as well as contributing to economic development, while even the most primitive AI only emerged several decades ago. Nevertheless, innovative ideas are being introduced in every industry, and agriculture is no exception. In recent years, the world has witnessed rapid advancements in agricultural technology, revolutionizing farming practices. These innovations are becoming increasingly essential as global challenges such as climate change, population growth together with resource scarcity threaten the sustainability of our food system. Introducing AI solves many challenges and helps to diminish many disadvantages of traditional farming.

IMPACT OF GLOBALIZATION ON SUSTAINABLE LAND USE AND FARMING SYSTEM IN THE RURAL DEVELOPMENT

Saeed Ahmad Zaman[a], Dr. Naima Nawaz[b], Dr. Zain Nawaz[c], Dr. Ijaz Ashraf[b], Dr. Muhammad Idrees[b], Nadia Idrees[b], Lubna Anjum[b], Dr. Shahzad[b], Ayesha Riaz[b], Abdul Rahman[b]

ABSTRACT

Globalization can accelerate development while, at the same time, negatively impacting nations that are not ready. Globalization benefits rural communities organizing the citizens' life order systematically. Exploiting land use to fulfill human needs is a result of globalization's effects on economic activity. Agricultural and industrial sectors must increase production reasonably and suitably. There is a gray area of needs due to the dependency on the land resources use, which causes rivalry in procuring production inputs for each sector and has a significant effect on the agricultural industry. Transformation of human, environmental, financial, and institutional resources for rural agriculture by implementing effective and efficient agricultural modernization will reduce globalization's negative effects. Smart farming applies modern technology to agriculture in order to achieve more productive and sustainable agricultural production. Agricultural land intensifi¬cation initiatives must be improved through the best use of technological innovation and agricultural infrastructure. Competition for resource utilization causes changes or decreases in land resources quality, which can be anticipated by technological capacities and capabilities, and adaptive capacity to innovations. Unhealthy competition must be eliminated, even these sectors will help each other because of government policy instruments so that the goal of rural sustainable agricultural growth will be achieved. The economic activities of rural farm management have three domains namelyagricultural sector, industrial sector, and both. There is a gray area, where interac-tion between two sectors like occurred at the study site. Each sector needs inputs tothe production process. The same interest in the function and economic activitiesas inputs, production, marketing, and income cause an interaction. The interactioneffect raises land use competition and farm resource change and impacts the agricul-tural sector.Community behavior in rural areas as a form of local wisdom contributes to thepreservation of land resources. Extracting soil for raw material of roof tile industryneeds some requirements such as only taking topsoil from rice fields to a depth of0.25 m, then letting the land rest for two to three years while being treated withmanure. Hence, the production and soil quality will be returned to their initial state.

ENVIRONMENT AND NATURAL RESOURCES

Saeed Ahmad Zaman[a], Dr. Naima Nawaz[b], Dr. Zain Nawaz[c], Dr. Ijaz Ashraf[b], Dr. Muhammad Idrees[b], Nadia Idrees[b], Lubna Anjum[b], Dr. Shahzad[b], Ayesha Riaz[b], Abdul Rahman[b]

ABSTRACT

Energy and Natural Resource Management (ENRM) are central concerns in poverty reduction, since millions of people in Pakistan rely directly on agriculture and livestock management for their livelihood. Across the country, soil and water pollution and loss of natural habitats are major problems. In many areas soil salinity and water pollution have reduced yields and the amount of arable land. These and other problems lead to more people, especially the poor, being 'food insecure'. The need for information on ENRM changes rapidly because of weather-related natural disasters such as the floods of 2010 and 2011 and ongoing climate change. To address both development and emergency issues as fully as possible NRSP has one full time NRM Specialist and one full-time Doctor of Veterinary Medicine on staff in the Head Office and 8 District Livestock Officers and 32 ENRM staff in its District and Field Unit Offices.

Environment is derived from the French word Environner, which means to encircle or surround. Environment is defined as the sum total of water, air, land and the interrelationships that exist among them and with the human beings, other living organisms and materials. Natural resources are resources that exist independently of human actions, found in the environment and developed without human intervention. Natural resources are essential for human survival and development, providing food, water, energy, and materials for building and clothing. Natural resources can be defined as the resources that exist (on the planet) independent of human actions. These are the resources that are found in the environment and are developed without the intervention of humans. The world's natural resources provide food, water, fuel, fiber, and many other ecosystem services to society. Agriculture and food systems depend on healthy ecosystems and natural resources, but these resources face rising pressure from unsustainable production practices, population growth, and climate change.

WHAT IS SMART FARMING? IT'S THE FUTURE OF AGRICULTURE

Saeed Ahmad Zaman[a], Dr. Naima Nawaz[b], Dr. Zain Nawaz[c], Dr. Ijaz Ashraf[b], Dr. Muhammad Idrees[b], Nadia Idrees[b], Lubna Anjum[b], Dr. Shahzad[b], Ayesha Riaz[b], Abdul Rahman[b]

ABSTRACT

Smart farming refers to managing farms using modern Information and communication technologies to increase the quantity and quality of products while optimizing the human labor required. Many believe that IoT can add value to all areas of farming, from growing crops to forestry. While there are several ways that IoT can improve farming, two of the major ways IoT can revolutionize agriculture are precision farming and farming automation. Precision farming, or precision agriculture, is an umbrella concept for IoT-based approaches that make farming more controlled and accurate. In simple words, plants and cattle get precisely the treatment they need, determined by machines with superhuman accuracy. Precision farming enables decision-making on a per square meter or even per plant/animal basis, contrasting with the classical approach which makes decisions at the field level. By precisely measuring variations within a field, farmers can boost the effectiveness of pesticides and fertilizers, or use them selectively. As is the case of precision agriculture, smart farming techniques enable farmers better to monitor the needs of individual animals and adjust their nutrition accordingly, thereby preventing disease and enhancing herd health. Large farm owners can use wireless IoT applications to monitor the location, well-being, and health of their cattle. With this information, they can identify sick animals, so that they can be separated from the herd to prevent the spread of disease. Traditional greenhouses control the environmental parameters through manual intervention or a proportional control mechanism, which often results in production loss, energy loss, and increased labor costs. IoT-driven smart greenhouses can intelligently monitor as well as control the climate, eliminating the need for manual intervention. Various sensors are deployed to measure the environmental parameters according to the specific requirements of the crop. That data is stored in a cloud-based platform for further processing and control with minimal manual intervention. Agriculture is one of the major verticals to incorporate ground-based and aerial drones for crop health assessment, irrigation, crop monitoring, and other spheres. Importantly, IoT-based smart farming doesn't only target large-scale farming operations. It can add value to emerging trends in agriculture like organic farming, family farming, including breeding particular cattle and/or growing specific cultures, preservation of particular or high-quality varieties, and enhance highly transparent farming to consumers, society and market consciousness.

COMPOST AS A TOOL FOR ENHANCING NUTRIENT BIOAVAILABILITY ON DEGRADED LANDS

ABSTRACT

Soil degradation is a critical environmental issue leading to reduced fertility, biodiversity loss, and overall ecosystem decline. A key aspect of restoring degraded lands is enhancing the bioavailability of nutrients, which supports plant nutrition and the recovery of soil ecosystems. Compost, derived from organic waste, emerges as an environmentally friendly and effective tool for soil restoration. It supplies macro- and micronutrients, humic substances, and beneficial microbial biota, all of which improve soil structure, increase water retention, and stimulate microbial activity. Through microbial mineralization, compost makes nutrients more accessible to plants, increasing levels of nitrogen, phosphorus, and potassium, enhancing buffering capacity, and contributing to carbon sequestration—vital for rehabilitating degraded soils. The specific effects of compost vary depending on its origin: agricultural residue compost is typically rich in potassium and phosphorus, while food waste composts offer a broader spectrum of trace elements. Selecting the appropriate compost type depends on soil needs and restoration goals. In Ukraine, composting is increasingly recognized as a sustainable method for processing organic waste and improving soil quality, supported by national policies such as the National Action Plan to Combat Land Degradation and Desertification. In the European Union, particularly in countries like Germany, composting plays a central role in the circular economy and sustainable land management, backed by strict quality standards to ensure effectiveness and environmental safety. The successful integration of composting into EU soil restoration practices serves as a valuable model for Ukraine and other countries. Overall, compost use enhances nutrient bioavailability, supports the restoration of soil physicochemical and biological functions, and promotes sustainable land management. Further research is needed to optimize compost formulations and assess their long-term impacts on different types of degraded soils.

Keywords: compost, nutrient bioavailability, degraded land, soil restoration, circular economy, sustainable development

QUESTIONING THE GENDER NARRATIVE IN AGRITECH: A CRITICAL PERSPECTIVE ON WOMEN'S ROLE IN VIKSIT BHARAT

ABSTRACT

Despite forming a significant portion of the agricultural workforce, women in India remain structurally marginalized in agrarian systems. Their labour is often unpaid, unrecognized, and shaped by patriarchal barriers to land, credit, and technology. While the rise of agritech—drones, robotics, AI—offers potential for transformation, it risks reinforcing existing inequalities if women's access and agency are not deliberately ensured.

The Viksit Bharat@2047 vision emphasizes a shift from women's empowerment to women-led development. While aspirational, this shift requires critical interrogation. What does "women-led" signify when women remain underrepresented in agritech leadership, innovation, and ownership? Without addressing foundational disparities—land rights, digital literacy, economic autonomy—this vision may remain rhetorical.

Government schemes often cite gender inclusion, yet their impact remains uneven. For instance, programs like the Mahila Kisan Sashaktikaran Pariyojana, though well-intentioned, lack integration with emerging agritech platforms. The absence of gender-disaggregated data and targeted monitoring further dilutes impact.

A case in point is the initiative by Farmonaut, where satellite-based advisory tools were introduced to women farmers. While promising in terms of yield and efficiency, deeper analysis reveals limited control by women over inputs, outputs, and profits—highlighting that access does not equal empowerment.

Crucially, gender-responsive budgeting remains inadequate in agritech investments. Aligning fiscal priorities with the goals of women-led development and Viksit Bharat requires more than symbolic gestures—it demands systemic reform. Without a structural rethinking of agrarian gender roles, India's agritech revolution may exclude those it claims to uplift.

ABSTRACT

Sugar beet is a 2-year-old agricultural plant from the spinach family, from which sugar is obtained from its fleshy root. The structure of sugar beet consists of 4.5% cell tissue, 4.5% chemically bound water and 99.95% sap. The composition of beet sap consists of 15.18% sugar (sucrose), 1.0-1.6% other non-sugar organic substances and 0.8% inorganic salts. Molasses is a syrupy substance with a high sugar and nutritional content that remains outside the main product in sugar factories and is not taken back to the factory. In Turkey, 19,253,962 tons of sugar beet was produced in 2023 and a total of 994,272.00 tons of molasses was produced from the sugar beet produced. Molasses; It is used in the production of ethyl alcohol, as animal feed, in direct distilled beverages, in industrial consumption and pharmaceutical industry, as vinegar, in dough yeast, in the production of briquette coal, in construction mortars and in the cosmetic industry. In animal nutrition, it has been determined as ruminant nutrition, liquid feed, silage additive, urea blocks and other areas of use.

With the addition of molasses to feeds, it can reduce the dustiness of the ration, be used as a binder in pellet production, stimulate microbial activities in the rumen and be used as a feed raw material. The chemical, mineral, vitamin and amino acid content of molasses also play an important role in preventing important diseases in nutrition.

As a result of the studies conducted; Adding molasses to silages has positively affected the quality of the silage and increased its quality. With the addition of molasses to plants that are difficult to ensile, it can be used as an alternative feed plant that increases the degree of ensiling. When molasses is used as a feed raw material, it increases digestion in ruminants and poultry and has a positive effect on milk and carcass weight. Molasses-added feeds can prevent metabolic and neurological diseases seen in animals. However, when molasses is given in excess, it causes neurological disorders such as coordination disorder and blindness, and when it is added insufficiently to the ration, it can cause low fiber intake and microbial proliferation. They can also cause urea toxicity, molasses toxicity and bloat in sheep and cattle. In this review, information on the use of molasses in animal nutrition is discussed.

Keywords: Molasses, Animal Feeding, Sugar Beet

MELASIN HAYVAN BESLEMEDE KULLANIMI

ÖZET

Şeker pancarı, etli kökünden şeker elde edilen, ıspanakgiller familyasından 2 yıllık tarım bitkisidir. Şeker pancarının yapısında %4,5 hücre dokusu, %4,5 kimyasal bağlı su ve %99,95 öz suyundan oluşmaktadır. Pancar öz suyunun bileşimi ise %15,18 şeker (sakkaroz), %1,0-1,6 diğer şeker dışı organik maddeler ve %0,8 inorganik tuzlardan oluşmaktadır. Melas, şeker fabrikalarında ana ürün dışında kalan ve fabrikasyona geri alınmayan, şeker oranı ve besleme içeriği yüksek olan şurup kıvamındaki maddedir. Türkiye'de 2023 yılı içerisinde 19.253,962 ton şeker pancarı üretilmiş ve üretilen şeker pancarından toplam 994.272,00 ton melas üretimi gerçekleşmiştir.

Melas; etil alkol üretiminde, hayvan yemi olarak, direk damıtılan içkilerde, endüstriyel tüketim ve ilaç sanayinde, sirke olarak, hamur mayasında, briket kömür imalinde, inşaat harçlarında ve kozmetik sanayinde kullanılmaktadır. Hayvan beslemede kullanımda ise ruminant beslemede, sıvı yem, silaj katkı maddesi, üre blokları ve diğer kullanım alanları olarak belirlenmiştir.

Yemlere melas katılması ile birlikte rasyonun tozluluğunu azaltması, pelet yapımından bağlayıcı olarak kullanılması, rumende gerçekleşen mikrobiyal aktiviteleri uyarmak ve yem hammaddesi olarak kullanılabilmektedir. Melasın kimyasal, mineral, vitamin ve aminoasit içeriği de beslemede önemli hastalıkların engellemede önemli rol üstlenmektedir.

Yapılan çalışmalara sonucunda; Silajların içine melas katılması silajı kalitesini olumlu yönde etkilemiş ve kalitesini artırmıştır. Silolaması zor bitkilere melas katılmasıyla birlikte silolama derecesi artıran ve alternatif yem bitkisi olarak kullanımı sağlanabilir. Melas yem hammaddesi olarak kullanıldığında ruminant ve kanatlı hayvanlarda sindirimi artırarak süt ve karkas ağırlığına olumlu etki yapmaktadır. Melas katkılı yemler hayvanlarda görülen metabolik ve nörolojik hastalıkları engelleyebilir. Fakat melasın fazla verildiği durumlarda koordinasyon bozukluğu ve körlük gibi nörolojik bozukluklara neden olur, rasyona eksik katıldığı zaman ise düşük lif alımına, mikropların çoğalmasına sebep olabilir. Ayrıca koyun ve sığırlarda üre toksisitesi, melas toksisitesi ve şişkinliğe sebep olabilirler. Bu derlemede, melasın hayvan beslemede kullanımına ilişkin bilgiler tartışılmıştır.

ABSTRACT

Water is a tasteless and odorless substance that is necessary for all known life forms. It is colorless when viewed with the naked eye and in small amounts. Worldwide, 97.50% of water resources consist of oceans and seas and 2.5% of fresh water resources. Worldwide water consumption is 7,600 m3 per person. With decreasing rainfall every passing year and pollution of clean water resources due to unconscious water use, approximately 600 million people worldwide will not have access to clean water by 2045. In Türkiye, the amount of usable water is 112 billion m3. In our country, the amount of fresh water per person per year is approximately 1566 m3.

Water footprint in livestock enterprises is the amount of water used directly or indirectly in the feeding, raising and production of animals. Water comes after oxygen in animals and constitutes 56-81% of the body and 90% of the blood. Animals get their water sources from drinking water (83%), from consumed feed (12% grain feed, 10-15% hay and haylage, 60-70% silage and 60-80% pastures) and from metabolic water (1/6 of the daily water requirement is water that occurs as a result of events occurring in the body). Water consumption in cattle varies according to factors such as the amount and characteristics of feed consumed, weather conditions, milk yield and lactation. The most important factor affecting water intake is ambient temperature. Ambient temperature also changes dry matter intake. While the amount of water required for 1 kg dry matter intake at ideal ambient temperature is 3-7 liters, when the temperature reaches 35 ºC and above, the amount of water that needs to be taken increases to 8-15 liters. Water is used as a building block in the animal body, as a heat regulation and lubricant. It is known that some animals consume water, cattle 25-66 l/day, dairy cattle 38-110 l/day, horses 30-45 l/day and sheep and goats 4-15 l/day. In this review, information on determining the water footprint in livestock enterprises is discussed.

HAYVANCILIK İŞLETMELERİNDE SU AYAK İZİ

ÖZET

Su bilinen tüm yaşam formları içim gerekli olan, saf halde iken tatsız ve kokusuz bir maddedir. Küçük miktarlarda ve çıplak göz ile bakıldığında renksizdir. Dünya genelinde su kaynakları %97,50 ile okyanus ve denizlerden %2,5 ise tatlı su kaynaklarından oluşmaktadır. Dünya genelinde su tüketimi kişi başı 7.600 m^3 dür. Her geçen yıl azalan yağışlar, bilinçsiz su kullanılması sonucu temiz su kaynaklarının kirletilmesi ile beraber 2045 yılına kadar dünya genelinden yaklaşık 600 milyon insan temiz suya ulaşamayacaktır. Türkiye'de ise kullanılabilir su miktarı 112 milyar m^3 tür. Ülkemizde bir yılda kişi başına düşün tatlı su miktarı yaklaşık 1566 m^3'tür.

Hayvancılık işletmelerinde su ayak izi, hayvanların beslenmesi, yetiştirilmesi ve ürünlerinin elde edilmesi sürecinde doğrudan ya da dolaylı olarak kullanılan su miktarıdır. Su hayvanlarda oksijenden sonra gelen ve vücudun %56-81'i, kanın ise %90'nı oluşturmaktadır. Hayvanlar su kaynağı olarak birincisi içme suyundan (%83), ikincisi tüketilen yemlerden (dane yemler %12, saman ve kuru otlar %10-15, silajdan %60-70 ve meralardan %60-80) sonuncu ise metabolik su (günlük su gereksiniminin 1/6'nı vücutta meydana gelen olaylar sonucu ortaya çıkan su) ile karşılamaktadır. Sığırlarda su tüketimi tüketmiş olduğu yem miktarı ve özelliği, hava koşulları, süt verimi ve laktasyon gibi faktörlere göre değişim göstermektedir. Su alımını etkileyen en önemli faktör ortam sıcaklığıdır. Ortam sıcaklığı kuru madde alımını da değiştirmektedir. İdeal ortam sıcaklığında 1 kg kuru madde alımı için gerekli su miktarı 3-7 litre iken sıcaklık 35 ºC ve üzerine çıkıldığında alınması gereken su miktarı da 8-15 litreye çıkmaktadır. Su hayvan vücudunda yapı taşı olarak, ısı regülasyonu ve kayganlık verici madde olarak kullanılmaktadır. Bazı hayvanların su tüketimi, sığırlar 25-66 l/gün, süt sığırları 38-110 l/gün, atlar 30-45 l/gün ve koyun ve keçiler 4-15 l/gün su tükettiği bilinmektedir. Bu derlemede hayvancılık işletmelerinde su ayak izinin belirlenmesine ilişkin bilgiler tartışılmıştır.

ABSTRACT

Bacterial Speck Disease of Tomato, caused by *Pseudomonas syringae* pv. *tomato*, is a bacterial infection that is prevalent in many regions and leads to significant economic losses in tomato production. The disease exhibits as small, dark-colored specks on various parts of the plant. Its management primarily relies on cultural practices, with the supplementary use of copper-based agrochemicals. Although several registered copper-based formulations are available on the market, it is well-documented that the pathogen can rapidly develop resistance due to improper application of these chemicals. For this reason, researchers have increasingly focused on biological control methods as an alternative strategy. In particular, this approach often utilizes beneficial bacteria as antagonistic agents. However, these agents may also be adversely affected by copper applications. This study not only aimed to isolate biological control agents against the pathogen but also evaluated their resistance to copper. To this end, 87 candidate antagonistic bacteria were isolated from healthy tomato plants. Dual culture assays revealed that 29 of these isolates exhibited inhibition zones of varying sizes against the pathogen. Further screening and selection tests were conducted on these antagonists. According to the results, two isolates showed positive results in the potato soft rot test. Twelve isolates demonstrated growth at 37 °C equal to or greater than at 25 °C, while seven isolates did not grow at 37 °C. All antagonistic bacteria tested negative in the tobacco hypersensitivity assay, whereas heat resistance tests demonstrated that six of them were capable of forming endospores. Seventeen isolates produced fluorescent pigments under UV light on King's B medium. In the mechanism of action tests, 10 isolates were DNase-positive, 16 were protease-positive, 1 was chitinase-positive, and 15 were siderophore-positive. Regarding copper resistance, nine antagonists were found to have minimum inhibitory concentrations ranging from 1.08 to 2.16 mM and minimum bactericidal concentrations ranging from 2.16 to 3.74 mM. Considering the results of the dual culture assays, preliminary screenings, mode-of-action tests, and copper resistance, three bacterial isolates (C2NK3, C2EK6, and CBEK3) were selected for pot experiments. For this purpose, combinations of biological control agents, pathogens, and copper applications were evaluated, and assessments conducted on the 24th day after inoculation demonstrated that all antagonist bacterial treatments reduced disease severity with varying effectiveness. However, these positive results must be further validated through multi-year field trials.

Keywords: Antagonistic bacteria, Copper resistance, Biological control, Bacterial speck disease

DOMATES BAKTERİYEL BENEK HASTALIĞINA (*Pseudomonas syringae* pv. *tomato*) KARŞI BAKIRA TOLERANSLI ANTAGONİST BAKTERİLER İLE BİYOLOJİK MÜCADELE

ÖZET

Domates Bakteriyel Benek Hastalığı; *Pseudomonas syringae* pv. *tomato*'nun neden olduğu, birçok bölgede yaygın olarak görülen ve domates üretiminde büyük ekonomik kayıplara yol açan bakteriyel bir hastalıktır. Bitkinin çeşitli kısımlarında koyu renkli ufak benek şeklinde belirtiler oluşturan hastalığın mücadelesi kültürel önlemlere dayanmakta, ayrıca bakırlı tarım ilaçlardan yararlanılmaktadır. Her ne kadar ruhsatlı bakırlı preparatlar piyasada mevcut olsa da hastalık etmeninin bu preparatlara uygun olmayan kullanım nedeniyle kısa sürede dayanıklılık kazandığı bilinmektedir. Bundan dolayı bilim insanları alternatif mücadele yöntemlerden biri olan biyolojik savaş yöntemleri üzerine odaklanmıştır. Özellikle yine bakterilerin savaş ajanı olarak kullanıldığı bu mücadele yönteminde yararlı bakteriler bakırlı preparat uygulanması durumunda etkilenmektedir. Bu çalışmada hastalığa karşı biyolojik savaş ajanlarının araştırılmasının yanında, elde edilen ajanların bakıra dayanıklılıkları da değerlendirmiştir. Bu amaçla; sağlıklı domates bitkilerinden 87 adet antagonist bakteri adayı izole edilmiş ve yapılan ikili kültür testleri ile az ya da çok 29 tanesinin engelleme zonu oluşturduğu bulunmuştur. Daha sonra bu antagonistlere gerek ön eleme gerekse seçim için bazı testler yapılmıştır. Yapılan testlerin sonuçlarına göre; 2 antagonist patates yumuşak çürüklük testinde pozitif sonuç verirken, 12 bakteri 37 ℃'de 25 ℃'deki kadar veya daha iyi bir gelişim göstermiş, 7 bakteri ise 37 ℃'de hiç gelişmemiştir. Tütünde aşırı duyarlılık testine göre antagonist bakterilerin tümü negatif sonuç verirken, yapılan ısı testi ile 6 tanesinin endospor oluşturduğu bulunmuştur. King's B besi yerinde 17 bakterinin UV ışık altında parlayan pigment oluşturduğu bulunmuştur. Antagonist bakterilerin etki mekanizması testlerine göre: 10 bakteri DNase pozitif, 16'sı proteaz pozitif, 1'i kitinaz pozitif, 15'i siderofor pozitif sonuç verdiği saptanmıştır. Bu antagonistlerin bakıra dayanıklılıkları araştırıldığında; 9 antagonistin 1.08−2.16 mM minimum inhibitör konsantrasyon ve 2.16−3.74 mM minimum bakterisidal konsantrasyon değerlerine sahip oldukları bulunmuştur. Gerek ikili kültür, gerek ön değerlendirme/etki mekanizması testleri ve gerekse bakır dayanıklıkları göz önünde bulundurularak bu 9 bakteri içerisinden saksı çalışmaları için 3 bakteri izolatı (C2NK3, C2EK6 ve CBEK3) seçilmiştir. Bunun için biyolojik savaş ajanı, hastalık etmeni ve bakır uygulaması farklı kombinasyonlarda kullanılarak değerlendirilmiş ve inokulasyondan sonra 24. günde yapılan sayımlarda tüm antagonist bakteri uygulamalarının değişen oranlarda hastalık şiddetini azalttığı görülmüştür. Bu olumlu sonuçların özellikle çok yıllık tarla çalışmaları ile desteklenmesi gerekmektedir.

Anahtar Kelimeler: Antagonist bakteri, Bakır dayanıklılığı, Biyolojik mücadele, Bakteriyel benek hastalığı

DETERMINATION OF METHANE CONCENTRATION IN BIOGAS USING LOW-COST MULTIPLE METHANE SENSORS

ABSTRACT

The quality of biogas generated by biogas plants primarily depends on its methane content, which in turn affects the fuel's energy value and proper combustion characteristics. Current technologies for measuring biogas methane content often involve sophisticated and costly equipment. Conventional methane analysis in biogas relies on laboratory gas chromatography or expensive infrared sensors, posing challenges for on-site, continuous monitoring in small-scale biogas plants. Gas chromatography with thermal conductivity or flame ionization detectors provides precise composition analysis but requires laboratory facilities and skilled technicians. Portable infrared gas analyzers tailored for biogas offer on-site measurements of CH_4 and CO_2. However, such instruments are expensive and may be impractical for small-scale or rural biogas operators. Even simpler handheld gas testers must be frequently calibrated and represent a significant investment. This creates a need for affordable, user-friendly alternatives that can operate in the field.

This study addresses the need for a cost-effective, methane measurement solution by developing a device based on multiple low-cost gas sensors. The system employs dual metal-oxide semiconductor methane sensors (MQ-4 and MQ-9), along with temperature and pressure sensors, all integrated with a microcontroller and housed in a custom-designed 1.2-liter airtight chamber. Since both MQ sensors have an upper detection limit of approximately 10,000 ppm (1% CH_4 by volume), direct measurement of raw biogas (typically containing 50–70% CH_4) would exceed their operational range. To address this, a fixed volume of biogas (10 mL) was injected into the chamber, effectively diluting the sample to maintain methane concentrations within the sensors' measurable limits. After each reading, the chamber was purged with clean air to remove residual gases and ensure accurate and reproducible measurements in subsequent sampling cycles. A calibration procedure was implemented using biogas obtained from laboratory-scale anaerobic bioreactors to determine accurate reference methane concentrations. The procedure was based on a chemical scrubbing method involving the absorption of CO_2 using a sodium hydroxide (NaOH) solution, in conjunction with a gas meter for precise volumetric measurement. Sensor outputs were then linearized via Python-based curve fitting. Data filtering and dual-sensor signal fusion improved measurement stability.

The findings suggest that low-cost sensors, when properly calibrated, can provide reliable methane monitoring for small-scale biogas digesters, enabling operators to continuously track gas quality on-site at minimal cost.

BİYOGAZDAKİ METAN KONSANTRASYONUNUN TESPİTİNDE DÜŞÜK MALİYETLİ ÇOKLU METAN SENSÖRLERİNİN KULLANIMI

ÖZET

Biyogaz tesisleri tarafından üretilen biyogazın kalitesi, öncelikle metan içeriğine bağlıdır ve elde edilen yakıtın enerji değerini ve yanma özelliklerini etkiler. Biyogaz metan içeriğini ölçmeye yönelik mevcut teknolojiler genellikle karmaşık ve maliyetli ekipmanları içermektedir. Küçük ölçekli biyogaz tesislerinde geleneksel metan analizi, gaz kromatografisi veya pahalı kızılötesi sensörlerle yapılmakta; yerinde ve sürekli metan izleme için zorluklar oluşturmaktadır. Termal iletkenlik veya alev iyonizasyon detektörlü gaz kromatografisi, hassas bileşim analizi sağlamakla birlikte, laboratuvar olanakları ve uzman teknisyenler gerektirmektedir. Biyogaz için özel olarak tasarlanmış taşınabilir kızılötesi gaz analizörleri, CH_4 ve CO_2'nin yerinde ölçümlerine imkân vermektedir. Ancak, bu tür cihazlar pahalıdır ve küçük ölçekli veya kırsal biyogaz işletmecileri için pratik olmayabilir. Daha basit el tipi gaz test cihazları bile sık sık kalibre edilmeli ve kalibrasyon için önemli bir bütçe ayrılmalıdır. Bu durum, sahada çalışabilecek uygun fiyatlı, kullanıcı dostu alternatiflere olan ihtiyacı ortaya çıkarmaktadır.

Bu çalışma, düşük maliyetli çoklu gaz sensörlerini temel alan bir cihaz geliştirerek, maliyet etkin bir metan ölçüm çözümü ihtiyacını ele almaktadır. Önerilen sistemde, sıcaklık ve basınç sensörleri ile birlikte iki adet metal oksit yarı iletken metan sensörü (MQ-4 ve MQ-9) kullanmaktadır. Sensörlerin tümü bir mikrodenetleyici ile entegre edilmiş ve özel olarak tasarlanmış 1,2 litrelik hava geçirmez bir hazne içine yerleştirilmiştir. Her iki MQ sensörünün de yaklaşık 10.000 ppm (hacimce %1 CH_4) üst algılama sınırına sahip olması nedeniyle, ham biyogazın (tipik olarak %50-70 CH_4 içeren) doğrudan ölçümü, sensörlerin çalışma aralığını aşmaktadır. Bu sorunu çözmek için, ölçüm haznesine sabit bir hacimde biyogaz (10 mL) enjekte edilmiş, bu da metan konsantrasyonlarını sensörlerin ölçülebilir sınırları içinde tutmak için numuneyi etkili bir şekilde seyreltmiştir. Her okumadan sonra, artık gazları uzaklaştırmak ve sonraki numune alma döngülerinde doğru ve tekrarlanabilir ölçümler sağlamak için hazne temiz hava ile temizlenmiştir. Çalışmada laboratuar ölçek anaerobik biyoreaktörlerden elde edilen biyogaz ile doğru referans metan konsantrasyonları elde etmek için, kimyasal yıkama yöntemi (CO_2'nin NaOH ile absorpsiyonu) ve bir gaz sayacı ile birlikte bir kalibrasyon prosedürü uygulanmıştır. Sensör çıktılarına daha sonra Python tabanlı eğri doğrusallaştırma uygulanmıştır. Veri filtreleme ve çoklu sensör sinyallerinin birlikte değerlendirilmesi, ölçüm kararlılığını artırmıştır.

Bulgular, düşük maliyetli sensörlerin, uygun şekilde kalibre edildiklerinde, küçük ölçekli biyogaz reaktörleri için güvenilir metan ölçümü sağlayabileceğini ve işletmecilerin gaz kalitesini yerinde ve minimum maliyetle sürekli olarak takip etmelerine olanak tanıdığını göstermektedir.

ABSTRACT

Systemic infections in potato-growing areas caused by potato virus Y (*Potyvirus yituberosi*; PVY), making it one of the most significant viral diseases due to its significant impact on yield and quality. PVY infections can lead to yield losses of 50 to 80% in potato plants. In conventional agriculture, the use of various chemical fertilizers, pesticides and other agrochemicals to increase yields and protect crops has shown to have a negative impact on biodiversity, soil fertility and the overall health of the ecosystem. Nanotechnology has become a more prominent topic in the past few years as a sustainable alternative to conventional agricultural inputs. In the present study, thyme essential oil was encapsulated with chitosan, a widely used organic nanoparticle, and lecithin, a natural biopolymer. The effects of this nanoencapsulation on the aphid-mediated transmission of PVY were studied under laboratory conditions. Three additional treatments were applied: thyme essential oil, chitosan + thyme oil nanoparticles, and chitosan nanoparticles alone. In the transmission assay, aphid individuals that had been starved for one hour were placed on potato shoots infected with PVY (*S. tuberosum* cultivar. 'Agria') for a 2.5-minute virus acquisition access period (AAP). The aphids were then transferred to healthy potato plants that had been treated with the nanoparticle formulations with foliar spray 24 hours earlier and allowed to feed overnight. Fifteen days after inoculation with the aphids, the plants were tested for PVY infection using the DAS-ELISA method. The effects of the different treatments on virus titer in the plants were statistically analyzed, and comparisons were made using the Tukey HSD post hoc test. The results show that besides the repellent effect of thyme essential oil against aphids described in the literature, the formulation thyme oil encapsulated with chitosan and lecithin also has a repellent effect against aphids.

KİTOSAN BAZLI NANOKAPSÜLLERİN PATATES Y VİRÜSÜNÜN YAPRAK BİTİ ARACILIĞI İLE TAŞINIMI ÜZERİNDEKİ ETKİSİ

ÖZET

Patates üretim alanlarında sistemik enfeksiyonlara yol açarak ciddi verim ve kalite kayıplarına sebep olan Patates Y Virüsü (*Potyvirus yituberosi*; PVY), en önemli viral hastalıklar arasında yer almaktadır. PVY enfeksiyonları, patates bitkilerinde %50 ila %80'e varan oranda verim kaybına yol açabilmektedir. Geleneksel tarımda üretimi artırmak ve bitkileri zararlılardan korumak amacıyla çeşitli kimyasal gübreler, pestisitler ve diğer zirai kimyasalların kullanımı; biyoçeşitlilik, toprak verimliliği ve genel ekosistem sağlığı üzerinde olumsuz etkiler oluşturmaktadır. Bu bağlamda, nanoteknoloji son yıllarda geleneksel uygulamalara sürdürülebilir bir alternatif olarak tarım sektöründe artan bir ilgi görmektedir. Bu çalışmada, yaygın olarak kullanılan organik bir nanopartikül olan kitosan (Kts) ve doğal bir biyopolimer olan lesitin (Ls), kekik uçucu yağı (Ky) ile enkapsüle edilerek (Kts+Ky+LsNP) hazırlanmış ve bu nanoenkapsülasyonunun, laboratuvar koşullarında, PVY'nin yaprak biti aracılığıyla patates bitkisine taşınımı üzerindeki etkileri araştırılmıştır. Üç ek uygulama daha yapılmıştır: kekik esansiyel yağı, kitosan + kekik yağı nanoparçacıkları ve yalnızca kitosan nanoparçacıkları. Taşınım denemesinde, bir saat aç bırakılan yaprak biti bireyleri, 2,5 dakikalık virüs alma süresi (acquisition access period, AAP) boyunca PVY enfekteli patates sürgünleri (*S. tuberosum* cv. 'Agria') üzerine yerleştirilmiş, ardından PVY'den ari olduğu bilinen ve 24 saat önce yapraktan sprey şeklinde nanopartikül uygulanan sağlıklı bitkiler üzerine aktarılmış ve bir gece boyunca beslenmelerine izin verilmiştir. Virüs taşınımı yapılan bu bitkiler, 15 gün sonra DAS-ELISA yöntemi ile PVY yönünden test edilmiştir. Uygulanan farklı formülasyonların, patates bitkilerindeki virüs titrelerine etkileri istatistiksel olarak değerlendirilmiş ve karşılaştırmalar Tukey HSD post hoc testi ile gerçekleştirilmiştir. Elde edilen bulgular doğrultusunda, literatürde yaprak biti kovucu etkisi bilinen Ky uygulamasına ek olarak, Kts+Ky+LsNP formülasyonunun da afitleri uzaklaştırıcı etkisi gösterdiği gözlemlenmiştir.

ABSTRACT

Poly-3-hydroxyalkanoates (PHA), produced biosynthetically by Pseudomonas bacteria, are promising substitutes for conventional plastics. Poly-3-hydroxyalkanoates (PHA) are polyesters produced biosynthetically by *Bacillus, Cupriavidus, Pseudomonas*, etc. They have a number of advantages over traditional polymers obtained by refining oil. In particular, they quickly decompose both in natural ecosystems and in the human body without forming toxic products. The study aimed to determine the stability of the polyhydroxyalkanoate-producing strain *Pseudomonas helmanticensis P1* with butanol concentration and without butanol. The toxic effect of butanol was carried out on biofilms of *Pseudomonas helmanticensis P1* and when cultivating the bacteria in suspension in liquid culture media.

Keywords: *Pseudomonas helmanticensis,* Luria-Bertani, *n*-butanol, Hydrogen potential, Oil refining, *mcl*-pha.

ABSTRACT

One of the main indicators of achieving high and quality yield from agricultural crops is the use of microorganisms that enhance plant growth and development, specifically lactic acid bacteria that synthesize phytohormones. Treating agricultural plants with these bacteria strengthens their growth and development, as the gibberellin synthesized by these microorganisms improves plant growth, enhances soil fertility, increases productivity, and improves product quality. As a result, soils used in agriculture are enriched with beneficial microorganisms.

ABSTRACT

This article discusses the composition of artificial nutrient media used for the growth of microorganisms. These media typically contain essential nutrients—macro and microelements—dissolved in water, often in amounts sufficient or even greater than what is required for microbial growth and development. For heterotrophic organisms, various organic compounds serve as carbon sources. In microbiological practice, the most commonly used carbon sources are sucrose, glucose, or other hexoses, as well as polyatomic alcohols and carboxylic acids obtained from the oxidation of sugars.

The article also highlights the preparation of an optimal nutrient medium for cultivating epiphytic microorganisms, using a nutrient medium derived from the aerial parts of the Jerusalem artichoke (topinambur) plant.

Keywords: *Azotobacter; Jerusalem artichoke; nutrient medium; soil; fertilizer; Petri dish; gliadin; germination.*

DETERMINATION OF CAST/MspI GENE POLYMORPHISM AND ITS EFFECTS ON 180-DAY WEIGHT IN MEAT PRODUCTION LINE OF KAZAKH SARYARKA LAMBS

ABSTRACT

The CAST gene has been extensively studied in livestock for meat quality and growth traits. The Saryarka breed is characterized by a hardy constitution that allows for year-round grazing. The aim of this study was to investigate the polymorphism of the CAST gene in lambs of the Saryarka meat production line and to investigate associations between the CAST genotype and live weight in 180-day-old lambs. A total of 60 lambs were genotyped by the PCR-RFLP method. Two genotypes, MM and MN, were identified with frequencies of 0.59 and 0.41, respectively. According tothe association analysis, lambs with the MN genotype produced significantly ($P<0.01$) more live weight (4.48 kg) than lambs with the MM genotype. The study was the first to demonstrate that the Saryarkabreed has a genetic variation of the CAST gene and its effects on lamb live weight. As a result of this study, it can be said that the CAST gene could potentially be a molecular marker for the Saryarka breed to increase lamb production and be integrated into the current selection program for the breed.

Keywords: Saryarka, CAST, MspI, RFLP

ÖZBEKİSTAN CUMHURİYETİ`NDE HAYVANCILIĞIN YERİ, DURUMU VE İSTATİSTİKSEL ANALİZİ

ÖZET

Bu çalışmada, Cumhuriyet genelindeki çeşitli kategorilerdeki tarım işletmelerinde yetiştirilen büyükbaş, küçükbaş ve kümes hayvanlarının sayıları vilayetler bazında analiz edilmiştir. Hayvancılığın sürdürülebilir gelişimini sağlamak amacıyla, hayvan türlerinin sayısının arttırılması artırılması, yürütülen emeğin verimliliği ile doğrudan ilişkilidir. Bu kapsamda, seleksiyon çalışmaları, hayvan ıslahı, soy seçimi, ekonomik ve sosyal önlemler bütüncül şekilde değerlendirilmiş ve hedef odaklı stratejilere temel oluşturmuştur.

Bölgesel doğal, coğrafi ve ekonomik koşullar ile pazar talepleri dikkate alınarak hayvancılığın tüm alt dallarının geliştirilmesi günümüzün öncelikli konularından biri olarak kabul edilmektedir. Gıda ve işleme sanayileri için et, süt, yün, deri, bal, balık, yumurta gibi temel ürünlerin üretimi sağlanmakta olup, bu durum yalnızca sanayi sektörlerinin gelişimini değil, aynı zamanda insan sağlığı için hayati öneme sahip protein açısından zengin ürünlerin üretimini de desteklemektedir.

ABSTRACT

The aim of this study was to investigate the DGAT1 gene polymorphism and its effects on lamb weight in Kazakh purebred (Edilbay) and crossbred lambs (Edilbay x Gissar). A total of 97 blood samples were collected from purebred and crossbred lambs. Animals were genotyped for DGAT1-AluI polymorphism using the polymerase chain reaction-restriction length polymorphism (PCR-RFLP) method. The result of PCR-RFLP showed that purebred lambs had three genotypes (CC, CT and TT) and crossbred lambs had two genotypes (CC and CT). The predominant genotype was CC with a frequency of 0.70 and 0.58 in purebred and crossbred breeds, respectively. The present study was the first to investigate the polymorphism of DGAT1 gene in Kazakh purebred and crossbred lambs.

Keywords: Edilbay, Gissar, DGAT1, Polymorphism, RFLP

ABSTRACT

The article discusses the use of Chlorella (Chlorella vulgaris) in the feeding of cattle. The effects on weight gain, feed conversion, milk composition, and overall animal health are examined. Data on the biochemical composition of Chlorella, its impact on the digestive system, and the immune status of animals are presented. Experimental data demonstrate the effectiveness of Chlorella as a feed additive for improving productivity and health in cattle.

Keywords: Chlorella, cattle, milk productivity, weight gain, feed conversion, feed additive.

ABSTRACT

The study was carried out at the "Zhenis" sheep breeding facility in Kazakhstan's Ulytau region, which is well-known for its purebred livestock. With a focus on the Zhanaarka interbreed, the lambs used in this study were Sararaka breed lambs, which are distinguished by their coarse wool and fat-tailed features. An experimental group of male and female lambs was created during the April lambing season at the "Zhenis" breeding farm. Well-developed, single-born lambs from desirable ewe and ram breeds were among the group. Weighings were taken of each animal in the experimental group at birth, as well as at 1, 2, 3, 4, 5, 6, 7, 12, and 18 months. Male and female lambs born in the same lambing were simultaneously measured for eight major body measurements: oblique body length, chest girth, cannon bone girth, withers height, croup height, chest width, chest depth, and width between shoulder blades. Five Sarara lambs were chosen and put through a controlled slaughter process at four to five months of age in order to assess the meat and fat productivity of these animals. Following a 24-hour fast, the live weight prior to slaughter was determined. Body morphological composition, meat-to-bone ratio, proportions of meat grades and parts, carcass weight without tail fat, tail fat weight, internal fat weight, and slaughter mass were all noted. Additionally, yields of these slaughter products (meat and fat including internal organs) were also noted. In the Kazakhstan-Japan Innovation Center at KazNARU, the genetic structure of the Saryarka sheep breed was also examined in terms of the GDF9 gene.

Anahtar Kelimeler: Saryarka sheep, Selection, Live weight, Meat quality, GDF9, RFLP.

PREPARATION OF BIONANOMATERIALS AS REINFORCING PHASE IN POLYMERIC MATRICES TO FORM NANOCOMPOSITES.

[3]LAFPC, University of Blida 1, Route de Soumaa, 09000 Blida, Algeria

ABSTRACT

The use of nanomaterials as reinforcing phase in polymeric matrices to form nanocomposites has attracted much research attention due to their ability to improve the mechanical properties of such systems. Hence, biobased materials have been a subject of immense research interest in recent years due to their great potential to produce a variety of biocompatible products. In this study, a suitable approach has been developed to prevent agglomeration of MCC (microcrystalline cellulose) during dispersion by partially or completely covering MCC with octenyl succinic anhydride (OSA) modified starch. This strategy is based on a simple coating technique involving a modest physical treatment, which is convenient and easily available.

The objectives of this work were to develop a new material based on MCC, in the form of colloidal suspension, obtained by hydrolysis with sulfuric acid. The second phase consists in coating the colloidal particles obtained with OSAstarch in order to prepare a bio-based composite material (OSA-Cel), which can be used as stabilizer in the formulation of dispersed systems or as reinforcing filler in a polymeric matrix. The obtained product was characterized in terms of chemical structure, morphology, surface aspects and rheology.

Keywords: microcrystalline cellulose, OSA-starch, composites, surface tension, rheology

USE OF ANTHER CULTURE IN HAPLOID PLANTS PRODUCTION IN STRAWBERRY

ABSTRACT

Strawberries are the most commercially produced berry plants among other berries in the world. It has been favoured due to its unique taste, high nutritional value, rich in vitamin C, anthocyanin etc., and high raw material potential for processed food. From past to present, breeding studies on strawberries have carried on fruit quality and production yield, disease-resistance, environmental adaptation, postharvest longevity. But some global issues (food scarcity, global warming etc.) and limitations in traditional breeding (being time-consuming, high cost) are restricted the strawberry production and breeding studies. Anther culture is one of the most widely used techniques in plant breeding and genetic research to produce haploid plants. Plants to be obtained will possess a single set of chromosomes in somatic cells. Later those plant also can have their chromosome numbers doubled by applying some treatments. This method enables the homozygous pure line to be obtained in a shorter time compared to traditional methods. However, this depends on various factors such as species, genotype, explant type, nutrient medium, culture conditions, explant age, type of chromosome doubling treatment etc. For strawberry breeding, anther culture could be alternative method to enhance homozygous inbred line. But, its high ploidy level, its complex genetic structure and obtaining high rate of heterozygous progenies by seed propagation are crucial challenges for anther culture studies in strawberry. This review will discuss the current practices, and challenges of anther culture on strawberries, potential applications of haploid and doubled haploid strawberry plants in breeding. This review could be beneficial for studies to be used in genetic studies, marker-assisted selection, genome editing technologies. This study is supported by Çukurova University BAP Coordination Office within the scope of project number FDK-2023-15809.

Keywords: Strawberry, haploid, breeding, anther culture

ÇİLEKTE HAPLOİD BİTKİ ÜRETİMİNDE ANTER KÜLTÜRÜNÜN KULLANIMI

ÖZET

Çilek, dünyadaki diğer üzümsü meyveler arasında ticari olarak en çok üretilen meyvedir. Benzersiz tadı, yüksek besin değeri, C vitamini, antosiyanin vb. açısından zengin olması ve işlenmiş gıda için yüksek hammadde potansiyeli nedeniyle tercih edilmektedir. Geçmişten günümüze çilekler üzerinde yapılan ıslah çalışmaları meyve kalitesi ve üretim verimi, hastalık direnci, çevresel adaptasyon, hasat sonrası uzun raf ömrü üzerinde yoğunlaşmıştır. Ancak bazı küresel sorunlar (gıda kıtlığı, küresel ısınma vb.) ve geleneksel ıslahtaki sınırlamalar (zaman alıcı, yüksek maliyetli olması) çilek üretimi ve ıslah çalışmalarını kısıtlamaktadır. Anter kültürü, haploid bitkiler üretmek için bitki ıslahı ve genetik araştırmalarında en yaygın kullanılan tekniklerden biridir. Elde edilecek bitkiler somatik hücrelerinde tek bir kromozom setine sahip olacaktır. Daha sonra bu bitkilerin kromozom sayıları da bazı işlemler uygulanarak iki katına çıkarılabilir. Bu yöntem, geleneksel yöntemlere kıyasla daha kısa sürede homozigot saf hattın elde edilmesini sağlar. Ancak bu yöntem türe, genotipe, eksplant tipine, besin ortamına, kültür koşullarına, eksplant yaşı, kromozom katlama yöntemi türü gibi vb. çeşitli faktörlere bağlıdır. Çilek yetiştiriciliğinde, anter kültürü homozigot saf hat geliştirmek için alternatif bir yöntem olabilir. Ancak, yüksek ploidi düzeyi, karmaşık genetik yapısı ve tohumla çoğaltım yoluyla yüksek oranda heterozigot yavru elde edilmesi, çilekte anter kültürü çalışmaları için önemli zorluklardır. Bu derlemede çileklerde anter kültürünün mevcut uygulamaları ve zorlukları, haploid ve çift haploid çilek bitkilerinin ıslahta potansiyel uygulamaları tartışılacaktır. Bu derleme genetik çalışmalarda, marker destekli seleksiyonda, genom düzenleme teknolojilerinde kullanılacak çalışmalara katkı sağlayabilir. Bu çalışma, Çukurova Üniversitesi BAP Koordinatörlüğü FDK-2023-15809 nolu proje kapsamında desteklenmektedir.

Anahtar Kelimeler: Çilek, haploid, ıslah, anter kültürü

ABSTRACT

With the developments in the second and third quarters of the twentieth century, it became possible to transfer genes to plants by asexual methods without taxonomic restrictions in the fourth quarter. In 1994, the first cultivated plant whose genetic structure was modified by biotechnological methods, the late-ripening tomato plant, was started to be cultivated. In 1996, widespread cultivation of varieties of corn, cotton, soybean and rapeseed whose genetic structure was modified by biotechnological methods was started in 5 countries on an area of 1.7 million hectares. This area increased rapidly and reached 206.3 million hectares in 2023. The number of transgenic plant species whose cultivation is widespread has also increased. The number of countries growing transgenic plants has changed between 6 and 29 in the past period. In 2023, transgenic plants were cultivated in 27 countries worldwide and transgenic plants were traded in 76 countries. Despite the rapid increase in the area of transgenic plants growing in the world, the discussions about the cultivation of these plants and the products obtained from these plants, which started with the beginning of the cultivation of these plants, continue in the world public opinion. Due to these discussions, the cultivation and trade of these plants has been legally prohibited in some countries, and their cultivation in some countries. For this reason, transgenic plant cultivation is carried out in one out of every seven countries in the world. Despite some of the economic and ecological advantages of transgenic plant cultivation, there are ongoing discussions about the possible risks to human health, economy and ecology with the widespread cultivation of these plants. On the other hand, no significant human health and ecological problem has been encountered in the public opinion regarding transgenic plants that have been cultivated, traded and consumed for nearly 30 years.

In this report, the current status and future of transgenic plant cultivation in the world and in our country, and the advantages and risks of transgenic plant cultivation are discussed.

Keywords: Gene, GMO, Transgenic crop, Advantage, Risk

DÜNYADA VE TÜRKİYE'DE GENETİĞİ DEĞİŞTİRİLMİŞ BİTKİ TARIMI

ÖZET

Yirminci yüzyılın ikinci ve üçüncü çeyreğinde sağlanan gelişmelerle dördüncü çeyrekte bitkilere taksonomik sınırlama olmaksızın eşeysel olmayan yöntemle gen aktarılması olanaklı hale gelmiştir. 1994 yılında biyoteknolojik yöntemlerle genetik yapısı değiştirilmiş ilk kültür bitkisi olan geç olgunlaşma özelliği kazandırılmış domates bitkisinin tarımına başlanmıştır. 1996 yılında ise 5 ülkede mısır, pamuk, soya ve kolzanın biyoteknolojik yöntemlerle genetik yapısı değiştirilmiş çeşitlerinin 1.7 milyon hektarlık alanda yaygın tarımına başlanmıştır. Söz konusu alan hızla artarak 2023 yılında 206.3 milyon hektara çıkmıştır. Tarımı yaygınlaşan transgenik bitki türü sayısı da artış göstermiştir. Geçen sürede transgenik bitki yetiştiren ülke sayısı 6 ile 29 arasında değişmiştir. 2023 yılında dünya çapında 27 ülkede transgenik bitki tarımı yapılmış ve 76 ülkede transgenik bitkiler ticarete konu olmuştur. Dünyada transgenik bitki yetiştirme alanı hızla artmasına karşılık, bu bitkilerin tarımının başlamasıyla birlikte dünya kamu oyunda başlayan bu bitkilerin tarımı ve bu bitkilerden elde edilen ürünlerle ilgili tartışmalar devam etmektedir. Bu tartışmalar nedeniyle bazı ülkelerde bu bitkilerin tarımı ve ticareti, bazı ülkelerde ise tarımı yasal olarak yasaklanmıştır. Bu nedenle dünyadaki her 7 ülkenin birisinde transgenik bitki tarımı yapılmaktadır. Transgenik bitki tarımının ekonomik ve ekolojik bazı avantajlarına karşılık, bu bitkilerin tarımının yaygınlaşması ile insan sağlığı, ekonomik ve ekolojik açıdan bazı risklerinin olabileceği konusundaki tartışmalar sürmektedir. Buna karşılık, 30 yıla yakın süredir tarımı, ticareti ve tüketimi yapılan transgenik bitkilerle ilgili kamu oyuna yansımış önemli bir insan sağlığı ve ekolojik sorunla karşılaşılmamıştır.

Bu bildiride, transgenik bitki tarımının dünyada ve ülkemizdeki mevcut durumu, geleceği, transgenic bitki tarımının avantajları ve riskleri tartışılmıştır.

Anahtar Kelimeler: Gen, GDO, Transgenik bitki, Fayda, Risk

1.GİRİŞ

Genomuna biyoteknolojik yöntemlerle aynı türden, başka bir türden veya başka bir organizmadan gen aktarılan organizma Genetiği Değiştirilmiş Organizma (GDO) olarak adlandırılmaktadır. Biyoteknolojik yöntemlerle genomuna gen aktarılmış bitkiye transgenik bitki adı verilmektedir. Aktarılan genin ve düzenleyici gen yapılarının orijinine bağlı olarak; transgenic, sisgenik, intragenik ve subgenik olmak üzere farklı transgenik tipleri bulunmaktadır. Bitkilere gen aktarılmasında kullanılan çok farklı yönetmler mevcuttur. Bunlardan en yaygın kullanılanları; 1) *Agrobacterium tümeaficens* bakterisi aracılığıyla gen aktarma 2) Biyolistik yöntemle gen aktarma 3) Protoplastlara gen aktarma. Bu yöntemlerden Agrobacterium bakterisi aracılığıyla gene aktarma yöntemi en eski vee n yaygın yöntemdir. Aktarılmak istenen genin aktarılmasında bakteri kurye olarak kullanılır. Aktarılacak gen klonlandıktan ve gene düzenleyici dizinler eklendikten sonar oluşturan gen kaseti Agrobacterium bakterisi içinde bulunan Ti plazmitinin T-DNA bölgesine aktarılır. Bakteri T-DNA bölgesine eklenen geni belirli koşullar altında bitki hücresine aktarır ve hücre içine giren gen kromozomlara entegre olur. Agrobacterium aracılığıyla gen aktarma, bakterinin çift çenekli bitkilerde (dikotiledon bitkiler) enfeksiyon yapabildiği için daha çok bitkilere gen aktarmada kullanılmaktadır. Ancak, günümüzde bu yöntemle tek çenekli (monokotiledon) bitkilere de gen aktarılabilmektedir. Biolostik yöntem ise özellikle monokotiledon bitkilere gen aktarma amacıyla geliştirilmiş bir direct gen aktarma yöntemidir. Bu yöntemin esası, yüksek derecede hızlandırılmış mikro-taşıyıcı adı verilen 1-2 µm çapındaki metal (çoğunlukla altın ya da tungsten) partiküller aracılığıyla, bir ateşleme mekanizmasından yararlanılarak DNA'nın hedef dokulara aktarılmasıdır. Mikro-taşıyıcılar makro-taşıyıcı olarak adlandırılan plastik bir silindir üzerinden hedef dokulara doğru bir helyum gazı basıncı ile hızlandırılır. Ateşleme gerek mikro-taşıyıcıların sürtünmesinden doğan sürüklenmeyi, gerekse yüksek basınçlı gaz şokundan doğabilecek hücre parçalanmasını ve sesi engellemek için vakum altında yapılır.

2. TRANGENİK BİTKİ TARIMININ TARİHÇESİ

1983 yılında sürdürülen bir araştırma ile elde edilen antibiyotiğe dayanıklılık geni aktarılmış tütün bitkisi dünyadaki ilk transgenik bitki olmuştur. 1986 yılında, ABD ve Fransa'da herbisite tolerans geni aktarılmış tütün bitkileri tarlaya aktarılan ilk transgenik bitkiler olmuştur. 1987 yılında, Belçika'da Marc Van Montagu ve Jeff Schell *Bacillus thuringiensis* bakterisinden gen aktarılarak böceklere karşı dayanıklı trangenik tütün bitkilerini üretmek üzere dünyadaki ilk transgenik bitki üretim şirketini kurmuşlardır.

Ticari olarak ilk transgenik bitki tarımı 1992 yıllında Çin Halk Cumhuriyeti'nde virüse dayanıklılık geni aktarılmış tütün bitkilerinin yetiştirilmeye başlanması ile başlamıştır (James, 1997). ABD'de ilk transgenik bitki tarımı, 1994 yılında geç olgunlaşma özelliği kazandırılmış ve *FlavrSavr* adıyla tescil edilmiş transgenik bir domates çeşidinin tarımı ile başlamıştır.

1996 yılından itibaren ise transgenik bitkilerin tarımı hızla yaygınlaşmaya başlamıştır. 1996 yılında Çin dışındaki diğer 5 dünya ülkesinde 1.7 milyon ha alan üzerinde transgenik bitki tarımı yapılmasına karşılık, bu alan 2014 yılında 179.4 milyon ha'a yükselmiştir (Çizelge 1).

Çizelge 1. Dünya'da Transgenik Bitki Ekim Alanlarının Değişimi

Yıl	Ekim Alanı (Milyon ha)
1996	1.7
2000	44.2
2010	148.0
2014	179.4
2015	176.8
2016	180.2
2017	186.9
2018	186.9
2019	186.4
2020	189.1
2021	106.2
2022	202.9
2023	205.8
2024	209.8

Kaynak: Anonim, 2025a

2015 yılında ise, % 1.4'lük azalma ile 176.8 milyon ha olmuştur. 2018 yılında, 186.9 milyon ha alanda transgenik bitki tarımı yapılmıştır. 2019 yılında ise 0.5 milyon ha'lık azalma ile 186.4 milyon ha'a düşmüştür. 2020 yılında 189.1'a yükselen transgenik bitki ekim alanı, artış eğilimini 2024 yılına kadar sürdürmüş ve 2024 yılında 209.8 milyon ha'a çıkmıştır. Bu alan, dünyadaki toplam 1.5 milyar hektarlık tarla arazilerinin % 14'ünü oluşturmaktadır.

3. TRANSGENİK BİTKİ TARIMI YAPAN ÜLKELER

1996 yılından ibaren transgenik bitki tarımı yapan ülke sayısı 6 ile 29 arasında değişmiştir. Halen Birleşmiş Milletlere kayıtlı 193 ülke dikkate alındığında, 2024 yılında transgenik bitki tarımı yapan ülke sayısı 27 olmuş ve dünyada her 7 ülkenin birisinde transgenik bitki tarımı yapılmıştır. Bu ülkelerin 11 adedi Amerika kıtasında, 8 adedi Asya kıtasında, 2 adedi Avrupa kıtasında ve 5 adedi Afrika kıtasında, 1 adedi ise Avustralya kıtasında bulunmaktadır.

En fazla transgenik bitki ekim alanı ABD'de bulunmaktadır (Çizelge 2). Nitekim, 2024 yılı rakamlarına göre ABD'de 75.4 milyon ha alan üzerinde transgenik bitki tarımı yapılmıştır. ABD'yi Brezilya ve Arjantin izlemektedir. Transgenik bitki ekim alanlarının % 89'u Amerika kıtasında, % 8.6'sı Asya, % 1.8'i Afrika, % 0.67'si Avustralya kıtasında ve % 0.03'ü Avrupa kıtasında ve bulunmaktadır.

Çizelge 2. Transgenik Bitki Tarımı Yapılan Ülkeler ve Ekim Alanları

Ülke	Ekim Alanı (Milyon ha)	Yetiştirdiği Transgenik Bitkiler
ABD	75.4	Soya, Mısır, Pamuk, Kanola, yonca, Ş. Pancarı
Brezilya	67.9	Soya, Mısır, Pamuk, Şeker kamışı
Arjantin	23.8	Soya, Mısır, Pamuk, Yonca, Buğday
Kanada	11.7	Kanola, Mısır, Soya, Şeker Pancarı
Hindistan	11.2	Pamuk
Paraguay	4.4	Soya, mısır, pamuk
Çin	3.5	Pamuk, Soya, Mısır
Güney Afrika	3.5	Mısır, Soya, Pamuk
Pakistan	1.9	Pamuk
Bolivya	1.8	Soya
Uruguay	1.5	Soya, Mısır
Avustralya	1.4	Pamuk, kanola
Filipinler	0.7	Mısır
Vietnam	0.4	Mısır
Myanbar	0.2	Pamuk
Sudan	0.2	Pamuk
Kolombia	0.2	Pamuk, Mısır
İspanya	<0.1	Mısır
Meksika	<0.1	Pamuk

4. TRANSGENİK ÇEŞİTLERİ BULUNAN BİTKİ TÜRLERİ

Dünyada halen dört bitki türünün transgenik çeşitlerinin yaygın olarak tarımı yapılmaktadır. Bu türler arasında ise, en fazla ekim alanına sahip tür soya fasulyesidir. Bunu, mısır, pamuk ve kanola izlemektedir (Çizelge 3). Halen toplam transgenik bitki ekim alanının % 99'unda söz konusu dört bitki türüne ait transgenik çeşitler yetiştirilmektedir. Bu dört bitki türü dışında

dışında, yoncanın transgenik çeşidi ABD'de, şeker pancarının trasngenik çeşidi ABD ve Kanada'da, transgenik buğday çeşidi Arjantin'de ve transgenik patlıcan çeşidi Bengladeş'te yetiştirilmektedir.

Çizelge 3. Transgenik Çeşitleri Bulunan Bitki Türleri ve ekim Alanları

Bitki Türü	**Ekim Alanı**	**Toplam Transgenik ekim Alanı İçindeki Oranı (%)**
Soya Fasulyesi	105.1	50.1
Mısır	68.4	32.6
Pamuk	24.2	11.5
Kanola	10.4	5.0
Yonca	1.1	0.50
Şeker Pancarı	0.5	0.2
Şeker Kamışı	0.06	0.02
Buğday	0.05	0.02
Patlıcan	0.003	0.001
Toplam	209.8	100.0

Kaynak: Anonim, 2025a

Transgenik çeşitlerinin tarımı yapılan söz konusu bitki türleri dışında, transgenik çeşitleri bulunan ancak, tarımı henüz yaygınlaşmamış bitki türleri de bulunmaktadır. Nitekim Dünya'da halen aşağıda verilen 32 bitki türünün transgenik çeşitleri için üretim izni alınmıştır(Çizelge 4).

Çizelge 4. Transgenik Çeşitleri İçin Üretim İzni Alınmış Bitki Türleri

Bitki Türü	**Bitki Türü**	**Bitki Türü**	**Bitki Türü**
Yonca	Patlıcan	Soya Fasulyesi	Buğday
Elma	Okaliptüs	Çeltik	Aspir
Kanola	Mısır	Gül	Keten
Fasulye	Kavun	Kabak	Ananas
Karanfil	Papaya	Şeker Pancarı	Petunya
Hindiba	Erik	Şeker Kamışı	Biber
Pamuk	Şalgam	Tavus otu	Tütün
Börülce	Kavak	Patates	Domates

5. TRANSGENİK ÇEŞİTLERİN EKİM ALANLARININ TÜRLERİN TOPLAM EKİM ALANI İÇİNDEKİ ORANI

Dünyada transgenik soya ekim alanlarının toplam soya üretim alanları içerisindeki oranı % 74.9 dir (Çizelge 5). Pamukta ise bu oran % 78.4'dır.

Çizelge 5. Transgenik Çeşitlerin Türlerin Toplam Ekim Alanları İçerisindeki Oranları

Bitki	Toplam Ekim Alanı (Milyon ha)	Transgenik Ekim Alanı/ Toplam Ekim Alanı (%)
Soya Fasulyesi	140.5	74.9
Pamuk	30.9	78.4
Kanola	42.9	24.3
Mısır	202.9	33.7

Kaynak: Anonim, 2025a

Ancak, farklı ülkelerde transgenik çeşitlerin toplam ekim alanı içindeki ekim oranı farklılık göstermektedir (Çizelge 6).

Çizelge 6. Transgenik Bitki Yetiştiren Ülkelerde Transgenik Çeşit Ekim Alanının Türün Toplam Ekim Alanı İçindeki Oranı (%)

Ülke	**Soya**	**Mısır**	**Pamuk**	**Kanola**
ABD	93	90	90	93

Bolivya	91	-	-	-
Pakistan	-	-	88	-
Myanmar	-	-	85	-

Kaynak: James, 2014; Anonim, 2025a.

Çizelgeden anlaşılacağı üzere ABD'de pamuk, mısır ve soyada transgenik oranı % 90'dır. Arjantin de bu açıdan benzerlik göstermektedir.

6. TRANSGENİK ÇEŞİTLERE KAZANDIRILAN ÖZELLİKLER

Halen tarımı yapılan transgenik bitki çeşitleri esas itibarıyla ya herbisitlere dayanıklılık veya bazı böcek türlerine dayanıklılık veyahut ta her iki özelliğe sahip çeşitlerdir. Mevcut transgenik bitki ekim alanlarının % 99'u söz konusu özelliği taşıyan transgenilk bitkilerle ilgilidir. Bunun yanın minör düzeyde tarımı yapılan farklı transgenik özelliklere sahip diğer bazı taransgenik bitkiler de mevcuttur (Çizelge 7)

Çizelge 7. Minör Düzeyde Tarımı Yapılan Transgenik Bitkiler, Özellikleri ve Tarımının Yapıldığı Ülkeler

*) Yetiştirilmeye başlandığı yıl

2023 yılı verilerine göre, transgenik bitki tohumlarının pazar değeri 30.63 milyar dolardır. Bu değer halen dünyadaki 54 milyar dolar değerindeki toplam tohum pazarının % 56.7'sini oluşturmaktadır. 2033 yılında transgenik bitki tohumlarının pazar değerinin 80. 9 milyar dolar olacağı tahmin edilmektedir (Anonim, 2025b).

7. TRANSGENİK BİTKİ TARIMININ AVANTAJLARI

7.1. VERİM ARTIŞI

Transgenik bitki tarımı ile 1996-2020 yılları arasında 979.6 milyon ton daha fazla üretim yapılmıştır. Bu üretimin değeri 263.1 milyar dolardır (Brookes, 2022a). 1996-2020 yılları arasında transgenik bitki yetiştiriciliği ile 183 milyon ha alan tasarrufu yapılmıştır.

Halen tarımı yapılan herbisite toleranslı ve/veya bazı böceklere karşı dayanıklı bitki çeşitleri ile klasik yabancı ot ve böcek kontrol yöntemlerine göre daha etkin mücadele edildiği için verim kayıpları azalmakta ve verimde artış ortaya çıkabilmektedir. Transgenik bitki tarımı yapılan ülkelerde 2020 yılında transgenik çeşit yetiştiriciliğiyle ortaya çıkan verim artışları Çizelge 8'de verilmiştir. Çizelgede izlendiği gibi, herbisite toleranslı soya çeşitleri transgenik olmayan soya çeşitlerine göre verim avantajı sağlamamıştır. Ancak, ABD ve Kanada'da 2009 yılından sonra üretime alınan ve daha yüksek verim potansiyeline sahip herbisite toleranslı soya

çeşitleri transgenik olmayan çeşitlere göre 2020 yılında % 8.9 verim artışı sağlamıştır. Hem herbisite tolerant ve hem de böceğe dayanıklılık özelliğine sahip transgenik soya çeşitleri ise yetiştirildikleri ülkelerin tamamında özellikle böceğe dayanıklılık özellikleri nedeniyle verim artışı sağlamıştır. Herbisite tolerans mısır çeşitleri de Arjantin, Brezilya, Filipinler ve Vietnam dışındaki ülkelerde verim avantajı sağlamamıştır. Arjantin'de hem böceğe dayanıklı ve hem de herbisite tolerans özelliğine sahip olan mısır çeşitleri % 10 verim artışı sağlamıştır. Herbisite tolerant pamuk çeşitleri Meksika, Kolombia ve Vietnam gibi mısır yetiştiriciliğinin daha ekstensif olarak yapıldığı ülkelerde verim artışı sağlamıştır. Geleneksel yetiştiricilikte yabancı ot mücadelesinin daha zor olduğu kanola bitkisinde herbisite toleranslı çeşitler yetiştirildiği tüm ülkelerde verim artışı sağlamıştır. Virüse dayanıklı papaya ve kabak çeşitleri virüs hastalıkları ile mücadelenin güç olması nedeniyle çok önemli verim artışı sağlamıştır. ABD ve Kanada'da herbisite toleranslı şeker pancarı az da olsa verim artışı sağlamıştır. Kurağa dayanıklı mısır ve böceğe dayanıklı patlıcan da 2020 yılında verim artışı sağlayan transgenik bitkiler olmuştur. Geleneksek yetiştiricilikte mücadelesi güç olan böceklere karşı dayanıklı mısır ve pamuk çeşitleri ise yetiştirildikleri ülkelerin tamamında verim artışı sağlamıştır.

Çizelge 8. Transgenik Bitki Tarımı Yapılan Ülkelerde 2020 Yılında Transgenik Çeşit Yetiştiriciliğiyle Ortaya Çıkan Verim Artışları

Transgenik Bitki	**Ülke**	**Verim Artışı (%)**
Herbisite Toleranslı Soya	ABD (2.generasyon çeşitler)	8.9
	Arjantin	0
	Brezilya	0

7.2. ÜRETİM MALİYETİNİN AZALMASI

Herbisite ve/veya böceğe dayanıklı çeşitlerin kullanılması ile miktar ve sayı olarak daha az herbisit ve insektisit kullanılması sonucu birim alandaki üretim maliyetinde azalma ortaya çıkabilmektedir. Nitekim 1996-2020 yılları arasında transgenik çeşit yetiştirilen ülkelerde farklı transgenik bir çeşitlerinin sağladığı üretim maliyeti azalışları Çizelge 9'da verilmiştir. Çizelgede izlendiği gibi genellikle herbisite tolerant çeşitlerin tarımı maliyette azalışa neden olurken, böceğe dayanıklı çeşitlerin tarımı genellikle maliyet artışına neden olmuştur. Ancak, bu çeşitlerin sağladığı verim artışları maliyet artışlarını rahatlıkla karşılamıştır. Kurağa dayanıklı ve virüse dayanıklı çeşitler ise maliyet artışına neden olmakla beraber sağladıkları verim artışları ile klasik çeşitlere göre verimi daha karlı hale getirmişlerdir.

Çizelge 8. Transgenik Çeşit Kullanımında Üretim Maliyeti Azalışları **(**2020)

7.3. PESTİSİT KULLANIMINDA AZALMA

1996-2020 yılları arasında trangenik bitki yetiştiriciliği ile dünya çapında pestisit kullanımı 748.6 milyon kg (%-7.2) azalmıştır (Çizelge 10). 2020 yılında transgenik bitki yetiştiriciliği ile 15.6 milyon otomobilin bir yılda çıkardığı CO2 kadar CO2 (23.631 milyar kg) emisyonunda azalma sağlanmıştır (Çizelge 11).

Çizelge 10. Transgenik Bitki Kullanımından Kaynaklanan Pestisit Kullanımında Azalma (1996-2020)

Transgenik Bitki	Pestisit Kullanımında Azalma (milyon kg)	Pestisit Kullanımında Azalma (%)
Herbisite Toleranslı Soya	-3.07	-0.1
Herbisite tolerant ve böceğe dayanıklı soya	-30.7	-6.1
Herbisite Toleranslı Mısır	-223.8	-6.2
Herbisite Toleranslı Pamuk	-38.8	-8.4
Herbisite Toleranslı Kanola	-27.3	-18.1
Böceğe Dayanıklı Mısır	-85.4	-45.0
Böceğe Dayanıklı Pamuk	-338.9	-29.9
Herbisite Toleranslı Şeker Pancarı	-0.8	+4.4
Toplam	-748.6	-7.2

Kaynak: Brookes, 2022b

Çizelgede izlendiği gibi, yaygın transgenik bitki tarımının başladığı 1996 yılından 2024 yılına kadar geçen 28 yılda bu bitkilerin tarımı ile dünya çapında pestisit kullanım 748.4 milyon ton , başka bir deyişle % 7.2 azalmıştır. Bu azalma pestisitlerden kaynaklı çevre zararlarının azalmasına yol açmıştır.

7.4. ATMOSFERE SALINAN CO_2 MİKTARINDA AZALMA

Halen yaygın olarak tarımı yapılan böceğe dayanıklı veya herbisite toleranslı transgenik bitkiler tarla trafiğini azalttıkları için yakıt tüketiminde azalmaya ve bu yakıt kaynaklı atmosfere CO_2 çıkışında azalmaya neden olmaktadırlar. Ayrıca, herbisite toleranslı çeşitler ekim öncesi ve ekim sonrası yabancı ot mücadelesi amaçlı toprak işlemeyi gereksiz yaparak, topraktan CO_2 çıkışını engellemektedir.

Çizelge 11. 2020 yılında Transgenik Bitki Tarımının Karbon Bütçesine Etkisi

Ülke/Bitki	**Yakıt Tüketimindeki Azalma Nedeniyle Karbondioksit Çıkışındaki Azalma (milyon kg)**	**Yakıt Tüketimindeki Azalma Nedeniyle ortaya çıkan karbondioksit azalmasına karşılık gelen bir yılda trafikten çekilen otomobil sayısı (X1000)***	**Topraktan Karbondioksit Çıkışının Azalmasından kaynaklanan karbondioksit (milyon kg)**	**Topraktan Karbondioksit Çıkışının Azalması Nedeniyle ortaya çıkan karbondioksit azalmasına karşılık gelen bir yılda trafikten çekilen otomobil sayısı (X1000)***

Toplam	39 147	25 942	21 101.1	13 980.7

Kaynak: Brookes, 2022c

Çizelgede izlendiği gibi, 2020 yılında transgenik bitki tarımı ile yakıt tüketimindeki azalma kaynaklı olarak atmosfere salınan CO_2 miktarı 39,147 milyar kg, herbisite tolerant bitkilerin tarımı ile azalan toprak işleme sonucu ise 21.101 milyar kg CO_2 azalmıştır. Yakıt tüketimindeki azalma nedeniyle azalan CO_2 miktarının 25.942 milyon aracı bir yılda atmosfere saldığı CO_2'e eş değer olduğu hesaplanmıştır. Toprak işlemenin azalması sonucu azalan CO_2 miktarının ise 13.980 aracı bir yılda atmosfere saldığı CO_2'e eş değer olduğu hesaplanmıştır.

8. TRANGENİK BİTKİ TARIMININ RİSKLERİ

Bitki genomuna biyoteknolojik yöntemlerle yeni genlerin eklenmesi, daha önce açıklandığı gibi, söz konusu bitkilerin verimlerinde, besin değerlerinde, bu bitkilerin üretim maliyetlerinde ve bitkisel üretimden kaynaklanan çevre üzerindeki olumsuz etkilerin giderilmesinde bazı olumlu gelişmelere neden olmaktadır. Ancak, transgenik bitkilerin tarımının sayılan bu avantajlı yönlerine karşılık, bu bitkilerin yaygın olarak tarımının yapılması ile bazı çok yönlü

risklerin de ortaya çıkabileceği üzerindeki tartışmalar sürmekte ve dünya kamu oyu bu konuda üç farklı görüş grubuna bölünmüş durumdadır.

Birinci grup: ‘’Transgenik bitkiler klasik bitki ıslahı ile geliştirilen bitkilerden kesinlikle farklı değildir. Bu bitkilerin tarımı ile ortaya çıkabilecek riskler geleneksel yöntemlerle geliştirilen bitki çeşitlerinin tarımında ortaya çıkabilecek risklerden farklı değildir’’. Teknolojiyi geliştiren uluslar arası şirketler, bu şirketler ile yakın ilişki içinde bulunan bilim adamları ve bu şirketlerin bulunduğu ülkelerdir.

İkinci grup: ‘’Transgenik bitkilerin yaygın olarak tarımının yapılması insan sağlığı ve çevre üzerinde büyük tehditler oluşturmaktadır. Transgenik bitkilerin tarımından hemen vazgeçilmelidir’’ (Çevre örgütleri).

Üçüncü grup: ‘’Bu iki cephe arasında yer almakta ve transgenik bitkilerin yaygın olarak yetiştirilmesinin bazı riskleri beraberinde getirebileceği, bu nedenle bu bitkilerin tarımına geçilmeden önce yetiştirilecekleri her çevrede riskleri açısından detaylı olarak araştırılmalı ve tüketiciye seçme hakkı verilmesi açısından bu tip bitkilerden üretilen gıdalarda etiketleme yapılmalıdır’’ (Bağımsız bilim insanları).

Bu tartışmalar sonucu, 1996 yılında başlamış olan Transgenik Bitki Tarımı 2024 yılında Birleşmiş Milletler üyesi 193 ülkeden ancak 27’sinde kabul görmüştür. Bu sayı zaman zaman 29’a kadar çıkmıştır. Avrupa birliği ülkeleri 1998 yılında bu bitkilerin tarımına ve bu bitkilerden elde edilen ürünlerin ithalatına yasak koymuştur. Bu yasak 2004 yılına kadar devam etmiştir.

Transgenik bitkilerin tarımı ile ilgili riskler, temelde bitkilere aktarılan ve bugünkü uygulamasıyla bitkiler dışındaki organizma orijinli (genelde bakteri orijinli) genlerin ürünü olan proteinlerin ve aktarılan gen yapılarının insan ve çevre üzerindeki olası olumsuz etkilerinden kaynaklanmaktadır. Transgenik bitkilerin yetiştirilmesi ve bu bitkilerden elde edilen ürünlerin gıda olarak tüketilmesi ile ilgili riskler üç ana grup altında toplanmaktadır (Kulikov, 2005).

8.1. GIDA OLARAK RİSKLERİ

1)Transgenik bitkilerdeki aktarılan gen veya genlerin ürettiği proteinin bu bitkilerden üretilen gıdaları tüketenlere alerjik ve toksik etki yapması

2) Transgenik Proteinlerin bitki metabolizmasındaki pleitropik etkileri sonucu ortaya çıkabilecek riskler

3) Herbisite toleranslı bitkilerde herbisit ve metabolitlerinin birikmesinden kaynaklanan riskler

4) Bitkilere aktarılan bakteriyel genlerin insan ve hayvanlarda simbiyotik olarak yaşayan bakterilere horizontal olarak transfer olması riski

8.2.EKOLOJİK RİSKLER

1)Dar Bir Genetik Tabandan geliştirilen Transgenik Bitkilerin Tarımının Yaygınlaşması ile Kültür Bitkilerinde Çeşitliliğin Azalması

2) Transgenik Bitkilerden Yabani akrabalarına gen kaçışı sonucu biyoçeşitliliğin azalması ve süper yabancı otların ortaya çıkışı

3)Transgenik bitkilere aktarılan bakteri kökenli genlerin toprak mikroflorasına horiontal olarak geçme riski

4)Toksik Transgenik Proteinlerin Hedef Dışı Organizmaları Olumsuz yönde Etkilemesi

5) Transgenik bitkilerin ürettiği toksik proteinlere hedef organizmaların dayanıklılık kazanması

8.3. SOSYO - EKONOMIK RISKLER

1)Pahalılık

2)Tek tip çeşit ve ilaç kullanımı

3)Tohumluğun her yıl yenilenmesi zorunluluğu

ABSTRACT

Allelopathy is defined as the phenomenon in which certain plants suppress or stimulate the growth of other plants through chemical compounds released into their environment. This effect provides a competitive advantage in natural ecosystems and is considered an alternative method for weed control in agricultural production. Sorghum (*Sorghum bicolor* L.) exhibits strong allelopathic properties through its root exudates and plant components. In particular, the inhibitory effects of sorghum extracts on weed germination and growth have been reported in various studies. Vetch (*Vicia sativa* L.) is an important forage crop in agricultural production and is widely used in cropping systems. However, in some cropping systems, vetch may compete with other plants, which can affect its germination and growth due to various environmental factors. In this context, determining how vetch responds to allelopathic effects during its germination and growth process is a key consideration in agricultural planning. This study aimed to investigate the allelopathic effects of sorghum extracts on common vetch. The Erdurmuş sorghum variety was obtained from the West Mediterranean Agricultural Research Institute, while vetch seeds were sourced from commercial suppliers. Sorghum seeds and plant parts were extracted with distilled water, ethanol, and methanol at concentrations of 0%, 5%, and 10%, and applied in controlled conditions to vetch seeds in petri dishes. The experiment was conducted under laboratory conditions (22±2°C) and monitored for 15 days. The parameters evaluated included germination rate (%), root length (mm), shoot length (mm), fresh weight (g), and dry weight (g), with data analyzed using SPSS software. Variance analysis revealed significant differences, and Duncan's multiple comparison test was used for grouping. The study found that the 10% sorghum seed extracts in ethanol and methanol completely inhibited vetch germination. The 5% methanol extract reduced the germination rate to 67.5%, while the 10% methanol extract reduced it to 20%. Root and shoot lengths showed significant reductions with the 10% ethanol and methanol extracts. Fresh and dry weights also significantly decreased with increasing extract concentration. In particular, plant-methanol extracts exhibited a suppressive effect on vetch root and shoot development, while water-based extracts showed

stimulatory effects at certain doses. The results suggest that sorghum's allelopathic components have varying effects depending on different extraction methods and dose levels, significantly inhibiting germination at higher concentrations. These findings highlight the importance of considering allelopathic interactions when cultivating vetch after sorghum. Further studies should focus on investigating the long-term effects on subsequent crops in crop rotation systems following sorghum cultivation.

Keywords: Allelopathy, sorghum, common vetch, germination.

SORGUM (*Sorghum bicolor* L.) EKSTRAKTININ ADİ FİĞ (*Vicia sativa* L.) ÜZERİNDEKİ ALLELOPATİK ETKİLERİNİN BELİRLENMESİ*

ÖZET

Allelopati, bazı bitkilerin çevrelerine salgıladıkları kimyasal bileşenler aracılığıyla diğer bitkilerin büyümesini baskılaması veya teşvik etmesi olarak tanımlanmaktadır. Bu etki, doğal ekosistemlerde rekabet avantajı sağlarken, tarımsal üretimde yabancı ot mücadelesinde alternatif bir yöntem olarak değerlendirilmektedir. Sorgum (*Sorghum bicolor* L.), kök salgıları ve bitkisel bileşenleri ile güçlü allelopatik özellikler sergileyen bir bitkidir. Özellikle sorgum ekstraktlarının yabancı otların çimlenmesi ve büyümesi üzerindeki engelleyici etkileri çeşitli çalışmalarda rapor edilmiştir. Fiğ (*Vicia sativa* L.), tarımsal üretimde önemli bir yem bitkisi olup, ekim sistemlerinde yaygın olarak kullanılmaktadır. Ancak bazı ekim sistemlerinde diğer bitkilerle rekabete girmesi nedeniyle çimlenme ve gelişim süreci farklı çevresel faktörlerden etkilenebilmektedir. Bu bağlamda, fiğin çimlenme ve büyüme sürecinde allelopatik etkilere karşı nasıl tepki verdiğini belirlemek, tarımsal planlamada önemli bir unsur olarak değerlendirilmektedir. Bu çalışmada, sorgum ekstraktlarının adi fiğ üzerinde oluşturduğu allelopatik etkiler araştırılmıştır. Erdurmuş sorgum çeşidi Batı Akdeniz Tarımsal Araştırma Enstitüsü'nden temin edilmiş, fiğ tohumları ise ticari firmalardan sağlanmıştır. Sorgum bitkisinin tohum ve bitkisel aksamları; saf su, ethanol ve methanol ile eksrakte edilip, %0, %5 ve %10'luk konsantrasyon oranlarında petri kaplarındaki fiğ tohumlarına kontrollü bir şekilde uygulanmıştır. Deneme laboratuvar şartlarında (22±2°C) yürütülmüş ve 15 gün boyunca izlenmiştir. Çimlenme oranı (%), kök uzunluğu (mm), sürgün uzunluğu (mm), yaş ağırlık (g) ve kuru ağırlık (g) parametreleri değerlendirilmiş ve elde edilen veriler SPSS programında analiz edilmiştir. Varyans analizi sonucu farklılık tepit edilen değerler Duncan çoklu karşılaştırma testi kullanılarak gruplandırılmıştır. Çalışma sonucunda, %10'luk sorgum tohum-etanol ve tohum-metanol ekstraktlarının fiğde çimlenmeyi tamamen engellediği görülmüştür. %5'lik metanol ekstraktının çimlenme oranını %67.5'ye, %10'luk metanol ekstraktının ise %20'ye düşürdüğü tespit edilmiştir. Kök ve sürgün uzunlukları, %10'luk etanol ve metanol ekstraktlarında belirgin bir azalma göstermiştir. Yaş ve kuru ağırlık değerleri de artan ekstrakt dozu ile önemli ölçüde düşüş göstermiştir. Özellikle, bitki-metanol ekstraktlarının adi fiğin kök ve sürgün gelişimi üzerinde baskılayıcı etkiye sahip olduğu belirlenirken, su bazlı ekstraktların bazı dozlarının teşvik edici etkiler gösterdiği tespit edilmiştir. Çalışma sonuçları, sorgumun allelopatik bileşenlerinin farklı ekstraksiyon yöntemleri ve farklı doz düzeylerine bağlı olarak farklı etki yarattığı ve yüksek konsantrasyonlarda önemli ölçüde çimlenme inhibisyonuna sebep olduğu belirlenmiştir. Bu doğrultuda, sorgum ekstraktlarının adi fiğ üzerinde belirgin allelopatik etkilere sahip olduğu ve belirli dozlarda çimlenme ve büyümeyi baskıladığı belirlenmiştir. Elde edilen bulgular, sorgum ekimi sonrası fiğ yetiştiriciliğinde allelopatik etkileşimlerin dikkate alınması gerektiğini ortaya koymaktadır. Sonraki çalışmalarda, ekim nöbeti içinde sorgumdan sonra gelen bitkiler üzerindeki uzun vadeli etkilerin incelenerek, sürdürülebilir tarımsal üretim stratejilerinin geliştirilmesi gerektiği düşünülmektedir.

Anahtar Kelimeler: Allelopati, sorgum, adi fiğ, çimlenme.

1. GİRİŞ

Tarım sektörü, artan nüfus ve azalan doğal kaynaklar karşısında sürdürülebilirliği sağlamak için yenilikçi ve çevre dostu yöntemlere yönelmektedir (Savcı, 2012). Bu bağlamda verim kayıplarını azaltmak ve tarımda sürekliliği sağlamak için yeni biyolojik mücadele yöntemlerine ihtiyaç duyulmaktadır (Farooq ve ark., 2011; Weston ve ark., 2013). Kimyasal herbisitlerin yoğun kullanımı, toprak mikrobiyal dengesini bozmakta ve dirençli yabancı ot türlerinin yaygınlaşmasına neden olmaktadır (Duke ve ark., 2002; Heap, 2014). Ayrıca bu kimyasallar çevresel toksisite ve gıda güvenliği risklerini de beraberinde getirmektedir (Carpenter ve ark., 2002; Inderjit ve Duke, 2003).

Bu nedenlerle doğal kökenli, biyoaktif bileşiklerin kullanımı tarımsal biyoteknoloji açısından ilgi görmektedir. Allelopati, bir bitkinin çevresine salgıladığı kimyasallar aracılığıyla diğer bitkilerin gelişimini baskılaması ya da teşvik etmesi durumu olarak tanımlanmaktadır (Cheema ve Ahmad, 1988; Reigosa ve ark., 1999). Bu doğal etkileşim, yabancı ot mücadelesinde alternatif yöntemlerin geliştirilmesine olanak tanımaktadır (Xuan ve ark., 2005; Scavo ve ark., 2018). Allelokimyasalların çimlenme, hücre bölünmesi, fotosentez ve protein sentezi gibi birçok fizyolojik süreci etkilediği bilinmektedir (Batish ve ark., 2007; Li ve ark., 2010).

Sorgum (*Sorghum bicolo*r L.), özellikle köklerinden salgıladığı sorgoleone bileşiği ile tanınan, yüksek allelopatik potansiyele sahip bir bitkidir (Dayan ve ark., 2009; Czarnota ve ark., 2001). Yapılan birçok araştırmada sorgumun farklı bitkiler üzerindeki baskılayıcı etkileri deneysel olarak gösterilmiştir (Uddin ve ark., 2013; Cheema ve Ahmad, 1988; Weston ve ark., 2013; Tesio ve Ferrero, 2010). Yapılan çalışmalarda sorgumdan elde edilen ekstraktların; çözücüye, dozuna ve uygulama biçimine göre farklı etki düzeyleri gösterdiği rapor edilmiştir (Inderjit ve Duke, 2003; Macías ve ark., 2007).

Fiğ (*Vicia sativa* L.), azot bağlama yeteneği ile tarım sistemlerinde toprak verimliliğini artıran, yem bitkisi olarak önemli bir türdür. Ancak stres faktörlerine karşı hassas olması nedeniyle dış çevresel etkilere duyarlıdır (Xuan ve ark., 2005; Batish ve ark., 2007). Allelopatik maddelere maruziyetin fiğ gelişimini olumsuz etkileyebileceği yapılan farklı çalışmalarda gösterilmiştir (Inderjit ve Duke, 2003; Hussain ve ark., 2011). Bu nedenle fiğ bitkisi, allelopatik çalışmalar için uygun bir model organizma olarak değerlendirilmektedir (Tefera, 2002; Weston ve ark., 2013).

Son yıllarda yapılan çalışmalar, sorgumun doğal herbisit potansiyelini ortaya koymakta ve bunun sürdürülebilir tarım uygulamalarında kullanımı üzerine yoğunlaşılmaktadır (Duke ve ark., 2002; Xuan ve ark., 2005; Tesio ve Ferrero, 2010; Uddin ve ark., 2013). Bu çerçevede sorgum münavebe sistemlerinde rotasyon bitkisi olarak kullanılmakta ve çevre dostu üretim stratejilerinin geliştirilmesine katkı sağlamaktadır (Reigosa ve ark., 1999; Dayan ve ark., 2009). Bu çalışmada, sorgumun farklı bitki aksamlarından ve çeşitli çözücülerle hazırlanan ekstraktlarının adi fiğ üzerindeki etkileri araştırılmış ve doğal herbisit potansiyeli değerlendirilmiştir.

2. MATERYAL VE METOT

2.1. Araştırma Yeri ve Deneme Koşulları

Deneme, 2024 yılında Sakarya Uygulamalı Bilimler Üniversitesi Ziraat Fakültesi laboratuvarlarında yürütülmüştür. Denemeler, tesadüf parselleri deneme deseninde, faktöriyel düzende dört tekerrürlü olarak gerçekleştirilmiştir. Denemelerde kontrollü ortamda 22±2°C sıcaklık ve %60 nem koşulları sağlanmıştır.

2.2. Bitki Materyalleri

Araştırmada kullanılan sorgum (*Sorghum bicolor* L.) materyali Erdurmuş çeşidi Batı Akdeniz Tarımsal Araştırma Enstitüsü'nden, adi fiğ (*Vicia sativa* L.) ise ticari bir firmadan temin edilmiştir.

2.3. Ekstraktların Hazırlanması

Sorgum bitkisinin tohum ve yeşil aksamları ayrı ayrı 37°C sıcaklıkta etüvde kurutulmuş, ardından öğütülerek toz haline getirilmiştir. Toplam 50 gram kuru materyal, 250 mL'lik; saf su, etanol ve metanol çözücülerinde 72 saat süreyle oda sıcaklığında ekstrakte edilmiştir (Namsi ve ark., 2018). Elde edilen sıvı ekstraktlar önce süzgeçten, ardından filtre kağıdından geçirilmiş ve çözücüsü evaporasyon yöntemiyle uçurularak saf ekstrakt elde edilmiştir. Elde edilen saf ekstraktan %5 ve %10'luk dozlar hazırlanarak, uygulamaya hazır hale getirilmiştir.

2.4. Tohumların Sterilizasyonu

Denemede kullanılan tohumlar ekimden önce yüzey sterilizasyonu yapmak amacıyla sodyum hipokloritte (NaClO %3 çamaşır suyu) 5 dakika bekletilmiştir. Daha sonra beş defa 5 dakika süre ile saf suda yıkanmış ve filtre kağıdı üzerinde oda sıcaklığında kurutulmuştur (Baltepe ve Mert, 1972).

2.5. Denemenin Kurulması ve Gözlemler

Tohumlar, çapları 90 mm olan petri kaplarına whatman kurutma kağıdı arasına yerleştirilmiştir. Her petri kabına 10 adet adi fiğ tohumu yerleştirilmiş ve üzerine 6 ml ekstrakt uygulanmıştır. Kontrol grubuna sadece saf su verilmiştir. Kurulan denemeler kontrollü (22°C +/-2°C) koşullarda 15 gün boyunca günlük takibi yapılmış; çimlenme oranı (%), kök uzunluğu (mm), sürgün uzunluğu (mm), yaş ağırlık (g) ve kuru ağırlık (g) gözlemleri alınmıştır. Ölçümler dijital kumpas ve 0.0001 g hassasiyetindeki terazilerle gerçekleştirilmiştir (Şin ve ark., 2017).

2.6. İstatistiksel Analiz

Elde edilen veriler SPSS 20.0 paket programında varyans analizine tabi tutulmuş, anlamlı fark bulunan uygulamalarda Duncan çoklu karşılaştırma testi uygulanarak gruplandırma yapılmıştır (Düzgüneş ve ark., 1987).

3. BULGULAR VE TARTIŞMA

3.1. Çimlenme Oranı

Sorgum ekstraktı uygulanan adi fiğ bitkisinin çimlenme oranı ortalamaları Tablo 1'de verilmiştir.

Tablo 1. Sorgum ekstraktı uygulanan adi fiğ bitkisinde çimlenme oranı ortalamaları

Ekstrakt dozu	Çimlenme Oranı (%)**						Ortalama
	Bitki			Tohum			
	Etanol	Metanol	Su	Etanol	Metanol	Su	
%0	90.00^{a*}	97.50^{a}	92.50^{a}	85.00^{a}	87.5^{a}	82.50^{a}	89.16
%5	0.00^{c}	67.50^{a}	72.50^{a}	22.50^{ab}	70.00^{a}	75.00^{a}	51.25
%10	0.00^{c}	20.00^{ab}	90.00^{a}	0.00^{c}	0.00^{c}	90.00^{a}	33.33
Ortalama	30.00	61.66	85.00	35.83	52.50	82.50	57.91

* Aynı harfle gösterilen ortalamalar arasındaki farklılık istatistiki açıdan önemli değildir. ** $p \leq 0.01$

Tablo 1 incelendiğinde, sorgum ekstraktlarının çimlenme üzerindeki etkisi istatistiksel olarak önemli bulunmuştur ($p \leq 0.01$). Özellikle tohumdan etanol ve metanol ile elde edilen ekstraktların %10'luk dozları ile bitkiden elde etanolün %5 ve 10'luk dozlarından edilen ekstrakların adi fiğ tohumlarının çimlenmesini tamamen inhibe ettiği tespit edilmiştir. Su bazlı hem bitki hemde tohumdan elde edilen ekstraktlarda ise çimlenme oranı kontrol grubuna yakın değerler göstermiştir. Golubinova ve Ilieva (2014), sorgum toprak üstü aksamından elde edilen ekstraktların yabancı otlar üzerindeki allelopatik etkisini belirlemek amacıyla yürüttüğü çalışmada çimlenme süresini arttırdığı fakat çimlenme hızı ve fide güç indeksini önemli derecede azalttığını bildirmiştir. Çalışmada elde edilen çimlenme üzerine olumsuz etki sonucu gözlemlerimizle uyum göstermektedir.

3.2. Kök Uzunluğu

Sorgum ekstraktı uygulanan adi fiğ bitkisinin kök uzunluğu ortalamaları Tablo 2'de verilmiştir.

Tablo 2. Sorgum ekstraktı uygulanan adi fiğ bitkisinde kök uzunluğu ortalamaları.

Ekstrakt dozu	Kök Uzunluğu (mm)**						Ortalama
	Bitki			Tohum			
	Etanol	Metanol	Su	Etanol	Metanol	Su	
%0	79.08^{ab*}	50.56^{d}	70.02^{bc}	52.43^{d}	46.69^{d}	70.62^{bc}	61.57
%5	0.00^{g}	16.80^{eg}	90.85^{a}	18.00^{ef}	28.10^{e}	57.91^{cd}	35.27
%10	0.00^{g}	8.31^{fg}	48.77^{d}	0.00^{g}	0.00^{g}	45.98^{d}	17.17
Ortalama	26.36	25.22	69.88	23.47	24.93	58.17	38.00

* Aynı harfle gösterilen ortalamalar arasındaki farklılık istatistiki açıdan önemli değildir. ** $p \leq 0.01$

Sorgum bitkisel kısımdan etanol ile ekstrakte edilen %5 ve 10'luk doz ekstraktlar ile sorgum tohumundan ekstrakte edilen etanol ve metanolün %10'luk ekstraktlarının fiğin çimlenmesini tamamen engellemesi sebebiyle kök uzunluğu gözlemi elde edilemmeiştir (Tablo 2). Bunun yanı sıra, sorgum tohumlarından elde edilen %5'lik etanol (18 mm), %5'lik metanol (28.10 mm) ve %10'luk su (45.98 mm) ekstraktları da fiğ köklerinde allelopatik etki oluşturmuştur. Bitki aksamı ve tohumdan elde edilen ekstrakların farklı dozlarının uygulanması sonucu en yüksek kök uzunluğu değeri %5'lik su ekstraktından (90.85 mm) elde edilirken, en düşük kök uzunluğu değeri yine %5'lik bitki metanol ekstraktından elde edilmiştir. Bitki aksamından elde edilen kök uzunluğu değerlerinin tohum ekstraktından elde edilen kök uzunluğu değerlerinden daha düşük olduğu gözlemlenmiştir. Ayrıca bitkisel kısım %5'lik su ekstraktının fiğin kök uzunluğuna olumlu etki yaptığı (90.85 mm), ekstrakt dozunun artması ile kök uzunluğunda olumsuz bir etki ortaya çıktığı belirlenmiştir (48.77 mm). Moosavi ve arkadaşları (2011), sorgum yaprak, gövde ve kök su özütlerinin maş fasulyesinin tohum çimlenmesi ve fide büyümesi üzerindeki etkilerini incelemişlerdir. Çalışmalarında elde ettikleri bulgulara göre, sorgum sapı özütünün maş fasulyesinin kök ve sürgün büyümesi üzerinde engelleyici etkiye sahip olduğunu belirtmişlerdir. Bu bulgu, gözlemlerimizle paralellik göstermektedir.

3.3. Sürgün Uzunluğu

Sorgum ekstraktı uygulanan adi fiğ bitkisinin sürgün uzunluğu ortalamaları Tablo 3'te verilmiştir.

Tablo 3. Sorgum ekstraktı uygulanan adi fiğde sürgün uzunluğu ortalamaları

Ekstrakt dozu	Sürgün Uzunluğu (mm)**						Ortalama
	Bitki			Tohum			
	Etanol	Metanol	Su	Etanol	Metanol	Su	
%0	46.76^{a*}	36.43^{a}	50.00^{a}	49.56^{a}	44.21^{a}	50.78^{a}	46.29
%5	0.00^{c}	26.52^{ab}	52.60^{a}	14.91^{ab}	30.59^{ab}	45.53^{a}	28.35
%10	0.00^{c}	6.31^{b}	42.26^{a}	0.00^{c}	0.00^{c}	40.15^{a}	14.78
Ortalama	15.58	23.08	48.28	21.49	24.93	45.48	29.80

* Aynı harfle gösterilen ortalamalar arasındaki farklılık istatistiki açıdan önemli değildir. ** p≤0.01

Tablo 3 incelendiğinde; sorgum bitkisel kısımdan etanol ile ekstrakte edilen %5 ve 10'luk doz ile sorgum tohumundan ekstrakte edilen etanol ve metanolün %10'luk dozu dışında fiğde sürgün uzunluğunu olumsuz etkileyen uygulama bitki kısmından metanolün %10'luk dozu (6.31 mm) olmuştur. Etanol ekstarkları hem bitki kısmı hem tohumda en düşük sürgün uzunluğu değerlerine sahip olmuştur. Doz ortalamalarına bakıldığında artışa paralel olarak sürgün uzunluğunun azaldığı görülmektedir. Uddin ve arkadaşları (2013) yaptıkları çalışmada, *Sorghum bicolor*'un kök özütü ile karabuğdayın (*Fagopyrum* spp.) kök özütlerinin, bazı geniş yapraklı yabancı otlar üzerindeki etkilerini incelemişlerdir. Çalışmalarında, bu özütlerin karışımının hedef fidelerin çimlenmesini ve büyümesini önemli ölçüde azalttığını belirtmişlerdir. Çalışmamız sonucu önceki yapılan çalışmayla benzerlik göstermektedir.

3.4. Yaş Ağırlık

Sorgum ekstraktı uygulanan adi fiğ bitkisinin yaş ağırlık ortalamaları Tablo 4'te verilmiştir

Tablo 4. Sorgum ekstraktı uygulanan adi fiğde yaş ağırlık ortalamaları

Ekstrakt dozu	Yaş Ağırlık (g)**						Ortalama
	Bitki			Tohum			
	Etanol	Metanol	Su	Etanol	Metanol	Su	
%0	0.997^{ce*}	0.890^{de}	0.771^{ef}	1.339^{ab}	1.211^{bc}	0.952^{de}	1.027
%5	0.00^{ı}	0.744^{ef}	0.444^{gh}	0.324^{h}	0.958^{de}	1.093^{bd}	0.599
%10	0.00^{ı}	0.251^{hı}	0.611^{fg}	0.00^{ı}	0.00^{ı}	1.494^{a}	0.392
Ortalama	0.332	0.638	0.608	0.554	0.723	1.180	0.672

* Aynı harfle gösterilen ortalamalar arasındaki farklılık istatistiki açıdan önemli değildir. ** p≤0.01

Tablo 4'teki verilere göre, %10'luk sorgum bitkisel kısım-etanol karışımı ve sorgum tohumu-etanol/metanol ekstraktları, fiğin çimlenmesini engellemiştir. En belirgin allelopatik etkiyi %10'luk bitki-metanol ekstraktı (0.251 g) göstermiştir. Bu bulgu, Xiong ve ark. (2017) tarafından sorgumun fenolik bileşiklerinin (özellikle metanol bazlı ekstraktların) baklagil çimlenmesini hücre zarı bütünlüğünü bozarak inhibe ettiğini belirten çalışmayla uyumludur. Düşük konsantrasyonlarda (%5), bitki-su (0.444 g) ve tohum-etanol (0.324 g) ekstraktları da fiğ yaş ağırlığı üzerinde allelopatik etkiler göstermiştir. Buna karşılık, %10'luk tohum-su ekstraktı (1.494 g), fiğin yaş ağırlığını artırmıştır. Bu durum, Jabran ve ark. (2015)'ın düşük doz suda çözünür allelokimyasalların bitki büyümesini teşvik edebileceğini öne süren bulgularını desteklemektedir. Sonuçlar, sorgum ekstraktlarının ikili rolünü ortaya koymaktadır: Yüksek konsantrasyonlarda inhibe edici, ancak düşük dozlarda veya sulu ekstraksiyonda uyarıcı etki gösterebilir. Bu ikilik, Einhellig ve Rasmussen (1979)'un allelopatik etkilerin ekstrakt türü, konsantrasyon ve hedef türe bağlı olarak değiştiğini vurgulayan çalışmasıyla örtüşmektedir.

3.5. Kuru Ağrılık

Sorgum ekstraktı uygulanan adi fiğ bitkisinin kuru ağırlık ortalamaları Tablo 5'te verilmiştir

Tablo 5. Sorgum ekstraktı uygulanan adi fiğde kuru ağırlık ortalamaları

Ekstrakt dozu	Kuru Ağırlık (g)**						Ortalama
	Bitki			Tohum			
	Etanol	Metanol	Su	Etanol	Metanol	Su	
%0	0.391^{ab*}	0.429^{a}	0.208^{de}	0.342^{ac}	0.404^{ab}	0.395^{ab}	0.361
%5	0.00^{g}	0.307^{bd}	0.156^{ef}	0.123^{ef}	0.334^{ac}	0.330^{ac}	0.208
%10	0.00^{g}	0.090^{fg}	0.276^{cd}	0.00^{g}	0.00^{g}	0.441^{a}	0.134
Ortalama	0.130	0.275	0.276	0.155	0.246	0.326	0.234

* Aynı harfle gösterilen ortalamalar arasındaki farklılık istatistiki açıdan önemli değildir. ** $p \leq 0.01$

Elde edilen verilere göre bitki kuru ağırlığı en yüksek; bitkisel kısım metanol ekstraktı %0 doz (0.429 g) ile tohum su ekstraktı %10'luk dozda (0.441 g) tespit edilirken, bitki su ekstraktı %0 doz en düşük kuru ağırlığı (0.208 g) sağlamıştır. Bitki kuru ağırlığı verilerine bakıldığında metanol ekstraktının tohum gelişimi üzerinde faydalı etkiler yarattığı ancak etanol ve su ekstraktlarının yüksek dozlarda bitki gelişimini baskılayıcı etkiler gösterdiğini ortaya görülmektedir. Bingöl ve Battal (2017), *Verbascum cheiranthifolium* var. *asperulum* ve *Salvia limbata* bitkilerinin su ve matanolle hazırlanan ekstraktlarının semizotu ve mısır bitkisi üzerine allelopatik etkisini inceledikleri çalışmada mısır bitkisinin çimlenmesi üzerine belirgin olumsuz etki görülmezken semizotu bitkisinin çimlenme parametrelerini önemli derece azalttığını bildirmişlerdir. Elde edilen sonuçlar, Bingöl ve Battal (2017) ile uyumlu olup, ekstrakt türü ve dozunun bitki gelişimi üzerindeki etkilerinin farklılıklar gösterebileceği bu çalışma ile de ortaya konmuştur.

Bitkilerin biyokütle üretimi, uygulanan ekstraktların etkisiyle belirgin şekilde azalmıştır. Etanol ve metanol ekstraktlarının %10'luk dozları yaş ağırlıkta %40, kuru ağırlıkta ise %45'e varan düşüşe neden olmuştur. Bitkisel aksam ve tohum kaynaklı ekstraktlar arasında ise bitkisel aksamdan elde edilenlerin daha güçlü etki yaptığı anlaşılmıştır. Elde edilen sonuçlar, sorgumun doğal herbisit olarak kullanılabileceğini öne süren çalışmalarla paralellik göstermektedir (Cheema ve Ahmad, 1988; Dayan ve ark., 2009; Uddin ve ark., 2013). Ayrıca, allelopatik etki düzeyinin ekstraktın kaynağına (tohum/bitki) ve kullanılan çözücüye bağlı olduğu, bu alanda yapılan diğer çalışmalarda da vurgulanmıştır (Xuan ve ark., 2005).

4. SONUÇ

Bu çalışmada, sorgum bitkisinin tohum ve bitkisel aksamları kullanılarak elde edilen su, etanol ve metanol ekstraktlarının adi fiğ üzerine etkileri araştırılmıştır. Elde edilen veriler, özellikle bitkisel aksamda etanolün %5 ve 10'luk dozu ile tohumdan metanolün %10'luk dozuyla hazırlanan ekstraktların adi fiğin çimlenmesini tamamen durdurduğu, bunların dışındaki uygulamalarda ise başta çimlenme oranı, kök ve sürgün uzunluğu ile biyokütle üretimi olmak üzere incelenen tüm özelliklerde farklı seviyelerde baskılayıcı etkiler oluşturduğu ortaya koymuştur. Bu durum, sorgum ekstraktlarının allelopatik potansiyel taşıdığını ve doğal herbisit olarak değerlendirilebileceğini göstermektedir. Ayrıca, çalışmada kullanılan farklı çözücülerin etkinliğinin değiştiği ve bitkisel aksamın tohumdan daha yüksek etki gösterdiği sonucuna varılmıştır. Bitkisel aksam ve çözücü farkı da allelopatik etki üzerinde belirleyici faktör olarak karşımıza çıkmaktadır. Bu veriler, ekim nöbeti planlamalarında ve örtü bitkisi seçimi süreçlerinde fikir verecek niteliktedir. Gelecekte yapılacak araştırmalarda, farklı bitki türleri, çözücüler ve çevresel koşullar dikkate alınarak sorgumun doğal herbisit potansiyeli daha ayrıntılı incelenmelidir.

(bdonmez@cu.edu.tr, https://orcid.org/0000-0003-1495-4553)

ASTRACT

This study was conducted to determine the effect of five different salt concentrations (0 mM NaCl [control], 50 mM NaCl, 100 mM NaCl, 150 mM NaCl, 200 mM NaCl) on germination and seedling growth of different cool season perennial forage grasses species. The following varieties were used as material in the study: the Yükselen cultivar of smooth bromegrass (*Bromus inermis* Leyss), the Nilüfer cultivar of tall fescue (*Festuca arundinecea* Schreb.), the No. 3 line of rescue grass (*Bromus catharticus* Vahl.) developed by selection breeding, the Lidacta cultivar of orchard grass (*Dactylis glomerata* L.) and the Temprano cultivar of perennial ryegrass (*Lolium perenne* L.). The experiment was established at the laboratory of Pasture Plants of the Çukurova University, Faculty of Agriculture, Department of Field Crops in 2025 according to the two-factor (species and salt concentration) completely randomized plot with 4 replications. In this study, germination percentages (%), seedling root lengths (cm), seedling shoot lengths (cm), seedling dry root weight (mg/seedling), seedling dry shoot weight (mg/seedling) and salt tolerance index (%) of cool season perennial forage grasses species at different salt concentrations were investigated. The responses of the cool season perennial forage grass species tested in the study to salt concentrations differed significantly. Increasing salt concentrations negatively affected germination, seedling development and salt tolerance index of the species. However, germination and seedling growth of the tested perennial cool-season forage grasses species could be promoted at low salt concentrations. Orchard grass and tall fescue species are very sensitive to salinity, and salinity tolerant cultivars or varieties should be preferred instead of these species in areas with high salinity. The fact that perennial ryegrass and smooth bromegrass were able to germinate over 50% up to 200 mM NaCl and 150 mM NaCl salt concentrations, respectively, showed that these species were more resistant to high salt concentrations. When germination percentage, seedling growth and salt tolerance index were evaluated together, it was determined that perennial ryegrass was partially advantageous over other species for saline areas.

Keywords: Forage grasses, salt stress, seedling growth, germination

ÇOKYILLIK BUĞDAYGİL YEMBİTKİLERİNİN ÇİMLENME VE FİDE GELİŞİMİ ÜZERİNE FARKLI TUZ KONSANTRASYONLARININ ETKİSİ

ÖZET

Bu araştırma, farklı serin mevsim çokyıllık buğdaygil yembitkisi türlerinin çimlenme ve fide gelişimi üzerine beş farklı tuz konsantrasyonu (0 mM NaCl [kontrol], 50 mM NaCl, 100 mM NaCl, 150 mM NaCl, 200 mM NaCl) uygulamasının etkisini saptamak amacıyla yürütülmüştür. Araştırmada materyal olarak kılçıksız bromun (*Bromus inermis* Leyss) Yükselen çeşidi, kamışsı yumağın (*Festuca arundinecea* Schreb.) Nilüfer çeşidi, seleksiyon ıslahı ile geliştirilmiş parlak bromun (*Bromus catharticus* Vahl.) 3 Nolu hattı, domuz ayrığının (*Dactylis glomerata* L.) Lidacta çeşidi ve çokyıllık çimin (*Lolium perenne* L.) Temprano çeşidi kullanılmıştır. Deneme, 2025 yılında Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Çayır-Mera laboratuvarında iki faktörlü (tür ve tuz konsantrasyonu) tesadüf parselleri deneme desenine göre 4 tekerrürlü olarak kurulmuştur. Araştırmada, serin mevsim çokyıllık buğdaygil yembitkisi türlerinin farklı tuz konsantrasyonlarındaki çimlenme yüzdeleri (%), fide kök uzunlukları (cm), fide sap uzunlukları (cm), fide kök kuru ağırlığı (mg/fide), fide sap kuru ağırlığı (mg/fide) ve tuz tolerans indeksi (%) incelenmiştir. Araştırmada test edilen serin mevsim çokyıllık buğdaygil yembitkisi türlerinin tuz konsantrasyonlarına karşı tepkileri önemli derecede farklılık göstermiştir. Tuz konsantrasyonunun artması, türlerin çimlenmesini, fide gelişimini ve tuza tolerans indekslerini olumsuz yönde etkilemiştir. Ancak, düşük tuz konsantrasyonlarında test edilen çokyıllık serin mevsim buğdaygil yembitkileri türlerinin çimlenmesi ve fide gelişiminin teşvik edilebileceği ortaya çıkmıştır. Domuz ayrığı ve kamışsı yumak türlerinin tuzluluğa çok duyarlı türler olduğu ve tuzluluk oranı yüksek alanlarda söz konusu türler yerine, tuzluluğa toleranslı tür veya varyetelerin tercih edilmesi gerektiği anlaşılmıştır. Çokyıllık çimin 200 mM NaCl, kılçıksız bromun 150 mM NaCl tuz konsantrasyonuna kadar %50 inin üzerinde çimlenebilmesi, söz konusu türlerin yüksek tuz konsantrasyonlarına daha dayanıklı olduğunu göstermiştir. Çimlenme yüzdesi, fide gelişimi ve tuz tolerans indeksi birlikte değerlendirildiğinde çokyıllık çimin tuzlu alanlar için diğer türlerden kısmen avantajlı olduğu belirlenmiştir.

Anahtar Kelimeler: Buğdaygil yembitkileri, tuz stresi, fide gelişimi, çimlenme

1. GİRİŞ

Tuzluluk, özellikle kurak ve yarı-kurak bölgelerde tarımsal üretimi kısıtlayan abiyotik stres faktörleri arasında yer almaktadır (Nawaz ve ark., 2010). Küresel ölçekte 932 milyon hektarlık alan tuzluluk problemiyle karşı karşıyayken, Türkiye'de 1.5 milyon hektarlık alanda hem tuzluluk hem de alkalilik sorunu bulunmaktadır (Sezen, 2021). Tuzluluk, bitkilerde metabolik dengesizliklere yol açarak çimlenme oranının azalmasına, kök ve sürgün gelişiminin gerilemesine, fotosentez kapasitesinin düşmesine ve genel biyokütle üretiminin azalmasına neden olmaktadır (Aydın ve Atıcı, 2015; Al-Ghumaiz ve ark., 2017). Bunların yanında, toprakta bulunan yüksek seviyedeki tuz konsantrasyonu, ozmotik basıncın artmasına ve buna bağlı olarak bitkinin su ve besin maddesi alımını engelleyip bitki büyüme ve gelişmesini sınırlandırmaktadır (Parida ve Das, 2005).

Buğdaygil yembitkileri, hayvancılık için kaliteli ve sürekli yem kaynağı sağlamaları nedeniyle tarımsal üretimin önemli bir bileşenidir. Hayvancılık sektöründe verimli bir yem üretimi sağlamak için yembitkilerinin yetişme koşullarına olan adaptasyonu büyük önem taşımaktadır. Tuzlu topraklarda buğdaygil yembitkisi yetiştiriciliği yapmak, hem hayvan beslenmesi için yeterli miktarda yem üretimini sürdürmek hem de toprak verimliliğini korumak açısından kritik bir konudur (Nawaz ve ark., 2010). Buğdaygil yembitkileri, özellikle kurak ve yarı kurak bölgelerde yüksek adaptasyon yetenekleri sayesinde tercih edilmekte olup, bu türlerin tuza karşı gösterdiği tolerans seviyesi büyük farklılıklar gösterebilmektedir (Al-Ghumaiz ve ark., 2017). Bazı türler düşük tuz seviyelerine dayanabilirken, bazıları yüksek tuz konsantrasyonlarına maruz kaldığında büyüme geriliği, hücresel zararlar ve metabolik bozukluklar gösterebilmektedir (Gupta ve Huang, 2014). Bu nedenle, yem bitkisi üretiminde tuza dayanıklı türlerin belirlenmesi hem üretim sürekliliğini sağlamak hem de yem kalitesini artırmak açısından büyük önem taşımaktadır. Aynı zamanda, tuza dayanıklı yem bitkilerinin belirlenmesi, çiftçilerin sürdürülebilir üretim sistemlerini geliştirmelerine yardımcı olurken, tuzlu alanların tarımsal kullanımını optimize edebilmektedir (Arslan ve ark., 2013).

Farklı tuz konsantrasyonlarının serin mevsim çokyıllık buğdaygil yembitkilerinin çimlenme oranı fide gelişimi gibi morfolojik parametreler üzerindeki etkilerinin incelenmesi, tarımsal üretim sistemleri için önemli bilgiler sunacaktır. Bunun yanı sıra, tuzluluğa toleranslı türlerin belirlenmesi ve uygun yetiştirme stratejilerinin geliştirilmesi, tuzlu alanlarda yembitkisi yetiştiriciliği için uygulanabilir çözümler sağlayacaktır.

Bu araştırma, farklı serin mevsim çokyıllık buğdaygil yembitkileri türlerinin değişen tuz konsantrasyonları altında çimlenme ve erken fide gelişimlerini belirlemek amacıyla yürütülmüştür.

2. MATERYAL ve YÖNTEM

Bu araştırma, Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Çayır-Mera Bitkileri laboratuvarında 2025 yılında yürütülmüştür. Denemede, Karadeniz Tarımsal Araştırma Enstitüsü Müdürülüğünden temin edilen kılçıksız bromun (*Bromus inermis* Leyss) Yükselen çeşidi, Ege Tarımsal Araştırma Enstitüsü Müdürlüğünden temin edilen kamışsı yumağın (*Festuca arundinecea* Schreb.) Nilüfer çeşidi, Namık Kemal Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü tarafından seleksiyon ıslahı ile geliştirilmiş parlak bromun

(*Bromus catharticus* Vahl.) 3 Nolu hattı ve Maro Tarım firmasından temin edilen domuz ayrığının (*Dactylis glomerata* L.) Lidacta çeşidi ile çokyıllık çimin (*Lolium perenne* L.) Temprano çeşidi kullanılmıştır. Deneme iki faktörlü tesadüf parselleri deneme desenine göre 4 tekerrürlü olarak kurulmuş ve yürütülmüştür. Denemede, kontrol (distile su) dahil toplamda 5 farklı tuz konsantrasyonu test edilmiştir (0 [kontrol], 50, 100, 150, 200 mM NaCl).

Araştırmada kullanılan serin mevsim çokyıllık yembitkisi türlerinin tohumları çimlenme testinden önce %10 luk sodium hypochlorite (NaClO) çözltesi ile yüzey sterilizasyonundan geçirilmiş ve sterilize edilen tohumlar en az 5 defa distile su ile durulanmıştır. Her bir tür için 25 temsili tohum, 10 cm çapındaki petri kaplarındaki iki katlı filtre kâğıdı üzerine yerleştirilmiştir. Ardından, petri kaplarına 0 (kontrol), 50, 100, 150, 200 mM NaCl konsantrasyonlarındaki önceden hazırlanmış çözeltilerden 10 ml ilave edilmiştir (Irik ve Bikmaz, 2024). Petri kaplarından su kaybını önlemek için parafilm kullanılmıştır. Tuz çözeltisi ilave edilmiş ve parafilm ile kaplanmış petri kapları çimlendirme odasında 20±1 °C'de ve karanlık koşullarda tutulmuştur.

Denemenin 10. gününde kökçüğü en az 2 mm olan tohumlar çimlenmiş olarak kabul edilmiş ve aşağıdaki formülle her türün çimlenme yüzdesi hesaplanmıştır (Atış, 2011).

$$Çimlenme\ yüzdesi\ (\%) = \frac{Çimlenen\ tohum\ sayısı}{Toplam\ tohum\ sayısı} \times 100$$

Denemede her tür için çimlenme yüzdeleri belirlendikten sonra, her türün her bir tekrarlamasından rastgele seçilen 10 fide alınarak, filtre kağıtları yenilenen petri kaplarına yerleştirilmiş ve test edilen her tuz konsantrasyonu için (0, 50, 100, 150, 200 mM NaCl) 10 ml NaCl çözeltisi petri kaplarına ilave edilmiş ve petrilerin etrafı parafilm ile kaplanmıştır. Serin mevsim çokyıllık buğdaygil yembitkisi türlerinin fide özelliklerinden kök ve sap uzunluğunu belirlemek için, denemenin 15. gününde petrilerdeki 10 bitkinin kök ve sap uzunluğu ölçülmüş ve her türün 10 bitkideki kök ve sap uzunluklarının ortalaması alınarak her türün kök ve sap uzunluğu hesaplanmıştır. Fide başına kuru kök ve kuru sap ağırlığını belirlemek için, fidelerin kök ve sapları kesilmiş ve 24 saat 70 °C'de etüvde kurutulmuştur. Etüvde kurutulan örnekler 0.0001 g hassasiyetli terazide tartılmış, her tür için kuru kök ve kuru sap ağırlıkları belirlenmiş ve 10 bitkide belirlenen kuru ağırlıklarının ortalaması alınarak her bir türün fidedeki kuru kök ve kuru sap ağırlığı hesaplanmıştır. Daha sonra, her tür için kök ve sap kuru ağırlıklarının toplamı kullanılarak aşağıdaki eşitlik yardımıyla tuz tolerans indeksi hesaplanmıştır (Kusvuran ve ark., 2015).

$$Tuz\ tolerans\ indeksi = \frac{TKA'daki\ Tx}{TKA'daki\ To} \times 100$$

Burada; TKA'daki T_x = x tuz konsantrasyonundaki kök ve sap toplam kuru ağırlığını, TKA'daki T_0= kontrol uygulamasındaki kök ve sap toplam kuru ağırlığını ifade etmektedir.

Araştırmadan elde edilen veriler R programında homojenite testine tabi tutulmuş ve normal dağılım göstermeyen değerlere varyans analizi öncesi karekök ve açı transformasyonu uygulanmıştır (R Core Team, 2024). Ardından veriler R programında "agricolae" paketi ile varyans analizine tabi tutulmuştur (de Mendiburu, 2023). İstatistiki olarak önemli çıkan özellik ortalamaları Duncan testi ile %5 önem düzeyinde karşılaştırılmıştır (Yurtsever, 2011).

3. BULGULAR ve TARTIŞMA

Araştırma sonuçları, serin mevsim çokyıllık buğdaygil yembitkisi türlerinde incelenen özelliklerin (çimlenme yüzdesi, kök uzunluğu, sap uzunluğu, kök kuru ağırlığı, sap kuru ağırlığı, tuz tolerans indeksi) tümünde tuz konsantrasyonu ve tür faktörü ile tuz konsantrasyonu x tür interaksiyonunun etkisinin istatistiki olarak önemli derecede fark yarattığını ortaya koymuştur ($P<0.001$).

3.1. Çimlenme Yüzdesi

Tuz konsantrasyonunun çimlenme yüzdeleri üzerine etkileri incelendiğinde, tuz konsantrasyonunun artmasıyla çimlenme yüzdeleri linear olarak azalmıştır. Bunun yanında, tuz konsantrasyonunun 100 mM NaCl ve üzerine çıkarılması, kontrol ve 50 mM NaCl seviyesine göre önemli derecede daha düşük çimlenme yüzdesinin ortaya çıkmasına neden olmuştur (Çizelge 1). Uygulanan tuz konsantrasyonuna bağlı olarak çimlenme yüzdesinin azalması birçok araştırmacı tarafından da bilidirilmiştir (Kuşvuran ve ark., 2014a, 2014b; Liu ve ark., 2021; Sharavdorj ve ark., 2021). Nitekim Arslan ve ark. (2013), ortamdaki tuz konsantrasyonunun artması ile ozmotik basıncın arttığını ve tohumun su alımı engellenerek bir nevi kuraklık stresinin ortaya çıktığını bildirmişlerdir. Bunun yanında Javaid ve ark. (2022), artan tuz konsantrasyonuna bağlı olarak embriyoya zararlı iyonların girişi için uygun ortamların sağlandığını ve tohumun çimlenme yüzdesinin azalmasına neden olduğunu bildirmişlerdir.

Çizelge 1. Çokyıllık buğdaygil yembitkilerinin farklı tuz konsantrasyonlarındaki çimlenme yüzdeleri ortalamaları (%)

İncelenen Türler	Tuz Konsantrasyonları (mM NaCl)					
	0 mM	**50 mM**	**100 mM**	**150 mM**	**200 mM**	**Ortalama**

* Aynı sütun içinde benzer büyük harflerle gösterilen Tür ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[1] Aynı satır içinde benzer büyük harflerle gösterilen Tuz konsantrasyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[2] Benzer küçük harflerle gösterilen Tuz konsantrasyonu x Tür interaksiyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

Araştırmada, farklı tuz konsantrasyonlarının ortalaması olarak türlerin çimlenme yüzdesi ortalaması %45.4 ile %78.0 arasında değişmiştir. Çokyıllık çimin çimlenme yüzdesi ortalaması, test edilen diğer türlerin çimlenme yüzdesi ortalamasına göre önemli derecede daha yüksek değer gösterirken, domuz ayrığının çimlenme yüzdesi ortalaması, test edilen diğer türlere göre önemli derecede daha düşük değer göstermiştir. Parlak brom ve benzer istatistiki grupta yer alan kılçıksız bromun çimlenme yüzdesi ortalaması ise çokyıllık çimin çimlenme yüzdesi ortalamasını izlemiştir (Çizelge 1). Maas ve Hoffman (1977), çokyıllık yembitkileri için hazırlamış oldukları tuzluluğa dayanım rehberinde, çokyıllık çimin kamışsı yumak ve domuz ayrığına göre tuzluluğa daha dayanıklı olduğunu, Song ve ark. (2023), kılçıksız brom varyetelerinin tuza dayanımının çok geniş bir genotipik varyasyona sahip olduğunu, Willy ve ark. (2020) parlak bromun tuza orta derecede dayanımının olduğunu ve kabul edilebilir düzeydeki tuz konsantrasyonlarında tohumların çimlenebildiğini bildirmişlerdir. Nitekim yapılan araştırmalarda serin mevsim çokyıllık buğdaygillerin tuzluluğa toleransının türlere bağlı olarak farklılık gösterdiğini ortaya koymaktadır (Khan ve Gulzar, 2003; Tod ve ark., 2021).

Araştırmada, tuz konsantrasyonu x tür interaksiyonun önemli çıkması, tuz konsantrasyonlarının çimlenme yüzdeleri üzerindeki etkisinin türlere bağlı olarak önemli derecede farklılık gösterdiğini ortaya koymaktadır. Nitekim çokyıllık çim ve parlak brom türlerinde 100 mM NaCl tuz konsantrasyona kadar çimlenme yüzdeleri önemli derecede farklılık göstermezken, kılçıksız brom ve domuz ayrığında 100 mM NaCl tuz konsantrasyonunda, kontrol ve 50 mM NaCl tuz konsantrasyonuna göre çimlenme yüzdesi önemli derecede daha düşük değer göstermiştir. Bunların yanında 50 mM NaCl tuz konsantrasyonunda çokyıllık çim en yüksek çimlenme yüzdesi gösterirken, domuz ayrığı ve kamışsı yumak türlerinde 200 mM NaCl tuz konsantrasyonunda çimlenme gözlenmemiştir (Çizelge 1).

3.2. Kök Uzunluğu

Farklı tuz konsantrasyonlarında serin mevsim çokyıllık buğdaygil yembitkilerinin kök uzunluğu değerleri Çizelge 2'de verilmiştir. Çizelge 2'de izlendiği üzere, kök uzunlukları ortalaması, tuz konsantrasyonundaki artışa (kontrolden 200 mM NaCl'ye) bağlı olarak önemli derecede daha düşük değer göstermiştir. Bu durum, artan tuz konsantrasyonuna bağlı olarak türlerin fide gelişiminin zayıfladığını ortaya koymaktadır. Nitekim, birçok araştırıcı artan tuz konsantrasyonuna bağlı olarak fide kök uzunluğunun kontrole göre daha düşük değer gösterdiğini bildirmiştir (Ashraf ve ark., 1986; Kökten ve ark., 2010; Ertekin ve ark., 2022; Zhang ve ark., 2024). Bunun yanında Doğu (2017), tuz stresine bağlı olarak köklerdeki hücre sayısında ve hücre bölünmesinde azalmalar olduğunu ve bu durumunda kök gelişiminin azalmasına neden olduğunu bildirmiştir.

Araştırmada incelene türlerin fide kök uzunluğu ortalaması 1.69 cm ile 3.43 cm arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır (Çizelge 2). Kök uzunluğu ortalaması parlak bromda, test edilen diğer türlere göre önemli derecede daha yüksek değer gösterirken, söz konusu türü benzer istatistiki grupta yer alan çokyıllık çim ve kılçıksız brom türleri izlemiştir. Domuz ayrığında ise fide kök uzunluğu ortalaması, test edilen diğer türlere göre önemli derecede daha düşük değer göstermiştir. Birçok araştırıcı fide kök uzunluğu

değerlerinin türlere göre farklılık gösterdiğini bildirmiştir (Surmen ve Kara, 2018; Kıldış, 2021).

Araştırmada, tuz konsantrasyonu x tür interaksiyonunun önemli olması, tuz konsantrasyonlarının kök uzunluğuna etkisinin türlere bağlı olarak önemli derecede farklılık gösterdiğini ortaya koymaktadır (Çizelge 2). Nitekim, kılçıksız brom, parlak brom ve çokyıllık çimin 0 mM NaCl tuz konsantrasyonu uygulamasında kök uzunlukları, test edilen diğer türlere göre önemli derecede daha yüksek değer gösterirken, 50 mM NaCl tuz konsantrasyonu uygulamasında çokyıllık çim test edilen diğer türlere göre önemli derecede daha yüksek kök uzunluğu ortalaması göstermiştir. Tuz konsantrasyonu 100 mM'a çıkarıldığında, kök uzunluğu ortalaması parlak brom ve benzer istatistiki grupta yer alan çokyıllık çimde en yüksek değer gösterirken, tuz konsantrasyonu 150 mM ve 200 mM'da kök uzunluğu ortalaması parlak bromda test edilen diğer türlere göre önemli derecede daha yüksek değer göstermiştir. Bu durum, parlak bromun kök uzunluğu açısından, artan tuzluluğa bağlı olarak su alım potansiyelini artırmak için kök gelişimini artırdığını ortaya koymaktadır.

Çizelge 2. Çokyıllık buğdaygil yembitkilerinin farklı tuz konsantrasyonlarındaki fide kök uzunlukları ortalamaları (cm)

İncelenen Türler	**Tuz Konsantrasyonları (mM NaCl)**					
	0 mM	**50 mM**	**100 mM**	**150 mM**	**200 mM**	**Ortalama**

Ortalama	4.73 A[1]	3.59 B	2.57 C	1.47 D	0.60 E	

* Aynı sütun içinde benzer büyük harflerle gösterilen Tür ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[1] Aynı satır içinde benzer büyük harflerle gösterilen Tuz konsantrasyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[2] Benzer küçük harflerle gösterilen Tuz konsantrasyonu x Tür interaksiyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

3.3. Sap Uzunluğu

Tuz konsantrasyonlarının sap uzunluğu üzerindeki etkisi incelendiğinde, sap uzunluğu ortalamsı 50 mM NaCl tuz konsantrasyonunda, test edilen diğer tuz konsantrasyonlarına göre önemli derecede daha yüksek değer göstermiştir. Tuz konsantrasyonunun 100 mM NaCl ve üzerine çıkarılması sap uzunluğu ortalamasının her tuz konsantrasyonu için önemli derecede daha düşük değer göstermesine neden olmuştur (Çizelge 3). Bu durum, tuz konsantrasyonunun 100 mM NaCl'nin üzerine çıkarılmasıyla fide gelişiminin zayıfladığını ortaya koymaktadır. Nitekim, tuz konsantrasyonunun artmasıyla fide sap uzunluğunun azaldığı birçok araştırıcı tarafından rapor edilmiştir (Atış, 2011; Aydın ve Atıcı, 2015; Balcı ve Boydak, 2021). Bunun yanında, düşük tuz konsantrasyonlarında fide sap gelişiminin teşvik edildiği, ancak artan tuz konsantrasyonuna bağlı olarak su ve mineral madde alımının azalmasıyla fide sap gelişiminin azaldığı birçok araştırıcı tarafından da bildirilmiştir (Radic ve ark., 2007; Çolak ve ark., 2008; Pinar ve ark., 2022).

Araştırmada, tuz konsantrasyonlarının ortalaması olarak incelenen türlerin sap uzunlukları ortalaması 2.66 cm ile 6.89 cm arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır (Çizelge 3). Kılçıksız bromun fide sap uzunluğu ortalaması, test edilen diğer türlere göre önemli derecede daha yüksek değer gösterirken, domuz ayrığının fide sap uzunluğu ortalaması test edilen diğer türlere göre önemli derecede daha düşük değer göstermiştir. Bu sonuçlar, parlak bromun tuzluluğa bağlı olarak sap gelişiminin kök gelişimine göre daha fazla etkilendiğini, kılçıksız bromun ise sap gelişiminin kök gelişimine göre tuzluluktan daha az etkilendiğini ortaya koymuştur (Çizelge 2, Çizelge 3). Bu bağlamda, tuzluluğa bağlı olarak türlerin kök ve sap gelişimlerinin farklılık gösterdiği söylenebilir. Nitekim, birçok araştırıcı türlerin fide kök ve sap uzunluğunun tuzluluğa bağlı olarak farklılık gösterdiğini bildirmişlerdir (Arslan ve ark., 2013; Aydın ve Atıcı, 2015; Javaid ve ark., 2022).

Araştırmada tuz konsantrasyonu x tür interaksiyonunun önemli çıkması, tuz konsantrasyonlarının fide sap uzunluğu üzerindeki etkisinin türlere bağlı olarak önemli derecede farklılık gösterdiğini ortaya koymaktadır (Çizelge 3). Nitekim, domuz ayrığının sap uzunluğu ortalaması 0 mM NaCl (kontrol) ve 50 mM NaCl tuz konsantrasyonlarında istatistiki olarak önemli derecede farklı değerler göstermezken, test edilen diğer türlerin sap uzunlukları ortalaması 0 mM NaCl (kontrol) tuz konsantrasyonuna göre 50 mM NaCl tuz konsantrasyonunda önemli derecede daha yüksek değer göstermiştir. Diğer taraftan parlak brom hariç, 100 mM NaCl tuz konsantrasyonundan 200 mM NaCl tuz konsantrasyonuna doğru türlerin sap uzunlukları ortalaması önemli derecede daha düşük değer göstermiştir. Parlak bromun sap uzunluğu ortalaması ise 150 mM NaCl tuz konsantrasyonu ile 200 mM NaCl tuz konsantrasyonunda benzer istatistiki grupta yer almıştır.

Çizelge 3. Çokyıllık buğdaygil yembitkilerinin farklı tuz konsantrasyonlarındaki fide sap uzunlukları ortalamaları (cm)

* Aynı sütun içinde benzer büyük harflerle gösterilen Tür ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[1] Aynı satır içinde benzer büyük harflerle gösterilen Tuz konsantrasyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[2] Benzer küçük harflerle gösterilen Tuz konsantrasyonu x Tür interaksiyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

3.4. Kök Kuru Ağırlığı

Serin mevsim çokyıllık buğdaygil yembitkileri türlerinin farklı tuz konsantrasyonlarındaki fide kök kuru ağırlığı ortalamaları Çizelge 4'te verilmiştir. Çizelgede izlendiği üzere, 0 mM (kontrol) NaCl tuz konsantrasyonunda fide kök kuru ağırlığı ortalaması, test edilen diğer tuz konsantrasyonlarındakine göre önemli derecede daha yüksek değer göstermiştir. Ayrıca, 0 mM NaCl tuz konsantrasyonundaki kök kuru ağırlığı ortalamasını sırasıyla benzer istatistiki grupta yer alan 100 mM NaCl (0.33 mg/fide), 50 mM NaCl (0.28 mg/fide) ve 150 mM NaCl (0.26 mg/fide) tuz konsantrasyonları izlemiştir. 200 mM NaCl tuz konsantrasyonunda kök kuru ağırlığı ortalaması ise, 150 mM NaCl tuz konsantrasyonu hariç, test edilen diğer tuz konsantrasyonlarındakine göre önemli derecede daha düşük değer göstermiştir. Benzer sonuçlar, bazı bitki türlerinin fide kök kuru ağırlığının tuz konsantrasyonlarına bağlı olarak önemli derecede farklılık gösterdiğini rapor eden Göçer ve ark. (2021) ve Çirka ve ark. (2022) tarafından da bildirilmiştir.

Farklı tuz konsantrasyonlarının ortalaması olarak, fide kök ağırlığı ortalaması parlak bromda, test edilen diğer serin mevsim çokyıllık buğdaygil yembitkileri türlerine göre önemli derecede daha yüksek değer göstermiş ve söz konusu türü fide kök kuru ağırlığı ortalaması bakımından kılçıksız brom izlemiştir. Ayrıca, benzer istatistiki grupta yer alan kamışsı yumak, domuz ayrığı ve çokyıllık çimin kök kuru ağırlığı ortalamaları test edilen diğer türlerin kök kuru ağırlığı

ortalamalarından önemli derecede daha düşük değer göstermiştir (Çizelge 4). Bu sonuçlar, araştırmada test edilen türlerin tuzluluğa toleranslarınının farklı olduğunu ortaya koymaktadır. Nitekim birçok araştırmacı, bitki türlerinin, hatta aynı türe ait varyetelerin genetik yapılarına bağlı olarak, fide kök kuru ağırlıklarının tuzluluktan önemli derecede etkilendiğini rapor etmiştir (Kıldış, 2021; Özyazıcı ve Açıkbaş, 2021; Alzahrani, 2024; Cui ve ark., 2025).

Çizelge 4. Çokyıllık buğdaygil yembitkilerinin farklı tuz konsantrasyonlarındaki fide kök kuru ağırlığı ortalamaları (mg/fide)

İncelenen Türler	Tuz Konsantrasyonları (mM NaCl)					
	0 mM	**50 mM**	**100 mM**	**150 mM**	**200 mM**	**Ortalama**
Kılçıksız Brom (*Bromus inermis*)	0.39 de[2]	0.27 e-g	0.26 e-g	0.30 ef	0.25 e-g	0.29 B*
Domuz Ayrığı (*Dactylis glomerata*)	0.23 e-h	0.16 f-h	0.13 f-ı	0.18 f-h	0.00 ı	0.14 C
Çokyıllık Çim (*Lolium perenne*)	0.25 e-g	0.19 f-h	0.14 f-ı	0.17 f-h	0.07 hı	0.16 C
Parlak Brom (*Bromus catharticus*)	1.22 a	0.69 c	0.96 b	0.56 cd	0.30 ef	0.74 A
Kamışsı Yumak (*Festuca arundineceae*)	0.12 g-ı	0.10 g-ı	0.14 f-ı	0.11 g-ı	0.00 ı	0.09 C
Ortalama	0.44 A[1]	0.28 B	0.33 B	0.26 BC	0.12 C	

* Aynı sütun içinde benzer büyük harflerle gösterilen Tür ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[1] Aynı satır içinde benzer büyük harflerle gösterilen Tuz konsantrasyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[2] Benzer küçük harflerle gösterilen Tuz konsantrasyonu x Tür interaksiyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

Araştırmada tuz konsantrasyonu x tür interaksiyonunun önemli çıkması, tuz konsantrasyonlarının kök kuru ağırlığı üzerindeki etkisinin türlere bağlı olarak önemli derecede farklılık gösterdiğini ortaya koymaktadır (Çizelge 4). Nitekim, kılçıksız bromun fide kök ağırlığı ortalaması tüm tuz konsantrasyonlarında benzer istatistiki grupta yer alırken, parlak bromda fide kök kuru ağırlığı ortalaması 0 mM NaCl (kontrol) tuz konsantrasyonunda, diğer tuz konsantrasyonlarındakine göre önemli derecede daha yüksek değer göstermiştir. Bunun yanında, kamışsı yumağında fide kök ağırlığı ortalaması tüm tuz konsantrasyonlarında benzer istatistiki grupta yer almıştır.

3.5. Sap Kuru Ağırlığı

Serin mevsim çokyıllık buğdaygil yembitkileri türlerinin farklı tuz konsantrasyonlarında fide sap kuru ağırlığı ortalamaları Çizelge 5'te verilmiştir. Çizelge 5'te izlendiği gibi, fide sap kuru

ağırlığı ortalamaları benzer istatistiki grupta yer alan 0 mM NaCl ve 50 mM NaCl tuz konsantrasyonlarında, test edilen diğer tuz konsantrasyonlarındakine göre önemli derecede daha yüksek değer göstermiştir. Bunun yanında, fide sap kuru ağırlığı ortalaması 200 mM NaCl tuz konsantrasyonunda, test edilen diğer tuz konsantrasyonlarındakine göre önemli derecede daha düşük değer vermiştir. Araştırmadan elde edilen bulgular, fide sap kuru ağırlığı değerlerinin tuz konsantrasyonlarına bağlı olarak önemli derecede farklılık gösterdiğini bildiren birçok araştırıcının bulguları ile uyum içerisinde olduğunu göstermektedir (Atış, 2011; Saud ve ark., 2013; Kuşvuran ve ark., 2018).

Tuz konsantrasyonlarının ortalaması olarak fide sap kuru ağırlığı ortalaması, parlak bromda (1.63 mg/fide) test edilen diğer serin mevsim çokyıllık buğdaygil türlerindekine göre önemli derecede daha yüksek değer göstermiştir (Çizelge 5). Bunun yanında, fide sap kuru ağırlığı ortalaması bakımından parlak bromu sırasıyla farklı istatistiki gruplarda yer alan kılçıksız brom (1.03 mg/fide), çokyıllık çim (0.63 mg/fide), kamışsı yumak (0.38 mg/fide) ve domuz ayrığı (0.26 mg/fide) türleri izlemiştir. Bu sonuç, fide sap kuru ağırlığının serin mevsim çokyıllık buğdaygil yembitkileri türlerine bağlı olarak farklılık gösterdiğini ortaya koymuştur. Nitekim Saud ve ark. (2013), serin mevsim buğdaygil yembitkileri ile yürüttükleri tuzluluk çalışmasında, fide sap kuru ağırlıklarının türlere göre önemli derecede farklılık gösterdiğini rapor etmişlerdir.

Çizelge 5. Çokyıllık buğdaygil yembitkilerinin farklı tuz konsantrasyonlarındaki fide sap kuru ağırlıkları ortalamaları (mg/fide)

[1] Aynı satır içinde benzer büyük harflerle gösterilen Tuz konsantrasyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[2] Benzer küçük harflerle gösterilen Tuz konsantrasyonu x Tür interaksiyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

Araştırmada tuz konsantrasyonu x tür interaksiyonunun fide sap kuru ağırlığı üzerindeki etkisinin önemli çıkması, tuz konsantrasyonunun fide sap kuru ağırlığı üzerindeki etkisinin türlere bağlı olarak önemli derecede farklılık yarattığını ortaya koymaktadır. Nitekim parlak brom fide sap kuru ağırlığı ortalaması 0 mM NaCl, 50 mM NaCl ve 100 mM NaCl tuz konsantrasyonlarında test edilen diğer türlerin söz konusu tuz konsantrasyonlarındaki fide sap kuru ağırlığı ortalamalarından önemli derecede daha yüksek değer göstermesine rağmen, 150 mM NaCl ve 200 mM NaCl tuz konsantrasyonlarında fide sap kuru ağırlığı bakımından kılçıksız brom ve parlak brom türleri istatistiki olarak birbirinden farklı olmayan değerler göstermiştir.

3.6. Tuz Tolerans İndeksi

Serin mevsim çokyıllık buğdaygil yembitkileri türlerinin farklı tuz konsantrasyonlarındaki tuz tolerans indeksi ortalamaları Çizelge 6'da verilmiştir. Çizelgede izlendiği üzere tuz tolerans indeksi ortalaması 0 mM NaCl ve 50 mM NaCl tuz konsantrasyonlarında istatistiki olarak birbirinden farklı olmayan değerler vermiştir. 100 mM ve daha yüksek NaCl konsantrasyonlarında konsantrasyon arttıkça tuz tolerans indeksi ortalaması önemli derecede daha düşük değer göstermiştir. Bu durum, tuzluluk oranının artmasıyla tuz tolerans indeksinin azaldığını ortaya koymaktadır. Nitekim Atış (2011), tuz konsantrasyonunu artırmamın fide gelişimini olumsuz etkilediğini ve tuz tolerans indeksinin, artan tuz konsantrasyonuna bağlı olarak önemli derecede düşüş gösterdiğini rapor etmiştir.

Araştırmada test edilen türlerin tuz tolerans indeksi ortalaması incelendiğinde, en yüksek tuz tolerans indeksi ortalaması %63.6 ile kılçıksız bromda tespit edilirken, çokyıllık çimin tuz tolerans indeksi ortalaması %62.9 ile kılçıksız bromdan istatistiki olarak farklı olmayan değer göstermiştir. Parlak bromun tuz tolerans indeksi, kamışsı yumak ve domuz ayrığı türleri hariç, test edilen diğer türlere göre önemli derecede daha düşük değer göstermiştir. Bu sonuç, tuz tolerans indeksinin bitki türüne bağlı olarak farklılık gösterdiğini bildiren birçok araştırmacının sonuçlarıyla uyum içerisindedir (Atış, 2011; Kıldış, 2021). Nitekim Al-Ghumaiz ve ark. (2017), birçok halofit bitki türünün tuz tolerans indeksinin yüksek olduğunu, halofit olmayan bitki türlerinin ise belli oranda tuzlulukta gelişim gösterebildiklerini ve tuza tolerans indeksinin bitki türüne bağlı olarak farklılık gösterdiğini rapor etmişlerdir.

Çizelge 6. Çokyıllık buğdaygil yembitkilerinin farklı tuz konsantrasyonlarındaki tuz tolerans indeksi ortalamaları (%)

İncelenen Türler	Tuz Konsantrasyonları (mM NaCl)					
	0 mM	50 mM	100 mM	150 mM	200 mM	Ortalama
Kılçıksız Brom (*Bromus inermis*)	100.0 ab[2]	65.3 c-e	81.0 b-d	45.8 ef	26.0 fg	63.6 A*
Domuz Ayrığı (*Dactylis glomerata*)	100.0 ab	110.2 a	61.3 de	12.6 g	0.0 h	56.8 B
Çokyıllık Çim (*Lolium perenne*)	100.0 ab	99.7 a-c	66.3 c-e	28.7 fg	20.0 g	62.9 A
Parlak Brom (*Bromus catharticus*)	100.0 ab	50.9 d-f	47.5 ef	17.8 g	2.0 h	43.6 B
Kamışsı Yumak (*Festuca arundineceae*)	100.0 ab	99.9 a-c	69.0 c-e	11.9 g	0.0 h	56.2 B
Ortalama	100.0 A[1]	85.2 A	65.0 B	23.3 C	9.6 D	

* Aynı sütun içinde benzer büyük harflerle gösterilen Tür ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[1] Aynı satır içinde benzer büyük harflerle gösterilen Tuz konsantrasyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

[2] Benzer küçük harflerle gösterilen Tuz konsantrasyonu x Tür interaksiyonu ortalamaları arasında Duncan testine göre %5 önem seviyesinde istatistiki olarak anlamlı fark yoktur.

Araştırmada tuz konsantrasyonu x tür interaksiyonunun önemli çıkması, tuz konsantrasyonlarının tuz tolerans indeksi üzerindeki etkisinin türlere bağlı olarak önemli derecede farklılık gösterdiğini ortaya koymuştur. Nitekim, domuz ayrığı, çokyıllık çim ve kamışsı yumak türlerinde tuz tolerans indeksi ortalaması 0 mM NaCl (kontrol) tuz konsantrasyonuna göre 50 mM NaCl tuz konsantrasyonunda istatistiki olarak önemli derecede farklı olmayan değerler verirken, kılçıksız brom ve parlak brom türleri tuz tolerans indeksi bakımından 0 mM NaCl (kontrol) tuz konsantrasyonuna göre 50 mM NaCl tuz konsantrasyonunda önemli derecede daha düşük değer göstermiştir. Diğer taraftan, domuz ayrığı, parlak brom ve kamışsı yumak türlerinin tuz tolerans indeksi 100 mM ve daha yüksek tuz konsantrasyonlarında tuz konsantrasyonu arttıkça önemli derecede daha düşük değer göstermiştir.

4. SONUÇ

Araştırma sonuçları, farklı serin mevsim çokyıllık buğdaygil türlerinin çimlenmesi ve fide gelişimi üzerinde tuz konsantrasyonlarının önemli derecede fark yarattığını ortaya koymuştur. Artan tuz konsantrasyonuna bağlı olarak türlerin hem çimlenmesi hem de fide gelişimi olumsuz etkilenmiştir. Domuz ayrığı ve kamışsı yumak türlerinin tuzluluğa çok duyarlı türler olduğu ve tuzluluk oranı yüksek alanlarda söz konusu türler yerine, tuzluluğa toleranslı tür veya varyetelerin tercih edilmesi gerektiği anlaşılmıştır. Çokyıllık çimin 200 mM NaCl, kılçıksız

bromun 150 mM NaCl tuz konsantrasyonuna kadar %50 inin üzerinde çimlenme yüzdelerinin olması, söz konusu türlerin yüksek tuz konsantrasyonlarında çimlenebileceğini göstermiştir. Ancak çokyıllık çim ve kılçıksız bromun 150 mM NaCl ve daha yüksek tuz konsantrasyonlarında tuz tolerans indekslerinin %50 nin altına düşmesi, türlerin yeteri kadar çimlense dahi ilerleyen dönemlerde türlerin fide gelişiminde sorunlar ortaya çıkacağını göstermektedir. Çimlenme yüzdesi, fide gelişimi ve tuz tolerans indeksi birlikte değerlendirildiğinde çokyıllık çimin tuzlu alanlar için diğer türlerden kısmen avantajlı olduğu ortaya çıkmıştır. Yürütülen bu araştırma, incelenen serin mevsim çokyıllık buğdaygil yembitkisi türleri açısından üreticiye ön bilgi verecek ve ileri seviyede yapılacak araştırmalar için kaynak oluşturacaktır.

ABSTRACT

Secondary metabolites found in plants function as part of their defense mechanisms. By releasing these secondary metabolites into their surroundings, plants can eliminate them from their own systems while simultaneously influencing the growth of neighboring plants either positively or negatively. This phenomenon is known as allelopathy. In this study, the aimed to determine the effects of extracts obtained from forage turnip (*Brassica rapa* L.) leaves on the germination parameters and seedling development of forage cowpea (*Vigna unguiculata* L. "Ülkem") seeds. Forage turnip leaves were harvested during the flowering period, weighed 500 grams, and soaked in 3 liters of distilled water for 7 hours to prepare the extract. From this extract, four solutions were prepared at concentrations of 25%, 50%, 75%, and 100%. Pure water (PW) was used as the control. The experiment, carried out in triplicates, lasted 21 days under conditions of 25/23 °C temperature, 60% humidity, and a 16/8-hour photoperiod. During the study, the germination rate (%), root and shoot lengths (cm), fresh and dry weights of roots and shoots (g), crude protein content (CP, %), acid detergent fiber (ADF, %), neutral detergent fiber (NDF, %), potassium (K, %), phosphorus (P, %), calcium (Ca, %), magnesium (Mg, %), total phenolics (TP, mg GA g^{-1}), total flavonoids (TF, mg QE g^{-1}), radical scavenging activity (DPPH, %) and condensed tannins (CT, %) were determined. The highest germination rates were obtained from the treatments of 100% DW (100%), 25FT% + 75PW% (100%), and 75FT% + 25PW% (96.67%). In terms of root-shoot lengths and fresh and dry weights, the 25FT+ 75PW% treatment was found to be the most effective. Regarding the seedling's CP, ADF, NDF, K, P, Ca, and Mg contents, the values ranged from 33.00-35.57%, 19.98-26.15%, 22.67-37.51%, 2.87-3.43%, 0.57-0.62%, 1.02-1.14%, and 0.30-0.32%, respectively. There was no significant difference between treatments in terms of secondary metabolites. As a result, the study concluded that fodder turnip extract has an allopathic effect on the germination and

seedling development of forage cowpea, with the 25% fodder turnip extract promoting germination and seedling growth.

YEM ŞALGAMI YAPRAK EKSTRAKTLARININ YEMLİK BÖRÜLCENİN ÇİMLENME VE FİDE GELİŞİMİ ÜZERİNE ETKİSİ

ÖZET

Bitkilerde bulunan ikincil metabolitler bitkilerin savunma mekanizmalarının bir parçası olarak görev yaparlar. Bitkiler bu ikincil metabolitleri çevrelerine salarak kendi bünyelerinden uzaklaştırırken, diğer bitkilerin gelişimlerini olumlu ya da olumsuz etkileyebilmektedirler. Bu durum allelopati olarak adlandırılmaktadır. Mevcut çalışmada; yemlik börülce "YB" (*Vigna unguiculata* L. "Ülkem") tohumlarının çimlenme parametreleri ile fide gelişimi ve kalitesi üzerinde yem şalgamı "YŞ" (*Brassica rapa* L.) yapraklarından elde edilen özütlerin etkisinin belirlenmesi amaçlanmıştır. Çiçeklenme döneminde hasat eden yem şalgamı yapraklarından 500 gr tartılarak 3 litre saf su içerisinde 7 saat süre ile bekletilmiş ve özüt hazırlanmıştır. Bu özütten %25, %50, %75 ve %100'lük 4 adet yem şalgamı çözeltisi hazırlanmıştır. Kontrol olarak ise saf su (SS) kullanılmıştır. Üç tekrarlı olarak gerçekleştirilen deney 25/23 °C sıcaklık, %60 nem ve 16/8 saat fotoperiyotta 21 gün boyunca devam etmiştir. Çalışmada; çimlenme oranı (%), kök ve gövde uzunlukları (cm), kök-gövde yaş ve kuru ağırlıkları (g), ham protein oranı (%), asit deterjanda çözünmeyen lif (ADF, %), nötr deterjanda çözünmeyen lif (NDF, %), potasyum (K, %), fosfor (P, %), kalsiyum (Ca, %), magnezyum (Mg, %), toplam fenolik (mg GA g^{-1}) toplam flavonoid (mg QE g^{-1}), radikal kovucu aktivite (DPPH, %) ve kondanse tanen (%) içerikleri belirlenmiştir. En yüksek çimlenme oranı %100SS (%100), %25YŞ+75SS (%100) ve %75YŞ+25SS (%96.67) işlemlerinden elde edilmiştir. Kök-gövde uzunlukları ile yaş ve kuru ağırlıkları bakımından %25YŞ+75SS işlemi ön plan acıkmıştır. Çalışmada fidelerin HPO, ADF, NDF K, P, Ca ve Mg içerikleri sırasıyla %33.00-35.57, %19.98-26.15, %22.67-37.51, %2.87-3.43, %0.57-0.62, %%1.02-1.14 ve %0.30-0.32 arasında olmuştur. Çalışmada sekonder metabolitler bakımından işlemler arasında fark olmamıştır. Sonuç olarak; yem şalgamı özütünün soyanın çimlenme ve fide gelişimi üzerinde allelopatik etkisinin belirlendiği çalışmada %25 yem şalgamı özütü yemlik börülcenin çimlenme ve fide gelişimini teşvik ettiği belirlenmiştir.

Anahtar Kelimeler: Allelopati, yem şalgamı, yemlik börülce, çimlenme, fide.

1. GİRİŞ

Ot tipi yem şalgamı olarak da bilinen Lenox, hiç sulanmadan yetiştirilebilen tek yıllık yem bitkisidir. Protein oranı oldukça yüksek olup, hayvan verimini ve kalitesini iyileştirmektedir. Süt verimine ve kalitesine doğrudan etki yapan bitki, üreticinin gelirine de katma değer sağlamaktadır. Bitkinin yağ oranı oldukça yüksek olup, vitaminler ve besin elementleri bakımından da oldukça zengindir (Denen, 2019). Yem şalgamı ile beslenen hayvanların tüyleri parlaklaşır, ayak hastalıkları ve ishal vakalarında belirgin düşüşler olur. Bitkinin yaprakları ve kökü, koyun, keçi, düve, sığır ve süt inekleri tarafından büyük bir iştahla tüketilmektedir (Geren ve ark., 2002; Yavuz, 2022). Yem şalgamı erken dönemde hasada gelmektedir. Bu durum arkasından ekilecek bitki için geniş bir vejetasyon dönemi anlamına gelmektedir. Yem şalgamı ayrıca biyoaktif bileşenlerce oldukça zengindir. (Yavuz ve Gülümser, 2022).

Börülce *(Vigna unguiculata* L. Walp.), tek yıllık ömürlü, otsu karakterde ve sıcak iklim koşullarına uygun bir baklagil türüdür. Hem insan gıdası hem de hayvan yemi olarak değerlendirilen bu bitki, aynı zamanda tarımsal üretimde toprak verimliliğini artırıcı özelliğe sahiptir. Köklerinde simbiyotik olarak yaşayan Rhizobium bakterileri aracılığıyla atmosferdeki serbest azotu bağlayarak toprağın besin değerini zenginleştirir. Pek çok kültür bitkisine kıyasla, kuraklık ve yüksek sıcaklık koşullarına daha dayanıklıdır (Can ve ark., 2021). Börülce; yeşil gübreleme amacıyla, yem bitkisi olarak ve doğrudan tüketim için yaygın şekilde kullanılır. Hayvancılıkta ise yeşil ve kuru ot formu, silaj (özellikle sorgum ve darı ile karışık) ve kuru tohumları yem olarak değerlendirilmektedir. Besin değeri açısından zengin olan börülcenin yeşil kısmı %14-21, tohumları ise %18-26 oranında ham protein içermektedir (Adeyanju ve ark., 2007; Ali ve ark., 2004). Bunun yanı sıra, doğal meralarda otlatma yoluyla da hayvan beslenmesinde kullanılabilmektedir.

Bitkiler tarafından sentezlenen ikincil metabolitler, bitkilerin çevresel stres etmenlerine karşı geliştirdiği savunma mekanizmalarının bir parçası olarak işlev görürler. Bu bileşiklerin birçoğu bitki için toksik olabileceğinden, bitkiler bu maddeleri çevrelerine salgılayarak bünyelerinden uzaklaştırma yoluna gider (Duke, 1991). Bu kimyasallar, çevredeki diğer bitkiler üzerinde doğrudan veya dolaylı etkiler meydana getirerek onların büyüme, gelişme ve fizyolojik süreçlerini etkileyebilir. Bu tür bileşikler allelokimyasallar, bu bileşiklerin neden olduğu etkileşimler ise allelopati olarak tanımlanır. Allelopatik etkiler bitki türüne bağlı olarak bazı bireylerde baskılayıcı, bazı bireylerde ise uyarıcı sonuçlar doğurabilir. Etkinin derecesi ve yönü; salgılanan bileşiğin kimyasal özellikleri, yoğunluğu ve diğer bitkilerle temas süresi gibi faktörlere bağlı olarak değişebilir. Ancak yapılan çalışmalarda, bu kimyasalların çoğunlukla olumsuz etkilere yol açtığı gözlemlenmiştir. Bu etkiler; bitki gelişiminde yavaşlama, fotosentezde azalma, besin elementlerinin alımında düşüş, yaprak sararması (klorozis), morfolojik deformasyonlar, yaprak dökülmesi, kurumalar ve hatta bitki ölümüne kadar ilerleyen sonuçlar doğurabilir (Rice, 1984).

Yukarıdaki açıklamalar ışığı altında bu çalışmada; yem şalgamı yapraklarından elde edilen özütlerden hazırlanan farklı solüsyonlarının yemlik börülcenin çimlenme ile fide gelişimi ve kalitesi üzerindeki alleloptik etkilerinin belirlenmesi amaçlanmıştır.

2. MATERYAL VE METOT

Araştırma, Bilecik Şeyh Edebali Üniversitesi'nin Tarımsal Uygulama ve Araştırma alanındaki laboratuvarda gerçekleştirilmiştir. Çalışmada allelopati materyali olarak yem şalgamının (*Brassica rapa* L.) "Lenox, çimlenme materyali olarak ise yemlik börülcenin (*Vigna unguiculata* L.) "ülkem" çeşitleri kullanılmıştır. Yem şalgamı %50 çiçeklenme döneminde hasat edilmiş ve yapraklarından 500 gram örnek alınarak 3 litre saf su içinde 7 saat süreyle bekletilerek özüt elde edilmiştir. Daha sonra bu özütlerden %100, %75, %50 ve %25 oranında 4 farklı solüsyon hazırlanmıştır. Solüsyonlar saf su ile hazırlanmış olup, kontrol grubu olarak yine saf su (%100 saf su) kullanılmıştır. Çimlenme ve fide gelişimi; plastik kaplar içerisinde ve iki kat kurutma kâğıdı üzerinde üçer tekrarlı (25x4) olarak gerçekleştirilmiştir. Laboratuvar koşulları ise;16 saat aydınlık/8 saat karanlık fotoperiyotta ve 25±1˚C olarak ayarlanmıştır. Çalışmaya 21 gün boyunca devam edilmiştir.

2.1. Çimlenme Oranı (%): ((Çimlenen tohum sayısı/Toplam tohum sayısı) × 100) (Kayacetin ve ark., 2018).

2.2. Kök-Gövde Yaş ve Kuru Ağırlığı (g): Hasat edilen örneklerin yaş ağırlıkları belirlendikten sonra, 60 °C'de sabit ağırlığa gelene kadar kurutulmuş ve tartılarak kuru ağırlıklar belirlenmiştir (Işık ve Çalıseki, 2017; Leblebici ve ark., 2024)

2.3. Ham Protein Oranı (HPO), Asit Deterjanda Çözünmeyen lif (ADF), Nötr Deterjanda Çözünmeyen Lif (NDF) ve Besin Elementleri (%): Örnekler, 60 °C'de sabit ağırlığa ulaşana kadar kurutulmuş ve ardından 1 mm elek çapına sahip bir değirmende öğütülerek analiz için hazırlanmıştır. Sonrasında bu örneklerin HPO, ADF, NDF, potasyum (K), kalsiyum (Ca), magnezyum (Mg) ve fosfor (P) içerikleri, Near Infrared Reflectance Spectroscopy (NIRS) (Foss 6500) cihazı ve IC-0904FE yazılımı kullanılarak belirlenmiştir.

2.4. Toplam Fenolik İçeriği (mg GA g^{-1}): Ekstraktların toplam fenolik içeriği, Folin-Ciocalteu Reaktifi (FCR) kullanılarak, Singleton ve ark. (1999) metoduna göre belirlenmiştir. Çalışma için, örnek çözeltilerinden 0.2 ml alınarak üzerine 9 ml distile su eklenmiş ve ardından 0.2 ml Folin-Ciocalteu reaktifi ilave edilmiştir. Bu karışım, 3 dakika süreyle bekletildikten sonra, 0.6 ml %20 sodyum karbonat (Na_2CO_3) eklenmiş ve toplam hacim 10 ml'ye tamamlanmıştır. Karışım, oda sıcaklığında karanlık ortamda 2 saat inkübe edildikten sonra, 760 nm'de absorbans ölçümü yapılmıştır. Standart kalibrasyon eğrisini oluşturmak için saf suda çözülmüş gallik asit kullanılmıştır. Gallik asit, ana stok çözeltisi olarak 0.1 mg ml^{-1} konsantrasyona getirilmiş ve seyreltme yöntemiyle yedi farklı konsantrasyon elde edilmiştir. Kontrol çözeltisi olarak, örnek çözeltisi kadar (0.2 ml) saf su ilave edilmiştir. Gallik asit standart eğrisine dayanarak, tüm bitki ekstraktlarındaki toplam fenolik madde miktarı, mg gallik asit eşdeğeri (GAE g^{-1}) olarak hesaplanmıştı

2.5. Toplam Flavonoid İçeriği (mg QE g^{-1}): Quercetin stok çözeltisi, 200 mg L^{-1} konsantrasyona hazırlanmış ve bu çözeltiden seyreltme yöntemiyle beş farklı konsantrasyon elde edilmiştir. Bitki ekstraktlarının her birinden 1 ml, aynı miktarda %2'lik $AlCl_3$ çözeltisiyle karıştırılarak oda sıcaklığında 10 dakika bekletilmiştir. Ardından, numunelerin 415 nm'deki absorbansları ölçülmüştür. Aynı prosedür, standart Quercetin için de uygulanmış ve örneklerin

flavonoid içerikleri Quercetin eşdeğeri (mg QE g^{-1}) olarak hesaplanmıştır (Arvouet-Grand ve ark., 1994).

2.6. Radikal Kovucu Aktivite İçeriği (DPPH, %): Serbest radikal süpürme aktiviteleri, 2,2-difenil-1-pikrilhidrazil (DPPH) radikali kullanılarak belirlenmiştir (Gezer ve ark., 2006). DPPH çözeltisi, 4 mg DPPH'in 100 ml metanolde çözündürülmesiyle hazırlanmıştır. Ekstraktlar, ana stok çözeltilerinden farklı konsantrasyonlarda seyreltildi. Her bir örnek için, 3.2 ml DPPH radikali çözeltisi ve farklı konsantrasyonlardaki ekstrakttan 200 µl eklenmiştir. Karışımlar, oda sıcaklığında karanlık ortamda 30 dakika inkübe edildikten sonra, spetofotometre cihazı ile 517 nm'de absorbans ölçümü yapılmıştır. Standart olarak, askorbik asit ve bütillenmiş hidroksi toluen (BHT) kullanılmıştır. Kontrol için, deney tüpüne örnek çözeltisi kadar çözücü ilave edilmiştir. Her bir deneme üç tekerrürlü olarak yapılmıştır. DPPH radikali süpürme yüzdesi aşağıdaki formül ile hesaplanmıştır.

%DPPH radikal süpürücü aktivitesi = [(Akontrol–Aekstrak) / Akontrol] × 100.

2.7. Kondanse Tanen İçeriği (%): 0.01 gr öğütülmüş örnek tartılarak üzerine 6 ml tanen çözeltisi eklenmiş ve karışım bir tüpe konarak vortex ile iyice karıştırılmıştır. Örnekler, kaynar suda 1 saat bekletildikten sonra çıkarılıp 1 saat boyunca 100 °C'de tutulmuş, sonrasında soğutulmuştur. Soğuduktan sonra, 550 nm'de absorbans ölçümü yapılmıştır (Bate-Smith, 1975). Kondanse tanen içeriği, aşağıdaki formül kullanılarak hesaplanmıştır.

Absorbans (550 nm x 156,5 x seyreltme faktörü)/ Kuru ağırlık (%).

2.8. Verilerin Değerlendirilmesi: Elde edilen sonuçlar MSTAT-C paket programı kullanılarak ve tesadüf parseller deneme desenine göre analizine tabi tutulmuş, grup ortalamaları arasındaki farklılıkların karşılaştırılmasında ise Duncan testi kullanılmıştır.

3. BULGULAR VE TARTIŞMA

Tablo 1'de yem şalgamının farklı oranlardaki özütleri ile sulanan soya tohumlarının bazı fenolojik ile kalite özellikleri verilmiştir. İşlemler arasında istatistiksel olarak çimlenme oranı (ÇO), gövde uzunluğu (GU), gövde yaş ağırlığı (GY), gövde kuru ağırlığı (GK) ve asit deterjanda çözünmeyen lif (ADF) bakımından önemli ($p<0.05$), kök uzunluğu (KU), kök yaş ağırlığı (KY), kök kuru ağırlığı (KK) ve nötr deterjanda çözünmeyen lif (NDF) bakımından çok önemli ($p<0.01$) farklılık olmuştur. Çalışmada ham protein oranı (HPO), potasyum (K), fosfor (P), kalsiyum (Ca) magnezyum (Mg), toplam flavonoid (TFL), toplam fenolik (TFN) radikal kovucu aktivite (DPPH) ve kondanse tanen (KT) bakımından ise farklılık olmamıştır (Tablo 1).

Tablo 1. Yemlik börülce tohumlarında belirlenen bazı fenolojik ve kalite özellikleri

**: p<0.01; *: p<0.05: Aynı sütunda aynı harfle gösterilen ortalamalar arasında fark yoktur (p<0.001). YŞ: yem şalgamı; S: Saf su; ÇO: Çimlenme oranı; KU: Kök uzunluğu; GU: Gövde uzunluğu; KY: Kök yaş ağırlığı; KK: Kök kuru ağırlığı; GY: Gövde yaş ağırlığı; GK: Gövde kuru ağırlığı; HPO: Ham protein oranı; ADF: Asit deterjanda çözünmeyen lif oranı; NDF: Nötr deterjanda çözünmeyen lif oranı; K: Potasyum; P: Fosfor; Ca: Kalsiyum; Mg: Magnezyum; TFN: Toplam fenolik; TFL: Toplam flavonoid; DPPH: Radikal kovucu aktivite; KT: Kondanse tanen

En yüksek çimlenme oranı aynı istatistiksel grupta yer alan %100SS (%100), %25YŞ+75SS (%100) ve %75YŞ+25SS (%100) işlemlerinden elde edilmiştir. Yem şalgamı özütünün en yüksek seviyesi yemlik börülce tohumları üzerinde toksik bir etki yaptığı ve çimlenme oranını düşürdüğü görülmüştür. Yem şalgamı ekstraktlarının %75 ve %25 oranlardaki özütleri ise çimlenmeyi teşvik etmiştir. Bu durum farklı seviyelerde yem şalgamı özütünün yemlik börülce üzerinde olumlu allelopatik etki yaptığını göstermektedir. Leblebici ve ark. (2024) yem şalgamı özütlerinin mürdümük tohumları üzerinde allelopatik etkisini belirlemek amacıyla yürüttükleri çalışmada; %25 oranında yem şalgamı özütünün tohumların çimlenmesini teşvik ettiğini tespit etmişlerdir. En uzun kök ve gövde uzunluğu ile kök ve gövde yaş ağırlıkları %25 yem şalgamı ile sulanan işlemlerden elde edilmiştir. Yem şalgamı yüksek miktarda sekonder metabolit içermektedir (Yavuz ve Gülümser, 2022; Leblebici ve ark., 2024). Bu sayede kendinden sonra gelen bitkinin gelişimi üzerinde etkili olabilmektedir.

Tablo 1 incelendiğinde; yem şalgamı özütü ile sulanan soya tohumlarının HPO %33.00-35.57 arasında değişmiştir. En düşük ADF ve NDF %25 yem şalgamı özütü ile sulanan yemlik börülce fidelerinde tespit edilmiştir. En yüksek ADF ve NDF ise aynı istatistiksel diğer

işlemlerde elde edilmiştir. Çalışmada börülce fidelerinin K, P, Ca ve Mg içeriklerinin sırasıyla %2.87-3.43, %0.57-0.62, %1.02-1.14 ve %0.30-0.32 arasında değişmiştir (Tablo 1).

Sekonder matabolitler bitkilerin hayatta kalabilmeleri açısından önem ihtiva etmektedir. Nitekim bitkiler stres koşullarında biyaoktif bileşenler salgılayarak hayatta kalabilmektedirler(Mammadov, 2014). Çalışmada yem şalgamı yaprak özütleri ile sulanan yemlik börülce fidelerinde TFL, TFN, DPPH ve KT içerikleri belirlenmiştir. Tüm özellikler arasında işlemler arasında önemli farklılıklar olmamıştır. Bu durum bitkilerin herhangi bir strese maruz kalmadığının bir göstergesi olabilir, ancak gelişime olumlu katkı sunmadığı da bir gerçektir. Nitekim çimlenme ve bazı fide gelişim parametreleri bunu göstermiştir. Mevcut çalışmada işlemlerin TFL, TFN, DPPH ve KT içerikleri sırasıyla 0.34-1.16 mg QE g^{-1}, 12.83-18.22 mg GA g^{-1}, %53.27-69.30 ve %0.97-1.25 arasında olmuştur (Tablo 1). Gürkan ve ark. (2025) yem şalgamı ekstraktlarının soyanın çimlenme ve fide gelişimi üzerindeki etkilerini inceldikleri çalışmada, %25 yem şalgamı ekstraktının soya üzerinde etkili olduğun belirlemişlerdir. Nitekim yem şalgamı ekstarkatının oranındaki artışlara bağlı olarak soya fidelerinde stres ortaya çıkmış ve sekonder metabolitlerde artış tespit edilmiştir.

SONUÇ

Bu çalışmada, yem şalgamı ekstraktlarının, yemlik börülce tohumlarının çimlenmesi, fide morfolojisi ve fide kalitesi üzerindeki allelopatik etkilerini ortaya koymayı amaçlamıştır. Çalışmadan elde edilen bulgular, yem şalgamı ekstraktlarının konsantrasyona bağlı olarak soya bitkisi üzerinde çift yönlü allelopatik etkiler oluşturduğunu göstermektedir. Gene olrak yüksek düzeylerde uygulanan ekstraktlar çimlenme oranı, kök ve gövde uzunluğu ile genel fide gelişimini olumsuz yönde etkilemiştir. Buna karşılık, daha düşük özellikle de %25 yem şagmı ekstrak uygulanması çimlenme yüzdesi ve fide gelişim parametrelerinde anlamlı bir artışa yol açmış ve olumlu allelopatik özellik sergilemiştir. Bu etkilerin, yem şalgamı yapraklarında doğal olarak bulunan flavonoid ve fenolik bileşikler gibi sekonder metabolitlerin varlığına bağlı olarak geliştiği değerlendirilmektedir. Sonuç olarak, %25 oranındaki yem şalgamı ekstraktının yemlik börülce tohumlarının çimlenmesi ve fide gelişimini destekleyici etkide bulunduğu, bu eşiğin üzerindeki konsantrasyonların ise olumsuz allelopatik etkiler yarattığı belirlenmiştir.

TEŞEKKÜR

Bu çalışmaya destek sağlayan, Türkiye Bilimsel ve Teknolojik Araştırma Kurumu (TÜBİTAK)'na teşekkür ederiz. (2209-A Üniversite Öğrencileri Araştırma Projeleri Destekleme Programı (Başvuru numarası: 1919B012301970).

ABSTRACT

The increase in the proportions of greenhouse gases such as carbon dioxide and methane in the atmospheric composition is causing an increase in the surface temperatures of our planet and climatic problems. This review addresses the current status of greenhouse gas (GHG) emissions from field crop cropping systems and focuses on key factors affecting greenhouse gas emissions, such as crop type, management practices, and soil conditions. In this context, challenges and opportunities for reducing GHG emissions in field crop cropping systems are assessed. Field crop cultivation accounts for a very large share of crop area, production, and energy use among crop groups worldwide. In this respect, field crops are important carbon dioxide (CO_2) sinks. They also release oxygen through photosynthesis, but also emit significant amounts of methane (CH_4) and nitrous oxide (N_2O) during growth and decomposition. In recent years, with the increasing severity of global warming, there has been an increasing interest and on examining the emission and absorption of GHG and reducing these emissions in field crop production systems to help mitigate the effects of global warming. The greenhouse gas emissions of different cultivation systems and processes vary. Conventional tillage systems release more greenhouse gases such as CO_2 and N_2O than reduced or zero tillage systems. Similarly, rotation, residue management, increasing carbon sequestration and controlling nitrogen fertilizer use can contribute to reducing GHG emissions. As a result, in this study, the contribution and importance of sustainable management practices in agricultural processes based on field crops for reducing greenhouse gas emissions and sustainable use of ecological resources are emphasized.

Keywords: Global warming, greenhouse gases, field crops, agricultural activities.

TARLA BİTKİLERİ ÜRETİM SİSTEMLERİNDE SERA GAZI EMİSYONLARININ AZALTILMASI

ÖZET

Atmosfer bileşiminde karbondioksit ve metan gibi sera gazlarının oranlarının yükselişi gezegenimizin yüzey sıcaklıklarında artışa ve iklimsel sorunlara yol açmaktadır. Bu derlemede, tarla bitkileri ekim sistemlerinden kaynaklanan sera gazı emisyonu (SGE)'na ilişkin mevcut durum ele alınmış ve ürün türü, yönetim uygulamaları ve toprak koşulları gibi SGE'yi etkileyen temel faktörlere odaklanılmıştır. Bu kapsamda tarla bitkileri ekim sistemlerinde SGE azaltılmasına yönelik zorluklar ve fırsatlar değerlendirilmiştir. Tarla bitkileri yetiştiriciliği tüm dünyada ürün grupları arasında ekiliş alanı, üretim ve enerji kullanımı bakımından çok büyük bir paya sahiptir. Bu bakımdan tarla bitikleri önemli karbondioksit (CO_2) yutakları arasındadır. Aynı zamanda fotosentez yoluyla oksijen de salarlar. Ancak büyüme ve ayrışma sırasında önemli miktarda metan (CH_4) ve azot oksit (N_2O) salınımına neden olurlar. Son yıllarda küresel ısınmanın etkilerini hafifletmeye yardımcı olmak için tarla bitkisi üretim sistemlerinde SGE ve emilimini incelemeye ve bu emisyonları azaltmaya yönelik ilgi artmıştır. Farklı yetiştirme sistem ve süreçlerinin SGE değişkenlik göstermektedir. Azaltılmış veya sıfır toprak işleme sistemlerinde, geleneksel toprak işleme sistemlerine göre CO_2 ve N_2O gibi sera gazlarının salınımı daha düşüktür. Benzer şekilde, münavebe, kalıntı yönetimi, karbon bağlamanın artırılması ve kontrolü azotlu gübre kullanımı SGE azaltılmasına katkı sağlayabilir. Sonuç olarak bu çalışmada ekolojik kaynakların sürdürülebilir kullanımı için, tarla bitkileri temelli tarımsal süreçlerde SGE azaltmanın yollarına değinilmiş ve sürdürülebilir yönetim uygulamalarının katkısı ve önemi vurgulanmıştır.

Anahtar Kelimeler: Küresel ısınma, sera gazı, tarla bitkileri, tarımsal faaliyetler.

1. GİRİŞ

Toplumların gelişmesine bağlı olarak artan insan kaynaklı sera gazı emisyonu (SGE) küresel ısınmaya katkıda bulunmuş ve Dünya'nın iklimini önemli ölçüde etkilemiştir (Yuan ve ark., 2024). Bu nedenle, SGE'yi azaltmak küresel ısınmanın etkilerini hafifletmek ve gezegeni korumak için çok önemlidir. Hükümetler Arası İklim Değişikliği Paneli (IPCC) raporlarına göre sanayi devriminden sonra küresel ortalama sıcaklık 1.1 °C artmış, ve bu artışın yüzyılın sonuna kadar 2.6-4.8 °C'yi bulması öngörülmektedir (Hayhoe ve ark., 2017). Yaşanan gelişmeler ve bilimsel tespitler de bu öngörüleri doğrulamakladır. Dünya Meteoroloji Örgütü (WMO) tarafından, 2024'ün 175 yıllık gözlem kayıtlarındaki en sıcak yıl olduğu bildirilmiştir. 2024 yılında ortalama küresel ortalama yüzey sıcaklığı 1850-1900 ortalamasının 1.55 °C ± 0.13 °C üzerinde gerçekleşmiştir. Bir önceki en sıcak yıl ise 1.45 °C ± 0.12 °C' lik bir anomali ile 2023 olarak kaydedilmiştir. Üstelik geçtiğimiz on yılın (2015-2024), kayıtlardaki en sıcak on yıl olduğu bildirilmiştir (WMO, 2025). WMO raporunda ayrıca deniz seviyesindeki uzun vadeli yükselme değerinin, uydu kaydının başlangıcından bu yana iki katından fazla artığı ve buna göre 1993 ile 2002 arasında yılda 2.1 mm iken 2015 ile 2024 arasında yılda 4.7 mm'ye ulaştığı bildirilmektedir. Raporda deniz suyu sıcaklığı ile ilgili veriler de endişe vericidir. Zira rapora göre; 2024 yılı yılında ölçülen okyanus sıcaklığı, 2023 yılına ait önceki rekoru aşarak 65 yıllık gözlemsel kayıtlardaki en yüksek seviyeye ulaşmıştır, üstelik son sekiz yılda her yıl rekor kırarak artmaya devam etmektedir. Ayrıca okyanuslarda son yirmi yılda (2005-2024) gerçekleşen ısınmanın, 1960-2005 döneminde gerçekleşen ısınmanın iki katından fazla olduğu bildirilmektedir.

Tüm bunların oluşmasında, insan faaliyetleri ve bu faaliyetler sonucu oluşan SGE önemli paya sahiptir. Tarım da büyük oranda insan kontrolünde gerçekleşen ve SGE'si yüksek bir sektördür. Tarımsal sistemler ve faaliyetler toplam emisyonun %30'undan (16 milyar ton CO_2 eşd.) sorumludur. Çitlik faaliyetleri ve üretimle ilgili süreçlerin payı ise %14'tür (12 milyar ton CO_2 eşd.). Tarım aynı zamanda arazi bozulmasını da tetikler ve bu bir taraftan emisyona neden olurken diğer taraftan toprakta karbon tutulumunu azaltmaktadır. Zira toprak en önemli karbon yutaklarından biridir. Arazi bozulması aynı zamanda milyarlarca insanın gıda üretim imkanlarını kısıtlamaktadır.

Son yıllarda küresel ısınmanın etkilerini hafifletmeye yardımcı olmak için, tarla bitkileri üretiminde sistemlerinde toplam ve net SGE'yi azaltmaya yönelik ilgi ve çabalar aratmaktadır (Xing ve Wang, 2024). Yüksek emisyon değerlerine rağmen tarım iklim değişiğini yavaşlatmada en önemli ve etkili sektörlerden biri olabilir. Tarla bitkileri üretim sistemlerinin hem karbon bağlama hem de emisyon oluşturma potansiyeli oldukça yüksektir. Bu nedenle olumsuz çevresel etkilerinin belirlenmesi ve bu etkilerin azaltılmasına yönelik yöntem ve sistemlerin değerlendirilmesi faydalı olacaktır. Bu kapsamda yapılacak eylem ve değerlendirmeler iklim değişikliği ile mücadele alanında oldu kadar sürdürülebilir tarım için de elzemdir. Zira tarımsal üretim, özellikle bitkisel üretim hava ve iklimle ilişkilidir ve iklimsel istikrara bağlıdır. İklimde olası bir istikrarsızlık, örneğin yağış rejiminde ve miktarındaki değişim öncelikle tarımı etkileyecektir Tarım, su ihtiyacı çok yüksek olan bir sektördür ve dünyada toplam kullanılabilir suyun % 72 gibi yüksek bir oranını kullanmaktadır (Anonim, 2023). Bu yüzden daha az suyla daha fazla üretime olanak sağlayacak girişimlere, yatırımlara ve iklimsel sorunlara adaptasyonu yüksek tarım sitemlerinin desteklenmesine ihtiyaç vardır.

2. TARLA BİTKİLERİ ÜRETİM SİSTEMLERİ

Tarla bitkileri belirli ekolojik koşullarda gıda ve yem üretimi ve farklı endüstrilerin veya sektörlerin ihtiyaçlarını karşılamak amacıyla tarla ortamında kültürü yapılan bitkilerdir. Tarla bitkileri üretim sistemleri ise yetiştirilecek ürünü ve bu ürününün yetiştiriciliğinde uygulanan toprak işleme, ekim nöbeti, ekim, gübreleme, sulama, yabancı ot mücadelesi, hasat ve harman gibi direk veya dolaylı konuları içerir. Tarla bitkileri temelde tahıllar, yemeklik baklagiller, endüstri bitkileri ve yem bitkileri olarak dört ana grupta toplanan çok geniş bir ürün grubuna sahiptir. Tarla bitkileri tüm dünyada ekim alanı ve üretim bakımından bitkisel üretimin en büyük kolunu teşkil eder. Türkiye'de tarla bitkileri 16.8 milyon ekim alanı ve 75.5 milyon ton üretim miktarına sahiptir. Türkiye'de toplam tarım arazisi 38.62 milyon ha kadardır ve bu alanın % 43.5'i, her yıl işlenmen alanların ise %70'i tarla bitkilerinden oluşmaktadır (Anonim, 2024a). Bu ölçek aynı zamanda tarla bitkileri üretim süreçlerinde oluşan SGE potansiyeline de işaret etmektedir. Üstelik tarla bitkileri sebze meyve ve mera alanlarıyla kıyaslandığında toprak işlemenin çok daha yoğun yapıldığı ve ilaçlama, hasat ve harman gibi süreçlerde çok daha fazla enerjiye ihtilaç duyulan bir alandır.

Teknoloji ve mekanizasyon alanında ki gelişmelerin sonucunda tarla bitkileri üretiminde her geçen yıl insan gücüne bağımlık azalmakta makina kullanımı artmaktadır. Yine son yıllarda ilim değişikliğinin de etkisiyle hastalık ve zararlılarla mücadele kapsamında yürütülen faaliyetlerde ve sulama işlemlerinde artışlar yaşanmaktadır. Tüm bu süreçler daha verimli bir üretim için gerekli görülse de daha fazla SGE ve kimyasal kirliliğe neden olabilir. Dolayısıyla tarla bitkileri üretim sistemlerinin çevresel boyutunun incelenmesi ve kontrol edilmesi doğal kaynaklar üzerindeki potansiyel olumsuz etkilerinin azaltılması için gereklidir.

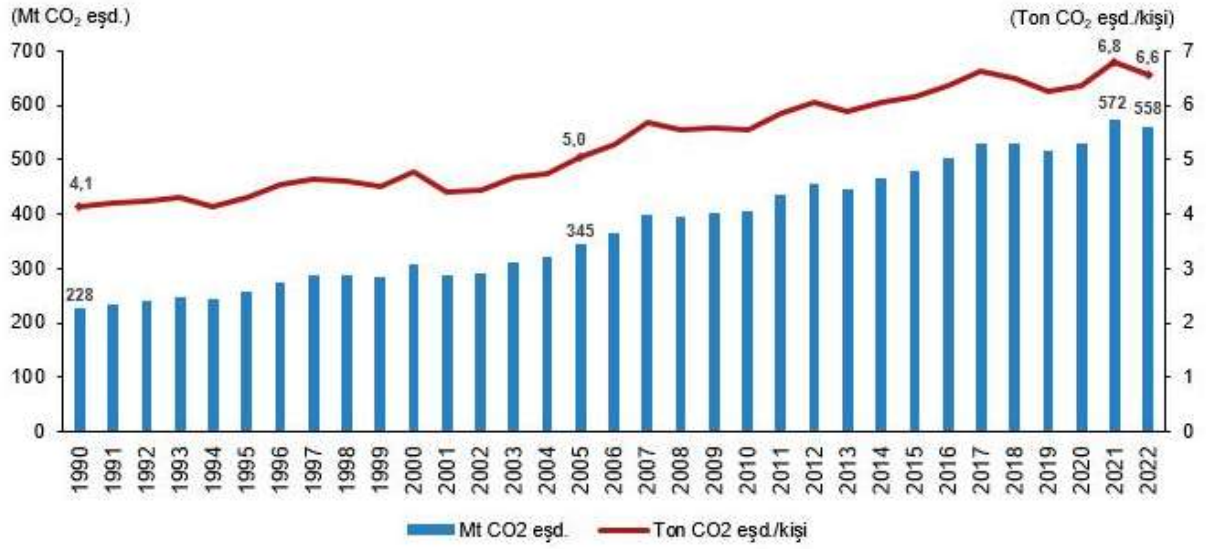
3. TARLA BİTKİLERİ ÜRETİM SİSTEMLERİNİN SERA GAZI EMİSYONLARI

2022 yılı sera gazı envanteri sonuçlarına göre, Türkiye'de toplam SGE 558.3 milyon ton (Mt) CO_2 eşd., kişi başı SGE ise 6.6 ton CO_2 eşd. olarak hesaplanmıştır (Şekil 1). Toplam SGE içinde en büyük payı %71.8 (700.6 Mt CO_2 eşd.) ile enerji kaynaklı emisyonlar alırken bunu sırasıyla %12.8 (71.5 Mt CO_2 eşd.) ile tarım, %12.5 (69.9 Mt CO_2 eşd.) ile endüstriyel işlemler ve ürün kullanımı ve %2.9 (16.3 Mt CO_2 eşd.) ile atık sektörü takip etmektedir (Şekil 2). Tarım sektörü kaynaklı emisyonlar 2022 yılında, 1990 yılına göre %37.9 artış göstermiştir. (Anonim, 2024b).

Küresel ısınmanın sonuçlarının giderek belirgin hale gelmesi ve tarımın SGE'de ki önemli katkısı, sürdürülebilir tarımsal üretim ve kalkınma için endişeye neden olmaktadır. Tarla bitkileri üretimi üretim ve hasat sonrası süreçlerde neden olduğu SGE ile çok yönlü ve büyük ölçekli etkilere sahiptir. Tarımsal faaliyetler en önemli sera gazları olan CO_2 , CH_4 ve N_2O ve bunun yanında su buharı ve kloroflorokarbonların (CFCs) salınımında etkilidir (Snyder ve ark., 2009). Bu gazların birikmesi, Dünya'nın yüzey sıcaklığında artışa ve böylece küresel ısınmaya yol açar. Karbondioksit en önemli sera gazıdır ve büyük oranda fosil yakıtların yanması ve ormansızlaşmadan kaynaklanır (Nunes, 2023). CH_4 ve N_2O ile kıyaslandığında, CO_2 büyük oranda tarımsal süreçlerde tekrar döngüye girer. Bitkiler fotosentez yoluyla büyük miktarda CO_2 bağlarlar ve tarım toprakları içerdikleri organik materyal ve canlılarla önemli bir karbon yutağıdır. Ancak kullanım ve çürüme nedeniyle bağlanan miktar tekrar salınır. Bu döngü sebebiyle bitkisel üretimde net CO_2 salınımı düşüktür. Net salınımının sebebi ise genellikle

işleme ve nakliye süreçlerinde kullanılan enerjidir (Kayıkçıoğlu ve Okur, 2012). IPCC'ye göre, metan başlıca hayvancılık ve pirinç tarlası emisyonlarından kaynaklanır ve üstelik küresel ısınma potansiyeli açısından karbondioksitten 28 kat daha güçlüdür (Thakur ve Solanaki, 2022). N_2O emisyonu başlıca gübre ve endüstriyel atıklardan kaynaklanır ve benzer şekilde karbondioksitten daha güçlü bir sera etkisine sahiptir. Sentetik kimyasallardan kaynaklanan CFCs, ise en güçlü sera gazları arasında kabul edilmektedir (Walling ve Vaneeckhaute, 2020; Xing ve Wang, 2024).

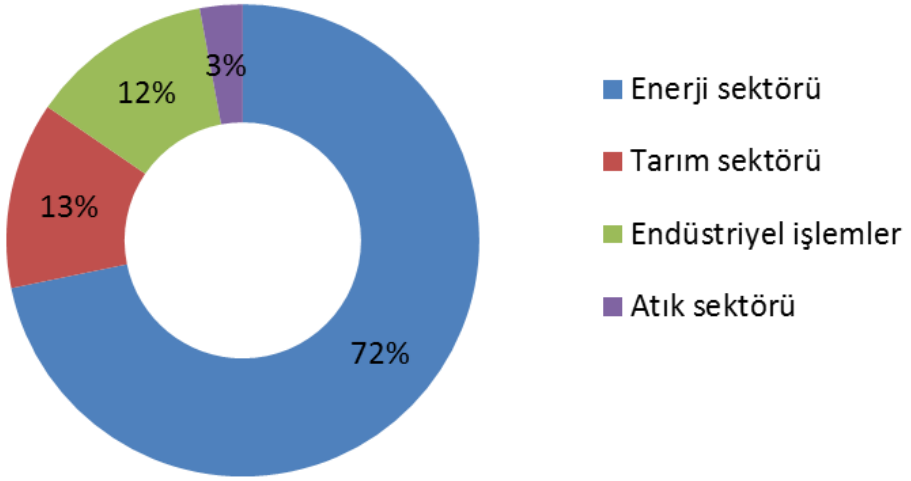
Tarla bitkileri üretim sistemlerinde oluşan sera gazlarının incelenmesi, tarımsal faaliyetlere bağlı SGE'yi azaltmak için stratejiler belirlemek açısından kritik öneme sahiptir. Ekim sistemlerinin SGE'si yetiştirilen ürün türlerine, gübre ve pestisit kullanımı, toprak ve su kaynaklarıyla ilgili yönetim uygulamaları dahil olmak üzere çeşitli faktörlere bağlı olarak değişir (Xing ve Wang, 2024). Bu kapsamda farklı üretim süreçlerinin, meydana gelen emisyon ve genel çevresel etki bakımından karşılaştırılarak incelemesi önemlidir. Geleneksel üretimde, verimi en üst düzeye çıkarmak için sentetik gübrelerin, pestisitlerin kullanılması ve mono kültür yetiştiriciliğin hakim olması toprakta fiziksel ve kimyasal bozulmaya zemin oluştururken (Altıeri ve ark., 2017), organik sistemlerde uygulanan ekim nöbeti, karışık ekim, ve örtü bitkisi gibi uygulamalar toprak verimliliğini artırmak, hastalık ve zararlıları baskılamak ve erozyonu azaltmak gibi sürdürülebilirlik için önemli katkılar sağlar (Durham ve Mizik 2021).



Şekil 1. Türkiye'nin toplam ve kişi başı sera gazı emisyonu, 1990-2022 (Anonim, 2024b).

Tarla bitkileri üretim sistemlerinde oluşan SGE'de topraktaki mikrobiyal aktivitelerin ve bitkilerin metabolik süreçlerinin rolü büyüktür. Sera gazları hem bitki büyümesi hem de ayrışma sırasında üretilir. Toprak mikroorganizmaları organik maddeleri ayrıştırarak metan ve azot oksit üretirken, karbondioksit redoks reaksiyonları yoluyla salınır (Zheng ve ark., 2024). Toprakta bulunan bakteriler ve mantarlar mikrobiyal aktiviteyi önemli ölçüde etkiler. Bakteriler

öncelikle organik maddeyi ayrıştırarak CO_2 açığa çıkartırken, mantarlar daha dirençli organik maddeleri ayrıştırarak metan salınımına neden olurlar (Ren ve ark., 2020). Ayrıca tarımda gübreleme emisyonlara önemli ölçüde katkıda bulunur, çünkü kimyasal gübrelerin aşırı kullanımı, ekosistem hasarına ve N_2O emisyonlarını teşvik eden yüksek azot kalıntısına yol açabilir (Bai ve ark., 2023). Bu nedenle, tarla bitkisi sistemlerinde SGE'nin azaltılması için, bitki yetiştirmede ki tüm süreçlerin gözden geçirilmesi ve tarla yönetimi uygulamalarının optimizasyonu acil bir ihtiyaçtır. Bunun yanında, tarla bitkisi sistemlerinin sürdürülebilir gelişimi için küresel ısınmayla mücadelede daha etkili çözümler sağlayacak sistematik bilimsel araştırma ve teknolojik yeniliklerin devamlılığı da kritik önemdedir (Xing ve Wang, 2024).



Şekil 2. Türkiye'de 2022 yılında sektörlerin toplam SGE'de ki payları (Anonim, 2024b).

Tarla bitkisi sistemlerinde, ürünler arasında SGE bakımından belirgin farklılıklar vardır. Tahıl ürünleri tarımsal üretimde önemli bir rol oynar ve SGE üzerinde önemli bir etkiye sahiptir (Shah ve ark., 2024). Örneğin pirinç ve buğdayın emisyon değerleri göz önüne alındığında, ürün seçiminin SGE'yi azaltmada önemli bir rol oynadığı açıktır. Nitekim pirinç ve buğdayın SGE'si farklılıklar gösterir. Genellikle nemli ortamlarda yetiştirilen pirinç, yüksek sulama ve gübreleme ihtiyacıyla toprakta daha fazla CH_4 üretimine neden olur. Bu nedenle pirinç tarlaların SGE spektrumunda CH_4 emisyonunu açısından önemli bir kaynaktır Buna karşılık, çoğunlukla kurak alanlarda yetiştirilen buğdayın, pirince oranla CH_4 salınımına katkısı çok düşüktür. Ancak buğday büyüme döngüsü sırasında daha yüksek N_2O emisyonları üretebilir (Ghimire ve ark., 2016; Maraseni ve ark., 2018).

4. TARLA TARIMI SİSTEMLERİNDE SERA GAZI EMİSYONLARININ AZALTILMASI

Tarım kaynaklı emisyonların büyük bir çoğunluğunun yanlış veya hatalı uygulamalardan kaynakladığı, bu itibarla büyük oranda azaltılmasının mümkün olduğu temel hareket noktası olmalıdır. Tarla tarımı sistemlerinde SGE'yi azaltmak için en önemli strateji, mevcut koşullarda en uygun üretim sistemlerini ve materyallerini kullanmak ve agronomik süreçleri iyi şekilde yönetmekten geçmemektedir. İkim değişikliği ile mücadele tüm bu alanlarda dinamik ve

kendini yenileyen mekanizmaları gerekli kılmaktadır. Bu kapsamda değişen koşullarda daha etkin ve verimli üretim için yeni çeşitlerin denemesi, ekim zamanlarının değiştirilmesi, mevcut üretim desenlerinde ve ekim nöbeti sistemlerinde değişikliğe gidilerek su tüketimi ve girdi ihtiyaçları daha düşük ürünlerin tercih edilmesi öncelikle başvurulabilecek yöntemlerdir. Bununla birlikte iklim değişikliği ile mücadele süreçlerinde tarla tarımı sistemlerinde kimyasal kullanımını azaltıcı organik uygulamaların sisteme dahil edilmesi, ıslahta yeni yaklaşımların benimsenmesi, toprak ve su korumaya yönelik tarımsal uygulamaların ve yetiştiricilik sistemlerinin uygulanması, verimli sulama sistemleri ve hassas tarım teknolojilerinin yaygınlaştırılması, sorunların ve çözümlerin olabildiğince lokal düzeyde ele alınması, yerel genotiplerin ve uygulamaların korunması ve sürecin genelini dikkate alan entegre çözümlerin benimsenmesi önemli bir potansiyele sahiptir. Tüm bu süreçte finansal desteklemeler, eğitim faaliyetleri, sosyal destekler, teknolojik gelişmeler ve bilimsel çalışmalar başarı için belirleyici rollere sahiptir.

Emisyon azaltma önlemlerinin genel etkisini değerlendirirken, farklı stratejilerin SGE'yi nasıl etkilediğini dikkate almak önemlidir. Ürünlerle ilgili bilinçli seçimler yaparak ve bilimsel gübreleme ve tasarruflu sulama uygulamaları ile, tahıl ürünlerinden kaynaklanan SGE etkili bir şekilde azaltılabilir ve böylece hem tarımsal üretkenliğe hem de çevre korumaya katkıda bulunulabilir. Bitkilerin büyümeleri sırasında yayılan sera gazı miktarı, ekim ve yönetim aşamaları boyunca farklı bitki türleri arasında değişir (Qian ve ark., 2023). Bu farklılık analiz edilerek, sahada her bitki SGE'yi etkili bir şekilde azaltmaya yönelik üretim senaryoları ve yönetim stratejileri, geliştirilebilir (Tian ve ark., 2023). Ayrıca bu alandaki tespit ve çalışmaklar hükümetlerin ve ilgili kurumların tarımsal emisyon azaltma çabalarını teşvik ederek bu konuda politikalar belirlemeleri için bilimsel kanıtlar da sağlayabilir. Bilimsel esaslara dayalı politikalar çiftçileri emisyon azaltma önlemlerini benimsemeye yönlendirilebilir. Nihayetinde tarla bitkisi sistemlerindeki SGE araştırılması, çevrenin korunmasına ve sürdürülebilir tarımsal uygulamaların geliştirilmesine destek olabilir.

Toplam SGE'nin azaltılması açısından tarla bitkisi üretim sistemlerinde, karbon bağlamanın ve yutaklarının geliştirilmesi önemlidir. Bu da genel anlamda üretim sürecinde enerji kullanımını veya fosil yakıtlara bağımlılığı azaltarak, toprağın organik madde içeriğini artırarak, mikrobiyal aktivitesini teşvik ederek, agregat stabilitesini iyileştirerek ve toprağı erozyona karşı daha dayanıklı hale getirerek ve elbette ürün verimini de artırarak elde edilebilir. Bunun yanında, tarım alanlarında azot döngüsünü teşvik edici uygulamalar, azotlu gübre kullanımının ve N_2O emisyonlarının azaltılması açısından önemlidir (Guenet ve ark., 2021). Azot kullanımı ve sistemleri optimize edilerek, organik ve biyolojik gübreler kullanarak, ve azot kullanımını iyileştirerek toprakta azot kaybı dolayısıyla da N_2O emisyonları düşürülebilir (Pan ve ark., 2022).

Bu kapsamda etkili olabilecek bir diğer yöntem de organik gübrelerin uygulanmasıdır. Yavaş salınımlı, uzun süreli etkileri ve toprak iyileştirme özellikleriyle organik gübreler, toprak verimliliğini artırır, toprak kalitesini iyileştirir, aşırı azot ve fosfor gübre kullanımını azaltır ve azot oksit ve metan emisyonlarını düşürür (Bryan ve ark., 2013). Organik gübrelerin kullanımı ayrıca toprak mikroorganizmalarının büyümesini ve aktivitesini teşvik ederek azot döngüsüne ve organik maddenin ayrışmasına yardımcı olur (Kangogo ve ark., 2021).

Gübreleme yönetimi, SGE'yi azaltırken aynı zamanda ürün verimini ve kalitesini artırdığı için tarla bitkisi sistemlerinin kritik bir yönüdür. Gübreleme yönetimini optimize etmede ilk dikkate alınması gereken husus, toprağın besin durumunun belirlenmesi olmalıdır. Toprak testi, toprağın besin içeriğini değerlendirmek ve uygun gübrelerin ve uygulama şekillerinin belirlenmesinde değerli bir araçtır. Bilimsel gübreleme uygulamalarını ürünle ve büyüme aşamalarının özel ihtiyaçlarıyla uyumlu hale getirerek, besin israfı ve N_2O emisyonu en aza indirilebilir. Organik gübreler, biyogübreler ve yeşil gübreleme yöntemlerinin kullanılması, kimyasal gübrelerin çevresel etkisini hafifletmeye, toprak verimliliğini iyileştirmeye ve SGE'yi daha da azaltmaya yardımcı olabilir. Ek olarak, gübrelemenin zamanlaması ve sıklığı gübreleme yönetimini optimize etmede çok önemlidir. Ürün büyüme gereksinimlerine ve mevsimsel özelliklere dayalı uygun zamanlamaya ve sıklığa uymak, gübre kullanım verimliliğini artırabilir ve emilmeyen besinlerin çevreye kaybını azaltabilir ve sonuçta gaz emisyonlarında bir azalmaya yol açabilir (Xing ve Wang, 2024).

Makul gübre uygulamaları ile birlikte, ekim nöbeti ve uygun ürünlerin ekimi CH_4 ve N_2O emisyonlarını etkili bir şekilde azaltabilir ve çevresel etkiyi hafifletebilir. Ekim nöbeti toprak dokusunu iyileştirmek, organik madde içeriğini artırmak, böylece gübre ihtiyacını ve azot salınımını azaltmak gibi faydalı sonuçlar içerir. Araştırmalar, ekim nöbetinin toprak organik madde içeriğini ve mikroorganizma aktivitesini önemli ölçüde artırdığını, toprak yapısını iyileştirdiğini, amonyağın gaz halde uçmasını engellediğini, SGE'yi azalttığını ve böylece tarım arazilerinde kirliliğinin azaltılmasına ve çevrenin korunmasına katkıda bulunduğunu göstermiştir (Ozor ve Nnaji, 2011; Fosu-Mensah ve ark., 2012).

Karışık ekim gibi uygulamalar da toplam karbon bağlama potansiyelini arttırır, toprak yapısını ve verimliliğini iyileştirir, toprak bozulmasını yavaşlatır, CH_4 ve N_2O emisyonlarını azaltır (Martin ve ark., 20214). Karışık ekim, aynı araziye aynı anda iki veya daha fazla ürün ekerek verimliliğini artırmayı hedefler ve bu aynı zamanda ve gübrelerin salınımını yavaşlatmaya yardımcı olur. Karışık ekim ayrıca zararlıların ve hastalıkları baskılayarak pestisitlere olan ihtiyacın azalmasına ve tarımsal faaliyetlerin daha düşük çevresel etkiye sahip olmasına yol açar. Bu itibarla hem münavebe hem de karışık ekim arazi kullanım verimliliğinin arttırılması, gübre kullanımının ve SGE'nin azaltılması açısından oldukça etkili olabilecek uygulamalardır.

Tarla tarımında en yüksek emisyon kaynaklarından biride toprak işleme aşmasıdır. Toprak işlemenin düzenlenmesi ve azaltılması enerji ihtiyacını düşürerek ve beraberinde toprak üzerindeki olumlu etkileri nedeniyle SGE'nin azaltılmasında önemli bir yere sahiptir. Azaltılmış veya sıfır toprak işleme gibi koruma amaçlı sistemler, enerji kullanımını, gübre ve pestisit kullanımını azaltır, toprak işleme sıklığını azaltır ve toprak ekosistemlerinin bütünlüğünü ve istikrarını korur. Hasat atıklarının geri dönüşümü, karışık ekim ve organik gübrelerin uygulanması, emisyonları etkili bir şekilde azaltabilir (Srivastava ve ark., 2026). Tarımsal atıkların geri dönüşümü toprağın organik madde içeriğini artırır, su ve besin tutma kapasitesini geliştirir ve kimyasal gübrelere olan ihtiyacı azaltır (Moniruzzaman, 2025) ve ayrıca toprak mikroorganizmalarının büyümesini teşvik ederek toprak ekosisteminin restorasyonuna ve sağlığına katkıda bulunur.

Tarla bitkileri üretiminde emisyon azaltıcı sitemlerin geliştirilmesi ve uygulanması aşamalarında maliyet-fayda analizinin yapılması önemlidir. Emisyon azaltıcı önlemlerin

rasyonalitesi ve uygulanabilirliği açısından ulaşılmak istenen hedefle azaltma için gerekli ekipman yatırımı, işletme, bakım ve enerji tüketim masraflarının kıyaslanması kritik önemdedir (Yang ve ark., 2020). Uygulanan önlemlerin faydaları azaltılan sera gazı miktarıyla ölçülür. Bu bağlamda, kimyasal gübrelerin yerine biyogübrelerin kullanılması belirli üretim ve nakliye maliyetlerini artırabilir, ancak toprak azot emisyonlarında uzun vadeli azalmalara yol açarak SGE'yi düşürür (Stephan ve Stephan, 2016).

Tarla bitkileri sisteminde emisyon azaltma önlemlerinin çevresel ve sosyal etkilerini değerlendirirken, çok çeşitli etkilerin dikkate alınması esastır. Tarla bitkileri sisteminde azaltma önlemlerinin uygulanması, hava kirletici emisyonlarında bir azalmaya da yol açabilir, böylece hava kalitesini iyileştirebilir ve hem insanlara hem de diğer organizmalara verilen zararı en aza indirebilir (Ruiz-García ve ark., 2021). Tarla bitkileri sisteminde emisyon azaltma önlemlerinin çevresel ve sosyal etkileri, yalnızca SGE ile ilişkili çevresel riskleri azaltmayı değil, aynı zamanda sosyo-ekonomik gelişmeyi ve sürdürülebilir kalkınmayı teşvik etmeyi de içerir. Sosyal etkiler, azaltma stratejilerinin değerlendirilmesinde eşit derecede önemlidir. SGE'yi düşürmek, toplum için genel çevre kalitesini iyileştirebilir, doğal afetlerin sosyal ilerleme üzerindeki potansiyel etkisini azaltabilir, yeşil bir ekonominin büyümesini teşvik edebilir, iş fırsatları yaratabilir ve sakinlerin yaşam kalitesini artırabilir. Dahası, azaltma önlemlerinin benimsenmesi sürdürülebilir tarım uygulamalarını destekleyebilir, tarımsal üretkenliği artırabilir, çiftçilerin gelirlerini artırabilir ve sürdürülebilir kırsal kalkınmaya katkıda bulunabilir. Bu nedenle, gelecekte tarımsal üretimde çevre ve toplum için de faydalar sağlayan yeşil, düşük karbonlu üretim modeli oluşturmak için araştırmalara, azaltma önlemlerinin güçlendirilmesi ve yaygınlaştırılmasına odaklanılmalıdır.

5. SONUÇ

Tarım ve özellikle tarla tarımı sistemleri direk iklim ve hava olaylarına bağlıdır. Bu nedenle iklim değişikliğinin olası etkilerinden ilk ve en fazla etkilenecek sektör hiç şüphesiz tarımdır. Ancak ilginç bir şekilde tarım, iklim değişikliğine neden olan uygulamalar ve sistemleri de içirmektedir. Diğer taraftan tarım önemli bir karbon yutak kaynağıdır. Bu itibarla tarım, iklim değişikliği konusunda hem sorunun hem de çözümün önemli bir parçasıdır. Tarla tarımını sistemleri gerek emisyon kaynağı, gerekse iklim değişikliği ile mücadele alanında çok kritik konumdadır. Zira ölçeği nedeni ile hem olumsuz hem de olumlu etkilerinin boyutu oldukça yüksektir. Tarımsal faaliyetler içerisinde tarla tarımı sistemleri geniş ekim alanı, yüksek miktarda gübre, ilaç ve enerjinin kullanımına sahiptir. Sonuç olarak tarla tarımı üretim sistemlerinde mevcut uygulamaların gözden geçilmesi çevre etki değerlerinin analiz edilmesi ve sara gazı emisyonlarını azaltıcı yeni yaklaşımların ve uygulamaların geliştirilmesi ikim değişikliği ile mücadele, sürdürülebilir tarımsal üretim ve gıda arz güvenliği açısından önemli faydalar sağlayacaktır.

ABSTRACT

This study was conducted in 2023 to determine the effects of different nitrogen doses on the yield and quality characteristics of sage (*Salvia officinalis* L.) under the ecological conditions of Eskişehir. The field experiment was carried out using a randomized complete block design with three replications, applying five different nitrogen doses (0, 5, 10, 15, and 20 kg N/da). Plant height, fresh herb yield, fresh leaf yield, dry leaf yield, essential oil content, and essential oil yield were examined in the study. The findings showed that increasing nitrogen doses significantly enhanced plant height, fresh herb yield, fresh leaf yield, and dry leaf yield. The highest plant height (38.50 cm) and fresh herb yield (736.62 kg/da) were obtained from the 20 kg/da nitrogen dose, while the highest fresh leaf yield (527.93 kg/da) and dry leaf yield (165.30 kg/da) were observed at the 15 kg/da nitrogen dose. The highest essential oil content (2.68%) was recorded at the 0 kg/da nitrogen dose. When the essential oil yield values were examined, the highest value (4.18 L/da) was determined at the 15 kg/da nitrogen dose. When the results obtained from the study were evaluated, it was seen that 15 kg N/da nitrogen application could be recommended to obtain the highest dry leaf and essential oil yield.

FARKLI AZOT DOZLARININ ESKİŞEHİR EKOLOJİK KOŞULLARINDA TIBBİ ADAÇAYI (*Salvia officinalis* L.)' BİTKİSİNİN VERİM VE KALİTE ÖZELLİKLERİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma, farklı azot dozlarının Eskişehir ekolojik koşullarında tıbbi adaçayı (*Salvia officinalis* L.) bitkisinin verim ve kalite özellikleri üzerine etkilerini belirlemek amacıyla 2023 yılında yürütülmüştür. Tarla denemesi 5 farklı azot dozu (0, 5, 10, 15 ve 20 kg N/da) kullanılarak tesadüf blokları deneme desenine göre üç tekerrürlü olarak yürütülmüştür. Denemede bitki boyu, yaş herba verimi, yaş yaprak verimi, kuru yaprak verimi, uçucu yağ oranı ve uçucu yağ verimi incelenmiştir. Elde edilen bulgulara göre, azot dozlarının artışıyla birlikte bitki boyu, taze herba verimi, taze yaprak verimi ve kuru yaprak verimi önemli ölçüde artmıştır. En yüksek bitki boyu (38.50 cm) ve taze herba verimi (736.62 kg/da) 20 kg/da azot dozundan elde edilirken, en yüksek taze yaprak verimi (527.93 kg/da) ve kuru yaprak verimi (165.30 kg/da) 15 kg/da azot dozunda gözlemlenmiştir. En yüksek uçucu yağ oranı (%2.68) 0 kg/da azot dozunda belirlenmiştir. Uçucu yağ verimi değerleri incelendiğinde ise en yüksek değer (4.18 L/da) 15 kg/da azot dozunda tespit edilmiştir. Çalışmadan elde edilen sonuçlar değerlendirildiğinde en yüksek kuru yaprak ve uçucu yağ verimi elde etmek için 15 kg N/da azot uygulamasının önerilebileceği görülmüştür.

Anahtar Kelimeler: *Salvia officinalis*, gübre, azot, uçucu yağ, verim

1. GİRİŞ

Tüm dünyada giderek artan beslenme ve sağlıklı yaşam ilişkisi konusundaki farkındalığa paralel olarak tıbbi aromatik bitkilere olan talep de artış göstermiş ve göstermeye de devam etmektedir. Artan taleple birlikte tüm dünyada tıbbi aromatik bitkilerin ticaret hacminde de artış gözlenmektedir. Adaçayı yaprağı ve uçucu yağı ülkemizin önemli dış satım ürünlerinden biridir. Ülkemizde iç ve dış ticarete konu olan adaçaylarından *Salvia tomentosa* Mill. ve *Salvia fruticosa* Mill. doğal floramızda bulunmakta olup, çoğunlukla doğal floradan toplanarak ticarete sunulurken, doğal floramızda bulunmayan *Salvia officinalis* türü tarla koşullarında üretilerek ticarete sunulmaktadır (Bayraktar ve ark., 2017; Elmas, 2021).

Tıbbi adaçayının (*Salvia officinalis*) mensup olduğu Lamiaceae familyası yaklaşık 245 cins ve 7886 türe sahiptir. Lamiaceae familyasına ait türler soğuk kutup bölgeleri hariç dünyanın hemen hemen her tarafında yayılış göstermektedir. Lamiaceae familyasının (Scutellaria 360 tür, Stachys 300 tür, Plectranthus 300 tür, Hyptis 280 tür, Thymus 220 tür ve Nepeta 200 tür) en büyük cinsi olan *Salvia*, 900'ün üzerindeki tür ve 11 alt türe sahip olduğu tespit edilmiştir (Wu et all, 2020; Abdelhalima and Hanrahan, 2021). Tıbbi adaçayı (*Salvia officinalis*) türü, *Salvia officinalis* spp. *lavandulifolia* Gams, *Salvia officinalis* spp. *minor* Gams ve *Salvia officinalis* spp. *major* Gams olmak üzere üç alt türe sahiptir (Ceylan, 1996). *Salvia officinalis* L. bitkisi uzun yıllardır değişik hastalıkların tedavisinde ve enfeksiyonların önlenmesinde kendisinden faydalanılan çok yıllık bir tıbbi aromatik bitkidir. Ayrıca bitki gıda, kozmetik ve farmasötik endüstrisinde de değişik şekillerde kullanılmaktadır. *Salvia officinalis* bitkisinin yapraklarından ekstrakte edilen uçucu yağ, güçlü ve çok yönlü kullanımı olan doğal bir sekonder metabolittir (Bonesi et al., 2017, Jakovljević ve ark., 2019; Özçoban ve Gedikoğlu, 2024). Yapılan birçok çalışma uçucu yağ oranlarının ve kompozisyonunun üretimin bölgenin iklim ve toprak koşullarının yanı sıra agro-teknik uygulamalara ve kullanılan ekstraksiyon teknolojisine bağlı olarak değiştiğini göstermiştir (Gedikoğlu ve ark., 2019; Özçoban ve Gedikoğlu, 2024). *Salvia officinalis* bitkisinde uçucu yağ oranı %1.0-2.5 arasında değişmekte ve uçucu yağın ana bileşenleri dikkate alındığında tıbbi adaçayı bitkilerinin çoğunluğu thujone grubunda yer almaktadır (Başer, 2002; Topçu, 2006; Başyiğit ve Baydar, 2017; Katar ve ark., 2018; Elmas, 2021).

Son yıllarda artan adaçayı iç ve dış talebi dikkate alındığında, talep edilen miktar ve kalitede sürekli ürün temin edebilmek için adaçayının yetiştiriciliğinin yapılması büyük önem taşımaktadır. Bu nedenle adaçayı yetiştiriciliğinde verim ve kalite üzerinde etkili olan iklim ve toprak istekleri ile birlikte en uygun üretim tekniklerinin belirlenmesini konu edinen çalışmalar oldukça büyük önem taşımaktadır. Ürünün verim ve kalitesi üzerinde etkili olan en önemli agro-teknik uygulamalardan biri de azotlu gübre uygulamasıdır (Madandoust and Mahmood Fooladchang, 2018). Azotlu gübrelerin miktarı ve uygulama yöntemleri verim ve kalite üzerinde etkili olduğu gibi ekolojik sistem üzerindeki etkisi ile birlikte ürünün maliyeti üzerinde de oldukça önemli bir etkiye sahiptir (Elmas, 2021).

Bu çalışmanın amacı Eskişehir ekolojik koşullarında farklı azot dozlarının tıbbi adaçayı (*Salvia officinalis*) bitkisinin verim ve kalitesi üzerindeki etkisini belirlemektir.

2. MATERYAL VE METOD

Araştırmada bitki materyali olarak Atatürk Bahçe Kültürleri Merkez Araştırma Enstitüsü Müdürlüğü'nden temin edilen tohumlardan Eskişehir Orman Fidanlık Müdürlüğünün seralarında üretilen Tıbbi adaçayı bitkisinin fideleri kullanılmıştır.

Çalışmanın yürütüldüğü Eskişehir İlinin uzun yıllar ve 2023 yılına ait aylar itibariyle yağış ve sıcaklık değerleri Çizelge 1'de verilmiştir. Çizelge 1 incelendiğinde denemenin yürütüldüğü 2023 yılında uzun yılların 22.7 mm üzerinde bir yağış aldığı görülmektedir.

Uzun yıllara ait yıllık ortalama sıcaklıkları ile çalışmanın yürütüldüğü 2023 yılına ait ortalama sıcaklıklar ise hemen hemen birbirine yakın olup, uzun yılların ortalama sıcaklığı 10.9 °C iken, 2023 yılında ise 11.1 °C olarak tespit edilmiştir. Aynı şekilde aylık ortalama sıcaklıklar bakımından da uzun yıllara ait değerler ile 2023 yılına ait değerlerin birbirlerine yakın olduğu Çizelge 1'de görülmektedir.

Çizelge 1. Eskişehir İlinin Deneme Yılına ve Uzun Yıllara Ait İklim Verileri*

* * Eskişehir Meteoroloji Genel Müdürlüğü Verileri

Denemenin yürütüldüğü tarlaya ait toprağın özelliklerini belirlemek amacıyla alınan örnekler Orman Toprak ve Ekoloji Araştırma Enstitüsü Müdürlüğü Toprak Analiz Laboratuvarı'nda analiz edilmiş olup, toprak özelliklerini gösteren değerler çizelge 2'de verilmiştir. Çizelge 2'de görüldüğü gibi deneme tarlasının toprak pH'sı 7.6 olup, hafif alkali bir toprak özelliği göstermektedir. % 1.7 organik madde içeren toprağımız organik madde bakımından fakir bir topraktır. Yararlanılabilir potasyum ve fosfor düzeyleri sırasıyla 240 kg/da ve 4 kg/da'dır. Kireç oranı ise % 8.46 olarak belirlenmiştir. Toprağın tuz içeriği ise % 0.34 olarak belirlenmiştir.

Çizelge 2. Deneme yeri toprağının bazı kimyasal ve fiziksel özellikler

Strüktürü	Kireç (%)	Tuz (%)	Yararlanılabilir fosfor (P_2O_5) (kg da^{-1})	Yararlanılabilir Potasyum (K_2O) (kg da^{-1})	pH	Organik Madde (%)
Tınlı*	8.46	0.34	4.0	240	7.6	1.7

***Analiz Orman, Toprak ve Ekoloji Araştırma Enstitüsü Müdürlüğü laboratuvarında yapılmıştır.*

25.02.2023 tarihinde Eskişehir Orman Fidanlık Müdürlüğü'nün seralarında viyollere (1/3 oranında kum + 2/3 oranında torf içeren) ekilen tıbbi adaçayı tohumlarından elde edilen fideler kullanılarak 18.04.2023 tarihinde deneme plantasyonu Eskişehir Orman Fidanlık Müdürlüğü'nün tarlasında kurulmuştur. Viyollerde yaklaşık 7 hafta süreyle gelişen ve şaşırtılacak olgunluğa ulaşan fideler 18.04.2023 tarihinde bitki sıklığı 50 × 20 cm olacak şekilde dikimleri yapılmıştır (Koç, 2000; Koç, 2006; Başyiğit ve Baydar, 2017; Tuğlu ve Baydar, 2019; Elmas 2021). Deneme tesadüf blokları deneme desenine göre 3 tekerrürlü olarak kurulmuş ve her tekerrürde 5 parsel (0 kg N/da, 5 kg N/da, 10 kg N/da, 15 kg N/da ve 20 kg N/da) bulunmaktadır (Koç, 2000; Koç, 2006). Azotlu gübreler 3 porsiyona bölünerek ilk porsiyon 18 Nisan 2023 uygulanırken, ikinci porsiyon 15 Haziran 2023 tarihinde ve üçüncü porsiyon ise 01 Ağustos 2023 tarihinde uygulanmıştır. Her parsel 4 sıra bitki içermekte olup, 2 m × 4 m= 8 m^2 alana sahiptir. Bitki plantasyonlarında özellikle ilkbaharda sorun oluşturan yabancı otlar çapayla temizlenmiştir. Plantasyona suya ihtiyaç durumu dikkate alınarak 15-20 gün aralıklarla damlama sulama sistemiyle su verilmiştir (Elmas, 2021). Plantasyona başka herhangi bir gübre uygulaması yapılmamıştır. Bu çalışmada kullanılan materyaller plantasyonun 1. yılından elde edilmiş bitki materyalleridir. Bitkiler 27.09.2023 tarihinde toprak yüzeyinden 5-10 cm yükseklikten biçilerek hasat edilmiştir. Hasat edilen taze bitkiler tartılarak taze herba verimleri (kg/da) belirlenmiştir. Hasat edilen taze bitkilerin yaprakları saplarından ayrılarak taze yaprak verimleri tespit edilmiştir. Taze yapraklar 35-38 °C'de 48 saat süreyle etüvde kurutularak kuru yaprak verimleri belirlenmiştir. Kurutulmuş yapraklardan alınan örneklerin uçucu yağ oranları su distilasyonu yöntemiyle tespit edilmiştir. Uçucu yağların distilasyonu için kurutulmuş 100 g yaprak örnekleri 2000 ml'lik balonlara yerleştirildikten sonra 1000 ml saf su eklenerek 3 saat boyunca distilasyon işlemi gerçekleştirilmiştir. Distilasyon işlemi tamamlandıktan sonra clevenger aparatının dereceli kısmından yağ miktarı okunarak % olarak belirlenmiştir (Kılıç, 2008).

Denemeden elde edilen bitki boyu (cm), taze herba verimi (kg/da), taze yaprak verimi (kg/da), kuru yaprak verimi (kg/da), uçucu yağ oranı (%) ve uçucu yağ verimine (l/da) ait veriler TARIST paket programı kullanılarak, tesadüf blokları deneme desenine göre varyans analizine tabi tutularak incelenen özelliklerin önemlilik düzeyleri tespit edilmiştir. Önemli çıkan uygulamalar arasındaki farklılıklar hesaplanan LSD değerine göre gruplandırılmıştır (Kayaalp ve Keser, 2017).

3. BULGULAR

Eskişehir ekolojik koşullarında farklı azot dozlarının tıbbi adaçayında bitki boyu (cm), taze herba verimi (kg/da), taze yaprak verimi (kg/da) üzerine etkilerine ait bulgu Çizelge 3'te ve drog yaprak verimi (kg/da), uçucu yağ oranı (%) ve uçucu yağ verimi (l/da) değerlerine ait bulgular ise Çizelge 4'de verilmiştir.

3.1. BİTKİ BOYU (cm)

Denemede uygulanan farklı azot dozları bitki boyu üzerinde istatistiki anlamda (%1) önemli bir farklılık oluşturmuştur. Bitki boyu değerleri 29.66-38.50 cm arasında değişmiştir. En yüksek bitki boyu 38.50 cm ile 20 kg N/da uygulamasından elde edilirken, en düşük bitki boyu ise 29.66 cm ile kontrol parselinde elde edilmiştir. Azot dozlarının ortalaması olarak ise 35.28 cm bitki boyu tespit edilmiştir (Çizelge 3).

Çizelge 3: Değişen azot dozlarının tıbbi adaçayı (*Salvia officinalis* L.) bitkisinin bitki boyu (cm), taze herba verimi (kg/da) ve taze yaprak verimi (kg/da) üzerine etkisi

N Dozları (kg/da)	Bitki boyu (cm)	Taze herba verimi (kg/da)	Taze yaprak verimi (kg/da)
0 kg	29.66^{d}	404.70^{c}	295.64^{c}
5 kg	34.58^{c}	449.04^{c}	325.51^{c}
10 kg	36.50^{b}	589.45^{b}	428.62^{b}
15 kg	37.16^{ab}	722.60^{a}	527.93^{a}
20 kg	38.50^{a}	736.62^{a}	527.66^{a}
Ortalama	35.28	580.48	421.08
F değeri	35.19**	76.88**	36.29**
V.K.	2.37	4.26	6.15

3.2. TAZE HERBA VERİMİ (kg/da)

Çalışmada kullanılan farklı azot dozları taze herba verimi üzerinde istatistiki anlamda (%1) önemli bir farklılığa neden olmuştur. Taze herba verimi değerleri 404.70-736.62 kg/da arasında değişmiştir. En yüksek taze herba verimi 736.62 kg/da ile 15 kg N/da dozuyla aynı grupta yer

alan 20 kg N/da uygulamasından elde edilirken, en düşük taze herba verimi ise 404.70 kg/da olarak kontrol parselinde belirlenmiştir. Azot dozlarının ortalaması olarak ise 580.48 kg/da taze herba verimi elde edilmiştir (Çizelge 3).

3.3. TAZE YAPRAK VERİMİ (kg/da)

Çalışmada kullanılan farklı azot dozları taze yaprak verimi üzerinde istatistiki anlamda (%1) önemlilik düzeyinde farklılık göstermiştir. Taze yaprak verimi değerleri 295.64 - 527.93 kg/da arasında değişmiştir. En yüksek taze yaprak verimi 527.93 kg/da ile 20 kg N/da dozuyla aynı grupta yer alan 15 kg N/da uygulamasından elde edilirken, en düşük taze yaprak verimi ise 295.64 kg/da olarak kontrol parselinden elde edilmiştir. Farklı azot dozlarının ortalaması olarak ise 421.08 kg/da taze yaprak verimi bulunmuştur (Çizelge 3).

3.4. KURU YAPRAK VERİMİ (kg/da)

Çalışmada kullanılan farklı azot dozları kuru yaprak verimi üzerinde istatistiki anlamda (%1) önemlilik düzeyinde farklılık göstermiştir. Kuru yaprak verimi değerleri 103.12-165.30 kg/da arasında değişmiştir. En yüksek kuru yaprak verimi 165.30 kg/da ile 20 kg N/da dozuyla aynı grupta yer alan 15 kg N/da uygulamasından elde edilirken, en düşük kuru yaprak verimi ise 103.12 kg/da olarak kontrol parselinden elde edilmiştir. Farklı azot dozlarının ortalaması olarak ise 135.91 kg/da kuru yaprak verimi tespit edilmiştir (Çizelge 4).

Çizelge 4: Değişen azot dozlarının tıbbi adaçayı (*Salvia officinalis* L.) bitkisinin kuru yaprak verimi (kg/da), uçucu yağ oranı ve uçucu yağ verim üzerine etkisi

N Dozları (kg/da)	Kuru yaprak verimi (kg /da)	Uçucu yağ oranı (%)	Uçucu yağ verimi (L/da)
0 kg	103.12^{c}	2.68^{A}	2.76^{B}
5 kg	110.96^{c}	2.36^{B}	2.62^{B}
10 kg	141.11^{b}	2.53^{A}	3.57^{A}
15 kg	165.30^{a}	2.52^{A}	4.18^{A}
20 kg	159.03^{a}	2.33^{B}	3,71^{A}
Ortalama	135.91	2.48	3.37
F değeri	36.36**	1.36*	8.05*
V.K.	4.90	6.90	9.93

**: %1 düzeyinde anlamlı ve *: %5 düzeyinde anlamlı V.K.: Varyans Katsayısı

3.5. UÇUCU YAĞ ORANI (%)

Çalışmada kullanılan farklı azot dozları uçucu yağ oranı üzerinde istatistiki anlamda (%5) önemli bir farklılık göstermiştir. Uçucu yağ oranı değerleri 2.33-2.68 % arasında değişmiştir. En yüksek uçucu yağ oranı 2.68 % kontrol dozundan elde edilirken en düşük uçucu yağ oranı ise 2.33 % ile 5 kg N/da dozuyla aynı grupta yer alan 20 kg N/da uygulamasından elde

edilmiştir. Azot dozlarının ortalama uçucu yağ oranı ise 2.48 % olarak belirlenmiştir (Çizelge 4).

3.6. UÇUCU YAĞ VERİMİ (L/da)

Çalışmada kullanılan farklı azot dozları uçucu yağ verimi üzerinde istatistiki anlamda (%5) önemli bir farklılık göstermiştir. Uçucu yağ verimi değerleri 2.62-4.18 L/da arasında değişmiştir. En yüksek uçucu yağ verimi 4.18 L/da ile 10 ve 20 kg N/da ile aynı grupta yer alan15 kg N/da dozundan elde edilirken en düşük uçucu yağ verimi ise 2.62 L/da ile kontrol dozuyla aynı grupta yer alan 5 kg N/da uygulamasından elde edilmiştir. Azot dozlarının ortalama uçucu yağ verimi ise 3.37 L/da olarak belirlenmiştir (Çizelge 4).

4. TARTIŞMALAR

Bilindiği gibi azot, su ile birlikte bitkisel üretimde yokluğu en fazla çekilen besin elementi olarak karşımıza çıkmaktadır. Bu nedenle azot, bitkisel üretimde bitkilerin büyüme ve gelişimini kontrol eden en önemli besin elementi olarak bilinmektedir (Gardiner ve Miller, 2008; Fageria, 2009; Bolat ve Kara, 2017). Azotun tıbbi aromatik bitkilerde verim ve kalite üzerine etkisini belirlemek amacıyla yapılan çalışmaların birçoğunda uçucu yağ oranları hariç diğer parametrelerin üzerinde özellikle yetersiz organik madde içeriğine sahip topraklarda artan azot dozları belirli bir düzeye kadar artışlara neden olduğu bildirilmiştir (Nurzynska-Wierdak, 2013; Özyiğit ve ark., 2016; Can, 2020; Can ve Katar, 2020). Benzer şekilde bu çalışmadan elde edilen bitki boyu (cm), taze herba verimi (kg/da), taze yaprak verimi (kg/da), drog yaprak verimi (kg/da) ve uçucu yağ verimi (l/da) değerlerinde de azalan azot miktarına paralel olarak bir azalış tespit edilmiştir. Azot, bitkilerin uygun şekilde büyüyüp gelişebilmesi için gerekli olan yeni hücre oluşumunun temel yapıtaşları olan proteinler, amino asitler, nükleik asitler, enzimler, klorofil, ATP, ADP gibi organik bileşiklerin önemli bir bileşenidir. Bu nedenle azot yetersizliğinde büyüme ve gelişme için mutlak gerekli olan proteinler, amino asitler, nükleik asitler, enzimler, klorofil, ATP, ADP gibi birçok organik bileşik yeterince üretilememekte ve dolayısıyla da bitkiler yeterince hücre üretememektedir. Azalan azot dozlarına paralel olarak azalan bitki boyu (cm), taze herba verimi (kg/da), taze yaprak verimi (kg/da), drog yaprak verimi (kg/da) ve uçucu yağ verimi (l/da) değerleri azot yetersizliği nedeniyle sap uzamasında meydana gelen azalışla, bitkilerin sahip olduğu düşük yaprak sayısı ve düşük yaprak alanı değerleriyle ve sürgün büyümesinde/uzamasında meydana gelen azalışla açıklanabilir (Hughes et al., 1989; Sarmadnia, 1993; Saeedfar et al., 2015). Dolayısıyla uygun bir büyüme ve gelişme gösteremeyen bitkilerden de hedeflenen yüksek verimin elde edilmesi mümkün olmamaktadır (Güzel ve ark., 2004; Gardiner and Miller, 2008; McCauley et al., 2009; Bolat ve Kara, 2017).

Diğer taraftan bitkilerin büyüme ve gelişme döneminde karşılaştıkları biyotik ve abiyotik stres koşulları bitkilerde Süperoksit Dismutaz, Katalaz, Glutatyon Peroksidaz gibi antioksidan enzimlerini, uçucu yağ oranlarını ve Absisik Asit içeriğini önemli ölçüde artırdığı yapılan birçok çalışmayla ortaya konmuştur. Çalışmadan elde edilen, azalan azot miktarlarına bağlı olarak artan uçucu yağ oranları ise azot eksikliğinin bitki üzerinde oluşturduğu stres durumunun uçucu yağ üretimini teşvik etmiş olmasıyla açıklamak mümkündür (Aliabadi Farahani et al., 2009a; Aliabadi Farahani et al., 2009b; Saeedfar et al., 2015).

5. Sonuç

Çalışmadan elde edilen veriler birlikte değerlendirildiği zaman Eskişehir ekolojik koşullarında tıbbi adaçayı üretmek için en yüksek drog yaprak 15 kg/da azot dozu ile gübreleme önerilirken, en yüksek uçucu yağ verimi elde edebilmek için ise 10 kg/da azot dozu ile gübreleme önerilmektedir. Çalışmanın tek yıllık olması yani plantasyonun ilk yılından elde edilen veriler dikkate alındığında bu konuda başka çalışmaların da yapılmasına da ihtiyaç duyulmaktadır.

ABSTRACT

This study was conducted in 2023 under the ecological conditions of Eskişehir. The experiment was established in a randomized block design with three replications. Five different nitrogen doses (0, 5, 10, 15, and 20 kg/da) were tested. The aim of this study was to determine the effects of different nitrogen doses applied to rosemary (*Rosmarinus officinalis* L.) on plant height (cm), fresh herb yield (kg/da), dry herb yield (kg/da), dry leaf yield (kg/da), essential oil ratio (%), and essential oil yield (L/da). According to the results, as nitrogen doses increased, a significant increase was observed in plant height, fresh herb yield, and dry herb yield. The highest plant height (67,75 cm), fresh herb yield (1682.19 kg/da), dry herb yield (655.00 kg/da), and dry leaf yield (435.92 kg/da) were obtained at a nitrogen dose of 20 kg/da. The essential oil ratio varied among nitrogen doses, with the highest essential oil ratio (0.81%) obtained at 0 kg/da nitrogen dose. Essential oil yield, calculated based on dry herb yield, was determined as 5.37 L/da at the nitrogen dose of 20 kg/da. In conclusion, while the application of 20 kg/da nitrogen resulted in the highest increase in biomass production for rosemary cultivation under Eskişehir ecological conditions, a decrease in essential oil content was observed.

Keywords: *Rosmarinus officinalis*, nitrogen, yield

FARKLI AZOT DOZLARININ ESKİŞEHİR EKOLOJİK ŞARTLARINDA BİBERİYE (*Rosmarinus officinalis* L.) BİTKİSİNİN VERİM VE KALİTE PARAMETRELERİ ÜZERİNE ETKİSİ

ÖZET

Bu araştırma Eskişehir ekolojik koşullarında 2023 yılında yürütülmüştür. Deneme tesadüf blokları deneme desenine göre üç tekerrürlü olarak kurulmuştur. Denemede 5 farklı azot dozu (0, 5, 10, 15 ve 20 kg/da) çalışılmıştır. Bu çalışmanın amacı biberiye (*Rosmarinus officinalis* L.) bitkisine uygulanan farklı azot dozlarının bitki boyu (cm), yeşil herba verimi (kg/da), kuru herba verimi (kg/da), kuru yaprak verimi (kg/da), uçucu yağ oranı (%) ve uçucu yağ verimi (L/da) üzerine etkisini belirlemektir. Araştırmaya göre, azot dozlarının artışıyla birlikte bitki boyu, yeşil herba verimi ve kuru herba veriminde belirgin bir artış gözlemlenmiştir. En yüksek bitki boyu (67,75 cm), yaş herba verimi (1682,19 kg/da), kuru herba verimi (655,00 kg/da) ve kuru yaprak verimi (435,92 kg/da) 20 kg/da azot dozunda elde edilmiştir. Uçucu yağ oranı azot dozları arasında değişiklik gösterirken, en yüksek uçucu yağ oranı (%0,81) 0 kg/da azot dozunda elde edilmiştir. Uçucu yağ verimi kuru herba verimi üzerinden 20 kg/da azot dozunda 5.37 L/da olarak belirlenmiştir. Sonuç olarak, Eskişehir ekolojik şartlarında biberiye tarımı için 20 kg/da azot uygulaması, biyokütle üretiminde en fazla artış sağlarken, uçucu yağ oranında azalma gözlemlenmiştir.

Anahtar kelime: *Rosmarinus officinalis*, azot, verim

1. GİRİŞ

Lamiaceae familyasına ait olan biberiye (*Rosmarinus officinalis*) bitkisi çok yıllık önemli bir tıbbi aromatik bitkidir. Rosmarinus cinsinin dünyanın farklı bölgelerinde yayılış gösteren *R. officinalis, R. eriocalyx, R. laxiflorus* ve *R. lavandulaceus* türleri bulunmaktadır. Bu türlerden kültürü yapılan en önemli biberiye türü olan *Rosmarinus officinalis*'in *erectus, humilis* ve *albiflorus* varyeteleri bulunmaktadır (Angioni et al., 2004; Sönmez, 2008; Yıldırım, 2018). Rosmarinus ismi, bitkiye deniz kenarlarında çok yaygın bulunmasından ve deniz iklimini çok sevmesinden dolayı verilmiş olabileceği dair kayıtlar bulunmaktadır (Baydar, 2005). Biberiye bitkisi Türkçe'de kuşdili, hasalbal, hasalban, akpüren, akpürün ve zeytin çiçeği gibi farklı isimlerle bilinmektedir (Baytop, 1999; Begumet al., 2013; Başkaya ve ark., 2016). Biberiye bitkisi İspanya başta olmak üzere Akdeniz'in sahil bölgelerinde yer alan ülkelerin doğal florasında yayılış göstermektedir (Elhaak et al., 2015; Katar et al., 2019). Bitki, ülkemizde Akdeniz ve Ege sahil kuşağında doğal yayılış göstermekte olup, Çanakkale, Mersin, Hatay ve Adana illerimizde yoğun bir şekilde doğal florada yer almaktadır (Katar et al., 2019). Türkiye'de bitki sahil kuşağından başlayarak 1000 m'ye kadar farklı rakımlarda doğal florada yayılış göstermektedir (Baydar, 2005). Bitkinin yetiştiriciliği Fransa, İspanya, Portekiz, Yunanistan, ABD, bazı Afrika ülkeleri ve Meksika gibi ülkelerde yapılmaktadır. Türkiye'de odun dışı orman ürünleri kategorisinde değerlendirilen bitki çoğunlukla Adana ve Mersin bölgesinde doğal vejetasyondan toplanarak iç ve dış pazarlara arz edilmektedir (Baydar, 2005; Kırıcı, 2015; Başkaya ve ark., 2016).

Biberiye bitkisinin drog olarak değerlendirilen kısımları yaprakları ve çiçekleridir. Çoğunlukla taze veya kurutulmuş haldeki çiçekli dalları ürün olarak piyasaya arz edilmektedir. Biberiye bitkisi tanen (%8), acı madde ve uçucu yağ (%0,1-2,5) içermektedir (Baytop, 1999). Biberiye bitkisinin en önemli sekonder metaboliti yaprak ve çiçeklerde yoğunlaşan uçucu yağıdır. Biberiye bitkisinin renksiz veya açık sarı renkli uçucu yağ oranı %0,1-2,5 arasında değişmektedir (Çetin,1996; Kırpık, 1998; Baytop, 1999; Kırıcı ve Inan, 2002; Gülbaba et al., 2002; De Mastro et al. 2004; Başkaya et al., 2016; Katar et al., 2019). Yapılan çalışmalar biberiye bitkisinin uçucu yağ oranı ve bileşenlerinde önemli düzeyde farklılıkların olduğu tespit edilmiştir. Bu farklılıklar, bitkinin genotipi/kemotipi, çevre ve agronomik koşullar, hasat zamanı, depolama süresi, bitkinin yaşı, hasat edilen organ ve hasat döneminde bitkinin bulunduğu gelişim dönemi gibi birçok faktörün etkisiyle oluştuğu tespit edilmiştir (Usai ve ark., 2011; Singh and Guleria, 2012; Başkaya ve ark. 2016). Biberiye bitkisinin kuru yapraklarında yapılan bir analizde; %5,7 nem, %4,5 protein, %17,7 yağ, %19 ham lif, %47,4 karbonhidrat, %6,0 kül, %1,5 kalsiyum, %0,7 fosfor, %0,03 demir, %0,004 sodyum, %1 potasyum, 175 IU/100 g vitamin A, 0,51 mg/100 g vitamin B, 61,3 mg/100 g vitamin C ve 440 kalori/100 g enerji içerdiği tespit edilmiştir (Farooqi et al., 2005; Sasikumar, 2012).

Tıbbi aromatik bitkilerin tarımında hedeflenen verim ve kalitede ürünün elde edilebilmesi için yüksek genotipik potansiyele sahip üretim materyalinin seçilmesi, yetiştirilecek bitki türü için uygun iklim ve toprak koşullarında üretimin yapılması ve yine üretim materyalinin sahip olduğu verim ve kalite potansiyelini ortaya çıkaracak agroteknik uygulamalar büyük öneme sahiptir (Singh and Guleria, 2012; Başkaya ve ark. 2016). Bilindiği gibi ürünün verim ve kalitesi üzerinde etkili olan en önemli yetiştiricilik uygulamalarından birisi gübrelemedir. Bitkilerin uygun bir şekilde büyüyüp gelişebilmeleri için en az 17 bitki besin maddesine ya da

elementine ihtiyaç bulunmaktadır (White, 2006; Gardiner ve Miller, 2008; Fageria, 2009; Bolat ve Kara, 2017). Bitkinin ihtiyacı olan makro ve mikro besin elementlerinin uygun miktarlarda topraktan ya da yapraktan bitkiye sağlanmasına gübreleme denmektedir. Karbon, hidrojen, oksijen, azot, potasyum kalsiyum, fosfor, magnezyum ve kükürt makro besin elementi grubu içerisinde değerlendirilmektedir (Bolat ve Kara, 2017). En önemli makro bitki besin elementi olan azot başta amino asit ve proteinlerin yapısında yer alarak bitki büyüme ve gelişiminde önemli bir fonksiyona sahiptir (Robertson and Groffman, 2007; Fowler et al., 2013; Martínez-Dalmau et al., 2021). Tarımsal üretimin üzerinde en önemli abiyotik stres koşullarından olan azot, su ile birlikte kıtlığı en fazla çekilen bitki besin elementi olarak karşımıza çıkmaktadır. Bu nedenle azot yetersizliği daha çok bitki büyümesini kontrol eden besin elementi olarak bilinmektedir. Bilindiği gibi azot toprağın ana kayasında ve ana kayadan gelen anorganik ana materyalde bulunmamaktadır ve azotun doğadaki kaynağı atmosferdir. Atmosfer ile birlikte bir miktar azot doğada hidrosfer ve canlılarda yer almaktadır. Toprakta var olan azotun ana kaynağı organik maddelerdir. Topraktaki organik maddelerin süreç içerisinde ayrışması ile ortaya çıkan azottan bitkiler faydalanabilmektedir (Çepel, 1996; Kantarcı, 2000; Boşgelmez ve ark., 2001; Gardiner ve Miller, 2008; Fageria, 2009; Bolat ve Kara, 2017). Bitkisel üretimde bitkilerin ihtiyacı olan azotun toprakta organik maddelerin ayrışmasıyla oluşan azotla karşılanamayan kısmının toprağa gübreleme yoluyla verilmesi hedeflenen verim ve kaliteye ulaşılmasında büyük bir öneme sahiptir (Gardiner ve Miller, 2008; Fageria, 2009; Bolat ve Kara, 2017).

Bu çalışmanın amacı Eskişehir ekolojik koşullarında değişen azot dozları uygulamasının biberiye (*Rosmarinus officinalis* L.) bitkisinin verim ve kalitesi üzerine etkisini belirlemektir.

2. Materyal ve Metot

Araştırmada bitki materyali olarak Atatürk Bahçe Kültürleri Merkez Araştırma Enstitüsü Müdürlüğü'nden ve piyasadan temin edilen biberiye fideleri Eskişehir Orman Fidanlık Müdürlüğünün tarlasında 3 yıl yetiştirilerek kış soğuklarına tolerans göstererek doğal seleksiyon sonucunda kalan 5 bitkiden alınan çelikler Eskişehir Orman Fidanlık Müdürlüğünün seralarında köklendirilerek kullanılmıştır.

Çalışmanın yürütüldüğü Eskişehir ilinin uzun yıllar ve 2023 yılına ait aylar itibariyle yağış ve sıcaklık değerleri Çizelge 1'de verilmiştir. Çizelge 1 incelendiğinde denemenin yürütüldüğü 2023 yılında uzun yılların 22.7 mm üzerinde bir yağış alındığı görülmektedir.

Uzun yıllara ait yıllık ortalama sıcaklıkları ile çalışmanın yürütüldüğü 2023 yılına ait ortalama sıcaklıklar ise hemen hemen birbirine yakın olup, uzun yılların ortalama sıcaklığı 10.9 °C iken, 2023 yılında ise 11.1 °C olarak tespit edilmiştir. Aynı şekilde aylık ortalama sıcaklıklar bakımından da uzun yıllara ait değerler ile 2023 yılına ait değerlerin birbirlerine yakın olduğu Çizelge 1'de görülmektedir.

Denemenin yürütüldüğü tarlaya ait toprağın özelliklerini belirlemek amacıyla alınan örnekler Orman Toprak ve Ekoloji Araştırma Enstitüsü Müdürlüğü Toprak Analiz Laboratuvarı'nda analiz edilmiş olup, toprak özelliklerini gösteren değerler Çizelge 2'de verilmiştir. Deneme tarlasının toprak pH'sı 7.8, hafif alkali bir toprak özelliği göstermektedir. Organik madde %1.9, yararlanılabilir potasyum ve fosfor düzeyleri sırasıyla 240 kg/da ve 14 kg/da'dır. Kireç oranı ise % 7.3 olarak belirlenmiştir. Toprağın tuz içeriği ise %0.25 olarak belirlenmiştir.

Çizelge 2. Deneme yeri toprağının bazı kimyasal ve fiziksel özellikler

Strüktürü	Kireç (%)	Tuz (%)	Yararlanılabilir fosfor (P_2O_5) (kg da^{-1})	Yararlanılabilir Potasyum (K_2O) (kg da^{-1})	pH	Organik Madde (%)
Tınlı*	7.3	0.25	14.0	240	7.8	1.9

***Analiz Orman, Toprak ve Ekoloji Araştırma Enstitüsü Müdürlüğü laboratuvarında yapılmıştır.*

Deneme plantasyonunu oluşturmak için 04.04.2020 tarihinde alınan çelikler Eskişehir Orman Fidanlık Müdürlüğü'nün seralarında köklendirildikten sonra viyollere (1/3 oranında kum + 2/3 oranında torf içeren) alınan fideler yaklaşık 1 yıl boyunca fidanlıkta büyütülmüş ve 15.04.2021 tarihinde Eskişehir Orman Fidanlık Müdürlüğü'nün deneme tarlasında fideler parsellere 100 x 40 cm sıklıkta dikilmiştir. Deneme tesadüf blokları deneme desenine göre 4 tekerrürlü olarak kurulmuş ve her tekerrürde 5 parsel (0 kg N/da, 5 kg N/da, 10 kg N/da, 15 kg N/da ve 20 kg N/da) bulunmaktadır. Azotlu gübrelerin ilk uygulaması 08 Nisan 2023 tarihinde, ikinci uygulaması 18 Haziran 2023 tarihinde ve üçüncü uygulaması ise 03 Ağustos 2023 tarihinde yapılmıştır. Her parsel, 4 sıra bitki olacak şekilde 4.0 × 4.0 m= 16 m^2 alana sahiptir. Bitkiler, gelişme döneminde yabancı otlardan çapayla temizlenmiştir. Bitkilerin ihtiyaç durumu dikkate alınarak 15-20 gün aralıklarla damlama sulama sistemiyle su verilmiştir. Bitkilere azotun dışında herhangi bir gübre uygulaması yapılmamıştır. Bu çalışmada kullanılan materyaller plantasyonun 3. yılından elde edilmiş bitki materyalleridir. Bitkiler 30.09.2023 tarihinde toprak yüzeyinden 30-35 cm yükseklikten biçilerek hasat edilmiştir. Hasat edilen taze bitkiler tartılarak taze herba verimleri (kg/da) belirlenmiştir. Taze herba örnekleri 35-38 °C'de 48 saat süreyle etüvde kurutularak kuru herba ve kuru yaprak verimleri belirlenmiştir. Kuru herbadan alınan örneklerin uçucu yağ oranları su distilasyonu yöntemiyle tespit edilmiştir. Uçucu yağların distilasyonu için kurutulmuş 100 g yaprak örnekleri 2000 ml'lik balonlara yerleştirildikten sonra 1000 ml saf su eklenerek 3 saat boyunca distilasyon işlemi gerçekleştirilmiştir. Distilasyon işlemi tamamlandıktan sonra clevenger aparatının dereceli kısmından yağ miktarı okunarak % olarak belirlenmiştir (Kılıç, 2008).

Denemeden elde edilen bitki boyu (cm), taze herba verimi (kg/da), kuru herba verimi (kg/da), kuru yaprak verimi (kg/da), uçucu yağ oranı (%) ve uçucu yağ verimine (l/da) ait veriler TARIST paket programı kullanılarak, tesadüf blokları deneme desenine göre varyans analizine tabi tutularak incelenen özelliklerin önemlilik düzeyleri tespit edilmiştir. Önemli çıkan uygulamalar arasındaki farklılıklar hesaplanan LSD değerine göre gruplandırılmıştır (Kayaalp ve Keser, 2017).

3. BULGULAR

Eskişehir ekolojik koşullarında farklı azot dozlarının biberiye bitkisinde bitki boyu (cm), taze herba verimi (kg/da), kuru herba verimi (kg/da) üzerine etkilerine ait bulgu Çizelge 3'te ve kuru yaprak verimi (kg/da), uçucu yağ oranı (%) ve uçucu yağ verimi (l/da) değerlerine ait bulgular ise Çizelge 4'de verilmiştir.

3.1. BİTKİ BOYU (cm)

Çalışmada kullanılan farklı azot dozları bitki boyu üzerinde istatistiki anlamda (%1) önemli bir farklılık oluşturmuştur. Bitki boyu değerleri 55.75-67.75 cm arasında değişmiştir. En yüksek bitki boyu 67.75 cm ile 20 kg /da azot uygulamasından elde edilirken, en düşük bitki boyu ise 55.75 cm ile kontrol parselinden elde edilmiştir. Azot dozlarının ortalaması olarak bitki boyu 61.20 cm olarak belirlenmiştir.

3.2. TAZE HERBA VERİMİ (kg/da)

Araştırmada kullanılan farklı azot dozları biberiye bitkisinin taze herba verimi üzerinde %1 önemlilik düzeyinde farklılığa neden olduğu belirlenmiştir. Taze herba verimi değerleri 1370.80-1682.19 kg/da arasında değişmiştir. En yüksek taze herba verimi 1682.19 kg/da ile 15 kg N/da dozuyla aynı grupta yer alan 20 kg N/da uygulamasından elde edilirken, en düşük taze herba verimi ise 1370.80 kg/da olarak kontrol parselinden elde edilmiştir. Uygulamaların ortalaması olarak ise 1560.38 kg/da taze herba verimi belirlenmiştir.

3.3. KURU HERBA VERİMİ (kg/da)

Denemede kullanılan farklı azot dozları kuru herba verimi üzerinde istatistiki anlamda (%1) önemlilik düzeyinde farklılık göstermiştir. Kuru herba verimi değerleri 455.36-655.00 kg/da arasında değişim göstermiştir. En yüksek kuru herba verimi 655.00 kg/da ile 20 kg/da azot dozu uygulamasından elde edilirken, en düşük kuru herba verimi ise 455.36 kg/da olarak kontrol parselinden elde edilmiştir. Farklı azot dozlarının ortalaması olarak ise 569.30 kg/da kuru herba verimi belirlenmiştir.

Çizelge 3: Değişen azot dozlarının Biberiye (*Rosmarinus officinalis* L.) bitkisinin bitki boyu (cm), taze herba verimi (kg/da) ve kuru herba verimi (kg/da) üzerine etkisi

N Dozları (kg/da)	Bitki boyu (cm)	Taze herba verimi (kg/da)	Kuru herba verimi (kg/da)
0 kg	55,75c	1370,80d	455,36c
5 kg	58,75d	1535,37c	571,85b
10 kg	61,00c	1576,96bc	581,01b
15 kg	62,75b	1636,57ab	583,26b
20 kg	67,75a	1682,19a	655,00a
Ortalama	61,2	1560,38	569,30
F değeri	103,27**	22,34**	8,43**
V.K.	11,13	12,57	6,74

3.4. KURU YAPRAK VERİMİ (kg/da)

Denemede kullanılan farklı azot dozları kuru yaprak verimi üzerinde istatistiki anlamda (%1) önemlilik düzeyinde farklılığa neden olmuştur. Kuru yaprak verimi değerleri 294.73-435.92 kg/da arasında farklılık göstermiştir. En yüksek kuru yaprak verimi 435,92 kg/da ile 20 kg/da azot uygulamasından elde edilirken, en düşük kuru yaprak verimi ise 294.73 kg/da olarak 10 ve 15 kg/da azot uygulamasıyla aynı grupta yer alan kontrol parselinden elde edilmiştir. Farklı azot dozlarının ortalaması olarak ise 338.97 kg/da kuru yaprak verimi elde edilmiştir.

3.5. UÇUCU YAĞ ORANI (%)

Çalışmada kullanılan farklı azot dozları uçucu yağ oranı üzerinde istatistiki anlamda (%1) önemli bir farklılık göstermiştir. Uçucu yağ oranı değerleri % 0.57-0.81 arasında değişmiştir. En yüksek uçucu yağ oranı % 0.81 kontrol dozundan elde edilirken en düşük uçucu yağ oranı ise % 0.57 ile 20 kg/da azot uygulamasından elde edilmiştir. Azot dozlarının ortalama uçucu yağ oranı değeri ise % 0.72 olarak belirlenmiştir.

3.6. UÇUCU YAĞ VERİMİ (L/da)

Denemede kullanılan farklı azot dozları uçucu yağ verimi üzerinde istatistiki anlamda (%1) önemli bir farklılık göstermiştir. Uçucu yağ verimi değerleri 3.75-5.37 L/da arasında değişmiştir. En yüksek uçucu yağ verimi 5.37 L/da ile 20 kg/da azot dozundan elde edilirken en düşük uçucu yağ verimi ise 3.75 L/da ile kontrol uygulamasından elde edilmiştir. Azot dozlarının ortalama uçucu yağ verimi ise 4.42 L/da olarak belirlenmiştir.

Çizelge 4: Değişen azot dozlarının Biberiye (*Rosmarinus officinalis* L.) bitkisinin kuru yaprak verimi (kg/da), uçucu yağ oranı ve uçucu yağ verim üzerine etkisi

N Dozları (kg/da)	Kuru yaprak verimi (kg /da)	Uçucu yağ oranı (%)	Uçucu yağ verimi (L/da)
0 kg	294,73c	0,81a	3,73c
5 kg	310,43bc	0,71b	4,69b
10 kg	318,39bc	0,75c	4,76b
15 kg	335,36b	0,73d	4,78b
20 kg	435,92a	0,57e	5,37a
Ortalama	338,97	0,72	4,42
F değeri	23,46**	163,74**	0,25**
V.K.	5,19	1,50	5,81

****: %1 düzeyinde anlamlı ve *: %5 düzeyinde anlamlı V.K.: Varyans Katsayısı**

4. TARTIŞMA

Azot, su ile birlikte bitkisel üretimde yokluğu en fazla çekilen besin elementi olarak karşımıza çıkmaktadır. Bu nedenle azot, bitkisel üretimde bitki büyümesini kontrol eden en önemli besin elementi olarak bilinmektedir (Gardiner ve Miller, 2008; Fageria, 2009; Bolat ve Kara, 2017). Azot uygulamasının aromatik bitkilerin verimleri üzerindeki etkisini belirlemek amacıyla yapılan çalışmalarda çoğunlukla uçucu yağ oranı hariç diğer parametrelerin (bitki boyu (cm), taze herba verimi (kg/da), drog herba verimi (kg/da), taze yaprak verimi (kg/da), drog yaprak verimi (kg/da) ve uçucu yağ verimi (l/da) gibi) hemen hemen tümünde özellikle yetersiz organik madde içeriğine sahip topraklarda artan azot dozları belirli bir düzeye kadar bu parametrelerde artışa neden olduğu tespit edilmiştir (Nurzynska-Wierdak, 2013; Özyiğit ve ark., 2016; Can, 2020; Can ve Katar, 2020). Bu çalışmadan elde edilen veriler de bu bulgulara paralellik arz etmektedir. Azalan azot miktarına paralel olarak azalan bitki boyu (cm), taze herba verimi (kg/da), drog herba verimi (kg/da), drog yaprak verimi (kg/da) ve uçucu yağ verimi (l/da), bitkilerin yeterince büyüyüp gelişebilmesi için mutlak gerekli olan proteinler, amino asitler, nükleik asitler, enzimler, klorofil, ATP, ADP gibi organik bileşiklerin önemli bir bileşeni olan azotun eksikliğinin yetersiz hücre oluşumuna ve buna bağlı olarak yetersiz sap uzamasına, daha düşük yaprak sayısına, yaprak alanına ve sürgün büyümesine/uzamasına neden olmasıyla açıklanabilir (Hughes et al., 1989; Sarmadnia, 1993; Saeedfar et al., 2015). Diğer bir ifade ile azot yetersizliğinde büyüme ve gelişme için mutlak gerekli olan yeni hücre oluşumunun temel yapıtaşları olan proteinler, amino asitler, nükleik asitler, enzimler, klorofil, ATP, ADP gibi birçok organik bileşiklerin yeterince üretilememiş olması ile açıklanabilir. Azot eksikliği nedeniyle yeterli miktarda yeni hücre üretme kabiliyeti olmayan bitkilerin yeterli miktarda ürün üretmesi de mümkün değildir (Güzel ve ark., 2004; Gardiner and Miller, 2008; McCauley et al., 2009; Bolat ve Kara, 2017).

Diğer taraftan bitkilerin büyüme ve gelişme döneminde karşılaştıkları biyotik ve abiyotik stres koşulları bitkilerde süperoksit dismutaz, katalaz, glutatyon peroksidaz gibi antioksidan enzimlerini, uçucu yağ oranlarını ve absisik asit içeriğini önemli ölçüde artırdığı yapılan birçok çalışmayla ortaya konmuştur. Bu çalışmadan elde edilen, azalan azot miktarlarına bağlı olarak artan uçucu yağ oranları ise azot eksikliğinin bitki üzerinde oluşturduğu stres durumunun uçucu yağ üretimini teşvik etmiş olmasıyla açıklamak mümkündür (Aliabadi Farahani et al., 2009a; Aliabadi Farahani et al., 2009b; Saeedfar et al., 2015).

5. SONUÇ

Çalışmadan elde edilen veriler ile birlikte değerlendirildiğinde Eskişehir ekolojik koşullarında biberiye üretiminde en yüksek kuru yaprak ve uçucu yağ verimi elde etmek için 20 k/da azot uygulamasının uygun olacağı tespit edilmiştir. Yürütülen çalışmanın tek yıllık olması ve kullanılan en yüksek azot dozundan en yüksek verimlerin alınmış olması bu konuda daha kesin önerilerde bulunulabilmesi için özellikle çok yıllık ve daha yüksek dozlar da kullanılarak denemelerin yürütülmesinde fayda bulunmaktadır.

ABSTRACT

In this study, the morphological and anatomical structures of some geophytes (*Crocus ancyrensis* (Herb.) Maw (Iridaceae), *Galanthus elwesii* Hook.f. (Amaryllidaceae) and *Muscari neglectum* Guss. ex Ten. (Asparagaceae)), which are ornamental plants with medical and economic importance and are distributed in the Kırşehir region, were examined; the obtained findings were compared with the literature data. Plant materials were collected from localities in the Kırşehir region during the flowering period in March–April 2024. Morphological data were obtained from fresh samples by measurement and observation, and anatomical data were obtained by examining stem and leaf preparations stored in 70% alcohol under a microscope. The source called "Flora of Turkey" was used for the diagnoses.

In the species *C. ancyrensis* (Iridaceae), corms are in two structures placed on top of each other, the lower one is a hollow old corm and the upper one is a newly formed corm. Corms are 14.82–18.4 × 10.35–13.62 mm in size. Tunics are reticulate, leaves are 2–5, linear and 0.5–1 mm wide. Flowers are bright yellow, blunt-tipped and 1.5–3 × 0.9–1.3 cm in size. Style is three-part and anthers are 8–13 mm long. In *G. elwesii* (Amaryllidaceae), the bulb is globose-ovate and 15.02–20.62 × 9.09–13.58 mm in size. Leaves are linear or narrowly lanceolate, rolled inwards. Scape is 44.49–55.36 mm long. Anthers are 4.08–5.23 mm, filaments are 0.85–2.21 mm long. The capsule is ovoid-spherical in shape, 11-16 × 10-14 mm in size. In the species *M.neglectum* (Asparagaceae), the bulb is ovate in size 22.34-32.44 × 13.61-19.51 mm. The number of leaves is 5-7 and it is in a linear-ribbon-lanceolate form. The inflorescence is in the form of a cluster 27.97-45.11 × 13.74-16.13 mm, dark blue in color and with white lobes at the ends. The capsule is 7-9 × 8-10 mm in size, circular-ovoid.

According to the cross-section of the species *C. ancyrensis* (Iridaceae), the stem is slightly wavy, the epidermis consists of circular cells and is covered with cuticle. The cortex is narrow and the vascular bundles are spread over the stem. The pith region is fragmented. The leaf has a horn-like cross-section. The midrib is distinct and the vascular bundles are located in the center and arms. The mesophyll is bifacial; there is a double-row palisade parenchyma and a spongy parenchyma underneath. Stomata are only a few on the upper surface. According to the cross-section of the species *G. elwesii* (Amaryllidaceae), the epidermis consists of circular cells

in the stem section and is covered with cuticle. The cortex is not distinct. The parenchyma cells are polygonal in shape and there are intercellular spaces between them. The leaf is spindle-shaped and the mesophyll is unifacial. The epidermis consists of square/circular cells and stomata are present on both surfaces. According to the cross-section of the species *M. neglectum* (Asparagacea), the stem is regularly circular in shape. There are parenchyma cells under the epidermis and a sclerenchyma ring afterwards. The vascular bundles are regularly arranged and the tracheids are distinct. The leaf cross-section is crescent-shaped. The mesophyll is unifacial, the parenchyma cells are circular and contain intermittent spaces. Stomata are present on both surfaces.

Keywords: Ornamental plants, medicinal plants, morphology, anatomy, *Crocus*, *Galanthus*, *Muscari*

KIRŞEHİR YÖRESİNDE YAYILIŞ GÖSTEREN SÜS BİTKİSİ NİTELİĞİNDEKİ BAZI GEOFİTLERİN MORFOLOJİK VE ANATOMİK ÖZELLİKLERİNİN İNCELENMESİ ÜZERİNE BİR ARAŞTIRMA

ÖZET

Bu araştırmada, Kırşehir yöresinde yayılış gösteren tıbbı ve ekonomik önemi olan, süs bitkisi niteliğindeki bazı geofitlerin (*Crocus ancyrensis* (Herb.) Maw (Iridaceae), *Galanthus elwesii* Hook.f. (Amaryllidaceae) ve *Muscari neglectum* Guss. ex Ten. (Asparagaceae)) morfolojik ve anatomik yapıları incelenmiş; elde edilen bulgular literatür verileriyle karşılaştırılmıştır. Bitkisel materyaller çiçeklenme dönemlerinde 2024 yılında Mart–Nisan aylarında Kırşehir yöresindeki lokalitelerden toplanmıştır. Morfolojik veriler taze örneklerden ölçüm ve gözlemle, anatomik veriler ise %70'lik alkolde saklanan gövde ve yaprak preparatlarının mikroskop altında incelenmesiyle elde edilmiştir. Teşhisler için "Flora of Turkey" adlı kaynaktan yararlanılmıştır.

C. ancyrensis (Iridaceae) türünde kormlar üst üste yerleşmiş iki yapıda olup, alttaki boşluklu eski korm ve üstteki yeni oluşmuş korm şeklindedir. Kormlar 14,82–18,4 × 10,35–13,62 mm boyutlarındadır. Tünikler ağsı yapıda olup, yapraklar 2–5 adet, şeritsi ve 0,5–1 mm genişliğindedir. Çiçekler parlak sarı renkte, küt uçlu ve 1,5–3 × 0,9–1,3 cm boyutlarındadır. Stilus üç parçalı anterler ise 8–13 mm uzunluğundadır. *G. elwesii* (Amaryllidaceae) türünde soğan küremsi-yumurtaması 15,02–20,62 × 9,09–13,58 mm boyutlarındadır. Yapraklar şerit ya da dar mızraksı, içe doğru dürülmüştür. Sıkapoz 44,49–55,36 mm uzunluğundadır. Anterler 4,08–5,23 mm, filamentler 0,85–2,21 mm uzunluğundadır. Kapsül ovoit–küremsi formda, 11–16 × 10–14 mm boyutlarındadır. *M.neglectum* (Asparagaceae) türünde soğan yumurtaması 22,34–32,44 × 13,61–19,51 mm boyutlarındadır. Yaprak sayısı 5–7 olup, şeritsi-şeritsi mızraksı formdadır. Çiçek kurulu salkım şeklinde 27,97–45,11 × 13,74–16,13 mm, koyu mavi renkte ve uçları beyaz lobludur. Kapsül 7–9 × 8–10 mm boyutlarında, dairesel–yumurtamsıdır.

C. ancyrensis (Iridaceae) türünün enine kesitine göre gövde hafif dalgalı, epidermis dairesel hücrelerden oluşur ve üzeri kutikula ile kaplıdır. Korteks dar olup iletim demetleri gövdeye yayılmıştır. Öz bölgesi parçalanmıştır. Yaprak boynuzsu enine kesite sahiptir. Orta damar belirgin olup iletim demetleri merkez ve kollarda yer alır. Mezofil bifasiyaldir; çift sıralı palizat parankiması ve altında sünger parankiması mevcuttur. Stomalar yalnızca üst yüzeyde az sayıda bulunur. *G. elwesii* (Amaryllidaceae) türünün enine kesitine göre gövde kesitinde epidermis dairesel hücrelerden oluşur ve kutikula ile kaplıdır. Korteks belirgin değildir. Parankima hücreleri poligonal şekilli ve aralarında hücre arası boşluklar vardır. Yaprak mekik şeklinde olup mezofil unifasiyaldir. Epidermis karesel/dairesel hücrelerden oluşur, her iki yüzeyde stomalar bulunur. *M. neglectum* (Asparagacea) türünün enine kesitine göre gövde düzgün dairesel şekildedir. Epidermisin altında parankima hücreleri ve devamında skleranкima halkası bulunur. İletim demetleri düzgün sıralanmıştır ve trakeidler belirgindir. Yaprak enine kesiti hilal şeklindedir. Mezofil unifasiyaldir, parankima hücreleri dairesel ve aralıklı boşluklar içerir. Stomalar her iki yüzeyde bulunur.

Anahtar Kelimeler: Süs bitkileri, tıbbi bitkiler, morfoloji, anatomi, *Crocus*, *Galanthus*, *Muscari*

1.GİRİŞ

Ülkemiz; yer aldığı coğrafik konum, çok kısa mesafelerde dahi değişebilen arazi topoğrafyası ve çok farklı ekolojik koşulları sayesinde biyoçeşitlilik yönünden dünyanın en önemli gen merkezlerinden birisi konumundadır. Bu zengin biyoçeşitlilik içerisinde önemli gruplardan birini de geofitler oluşturur. Geofit olarak adlandırılan ve yaşamlarının büyük bölümünü toprak altında geçiren bitki topluluğu, ülkemizin floristik çeşitliliğinde önemli bir yer tutmaktadır. Geofitlerin gövdeleri korm, yumru, rizom, soğan şeklinde metamorfoza uğramış ve toprak seviyesinin altında yer almaktadır. Geofitlerin önemli bir kısmı, doğanın canlandığı ilkbahar aylarında çiçek açarak bu mevsimin gelişini müjdelemektedirler (Avcu ve ark., 2016).

Kökeni Anadolu toprakları olan geofitler günümüzde Avrupa'daki birçok bahçede süs bitkisi olarak yetiştirilmektedir. Geofitler, yalnızca estetik amaçlarla süs bitkisi olarak değil, aynı zamanda ilaç ve gıda alanlarında da değerlendirilmektedir. Bu etkileyici zenginliğinin bir yansıması olarak, geofitler Türkiye florasının yaklaşık %15'ini oluşturmaktadır. Anadolu'da doğal olarak yetişen bu bitkilerin büyük bir kısmı; Liliaceae, Amaryllidaceae, Ranunculaceae, Iridaceae, Primulaceae, Araceae, Geraniaceae ve Orchidaceae familyalarına ait türler ile temsil edilmektedir (Başköse ve ark., 2013).

Kırşehir, İç Anadolu bozkır florası içerisinde önemli bir konuma sahip olup, Anadolu'da endemik bitki türlerinin doğal olarak yetiştiği değerli alanlardan biridir. Bu alanda yayılış gösteren bitki çeşitliliği ile ilgili çalışmalar hali hazırda devam etmekte olup, araştırmalar sonuçlandıkça flora ile ilgili bilgiler güncellenmektedir (Aktoklu ve Arslan, 2012).

Geofitlerin, özellikle bazı türlerinin, çok yüksek bir süs bitkisi potansiyeli vardır. Birçok geofit türü kültüre alınmış ve hatta ıslah çalışmaları ile günümüzde binlerce çeşit geliştirilmiştir. Kırşehir florasında doğal olarak yayılış gösteren ve bu çalışmanın da bitkisel materyalini oluşturan türlere ait ayrıntılı bilgi aşağıda türler bazında verilmiştir.

Iridaceae (süsengiller) familyasına ait *Crocus* L. Dünyada Orta ve Güney Avrupa, Kuzey Afrika ve Güneybatı Asya'dan Batı Çin'e kadar birçok bölgede yayılış göstermektedir. *Crocus* cinsi, Plants of the World Online'a göre Dünya genelinde güncel olarak 250 kabul edilmiş türe sahiptir. Türkiye *Crocus* türlerinin varlığı açısından oldukça zengindir. Türkiye çiğdemlerinin 156 tür ve 56 alt türü bulunmaktadır. Bu türlerin 55 tanesi ise endemiktir. Cins son yıllarda, fazla sayıda tanımlanan yeni türlerinin etkisiyle hızlı bir taksonomik genişleme göstermektedir, Bu sebeple de farklı çalışmalarda tür sayıları farklı olabilmektedir. Ülkemiz endemik türlerinden biri olan *Crocus ancyrensis* (Herb.) Maw Türkçe ismiyle Ankara Çiğdemi olarak bilinmekte olup Türkiye' de Batı ve Orta Karadeniz bölgesi, Orta ve Yukarı Kızılırmak Bölgesi, yukarı Fırat bölgesinde doğal olarak yayılış göstermektedir. Dünyada ise Almanya ve Büyük Britanya'ya taşınmıştır (Kravkaz ve ark., 2006; POWO, 2023; Bizim Bitkiler, 2013).

Çiğdemler otsu, çok yıllık, yaprak ve çiçekleri mevsimlik olan bitkilerdir. Çiğdemler genel olarak beyaz, sarı ve mavi olmak üzere değişik renk tonlarında çiçek açmaktadır. Türlerin bazıları ilkbahar aylarında çiçek açarken bazıları sonbahar aylarında çiçek açmaktadırlar.. Araştırmamızın materyalini oluşturan *Crocus ancyrensis* ise Şubat- Mart aylarında 1000- 1600 metre rakımlarda ormanlık, kayalık ve fundalıklarda sarı renkte çiçek açan ayrıca cormu besin olarak tüketilen bir türdür. *Crocus ancyrensis* türünü diğer türlerden ayıran özellikler

soğanlarının ağsı yapıda olması, periantların sarı olması ve üçlü stillerinin olmasıdır (Kravkaz ve ark., 2006).

Galanthus elwesii Hook.f., Amaryllidaceae (nergisgiller) familyasına ait *Galanthus* cinsinin bir üyesi olup, Kardelen adıyla bilinmektedir. *Galanthus* cinsi, Plants of the World Online veritabanına göre Dünyada 23 kabul edilmiş türe sahiptir (POWO, 2023). Bu cinsin 19 türü ve 6 alt türü bulunmakta, bunlardan 5 tanesi Türkiye endemiği olarak öne çıkmaktadır (Bizim Bitkiler, 2013). *Galanthus elwesii* Arnavutluk, Bulgaristan, Yunanistan, Türkiye, Ukrayna ve eski Yugoslavya topraklarında doğal olarak bulunurken; Avusturya, Almanya, Büyük Britanya, İrlanda ve bazı Amerika Birleşik Devletleri eyaletlerine taşınmış materyaller aracılığıyla yayılış göstermektedir. Türkiye'de ise bu tür; Çatalca, Ergene, Asıl Ege, İç Anadolu, Yukarı Sakarya, Orta Kızılırmak, Antalya ve Adana bölümlerinde doğal olarak yayılış göstermektedir (Baktır, 1996).

Galanthus elwesii çoğunlukla 800-1000 m ile 1600 m arasındaki dağlarda, subalpin meralarda bulunur. Tür ülkemizde süs bitkisi olarak ihraç edilen çiçek soğanları arasında ilk sıralarda yer almaktadır. Bunun sebebi baharın müjdecisi bu çiçeklerin dış pazarda fazlaca talep edilmesidir. Geofitlerde genel olarak tohumdan yeni soğanların oluşması için geçen süre oldukça uzundur. Örneğin kardelen bitkisinin tohumdan yeni yumru oluşturabilecek olgunluğa gelmesi için geçen süre yaklaşık olarak 4 ila 5 yıl arasındadır. Dolayısıyla bu bitkilerin çoğaltılmasında vejetatif yöntemler yani yavru soğanlar kullanılmaktadır. Kardelen gibi ticaret hacmi büyük olan geofitlerin sürekli sökülmesi nesillerini tehlike altına sokmaktadır. Nesli bilinçsizce toplamadan dolayı tehlike altına giren geofitlerin korunması için uluslararası anlaşmalar yapılmış ve bazı geofit türlerinin toplanması yasaklanmıştır (Baktır, 1996; Nasırcılar ve Karagüzel, 2006; Zeybekoğlu, 2024).

Asparagaceae (kuşkonmazgiller) familyasının *Muscari* cinsine ait olan *Muscari neglectum* Guss.Ex Ten. ülkemizde Arapüzümü olarak bilinmektedir. *Muscari* cinsi, Plants of the World Online (POWO) veri tabanına göre 84 kabul edilmiş türe sahiptir. Tür Dünya genelinde doğal olarak doğu Avrasyada yayılış göstermekte ve diğer birçok bölgeye de taşınarak kendine geniş bir yayılış alanı bulmaktadır (POWO, 2023). Türkiye'de 37 türü mevcut olup bu türlerden 26 tanesi endemiktir. Ülkemizde Istranca, Çatalca-Kocaeli,Güney Marmara, Batı ve Orta Karadeniz, Ege, İç Batı Anadolu, Yukarı Sakarya, Yukarı Kızılırmak ve Fırat, Adana, Antalya bölümünde yayılış göstermektedir (Bizim Bitkiler, 2013). Muscari türleri otsu formda, ilkbaharda çiçeklenen ve genel olarak çok yıllık soğanlı bitkilerdir. Deniz seviyesi ile 2300 m yükseklikler arasında; çam korulukları, makilikler, çalılıklar ve çayırlıklarda; taşlık kireç taşı yamaçlar ve nadiren kayalık kumluk alanlarda gözlenebilirler. Çiçekler toplu şekilde salkım şeklinde koyu mavi, uçlarına doğru beyazdır. Tepede biriken çiçekler daha açık renkli olabilmektedir. Muscari cinsine ait birçok bitki türü geleneksel halk tıbbında ve gıda amaçlı olarak kullanılmaktadır (İlçim ve ark., 2020).

Farklı ekolojilerde bitki türlerinin hem floral hem de vejetatif aksamlarında bazı farklılıklar meydana gelebilmektedir. Çalışma konusu türler daha önce tanımlanmış ve bilim dünyasına kazandırılmış bilindik türlerdir. Bu çalışma ise Kırşehir ekolojisinin mevcut türler üzerine herhangi bir etkisinin olup olmadığını belirlemek için yapılmıştır. Bu çalışmanın amacı Kırşehir'de doğal olarak yayılış gösteren *Crocus ancyrensis, Galanthus elwesii, Muscari*

neglectum türlerinin bazı morfolojik ve anatomik özelliklerini ortaya koyarak bölgenin florasına ilişkin literatüre katkı sağlamak ve yapılacak diğer çalışmalara kaynak oluşturmaktır.

2.GELİŞME

2.1.Materyal ve Yöntem

Araştırma Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesinde yürütülmüştür. Çalışma konusunu oluşturan bitkisel materyaller çiçeklenme dönemlerinde belirtilen lokalitelerden toplanmıştır (Tablo 1.). Toplanan örneklerin bir kısmı preslere alınarak, gölgeli ve hava akımı olan bir ortamda kurumaya bırakılmış ve her tür için herbaryum örneği hazırlanmıştır.

Tablo 1. İncelenen türlerin toplanıldığı lokaliteler

No	Tür	Lokalite	Toplanma Tarihi
1	*Crocus ancyrensis* (Herb.) Maw	Kırşehir, Kervansaray Dağı	29.03.2024
2	*Galanthus elwesii* Hook.f.	Kırşehir, Kervansaray Dağı	29.03.2024
3	*Muscari neglectum* Guss.Ex Ten.	Kırşehir, Mucur, Köme mevki	01.04.2024

Peak Visor veri tabanındaki verilere göre Kervansaray Dağı, Kırşehir merkezinin güneydoğusunda, 39°11′32″ K, 34°13′53″ D koordinatlarında ve deniz seviyesinden 1682 m yüksekliğiyle ilin belirgin yükseltilerinden biri olarak karşımıza çıkmaktadır. Kervansaray Dağları'nda 50 familyaya ait yaklaşık 250 türe ulaşmış ve bunların 27'si endemik olarak tanımlanmıştır (ÇŞİDB, 2023). Mucur, Köme ise Mucur ilçesi sınırları içinde, ilçe merkezine yaklaşık 21 km uzaklıkta, 935 m rakımlı platolarda konumlanmıştır (Kırşehir İl Kültür ve Turizm Müdürlüğü,2025).

2.1.1.Bitki Örneklerinin Toplanması

Türlere ait bitki örnekleri Mart-Nisan ayları arasında toplanılmıştır. Toplanan örneklerin bitkinin bütün özelliklerini temsil etmesine dikkat edilmiştir. Ayrıca örneklerin toplanması esnasında teşhis için gerekli olan örneklere ait bazı önemli morfolojik özelliklerin fotoğrafları da çekilmiş ve gözlenen özellikler tespit edilmiştir.

2.1.2.Örneklerin Korunması ve Saklanması

Toplanan örneklerin bir kısmı preslere alınarak nemsiz, gölgeli ve hava akımı olan bir ortamda kurumaya bırakılmıştır. Örneklerin sağlıklı bir şekilde kuruması için kuruma kağıtları belirli aralıklarla değiştirilmiştir. Daha sonra kuruyan örneklerin teşhisleri yapılarak her bir örnek için herbaryum örneği hazırlanmıştır.

Araştırmanın anatomik çalışmalarında kullanılmak üzere toplanan örnekler temizlenmiş, yaprak ve skapus kısımlarından alınan numuneler ,%70 'lik alkol içeren cam kavanozlar içerisine konularak ışık almayan bir yerde saklanmıştır.

2.1.3.Örneklerin Teşhisleri

Alınan örneklerin teşhislerinde, Flora of Turkey isimli eserden yararlanılmıştır (Davis, 1984; Davis, 2000).

2.1.4.Örneklerin Morfolojik Olarak İncelenmesi

Tür örneklerinin yapraklı ve çiçekli dönemlerinde yapılan gözlemlerde kök, gövde, yaprak, soğan, çiçek gibi organların morfolojik şekilleri ve özellikleri fotoğraf ve mikroskop görüntüleri ile belirlenmiş ve ölçümleri yapılmıştır.

2.1.5.Örneklerin Anatomik Olarak İncelenmesi

Anatomik incelemelerde alkol içerisinde fiske edilen bitki materyalleri kullanılmıştır. Türlerin gövde ve yaprak anatomisinde bu kısımlardan bir parça strafor içerisine yerleştirilerek jilet yardımı ile enine kesitler alınmış ve saf su damlatılmış lam üzerine yerleştirilip üzeri lamel ile kapatılıp mikroskop altında incelenmiştir.

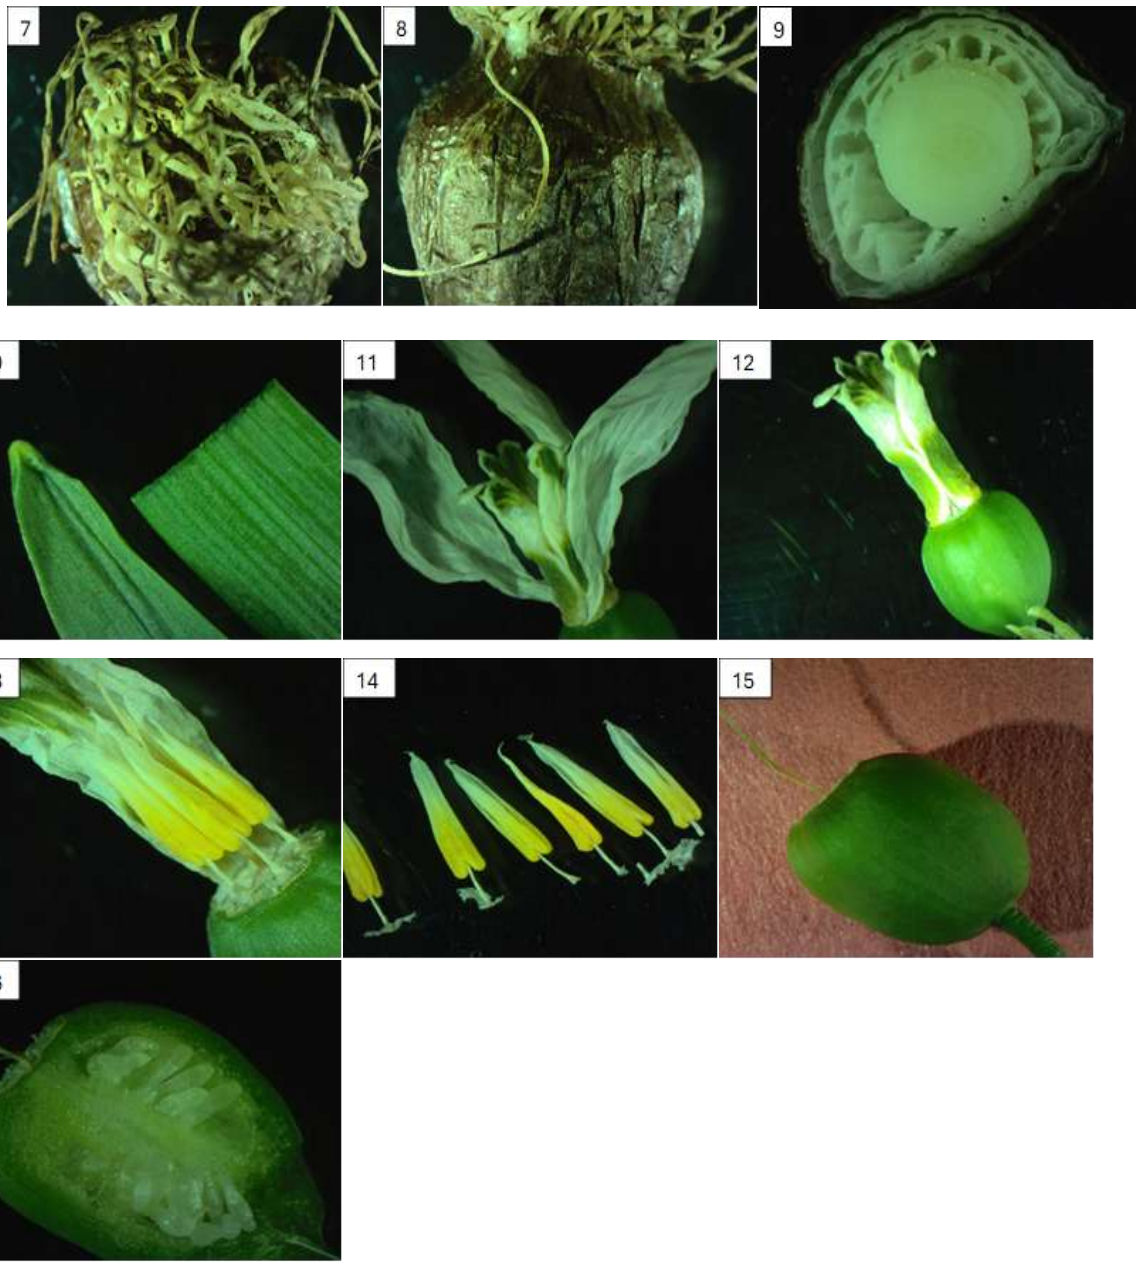
2.2.Bulgular

2.2.1.Morfolojik Bulgular

Crocus ancyrensis türünde kormus yumurtamsı ya da basık küremsi, 14,82-18,4 × 10,35-13,62 mm aralığındadır (Şekil 2,3). Tünik ağsı liflidir (Şekil 1). Yapraklar 2-5 adet, şeritsi, 0.5-1 mm genişliğindedir (Şekil 4). Çiçeklenme ve yapraklanma eşzamanlıdır. Brakte mevcuttur. Perigon tüpü sarı renkli ve tüysüzdür. Çiçek segmentleri 1.5-3 × 0.9-1.3 cm, küt uçlu veya yuvarlağımsı olup parlak sarı renklidir. Çoğunlukla tabanda ve perigon tüpünde morumsu renktedir. Stamenler 3 adettir. Filamentler 2-4 mm olup tüysüzdür. Anterler 8-13 mm uzunluğunda olup sarı renklidir (Şekil 5). Stilus portakal rengi veya kırmızımsı-portakal rengi olup 3 parçaya ayrılmıştır (Şekil 6).

Şekil (1),(2),(3) *Crocus ancyrensis* corm mikroskop görüntüleri , (4) *Crocus ancyrensis* yaprak mikroskop görüntüsü , (5) *Crocus ancyrensis* anter mikroskop görüntüsü ,(6) *Crocus ancyrensis* stilus mikroskop görüntüsü.

Galanthus elwesii türünde soğanlar küremsi ya da yumurtamsı, 15,02−20,62 × 9,09-13,58 mm aralığındadır (Şekil 7,8,9). Yapraklar şerit şeklinde ya da daralan ters mızraksı, tomurcukta içe doğru dürülmüş, tepede küt, mumludur (Şekil 10). Sıkapoz 44,49-55,36 mm'dir. Dış periant segmentleri dışbükey, obovat ya da spatulat, 15-26 ×7-10 mm, iç periant segmentleri yassı, dar oblong-spatulat, 10,1-22,68 × 3,75-8,72 mm, tabanda ve tepede yeşil lekeler bulunur, lekeler bazen merkezde birleşir (Şekil 11,12). Filamentler 0,85-2,21 mm, anterler 4,08-5,23 mm aralığındadır (Şekil 13,14). Kapsül ovoit ilâ küremsiye kadar, 11-16 × 10-14 mm'dir.



Şekil (7), (8), (9) *Galanthus elwesii* türünün soğan yapısının mikroskop görüntüleri , (10) *Galanthus elwesii* türünün yaprak mikroskop görüntüsü , (11),(12) *Galanthus elwesii* türünün dış ve iç periant mikroskop görüntüleri , (13),(14) *Galanthus elwesii* filament ve anter mikroskop görüntüleri , (15),(16) *Galanthus elwesii* ovaryum mikroskop görüntüleri.

Muscari neglectum türünde soğan yumurtamsı ve 22,34 - 32,44 × 13,61 - 19,51 mm aralığındadır (Şekil 17,18,19). Yapraklar 5-7 adettir. Yapraklar şeritsi ila şeritsi mızraksı, 6 - 40 cm x 2-8 mm olup parlak yeşil renklidir (Şekil 20).. Sıkapa ve yapraklar genellikle aynı

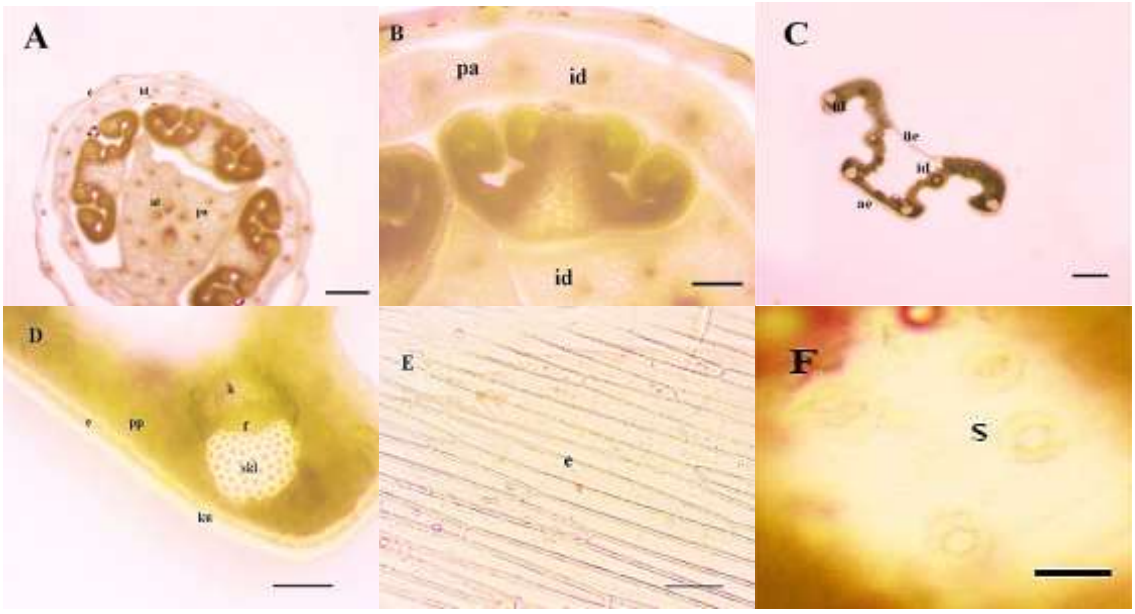
uzunluktadır. Çiçek kurulu sıkı, 27,97 - 45,11 x 13,74 - 16,13 mm ve 34 - 58 adet çiçek barındırır. Çiçekler koyu mavi renkli olup uçları beyaz lobludur. Bu loblar tırtıklı bir yapıya sahiptir (Şekil 21). Fertil çiçekler kokulu, yumurtamsı ila dikdörtgenimsi-testimsi olup koyu mavi ila siyahımsı mavi renklidir (Şekil 22). Stamenler iki sıralı olup tüpün ortasının hemen altındadır (Şekil 23). Steril çiçeklerin sapı yatay ya da yükselicidir. Bunlar en çok 33 adet olup fertil çiçeklerden daha küçüktür ve renkleri daha soluktur. Meyve zamanı çiçek kurulu uzar ve gevşer. Kapsül genişçe yumurtamsı ila dairesel olup 7-9 x 8-10 mm'dir.

Şekil (17), (18), (19) *Muscari neglectum* soğan yapısının mikroskop görüntüleri, (20) *Muscari neglectum* türünün yaprak mikroskop görüntüsü , (21) *Muscari neglectum* çiçek kurulu mikroskop görüntüsü, (22) *Muscari neglectum* çiçek mikroskop görüntüsü , (23) *Muscari neglectum* çiçek boyuna kesit mikroskop görüntüsü, (24) *Muscari neglectum* anter yapısı mikroskop görüntüsü.

2.2.2.Anatomik Bulgular

Crocus ancryensis türünün gövde enine kesitine göre gövde hafif dalgalı-kıvrımlı şekillidir (Şekil 25-A). Gövdenin en dışında dairesel ve silindirik şekilli epidermis hücreleri

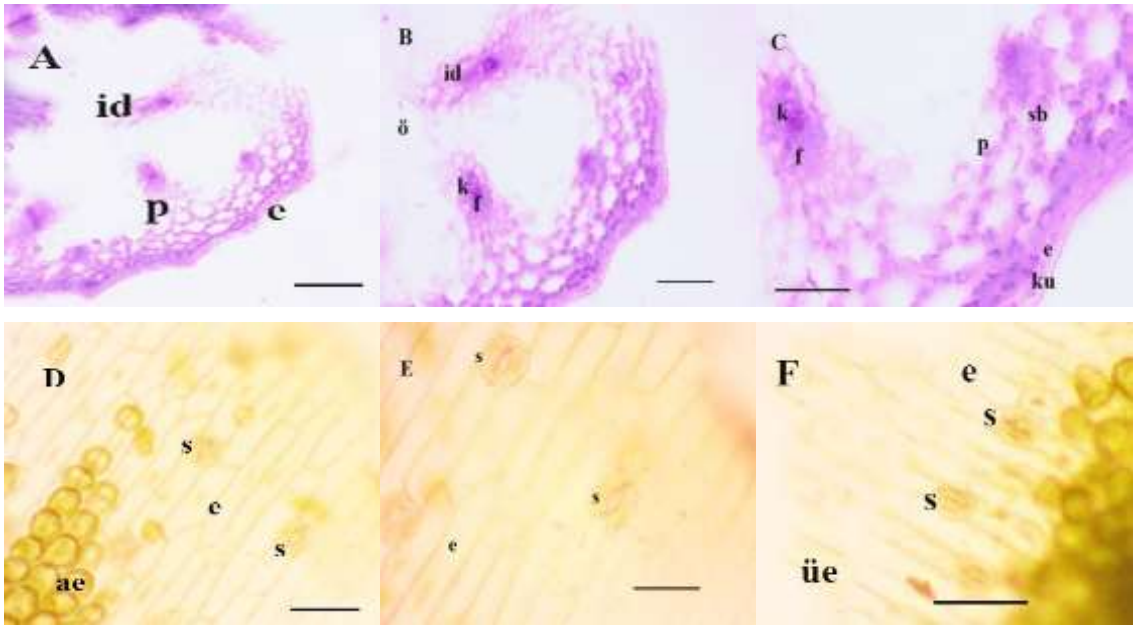
görülmektedir. Epidermis üzeri kutikula tabakası ile kaplıdır. Epidermisin hemen altında daralmış bir korteks görülmektedir. İletim demetleri merkezde 4 büyük olmak üzere gövde geneline dağılmıştır (Şekil 25-B) . Öz bölgesi bütünlüğünü kaybetmiş olup parçalanmıştır. *Crocus ancyrensis* 'in yaprak enine kesitine göre orta kısımda karesel bir orta damar alanı bulunup kenarlara doğru kollar oluşmuştur (Şekil 25-C). Yaprak enine kesitinin genel görünümü boynuzsudur. Yaprağın orta damar kısmında 4 adet iletim demeti bulunmakta olup yan kollarda 2'şer adet iletim adeti yerleşmiştir. Hem alt hem üst yüzeyde kalın bir kutikula tabakası epidermis hücrelerinin üzerini kaplamaktadır. Epidermis üzerinde tüyler yok denecek kadar azdır. Epidermis hücreleri dikdörtgensel veya karesel şekillidir (Şekil 25-E). Bu epidermis hücrelerinin zaman zaman konveks şekil almıştır. Epidermisin iç çeperlerinin kalınlaştığı görülmektedir. Mezofil bifasiyaldir. 2 sıra palizat parankimasının altında sünger parankiması vardır. Her bir iletim demetinin üzerinde kubbe şeklinde sklerankima hücreleri yer almaktadır (Şekil 25- D). Yaprağın alt yüzeyinde stomaya rastlanmamıştır. Sadece üst yüzeyde stoma gözlemlenmiş olup çok az sayıdadır (Şekil 25-F).



Şekil 25. *Crocus ancyrensis*'in kesitleri. A-B gövde enine kesiti, C-F yaprak enine kesiti, e:epidermis, id: iletim demeti, pa: parankima, ae: alt epidermmiş, üe: üst epidermis, ku: kutikula, pp: palizat parankiması, k: ksilem, f: floem, skl: sklerenkima, s: stoma.

Galanthus elwesii'nın gövde kesitine göre en dışta dairesel şekilde epidermis hücreleri olup üzeri kutikula tabakası ile kaplıdır (Şekil 26- A). Belirli bir korteks alanı yoktur. Gövdenin genelinde parankima hücreleri poligonal şekildedir (Şekil 26-B). Parankima hücrelerinin arasında hücre arası boşluklar çok geniştir (Şekil 26-C). Merkeze doğru zaman zaman parankima hücrelerinin kaybolduğu görülmektedir. Kollateral iletim demetleri gövde geneline dağılmıştır. *Galanthus elwesii* ' nin yaprak enine kesitine göre yaprak mekik şeklindedir.

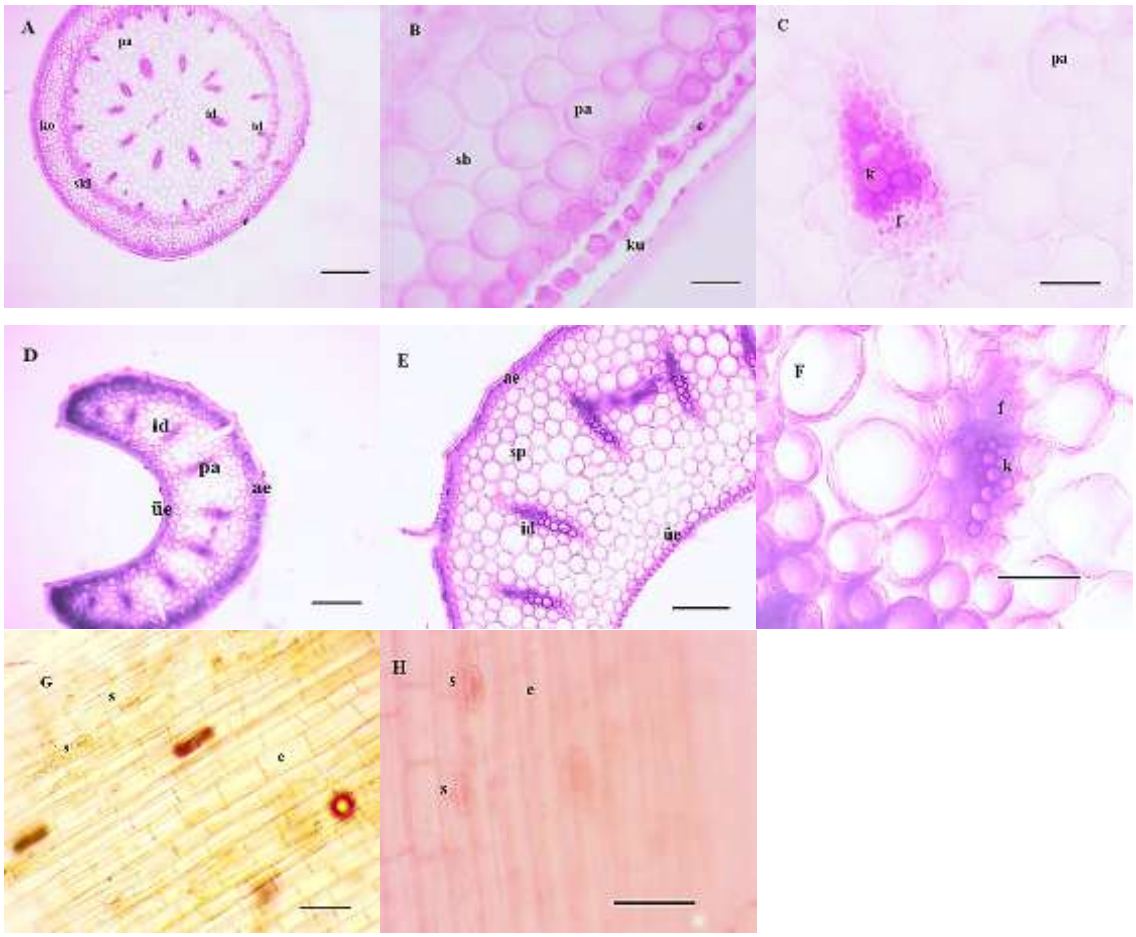
Epidermis hücreleri karesel veya dairesel şekillidir (Şekil 26-D) İnce bir kutikula tabakası epidermis üzerini kaplamaktadır. Epidermis üzerinde az sayıda örtü tüyü mevcuttur. Belirgin bir orta damar bölgesi yoktur. Epidermisin hemen altında dairesel şekilli sünger parankiması hücreleri görülmektedir. Mezofil unifasiyaldir. Mezofilde bir iki sıra palizat parankiması merkeze doğru ise sünger parankiması hücreleri görülmektedir. Yaprağın hem alt hem de üst yüzeyinde stomalara rastlanmıştır (Şekil 26-E-F).



Şekil 26. *Galanthus elwesii*'nin kesitleri. A-C gövde enine kesiti,D-F yaprak enine kesiti,

e: epidermis, p: parankima, id: iletim demeti, ö: öz, k: ksilem, f: floem, ku: kutikula, sb: salgı doku. s: stoma, ae: alt epidermis, üe: üst epidermis.

Muscari neglectum'un gövde kesitine göre gövde düzgün dairesel şekillidir (Şekil 27-A). En dıştaki epidermis hücreleri karesel veya dairesel şekilli olup üzeri kalın bir kutikula tabakası ile kaplıdır (Şekil 27-B). Epidermisin alt yüzeylerinde hücre çeperi kalınlaşması görülmektedir. Epidermisin hemen altıda 6-7 sıralı parankima hücrelerinden sonra devamlı bir halka halinde sklerankima tabakası görülmektedir. Merkeze doğru çok farklı büyüklükteki parankima hücreleri arasında boşluklar bulunmaktadır. Merkezdeki iletim demetleri düzgün bir sıra halinde dağılmıştır(Şekil 27-C).. Sklerankima halkasının hemen altındaki iletim demetleri de düzgün bir sıra oluşturmaktadır. İletim demetlerinde trakeidler çok belirgindir (Şekil 27-F).*Muscari neglectum*'un yaprak enine kesitine göre yaprak hilal şeklindedir (Şekil 27-D). Epidermis hücreleri karesel veya dairesel şekillidir (Şekil 27-E). Mezofil dairesel şekilli parankima hücrelerinden oluşur. Mezofil unifasiyaldir. Çok kalın bir kutikula tabakası epidermisin üzerini örter. Orta damar bölgesi belirgin değildir. Şekilli parankima hücreleri arasında boşluklar vardır. Hem alt hem de üst yüzeyde stomalara rastlanmıştır (Şekil 27-G-H).



Şekil 27. *Muscari neglectum*'un kesitleri. A-C gövde enine kesiti. D-H yaprak enine kesiti, e: epidermis, ko: kollenkima, skl: sklerankima, id: iletim demeti, pa: parankima, ku: kutikula, sb: salgı boşluğu, f: floem, k: ksilem, ae: alt epidermis, üe: üst epidermis, sp: süger parankiması, s: stoma.

2.3.Tartışma

Çalışılan türler ait oldukları familyaların genel özelliklerini göstermektedir. *C. ancyrensis* gövdesinde iletim demetleri merkezde 4 büyük olmak üzere gövde geneline dağılmıştır. *Crocus pulchellus* Herbert türünde 7 adet iletim demetleri, gövde orta kısmında yer almaktadır (Özdemir ve Akyol, 2005). *C. ancyrensis* yaprak enine kesiti oldukça karakteristiktir. Orta damar bölgesi kareseldir ve karenin köşe kısımlarına denk gelen bölgelerde 4 adet iletim demeti bulunmaktadır. Mezofil yanlara doğru kıvrılarak iki kolu meydana getirmektedir. Yaprağın alt yüzeyinde stomaya rastlanmamıştır. Kandemir (2011) *C. ancyrensis* türünde iletim demetlerini alt iki köşede iki adet olarak belirlemiştir. *C. olivieri* J.Gay ve *Crocus abantensis* T. Baytop et Mathew türlerinin yapraklarının kesit şekli *C. ancyrensis* ile benzerlik göstermektedir (Uslu ve ark. 2022). *G. elwesii* gövde ve yaprak anatomik bulgular ilk defa literatüre kazandırılmıştır. *G. elwesii* yaprağında 2-3 sıralı palizat parankiması merkeze doğru ise sünger parankiması

hücreleri görülmekte olup yaprak mezofili bifasiyaldir. Yaprakların her iki yüzeyinde de stomalara rastlanmıştır (Amfistomatik yaprak). Demetler kollateraldir. Bol miktarda hava boşluğu mezofilde bulunmaktadır. *G. fosteri* var. *fosteri* and *G. fosteri* var. *antepensis* taksonlarında bifasiyal mezofil, kollateral demetler ve amfistomatik yaprak tipi ve bol miktarda hava boşluğu rapor edilmiştir (Kandemir ve Akçin 2006). *G. peshmenii* A.P. Davis & C.D. Brickell mezofilinde de büyük hava boşlukları bulunmaktadır (Davis ve Barnett 1997).

3.SONUÇ

Yapılan bu çalışma ile Kırşehir yöresinden toplanan *C. ancyrensis*, *G. elwesii*, *M. neglectum* türleri ile ilgili bazı morfolojik ve anatomik değerler aydınlatılmaya çalışılmıştır. Elde edilen bulgular literatür ile uygunluk göstermiş, bulunan farklılıklar belirtilmiştir. Ülkemizin biyolojik zenginliğine katkıda bulunan bu türlerin bilinçli bir şekilde in-situ ve ex-situ muhafazasının yapılması ve bu bitkilerin gelecek nesillere aktarılması önem arz etmektedir.

ABSTRACT

This study was conducted to investigate the effects of glycine betaine (GB) priming on the drought stress tolerance of safflower (*Carthamus tinctorius* L.) OLAS variety seeds. Drought stress is a physiological condition that arises when the water required for plant growth, development, and productivity becomes insufficient. This stress factor adversely affects seed germination, early seedling development, and overall plant vigor, thereby playing a direct and critical role in determining the success of plant populations and agricultural productivity. In the experiment, seeds were pre-treated with 20 mg/l glycine betaine for different durations (control, 1, 2, 3 and 4 h) and then subjected to different concentrations of PEG (polyethylene glycol) (Control, -0.25, -0.50, -0.75, -1.00 MPa) for germination testing. The experiment was conducted in the Field Crops Laboratory of the Faculty of Agriculture at Sakarya University of Applied Sciences, using factorial completely randomized design arrangement with three replications. The results showed that increasing PEG concentration caused a decline in germination rate, germination vigor, seedling and root length, total fresh and dry weights, water content (WC), and relative water content (RWC). However, glycine betaine priming applied for different durations partially alleviated these adverse effects, enhancing the tolerance of plants to drought stress. These findings suggest that glycine betaine pretreatment could be an effective approach to promote uniform germination and seedling emergence of safflower under drought conditions.

Keywords: Safflower, Glycine Betaine, Priming, PEG.

ASPİR TOHUMLARINDA GLİSİN BETAİN PRİMİNG UYGULAMASININ KURAKLIK STRESİ ALTINDA ÇİMLENME VE FİDE GELİŞİMİNE ETKİSİ

ÖZET

Bu araştırma, aspir (*Carthamus tinctorius* L.) OLAS çeşidi tohumlarında glisin betain (GB) ile yapılan priming uygulamasının kuraklık stresine karşı etkisini incelemek amacıyla gerçekleştirilmiştir. Kuraklık stresi, bitkilerin büyüme, gelişme ve verimlilik süreçlerinde ihtiyaç duyduğu suyun yetersizliği sonucu ortaya çıkan fizyolojik bir durumdur. Bu stres faktörü, tohumların çimlenmesi, erken dönem fide gelişimi ve genel bitki canlılığı üzerinde olumsuz etkiler oluşturmakta; dolayısıyla bitki popülasyonlarının gelişimi ve tarımsal verimlilik üzerinde doğrudan belirleyici rol oynamaktadır. Çalışmada, tohumlar 20 mg/l glisin betain ile farklı sürelerde (kontrol, 1, 2, 3 ve 4 saat) ön işleme tabi tutulmuş ve ardından farklı seviyelerde PEG (polietilen glikol) konsantrasyonları (kontrol, -0.25, -0.50, -0.75, -1.00 MPa) altında çimlenme testine alınmıştır. Deneme, tesadüfi parselleri faktöriyel deneme desenine göre üç tekerrürlü olarak Sakarya Uygulamalı Bilimler Üniversitesi Ziraat fakültesinin tarla bitkileri laboratuvarında yürütülmüştür. Elde edilen sonuçlara göre, artan PEG konsantrasyonunun çimlenme hızı, çimlenme gücü, fide ve kök uzunluğu, toplam yaş ve kuru ağırlık, su içeriği (WC) ve bağıl su içeriği (RWC) gibi parametrelerde düşüşe neden olduğunu göstermiştir. Ancak, tohumlara uygulanan farklı sürelerde glisin betain priming işlemi, bu olumsuz etkileri kısmen hafifleterek bitkilerin kuraklık stresine karşı daha dayanıklı hale gelmesini sağlamıştır. Elde edilen bulgular, glisin betain ile yapılan ön işlemin, aspir tohumlarının kuraklık koşullarında uniform çimlenme ve çıkışlarına etkili bir yöntem olabileceğini ortaya koymaktadır.

Anahtar Kelimeler: Aspir, Glisin Betain, Priming, PEG.

1. GİRİŞ

Aspir (*Carthamus tinctorius* L.) yüksek adaptasyon kabiliyeti, agronomik özellikleri, biyolojik aktif bileşen içeriği ve tohumlarında bulunan kaliteli yağ asitleri kompozisyonu ile dikkat çeken önemli bir yağ bitkisidir. Hem gıda sanayisinde hem de kozmetik endüstrilerinde kullanım potansiyeli sayesinde ekonomik değeri giderek artmaktadır. Özellikle linoleik asit açısından zengin tohum yağı, aspirin dünya genelinde yaygın olarak yetiştirilmesine neden olan başlıca faktörlerden biridir. Ayrıca, yarı kurak iklim koşullarına uyum sağlayabilmesi, düşük girdi gereksinimi ve alternatif ürün olma potansiyeli ile sürdürülebilir tarımsal üretim sistemlerinde önemli bir yer tutmaktadır (Delshad ve ark., 2018). Toplam yağ asitlerinin yaklaşık %90'ını oluşturan yüksek oranda doymamış yağ asitleri içermektedir. Bu yağ asitlerinin başlıcaları linoleik (%71–75) ve oleik (%16–20) asitlerdir. Aspir bitkisi, abiyotik stres faktörlerine karşı yüksek tolerans göstermektedir. Özellikle tuzluluk ve kuraklık gibi çevresel stres koşullarında, aspir bitkisinin fizyolojik ve moleküler adaptasyon mekanizmaları sayesinde verim kayıpları minimize edilebilmektedir. Su stresi, tarımsal üretimde küresel ölçekte en önemli abiyotik kısıtlayıcı faktörlerden biri olarak kabul edilmekte olup, bitkisel gelişim, biyokütle üretimi ve verim üzerinde ciddi düzeyde olumsuz etkiler oluşturmaktadır. (Mahajan ve Tuteja, 2005). Tuzluluk ve kuraklık bitkisel üretimi etkileyen iki önemli çevresel faktördür. Su ve toprak tuzluluğu kurak ve yarı kurak bölgelerde bitkisel üretimi sınırlayabilen önemli stres faktörlerinden biridir. Kuraklık, iyon adsorpsiyon süreci sırasında su emilimini azaltır. Su, tohumlardaki maddelerin çimlenmesinde ve metabolizmasında önemli bir faktördür (Serrano ve ark., 1999; Murillo- Amador ve ark., 2002). Özellikle çimlenme sürecinin başlangıcında su potansiyelinin düşük olması, tohumun su almasını bozar ve çimlenmeyi geciktirir (Hardegree ve Emmerich, 1990). Tohum ön işlemleri (priming), çeşitli bitki türlerinde hem optimal hem de stres koşullarında çimlenme performansını ve fide gelişimini artırmada etkili bir agronomik uygulama olarak öne çıkmaktadır. Glisin betain (GB), diğer adıyla trimetilglisin, bitkilerde ozmoprotektan olarak işlev gören doğal olarak oluşan bir bileşiktir. Glisin aminoasidinin bir türevi olan bu bileşik, kuraklık ve tuzluluk gibi çeşitli çevresel stres faktörlerine karşı organizmaların toleransını artırmadaki rolüyle bilinmektedir (Ashraf ve Foolad, 2007). Tüm bitkiler, abiyotik stres koşullarının olumsuz etkilerini dengelemek amacıyla yeterli düzeyde glisin betain (GB) sentezleyememektedir. Bu durum göz önüne alındığında, stres toleransını artırmak için önerilen yaklaşımlardan biri, glisin betain gibi osmolotik modülatörlerin dışsal olarak uygulanması yoluyla bitkilerde bu bileşiğin içsel konsantrasyonunun artırılmasıdır. Prolin ve glisin betain gibi uyumlu çözücülerin stres öncesinde, stres süresince ya da stres sonrasında bitkilere eksojen olarak uygulanması, bu bileşiklerin endojen seviyelerinin yükseltilmesine katkı sağlamakta ve bu durum, genellikle stres koşullarında bitki büyümesi ve verimliliğinde iyileşmelerle sonuçlanmaktadır. Çeşitli çalışmalarda, glisin betainin dışsal uygulanmasının, abiyotik stres altındaki bitkilerin büyüme ve fizyolojik performansı üzerinde olumlu etkiler oluşturduğu rapor edilmiştir (Makelan ve ark., 1996; Agboma ve ark., 1997; Ashraf ve Foolad, 2007). Buğday (*Triticum aestivum* L.), bezelye (*Pisum sativum* L.), ayçiçeği (*Helianthus annuus* L.) ve pamuk (*Gossypium hirsutum* L.) gibi türlerde, fide çıkışını hızlandırmak ve kuraklık stresine toleransı artırmak amacıyla hidropriming, osmo-priming ve hormonal priming gibi farklı priming teknikleri başarıyla uygulanmıştır. Benzer şekilde, şeker pancarı (*Beta vulgaris* L.), mısır (*Zea mays* L.), soya fasulyesi (*Glycine max* L.) ve aspir (*Carthamus tinctorius* L.) gibi diğer bitki türlerinde de tohum priming uygulamalarının

çimlenme ve erken gelişim üzerindeki olumlu etkileri çeşitli çalışmalarda rapor edilmiştir (Koçak Şahin., 2024; MacDonald & Mohan., 2025; Mylsamy ve ark., 2025). Aspir diğer yağ bitkileriyle karşılaştırıldığında kuraklık ve tuzluluk gibi abiyotik stres koşullarına karşı daha yüksek tolerans göstermektedir. Ancak, çimlenme ve erken fide gelişimi dönemlerinde bu stres faktörlerine karşı duyarlılığı artmaktadır. Özellikle çimlenme aşamasında tuz stresi, çimlenme oranını ve fide gelişimini olumsuz etkilemektedir. Bu durum, aspir bitkisinin erken gelişim evrelerinde tuzluluk ve kuraklık stresine karşı hassas olduğunu göstermektedir (Fatahiyan ve ark., 2025).

Bu çalışmanın amacı, aspir bitkisinde çimlenme döneminde uygulanan glisin betain (GB) ön uygulamasının kuraklık stresine karşı dayanıklılık üzerine etkilerini araştırmaktır.

2. MATERYAL ve YÖNTEM

Araştırma 2025 yılında Sakarya Uygulamalı Bilimler Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Laboratuvarında tesadüf parselleri faktöriyel deneme deseninde ve 3 tekerrürlü olarak kurulmuştur. Bu çalışmada bitki materyali olarak, Trakya Tarımsal Araştırma Enstitüsü Müdürlüğü'nden temin edilen OLAS aspir (*Carthamus tinctorius* L.) çeşidi kullanılmıştır. Denemede kullanılan cam petri kapları ve kurutma kağıtları, sterilizasyon amacıyla etüvde 175 °C'de 30 dakika süreyle bekletilmiştir. Tohumlara ön muamele amacıyla biyostimülant olarak glisin betain (GB) uygulanmıştır. Çimlendirme öncesinde, kontaminasyon riskini en aza indirmek için tohumlar %3'lük sodyum hipoklorit (NaClO) çözeltisinde 15 dakika süreyle çalkalanmış ve ardından üç kez saf su ile durulanmıştır. Denemede tohumlar, 20 mg/l konsantrasyonunda glisin betain çözeltisi ile farklı sürelerde (kontrol, 1, 2, 3 ve 4 saat) ön işleme tabi tutulmuştur. Ön muamele sonrası, farklı seviyelerdeki polietilen glikol (PEG 6000) çözeltileri (kontrol, -0.25, -0.50, -0.75 ve -1.00 MPa) altında çimlendirme testleri gerçekleştirilmiştir. Her tekerrürde 50 adet tohum kullanılmış ve deneyler sabit 23 ± 1 °C sıcaklıktaki çimlendirme ortamında yürütülmüştür.

Kuraklık stresini simüle etmek amacıyla, su potansiyelinin hesaplanmasında aşağıdaki denklemden yararlanılmıştır (Michel ve Kaufmann, 1973).

$$\Psi H = (-1.18 \times 10^{-2}) \times C - (1.18 \times 10^{-4}) \times C + (2.67 \times 10^{-4}) \times C \times T + (8.39 \times l0^{-7}) \times C^2T$$

(ψ: su potansiyeli, MPa; C: PEG 6000 konsantrasyonu, g L^{-1}; T: sıcaklık, °C).

Bu denklem kullanılarak 1 L distile suya eklenmesi gereken PEG 6000 miktarları belirlenmiş ve kontrol ile –0.25, –0.50, –0.75 ve –1.00 MPa su potansiyeline sahip çözeltiler hazırlanmıştır.

Bu araştırmada çimlenme hızı (%), çimlenme gücü (%), kök uzunluğu (mm), fide uzunluğu (mm), yaş ağırlığı (g), kuru ağırlığı (g), bağıl su içeriği (%) ve su içeriği (g/g) gözlemler ISTA (2010) kurallarına göre 4. ve 14. günde alınmıştır. hesaplanmıştır. Bağıl su içeriği (RWC) Weatherley (1950), ve su içeriği (WC), Wu ve diğerleri (2013) gözlemler sırasıyla verilen formüllerden hesaplanmıştır:

RWC (%)=[(Yaş ağırlık- Kuru ağırlık/ Tam turgor ağırlığı – Kuru ağırlığı)]×100

WC (g/g) = (Yaş ağırlık- Kuru ağırlık)/ Kuru ağırlık

Denemeden elde edilen veriler varyans analizine (ANOVA) tabi tutulmuştur. Tüm istatistiksel analizler MSTAT-C paket programı kullanılarak gerçekleştirilmiştir. Elde edilen ortalamalar arasındaki farkların belirlenmesinde, anlamlılık düzeyine göre Duncan çoklu karşılaştırma testi uygulanmış ve sonuçlar gruplandırılarak yorumlanmıştır.

3. BULGULAR VE TARTIŞMA

Bu çalışmada incelenen tüm özelliklere ait varyans analizi sonuçları Tablo 3.1'de sunulmuştur. Elde edilen bulgulara göre, GB uygulama süresi ile PEG seviyeleri arasındaki etkileşim, tüm özellikler açısından %1 anlamlılık düzeyinde istatistiksel olarak önemli bulunmuştur ($P < 0.01$).

Tablo 3.1: PEG stresi altında farklı GB uygulamalarıyla aspir özelliklerinin varyans analizi sonuçları.

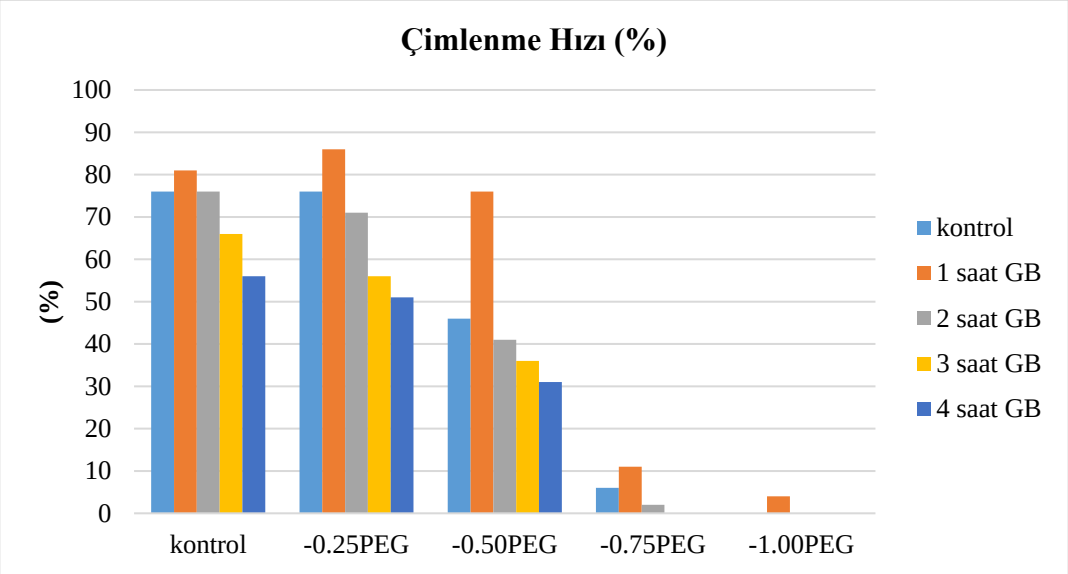
Glisin Betain uygulama süresi (GB), PEG (P)

Çimlenme Hızı (%)

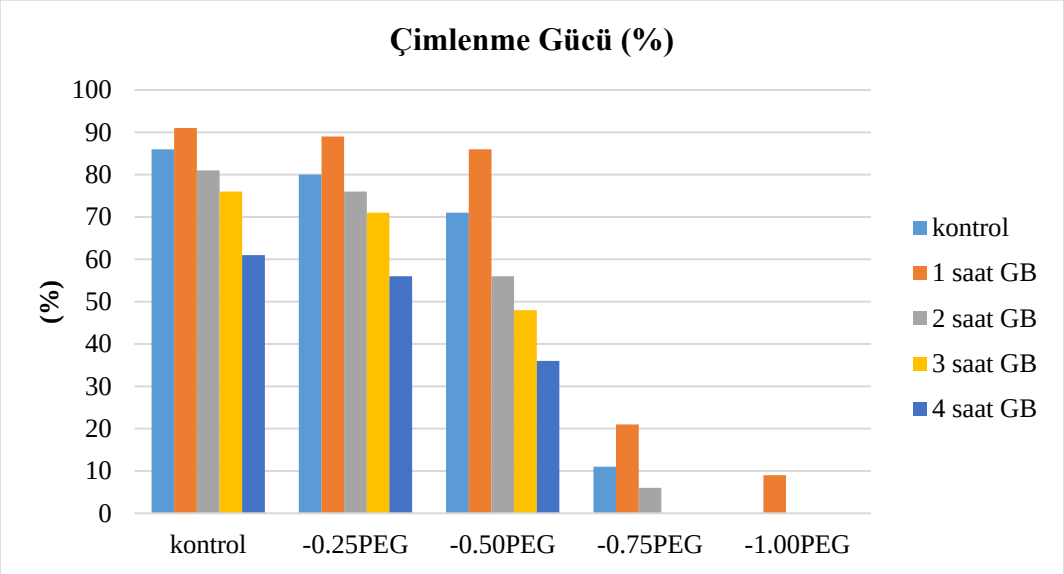
Grafikte, farklı GB ön uygulama sürelerinin (kontrol, 1, 2, 3 ve 4 saat) PEG ile oluşturulan kuraklık koşulları altında aspir tohumlarının çimlenme hızına etkisi gösterilmektedir. Elde edilen sonuçlara göre GB × PEG interaksiyonunun genel ortalamalarında en yüksek çimlenme hızı %86 olarak 1 saat GB uygulamasında ve –0.25 Mpa polietilen glikol dozunda gözlemlenmiştir ve 4 saat ön uygulama ve –0.75 Mpa polietilen glikol dozunda çimlenme gerçekleşmemiştir (Şekil 3.1).



Şekil 3.1: GB ön uygulama süresinin PEG stresi altında çimlenme hızına etkisi

Çimlenme Gücü (%)

Şekil 3.2'de, farklı glisin betain (GB) ön uygulama sürelerinin (kontrol, 1, 2, 3 ve 4 saat) PEG ile oluşturulan kuraklık stresi koşulları altında aspir tohumlarının çimlenme gücü üzerindeki etkisi gösterilmektedir. Uygulamadan 14 gün sonra elde edilen bulgulara göre, GB × PEG etkileşiminin genel ortalamalarında en yüksek çimlenme gücü %91 ile 1 saatlik GB uygulaması ve kontrol grubunda kaydedilmiştir. Öte yandan, 4 saatlik GB uygulaması ile –0.75 MPa PEG konsantrasyonunun birlikte uygulandığı koşullarda çimlenme gerçekleşmemiştir. Elde edilen sonuçlara göre, artan PEG dozları aspir tohumlarının çimlenmesini olumsuz yönde etkilemiştir. Özellikle –0.75 ve –1.00 MPa seviyelerindeki PEG uygulamalarında çimlenme gözlenmemiştir. Bu durum, yüksek osmotik basıncın tohumun su alımını engelleyerek çimlenme sürecini durdurabileceğini ortaya koymaktadır. Benzer şekilde, Kaya ve ark. (2006) ve Farooq ve ark. (2009) yaptıkları çalışmalarda, artan PEG konsantrasyonlarının bitki tohumlarında çimlenme oranını ve çimlenme hızını önemli ölçüde düşürdüğünü bildirmişlerdir. Ayrıca, çimlenme ortamına uygulanan PEG'nin, hücre içi su potansiyelini azaltarak metabolik aktiviteleri baskıladığı belirtilmiştir (Bewley ve ark., 2013).

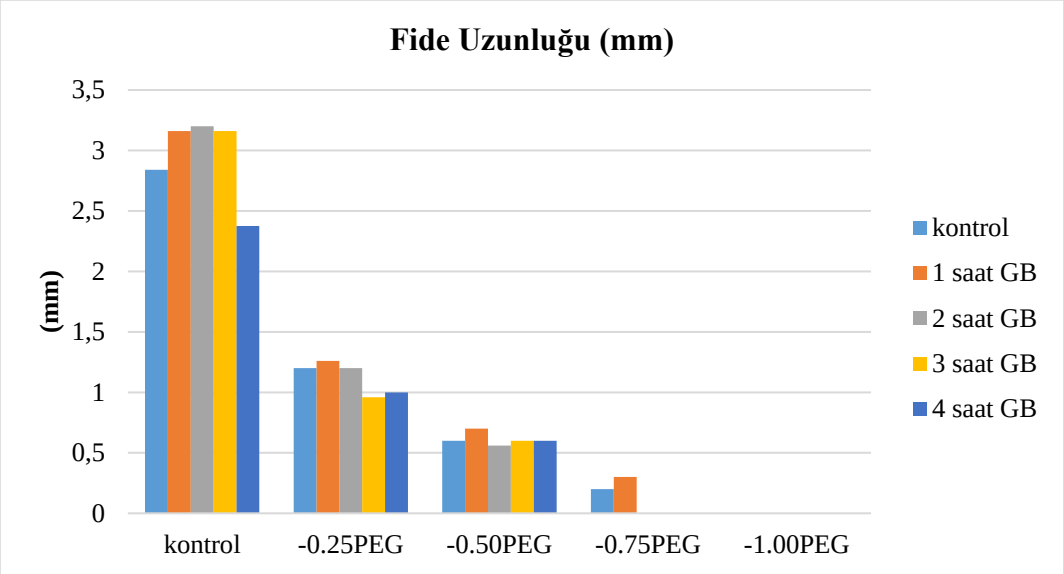


Şekil 3.2: GB ön uygulama süresinin PEG stresi altında çimlenme gücüne etkisi

Fide Uzunluğu (mm)

Şekil 3.3'te, farklı glisin betain (GB) ön uygulama sürelerinin ve PEG ile oluşturulan kuraklık stresinin aspir fide boyu üzerindeki etkileri gösterilmektedir. Elde edilen bulgulara göre, en uzun fide boyu (3.20 mm) kontrol grubunda ve 2 saatlik GB ön uygulamasında gözlemlenmiştir. Bununla birlikte, –0.75 MPa PEG dozunda 3 ve 4 saatlik GB ön uygulamalarında, ayrıca –1.00 MPa PEG uygulamasında çimlenme gerçekleşmemiştir. Grafik verileri incelendiğinde, artan PEG konsantrasyonlarının fide boyunda belirgin bir azalmaya neden olduğu görülmektedir. Bu durum, PEG'in oluşturduğu osmotik stresin hücre bölünmesi ve uzamasını sınırlayarak fidelerin gelişimini olumsuz etkilediğini göstermektedir. Ancak 1 saatlik GB ön uygulamasının, yüksek PEG seviyelerinde dahi diğer uygulama sürelerine kıyasla daha iyi fide gelişimi sağladığı belirlenmiştir.

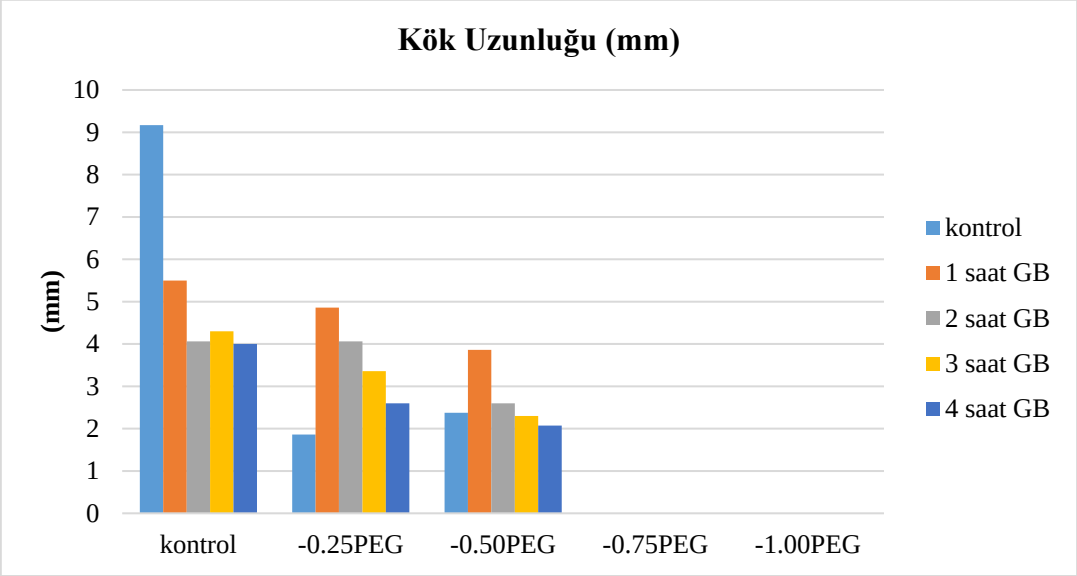
Bu sonuçlar, glisin betainin uygun süre ve dozlarda uygulanmasının osmotik stres koşullarında bitki fide gelişimini destekleyebileceğini göstermektedir. Benzer şekilde, Zhang ve ark. (2013) GB'nin antioksidan savunmayı artırarak ve ozmotik dengeyi düzenleyerek kuraklık stresine karşı koruyucu rol oynadığını bildirmiştir. Ayrıca, Noreen ve ark. (2010) ve Farooq ve ark. (2008) gibi araştırmacılar da glisin betain uygulamasının fide gelişimini iyileştirdiğini ve bitkilerin stres koşullarına karşı dayanıklılığını artırdığını vurgulamışlardır.



Şekil 3.3: GB ön uygulama süresinin PEG stresi altında fide uzunluğuna etkisi

Kök Uzunluğu (mm)

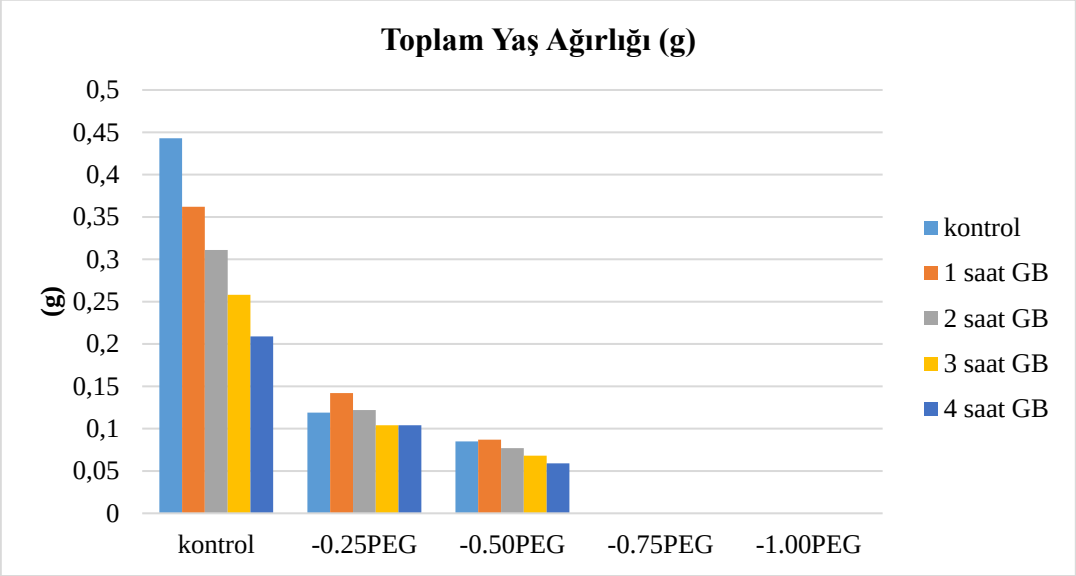
Şekil 3.4'te, farklı glisin betain (GB) ön uygulama sürelerinin ve polietilen glikol (PEG) ile oluşturulan kuraklık stresinin aspir tohumlarının kök uzunluğu üzerindeki etkileri gösterilmektedir. Ortalama değerlere göre, en uzun kök gelişimi kontrol grubunda gözlemlenmiş, en kısa kök uzunluğu ise kontrol grubunun –0.25 MPa PEG uygulamasında kaydedilmiştir. Genel eğilim incelendiğinde, artan PEG konsantrasyonlarının kök gelişimini belirgin biçimde sınırlandırdığı görülmektedir. Bununla birlikte, grafik verileri 1 saatlik GB ön uygulamasının diğer sürelerle karşılaştırıldığında daha uzun kök gelişimi sağladığını ortaya koymaktadır. Bu bulgu, GB'nin stres koşulları altında ozmotik düzenleyici olarak görev yaparak su dengesini koruduğu ve kök gelişimini desteklediği yönündeki literatür ile örtüşmektedir. Agboma ve ark. (1997) ve Ashraf ve Foolad. (2007) glisin betainin kök sisteminin gelişimini artırarak bitkilerin kuraklık koşullarına karşı dirençlerini yükselttiğini bildirmişlerdir. Ayrıca, Kaya ve ark. (2006) GB uygulamasının kök uzunluğu üzerindeki pozitif etkilerini farklı bitki türlerinde göstermiştir.



Şekil 3.4: GB ön uygulama süresinin PEG stresi altında kök uzunluğuna etkisi

Toplam Yaş Ağırlığı (g)

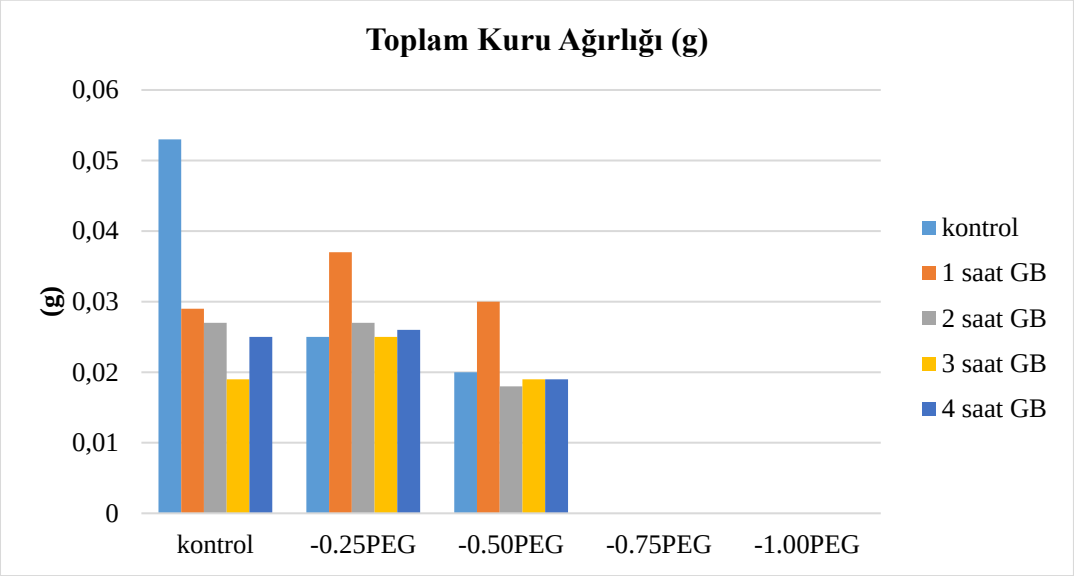
Elde edilen bulgulara göre, en yüksek toplam yaş ağırlığı 0.44 g ile kontrol grubunda kaydedilirken, en düşük değer 0.059 g olarak –0.50 MPa PEG uygulaması ve 4 saatlik GB ön uygulaması kombinasyonunda gözlemlenmiştir (Şekil 3.5). Genel olarak artan PEG konsantrasyonları, aspir fidelerinin biyokütle üretimini olumsuz yönde etkilemiştir. Bu durum, yüksek osmotik stresin hücresel su dengesini bozarak metabolik faaliyetleri yavaşlatmasıyla ilişkilendirilmektedir. Öte yandan, 1 saatlik GB ön uygulaması, diğer sürelerle karşılaştırıldığında özellikle orta düzeydeki PEG uygulamalarında daha yüksek yaş ağırlığı değerleri sağlamıştır. Bu bulgu, glisin betainin ozmotik dengeyi düzenleyerek su alımını artırdığı ve fizyolojik stres tepkilerini hafiflettiğini gösteren önceki çalışmalarla uyumludur (Ashraf ve Foolad, 2007; Wahid ve ark., 2007). Ayrıca, Hanif ve ark. (2023) yaptıkları çalışmada, glisin betain kaplı çinko oksit nano-parçacıklarının, PEG ile indüklenen kuraklık stresi altında kişniş bitkilerinin morfolojik parametrelerini ve yaş ağırlığını önemli ölçüde artırdığını bildirmişlerdir. Benzer şekilde, 2024 yılında yayımlanan bir araştırmada, glisin betain ile yapılan tohum ve kök ön uygulamalarının, buğday fidelerinde kuraklık toleransını artırarak büyümeyi ve antioksidatif savunmayı iyileştirdiği gösterilmiştir (Baroi ve ark., 2024).



Şekil 3.5: GB ön uygulama süresinin PEG stresi altında toplam yaş ağırlığına etkisi

Toplam Kuru Ağırlığı (g)

Toplam kuru ağırlık açısından elde edilen bulgular, en yüksek değerin 0.053 g ile kontrol grubunda kaydedildiğini göstermiştir (Şekil 3.6). Buna karşılık, en düşük toplam kuru ağırlık değeri 0.018 g olarak, –0.50 MPa PEG ile uygulanan kuraklık stresi altında ve 2 saatlik glisin betain (GB) ön uygulamasında gözlemlenmiştir. Artan PEG konsantrasyonlarına bağlı olarak tohumların toplam kuru madde birikimi anlamlı düzeyde azalmış; bu durum, kuraklık stresinin bitki büyümesi ve biyokütle üretimi üzerindeki olumsuz etkisini ortaya koymuştur. GB ön uygulaması belirli düzeylerde bu olumsuz etkileri hafifletmiş olsa da, yüksek düzeyde PEG uygulamalarında biyokütle üretimi belirgin şekilde düşmüştür. Acar ve ark. (2020), buğdayda PEG ile oluşturulan kuraklık stresinin bitki kuru ağırlığını önemli ölçüde azalttığını ve GB ön uygulamasının bu etkiyi kısmen hafiflettiğini rapor etmiştir. Demirtaş ve ark., (2023) ise ayçiçeğinde benzer şekilde yüksek PEG dozlarının toplam kuru ağırlık üzerinde baskılayıcı etkiler gösterdiğini ve 1 saatlik GB uygulamasının kök ve gövde biyokütlesi üzerinde olumlu etkiler yarattığını bildirmiştir.

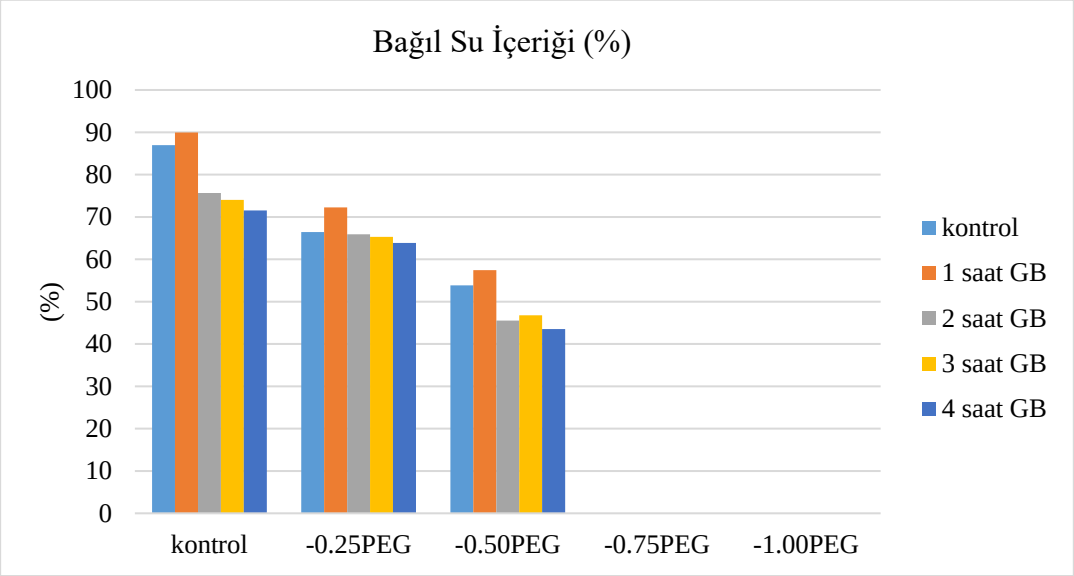


Şekil 3.6: GB ön uygulama süresinin PEG stresi altında toplam kuru ağırlığına etkisi

Bağıl Su İçeriği (%)

Bitkilerde bağıl su içeriği (RWC), fizyolojik durumun belirlenmesinde yaygın olarak kullanılan önemli bir parametredir. RWC'nin %90–100 aralığında olması, bitkinin su bakımından sağlıklı olduğunu ve herhangi bir stres altında olmadığını göstermektedir. Buna karşılık, bu oranın %50'nin altına düşmesi, şiddetli su stresine işaret eder ve hücre düzeyinde hasar riskinin yüksek olduğunu gösterir (Barrs ve Weatherley, 1962).

Çalışmamızda elde edilen bulgulara göre, en yüksek bağıl su içeriği %89.95 ile kontrol + 1 saat glisin betain (GB) ön uygulamasında ölçülmüştür. En düşük RWC değeri ise %43.53 oranıyla –0.50 MPa PEG + 4 saat GB uygulamasında tespit edilmiştir (Şekil 3.7). Bu durum, –0.50 MPa ve üzeri PEG konsantrasyonlarının bitkilerde şiddetli su stresine neden olduğunu göstermektedir. Bununla birlikte, 1 saatlik GB ön uygulaması, bu stresin etkilerini kısmen de olsa hafifleterek diğer stres gruplarına kıyasla daha yüksek RWC değerlerinin korunmasına katkı sağlamıştır. Bu sonuçlar, GB'nin osmotik stres koşullarında koruyucu etkisi olabileceğini desteklemektedir. Chen ve ark. (2008), glisin betainin (GB) stres koşullarında bağıl su içeriği üzerindeki olumlu etkisini kanıtlamışlardır.

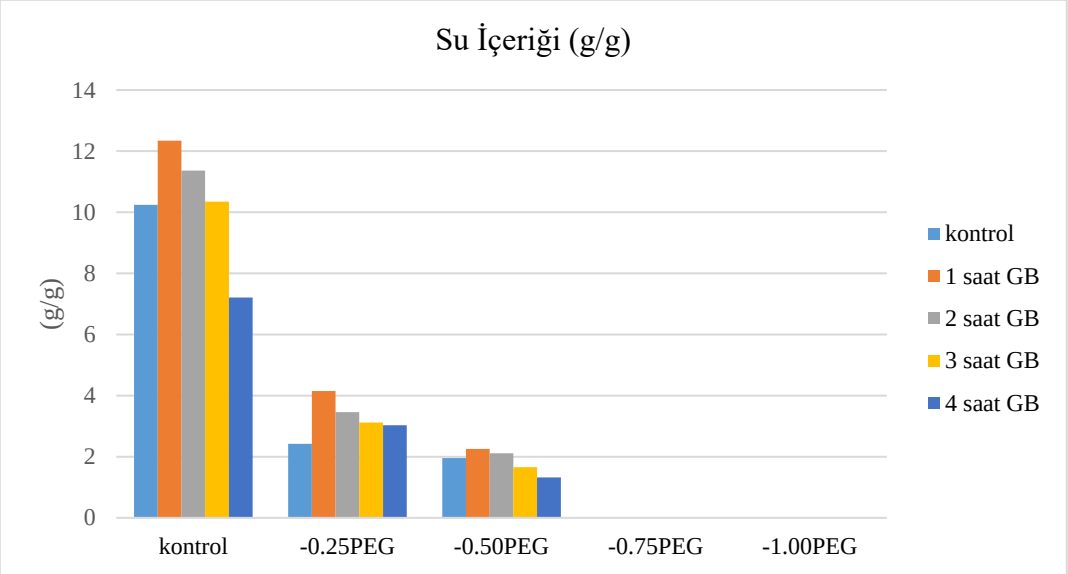


Şekil 3.7: GB ön uygulama süresinin PEG stresi altında bağıl su içeriğine etkisi

Su İçeriği (g/g)

Bitkilerin fizyolojik durumunu ve çevresel stres koşullarına verdiği tepkileri değerlendirmede su içeriği (WC, g/g) önemli bir göstergedir. Su içeriği, bitkilerin su tutma kapasitesini ve hücre içi turgor durumunu yansıtarak, özellikle kuraklık veya osmotik stres gibi suya bağlı çevresel etkilere karşı tolerans seviyelerinin belirlenmesinde kullanılır (Sade ve ark., 2012). Bu çalışmada, aspir (*Carthamus tinctorius* L.) bitkisinde su içeriği ortalamalarının 12.34 ile 1.32 g/g arasında değiştiği belirlenmiştir. Şekil 3.8'de de görüldüğü üzere, en yüksek su içeriği değeri kontrol + 1 saat glisin betain (GB) ön uygulaması yapılan grupta ölçülmüştür. Buna karşın, PEG dozunun artırılmasıyla su içeriğinde belirgin bir azalma gözlemlenmiştir. Bu durum, PEG'in ortamdaki ozmotik potansiyeli düşürerek bitki köklerinin su alımını sınırlandırmasıyla açıklanabilir. PEG-6000, hücre zarından geçemeyecek kadar büyük bir polimer olduğundan, ortamın su potansiyelini düşürerek yapay bir su stresi oluşturur (Verslues ve ark., 2006). Glisin betain uygulamasının ise PEG kaynaklı stres koşullarında su içeriği üzerinde olumlu bir etkisi olduğu görülmüştür. GB, hücre içi osmotik dengeyi koruyan ve hücre zarlarını stabilize eden bir osmolittir. Bu özellikleri sayesinde, bitkinin suyu daha etkin tutmasını sağlar ve su stresinin zararlarını azaltır (Chen ve Murata, 2008). Çalışmamızda, özellikle 1 saatlik GB ön uygulamasının en yüksek WC değerine sahip grup olması, GB'nin su tutma kapasitesini artırarak aspir bitkisinde osmotik stres toleransını yükseltebileceğini göstermektedir.

1.



Şekil 3.8: GB ön uygulama süresinin PEG stresi altında su içeriğine etkisi

SONUÇ

Bu çalışmada, farklı sürelerde uygulanan glisin betain (GB) ön uygulamalarının, polietilen glikol (PEG) ile oluşturulan kuraklık stres koşulları altında aspir (*Carthamus tinctorius* L.) tohumlarının çimlenme ve erken gelişim parametreleri üzerindeki etkileri incelenmiştir. Bulgular, artan PEG konsantrasyonlarının çimlenme hızı, çimlenme gücü, fide ve kök uzunluğu, toplam yaş ve kuru ağırlık ile bağıl su ve su içeriği gibi fizyolojik parametreleri anlamlı şekilde olumsuz etkilediğini göstermektedir. Bununla birlikte, özellikle 1 saatlik GB ön uygulaması, tüm PEG düzeyleri altında genel olarak en yüksek performansın elde edildiği uygulama süresi olmuştur. En yüksek çimlenme hızı (%86) ve çimlenme gücü (%91), sırasıyla –0.25 MPa PEG dozunda ve kontrol koşullarında 1 saat GB uygulamasıyla elde edilmiştir. Aynı süre, fide ve kök uzunluğu ile toplam yaş ve kuru ağırlıkta da olumlu etkiler göstermiştir. Ayrıca, bağıl su içeriği (%89.95) ve su içeriği (12.34 g/g) en yüksek düzeyde yine 1 saatlik GB uygulamasında gözlemlenmiştir. Bu bulgular, glisin betainin osmotik stres koşullarında su alımını kolaylaştırarak fizyolojik dengeyi desteklediğini ve bitki gelişimini iyileştirdiğini ortaya koymaktadır. Sonuç olarak, glisin betainin özellikle kısa süreli (1 saat) ön uygulamaları, PEG ile oluşturulan yapay kuraklık koşullarında aspir bitkisinin çimlenme ve erken gelişim sürecini destekleyerek kuraklık stresine karşı toleransını artırmada etkili olmuştur. Bu nedenle, glisin betainin uygun süre ve dozlarda tarımsal uygulamalara entegre edilmesi, kuraklık stresine karşı dirençli bitki üretiminde önemli bir strateji olabilir.

ABSTRACT

This study was conducted to determine the effects of chitosan priming on salt stress tolerance of soybean (*Glycine max* L.) KRİSTAL variety seeds. The seed germination stage is one of the most sensitive phases in the plant life cycle and is highly susceptible to environmental stress factors, particularly salt stress. Germination under high salinity conditions negatively affects both water uptake and metabolic activation processes, leading to a decrease in germination rate, germination speed, and seedling vigor. Therefore, enhancing plant resistance to salt stress during the seed stage is of critical importance for the sustainability of agricultural productivity. In this study, the seeds were pre-treated with 30 mg/l chitosan for different durations (control, 2, 4, and 6 h) and then subjected to different salt concentrations (control, 3, 6, and 9 dS/m) for germination. The experiment was conducted in the Field Crops Laboratory of the Faculty of Agriculture at Sakarya University of Applied Sciences, using factorial completely randomized design arrangement with three replications. The results indicated that increasing salt concentrations led to a general decrease in germination rate, germination vigor, seedling length, root length, total fresh weight, total dry weight, and relative water content (RWC). However, chitosan pretreatment mitigated these adverse effects and enhanced plant tolerance to salt stress. These findings suggest that chitosan priming could be an effective strategy for improving salt stress resistance in soybean seeds.

Keywords: Priming, Chitosan, Soybean, Salt stress

KİTOSAN İLE PRİMİNG UYGULAMASININ SOYA (*GLYCINE MAX* L.) TOHUMLARININ TUZ STRESİNE KARŞI ETKİLERİNİN İNCELENMESİ

ÖZET

Bu çalışma, soya (*Glycine max* L.) KRİSTAL çeşidinin tohumlarında kitosan ile priming uygulamasının tuz stresine karşı etkilerini belirlemek amacıyla gerçekleştirilmiştir. Tohum çimlenme evresi, bitkilerin yaşam döngüsündeki en hassas aşamalardan biridir ve çevresel stres faktörlerine, özellikle tuz stresine karşı son derece duyarlıdır. Tohumun yüksek tuzluluk koşullarında çimlenmesi, hem su alımını hem de metabolik aktivasyon süreçlerini olumsuz etkileyerek çimlenme oranı, çimlenme hızı ve fide canlılığında düşüşe yol açmaktadır. Bu nedenle, tohum aşamasında uygulanan tuz stresine karşı bitkisel dayanıklılığın artırılması, tarımsal verimliliğin sürdürülebilirliği açısından kritik öneme sahiptir. Çalışmada, tohumlar 30 mg/l kitosan ile farklı sürelerde (kontrol, 2 saat, 4 saat ve 6 saat) ön işlemden geçirilmiş ve ardından farklı tuz konsantrasyonlarda (kontrol, 3, 6, 9 dS/m) çimlenmeye alınmıştır. Deneme, tesadüfi parselleri faktöriyel deneme desenine göre üç tekerrürlü olarak Sakarya Uygulamalı Bilimler Üniversitesi Ziraat fakültesinin tarla bitkileri laboratuvarında yürütülmüştür. Elde edilen sonuçlara göre, artan tuz konsantrasyonu çimlenme hızı, çimlenme gücü, fide uzunluğu, kök uzunluğu, toplam yaş ağırlık, toplam kuru ağırlık ve bağıl su içeriği (RWC) gibi özelliklerde genel bir azalmaya neden olmuştur. Ancak, kitosan ile yapılan ön uygulama, bu olumsuz etkileri azaltarak bitkilerin tuz stresine karşı daha toleranslı hale gelmesini sağlamıştır. Sonuçlar, kitosan priming uygulamasının, soya tohumlarının tuz stresine karşı dayanıklılığını artırmada etkili bir yöntem olabileceğini göstermektedir.

Anahtar Kelimeler: Priming, Kitosan, Soya, Tuz stresi

1. GİRİŞ

Soya fasulyesi (*Glycine max* L.), dünya genelinde hem insanlar hem de hayvanlar için önemli bir protein ve yağ kaynağı olarak yetiştirilen ekonomik değeri yüksek bir baklagildir. Küresel bitkisel yağ üretiminin %55'ini, toplam yağ tohumu üretiminin ise %53'ünü karşılamaktadır. (Pratap ve ark. 2016; Liu ve ark. 2020). Tohumları %35 oranında protein, %21 oranında yağ içerir ve çeşitli mineraller (Fe, Cu, Mn, Zn vb.) ile B1, B2, B6 vitaminleri ve izoflavonlar bakımından zengindir. Aynı zamanda yüksek biyolojik azot fiksasyon kapasitesiyle toprak verimliliğine katkı sağlar (Shereen ve Ansari, 2001). Gıda endüstrisinin dışında; ilaç, kozmetik, boya, mürekkep ve pestisit gibi birçok sanayi kolunda da kullanılmaktadır. (Pratap ve ark., 2012) Günümüzde artan insan nüfusu, hayvansal yem ihtiyacı ve endüstriyel talep doğrultusunda, soya fasulyesi üretimi dünya çapında hızla artmaktadır. Soya fasulyesi, küresel ölçekte dördüncü en önemli tahıl ürünü olup en kârlı tarım ürünlerinden biridir (Ferreir ve ark., 2017; Ahmed ve ark., 2021). Tüm bu avantajlarına rağmen, soya fasulyesi kuraklık ve tuzluluk gibi çevresel streslere karşı hassastır. Soya fasulyesi, 2-5 dS/m (1,28 g/l - 3,2 g/l) tolerans eşiğine sahip tuzluluğa duyarlı bitki olarak sınıflandırılmaktadır (Taufiq ve ark., 2020).

Tuzluluk, dünya genelindeki tarımsal üretimi tehdit eden başlıca abiyotik stres faktörlerinden biridir. Özellikle NaCl kaynaklı tuzluluk, ozmotik ve iyonik stres yoluyla bitki çimlenmesini, büyümesini ve verimini olumsuz etkiler (Cho ve ark., 2021). Bu stres; su alımında azalma, sodyum toksisitesi, enzim ve protein aktivitesinde bozulma, hormon dengesizlikleri, hücre duvarı hasarı ve besin alımında (özellikle K ve N) yetersizlik gibi fizyolojik sorunlara yol açar. Ayrıca reaktif oksijen türlerinin (ROS) üretimini artırarak oksidatif stres meydana getirir. Bu durum, lipid peroksidasyonu, DNA mutasyonları, protein bozulmaları ve gen ekspresyonunda değişiklikler ile sonuçlanır (Mushtaq ve ark., 2022). Tuzluluğun etkisiyle bitkilerde kök gelişimi, yaprak alanı, bitki boyu ve tohum verimi azalırken; fotosentez, membran stabilitesi ve metabolik süreçler de zarar görür (Sinaga ve ark., 2023; Yunita ve ark., 2023). Dünyada yaklaşık 932 milyon hektar tarım arazisi tuzluluk tehdidi altındadır ve bu sorun, iklim değişikliği ve yanlış tarım uygulamalarıyla giderek büyümektedir (Fagodiya vd., 2022). Türkiye'de ise tarım alanlarının %1,7'si bu durumdan etkilenmektedir (Kaplan ve Kara, 2014; Çakmakcı ve ark., 2016).

Tohum çimlenmesi, bitki yaşam döngüsünün en hassas evrelerinden biri olup, özellikle tuzlu koşullarda başarılı çimlenme, bitki gelişiminde kritik öneme sahiptir (Acikbaş ve ark., 2021; Açıkbaş ve Özyazıcı, 2022). Yüksek tuz konsantrasyonları, tohumların su alımını engelleyerek çimlenme oranını düşürmekte; düşük seviyeler ise tohumun uykuda kalmasına neden olabilmektedir (Zuffo ve ark., 2020). Çimlenme ve erken fide gelişimi, bitki büyümesinin tuzluluğa en duyarlı evreleri arasında yer alır. Bu süreçteki başarı, yalnızca çevresel koşullar ve tuzun türüyle değil, aynı zamanda bitki türü, çeşidi ve tuz yoğunluğu ile de yakından ilişkilidir. Genotipler arası farklılıkların tanımlanması da, tuz stresine dayanıklı çeşitlerin geliştirilmesi açısından büyük önem taşımaktadır (Özyazıcı ve Açıkbaş, 2021).

Tohum çimlenmesi ve bitki gelişiminin önemi, sürdürülebilir tarım, ekosistem restorasyonu ve küresel gıda güvenliği açısından kritik olup, bu süreçlerde karşılaşılan zorluklar yenilikçi çözümlere olan ihtiyacı ortaya koymaktadır. Bu bağlamda, çevre dostu ve biyolojik olarak parçalanabilir özellikleriyle öne çıkan kitosan, bitki gelişimini destekleyen potansiyel bir ajan

olarak dikkat çekmektedir (Pichyangkura ve Chadchawan, 2015; Malerba ve Cerana, 2016; Crini, 2019; Shahrajabian ve ark., 2021). Kitosan, kitinin deasetillenmiş formu, kabukluların atıklarından, farklı mantar kaynaklarından ve son zamanlarda çiftlik böceklerinden elde edilebilen doğal bir biyopolimerdir. Kitosan yalnızca biyouyumlu ve biyolojik olarak parçalanabilir bir polimer olmakla kalmaz, aynı zamanda neredeyse her zaman biyolojik atıkların geri dönüştürülmesiyle üretilir (Iber ve ark., 2022; Chatterjee ve ark., 2022). Kitosanın çok çeşitli bitki türlerinde çimlenme, büyüme, çiçeklenme ve abiyotik stres toleransı üzerindeki uyarıcı etkilerini gösteren birçok çalışma bulunmaktadır (Abdel-Mawgoud ve ark., 2010; Pichyangkura ve Chadchawan, 2015; Malerba ve Cerana, 2016; Shahrajabian ve ark., 2021). Kitosan, tohumların su ve besin alımını artırarak çimlenme oranlarını ve erken fide gelişimini olumlu yönde etkiler. İçerdiği amino ve hidroksil grupları sayesinde ağır metallerle şelat oluşturarak toksik etkileri azaltır. Aynı zamanda doğal bir uyarıcı gibi davranarak, bitkilerde savunma sistemlerini aktive eden antimikrobiyal bileşiklerin sentezini teşvik eder. Jel benzeri yapısı nem emilimini artırırken, kök gelişimini destekleyerek besin alım kapasitesini güçlendirir (Rom´an-Doval ve ark., 2023). Kitosanın biyouyumluluğu, toksik olmaması ve ekosistem üzerinde kalıcı bir zarar bırakmaması, onu sentetik kimyasallara sürdürülebilir bir alternatif haline getirmektedir (Riseh ve ark., 2024).

Priming dediğimiz tohum astarlama, çimlenme sırasında tohumlardaki metabolik süreçleri uyarmak ve farklı çevre koşullarındaki performanslarını iyileştirmek için kullanılan bir tekniktir (Prajapati ve ark., 2020). Kitosanla tohum astarlama, stres altında büyümeyi destekleyen indolasetik asit ve serbest amino asitlerin birikimini artırmaktadır. Tuzluluk stresi, büyüme parametrelerinde, çözünür şekerlerde, çözünür proteinlerde, prolin ve malondialdehit içeriğinde bir azalmaya neden olurken; kitosan işlemi morfolojik özellikleri iyileştirmektedir (Attia ve ark., 2021; Bakhoum ve ark., 2022).

Bu çalışma, tuzluluk stresi altında soya fasulyesi genotipinin çimlenme yanıtlarını değerlendirmeyi ve kitosan ile yapılan ön işlem (priming) uygulamasının farklı tuz konsantrasyonlarına karşı tolerans geliştirmedeki etkisini belirlemeyi amaçlamaktadır.

2. MATERYAL ve YÖNTEM

Bu araştırma, 2025 yılında Sakarya Uygulamalı Bilimler Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Laboratuvarında, tesadüf parsellerine dayalı faktöriyel deneme deseninde ve üç tekerrürlü olarak kurulmuştur. Bitki materyali olarak, Trakya Tarımsal Araştırma Enstitüsü Müdürlüğü'nden temin edilen KRİSTAL soya (*Glycine max* L.) çeşidi kullanılmıştır. Çimlendirme için kullanılan cam petri kapları ve kurutma kâğıtları, 175 °C sıcaklıktaki etüvde 30 dakika bekletilerek sterilize edilmiştir. Tohumlara ön uygulama amacıyla biyostimülant olarak kitosan uygulanmıştır. Çimlendirme öncesinde kontaminasyon riskini en aza indirmek amacıyla tohumlar %3'lük sodyum hipoklorit (NaClO) çözeltisinde 15 dakika süreyle çalkalanmış, ardından üç kez saf su ile durulanmıştır. Tohumlar, 30 mg/l derişimindeki kitosan çözeltisi ile farklı sürelerde (kontrol, 2, 4 ve 6 saat) ön işlemden geçirilmiştir. Bu işlemin ardından, farklı tuz konsantrasyonlarına (kontrol, 3, 6 ve 9 dS/m) maruz bırakılarak çimlendirme testleri gerçekleştirilmiştir. Her tekerrürde 50 tohum kullanılmış olup, denemeler 23 ± 1 °C sabit sıcaklıktaki çimlendirme ortamında yürütülmüştür. Çimlenme oranı (%),

çimlenme gücü (%), kök uzunluğu (mm), fide uzunluğu (mm), toplam yaş ağırlık (g), toplam kuru ağırlık (g) ve bağıl su içeriği (%) parametrelerine ilişkin gözlemler, ISTA (2010) kurallarına göre 5. ve 8. günlerde yapılmıştır. Bağıl su içeriği (RWC), Weatherley (1950) tarafından önerilen formül ile;

RWC (%) = [(Yaş Ağırlık – Kuru Ağırlık) / (Tam Turgor Ağırlığı – Kuru Ağırlık)] × 100

Denemeden elde edilen veriler varyans analizine (ANOVA) tabi tutulmuştur. Tüm istatistiksel analizler MSTAT-C paket programı kullanılarak gerçekleştirilmiş; anlamlılık düzeyine bağlı olarak ortalamalar arasındaki farkların belirlenmesinde Duncan çoklu karşılaştırma testi uygulanmış ve elde edilen sonuçlar gruplandırılarak yorumlanmıştır.

3. BULGULAR VE TARTIŞMA

Bu çalışmada incelenen tüm özelliklere ilişkin varyans analizi sonuçları Tablo 3.1'de verilmiştir. Elde edilen verilere göre, kitosan uygulama süresi ile tuz seviyeleri arasındaki etkileşim, tüm parametreler açısından %1 düzeyinde istatistiksel olarak yüksek derecede anlamlı bulunmuştur ($P < 0.01$).

Tablo 3.1: Tuz stresi altında farklı kitosan uygulamalarıyla soya özelliklerinin varyans analizi sonuçları.

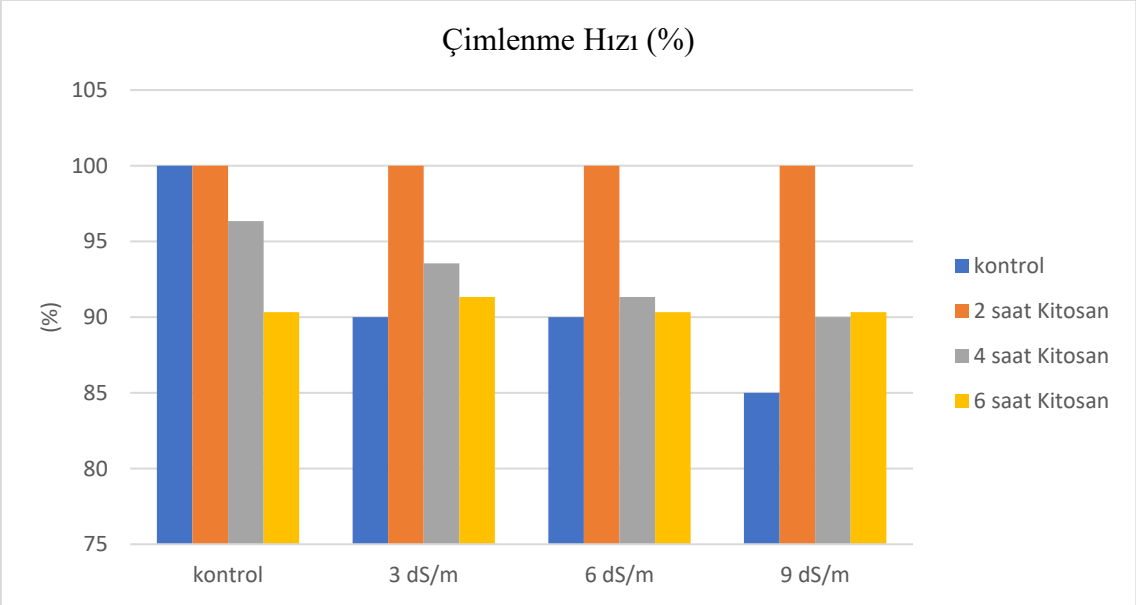
** P <0.01 seviyesinde önemli, * P <0.05 seviyesinde önemli olduğunu göstermektedir.

Çimlenme Hızı (%)

Şekil 3.1'de, farklı sürelerde uygulanan kitosan ön işlemlerinin (kontrol, 2, 4 ve 6 saat), çeşitli tuz stresi düzeyleri (0, 3, 6 ve 9 dS/m) altında soya tohumlarının çimlenme hızına etkisi gösterilmektedir. Analiz sonuçlarına göre, kitosan × tuz etkileşimi genel ortalamalar açısından istatistiksel olarak anlamlı bulunmuş ve en yüksek çimlenme hızı %100 ile kontrol grubunda ve 2 saatlik kitosan uygulamasına tabi tutulan 3, 6 ve 9 dS/m tuz konsantrasyonlarında elde edilmiştir. En düşük çimlenme hızı %85 oranında 9 dS/m tuz konsantarsyonunda ve kontrol grubunda gözlemlenmiştir. Bu sonuçlar, kitosanın tohum çimlenmesi üzerindeki olumlu etkilerini desteklemektedir. Benzer şekilde, daha önce yapılan çalışmalarda da kitosan uygulamalarının çimlenme oranını artırdığı ve bitkilerin tuz stresi gibi olumsuz çevresel

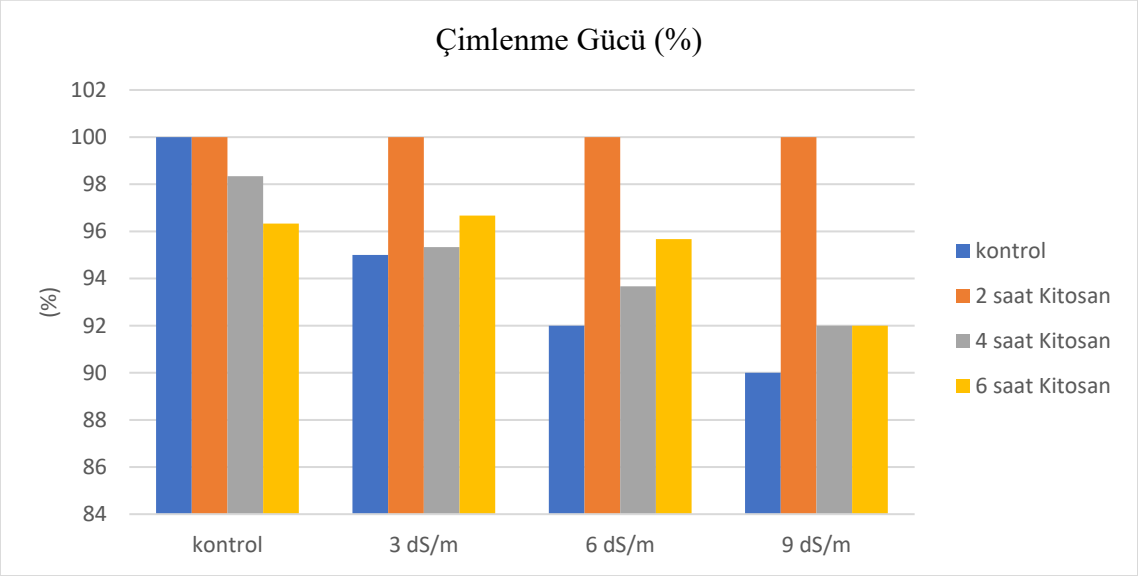
koşullara karşı dayanıklılığını yükselttiği bildirilmiştir (Guan ve ark., 2009; Farouk ve ark., 2011; El-Tarabily ve ark., 2021). Kitosanın bu etkisi, su alımını iyileştirme, hücre zarlarını stabilize etme ve stresle ilişkili fizyolojik mekanizmaları destekleme yeteneği ile ilişkilendirilmektedir.



Şekil 3.1: Kitosan ön uygulama süresinin Tuz stresi altında çimlenme hızına etkisi

Çimlenme Gücü (%)

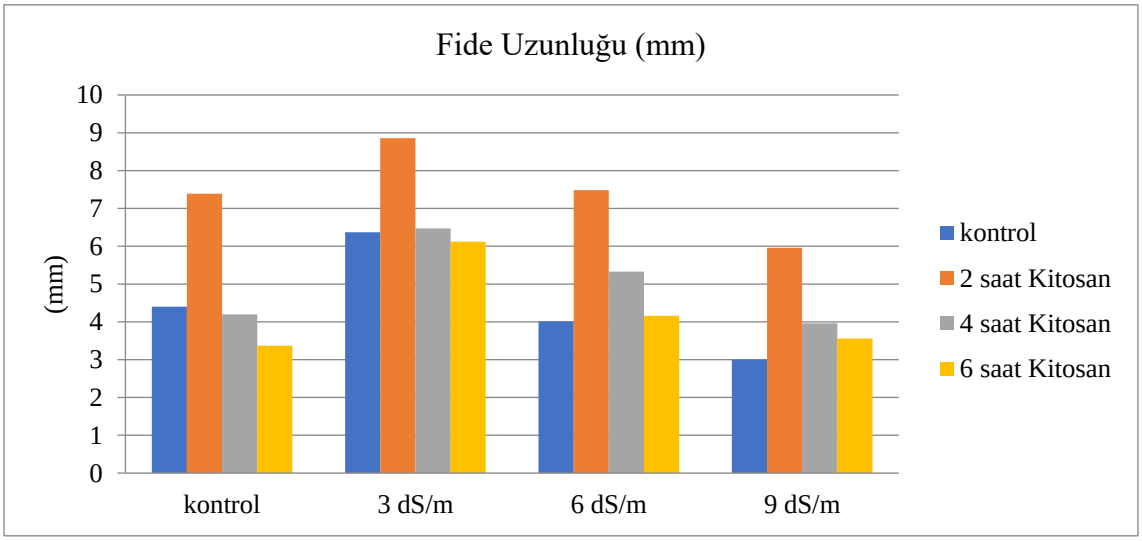
Şekil 3.2'de, farklı kitosan ön uygulama sürelerinin (kontrol, 2, 4 ve 6 saat) tuz stres koşulları altındaki soya tohumlarının çimlenme gücü üzerindeki etkileri sunulmaktadır. Denemenin 8. gününde elde edilen verilere göre, kitosan ve tuz etkileşiminin genel ortalamaları değerlendirildiğinde, en yüksek çimlenme gücünün (%100) hem kontrol grubunda hem de 2 saatlik kitosan ön işlemesine tabi tutulan 3, 6 ve 9 dS/m tuz konsantrasyonlarında gerçekleştiği belirlenmiştir. Buna karşın, kontrol grubunda çimlenme gücünün en düşük değeri %90 olarak tespit edilmiştir. Bu bulgular, artan tuz konsantrasyonlarının çimlenme performansı üzerinde baskılayıcı bir etki yarattığını ortaya koymaktadır. Ancak, 2 saat süreyle kitosan ile ön işleme tabi tutulan tohumların tüm tuz seviyelerinde %100 çimlenme gücü göstermesi, kitosanın tuz stresine karşı çimlenme üzerinde koruyucu bir etki sağladığını göstermektedir. Literatürde de benzer şekilde, kitosan uygulamalarının çimlenme ve fide gelişimi üzerinde olumlu etkiler sağladığı, özellikle tuz stresine karşı bitkisel dayanıklılığı artırdığı bildirilmektedir (Guan ve ark., 2009; Farouk ve ark., 2011; El-Tarabily ve ark., 2021).



Şekil 3.2: Kitosan ön uygulama süresinin Tuz stresi altında çimlenme gücüne etkisi

Fide Uzunluğu (mm)

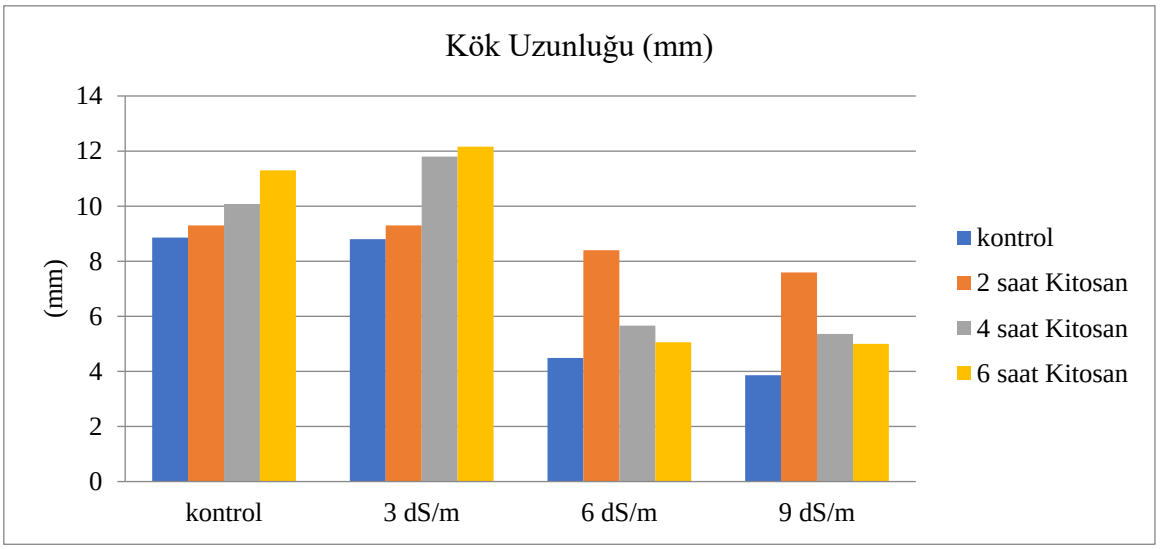
Elde edilen verilere göre, en uzun fide boyu (8.86 mm) 2 saatlik kitosan ön uygulaması ve 3 dS/m tuz konsantrasyonu kombinasyonunda gözlemlenmiştir (Şekil 3.3). Buna karşın, 9 dS/m tuz seviyesinde ve kitosan uygulanmayan (kontrol) grupta fide boyunun en düşük düzeyde kaldığı belirlenmiştir. Grafik verilerinin incelenmesi sonucunda, artan tuz konsantrasyonlarının fide boyunda anlamlı bir azalmaya yol açtığı görülmektedir. Bu durum, yüksek tuz konsantrasyonlarının bitki hücrelerinde osmotik stres oluşturarak hücre bölünmesi ve hücre uzamasını sınırladığı, dolayısıyla vegetatif büyümeyi olumsuz etkilediği şeklinde değerlendirilebilir (Munns ve Tester, 2008). Bununla birlikte, 2 saat süreyle uygulanan kitosan ön işlemesinin, özellikle yüksek tuz seviyelerinde, diğer uygulama sürelerine göre daha iyi fide gelişimi sağladığı tespit edilmiştir. Bu bulgu, kitosanın stres koşullarında bitkisel büyüme parametreleri üzerinde düzenleyici bir etki oluşturduğunu ve ozmotik dengeyi destekleyerek tuz stresine karşı toleransı artırdığını ortaya koymaktadır (Guan ve ark., 2009; Ali ve ark., 2014; El-Tarabily ve ark., 2021).



Şekil 3.3: Kitosan ön uygulama süresinin Tuz stresi altında fide uzunluğuna etkisi

Kök Uzunluğu (mm)

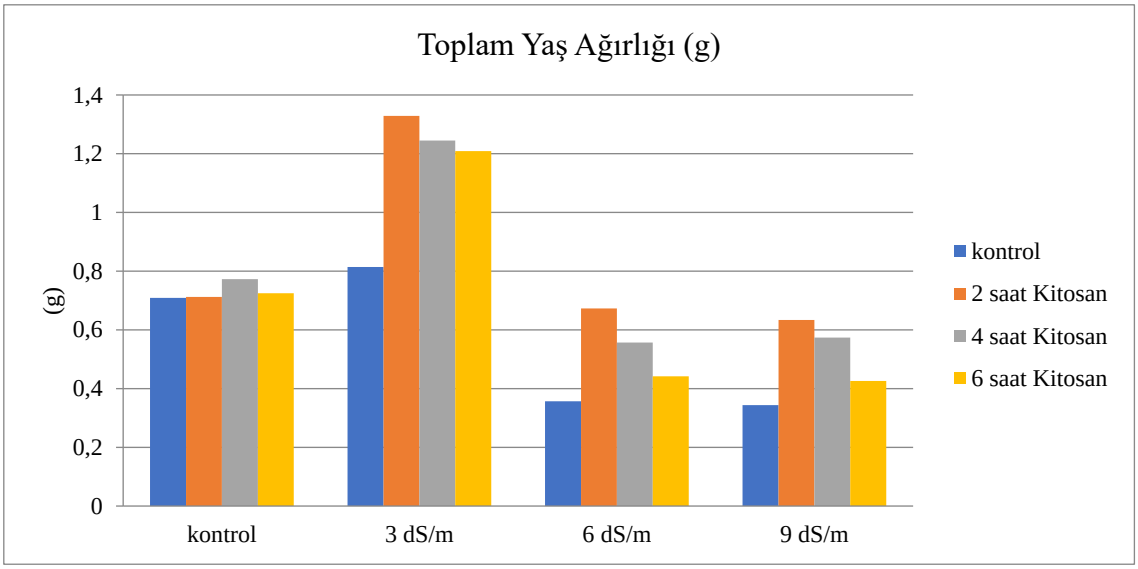
Şekil 3.4'te, farklı kitosan ön uygulama sürelerinin ve tuz kaynaklı stresin soya tohumlarının kök uzunluğu üzerindeki etkileri sunulmaktadır. Ortalama değerlere göre, en uzun kök gelişimi (12.16 mm), 6 saatlik kitosan ön uygulaması ve 3 dS/m tuz konsantrasyonu kombinasyonunda gözlemlenmiştir. Buna karşılık, en kısa kök uzunluğu (3.86 mm), kontrol grubunda 9 dS/m tuz uygulamasında kaydedilmiştir. Genel eğilim incelendiğinde, artan tuz konsantrasyonlarının kök gelişimini anlamlı düzeyde sınırladığı görülmektedir. Tuz stresinin, hücre bölünmesi ve uzamasını engelleyerek kök uzamasını baskıladığı bilinmektedir (Munns ve Tester, 2008; Yeo, 1998). Bununla birlikte, özellikle 2 saatlik kitosan ön uygulaması, yüksek tuz seviyelerinde bile diğer uygulama sürelerine kıyasla daha uzun kök gelişimini desteklemiştir. Bu durum, kitosanın hücre zarlarının stabilizasyonunu sağlayarak iyon dengesini koruması ve bitkisel büyümeyi teşvik edici etkisiyle açıklanabilir (Guan ve ark., 2009; El-Tarabily ve ark., 2021). Kitosanın antioksidan savunma sistemini aktive ederek tuz stresine karşı dayanıklılığı artırdığı da önceki çalışmalarla doğrulanmıştır (Ali ve ark., 2014; Abdel-Aziz ve ark., 2016).



Şekil 3.4: Kitosan ön uygulama süresinin Tuz stresi altında kök uzunluğuna etkisi

Toplam Yaş Ağırlığı (g)

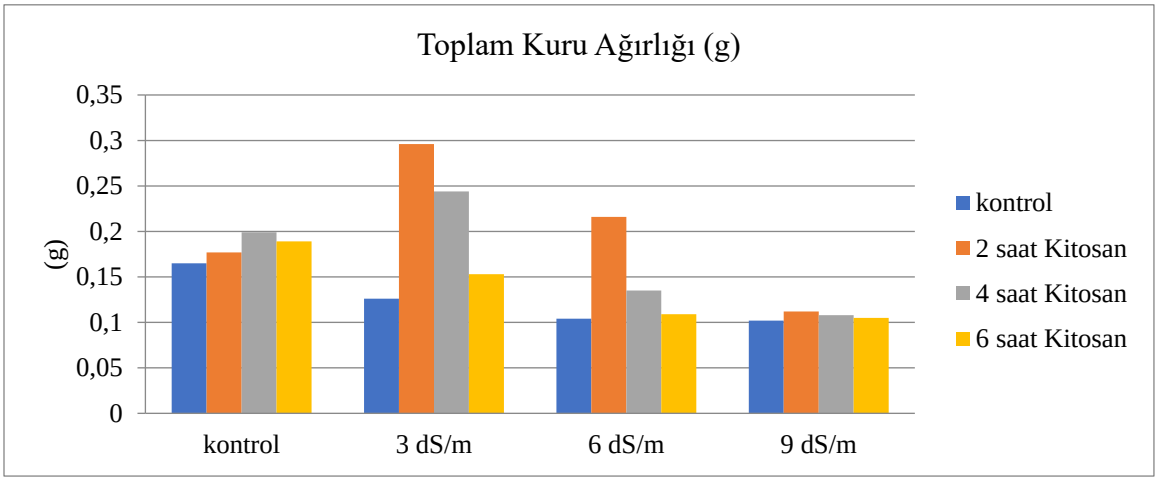
Şekil 3.5'te, farklı kitosan ön uygulama sürelerinin ve tuz stresinin soya fidelerinin toplam yaş ağırlığı üzerindeki etkisi gösterilmektedir. Elde edilen bulgulara göre, en yüksek toplam yaş ağırlığı (1.32 g), 2 saatlik kitosan ön uygulaması ve 3 dS/m tuz konsantrasyonu kombinasyonunda kaydedilmiştir. Buna karşın, en düşük yaş ağırlığı değeri (0.344 g), 9 dS/m tuz uygulamasında ve herhangi bir kitosan uygulaması yapılmayan kontrol grubunda gözlemlenmiştir. Genel olarak, artan tuz konsantrasyonları, soya fidelerinin yaş biyokütle üretimini anlamlı şekilde azaltmıştır. Bu durum, tuz stresinin bitkilerde hücre içi ozmotik dengeyi bozarak su alımını sınırlandırması ve metabolik aktiviteleri yavaşlatmasıyla ilişkilendirilmektedir (Acosta-Motos ve ark., 2017). Bununla birlikte, 2 saatlik kitosan uygulaması, özellikle orta ve yüksek tuz dozlarında (3, 6 ve 9 dS/m) diğer uygulamalara kıyasla daha yüksek yaş ağırlığı değerlerinin elde edilmesini sağlamıştır. Bu sonuçlar, kitosanın stres koşulları altında bitkisel büyümeyi teşvik edici etkilerini desteklemektedir. Kitosan, osmotik dengenin korunmasına, su alımının artırılmasına ve stres kaynaklı hasarların azaltılmasına katkı sağlayarak biyokütle üretimini olumlu yönde etkilemektedir (Ali ve ark., 2014; Khan ve ark., 2020).



Şekil 3.5: Kitosan ön uygulama süresinin Tuz stresi altında toplam yaş ağırlığına etkisi

Toplam Kuru Ağırlığı (g)

Şekil 3.6'da sunulan verilere göre, toplam kuru ağırlık açısından en yüksek değer 0.296 g ile 2 saatlik kitosan ön uygulaması ve 3 dS/m tuz konsantrasyonu kombinasyonunda elde edilmiştir. Buna karşın, en düşük toplam kuru ağırlık değeri (0.102 g), kontrol grubunda ve 9 dS/m tuz konsantrasyonunda kaydedilmiştir. Artan tuz düzeylerinin, tohumların toplam kuru madde birikimini anlamlı ölçüde azalttığı gözlemlenmiştir. Bu durum, tuz stresinin osmotik dengesizlik, iyon toksisitesi ve su yetersizliği gibi etkilerle bitki büyümesini ve biyokütle üretimini kısıtladığını göstermektedir (Munns ve Tester, 2008; Parida ve Das, 2005). Bununla birlikte, özellikle 2 saatlik kitosan ön uygulaması, orta düzeydeki tuz stresi koşullarında kuru madde birikimini destekleyerek osmotik stresin etkilerini hafifletmiştir. Ancak, yüksek tuz konsantrasyonlarında (özellikle 9 dS/m) biyokütle üretiminde gözlenen düşüş, kitosanın bu seviyelerdeki tuz stresini tam olarak telafi edemediğini ortaya koymaktadır. Bu bulgu, kitosan uygulamasının etkili olduğu stres aralığının sınırlı olabileceğini ve optimal uygulama koşullarının belirlenmesi gerektiğini düşündürmektedir.

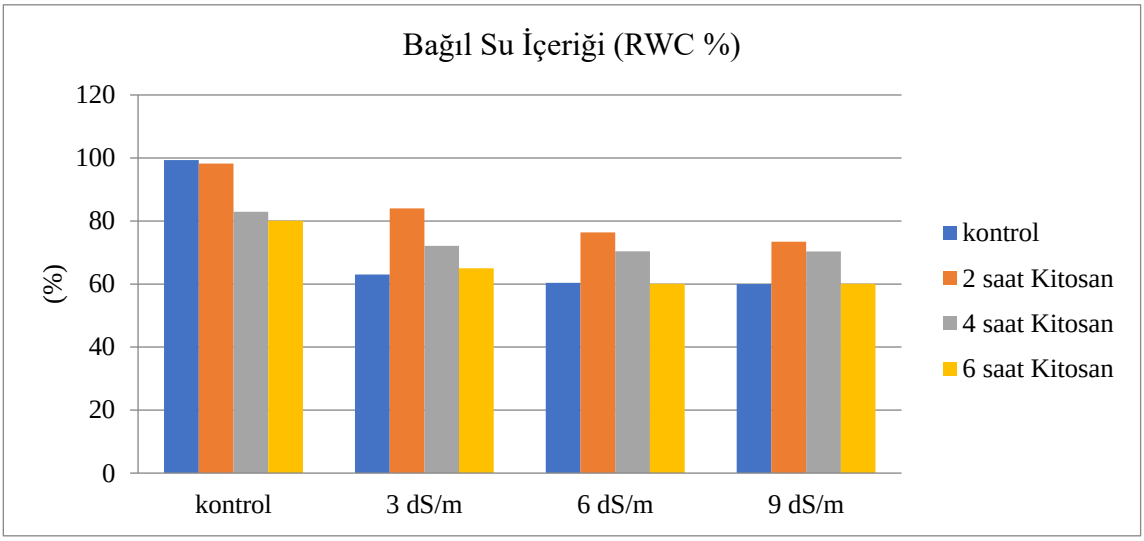


Şekil 3.6: Kitosan ön uygulama süresinin Tuz stresi altında toplam kuru ağırlığına etkisi

Bağıl Su İçeriği (%)

Bitkilerde bağıl su içeriği (Relative Water Content, RWC), bitkinin su durumunu ve fizyolojik dengesini değerlendirmede temel göstergelerden biridir. Yüksek RWC değerleri (%90–100), hücrelerin turgor basıncını koruduğunu, metabolik süreçlerin sağlıklı şekilde sürdüğünü ve bitkinin herhangi bir su stresi altında olmadığını göstermektedir. Buna karşın, RWC değerinin %50'nin altına düşmesi, bitkinin ciddi düzeyde su stresine maruz kaldığını, hücre zarı bütünlüğünün bozulabileceğini ve fotosentetik kapasitenin önemli ölçüde azalabileceğini işaret etmektedir (Barrs ve Weatherley, 1962; Yamasaki ve Dillenburg, 1999). Bu nedenle, RWC parametresi, çevresel stres koşullarına verilen fizyolojik tepkilerin izlenmesinde güvenilir bir belirteç olarak yaygın şekilde kullanılmaktadır.

Bu çalışmada elde edilen sonuçlara göre, en yüksek bağıl su içeriği (RWC) %99.35 ile stres uygulanmayan kontrol grubunda belirlenmiştir. Buna karşılık, en düşük RWC değeri %60.00 ile 9 dS/m tuz konsantrasyonuna maruz bırakılan ve kitosan uygulanmamış kontrol grubunda gözlemlenmiştir (Şekil 3.7). Tuz stresinin artan düzeylerde bağıl su içeriğini önemli ölçüde azalttığı görülmektedir. Bu durum, yüksek tuzluluk seviyelerinde meydana gelen osmotik stresin, hücre içi su potansiyelini düşürerek su alımını sınırlandırmasıyla açıklanabilir (Munns ve Tester, 2008). Ancak dikkat çekici şekilde, 2 saatlik kitosan ön uygulamasına tabi tutulan tohumlarda tüm tuz seviyelerinde bağıl su içeriği görece yüksek değerlerde kalmıştır. Bu bulgu, kitosanın osmotik dengeyi koruyarak membran stabilitesini artırabileceğini ve su kaybını azaltabileceğini göstermektedir (Gornik ve ark., 2008; Ali ve ark., 2021). Dolayısıyla kitosan, bitkilerin tuz stresine karşı fizyolojik adaptasyonlarını destekleyen etkili bir biyostimülant olarak değerlendirilebilir.



Şekil 3.7: Kitosan ön uygulama süresinin Tuz stresi altında bağıl su içeriğine etkisi

SONUÇ

Bu çalışmada, farklı sürelerde uygulanan kitosan ön işlemlerinin, çeşitli tuz stres düzeyleri altında soya tohumlarının çimlenme ve erken dönem fide gelişimi üzerindeki etkileri değerlendirilmiştir. Elde edilen veriler, tuz stresinin bitkisel fizyoloji ve büyüme parametreleri üzerinde baskılayıcı bir etki yarattığını açıkça ortaya koymuştur. Özellikle yüksek tuz konsantrasyonları (6 ve 9 dS/m), çimlenme hızı, fide ve kök uzunluğu, yaş ve kuru biyokütle ile bağıl su içeriği gibi fizyolojik göstergelerde anlamlı düşüşlere neden olmuştur. Ancak dikkat çekici bir şekilde, 2 saatlik kitosan ön uygulaması tüm tuz dozlarında hem çimlenme gücü hem de fide gelişimi parametrelerinde olumlu etkiler sağlamıştır. Bu uygulama, özellikle %100 çimlenme oranı ve en yüksek fide boyu (8.86 mm), yaş ağırlık (1.32 g) ve kuru ağırlık (0.296 g) gibi sonuçlarla öne çıkmış; ayrıca RWC'nin stresli koşullarda bile yüksek düzeylerde kalmasına katkı sağlamıştır. Bu bulgular, kitosanın bitkisel hücre zarlarını stabilize etme, ozmotik dengeyi koruma, su alımını destekleme ve antioksidatif savunma sistemlerini aktive etme potansiyelini vurgulamaktadır. Sonuç olarak, kitosan uygulaması, özellikle 2 saatlik ön işlem süresiyle, soya bitkisinin tuz stresine karşı dayanıklılığını artırmakta etkili bir yaklaşım olarak değerlendirilebilir. Bu biyopolimerin tarımsal uygulamalarda düşük maliyetli ve çevre dostu bir biyostimülant olarak kullanılabilirliği, sürdürülebilir bitki üretimi açısından önem taşımaktadır. Ancak, kitosan uygulamalarının etkili olduğu stres aralıklarının daha net belirlenebilmesi için farklı türler, dozlar ve uygulama sürelerini içeren ileri düzey çalışmaların yürütülmesi gerekmektedir.

ABSTRACT

Fetal calf serum and other chemical compounds are widely used as protein sources in the culture medium for in vitro nuclear maturation of bovine oocytes. After the transfer of embryos obtained from in vitro matured oocytes using fetal calf serum and other chemicals as a protein source in a culture medium, different physiological and metabolic syndromes can be encountered both in the fetal period and in the postnatal period. This situation has led to the search for different sources of protein in the culture medium for in vitro maturation. In this context, it has been tested as a royal jelly protein source in the culture medium during the in vitro maturation phase and successful results have been obtained. It is also of great importance to determine the capacity to obtain embryos from in vitro matured oocytes in environments using royal jelly. The aim of this study was to determine the division capacities of in vitro matured bovine oocytes in culture media with and without royal jelly as a protein source. In this context, the material of the study consisted of ovaries obtained after slaughter from different cattle breeds. The ovary was transferred to the laboratory under appropriate conditions. A total of 239 oocytes with suitable characteristics for in vitro maturation from these ovaries were obtained. These oocytes were subjected to in vitro maturation in culture media with and without royal jelly (control group) as a protein source. The parthenogenetic activation protocol was applied to mature oocytes that were subjected to in vitro maturation in culture media using different protein sources. The division rates of oocytes matured in culture media containing and not containing (control group) royal jelly as a protein source after parthenogenetic activation were determined as 35.5% and 42.4%, respectively ($P>0.05$). These results showed that the capacities to obtain embryos from in vitro matured oocytes in culture media with and without royal jelly were similar. In summary, this study has shown that embryos can be successfully obtained when royal jelly is used as a protein source in the culture medium during in vitro maturation.

Keywords: Bovine, oocyte, in vitro maturation, protein source, royal jelly

PROTEİN KAYNAĞI OLARAK ARI SÜTÜ KULLANILAN KÜLTÜR ORTAMLARINDA İN VİTRO OLGUNLAŞTIRILAN SIĞIR OOSİTLERİNİN PARTHENOGENETİK AKTİVASYON KAPASİTELERİNİN BELİRLENMESİ

ÖZET

Sığır oositlerinin in vitro nükleer olgunlaştırılmalarında kültür ortamında protein kaynağı olarak fötal buzağı serumu ve diğer kimyasal bileşikler yaygın bir şekilde kullanılmaktadır. Kültür ortamında protein kaynağı olarak fötal buzağı serumu ve diğer kimyasallar kullanılarak in vitro olgunlaştırılan oositlerden elde edilen embriyoların transferi sonrasında hem fötal dönemde hem de doğum sonrası dönemde farklı fizyolojik ve metabolik sendromlar ile karşılaşılabilinmektedir. Bu durum in vitro olgunlaştırmada kültür ortamında protein olarak farklı kaynakların arayışını ortaya çıkarmıştır. Bu kapsamda in vitro olgunlaştırma aşamasında kültür ortamında arı sürü protein kaynağı olarak denenmiş ve başarılı sonuçlar elde edilmiştir. Arı sütü kullanılan ortamlarda in vitro olgunlaştırılan oositlerden embriyo elde etme kapasitelerinin belirlenmeside büyük önem taşımaktadır. Bu çalışmada da, protein kaynağı olarak arı sütü kullanılan ve kullanılmayan kültür ortamlarında in vitro olgunlaştırılan sığır oositlerinin bölünme kapasitelerinin belirlenmesi amaçlanmıştır. Bu kapsamda çalışmanın materyalini farklı sığır ırklarından kesim sonrası elde edilen ovaryumlar oluşturmuştur. Ovaryumla uygun şartlarda laboratuvara transfer edilmiştir. Bu ovaryumlardan in vitro olgunlaştırma için uygun özelliklere sahip toplam 239 adet oosit elde edilmiştir. Bu oositler, protein kaynağı olarak arı sütü kullanılan ve kullanılmayan (kontrol grubu) kültür ortamlarında in vitro olarak olgunlaştırmaya tabi tutulmuşlardır. Farklı protein kaynağı kullanılan kültür ortamlarında in vitro olgunlaştırmaya tabi tutulan oositlerden olgunlaşanlara parthenogenetic aktivasyon protokolü uygulanmıştır. Parthenogenetik aktivasyon sonrası protein kaynağı olarak arı sütü içeren ve içermeyen (kontrol grubu) kültür ortamlarında olgunlaşan oositlerin bölünme oranları sırasıyla %35,5 ve %42,4 olarak belirlenmiştir ($P>0,05$). Bu sonuçlar, arı sütü kullanılan ve kullanılmayan kültür ortamlarında in vitro olgunlaştırılan oositlerden embriyo elde edilme kapasitelerinin benzer olduğunu göstermiştir. Özetle, bu çalışma in vitro olgunlaştırmada kültür ortamında protein kaynağı olarak arı sütünün kullanılması durumunda da başarılı bir şekilde embriyoların elde edilebileceğini ortaya koymuştur.

Anahtar Kelimeler: Sığır, oosit, in vitro olgunlaştırma, kültür ortamı, protein kaynağı, arı sütü

1.GİRİŞ

Hayvancılıkta üretim etkinliğinin artırılmasının yanısıra hayvan ıslahına yardımcı olabilecek yeni biyoteknolojiler geliştirilirken bir kısım teknolojiler de son yıllarda uygulama alanlarına yayılmaya başlamıştır. Bu biyoteknolojiler arasında kızgınlık senkronizasyonu, suni tohumlama, in vitro embriyo üretimi, klonlama Multıple Ovulasyon Embriyo Transferi (MOET) bulunmaktadır. Bu üreme biyoteknolojilerinin amacı, seçilmiş erkek ve dişilerden elde edilen döllerin sayısını artırmak ve generasyonlar arası süreyi kısaltarak çiftlik hayvanlarında genetic ilerlemeyi hızlandırmaktır.

Suni tohumlama ile erkeklere ait genetic ilerleme hızı artırılmıştır. Özellikle dişi sığırlarda yılda bir döl alınması nedeniyle generasyonlar arası süre daha uzun olmaktadır. Bu nedenle dişi sığırlarda generasyonlar arası süre kısaltılarak genetik ilerleme hızının artırılması için üreme biyoteknolojilerine daha fazla ihtiyaç duyulmaktadır. Dişilerde yılda birden fazla döl elde edilmesi için geliştirilen biyoteknolojilerden biriside in vitro embriyo üretimi teknolojisidir.

İn vitro embriyo üretimi; in vitro olgunlaştırma, in vitro fertilizasyon ve in vitro kültür aşamalarından oluşmaktadır. Ayrıca bu teknoloji ile üretilmiş buzağıların doğum ağırlıkları in vivo üretilmiş buzağılara göre daha yüksek olduğu tespit edilmiştir. Doğum ağırlığının artmasına paralel olarak yaşama gücüde artmaktadır (Kruip ve Dendaas,1997).

İn vitro olgunlaştırmada kültür ortamının kompozisyonu, oositlerin metabolizasmasını buna bağlı olarak da gelişimlerini etkilemektedir (Barnet ve Bavister, 1996). Bu nedenle in vitro olgunlaştırmada kültür ortamına ilave edilen protein kaynağı önemlidir. İn vitro olgunlaştırma aşamasında kültür ortamına ilave edilen protein kaynağı, oositlerin hem metefaz II aşamasına ulaşma oranlarını hem de fertilizasyon sonrası gelişimi etkilemektedir (Bavister, 1995). İn vitro olgunlaştırmada kullanılan protein kaynağı olasıl etkisini morula/blastosist aşamasına ulaşmada göstermektedir (Van de Sandt ve ark., 1990). Kültür ortamında protein kaynağı olarak serum, serum albumin, polivinil alkol (PVA) yaygın olarak kullanılmaktadır. Serum ve serum albumin gibi çeşitli yollarla canlılarlardan elde edilen protein kaynaklarında hastalık etkeni bulunma ve protein kaynaklarının bünyelerinde çeşitli patojenleri barındırm riski kültür ortamlarında kullanımlarını sınırlandırmaktadır (McEvoy ve ark., 2000). Bu durum külür ortamlarında risk barındırmayan protein kaynakları arayışını hızlandırmıştır. Şirin ve Kuran (2021) yaptıkları çalışmada in vitro olgunlaştırmada kültür ortamında arı sütünü protein kaynağı olarak başarılı bir şekilde kullanmışlardır. Bu çalışmada oositleri in vitro olgunlaşmaya tabi tutulmuşlar ve bu süreç sonunda protein kaynağı olarak arı sütü kullanılan kültür ortamında oositlerin olgunlaştığını tespit etmişlerdir. Arı sütünün in vitro olgunlaştırmada başarılı bir şekilde kullanılmasından sonra bu oositlerin embriyo oluşturma kapasitelerinin belirlenmesi gerekliliği ortaya çıkmıştır.

Bu çalışmada, kültür ortamında protein kaynağı olarak arı sütü kullanılarak olgunlaştırılan oositlerin partheneogenetik aktivasyon sonrası embriyo oluşturma kapasitelerinin belirlenmesi amaçlanmıştır.

2. MATERYAL ve METOT

Araştırma materyalini, kesim sonrası farklı sığır ırklarından elde edilen ovaryumlar oluşturmuştur.

Kesim sonrası elde edilen ovaryumlar 37 ^{0}C'de fosfat tamponlu tuz çözelitisi (PBS) içerisinde laboratuvara transfer edilmiştir. Laboratuvara getirilen ovaryumlar üzerinde bulunan 5-8 cm çapındaki follikül içersindeki oositler 18 g çapındaki şırınga yardımı ile toplanmışlardır. Follikül içi sıvı içerisinde bulunan oositler mikroskop altında incelenerek sitoplazması düzgün olanlar seçilmiştir. İki farklı kültür ortamı hazırlanmıştır. Bunlardan birincisi 9 ml bikarbonat tamponlu kültür medium içerisine 1 ml fötal buzağı serumu (FCS), 100 µl penisilin-streptomisin ve 20 µl sodyum pürüvat ilave edilerek hazırlanmıştır. Diğer kültür ortamı ise 9 ml bikarbonat tamponlu kültür medium içerisine protein kaynağı olarak %10 arı sütü, 100µl penisilin-streptomisin ve 20 µl sodyum pürüvat ilave edilerek hazırlanmıştır. Her iki kültür ortamı kullanmadan önce 39 ^{0}C'de %5 CO_2 ve % 95 nemli ortamda 2 saat süreyle gazlanmıştır. Daha sonra seçilen oositler bu kültür ortamları içerisine eşit sayıda transfer edilmiştir. Kültüğr ortamına transfer edilen oositler 22 saat süreyle 39 ^{0}C'de %5 CO_2 ve % 95 nemli ortamda olgunlaştırmaya tabi tutulmuşlardır. 22 saat süreyle olgunlaştırmaya tabi tutulan oositlerden metafaz-II aşamasına ulaşanlar mikroskop altında tespit edilerek her iki ortamda olgunlaşan oositlerin oranları belirlenmiştir. Her iki kültür ortamında olgunlaşan oositlerin parthenogenetik aktivasyon sonrası bölünme oranlarının tespit edilmesi için aşağıdaki protocol uygulanmıştır. Buna göre her iki gruptada olgunlaşan oositler önce 100 ml Hepes tamponlu kültür mediumuna % 7 oranında ethanol katılarak oda sıcaklığında 5 dakika süreyle bekletilmişlerdir. Bu işlemi takiben olgunlaştırılmış oositler iki defa Hepes tamponlu kültür mediumunda yıkanmışlardır. Ethanol ile aktivasyonu takiben 1.5 ml Hepes tamponlu kültür medium içerisine 10 µl cycloheximide ve 10 µl cytohalasin-B çözülerek ilave edilmiştir. Her iki gruptaki olgunlaştırılmış oositler 6 saat süreyle 39 ^{0}C'de %5 CO_2 ve % 95 nemli ortamda aktivasyona tabi tutulmuşlardır. 48. saat sonunda ise her iki gruptaki oositlerin bölünme oaranları mikroskop altında tespit edilerek kayıt altına alınmıştır.

3. BULGULAR ve TARTIŞMA

İki farklı kültür ortamında olgunlaştırılan oositlerin olgunlaşma oranları Tablo 1'de verilmiştir. Protein kaynağı olarak arı sütü ilave edilen kültür ortamında olgunlaştırılan oositlerin % 78'i olgunlaşırken protein kaynağı olarak fötal buzağı serumu kullanılan kültür ortamında olgunlaştırılan oositlerin ise % 77 oranında olgunlaştığı tespit edilmiştir. Gruplar arasında isitatistiksel olarak bir farklılık tespit edilmemiştir ($P>0.05$). Bu sonuçlar arı sütünün in vitro olgunlaştırmada protein kaynağı olarak kullanılabileceğini de ortaya koymuştur. Bununla birlikte Fukui ve Ono (1989) yaptıkları çalışmada in vitro olgunlaşma oranını % 59, Lonergan ve ark., (1996) % 64, Ali ve Sirard (2002) ise % 69 olarak tespit etmişlerdir. Çalışmamızda her iki kültür ortamında tespit edilen in vitro olgunlaşma oranları ise bu çalışmalarda elde edilen oranlardan daha yüksek olduğu görülmektedir. Ocana-Quenro ve ark., (1998) in vitro olgunlaştırma oranını % 78, Geshi ve ark., (2000) % 77 olarak oalrak tespit etmişlerdir. Bu çalışmalardaki in vitro olgunlaşma oranları ise çalışmamızdaki oranlar ile benzerlik göstermektedir.

Tablo 1. İki farklı kültür ortamında olgunlaştırılan oositlerin nükleer olgunlaşma oranları

Kültür Ortamı	İncelenen Oosit Sayısı	Kumulus Ekspansiyon Oranları (%)	Nükleer Olgunlaşma Derecesi (%)			
			Metefaz-I	Anafaz-I	Telefaz-I	Metafaz-II
FCS İlaveli	172	97	20	2	1	77
Arı Sütü İlaveli	179	94	19	2	1	78

İki farklı protein kaynağı kullanılan kültür ortamında olgunlaştırılan oositlerin parthenogenetik aktivasyon sonrası bölünme oranları Tablo 2'de verilmiştir. Buna göre protein kaynağı olarak arı sütü kullanılan kültür ortamında olgunlaştırılan oositlerin parthenogenetik aktivasyon sonrası bölünme oranı % 36 iken, protein kaynağı olarak fötal buzağı serumu kullanılan kültür ortamlarında olgunlaştırılan oositlerin bölünme oranı ise % 42 olarak tespit edilmiştir. Gruplar arasında bölünme oranları bakımından istatistiksel bir farklılık tespit edilmemiştir ($P>0.05$). Bu sonuçlar kültür ortamında protein kaynağı olarak arı sütü kullanılarak olgunlaştırılan oositlerden de benzer oranlarda embriyo elde edilebileceğini ortaya koymuştur. Bununla birlikte Otoi ve ark., (1996) yaptıkları çalışmada parthenogenetik aktivasyon sonrası bölünme oranını % 45, Matsushida ve ark., (2004) ise yaptıkları çalışmada % 68 olarak tespit etmişlerdir. Bu iki çalışmada elde edilen parthenogenetik aktivasyon sonrası bölünme oranları çalışmamızda elde edilen oranlarda daha yüksektir. Bu duruma rağmen çalışmamızda elde edilen bölünme oranları arı sütü kullanılan kültür ortamlarında in vitro olgunlaştırılan sığır oositlerinin başarılı bir şekilde bölünebileceği, yani embriyo oluşturma kapasitelerinin bulunduğunu ortaya koymuştur.

Tablo 2. İki farklı kültür ortamında olgunlaştırılan oositlerin parthenogenetik aktivasyon sonrası bölünme oranları

Kültür Ortamı	Olgunlaştırılan Oosit Sayısı	Bölünen Oosit Sayısı	Bölünme Oranı (%)
FCS İlaveli	59	25	42
Arı Sütü İlaveli	61	22	36

4.SONUÇLAR

İn vitro olgunlaştırmada kültür ortamında serum ve serum albümin gibi canlılardan elde edilen protein kaynaklarının kullanımı hem kültür ortamına patojen aktarma riski hem de elde edilen embriyoların gelişimi ve doğum sonrası dönemde ortaya çıkabilecek çeşitli metabolik ve fizyolojik sendromlar sonrası buzağı kayıplarına yol açma riski bulunmaktadır. Bu risk sonrası

kültür ortamlarında daha güvenilir ve bu riskleri minimuma indirecek alternatif protein kaynakları arayışı hızlanmıştır. Bu arayışlar sonrasında arı sütü in vitro olgunlaştırmada kültür ortamında başarılı bir şekilde kullanılmıştır. Fakat in vitro olgunlaştırılan oositlerin embriyo oluşturma kapasiteleri büyük önem taşımaktadır. Bu nedenle bu çalışmada in vitro olgunlaştırmada kültür ortamında protein kaynağı olarak arı sütü kullanılması durumunda embriyo oluşturma yani bölünme kapasitelerinin belirlenmesi ihtiyacı ortaya çıkmıştır. Yapılan bu çalışmada in vitro olgunlaştırmada protein kaynağı olarak arı sütü kullanılan kültür ortamlarında olgunlaştırılan oositlerin parthenogenetik aktivasyon sonrasında başarılı bir şekilde bölündükleri tespit edilmiştir. Bu duruma bağlı olarak in vitro olgunlaştırmada kültür ortamında protein kaynağı olarak arı sütü kullanımı sonucunda olgunlaştırılan oositlerden başarılı bir şekilde embriyoların elde edilebileceğini ortaya koymuştur.

ORCID NO: 0000-0002-0459-9589

ABSTRACT

The Karayaka breed is a local genetic resource cultivated in the Black Sea region. Although the Karayaka breed has a low fertility rate, its meat quality is one of our best breeds. The most important source of income in sheep breeding in Türkiye is lamb sales. Therefore, fertility in sheep and growth characteristics of lambs have a significant impact on the income obtained. In order to improve incomes, breeding programs in herds need to be carried out. It is known that the number of breeding programs carried out in sheep breeding in our country is very limited. For this reason, the "National Sheep and Goat Breeding Project of Türkiye" has been implemented throughout the country by the General Directorate of Agricultural Research and Policies, which is affiliated to the Ministry of Agriculture and Forestry. Within the scope of this project, the "Project for Breeding of Karayaka Breed in Tokat Province" has been started to be implemented. In this study, it was aimed to determine the fertility characteristics of Karayaka sheep and the average live weights of lambs in various periods within the scope of the project. The animal material of this study consists of the herds in this project. Data were collected from 26797 Karayaka lambs of 28325 Karayaka sheep which were born during 2020 to 2024 birth season. In this study, live weights in various periods, daily live weight gains, survival rates of lambs and some fertility traits of Karayaka sheep were examined. The average birth weight, 60th day and 90th day (weaning) weights and daily live weight gains of lambs were determined as 3.90 kg, 22.97 kg, 26.81 kg and 262.07 g, respectively. The average survival rate in lambs was 0.97. The infertility rate, birth rate, twins, fecundity and litter size in Karayaka sheep were 8%, 92%, 6%, 1.06 and 1.14, respectively. These results show that although the averages have fluctuated over the years depending on environmental factors, they have improved compared to the beginning of the project. In addition, the variation among the data showed that improvements would be achieved in terms of the characteristics emphasized through breeding studies.

TOKAT İLİNDE YETİŞTİRİLEN KARAYAKA KOYUNLARININ BAZI DÖL VERİM ÖZELLİKLERİ ve KUZULARIN BÜYÜME ÖZELLİKLERİNİN BELİRLENMESİ

ÖZET

Karayaka ırkı karadeniz bölgesinde yetiştiriciliği yapılan yerli bir gen kaynağımızdır. Döl verimi düşük olmasına rağmen et kalitesi en iyi ırklarımızdan birisidir. Türkiye'de, koyun yetiştiriciliğinde en önemli gelir kaynağını kuzu satışları oluşturmaktadır. Bu nedenle koyunlarda döl verimi ve kuzuların büyüme özellikleri elde edilen gelir üzerine önemli miktarda etki etmektedir. Gelirlerin iyileştirilmesi için sürülerde ıslah programlarının yürütülmesi gerekmektedir. Ülkemizde ise koyun yetiştiriciliğinde ıslah programlarının yürütüldüğü işletme sayısının çok sınırlı olduğu bilinmektedir. Bu nedenle, Tarım ve Orman Bakanlığına bağlı olan Tarımsal Araştırmalar ve Politikalar Genel Müdürlüğü tarafından ülke genelinde "Halk Elinde Hayvan Islahı Ülkesel Projesi" uygulamaya alınmıştır. Bu proje kapsamında ise Tokat İlinde Karayaka Irkının Halk Elinde Islahı Projesi" uygunlamaya başlamıştır. Bu çalışmada, proje kapsamında Karayaka koyunlarının döl verim özellikleri ile kuzuların çeşitli dönemlerdeki canlı ağırlıklarına ait ortalamaların belirlenmesi amaçlanmıştır. Bu çalışmanın hayvan materyalini ise bu projede yer alan sürüler oluşturmaktadır. Bu çalışmada 2020-2024 yılları arasında 28360 baş anaç hayvana ait toplam 26797 veri kullanılmıştır. Bu kapsamda kuzuların çeşitli dönem canlı ağırlıkları, günlük canlı ağırlık artışları, yaşama güçleri ve Karayaka koyunlarının bazı döl verim özellikleri incelenmiştir. Kuzuların ortalama doğum ağırlığı, 60.gün ve 90.gün (sütten kesim) ağırlıkları ile günlük canlı ağırlık artışları sırası ile 3.90 kg, 22.97 kg, 26.81 kg ve 262.07 gr olarak tespit edilmiştir. Kuzularda yaşama gücü ortalaması ise 0.97 olarak gerçekleşmiştir. Karayaka koyunlarında döl verim özelliklerinden kısırlık oranı, doğum oranı, ikizlik oranı, koç altı koyun başına kuzu sayısı ve doğuran koyun başına kuzu sayısı sırasıyla % 8, % 92, % 6, 1.06, 1.14 olarak gerçekleşmiştir. Bu sonuçlar, ortalamaların yıllar itibariyle çevresel faktörlere bağlı olarak dalgalanma göstermiş olmasına rağmen projenin başlangıcına göre iyileştiği ortaya konulmuştur. Ayrıca veriler arasındaki varyasyon ıslah çalışmaları ile üzerinde durulan özellikler bakımından iyileşmeler sağlanacağını da göstermiştir.

Anahtar Kelimeler: Koyun, Karayaka, Kuzu, Islah, Döl Verimi, Büyüme Özellikleri

1.GİRİŞ

Karayaka koyun ırkı Karadeniz Bölgesinde yetiştiriciliği yapılan yerli bir ırkımızdır. Döl verimi düşük fakat et kalitesi yüksektir (Akçapınar ve ark., 2005). Karayaka koyun ırkı Sinop'tan Giresun'a kadar uzanan Karadeniz sahili ile Amasya, Tokat il ve ilçelerinde yetiştirilen genelliklede Doğu ve Orta Karadeniz bölgesinin hakim bir ırkıdır. Karayaka koyunu yazın yayla, kışın ise sahil kesimine yakın yerlerde yetiştirilmektedir. Çoğunlukla yaylada üretim sistemi hakimdir (Çam ve ark., 2012). Türkiye koyun varlığının yaklaşık % 3'lük kısmını oluşturan bir ırkımızdır. İnce kuyruklu koyun ırklarından olan Karayaka koyunlarının vücutları beyaz, baş, kulak ve bacaklarda siyah lekeler görülebilir. Karayaka koyunu, öncelikle et daha sonra süt ve yapağısı için yetiştirilir (Kaymakçı ve Sönmez, 1996). Vücutları küçük yapıdadır (cidago yüksekliği 60-62 cm). Anaç koyunlarda canlı ağırlık 35-40 kg kadar, kirli yapağı verimi 2.0-2. 5 kg, lüle uzunluğu 20-30 cm,süt verimi 30-45 kg, laktasyon süresi 100-140 gündür (Akçapınar, 2000). Karayaka koyununda et (karkas ağırlığı) verimi 20-22 kg, döl verimi ise 1.18 civarındadır (Ulutaş ve ark., 2008).

Diğer hayvancılık kolların da olduğu gibi koyunculukta da önemli olan döl yani kuzu verimidir. Et, süt, yapağı gibi ekonomik olarak önemi olan hayvansal ürünler verimlilik açısından büyük ölçüde döl verimine bağlıdır (Altınel ve Hacıismailoğlu, 1993). Döl verimine; ırk, yaş, damızlıkta kullanım yaşı, bakım besleme, iklim gibi çevresel faktörler gibi bir çok etmen etkilidir (Esen ve Bozkurt 2001; Esen ve Özbey 2002).

Koyun yetiştiriciliği çok farklı verimlere sahip bir hayvancılık koludur. Günümüz koşullarında ise en önemli verimi et üretimi yani kuzu üretimi oluşturmaktadır. Bu nedenle ekonomik olarak daha fazla kazanç sağlanması için, döl verimi ve canlı ağırlık artış hızının iyileştirilmesi gerekmektedir.

Bu çalışmada proje kapsamında elde edilen verilerin değerlendirilmesi sonucunda canlı ağırlık ve döl verimi ile ilgili ortalamaların belirlenmesi amaçlanmıştır.

2.MATERYAL VE METOT

Araştırma materyalini, "Halk Elinde Hayvan Islahı Ülkesel Projesi" kapsamında Tokat ilinde 2020-2024 yılları arası sürdürülen "Tokat İlinde Karayaka Koyununun Halk Elinde Islahı" projesi kapsamında yer alan 28360 baş Karayaka ırkı koyun ile bu koyunlardan doğan 26797 baş kuzuya ait veriler oluşturmuştur.

Meraların açık olduğu dönemde anaç hayvanlar tamamen meralardan faydalandırılmışlardır. Mera dışı dönemde ise kapalı barınaklarda tutulmuşlardır. Kapalı ağıllarda barındırıldıkları dönemlerde hayvanların ihtiyaçlarına göre buğday ya da arpa samanı, yonca, arpa ve buğday danesi ile birlikte kesif yem kullanılmıştır.

Sürülerde koç katım işlemi, Temmuz-Eylül ayları arasında serbest koç katım usulüne göre yapılmıştır. 20-25 baş anaç koyun için 1 baş koç olacak şekilde planlama yapılmıştır.

Doğumu takiben kuzulara ilk 24 saat içerisinde kulak küpesi takılarak 30 kg'lık el baskülü ile tartılmış ve kayıt altına alınmıştır. Ayrıca kuzulara ait ana numarası, doğum tarihi, doğum ağılığı, cinsiyet ve doğum şekli gibi bilgilerde tutulmuştur. Kuzular doğumu takiben 7 gün

süreyle 24 saat olacak şekilde anneleri ile birlikte tutularak ağız sütünü almaları sağlanmıştır. 7. günden sonra ise kuzular annelerinden ayrılarak günde 2 ya da 3 defa olacak şekilde annelerini emmelerine izin verilmiştir. Kuzular 90 günlük yaşta sütten kesilmişlerdir.

Kuzular ortalama 90 günlük yaşta olacak şekilde bir tarih belirlenerek 50 gr hassasiyetindeki bir baskül ile tartılmış ve sütten kesim ağırlıkları tespit edilmiştir.

Kuzulama oranı (doğum oranı), tekiz doğum oranı, ikiz doğum oranı, kısırlık oranı, koç altı koyun başına doğan kuzu sayısı (KAKBDKS) ve doğuran koyun başına doğan kuzu sayısı (DKBDKS) ile 3 aylık yaştaki yaşama gücü Kaymakçı ve Sönmez (1996)'in bildirdiği şekilde hesaplanmıştır. Hesaplamalar aşağıdaki formüllere göre yapılmıştır.

$$\text{Kuzulama oranı (Doğum oranı)} = \frac{\text{Doğuran Koyun Sayısı}}{\text{Koç Altı Koyun Sayısı}} X100$$

$$\text{Tekiz Doğum Oranı} = \frac{\text{Tekiz Doğuran Koyun Sayısı}}{\text{Doğuran Koyun Sayısı}} X100$$

$$\text{İkiz Doğum Oranı} = \frac{\text{İkiz Doğuran Koyun Sayısı}}{\text{Doğuran Koyun Sayısı}} X100$$

$$\text{Kısırlık Oranı} = \frac{\text{Kısır Koyun Sayısı}}{\text{Koç Altı Koyun Sayısı}} X100$$

$$\text{KAKBDKS} = \frac{\text{Doğan Kuzu Sayısı}}{\text{Koç Altı Koyun Sayısı}} X100$$

$$\text{DKBDKS} = \frac{\text{Doğan Kuzu Sayısı}}{\text{Doğuran Koyun Sayısı}} X100$$

$$\text{Yaşama Gücü} = \frac{\text{3 Aylık Yaşa Ulaşan Kuzu Sayısı}}{\text{Doğan Kuzu Sayısı}} X100$$

Bu çalışmada elde edilen sütten kesim ağırlığı ile ilgili veriler yaşa göre düzeltilmiştir. Bu verilen düzeltilmesinde aşağıdaki formülden yararlanılmıştır.

$$DA=CA-(b\times(TY-90))$$

DA: Düzeltilmiş ağırlık

CA: Canlı ağılık

TY: Tartım tarihindeki yaş

b:Tartım yapılan dönemdeki kuzu yaşı ile canlı ağırlıkları arasındaki regresyon katsayısı

Ayrıca bu çalışmada kuzuların doğum ve sütten kesim ağırlıkları üzerine etki eden çevresel faktörlerin (yıl, cinsiyet ve doğum şekli) etkisi MINITAB 13.0 programında en küçük kareler metoduna göre istatistiksel analize tabi tutulmuştur. Ortalamaların karşılaştırılmasında ise Tukey çoklu karşılaştırma testi kullanılmıştır.

3. BULGULAR ve TARTIŞMA

Karayaka kuzularının yıl, cinsiyet, ana yaşı ve doğum şekillerine göre doğum ağırlık ortalamaları Tablo 1'de verilmiştir. Buna göre istatistiksel olarak en yüksek doğum ağırlığına 2021 ve 2023 yıllarında ulaşılmıştır ($P<0.01$). Ana yaşı bakımından en yüksek doğum ağırlığına sahip kuzular 5 yaşındaki analardan elde edilmiştir ($P<0.01$). Buna göre 5 yaşındaki analardan elde edilen kuzuların doğum ağırlığı ortalaması 3.95 kg olarak gerçekleşmiştir. Doğum ağırlığı bakımından tekizler ikizlere göre, erkeklerde dişilere göre daha yüksek doğum ağırlığına sahiptirler ($P<0.01$). Olfaz ve Saylam, (1996) tarafından yapılan çalışmada sonbahar ve ilkbaharda doğan Karayaka kuzularında doğum ağırlıkları sırası ile 3.20 kg ve 3.84 kg olarak tespit edilmiştir. Çalışmamızda ise ortalama doğum 3.92 kg olarak tespit edilmiş ve tespit edilen bu doğum ağırlığı Olfaz ve Saylam, (1996) tarafından yapılan çalışmada elde edilen doğum ağırlığı ortalamasından yüksek bulunmuştur. Ünal ve ark., (2003) ve Çam ve ark., (2012) tarafından yapılan çalışmalarda sırası ile doğum ağırlığı 3.10 ve 3.30 kg olarak tespit edilmiştir. Bu doğum ağırlığı ortalamaları da çalışmamızdaki doğum ağırlığı ortalamasından düşük olduğu görülmektedir. Bu sonuçlar yıllar itibariyle yürütülen ıslah çalışması ile birlikte doğum ağırlığının Karayaka kuzularında arttığını göstermiştir. Doğum ağırlığının artması kuzularda yaşama gücünün de artırarak doğan kuzuların hayatta kalmalarına katkıda bulunmaktadır. Aynı zamanda doğum ağırlığı yüksek olan kuzuların beside daha iyi performans verdikleri de bilinmektedir.

Tablo 1. Yıl, ana yaşı, doğum şekli ve cinsiyete göre doğum ağırlığı ortalamaları (kg)

	n	Ort.	SH
Genel Ortalama	26797	3,91	± 0,06

Dişi	12926	3,84	± 0,07[b]

*Aynı sütün da farklı harfler ile gösterilen ortalamalar arasındaki farklılıklar çok önemli bulunmuştur (P<0.01).

Karayaka kuzularının yıl, cinsiyet, ana yaşı ve doğum şekillerine göre 60. ve 90. gün yaşa göre düzeltilmiş ağırlık ortalamaları Tablo 2'de verilmiştir. En yüksek 60.gün ağırlığına 2024 yılında, 90.gün ağırlığı bakımından ise 2021 yılında ulaşılmıştır (P<0.01). 4 yaşındaki analardan elde edilen kuzularda en yüksek 60.gün ve 90. gün ağırlığına ulaşılmıştır (P<0.01). Hem 60. gün hem de 90. gün ağırlıkları bakımından tekizler ikizlere göre, erkekler ise dişilere göre daha yüksek ağırlıklara ulaşmışlardır (P<0.01). Yapılan bir çalışmada Karayaka ve Bafra kuzuları 90. Günde sütten kesilmişler ve sırasıyla sütten kesim ağırlıkları 19.5 ve 22.5 kg olarak tespit edilmiştir (Ünal ve ark., 2003). Bu çalışmada Karayaka kuzuları için tespit edilen 90 günlük yaştaki sütten kesim ağırlığı çalışmamızda tespit edilen sütten kesim ağırlığından hatta 60. gün ağırlık ortalamasından bile daha düşük olduğunu göstermektedir. Çalışmamızdaki 60. gün ve 90. gün (sütten kesim) ağırlıklarının daha yüksek olmasının sebebi sürülerde uzun

yıllardır yürütülen ıslah çalışmalarında sütten kesim ağırlığının (90.gün) damızlık seçiminde bir kriter olarak baz alınmasından kaynaklandığı söylenebilir. Bu duruma bağlı olarak yıllar itibariyle sütten kesim ağırlığı Karayaka kuzularında artmıştır. Sütten kesim ağırlığının artmasındaki diğer etkili bir faktör ise doğum ağırlığındaki artışı da söylenebilir. Doğum ağırlığı yüksek olan kuzularda sütten kesim ağırlıklarının da yüksek olduğu bilinmektedir.

Karayaka kuzularında sütten kesim yaşına (90.gün) kadar ki günlük canlı ağırlık kazançları yıl, ana yaşı, cinsiyet ve doğum şekline göre Tablo 3'de verilmiştir. En yüksek günlük canlı ağırlık artışına 2021 yılında ulaşılmış ve bu yıldaki günlük canlı ağırlık kazancı 276.20 kg olarak gerçekleşmiştir ($P<0.01$). Ayrıca 4 ve 5 yaşlı annelerden elde edilen kuzularda günlük canlı ağırlık kazançlarının daha yüksek olduğu görülmüştür ($P<0.01$). Tekiz doğan kuzular ikizlerden, erkek kuzularda dişilerden daha yüksek canlı ağırlık artışına sahiptirler ($P<0.01$). Aksoy (2008)'in yaptığı çalışmada Karayaka kuzularında 8 ve 20 haftalık yaşa kadar olan günlük canlı ağırlık artışlarının sırasıyla 180 ve 150 gr olduğunu bildirmiştir. Çalışmamızda elde edilen Karayaka kuzularında 90 günlük yaşa kadar olan canlı ağırlık kazançlarının ortalama 262.07 gr olduğu tespit edilmiş ve bu günlük canlı ağırlık kazancının Aksoy (2008) tarafından yapılan çalışmada elde edilen ortalamadan çok daha yüksek olduğu belirlenmiştir. Bu farkın hem doğum ağırlığı artışından hem de yürütülen ıslah çalışmalarından kaynaklandığı söylenebilir.

*Aynı sütün da farklı harfler ile gösterilen ortalamalar arasındaki farklılıklar çok önemli bulunmuştur (P<0.01).

Karayaka kuzularında sütten kesim yaşına (90.gün) kadar ki yaşama gücü oranları yıl, ana yaşı, cinsiyet ve doğum şekline göre Tablo 4'de verilmiştir. Karayaka kuzularında en yüksek yaşama gücü oranlarına 2023 ve 2024 yıllarında (% 95) ulaşılmıştır (P<0.01). En yüksek yaşama gücü oranı 4 yaşındaki analardan (% 95) elde edilen kuzularda elde edilmiştir (P<0.01). Yaşama gücü oranı tekiz kuzularda ikiz kuzulara göre, erkek kuzularda dişi kuzulara göre daha yüksek olduğu tespit edilmiştir (P<0.01). Belgüzar (2011) tarafından yapılan çalışmada Karayaka kuzularında 56. ve 140. günlerdeki yaşama gücü sırasıyla % 89.39 ve % 93.77 olarak tespit edilmiştir. Çalışmamızdaki 90. Gün yaşama gücü oranı Belgüzar (2011) tarafından yapılan çalışmada elde

edilen bulgular ile benzerlik göstermektedir. Ayrıca çalışmamızda elde edilen yaşama gücü ekonomik bir hayvancılık için kabul edilen sınırlar içerisinde olduğu da söylenebilir.

Tablo 3. Yıl, ana yaşı, doğum şekli ve cinsiyete göre 90. gün (sütten kesim) yaştaki günlük canlı ağırlık artış ortalamaları (gr)

Karayaka koyunlarında yıllara göre bazı döl verim ölçütleri Tablo 5'de verilmiştir. En yüksek doğum oranına 2023 yılında ulaşılmıştır. En yüksek ikiz doğum oranı 2020 yılında % 13 olarak gerçekleşmiştir. Tamer ve Şirin (2021) tarafından yapılan çalışmadaki ikiz doğum oranı %8 olarak tespit etmişlerdir. Çalışmamızda elde edilen ikizlik oranının daha yüksek olduğu tespit edilmiştir. Bu durum yıllardır sürülerde yapılan ıslah çalışmasında damızlık olarak ikiz doğmuş kuzuların daha fazla damızlık olarak kullanılmasından kaynaklandığı söylenebilir. En düşük

kısırlık oranı ise % 7 ile 2023 yılında gerçekleşmiştir. Yine Tamer ve Şirin (2021) tarafından yapılan çalışmada elde edilen kısırlık oranı % 13.8 olarak tespit edilmiştir. Çalışmamızda ise kısırlık oranı çok daha düşük tespit edilmiştir. Koç altı koyun başına kuzu sayısı en yüksek olarak 2020 yılında 1.10 şeklinde gerçekleşirken, doğuran koyun başına düşen kuzu sayısı yine 2020 yılında en yüksek 1.19 olarak gerçekleşmiştir. Olfaz ve Saylam (1996) yılında yapılan çalışmada KAKBDKS ve DKBDKS sırası ile 1.0 ve 1.15 olarak gerçekleşmiştir. Çalışmamızda elde edilen değerler ile benzerlik gösterdiği söylenebilir.

4. SONUÇLAR

Sonuç olarak yıllar itibariyle doğum ağırlığında dalgalanmaların olduğu görülmektedir. Bunun nedeni ise çevre koşullarından kaynaklanmaktadır. Koyunculuğun ülkemizde meraya dayalı bir hayvancılık faaliyeti olması nedeniyle o dönemki mera koşulları ve mera koşullarına ilave yapılan ek yemlemeler doğum ağırlığı üzerinde ciddi değişimlere yol açmaktadır. Çalışmamızda yıllar itibariyle doğum ağırlıklarındaki artış ve azalışların nedeni de bu duruma bağlı olarak gerçekleşmiş olabilir. Doğum ağırlığı bakımından Karayaka kuzuları için kabul edilebilir değerler olmakla birlikte sürülerde yürütülen ıslah çalışmalarının sonucu olarak bu ırk için daha önceki literatürler de belirlenen doğum ağırlıklarının üzerinde olduğu da görülmektedir. Bununla birlikte sütten kesim ağırlığı da yıllar itibariyle yükselmiştir. Sütten kesim ağırlığında ki iyileşmeler damızlık seçiminde bu ağırlığın referans olarak kabul edilmesine bağlı olduğu söylenebilir. Ayrıca kuzuların yaşama gücünde de iyileşmeler olmuştur. Bu durum kuzuların bakım ve beslenmesi noktasında yeniliklerin sürülerde uygulanması ile sağlanmıştır. Döl verim ölçütlerinde ise bu ırk için belirlenen ortalamaların genellikle üzerinde olduğu, özetle döl veriminin iyileştiği de söylenebilir. Ayrıca kısırlık oranlarının azaldığı tespit edilmiştir.

Sonuç olarak, yıllar itibariyle yürütülen ıslah çalışmasına bağlı olarak Karayaka ırkında canlı ağırlık ve döl veriminde ciddi iyileşmelerin olduğu tespit edilmiştir.

ABSTRACT

The total of volatile compounds determines strawberry (Fragaria × ananassa) odor and taste alike while directly creating consumer preferences and commercial potential. This article delves into strawberry volatile compound genetic determinants using Quantitative Trait Loci (QTL) mapping wherein researchers apply Genome-Wide Association Studies (GWAS). The identification of volatile compound synthesis responsible genes and genomic regions becomes possible due to these genetic techniques , including esters along with aldehydes and terpenes. these Genetic tools integration provides beneficial knowledge to develop better strawberry flavors through breeding programs. The study of genetic volatile compound regulation helps breeders produce marketable varieties with better consumer appeal and enhanced market value.

Keywords: Strawberry, aroma, volatile compounds, QTL, GWAS

ÇİLEKLERDE UÇUCU BİLEŞİK ÜRETİMİNİN GENETİK TEMELİ: QTL HARİTALAMA VE GWAS'TAN ELDE EDİLEN BİLGİLER

ÖZET

Aroma ve tad temel çilek (Fragaria × ananassa) uçucu bileşiklerinin toplamı belirlerken doğrudan da sanı ve bunun niteliği de ticaret üstlendi. Yeni makale, araştırmacıların araştırma konusu olan genom çapında bağlantı çalışmaları (GWAS) araçlarını uygulama Niceliksel Karakter Bölgesi Biçimleri (QTL) haritalama yaparak çilek uçucu bileşiklerinin genetik galer◌ิเศษlerini anlamaya çalışıyor. Bu genetik teknolojiler ile esterler, aldehitler, terpenler dahil olmak üzere aromatik bileşik sentezinden sorumlu genlerin ve genomik alanların tanımlanması mümkün olur. Bu genetik araçların kullanımı on yıllar içinde gen kat hizmetleri sayesinde daha iyi çilek aromaları_AVAILABLE. Genetik uçucu bileşik/configürasyonunun incelenmesi ıslahçıların daha tüketici çekiciliği ve daha yüksek market değeri ile pazarlanabilir çeşitler üreterek yardımcı olur.

INTRODUCTION

Strawberry is among the most consumed berries in the world. During the last decades, Strawberry programs have been mainly characterized by fruit quality and disease. resistance. However, consumers call for improved fruits' taste (Folta and Klee, 2016). and for this reason, quality traits such as volatiles and polyphenolic content has gained importance in breeding programs. Various volatile compounds that are enhanced in the fruit materials ripening, is seen to be part of a healthy nutrient label (Goff and Klee, 2006).

Of volatile organic compounds (VOCs) in strawberries 979 were identified. (Ulrich et al., 2018).but humans only detect a handful of them making up the strawberry aroma y aroma (Schieberle and Hofmann, 1997; Urrutia et al., 2017)The large variability genetics can explain strawberry volatile compound in strawberry. maturity stage and post harvest factors (Schwieterman et al. 2014). The synthesis of volatile compounds such as esters, aldehydes, alcohols and terpenes is of importance to the characteristic aroma of the strawberry. These compounds are of great importance in the determination of the sensory experience of the fruit and consumer preference (Urrutia et al., 2017). The complex taste profile of strawberries is a result of the balance shared between these volatile compounds, which differ according to the cultivar and the growing environment and the level of ripeness of the fruit (Fan et al., 2022). The biosynthesis of volatile compounds is controlled by a set of genetic and environmental factors. The recent advances in genomics especially through Quantitative Trait Loci (QTL) mapping and Genome-Wide Association Studies (GWAS) have revealed new opinions that pertain to the genetic causation of volatile production in strawberries (Zorrilla-Fontanesi et al. 2020). These were molecular tools and helped to identify areas of the genome were responsible for specific genes and genomic areas that compound volatile compounds and utilize these to develop strategies of breeding to enhance the flavor and aroma of the strawberry fruits. The identification of molecular determinants of aroma formation in strawberry is of great importance for breeding efforts of improved fruit quality. Combining genomic information with the biochemical pathways of VOC synthesis provides opportunities for VD targeted breeding via marker-assisted selection or genomic prediction. This paper summarizes recent findings for the genetic dissection of volatile compound biosynthesis in strawberry with emphasis given to QTL and GWAS analyses and their implications for genetic improvement of strawberry flavor using molecular breeding.

GENETIC BACKGROUND OF VOLATILE COMPOUND PRODUCTION.

The biosynthetic pathways of volatile compounds are numerous and for each class of compounds a different biosynthetic pathway exists. For instance, esters that make a considerable contribution to the delicious aroma fruit of strawberries are mainly produced by alcohol acyltransferases (Aharoni et al., 2004). Analogously, terpenes that add green, floral accents to strawberries are synthesized by terpene synthases (Fan et al., 2022). The regulation of these pathways is under genetic control by many genes, several of which map to environmental variables such as temperature, light, and soil components (Urrutia et al., 2017). The genetic mechanism underlying production of volatile compounds in strawberries, as well as in many other crops, is complicated by the existence of many alleles located on different loci.

QTL mapping is a strong tool for localization of genome regions that govern the traits such as production of volatile compounds. By intercrossing genetically different parental lines with opposite volatile profiles, QTL mapping of cv11 and cv12 will allow the identification of genomic regions correlated with the production of certain volatile compounds (Zorrilla-Fontanesi et al., 2020).

QTL MAPPING IN STRAWBERRIES

QTL mapping in strawberries has proven to be an effective way to identify the genetic basis of volatile compound production. In a typical QTL mapping study, a cross is made between two parental lines that exhibit differences in a particular trait, such as the levels of specific volatile compounds. The F1 population resulting from the cross is then phenotypically evaluated, and genetic markers are used to associate the observed variation in volatile compounds with specific regions of the genome (Zorrilla-Fontanesi et al., 2022).

Recently, a QTL mapping study across strawberries has identified several genomic sites that are directly tied to ester and terpene synthesis, and genes responsible for their synthesis are identified as key candidates (Zorrilla-Fontanesi et al., 2020). The information about these genetic regions has allowed researchers to choose specific markers to direct breeding strategies for strawberries bearing better aroma and flavour.

GWAS IN STRAWBERRY FLAVOR IMPROVEMENT

Genome-Wide Association Studies act as dissection of the genetic basis of building volatile compounds. GWAS treats the advantage of natural variation present in an existing population where quantile-quantile methods study the results from controlled crosses. When specialists use genetic markers in searching for relationships with measurable properties, they can find genome regions associated with the levels of strawberry volatile compounds (Fan et al., 2022).

Most recently, researchers who have employed GWAS in the strawberries have identified several genomic regions involved with the build-up of key volatile substances, including esters and terpenes key for floral fragrance (Zorrilla-Fontanesi et al., 2022). The results will prove of great use to the breeders of strawberries who will succeed in boosting flavor in general across the fruit. GWAS allows for accurate identification of the genes responsible for volatile compound synthesis, which is emphasized by this study, that can help in designing better genome-assisted breeding strategies.

INTEGRATION OF QTL AND GWAS FOR STRAWBERRY BREEDING.

Putting together results of the QTL mapping and GWAS provides a deeper understanding of the genetic organization controlling volatile compound synthesis in strawberries. Combining advantages of QTL mapping and GWAS allows researchers to identify candidate genes and regulatory network(s) that will control flavoration. Such insights are needed to design breeding

regimes, which address improving strawberry flavor of the fruit – a vital necessity in light of the rises of competition in the fruit market (Zorrilla-Fontanesi et al., 2022).

Both flavor quality as well as improvement of crucial characters like yield, disease tolerance and shelf life in the breeding of strawberries will gain from the use of genomic tools like QTL mapping and GWAS. Because there is increasing demand for superior-tasting strawberries, discovery of the genomic basis for the flavor substances is critical to meeting this demand.

CONCLUSION

Strawberry volatile compound synthesis is controlled by intricate genetic arrangements influenced by environmental conditions. QTL mapping and GWAS have proved their usefulness in identification of the genes and chromosomal regions responsible for the formation of significant volatile compounds. By combining these methods, researchers are in a position to increase the flavour characteristics of strawberries therefore honouring the interest of both farmers and the product consumers. As breeders try to make the taste of strawberries better, it is eventually going to be fundamental that the genetic loci controlling the production of volatile compounds be identified for creating flavorful, premium quality varieties.

ABSTRACT

Silage is a basic feed source in animal husbandry, and quality silage production is of critical importance in terms of reducing animal feeding costs and increasing environmental sustainability. This study was carried out to determine the effects of five different commercial inoculants added to millet (Panicum miliaceum L.) on silage quality, microorganism growth, and aerobic stability. The study was conducted by vacuuming a control group (Control-M) and five different inoculant groups—MSILD, MSILAP, MLAC, MSILAL, MMIC—in 2 kg packages with eight replications. The prepared silage samples were left to ferment under laboratory conditions, and physical, chemical, microbiological, and aerobic stability analyses were performed after 90 days. As a result of chemical analyses, inoculant addition provided a significant decrease in the pH levels of the silages ($P<0.01$), with the lowest pH value (4.39±0.00) determined in the MMIC group. The highest crude protein (13.07±0.03%) was determined in the MSILAL group, and the highest water-soluble carbohydrate (WSC) value (13.40°Brix) was determined in the MLAC group. Although no statistically significant difference was observed between the groups in terms of color parameters, inoculant applications showed positive effects on color stability in ΔE* and hue (h) values ($P>0.05$). In microbiological analyses, the highest lactic acid bacteria density (36.33 log5 cfu/g) was determined in the MMIC group, and yeast-mold development was detected at the lowest level. This supports the aerobic stability-enhancing effects of inoculants. In terms of nutritional value parameters, the highest digestible dry matter (69.45%), total digestible nutrient (69.45%), metabolic energy (2.26 Mcal/kg), and net energy for milk yield (NEL: 1.41 Mcal/kg) values

were obtained in the MSILAL group. As a result, inoculant applications significantly improved silage quality, increased fermentation efficiency, decreased pH levels, suppressed yeast and mold formation, and improved aerobic stability. The MSILAL and MMIC groups showed superior performance compared to other groups, especially in terms of chemical composition, energy value, and microbiological quality.

THE EFFECTIVENESS OF MICROBIAL INOCULANTS IN IMPROVING SILAGE QUALITY: MILLET (*Panicum miliaceum L.*)

ÖZET

Silaj, hayvancılıkta temel bir yem kaynağı olup, kaliteli silaj üretimi, hayvan besleme maliyetlerinin azaltılması ve çevresel sürdürülebilirliğin artırılması açısından kritik öneme sahiptir. Bu çalışma, darıya (Panicum miliaceum L.) ilave edilen beş farklı ticari inokulantın silaj kalitesi, mikroorganizma gelişimi ve aerobik stabilite üzerine etkilerini belirlemek amacıyla yapılmıştır. Çalışma, bir kontrol grubu (Kontrol-M) ve beş farklı inokulant grubu - MSILD, MSILAP, MLAC, MSILAL, MMIC- 2 kg'lık paketler halinde vakumlanarak sekiz tekrarlamalı olarak yürütülmüştür. Hazırlanan silaj örnekleri laboratuvar koşullarında fermente edilmeye bırakılmış ve 90 gün sonra fiziksel, kimyasal, mikrobiyolojik ve aerobik stabilite analizleri yapılmıştır. Kimyasal analizler sonucunda, inokulant ilavesi silajların pH seviyelerinde önemli bir düşüş sağlamış ($P<0,01$), en düşük pH değeri (4,39±0,00) MMIC grubunda belirlenmiştir. En yüksek ham protein (%13,07±0,03) MSILAL grubunda, en yüksek suda çözünür karbonhidrat (WSC) değeri (13,40°Brix) ise MLAC grubunda belirlendi. Renk parametreleri açısından gruplar arasında istatistiksel olarak anlamlı bir fark gözlenmezken, inokulant uygulamalarının ΔE* ve renk tonu (h) değerlerinde renk stabilitesi üzerinde olumlu etkileri olduğu görüldü ($P>0,05$). Mikrobiyolojik analizlerde ise en yüksek laktik asit bakteri yoğunluğu (36,33 log5 cfu/g) MMIC grubunda belirlenirken, maya-küf gelişimi en düşük seviyede tespit edilmiştir. Bu durum inokulantların aerobik stabiliteyi artırıcı etkilerini desteklemektedir. Besin değeri parametreleri açısından en yüksek sindirilebilir kuru madde (%69,45), toplam sindirilebilir besin maddesi (%69,45), metabolik enerji (2,26 Mcal/kg) ve süt verimi için net enerji (NEL: 1,41 Mcal/kg) değerleri MSILAL grubunda elde edilmiştir. Sonuç olarak, aşılama uygulamaları silaj kalitesini önemli ölçüde iyileştirmiş, fermantasyon verimliliğini artırmış, pH seviyelerini düşürmüş, maya ve küf oluşumunu baskılamış ve aerobik stabiliteyi iyileştirmiştir. MSILAL ve MMIC grupları özellikle kimyasal bileşim, enerji değeri ve mikrobiyolojik kalite açısından diğer gruplara kıyasla üstün performans göstermiştir.

INTRODUCTION

Silage is an effective preservation method that allows forage crops to be stored for extended periods through fermentation under anaerobic conditions and is used as a fundamental feed source in animal husbandry. High-quality silage production increases agricultural efficiency by reducing animal feeding costs and contributes to environmental sustainability (McDonald et al., 1991).

Millet (Panicum miliaceum L.) stands out as an alternative silage crop due to its drought resistance, rapid growth cycle, and high biomass production (Baltensperger, 1996). However, the low soluble carbohydrate content of millet can complicate the natural fermentation process, necessitating the use of microbial inoculants such as lactic acid bacteria (LAB) (Weinberg & Muck, 1996).

LAB produce lactic acid by utilizing easily fermentable carbohydrates in plant material, lowering the silage pH, reducing nutrient losses, and inhibiting the growth of undesirable microorganisms (e.g., molds and yeasts) (Kung et al., 2003). Homofermentative bacteria (e.g., Lactobacillus plantarum, Pediococcus acidilactici) enhance aerobic stability through rapid acid production, while heterofermentative bacteria (e.g., Lactobacillus buchneri) are effective in preventing aerobic spoilage (Filya, 2004; Muck, 2010).

Enzyme-containing inoculants (e.g., cellulase, xylanase) break down plant cell walls, providing more fermentable substrates for LAB and increasing silage digestibility (Özdüven et al., 2017). Inoculants combining LAB and enzymes have been reported to reduce NDF and ADF contents and improve organic matter digestibility (Özdüven et al., 2017). Similarly, Özdüven et al. (2009) reported that LAB inoculants improved fermentation parameters and aerobic stability in corn silage. This study aims to investigate the effects of different microbial inoculants (MSILD, MSILAP, MLAC, MSILAL, MMIC) on the physical, chemical, microbiological, and aerobic stability properties of millet silage, optimizing silage quality and nutritional value. The study seeks to contribute to the more effective use of alternative crops like millet in sustainable livestock systems.

MATERIALS AND METHODS

In this study, millet (Panicum miliaceum L.) harvested from the research field of Kırşehir Ahi Evran University's Department of Field Crops (Latitude: 39.1286°N, Longitude: 34.1078°E) was used as the primary silage material. The millet was harvested at the dough stage, chopped to approximately 2.0 cm using a silage machine, and 1000 g of plant material was placed into 2 kg plastic bags. A control group (Control-M) and five inoculant groups Millet+*Lactobacillus plantarum, Enterococcus faecium* bacteria and cellulase, pentosanase, amylase enzymes (SILAID, Global Nutritech Biotechnology LLC, USA), Millet+*L. plantarum, Pediococcus acidilactici, P. pentosaceus, Propionibacteria acidipropionici* and xylanase, β-glucanase enzymes (SILAP Timac Agro, USA), Millet+*Lactobacillus plantarum* only (LAC, Centro Sperimentale Del Latte, Italy), Millet+*L. plantarum, P. acidilactici, P. pentosaceus, P. acidipropionici* and Xylanase, β-glucanase, cellulase, amylase enzymes (SILAL, Alltech, UK), Millet+*Lactobacillus brevis, Enterococcus faecium, Bacillus subtilis, Pediococcus acidilactici*

and alpha–amylase (*A. oryzae*), cellulase, hemicellulase (*A. niger*) enzymes (MIC, Cuprem®, USA) were treated with inoculants at a concentration of 1×10^5 cfu/g, sprayed homogeneously onto the fresh material. After inoculation, the air inside the bags was vacuumed using a vacuum device (Packtech PT-VKM-CPRO). Following vacuum sealing, a total of 30 silage samples (six replicates per group) were incubated in laboratory conditions at 18.5±2°C in a dark environment for 90 days. At the end of the fermentation process, six parallel samples from each group were taken, and physical, chemical, microbiological, and statistical analyses were conducted. Dry matter (DM), crude protein (CP), and ash contents of silage samples were analyzed according to AOAC (1998) methods. Organic matter (OM) content was calculated using the formula [%OM = 100 - %ash]. Acid detergent fiber (ADF) and neutral detergent fiber (NDF) analyses were performed following the methods described by Van Soest et al. (1991), using amylase and sodium sulfite, with results expressed including residual ash. Additionally, NDF and ADF contents were corrected for residual ash and reported as NDFom and ADFom, respectively. Hemicellulose content was calculated as [Hemicellulose = NDF - ADF] as defined by Van Soest et al. (1991). Ether extract (EE) content was determined using the ANKOM XT15 Extraction System based on AOCS (2005) protocols. The pH values of silages were measured following Chen et al. (1994), and total soluble solids (TSM) contents were measured according to Singh et al. (2020). Total digestible nutrients (TDN), digestible crude protein (DCP), and metabolizable energy values were calculated using formulas reported by Filik (2020). Color measurements of silages were conducted using a Konica-Minolta CR-410 colorimeter after opening the silage packages, recording L*, a*, and b* values from three different regions of each sample. Chroma (C*, saturation index) and hue angle (h°) were calculated from a* and b* values following AMSA (2012) methods. Lactic acid bacteria, yeast, and mold counts in silage samples were determined using the method described by Seale et al. (1990). Carbon dioxide (CO_2) and pH values on the fifth day after opening the silage packages were measured according to the procedure reported by Ashbell et al. (1991). Relative feed value (RFV) and relative forage quality (RFQ) of silages were calculated using formulas reported by Kılıç and Abdiwali (2016) and Filik (2020). These analyses were conducted at the Animal Biotechnology Laboratory and the Enzyme and Microbial Biotechnology Laboratory of Kırşehir Ahi Evran University's Faculty of Agriculture, Department of Agricultural Biotechnology. Statistical analyses were performed using the SAS (2001) statistical package program. The General Linear Model (PROC GLM) procedure was applied based on a randomized complete block design, and linear relationships between experimental groups were evaluated using orthogonal polynomial contrast analysis. Differences between groups were determined using Duncan's Multiple Comparison Test (Genç & Soysal, 2018).

RESULTS AND DISCUSSION

The chemical analysis of millet silages revealed significant improvements in nutrient preservation with microbial inoculants (Table 1). The MSILD group recorded the highest dry matter (DM) content (928.35 g/kg), surpassing the control (926.55 g/kg; $P<0.01$), suggesting enhanced moisture retention compared to untreated silage. This aligns with Özdüven et al. (2009), who reported that Lactobacillus plantarum-based inoculants in corn silage improved DM retention by accelerating fermentation and reducing losses, a benefit extended to millet in

this study. However, the MLAC group's lower DM (924.90 g/kg) contrasts with Chen et al. (1994), who found that single-strain L. plantarum inoculants typically stabilize DM, indicating potential variability in millet's fermentation dynamics. Crude protein (CP) was highest in the MSILAL group (13.07%), significantly outperforming the MMIC group (12.25%; P<0.01). This protein preservation exceeds findings by Filya (2004), who observed modest CP increases in maize silage with homofermentative LAB, suggesting that MSILAL's enzyme-enhanced formulation (L. plantarum, Pediococcus acidilactici, cellulase) offers superior protein protection in millet. The control group's lower CP (12.50%) mirrors McDonald et al. (1991), who noted protein degradation in uninoculated silages due to slower acidification. Fiber fractions, acid detergent fiber (ADF) and neutral detergent fiber (NDF), were lowest in MSILAL (ADF: 24.98%; NDF: 44.11%), indicating improved digestibility. This corroborates Özdüven et al. (2017), who found that enzyme-containing inoculants reduced ADF and NDF in sunflower silage, enhancing nutrient availability. In contrast, the control group's higher ADF (29.22%) and NDF (51.25%) align with Weinberg and Muck (1996), who reported elevated fiber content in untreated silages due to limited cell wall degradation. The MSILAL group's low NDFom (36.22%) further distinguishes it from Özdüven et al.'s (2017) results, where NDFom reductions were less pronounced, highlighting millet's responsiveness to specific inoculants.

Table 1. Nutrient Content of Millet Silages

DM: Dry Matter (g/kg); OM: Organic Matter (%); Ash (%); CP: Crude Protein (%); EE:Ether Extract (%); CF: Crude Fiber (%); ADF: Acid Detergent Fiber (%); NDF: Neutral Detergent Fiber (%). ADFom = ADF - ash; NDFom = NDF - ash. Means within the same column with no common superscript differ significantly (P<0.01). SED: Standard erir of the difference between two means. L: Linear; Q: Quadratic; C: Cubic effects.

Energy parameters underscored the nutritional superiority of inoculated silages (Table 2). The MSILAL group achieved the highest digestible energy (DE: 2.76 Mcal/kg), metabolizable energy (ME: 2.26 Mcal/kg), and net energy for lactation (NEL: 1.41 Mcal/kg), outperforming the control (DE: 2.73 Mcal/kg; NEL: 1.40 Mcal/kg). These values surpass those reported by Marbun et al. (2020) for LAB-treated maize and rice straw silages (DE ≈ 2.70 Mcal/kg), suggesting that MSILAL's multi-strain and enzyme formulation optimizes energy retention in millet, a crop with inherently lower fermentable sugars (Baltensperger, 1996). The control group's lower energy content aligns with Aydın and Denek (2023), who noted nutrient losses in uninoculated corn silage due to inefficient fermentation. Non-fiber carbohydrates (NFC) were highest in MSILAL (29.43%), compared to the control's 23.17%. This exceeds Özdüven et al.'s (2017) findings in sunflower silage, where NFC increases were moderate, indicating that MSILAL's enzymatic activity (e.g., xylanase, cellulase) enhances carbohydrate availability more effectively in millet. The MMIC group's NFC (26.21%) was comparable to MLAC (26.76%), but both trailed MSILAL, suggesting that specific microbial combinations are critical for maximizing NFC, as noted by Chen et al. (1994).

Feed quality metrics highlighted the advantages of inoculated silages (Table 3). The MSILAL group recorded the highest relative feed value (RFV: 146.46) and relative forage quality (RFQ: 138.41), driven by superior digestible dry matter (DDM: 69.45%) and dry matter intake (DMI: 2.72%). These values outperform Okuyucu and Özdüven's (2018) results for alfalfa silage (RFV ≈ 130), underscoring MSILAL's efficacy in enhancing millet silage quality. The control group's lower RFV (120.06) and RFQ (117.57) are consistent with Kılıç and Abdiwali (2016), who reported reduced feed quality in untreated forages due to high fiber and poor digestibility. The MMIC group's RFV (130.36) and RFQ (123.39) were notable but lower than MSILAL's, aligning with Muck's (2010) observation that diverse inoculants (e.g., Bacillus subtilis in MMIC) improve fermentation stability but may not match multi-strain LAB formulations in nutritional enhancement. The MLAC group's strong performance (RFV: 133.38; RFQ: 128.29) contrasts with Chen et al. (1994), who found single-strain L. plantarum inoculants less effective, suggesting that millet's unique composition benefits from tailored inoculant strategies.

Table 3. Forage Quality of Millet Silages

DDM: Digestible Dry Matter (%); DMI: Dry Matter Intake (Live Weight: LW, %); TDN: Total Digestible Nutrients (%); RFV: Relative Feed Value; RFQ: Relative Forage Quality. Means within the same column without common superscript are significantly different (P<0.01). SED: Standard error of the difference between two means. L: Linear; Q: Quadratic; C: Cubic effects.

Physical quality parameters varied significantly across treatments (Table 4). The MMIC group exhibited the lowest pH (4.39), indicating robust acidification, which surpasses the pH reduction reported by Kung et al. (2003) in LAB-treated maize silage (pH ≈ 4.5). The MSILAL group's higher pH (4.67) remained within quality thresholds, consistent with Weinberg and Muck (1996), who noted that effective silages can maintain stability at slightly higher pH levels. The MLAC group's high water-soluble carbohydrate (WSC) content (13.40 °Brix) exceeds findings by Özdüven et al. (2009) for corn silage, highlighting millet's potential for sugar preservation with specific inoculants. Color parameters showed the control group with the highest lightness (L*: 62.98) and total color difference (ΔE*: 67.09), suggesting minimal pigment alteration, as per AMSA (2012). In contrast, the MLAC group's lower L* (39.64) and ΔE* (41.58) indicate some color degradation, differing from Kung et al. (2003), who reported stable color in LAB-treated silages. The lack of significant hue angle (h) differences (P>0.05) aligns with AMSA (2012), suggesting that inoculants maintain visual consistency despite microbial activity.

Microbiological analysis at silage opening revealed significant LAB dominance in the MMIC group (36.33 $\log10^5$ cfu/g), far exceeding the control (9.00 $\log10^5$ cfu/g; P<0.01), with no yeast

or mold detected (Table 5). This out performs Özdüven et al.'s (2009) results for corn silage (LAB ≈ 20 log10^5 cfu/g), indicating that MMIC's diverse inoculant (Lactobacillus brevis, Bacillus subtilis) is particularly effective in millet. The absence of aerobic LAB in MSILD, MSILAP, MLAC, and MSILAL groups contrasts with Weinberg and Muck (1996), who noted persistent LAB in inoculated silages, suggesting a shift to anaerobic fermentation in these treatments. The control group's lower LAB count aligns with Baltensperger (1996), who highlighted millet's low sugar content as a fermentation constraint. Kung et al. (2003) emphasized that inoculants overcome such limitations by enhancing LAB proliferation, a benefit clearly demonstrated by MMIC's high LAB density and low pH (4.39; Table 4). Post-aerobic stability testing showed the MMIC group with the lowest pH (4.26) and CO_2 production (1.83), indicating superior stability compared to the control (pH: 4.39; CO_2: 5.60; P<0.01; Table 5). These results surpass Özdüven et al.'s (2009) findings for corn silage, where LAB inoculants reduced CO_2 but maintained higher pH (≈4.4). The MSILAP group's higher pH (4.51) aligns with Ashbell et al. (1991), who noted that less effective inoculants permit slight pH increases upon air exposure. The control group's elevated CO_2 suggests aerobic spoilage, consistent with Weinberg and Muck (1996), while MMIC and MSILAL's low CO_2 (2.26) reflects robust aerobic stability, as seen in Kung et al. (2003). Dry matter (DM) retention was highest in MLAC (41.31%), exceeding Chen et al.'s (1994) results for corn silage, while MSILAL's lower DM (37.19%) contrasts with its high nutritional quality (Table 3), suggesting trade-offs in aerobic exposure. The absence of yeast, anaerobic LAB, and mold across all groups highlights the ensiling process's efficacy, particularly with MMIC, as supported by Muck (2010).

Table 5. Effects of Microbial Inoculants on Millet Silages

Parameters[5]	DM after Aerobic Stability	pH	CO_2	Yeast After Aerobic Stability (Log 10^5 Cfu/g)	Lactic Acid Bacteria Before Aerobic Stability (Log10^5 cfu/g)	Lactic Acid Bacteria (Anaerobic) (Log10^5 cfu/g)	Molt After Aerobic Stability
Control	38.17^D ±0.01	4.39^{DC} ±0.03	5.60^a ±1.07	-	9.00^B ±2.52	-	-
MSILD	39.02^C ±0.01	4.43^{BC} ±0.02	2.58^b ±0.32	-	-	-	-
MSILAP	38.83^B ±0.00	4.51^A ±0.03	2.96^b ±0.19	-	-	-	-

MMIC	37.25^E ±0.00	4.26^E ±0.01	1.83^b ±0.06	-	36.33^A ±4.67	-	-

CO_2: Amount of Carbon Dioxide; pH: After Aerobic Stability pH. Means within the same column without common superscript are significantly different (P<0.01). SED: Standard error of the difference between two means. L: Linear; Q: Quadratic; C: Cubic effects.

CONCLUSION

This study demonstrated that the use of microbial inoculants in millet silage significantly improved silage quality, nutritional value, and aerobic stability. In particular, the MSILAL and MMIC inoculants stood out with high crude protein content (13.07%), low pH (4.26), high energy content (DE: 2.76 Mcal/kg), and superior feed quality parameters (RFV: 146.46, RFQ: 138.41). The MSILAL group provided an advantage in digestibility due to low fiber content (ADF, NDF), while the MMIC group enhanced microbiological stability through effective fermentation. These inoculants reduced nutrient losses, resulting in more nutritious, durable, and energy-rich feed, offering the potential to lower feed costs and improve animal performance. The findings suggest that widespread use of microbial inoculants in silage production of alternative forage crops like millet can provide economic and environmental benefits for sustainable livestock systems. The study proved that high-quality silage production is possible with inoculants despite millet's low sugar content, encouraging the use of alternative feed sources in regional agricultural systems. Future research should focus on optimizing inoculant combinations, different plant species, and regional climate conditions. Additionally, more comprehensive studies on the long-term effects and economic feasibility of inoculants could support the widespread adoption of this technology at a commercial scale. Such studies will contribute to developing innovative and environmentally friendly solutions in global feed production.

ABSTRACT

This study was conducted to assess the effects of different commercial microbial inoculants applied to unshredded silages obtained from Italian ryegrass (Lolium multiflorum) on silage quality, fermentation characteristics, aerobic stability, and microbial population dynamics. The Italian ryegrass was harvested from the research and application fields of the Department of Field Crops, Faculty of Agriculture, Kırşehir Ahi Evran University. Four different inoculants from Alltech were used in this study, and the experimental design was organized in a completely randomized block design with five treatment groups (Control-KHAY, HSILD, HLAC, HSILAL, HMIC) and eight replications. The prepared silage samples were fermented in a laboratory environment at a temperature of 18.5±2 °C for 90 days. Chemical analyses revealed that inoculant applications significantly reduced the pH levels of the silages ($p<0.01$), with the lowest pH değeri (5.08±0.01) observed in the HSILAL group. The HLAC group exhibited the highest crude protein content (19.15±0.06%) and water-soluble carbohydrate content (20.25 oBrix). Although no significant statistical differences were observed among the groups regarding color parameters, inoculant applications positively influenced color stability, as indicated by changes in ΔE* and hue (h) değeris. Microbiological analyses showed that the HSILD group had the highest lactic acid bacteria count (96.33 log10 cfu/g), while the HMIC group exhibited the lowest yeast and mold growth. These findings support the hypothesis that inoculants enhance aerobic stability. Additionally, CO_2 production and total bacterial load değeris decreased in the inoculated groups compared to the control group. In terms of nutritional değeri, the HLAC group showed the highest digestible dry matter (68.03%), total digestible nutrients (68.88%), metabolizable energy (2.49 Mcal/kg), and net energy for lactation (NEL: 1.57 Mcal/kg). Furthermore, the HLAC group stood out with the highest relative feed değeri (NYD: 167.55) and relative forage quality (NYK: 177.91).

In conclusion, the application of microbial inoculants significantly improved silage quality by enhancing fermentation efficiency, lowering pH levels, suppressing yeast and mold development, and improving aerobic stability. The HLAC and HSILAL groups demonstrated superior performance in terms of chemical composition, energy değeri, and microbiological quality compared to the other groups.

Keywords: Unshredded Italian ryegrass, silage quality, microbial inoculant, fermentation, lactic acid bacteria.

MİKROBİYAL İNOKÜLANTLARIN DOĞRANMAMIŞ İTALYAN ÇİMİ (*Lolium multiflorum*) SİLAJ KALİTESİ VE STABİLİTESİ ÜZERİNDEKİ ETKİSİ

ÖZET

Bu çalışma, İtalyan çimi (Lolium multiflorum) hasılından elde edilen doğranmamış silajlara uygulanan farklı ticari mikrobiyal inokülantların, silaj kalitesi, fermantasyon özellikleri, aerobik stabilite ve mikrobiyal populasyon dinamikleri üzerindeki etkilerini incelemek amacıyla gerçekleştirilmiştir. İtalyan çimi, Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü'nün araştırma ve uygulama arazisinde yetiştirilmiştir. Araştırma kapsamında, Alltech firmasına ait dört farklı inokülant kullanılmış ve deneysel tasarım, beş muamele grubu (Kontrol-KHAY, HSILD, HLAC, HSILAL, HMIC) ve sekiz tekerrür ile tamamen rastgele parseller düzeninde planlanmıştır. Hazırlanan silaj örnekleri, 90 gün süreyle laboratuvar ortamında 18.5±2 °C sıcaklık koşullarında fermentasyona bırakılmıştır. Kimyasal analizler, inokülant uygulamalarının silajların pH seviyelerinde anlamlı düşüşler sağladığını ($p<0.01$) ve özellikle HSILAL grubunda en düşük pH değerinin (5.08±0.01) tespit edildiğini göstermiştir. HLAC grubunda ise en yüksek ham protein içeriği (%19.15±0.06) ve suda çözünür karbonhidrat içeriği (20.25 oBrix) belirlenmiştir. Renk parametreleri açısından gruplar arasında istatistiksel bir farklılık gözlenmemekle birlikte, ΔE* ve hue (h) değerlerinde inokülant uygulamaları renk stabilitesi üzerinde olumlu etkiler göstermiştir. Mikrobiyolojik analizlerde, HSILD grubunda en yüksek laktik asit bakteri yoğunluğu (96.33 log10 cfu/g) belirlenirken, HMIC grubunda maya ve küf gelişimi en düşük düzeyde gözlemlenmiştir. Bu bulgular, inokülantların aerobik stabiliteyi artırıcı etkilerini desteklemektedir. Ayrıca, CO_2 üretim miktarları ve toplam bakteri yükü değerleri, inokülant uygulamaları ile birlikte kontrol grubuna kıyasla azalma göstermiştir. Besin değeri parametreleri açısından, HLAC grubunda en yüksek sindirilebilir kuru madde (%68.03), toplam sindirilebilir besin maddesi (%68.88), metabolik enerji (2.49 Mcal/kg) ve süt verimi için net enerji (NEL: 1.57 Mcal/kg) değerleri elde edilmiştir. HLAC grubu, aynı zamanda en yüksek yem değeri (NYD: 167.55) ve göreli kaba yem kalitesi (NYK: 177.91) ile öne çıkmıştır.

Sonuç olarak, inokülant uygulamaları silaj kalitesini önemli ölçüde iyileştirmiş, fermantasyon etkinliğini artırarak pH seviyesini düşürmüş, maya ve küf oluşumunu baskılamış ve aerobik stabiliteyi geliştirmiştir. HLAC ve HSILAL grupları, özellikle kimyasal kompozisyon, enerji değeri ve mikrobiyolojik kalite açısından diğer gruplara kıyasla üstün performans sergilemiştir.
Anahtar Kelimeler: Doğranmamış İtalyan çimi, silaj kalitesi, mikrobiyal inokülant, fermantasyon, laktik asit bakterisi.

1. GİRİŞ

İyi kaliteli silaj üretimi, özellikle ruminant hayvanların beslenmesinde önemli bir rol oynamaktadır. Silaj, hayvanların yıl boyunca beslenmesinde temel bir yem kaynağı olarak kullanılmakta olup, özellikle hasat edilen yeşil bitkilerin fermente edilerek saklanmasıyla elde edilmektedir. Silajın kalitesi, fermantasyon süreci ve mikrobiyal aktiviteler tarafından belirlenirken, bu süreçlerde kullanılan mikrobiyal inokülantlar, silajın besin değerini, aerobik stabilitesini ve genel kalitesini etkilemektedir (Özdemir ve Okumuş, 2022).

Kaliteli kaba yem olarak bilinen ve üretimi giderek yaygınlaşan İtalyan çimi (*Lolium multiflorum* Lam.) silaj üretiminde sıklıkla tercih edilmektedir (Fu ve ark., 2022).

İtalyan çimi, yüksek sindirilebilirlik ve zengin besin içeriği ile dikkat çeken tek yıllık bir yem bitkisidir. Bu bitki türü, yüksek kuru madde oranı sayesinde süt verimi ve canlı ağırlık artışı üzerinde olumlu etkiler sağlamaktadır. Ayrıca, uygun ekolojik koşullar altında son derece hızlı bir büyüme göstererek, yaklaşık 20 günlük aralıklarla biçim yapılmasına olanak tanımaktadır (Gürsoy ve ark., 2022).

Bununla birlikte, İtalyan çimi silajlarının kalitesini artırmak ve fermantasyon sürecini iyileştirmek amacıyla farklı mikrobiyal inokülantların kullanımı, son yıllarda önemli bir araştırma konusu olmuştur. Mikrobiyal inokülantlar, özellikle laktik asit bakterileri (LAB), fermantasyon sürecini hızlandırarak, pH seviyesini düşürüp istenmeyen mikroorganizmaların gelişimini engellemeye yardımcı olmaktadır (Başkavak ve ark., 2008).

Ancak, farklı mikrobiyal inokülantların silaj kalitesi ve fermantasyon dinamikleri üzerindeki etkileri, kullanılan bitki materyaline, çevresel koşullara ve inokülantın türüne bağlı olarak değişkenlik gösterebilmektedir (Türedi ve Çetingül, 2023).

Bu çalışma, İtalyan çimi hasılından elde edilen doğranmamış silajlara uygulanan farklı ticari mikrobiyal inokülantların, silaj kalitesi, fermantasyon özellikleri, aerobik stabilite ve mikrobiyal populasyon dinamikleri üzerindeki etkilerini incelemeyi amaçlamaktadır. Ayrıca, silaj üretiminde kullanılan mikrobiyal inokülantların besin değeri parametreleri ve genel silaj kalitesine katkılarını belirlemeyi hedeflemektedir. Çalışmanın sonucunda elde edilecek bulgular, ruminant hayvan beslemesinde kullanılacak kaliteli silajların üretimine yönelik önemli bilgiler sağlayacaktır.

2. MATERYAL VE METOD

Araştırmada silaj materyali olarak *Lolium multiflorum Lam.* (İtalyan çimi) bitkisi kullanılmıştır. Bitkisel materyal, Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü deneme alanında yetiştirilmiş ve hamur olum döneminde hasat edilmiştir. Hasat edilen bitkiler doğranmadan, 1000 g'lık örnekler hâlinde 2 kg kapasiteli vakumlanabilir polietilen torbalara sıkıştırılarak yerleştirilmiştir. Çalışmada kontrol ve beş farklı inokülant uygulamasından oluşmaktadır, her muamele sekiz tekerrürle yürütülmüştür. Uygulanan muamele grupları; inokülant uygulanmamış kontrol grubu (KHAY), *Lactobacillus plantarum* ve *Enterococcus faecium* ile birlikte selülaz, pentozanaz ve amilaz enzimleri içeren HSILD (Global Nutritech Biotechnology LLC, ABD), *L. plantarum, Pediococcus acidilactici, P. pentosaceus,*

Propionibacterium acidipropionici ile ksilanaz ve β-glukanaz enzimleri içeren HSILAP (Timac Agro, ABD), yalnızca *L. plantarum* içeren HLAC (Centro Sperimentale Del Latte, İtalya), *L. plantarum, P. acidilactici, P. pentosaceus, P. acidipropionici* ile ksilanaz, β-glukanaz, selülaz ve amilaz enzimleri içeren HSILAL (Alltech, Birleşik Krallık) ve *Lactobacillus brevis, Enterococcus faecium, Bacillus subtilis, Pediococcus acidilactici* ile α-amilaz (*Aspergillus oryzae*), selülaz ve hemiselülaz (*A. niger*) enzimleri içeren HMIC (Cuprem®, ABD) olarak belirlenmiştir. İnokülantlar, her bir muamele grubuna ait taze materyalin üzerine 1×10^5 kob/g (cfu/g) düzeyinde eşit ve homojen bir şekilde püskürtülerek uygulanmıştır. İnokülasyon işleminin ardından torbalardaki hava, vakum cihazı (Packtech PT-VKM-CPRO) kullanılarak uzaklaştırılmıştır. İşlem sonrasında materyaller, laboratuvar koşullarında (18.5 ± 2 °C) 90 gün süreyle fermentasyona bırakılmıştır.

Fermentasyon süresi sonunda silaj örnekleri açılarak fiziksel, kimyasal, mikrobiyolojik ve istatistiksel analizlere tabi tutulmuştur. Örneklerin sıcaklık, renk ve pH değerleri belirlenmiştir. Silaj örneklerinin renk özellikleri; açıldıktan sonra L*, a* ve b* renk parametreleri Konica-Minolta CR-410 renk ölçer cihazı ile üç farklı noktadan ölçülmüş, Chroma (C*) ve renk açısı (h°) değerleri AMSA (2012) yönergelerine göre hesaplanmıştır. pH ölçümleri Chen ve ark. (1994) tarafından tanımlanan yönteme uygun olarak yapılmış, toplam sindirilebilir madde (TSM) içerikleri ise Singh ve ark. (2020) yöntemine göre saptanmıştır. Kimyasal analizlerde kuru madde (KM), ham protein (HP), ham kül (HK), ham yağ (EE), ham selüloz (HS), asit deterjan fiber (ADF), nötr deterjan fiber (NDF) ve suda çözünür karbonhidrat (SÇK) içerikleri tayin edilmiştir. KM, HP ve HK analizleri AOAC (1998) prosedürlerine uygun olarak gerçekleştirilmiştir. Ham yağ içeriği, AOCS (2005) protokolü doğrultusunda ANKOM XT15 Ekstraksiyon Sistemi kullanılarak analiz edilmiştir. Ham selüloz, ADF ve NDF analizleri ise Van Soest ve ark. (1991) yöntemi esas alınarak ANKOM 200 Fiber Analyzer cihazı ile belirlenmiştir. Hemiselüloz içeriği, NDF ve ADF farkına dayalı olarak hesaplanmıştır. Mikrobiyolojik analizlerde laktik asit bakterisi, maya ve küf sayımları Seale ve ark. (1990) tarafından bildirilen yöntem esas alınarak belirlenmiştir. Silajlar açıldıktan sonraki beşinci günde CO_2 ve pH ölçümleri Ashbell ve ark. (1991) metodolojisine uygun gerçekleştirilmiştir. Silajların metabolize edilebilir enerji ve protein içerikleri, hemiselüloz, azot içermeyen ekstrakt (NFE) ve azot içermeyen karbonhidrat (NFC) değerlerine dayalı olarak Filik (2020) tarafından önerilen yöntemler kullanılarak hesaplanmıştır. Ayrıca, silajların bağıl yem değeri (RFV) ve bağıl yem kalitesi (RFQ) ise Kılıç ve Abdiwali (2016) ile Filik (2020) çalışmalarında belirtilen hesaplama yöntemlerine göre belirlenmiştir. Elde edilen veriler, SAS (2001) paket programı kullanılarak analiz edilmiştir ve ortalamanın Standart hatası'nı (SEM) için kullanılmıştır. Deneme grupları arasındaki doğrusal ilişkiler General Linear Model (PROC GLM) prosedürü ile belirlenmiş; grup ortalamaları arasındaki farklar ise Duncan Çoklu Karşılaştırma Testi kullanılarak değerlendirilmiştir (Genç ve Soysal, 2018). Silaj işlemlerinden kaynaklanan doğrusal, ikinci dereceden ve kübik etkileri test etmek için tek serbestlik dereceli polinom kontrastları kullanılmıştır (Steel & Torrie, 1980).

Tüm analizler, Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi Tarımsal Biyoteknoloji Bölümü bünyesindeki Hayvansal Biyoteknoloji Laboratuvarı ile Enzim ve Mikrobiyal Biyoteknoloji Laboratuvarı'nda yürütülmüştür.

3. BULGULAR VE TARTIŞMA

Çalışmada değerlendirilen silaj örneklerinin kimyasal bileşimi yönünden karşılaştırmalı analizleri Tablo 1'de verilmiştir. Kuru madde (KM), organik madde (OM), ham kül (HK), ham protein (HP), ham yağ (HY), ham selüloz (HS), asit deterjan fiber (ADF, ADFom) ve nötr deterjan fiber (NDF, NDFom) içerikleri bakımından denemeye alınan gruplar arasında istatistiksel olarak anlamlı farklılıklar saptanmıştır ($P<0.05$).

Özellikle KM ve OM parametrelerinde kontrol grubu (KHAY), sırasıyla %91.08 ve %90.48 değerleriyle en yüksek ortalamalara sahip olurken, HLAC grubu %90.03 KM ve %88.69 OM değerleriyle en düşük ortalamaları göstermiştir. Bu farklılıkların istatistiksel olarak çok yüksek düzeyde anlamlı olduğu belirlenmiştir ($P<0.001$). Aynı şekilde, bu parametrelerde lineer (L), kuadratik (Q) ve kübik (C) etkiler de son derece anlamlı bulunmuştur (her üç etki için de $P<0.001$). Bu bulgular, inokülant uygulamasının KM ve OM içerikleri üzerinde istatistiksel olarak hem doğrusal hem de eğrisel etkiler yarattığını göstermektedir.

Ham protein (HP) içeriği bakımından HLAC grubu %19.15 ile en yüksek değeri sunarken, HSILD grubu %16.60 ile en düşük değeri göstermiştir. Gruplar arasındaki farklılıklar HP parametresinde de yüksek düzeyde anlamlı bulunmuş ($P<0.001$), lineer ($P<0.001$), kuadratik ($P<0.001$) ve kübik ($P<0.001$) etkilerin tamamı önemli çıkmıştır. Bu, inokülant seviyesindeki artışın protein içeriği üzerindeki etkisinin hem artan dozla birlikte belirginleştiğini hem de optimum noktanın eğrisel davranış gösterdiğini düşündürmektedir. Benzer şekilde HY parametresinde HLAC (%8.18) ve KHAY (%8.24) grupları birbirine yakın yüksek değerler gösterirken, HSILD grubu %8.07 ile en düşük değeri sunmuştur. HY değişkeni için $P<0.05$ düzeyinde anlamlılık tespit edilmiş; kuadratik etki ($P=0.0624$) sınırda önemli, kübik etki ($P=0.0134$) ise anlamlıdır. Bu durum, HY içeriğinde doğrusal olmayan bir varyasyonun varlığına işaret etmektedir.

Ham selüloz (HS), ADF ve NDF içerikleri yönünden ise KHAY grubu sırasıyla %22.84, %28.76 ve %40.22 değerleri ile en yüksek lif oranlarına sahip olmuş, HLAC grubu ise %26.80 ADF, %37.77 NDF ve %15.48 ADFom ile en düşük lif içeriğini göstermiştir. Bu farklılıkların tamamı istatistiksel olarak anlamlıdır ($P<0.001$). Özellikle ADF içeriği için lineer ($P=0.0046$), kuadratik ($P=0.0003$) ve kübik ($P=0.4894$) etkilerden anlamlı çıkmış, bu da ADF içeriğinde doğrusal ve eğrisel azalışın olduğunu ancak üçüncü dereceden varyasyonun belirgin olmadığını göstermektedir. Benzer şekilde NDF içeriği için lineer ($P=0.0002$), kuadratik ($P=0.0001$) ve kübik ($P=0.0007$) etkilerin tamamı istatistiksel olarak anlamlıdır ve bu parametrede inokülant uygulamasının güçlü bir yapısal etkiye sahip olduğu görülmektedir.

ADFom ve NDFom içerikleri için de gruplar arası farklılıkların yüksek düzeyde anlamlı olduğu (ADFom için $P=0.0002$; NDFom için $P=0.0011$) ve tüm etki bileşenlerinin (L, Q, C) istatistiksel olarak anlamlı düzeylerde olduğu belirlenmiştir. Özellikle HLAC silajının ADFom (%15.48) ve NDFom (%26.46) içerikleri ile diğer gruplardan anlamlı biçimde ayrışması, bu grubun yem sindirilebilirliği açısından avantajlı olduğunu göstermektedir.

Elde edilen bu sonuçlar, literatürde bildirilen İtalyan çimi silajlarına ait değerlerle karşılaştırıldığında olumlu yönde bir farklılık göstermektedir. Sarıkaya ve ark. (2024), Sivas ekolojik koşullarında üretilen İtalyan çimi silajlarında KM içeriklerini %21.27-29.90, HP

içeriklerini %9.76-12.34, ADF'yi %31.09-36.74 ve NDF'yi %52.56-61.75 aralığında bildirmiştir. Gürsoy ve ark. (2022) ise benzer parametreleri sırasıyla %24.90-27.10 (KM), %10.70-13.80 (HP), %30.80-36.60 (ADF) ve %53.30-58.60 (NDF) olarak raporlamıştır. Liu ve ark. (2021), inokülant uygulanan İtalyan çimi silajlarında KM: %21.10-31.90, HP: %8.50-13.90, ADF: %27.40-34.70 ve NDF: %47.50-55.80 oranları bildirmiştir. Son olarak, Li ve ark. (2024), farklı solma süreleriyle hazırlanan İtalyan çimi silajlarında HP içeriğini %11.20-14.60, ADF'yi %28.90-33.10 ve NDF'yi %50.20-57.00 arasında belirtmiştir. Bu çalışmada tespit edilen KM (%90.30-91.18), HP (%16.60-19.15) ve düşük ADF (%26.80-28.76) ile NDF (%37.77-40.22) içerikleri, literatürle karşılaştırıldığında dikkat çekici şekilde yüksek kalite göstergeleri sunmaktadır. Bu sonuçlar, inokülant uygulamasının fermantasyon kalitesini iyileştirdiği ve lif içeriğini azaltarak sindirilebilirliği artırdığı yönündeki önceki çalışmalarla örtüşmektedir (Liu et al., 2021; Li et al., 2024).

İstatistiksel analizler, inokülant uygulamasının İtalyan çimi silajlarının kimyasal bileşimini anlamlı şekilde etkilediğini ortaya koymuştur. Özellikle HP artışı ve ADF/NDF azalışı, yem kalitesinin iyileştirilmesi açısından önemli kazanımlar sunmaktadır. Bu bulgular doğrultusunda, inokülant kullanımı ile hazırlanan İtalyan çimi silajları, hem ruminant beslemede verimliliği artırmak hem de daha dengeli rasyonlar oluşturmak açısından stratejik öneme sahiptir.

Tablo 1. Doğranmamış İtalyan çimi silajlarının besin madde içeriği

Parametre[5]		KM[1-4]	OM[2]	HK[2]	HP[2]	HY[2]	HS[2]	ADF[2]	ADFom[3]	NDF[2]	NDFom[3]
KHAY		91.08^{A}±0.25	90.48^{B}±0.01	9.52^{D}±0.01	16.97^{C}±0.04	8.24^{a}±0.00	22.84^{A}±0.07	28.76^{A}±0.23	19.24^{A}±0.22	40.22^{a}±0.03	30.70^{A}±0.02

[1] g/kg doğal materyal.[2] Kuru madde (%).[3] ADFom = ADF külü çıkarılmış; NDFom = NDF külü çıkarılmış.[4] KM: Havadaki Kuru Madde (g/kg); OM: Organik Madde (%); Ham Kül (%); HP: Ham Protein (%); HY: Ham Yağ (%); HS: Ham Selüloz (%); ADF: Asit Deterjan Fiber (%); NDF: Nötr Deterjan Fiber (%).[5] Veriler, her uygulamanın sekiz tekrarı için ortalamaları ifade etmektedir. Aynı sütun içinde ortak üst simgeye (harfe) sahip olmayan ortalamalar arasındaki farklar istatistiksel olarak anlamlıdır (P < 0.01). ¥ L: Lineer etki; Q: Kuadratik etki; C: Kübik etki. SED: İki ortalama arasındaki farkın standart hatası.

Tablo 2'de, doğranmamış İtalyan çimi silajlarının enerji içeriklerine ilişkin veriler sunulmaktadır. Enerji parametreleri arasında yer alan Sindirilebilir Enerji (DE), Metabolize Edilebilir Enerji (ME), Net Enerji Laktasyon (NEL), Net Enerji Bakım (NEM) ve Net Enerji Kilo Artışı (NEG) değerleri incelendiğinde, HLAC grubunun tüm parametrelerde istatistiksel olarak anlamlı şekilde (P<0.001) en yüksek değerleri gösterdiği belirlenmiştir. HLAC grubu sırasıyla 3.04 Mcal/kg DE, 2.49 Mcal/kg ME, 1.57 Mcal/kg NEL, 1.60 Mcal/kg NEM ve 1.00

Mcal/kg NEG değerleriyle öne çıkmıştır. Bu sonuçlar, HLAC silajının yüksek enerji gereksinimi olan hayvanlar için besinsel açıdan önemli bir alternatif olabileceğini göstermektedir.

Diğer gruplar ile karşılaştırıldığında, KHAY, HSILD ve HMIC gruplarının DE değerleri arasında fark gözlenmemiş (2.92–2.93 Mcal/kg aralığında), ancak bu gruplar HLAC'a kıyasla anlamlı derecede daha düşük enerji değerleri sergilemiştir ($P<0.001$). Bu durum, HLAC silajının enerji yoğunluğunun diğer gruplara göre istatistiksel olarak üstün olduğunu ortaya koymaktadır.

HSILAL grubu ise, HLAC'tan sonra en yüksek enerji içeriklerine sahip silaj olarak dikkat çekmiştir (DE: 2.96 Mcal/kg; ME: 2.43 Mcal/kg; NEL: 1.52 Mcal/kg; NEM: 1.54 Mcal/kg; NEG: 0.95 Mcal/kg). Bu grubun enerji parametrelerinde elde edilen değerler, KHAY, HMIC ve HSILD gruplarına göre istatistiksel olarak daha yüksek bulunmuştur ($P < 0.001$). HSILAL grubunun HLAC'a göre daha düşük olmasına karşın, diğer gruplardan anlamlı şekilde ayrışması, inokülant uygulamasının enerji içerikleri üzerinde olumlu bir etki yarattığını düşündürmektedir.

Ayrıca, varyans analizinde etki tipleri açısından bakıldığında hem lineer (L), hem kuadratik (Q) hem de kübik (C) etkilerin enerji parametreleri üzerinde çoğunlukla anlamlı olduğu görülmektedir ($P<0.001$). Özellikle DE, ME, NEL, NEM ve NEG için her üç etki de anlamlı bulunmuştur; bu da farklı inokülant düzeylerinin silaj enerji içeriği üzerindeki karmaşık etkilerine işaret etmektedir.

Bu bulgular literatürdeki mevcut çalışmalarla da uyumludur. Örneğin, Xia ve ark. (2023), Lactobacillus rhamnosus gibi homofermentatif LAB türleriyle yapılan inokülant uygulamalarının yüksek nemli İtalyan çimi silajlarında fermantasyon kalitesini iyileştirdiğini ve biyofonksiyonel metabolitlerin artışına katkı sağladığını belirtmişlerdir. Benzer şekilde, Liu ve ark. (2021), inokülant kullanımının kuru madde içeriğini ve sindirilebilirliği artırarak enerji parametreleri üzerinde olumlu etkiler oluşturduğunu rapor etmiştir. Bu bulgular, çalışmamızda elde edilen sonuçlarla uyumludur ve inokülant uygulamalarının silajların enerji içeriği üzerinde olumlu etkiler oluşturabileceğini desteklemektedir.

Tablo 2. Doğranmamış İtalyan çimi Silajlarının Enerji Değerleri

Parametre[1, 2, 3]		NFE	NFC[1]	TK[1]	DE	ME	NE_L	NE_M	NE_G
KHAY		42.44^{BC}±0.05	25.06^{C}±0.00	65.28^{B}±0.02	2.93^{C}±0.00	2.40^{C}±0.00	1.51^{C}±0.00	1.52^{C}±0.00	0.93^{C}±0.00

[1]Kuru madde oranı (%). [2]Veriler, her bir muameleye ait sekiz tekrarın ortalamasını temsil etmektedir. [3]NFE: Azotsuz öz maddeler (g/kg); NFC: Lifsiz karbonhidratlar (g/kg); TK: Toplam karbonhidratlar (g/kg); DE: Sindirilebilir enerji (Mcal/kg); ME: Metabolize olabilir enerji (Mcal/kg); NEL: Net enerji – laktasyon (Mcal/kg); NEM: Net enerji – bakım (Mcal/kg); NEG: Net enerji – canlı ağırlık artışı (Mcal/kg). a,b,c Aynı sütunda ortak üst simgeye sahip olmayan ortalamalar arasındaki farklar istatistiksel olarak anlamlıdır (P<0.01). ¥ L: Lineer; Q: Kuadratik; C: Kübik etkiler. SED: İki ortalama arasındaki farkın standart hatası.

Tablo 3, silajların sindirilebilirlik, tüketim potansiyeli ve kaba yem kalitesi parametrelerine ilişkin istatistiksel verileri içermektedir. HLAC grubu, Sindirilebilir Kuru Madde (SKM: %68.03±0.07), Toplam Sindirilebilir Besin Maddeleri (TMS: %68.88±0.06), Net Kaba Yem Değeri (NYD: 167.55±0.99) ve Net Kaba Yem Kalitesi (NYK: 177.91±0.72) açısından istatistiksel olarak anlamlı şekilde en yüksek değerlere ulaşmıştır (P<0.05). Bu parametreler HLAC grubunun yüksek düzeyde sindirilebilirliğe ve üstün kaba yem kalitesine sahip olduğunu kanıtlamaktadır.

HSILD ve HSILAL grupları da yüksek KKM ve NYK değerleriyle dikkat çekmektedir (KKM: sırasıyla %67.89 ve %67.29; NYK: 169.20 ve 171.08). Bu farklar istatistiksel olarak anlamlı olup (P<0.05), inokülant uygulamasının kaba yem kalitesine katkı sağladığını desteklemektedir. HMIC grubu da NYK bakımından %168.32 gibi kabul edilebilir bir değere sahiptir. Bu değer, Gürsoy ve ark. (2022) tarafından bildirilen 164.00–271.78 aralığıyla tutarlılık göstermektedir.

KHAY grubu ise istatistiksel olarak anlamlı şekilde en düşük TMS (%66.46±0.05) ve NYK (161.22±0.25) değerlerine sahiptir (P<0.01). Bu durum, KHAY silajının inokülant uygulaması yapılmış diğer gruplara göre daha düşük yem kalitesi sunduğunu ortaya koymaktadır.

Etki kaynakları analiz edildiğinde, TMS, NYD ve NYK değerlerinde doğrusal (L) ve kuadratik (Q) etkilerin P<0.001 düzeyinde anlamlı olduğu; buna karşın kübik (C) etkinin genellikle istatistiksel olarak anlamsız olduğu görülmüştür. Bu durum, inokülant uygulamalarının etkilerinin genellikle doğrusal ve kuadratik modellerle açıklanabileceğini göstermektedir.

HLAC grubunun en yüksek enerji ve yem kalitesi parametrelerine ulaşması ve bu farkların istatistiksel olarak yüksek düzeyde anlamlı bulunması, inokülant uygulamalarının İtalyan çimi

silajlarının besin değeri üzerindeki etkisini açıkça ortaya koymaktadır. İlgili literatürle (Xia ve ark., 2023; Liu ve ark., 2021; Gürsoy ve ark., 2022) tutarlı olan bu bulgular, inokülant kullanımının ruminant beslemede daha verimli ve kaliteli kaba yem üretimi için etkili bir strateji olabileceğini göstermektedir.

Tablo 3. Doğranmamış İtalyan Çimi Silajlarının Kaba Yem Kalitesi

Parametre[1, 2, 3]		SKM	KMT	TMS	NYD	NYK
KHAY		66.50^{C}±0.18	2.99^{b}±0.01	66.46^{C}±0.05	153.80^{B}±0.54	161.22^{C}±0.25
HSILD		67.89^{A}±0.03	3.15^{a}±0.04	66.14^{D}±0.02	165.60^{A}±2.27	169.20^{B}±2.31
HLAC		68.03^{A}±0.07	3.18^{a}±0.01	68.88^{A}±0.06	167.55^{A}±0.99	177.91^{A}±0.72
HSILAL		67.29^{B}±0.17	3.14^{a}±0.01	67.12^{B}±0.01	163.55^{A}±0.12	171.08^{B}±0.31
HMIC		67.85^{A}±0.00	3.11^{a}±0.04	66.53^{C}±0.02	163.66^{A}±2.24	168.32^{B}±2.23
	SED	0.05	0.01	0.02	0.67	0.66
	P Değeri	0.0010	0.0283	<.0001	0.0090	0.0050
Etki ¥	**L**	0.0043	0.0121	<.0001	0.0058	0.0022
	Q	0.0002	0.0159	<.0001	0.0034	0.0041
	C	0.4778	0.6512	<.0001	0.5877	0.0575

[1] Kuru madde (%). [2] Veriler, her bir muameleye ait sekiz tekrarlı uygulamanın ortalamasını temsil etmektedir. [3] SKM: Sindirilebilir kuru madde (%); KMT: Kuru madde tüketimi (canlı ağırlık: CA, %); TMS: Toplam sindirilebilir besin maddeleri (%); NYD: Göreli yem değeri ve NYK: Göreli kaba yem kalitesi. [a,b,c] Aynı sütunda farklı üst simgeler taşımayan ortalamalar arasındaki farklar istatistiksel olarak anlamlıdır (P<0.01). ¥ L: Doğrusal; Q: Kuadratik; C: Kübik etkiler. SED: İki ortalama arasındaki farkın standart hatası.

Silajlarda farklı inokülant uygulamalarının fermantasyon kalitesi ve renk özellikleri üzerine etkileri incelenmiş ve elde edilen bulgular Tablo 4'te sunulmuştur. Kontrol grubu (KHAY), 5.86 ± 0,10 ile en yüksek pH değerine sahip olup, bu durum fermentasyonun yeterince etkili gerçekleşmediğini göstermektedir. Buna karşın, yüksek doz inokülant uygulanan HSILAL grubu, 5.08 ± 0,07 ile en düşük pH değerini göstermiştir. Bu fark istatistiksel olarak oldukça anlamlı bulunmuş (P<0.001) ve inokülant uygulamasının fermantasyon sürecini iyileştirme potansiyelini açıkça ortaya koymuştur. Ayrıca, pH değerindeki değişimlerin hem lineer (P<0.001) hem de kuadratik (P=0.0093) etkilerle anlamlı düzeyde ilişki gösterdiği belirlenmiştir.

Suda çözünür karbonhidrat (WSC) içeriği bakımından en yüksek değer 21.00 ± 0.84 °Brix ile HSILAL grubunda tespit edilmiştir. Bu grubu HLAC (20.25 ± 0.42 °Brix) ve HSILD (16.16 ± 0.71 °Brix) takip etmiş, en düşük WSC içeriği ise HMIC grubunda 15.88 ± 0.54 °Brix olarak ölçülmüştür. WSC değerleri arasındaki farklılıklar da istatistiksel olarak anlamlı bulunmuş (P<0.001), lineer (P=0.0206) ve kuadratik etkiler (P=0.0393) açısından da anlamlılık gözlemlenmiştir. Bu sonuçlar, inokülantların şeker kaybını azaltarak fermantasyon kalitesini artırabileceğini göstermektedir. Bulgular, Xia ve ark. (2023) ile Liu ve ark. (2021) tarafından yapılan çalışmalardaki sonuçlarla örtüşmektedir. Söz konusu çalışmalarda, *Lactobacillus*

rhamnosus gibi inokülantların silajın pH'ını düşürerek fermantasyon kalitesini iyileştirdiği ve şeker kaybını sınırladığı belirtilmiştir.

Renk parametreleri açısından değerlendirildiğinde, KHAY grubu 28.38 ± 0.79 ile en yüksek L* değerine sahip olmuş, bu da silajın en açık renge sahip olduğunu göstermektedir. Aynı zamanda bu grup, 29.96 ± 0.64 ile en yüksek renk farkı (ΔE*) değerini de göstermiştir. L* parametresi açısından gruplar arası farklar istatistiksel olarak anlamlı bulunmuş (P<0.001), lineer etkiler de anlamlı çıkmıştır (P=0.0365). HLAC ve HSILAL grupları, daha yüksek a* (sırasıyla 1.85±0.05 ve 2.03±0.25) ve b* (sırasıyla 8.74±0.21ve 9.72±0.74) değerleri ile daha doygun kırmızı ve sarı tonlar sergilemiştir. Bu durum, bu gruplarda renk pigmentlerinin ve bitkisel bileşiklerin daha iyi korunduğunu düşündürmektedir. Ancak, a* ve b* parametreleri bakımından gruplar arası fark istatistiksel olarak anlamlı bulunmamıştır (P=0.0992 ve P=0.4187). ΔE* parametresi için de fark anlamlı olmamakla birlikte (P=0.5855), inokülant uygulamalarının renk farklılıklarını azalttığı ve görsel kaliteyi artırdığı söylenebilir.

Renk tonu (h) değeri en yüksek 81.81 ± 0.76 ile HSILD grubunda, en düşük ise 78.02 ± 0.30 ile HLAC grubunda ölçülmüştür. KHAY grubu da 80.14 ± 0.55 ile benzer şekilde yüksek bir h açısı göstermiştir. Renk yoğunluğu (C*) bakımından en yüksek değer 9.94 ± 0.76 ile HSILAL grubunda saptanmış, ancak gruplar arası farklılıklar h (P=0.0366) ve C* (P=0.4073) değerleri açısından istatistiksel olarak anlamlı bulunmamıştır. Bu bulgular, inokülant uygulamalarının renk parametreleri üzerinde sınırlı, ancak pozitif etkiler oluşturduğunu göstermektedir. İnce ve Vurarak (2019) tarafından yapılan çalışmada da renk parametreleri ile kaba yem kalitesi arasında anlamlı korelasyonlar tespit edilmiş, özellikle L*, a* ve b* değerlerinin pH ve protein içeriği gibi kalite parametreleriyle ilişkili olduğu rapor edilmiştir.

İnokülant uygulamaları İtalyan çimi silajlarında fermantasyon kalitesini belirgin şekilde artırmakta ve renk parametrelerini olumlu yönde etkilemektedir. pH düşüşü ve WSC'nin korunması, mikrobiyal aktivitenin etkinliğini ve silajın besin değerini artırmaktadır. Renk parametrelerindeki iyileşmeler ise yemlerin görsel kalitesini yükselterek hayvan tüketimini artırabilecek potansiyele sahiptir. Bu veriler, inokülant kullanımının yem kalitesi açısından önemli bir yönetim stratejisi olabileceğini göstermektedir.

Tablo 4. Doğranmamış İtalyan çimi silajının kalite ve renk özellikleri

Parametre[1]		°C±SEM	pH	WSC (°Brix)	*L**	*a**	*b**	*ΔE**	*h*	*C**
KHAY		19.13^{B}±0.06	5.86^{A}±0.10	16.33^{B}±0.17	28.38±0.79	1.64±0.08	9.46±0.29	29.96±0.84	80.14^{ab}±0.55	9.60±0.29

[1] °C: Santigrat derece; WSC: Suda çözünür karbonhidrat değeri (Brix derecesi 0–25°); L: Açıklık (parlaklık); a*: Kırmızılık; b*: Sarılılık; ΔE*: Toplam renk farkı; h: Renk tonu açısı; C*: Doygunluk (kroma). a,b,c Aynı sütunda farklı üst simgeler taşımayan ortalamalar arasındaki farklar istatistiksel olarak anlamlıdır (P<0.01). ¥ L: Doğrusal; Q: Kuadratik; C: Kübik etkiler. SED: İki ortalama arasındaki farkın standart hatası.*

Tablo 5 verilerine göre, farklı inokülant uygulamalarının İtalyan çimi silajlarının aerobik stabilitesi üzerindeki etkileri mikrobiyolojik ve kimyasal parametreler bakımından ayrıntılı olarak değerlendirilmiştir. HLAC uygulaması, aerobik stabilite sonrası %35.95 ± 0.01 ile en yüksek kuru madde (KM) içeriğine ulaşmıştır. Bu oran, KHAY (%34.03 ± 0.01), HSILD (%32.35 ± 0.01), HMIC (%32.67 ± 0.01) ve özellikle HSILAL (%29.77 ± 0.01) gruplarına kıyasla anlamlı derecede yüksektir (P<0.001). Söz konusu sonuçlar, yüksek kuru madde içeriğinin silajın aerobik stabilitesini artırıcı etkisini vurgulayan Srisesharam ve ark. (2018) tarafından bildirilen bulgularla örtüşmektedir.

pH değerleri açısından en yüksek ortalama, KHAY grubunda 5.57 ± 0.03 olarak tespit edilmiştir. Buna karşın, en düşük pH değeri 5.15 ± 0.08 ile HSILAL grubunda gözlemlenmiş ve bu fark istatistiksel olarak oldukça anlamlı bulunmuştur (P<0.001). pH değerleri bakımından elde edilen bu sonuçlar, inokülant uygulamalarının homofermentatif laktik asit bakterileri (LAB), özellikle Lactobacillus rhamnosus gibi türler aracılığıyla ortamın asitleşmesini hızlandırarak silajın aerobik stabilitesini iyileştirebileceğini ortaya koymaktadır (Xia ve ark., 2023).

Aerobik stabilite sonrasında CO_2 üretim miktarları gruplar arasında değişiklik göstermiştir. En yüksek CO_2 üretimi KHAY grubunda 3.65 ± 0.25 g/kg olarak kaydedilmiş, en düşük üretim ise 2.46 ± 0.32 g/kg ile HMIC grubunda gerçekleşmiştir. Ancak bu farklılık istatistiksel olarak anlamlı bulunmamıştır (P=0.2849). Bununla birlikte, varyans analizinde lineer etki (L) istatistiksel olarak anlamlı olmasa da (P=0.2976), kuadratik etki (Q) açısından CO_2 üretiminde eğilimsel bir fark gözlemlenmiştir (P=0.1458). Bu bulgular, inokülant uygulamalarının mikrobiyal bozulmayı sınırlandırarak CO_2 üretimini azaltabileceğini öne süren Uğurlu ve ark. (2022) tarafından bildirilen sonuçlarla paralellik göstermektedir.

Aerobik stabilite sonrası maya sayısı değerlendirmeye uygun düzeyde tespit edilememiştir. Küf varlığına hiçbir grupta rastlanmamış olması, inokülant uygulamalarının ve uygun fermentasyon koşullarının mantar gelişimini önleyici etkilerini göstermektedir. Bu durum, Li ve Nishino (2013)'nun silaj ortamında uygun asidifikasyonun maya ve küf gelişimini sınırlandırabileceğini belirttiği çalışmalarıyla tutarlıdır.

Laktik asit bakterisi (LAB) popülasyonu açısından, aerobik koşullar altında HSILD grubu 96.33 ± 8.19 log CFU/g ile en yüksek LAB yoğunluğuna ulaşmıştır ve bu fark istatistiksel olarak oldukça anlamlıdır (P<0.001). HLAC (%31.67 ± 2.91), HSILAL (%17.33 ± 1.76), HMIC (%63.67 ± 5.04) ve KHAY (%13.67 ± 3.84) grupları arasında da anlamlı farklılıklar gözlemlenmiştir. Anaerobik koşullarda LAB sayısı HLAC ve KHAY gruplarında 3.00 ± 0.00 log CFU/g iken, HMIC grubunda 1.00 ± 0.00 log CFU/g olarak belirlenmiştir (P=0.2055; istatistiksel olarak anlamsız). LAB düzeyindeki farklılıklar özellikle lineer (P=0.0336) ve kuadratik (P<0.0001) etkiler açısından anlamlı bulunmuştur. Bu durum, inokülantların silaj içerisindeki LAB popülasyonunu artırarak fermantasyon kalitesini geliştirme potansiyelini göstermektedir (Srisesharam ve ark., 2018).

Genel olarak değerlendirildiğinde, inokülant uygulamalarının hem kimyasal hem de mikrobiyolojik parametrelerde önemli farklılıklara neden olduğu görülmektedir. Yüksek kuru madde oranı, düşük pH, yüksek LAB popülasyonu ve düşük maya varlığı, aerobik stabiliteyi artıran temel unsurlar olarak öne çıkmaktadır. Bu bulgular, silaj kalitesinin artırılmasında inokülantların etkin kullanımının önemli bir yönetim aracı olabileceğini göstermektedir.

4. SONUÇ

Bu çalışmada elde edilen bulgular, inokülant uygulamalarının silaj kalitesini artırıcı etkilerini açıkça ortaya koymuştur. Kimyasal bileşim açısından, HLAC grubu silajı, yüksek ham protein (%19.15) ve kül (%11.32) içerikleriyle dikkat çekmiş ve en düşük ADFom (%15,48) değeriyle sindirilebilirlik potansiyelini göstermiştir. Ayrıca, HLAC silajı en yüksek enerji değerlerine (ME: 2.49 Mcal/kg) ulaşarak, yüksek enerji ihtiyacı olan ruminantlar için uygun bir yem alternatifi olabileceğini göstermiştir. Yem kalitesi parametreleri açısından HLAC silajı, KKM (%68.03), TMS (%68.88), NYD (167.55) ve NYK (177.91) değerleriyle üstün performans sergilemiştir. İnokülant uygulamaları (HSILD ve HSILAL) da benzer şekilde yem tüketimi (KMT) ve yem kalitesi (NYK) üzerinde olumlu etkiler sağlamıştır. Fermantasyon kalitesi ve görsel renk parametreleri yönünden HSILAL grubu, düşük pH (5.08) ve yüksek suda çözünür karbonhidrat (WSC) içeriği 21.00 °Brix ile güçlü fermentasyon ve iyi şeker korunumu sağlamıştır. Ayrıca HLAC ve HSILAL gruplarında daha zengin a* ve b* renk değerleri, daha iyi yem tazeliği ve görsel kaliteyi göstermiştir. Aerobik stabilite sonrası değerlendirmelerinde, HLAC uygulaması en yüksek kuru madde oranı (%35.95) ve HSILAL grubu ise en düşük pH (5.15) değerleriyle stabiliteyi desteklemiştir. HSILD grubu, aerobik koşullarda en yüksek LAB popülasyonuna (96.33 log CFU/g) ulaşarak fermentasyon kapasitesini koruduğunu göstermiştir. CO_2 üretimi ve küf/maya varlığı bulguları, inokülant uygulamalarının mikrobiyal bozulmayı sınırladığını ve aerobik stabiliteyi artırdığını kanıtlamaktadır.

Sonuç olarak, laktik asit bakteri bazlı inokülant uygulamalarının, İtalyan çimi silajlarının hem besin değerini hem de fermantasyon ve aerobik stabilite kalitesini anlamlı düzeyde iyileştirdiği belirlenmiştir. Özellikle HLAC ve HSILAL grupları, hem besleyici değer hem de koruma stabilitesi açısından öne çıkmıştır. Bu nedenle, yüksek kaliteli İtalyan çimi silaj üretiminde bakteriyel inokülant kullanımı, ruminant beslenmesinde verimlilik artışı sağlamak amacıyla önerilmektedir. İlerleyen çalışmalarda, bu silajların hayvan performansı ve süt/et verimi üzerine etkilerinin uzun dönemli değerlendirilmesi faydalı olacaktır.

ABSTRACT

Water, the source of life and living things, is a resource that cannot be replaced. Water is an indispensable element of life and the basic input of agriculture. Global warming and climate change have a significant impact on rainfall regimes. This effect causes serious consequences such as drought and flood. In this study, the effects of flood-drought-water pollution on the main agricultural products produced in Bilecik Districts were examined. In the study, Arap stream and Delikbağ stream in Gölpazarı; Gümüşdere in Pazaryeri; Çöte stream basins in Yenipazar were used. The characteristics of the watershed (such as area, length, slope, curve number) and climate data (such as precipitation, temperature and evapotranspiration) were prepared and used in the WinTR-55 and DrinC model. As a result, the R^2 value between the RDI drought index result and hop yield reached the highest value among the compared districts with a value of 0.50 in Pazaryeri. The R^2 value between the RDI drought index result and wheat yield reached the highest value among the compared districts with a value of 0.80 in Söğüt. Besides, a significant decrease was observed in drought index values in Bilecik in 2017. The years when drought was most apparent in Bozüyük were 2006 and 2007. In Pazaryeri, 2007 was seen as the year when the effect of drought was felt most intensely. When the peak flow values of the 100-year return period were compared with the WinTR-55 model, Gölpazarı-Arap Stream was the area with the highest risk with 66.59 m^3/s. This was followed by Gölpazarı-Gümüşdere with 47.06 m^3/s, Gölpazarı-Delikbağ Stream with 47.00 m^3/s and Yenipazar-Çöte with 26.27 m^3/s, respectively.

Keywords: Climate change, Drought, Flood, WinTR-55

TARIMSAL SU YÖNETİMİ PLANLAMASI: BİLECİK İLİ ÖRNEĞİ

ÖZET

Yaşamın ve canlıların kaynağı olan su, yerine konulamayan bir kaynaktır. Su, yaşamın vazgeçilmez bir unsuru ve tarımın temel girdisidir. Küresel ısınma ve iklim değişikliği yağış rejimleri üzerinde önemli etkilere sahiptir. Bu etki kuraklık ve sel gibi ciddi sonuçlara neden olmaktadır. Bu çalışmada, Bilecik İlçelerinde üretilen başlıca tarım ürünlerine sel-kuraklık-su kirliliğinin etkileri incelenmiştir. Çalışmada Gölpazarı'nda Arap deresi ve Delikbağ deresi; Pazaryeri'nde Gümüşdere; Yenipazar'da Çöte Dere havzaları kullanılmıştır. Havza özellikleri (alan, uzunluk, eğim, eğri numarası gibi) ve iklim verileri (yağış, sıcaklık ve evapotranspirasyon gibi) hazırlanarak WinTR-55 ve DrinC modelinde kullanılmıştır. Sonuç olarak, RDI kuraklık indeksi sonucu ile şerbetçiotu verimi arasındaki R^2 değeri, karşılaştırılan ilçeler arasında en yüksek değere 0,50 değeri ile Pazaryeri'nde ulaşmıştır. RDI kuraklık indeksi sonucu ile buğday verimi arasındaki R2 değeri ise karşılaştırılan ilçeler arasında en yüksek değere 0,80 değeri ile Söğüt'te ulaşmıştır. Ayrıca, Bilecik'te 2017 yılında kuraklık indeksi değerlerinde önemli bir düşüş gözlenmiştir. Bozüyük'te kuraklığın en belirgin olduğu yıllar 2006 ve 2007 olmuştur. Pazaryeri'nde kuraklığın etkisinin en yoğun hissedildiği yıl 2007 yılı olarak görülmüştür. 100 yıllık tekerrür periyoduna ait pik debi değerleri WinTR-55 modeli ile karşılaştırıldığında, Gölpazarı-Arap Deresi 66,59 m^3/s ile en yüksek riske sahip alan olmuştur. Bunu sırasıyla 47,06 m^3/s ile Gölpazarı-Gümüşdere, 47,00 m^3/s ile Gölpazarı-Delikbağ Deresi ve 26,27 m^3/s ile Yenipazar-Çöte izlemiştir.

Anahtar Kelimeler: İklim değişikliği, kuraklık, sel, WinTR-55

1. INTRODUCTION

Water is the source of life and living things. Therefore, water resources need to be protected and need to used sustainably. Protection of water resources refers to the measures taken to prevent pollution and depletion of water resources. Sustainable usage of water resources refers to ensure their protection for future generations [1]. Water is an indispensable element of life and it is the basic input of agriculture. Irrigation enhances agricultural production. On the other hand, it can be harmful for environment and endamages the natural balance if it applies excessively. The agricultural sector is in danger in terms of two major problems. They are the increasing population and climate change. As water resources are consumed unconsciously, the agricultural sector will have more difficulty accessing water and world food security will be in danger [2]. Reasons such as population growth, urbanization, industrialization and increased agricultural activities enhance the need for water. This situation leads to excessive consumption and pollution of water resources [3]. In the globalizing system of the 21st century, the population of humanity has increased rapidly and has exceeded 8 billion [4]. According to United Nations (UN) reports, the world population will reach 10 billion in 2050. Therefore, cities might be uninhabitable and the water might be undrinkable [5].

At the 1972 Stockholm Conference, the United Nations emphasized that environmental protection requires "protection of water, soil, air and natural ecosystems for future generations through planning or management." The aims of the UN Conference on Environment and Development organized in Rio de Janeiro (Brazil) in June 1992 were strengthening relationships between different water-related programs and developing approaches to ensure coordination across sectors [6].

Turkey's total water potential is estimated as 501 billion m^3/year. 166 billion m^3/year of this amount passes directly into the flow. 67% of the remaining water is lost through percolation, evaporation and transpiration. The total flow rate of our rivers is on average 186.1 billion m^3/year with the contribution of water leaking underground. The amount of water stored in dams and ponds is approximately 91.1 billion m^3/year. A total of 111 billion m^3/year of water (consisting of rivers, lakes and groundwater) is accepted as usable water potential [7]. When we look at the sectoral distribution of water usage, it is seen that on average 74% is for agricultural irrigation, 13% is for industry, and 13% is for domestic usage [8].

The atmosphere consists of different gases. Gases such as CO_2, CH_4, N_2O, O_3, CFC (chlorofluorocarbon) in the atmosphere insulate some of the heat coming from the sun to the earth and they allow the earth to remain at a certain temperature [9]. The increase in earth temperature is called global warming. The warming affects the whole world and living things and it causes important environmental changes [10]. The temperature on the earth's surface can be determined with the help of factors such as the amount of sunlight received and reflected by the earth, the retention of heat by the atmosphere, the evaporation and condensation of water vapor [11].

As a result of global warming, direct and indirect problems in water resources will cause a decrease in agricultural and forest products, energy shortage and population movement from coastal areas to inland areas [12].

Climate is the average of weather conditions observed in any place on earth over many years. The limits of this average are determined by the highest and lowest values. Climate change is the alteration in the average state or change of the climate over decades or longer [13]. Climate change lead to dense droughts and floods [14].

Reduction of poverty and protection of ecosystems are necessary to ensure food security. Much more food can be produced per unit of water in an agricultural system. For sustainable water management, a major policy shift is required in irrigated and rain-fed agriculture. Remarkable developments occurred in water resources and agriculture in the last 50 years. Major developments in hydraulic infrastructure have made available water for people. As the world population has increased from 2.5 billion in 1950 to 6.5 billion for today, irrigated area has doubled and water usage has tripled. Water management plans should be made for each city. Water quantity and quality of the cities are at risk. They might be negatively affected by water-related disasters such as drought and flood [15].

Global warming and climate change have a significant impact on rainfall regimes. This effect causes serious results such as drought and flood. It is predicted that the problem might increase further in arid areas. On the other hand, much more rain might fall in rainy cities [16]. Long-term trends in drought occurrence, heat stress, and floods highlight geographic variation in the impact of climate change on agriculture [17]. The most important cause of global warming is the greenhouse gas effect. Greenhouse gases accumulated in the atmosphere prevent the sun's rays, which have turned into infrared radiation from leaving the atmosphere. This causes global warming. As a result, global warming leads to climate change. This changes the physical and human geography of our planet [18].

Studies on the impact of climate change on water resources were summarized below. Alkan (2021) investigated the effect of climate change on drought and wheat yield in the Porsuk Stream basin and he determined that the basin was in an arid region. It was determined that hydrological and agricultural droughts were common and a meteorologically normal climate prevailed for the past period. The researcher states that the Porsuk Stream watershed will become arid meteorologically, but a normal climate will prevail hydrologically in the future [19]. Sırdaş and Şen (2003) determined the spatial distribution of monthly precipitation data of 60 large stations in Turkey between 1930 and 1990. They also state that our country is in a semi-arid region and they stated that drought is a constant threat for Turkey [20].

Richter and Semenov (2005) investigated the effects of drought risks on wheat yield by modeling for future climate changes in the United Kingdom. They determined that the warming will increase in the region between 2020 and 2050, which will have a positive impact on agricultural production. Another result is that the average wheat production will increase by 1.5-2 tons per hectare [21].

Türkeş (2012) found that the significant decrease in frost and snowy days especially in the 1900s in the Eastern Mediterranean and Turkey. The researcher also found that climate parameters such as the number of warm days and nights and the air temperatures (average, lowest at night and highest during the day) have increased [22].

Kapluhan (2013) examined the impact of drought on agriculture in Turkey. The study emphasized that the effects of drought was generally firstly seen in agriculture and gradually spread to other sectors. The researcher stated that Turkey is among the high-risk group countries in terms of the negative effects of the warming. Especially, the Mediterranean and Central Anatolia regions will be more affected by climate change in the future. Besides, it was determined that reducing the negative effects of agricultural drought might be possible by taking precautions before the drought begins. [23].

Studies on agricultural water quality were summarized below. Öktüren Asri et al. (2013) conducted a study to determine the quality of well water used for irrigation purposes in greenhouse cultivation in Osmaneli district of Bilecik province. They took water samples from 46 well waters and determined the values of pH, EC, Ca^{+2}, Mg^{+2}, K^{+}, Na^{+}, HCO_3^{-}, Cl^{-}, SO_4^{-2} and B. Besides, they determined quality classes by calculating SAR and Na% values. In addition, it was determined that 41.30% of the samples were in the C_2 salinity class and 47.82% were in the C_3 salinity class. All irrigation water samples were classified as 1st class water in terms of sodium adsorption rate (SAR) [24].

Alkan and Meral (2024) comprehensively investigated agricultural water quality in Bilecik Karasu River. According to the results, in Bozüyük county, in 2023, SAR in June is 0.1 (A1), SAR is 0.45 (A1) in September. SAR in June 2023 is 0.83 (A1) in Bilecik, SAR in September is 0.93 (A1). As a result, no problems were observed in terms of agricultural water quality in Bilecik and Bozüyük [25].

Drought indices are usually calculated by manually applying the relevant equations or using tools designed for this purpose. Some of the calculation tools of drought index are [26] SPI_SL_6, SPATSIM, SPEI package program and CDI. The software package called DrinC was developed at the Center for Assessment of Natural Disasters and Proactive Planning and the Laboratory of Land Reclamation and Water Resources Management at the National Technical University of Athens. DrinC can be used to calculate drought indices suitable for drought characterization, drought monitoring, spatial analysis of drought risks and exploration of climate scenarios [27].

The main goal in the design of the DrinC software is to provide the widest applicability for different drought types and various locations such as meteorological, hydrological and agricultural drought. Based on these criteria, DrinC consists of Reconnaissance Drought Index (RDI), Streamflow Drought Index (SDI), Standardized Precipitation Index (SPI) and Precipitation Deciles (PD).

Studies on agricultural drought were summarized below. Menteşe and Akbulut (2023) investigated the drought situation of Bilecik station (1964–2021) and Bozüyük stations (1964–2021) with the help of Standardized Precipitation Index (SPI). Researchers determined that the dry, normal and humid period rates of the two districts are similar to each other. Arıkan Uysal (2022) applied trend analysis methods for Bursa's rainfall and temperature values between 1990 and 2019. As a result, she found no statistically significant trend in precipitation data and She observed increasing trends in temperature data. According to SPI and SPEI indices, “normal” drought class prevailed [28]. Bacanlı and Kargı (2018) conducted drought analysis in Bursa with the Standard Precipitation Index (SPI). While normal or mild droughts were more common

in short-term periods (3-6 months), severe and very severe droughts were observed in long-term periods (12-24-48 months) [29]. Karaer and Gültaş (2018) determined that drought was generally seen in the summer months for Bilecik province using the SPI method [30].

Studies on agricultural floods were summarized below. Bayazıt (2021) examined the effects of urbanization on flood risk in Bilecik province. It was determined that Bozüyük district is under constant flood risk. It is also found that agricultural lands have a higher flood risk than forest areas in the study [31]. Dursun (2022) examined the flood risk in Osmaneli district of Bilecik using a geographical information system. In the study, the weight values of the flooding parameters were calculated using the Analytical Hierarchy Process (AHP) Method. Besides, the areas with flood risk were determined. As a result, very high risk with 11.94%, high risk with 35.98%, risky with 28.72%, low risk with 20.61% and no risk with 2.75% areas were determined. It was also determined that the risk of flood occurrence is generally higher in areas close to river basins [32].

Alkan (2016) estimated flood flow values in Bursa Province using the WinTR-55 model, Mockus, Rational and DSI synthetic methods. As a result, it was found that the WinTR-55 model predicted higher flood flow compared to other methods in fifteen of the seventeen basins [33].

In this study, the sensitivity of the main agricultural products in Bilecik Province was analyzed in terms of flood, drought and water pollution. For this purpose, agricultural product data in Bilecik was accessed from Turkish Statistic Institution. Climatic data was accessed from Bilecik Meteorology Directorate. Firstly, studies on the subject was compiled and evaluated. Later, a comprehensive result that would be beneficial for the stakeholders in the city was reached through this study.

2. MATERIAL AND METHODS

2.1. Materials

2.1.1. The research area

Bilecik is located in the southeast corner of the Marmara Region. The region intersect to the Marmara, Black Sea, Central Anatolia and Aegean regions. It is located between 39° and 40° 31' north latitudes and 29° 43' and 30° 41' east longitudes. It is adjacent to the provinces of Bolu and Eskişehir in the east, it is adjacent to Kütahya in the south, the region is adjacent to Bursa in the west and Sakarya in the north (Figure 1). The ranking of surface area (4321 km^2) of Bilecik is 65th in Turkey. Bilecik's land structure varies from hilly areas to eroded plains divided by steep and deep valleys. The borders of Bilecik contain the Northern Anatolian Mountains, the Central Anatolian Plateaus and fluvial plains of the Marmara Region. Bilecik's average altitude above sea level is 500 meters. As you go towards Karasu Valley, the altitude decreases and goes down to sea level in Istasyon District.

Figure 1. Map of Bilecik [31]

Bilecik is a province located in the southeast of the Marmara Region. Being adjacent to different geographical regions and topographic diversity also affects the climate of the province. For this reason, there are three different climate types in Bilecik. They are below.

• Marmara Region Climate: It is dominant in the Central, Gölpazarı, Osmaneli and Söğüt districts. In these regions, winters are warm and rainy. Besides, summers are hot and dry.

• Central Anatolia Region Climate: It is seen in Bozüyük, Pazaryeri and Yenipazar districts. In these regions, winters are cold and snowy. Besides, summers are hot and dry.

• Micro-climate Climate: It is seen along the Sakarya River coastline of Gölpazarı, Osmaneli and Söğüt districts. A milder climate prevails in these regions due to the influence of the river.

The average annual rainfall in Bilecik is 450 kg/m². Precipitation is generally concentrated in January and May. In terms of cloudiness, 92 days of the year are clear, 96 days are muggy and 177 days are cloudy. The data used in the WinTR-55 model were shown in Tables 1 and 2.

Table 1. Physical characteristics of the basins in Bilecik for the WinTR-55 model

Name of the watershed	Area of the watershed (km^2)	Length of the watershed (km)	Harmonic slope of the watershed	T_c (Time of concentration, hour)	CN (Curve number)
Gölpazarı-Arap stream	3.4	3.3	0.094	0.005	75
Gölpazarı- Delikbağ stream	2.4	2.7	0.04	0.007	75
Pazaryeri-Gümüşdere	4.91	5.82	0.038	0.014	74
Yenipazar-Çöte	3.87	4.9	0.028	0.014	74

Table 2. 24-hour rainfall amount of the watersheds (mm)

Name of the watershed	Return period (year)	24-hour rainfall amount (mm)

	10	47.32
	25	55.21
	50	61.06
	100	66.87

2.1.2. Determination of the study data

For drought analysis, average temperature and precipitation data for the period 1990-2021 for Bilecik-Central (Station No: 17120), for the period 2005-2022 for Pazaryeri (Station No: 17701), for the period 1990-2020 for Bozüyük were used. For this purpose, rainfall data measured in the periods of the relevant years were obtained from the General Directorate of Meteorology.

2.2. Methods

In this study, DrinC and WinTR-55 programs were used. The method equations used by the programs were explained below.

2.2.1. DrinC program

In the study, monthly maximum and minimum temperature, monthly average temperature and precipitation data of the Meteorology Station were processed in the format requested by the DrinC program. Indexes used in the DrinC model are Reconnaissance Drought Index (RDI), Streamflow Drought Index (SDI), Standardized Precipitation Index (SPI) and Precipitation Deciles (PD).

The Reconnaissance Drought Index (RDI) was developed to more accurately refer water deficit as a balance between input and output in a water system [35]. It is based on both cumulative precipitation (P) and potential evapotranspiration (PET). The initial value of RDI (α_k) is calculated in the k (month) time period for the i. year and is given in Equation (1).

$$\alpha_k = \frac{\sum_{j=1}^{k} p_{ij}}{\sum_{j=1}^{k} PET_{ij}}, i = 1(1)N \quad (1)$$

Where:

P_{ij}: Precipitation for month j for year i

PET_{ij}: Potential evapotranspiration for month j for year i

N: Total year

k: Month

Assuming that the lognormal distribution is valid, the calculation of RDIst is given in Equation (2).

$$RDI_{st}^{(i)} = \frac{y^{(i)} - \bar{y}}{\bar{\sigma}_y} \quad (2)$$

Where:

$y^{(i)}$: Logarithm of the αk value of year i

$\bar{y}$: Arithmetic mean of all αk values

$\bar{\sigma}_y$: Standard deviation of logarithms of αk values

2.2.2. WinTR-55 program

WinTR-55 model is based on the NRCS-TR 55 method in calculating the rate of peak surface flow. The NRCS-TR 55 method can be used safely in small, rural and urban basins if the area of the basin is less than 900 ha and the average slope is greater than 0.5%. The WinTR-55 model can be used safely in basins with a maximum of 10 sub-basins, where the curve number (CN) is greater than 40, where Tc is between 0.1 and 10 hours, and whose area is up to 6500 hectares. The method equation used in the model is also given in Equation (3).

$$q_p = q_u A\ Q\ F_p \quad (3)$$

Where:

q_p: Peak runoff discharge (m^3/s)

q_u: Unit peak runoff discharge (km^2/cm)

A: Watershed area (km^2)

Q: Surface runoff depth (mm) resulting from 24-hour rainfall in the desired return period

F_p: Correction factor determined according to the ratio of lakes and swamps in the basin fp value is shown in table 3.

Table 3. Correction factor, Fp (Huffman et al. 2013)

Percentage of lakes and swamps in the basin	*Fp*
0	1
0.2	0.97
1	0.87
3	0.75
5	0.72

After calculating *T*c by using Equation (4), unit peak runoff amount (*q*u) can be determined by using *T*c and la/p parameters from Figure 2 [33]. Figure 2 should be use for Type II Storm (A kind of precipitation distrubition).

$$T_c = L^{0.8} \left[\frac{\left(\frac{1000}{CN} - 9\right)^{0.7}}{4407\ (s_g)^{0.5}} \right] \quad (4)$$

where:

T_c: Concentration time (hours), L: Longest waterway length, which is from the farthest point of the basin to outlet (meters), CN: Runoff curve number, S_g: Average basin slope (m/m)

Precipitation distribution in the United States of America (USA) is divided into four different categories. They are Type I, Type IA, Type II, and Type III (Figure 3) [33]. The Type II precipitation distribution dominates most part of the USA. We have entered the distribution type II into the WinTR-55 model for the pond basins in Bilecik because this type represents an average distribution.

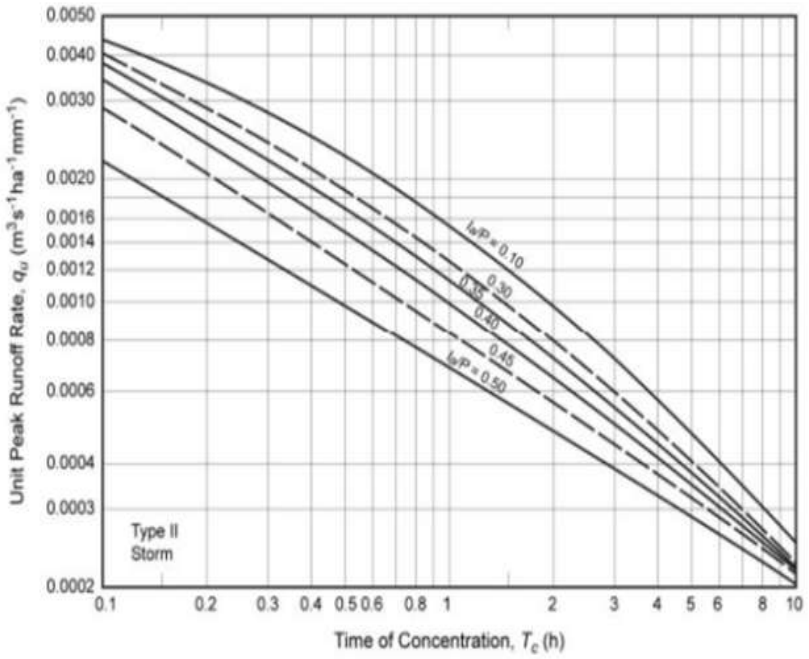

Figure 2. Unit peak runoff for NRCS Type II precipitation distribution

Figure 3. Precipitation distribution in the USA

In addition to calculating CN and Tc values, the WinTR-55 model also has the ability to calculate surface flow volume and peak flow rate. Basin characteristics such as size, shape, slope, soil type, land use, geological structure, vegetation and climate of the basin are among the factors. Besides, they affect the T_C value. There are different formulas developed to calculate the T_C value. Some of these formulas divide flow into categories such as channel flow and sheet flow. On the other hand, the others calculate Tc by using a single equation. In order to calculate the required CN value in the WinTR-55 model, the class of the soil group is shown in Table 4.

Table 4. The groups of soil class

Soil class	Description	The limit value that the infiltration capacity will reach as rainfall progresses, fc (mm/h)
A	Lowest runoff potential	8-12
B	Slightly low runoff potential	4-8
C	Slightly high runoff potential	1-4
D	Maximum runoff potential	0-1

The NRCS graphical (CN) method is shown below with its formula Equation (5) [33].

$$Q = \frac{(l-0.2S)^2}{l+0.8S} \quad (5)$$

Where:

Q : Runoff amount (mm) l: Storm rainfall amount (mm) S: Maximum potential difference between Runoff and Precipitation (Water holding capacity) (mm)

$$S = \left(\frac{25400}{CN}\right) - 254 \quad (6)$$

Where:

CN: Unoff Curve Number

l_a: 0.2S

l_a: The factors such as delay losses, surface deposits, infiltration etc

3. RESULTS AND DISCUSSION

In the study area, the effect of drought on crop production was analyzed spatially and temporally as follows.

3.1. Spatial variation of agricultural drought

In order to analyze the effect of drought on agricultural production, Durum wheat (Triticum Durum) and Hops (Humulus lupulus) plants were selected in this study and an analysis was made on their R^2 values (Determination coefficient between RDI and yield). The analysis results showed that the R^2 values for Durum wheat were 0.80 in Söğüt, 0.18 in Bilecik city center, 0.43 in Bozüyük and 0.0095 in Pazaryeri (Table 5). It can be seen that the region where Durum wheat is directly affected by drought is Söğüt with an R^2 value of 0.80, and Pazaryeri is the region where drought affects wheat yield the least with an R^2 value of 0.0095. As a result of the analysis, the R^2 value for hops was found to be 0.50 in Pazaryeri and 0.01 in Bilecik city center (Table 6). Agricultural drought affected Durum wheat and hop production in different ways. For Durum wheat yield, Bilecik was much more affected by drought compared to Pazaryeri. For Hop yield, Pazaryeri was much more affected by the drought compared to Bilecik. In order to examine the effects of drought on plant physiology and yield in more detail, the plant varieties used in studies can be increased.

Table 5. R^2 Determination coefficient results for Durum wheat (correlation with RDI)

R^2 results for Durum wheat	
Bilecik/City center	0.18
Bozüyük	0.043
Pazaryeri	0.0095
Söğüt	0.8

Table 6. R^2 Determination coefficient results for Hop (correlation with RDI)

R^2 results for Hop	
Bilecik/City center	0.01
Pazaryeri	0.5

Uzun (2024) found the high density of drought susceptibility in the area surrounding the Yenişehir Plain. In particular, this study reached the similar result in terms of results of Bilecik City center which was closed to Yenişehir Plain [36].

Taylan (2024) found that Bozuyuk reached positive SPI values. This study reached the similar result with the increasing trend of SPI too [37].

3.2. Temporal variation of agricultural drought

In this research, it was analyzed how the drought values of Bilecik, Bozüyük and Pazaryeri changed over the years. A significant decrease in drought index values was observed in Bilecik in 2017 and a significant increase in the index value was observed in 2011 (Figure 4).

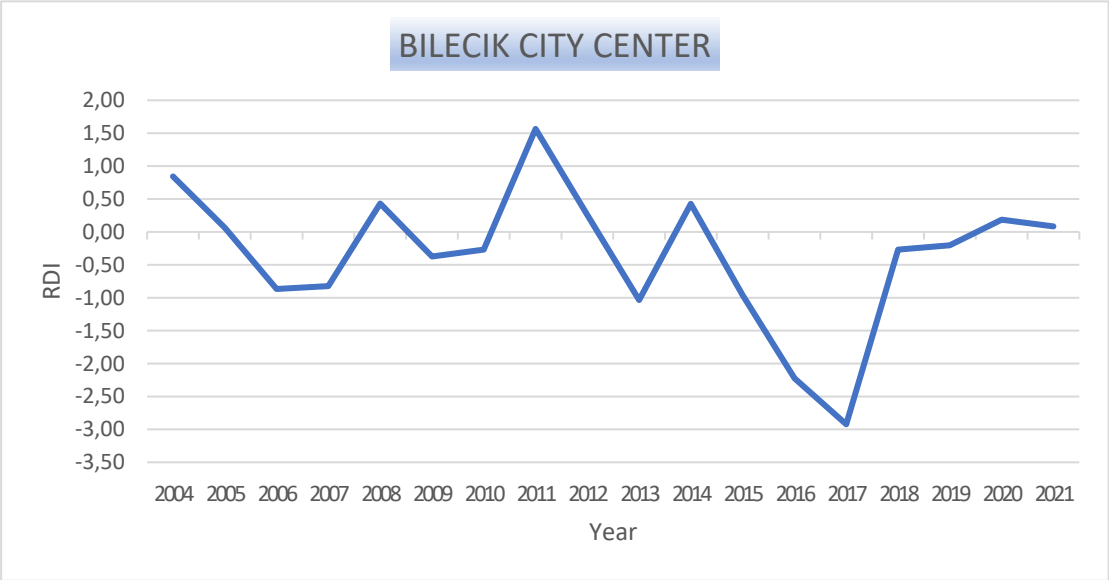

Figure 4. Temporal drought change of Bilecik

2006 and 2007 were most severe drought in Bozüyük. In 2004, there was an increase in the index value (Figure 5). In Pazaryeri, the drought was felt most intensely in 2007. In 2011 and 2015, an increase in drought index values was observed (Figure 6).

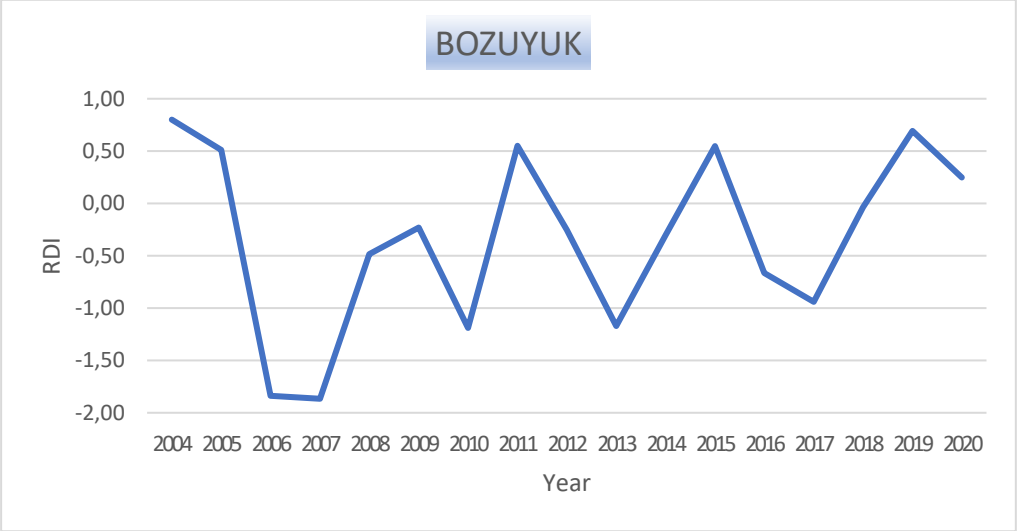

Figure 5. Temporal drought change of Bozüyük

Figure 6. Temporal drought change of Pazaryeri

3.3. The results related to reconnaissance drought index (RDI)

To compare with water quality results in the literature, the RDI values of Bilecik and Bozüyük in June and September in 2023 were taken and the correlation between them and the SAR water quality index was discussed in the conclusion section. RDI results were calculated with the help of DrinC model. RDI values were prepared based on the months of June and September in Bilecik and Bozüyük. While RDI was 1.18 in Bozüyük in June, it dropped to 0.17 in September and became more drier condition. In Bilecik province, the RDI value, which was 0.8 in June, decreased to 0.37 in September and started to trend towards drought (Figure 7)

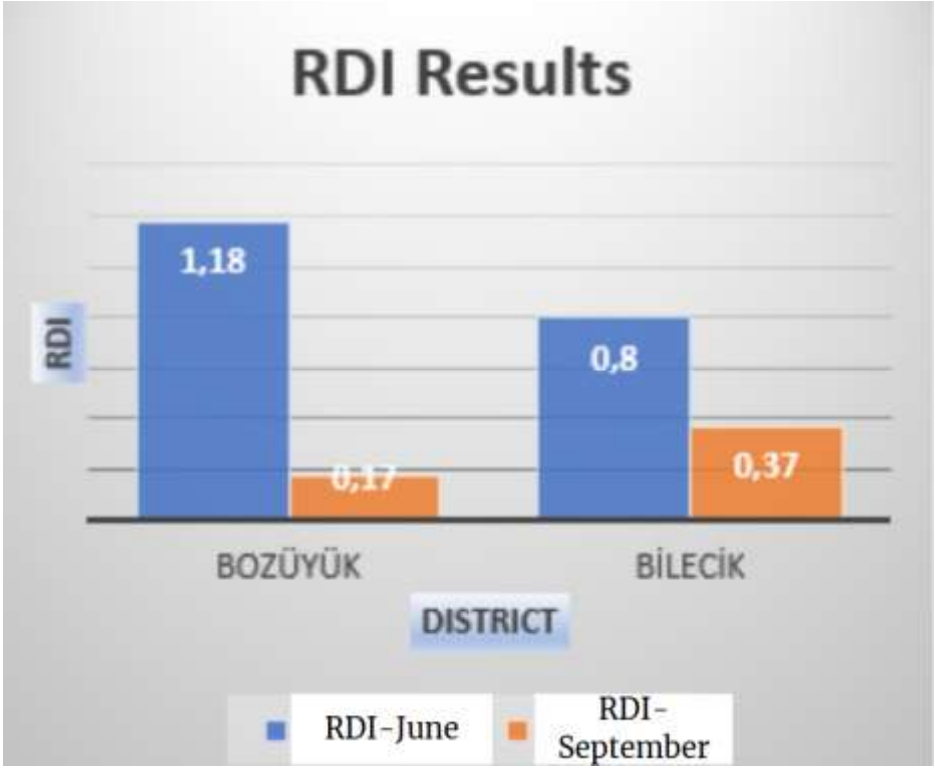

Figure 7. RDI change on a spatial and temporal basis

Kartal (2024) used RDI to determine the drought periods for between 1979 and 2022 years in Elazığ. He revealed that Ağın and Baskil County were drought regions [39]. Başakın et al. (2024) investigated determine of the correlation SPEI and scPDSI index [40].

As in these examples, there are widespread publications in the literature on the determination of the correlation between the drought indices and spatial distribution of drought. However, as in our study, there is very little research on the determination of the relationship between drought and crop yield. The results of our study are also very valuable in this respect.

3.4. Results related to agricultural flood

A comparative analysis of the flood risk was made by determining the peak flow values (m^3/s) of each research area at different return periods with the help of WinTR-55 model. For this purpose, peak flow values for 2, 5, 10, 25, 50 and 100 year return periods were calculated Table 7.

Table 7. Possible peak flow value for different return period

Watershed name	Return period (year)	Peak flow (m^3/s)
Gölpazarı-Arap stream	2	0.75
	5	7.82
	10	15.74
	25	31.54
	50	47.28
	100	66.59
Gölpazarı- Delikbağ stream	2	0.53
	5	5.52
	10	11.1
	25	22.26
	50	33.38
	100	47
Pazaryeri-Gümüşdere	2	1.65
	5	8.64
	10	15.16
	25	25.38
	50	35.46
	100	47.06
Yenipazar-Çöte	2	1.13
	5	5.9
	10	9.94
	25	15.79
	50	20.65
	100	26.27

The flood risk of each research area was compared based on the peak flow values of the 100-year return period. Gölpazarı-Arap Stream is the area with the highest risk with 66.59 m³/s. This is followed by Gölpazarı-Gümüşdere with 47.06 m³/s, Gölpazarı-Delikbağ Stream with 47.00 m³/s and Yenipazar-Çöte with 26.27 m³/s, respectively (Figure 8).

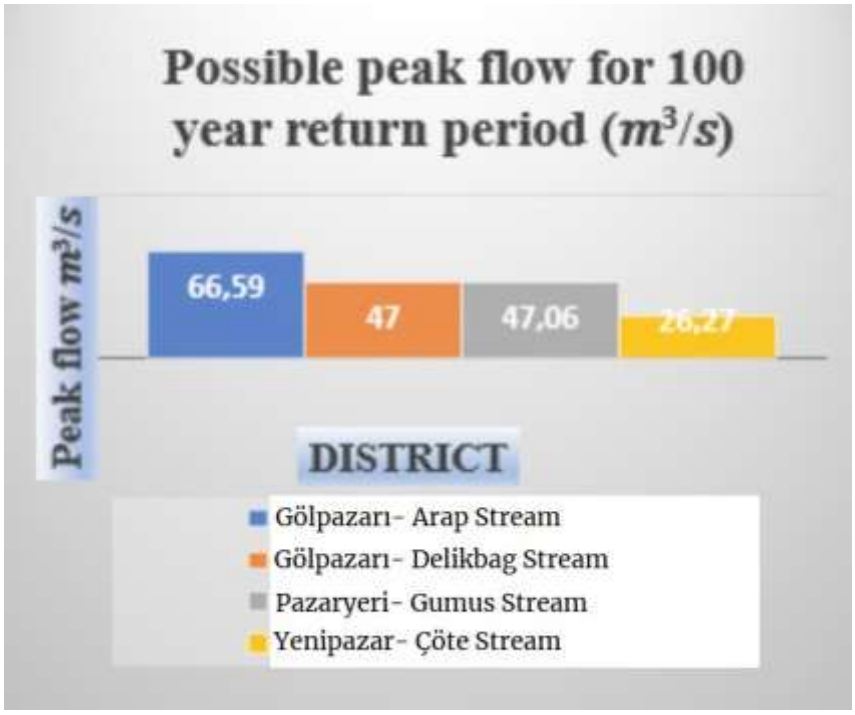

Figure 8. Possible peak flow for 100 year return period

Tarate et al. (2024) said that hydrologic models are so valuable in ungauged watersheds. The models are crucial for accurate runoff estimation. Besides, the NRCS-CN method is fertile and superior. WinTR-55 hydrologic model (NRCS-CN method inside of it), which are populer methods in the literature was used in this study [38].

Aktaş and Uncu (2024) stated that hollow areas carry flood risk. They especially draw attention to the fact that Gölpazarı district is quite mountainous and hollow [41]. The result of our study also coincides with this information in the literature. It is expected that very high peak flow rates will be observed in our Arap and Delikbağ basins in Gölpazarı.

Bathis and Ahmed (2016) used the HEC-HMS model in Doddahalla watershed [42]. The model is very similar to WinTR-55 medel. Both of these models are very valuable in ungauged watersheds and water-scarce regions where limited monitored data exist.

4. CONCLUSION

Menteşe and Akbulut (2023) found that the dry, normal and humid period rates of Bilecik and Bozüyük were similar to each other. They also noted that both weather stations are not facing a serious drought yet. Our study shows that the drought relationship between Bilecik and Bozüyük districts is similar and supports the study of Menteşe and Akbulut (2023). However,

when the R^2 values of Durum wheat are compared, the values of 0.043 in Bozüyük and 0.18 in Bilecik show that Durum wheat is much more affected by drought in terms of yield in Bozüyük compared to Bilecik City center. It is also important to consider that different plant varieties may have different levels of tolerance to drought. Therefore plant yield values and drought severity will not always correlate strongly. Future research should focus on examining the tolerance levels of different plant varieties to drought and adaptation strategies of crop against the drought.

Menteşe and Akbulut (2023) said that 2017 was a "very dry" year for Bilecik. In addition, Uysal (2022) examined 2017 for Bursa with the SPEI method and found that it was a less drier year than the estimation of SPI method. Our research evaluates Bilecik in terms of agricultural drought, which is similar to the results of Uysal (2022) conducted in Bursa. This shows that the drought assessment method used has a significant impact on the results. While the SPI method tries to evaluate drought severity using only precipitation data, the SPEI method offers a more comprehensive evaluation by consider other factors such as evapotranspiration and precipitation. Therefore, the SPEI method is expected to give more accurate results than the SPI method in different climatic regions and seasons. When compared to the results in these researches, the drought results of Menteşe and Akbulut (2023) and Uysal (2022) for 2017 show that the SPEI method is much more reliable than the SPI method. Therefore, it would be more appropriate to use the SPEI method in drought analyses. Drought indices are only indicators. To fully evaluate the effects of drought, other factors (soil moisture, plant stress, etc.) should also be considered.

Alkan (2016) found that for the Osmangazi Güneybayır basin, the peak flow rate, which may occur once in 100 years, reached 156.96 m^3/s. This value is quite above the peak flow rate values of the 4 regions selected as research areas in our research. Therefore, it is thought that this is due to the fact that the construction in the Osmangazi region of Bursa is more dense compared to the 4 regions in our research. On the other hand, the researcher found a peak flow rate of 41.13 m^3/s in the Bayramdere region of Karacabey Kocadere Village, and a peak flow rate of 47.06 m^3/s in the Pazaryeri-Gümüşdere region and 47 m^3/s in the Gölpazarı-Delikbağ stream in our Bilecik study. Since these basins are regionally close to Bursa and have similar hydrological characteristics, it can be said that their peak flow rates are similar.

Among these 4 regions investigated in the research, the fact that the peak flow values that may occur in 100 years in the Gölpazarı-Arap stream, Gölpazarı-Delikbağ stream and Pazaryeri-Gümüşdere region are higher than the Yenipazar-Çöte region. It shows that all 3 regions are higher in terms of construction and slope than Yenipazar-Çöte. Other factors that may affect peak flow values should also be considered. For example, factors such as land use, rainfall amount, concentration time and climate change may also play an important role.

Gölpazarı-Arap Stream has a higher flood risk than other research areas. This area should be considered as a priority to manage flood risk and take preventive precautions. Detailed flood risk maps should be created for each research area. Awareness and education activities should be carried out against flood risk. Necessary steps should be taken for the protection and sustainable management of water basins.

Alkan and Meral (2024) said that the sodium absorption rate in Bozüyük increased (350%) from 0.1 in September to 0.45 in June, and this caused the water quality to deteriorate. Similarly, in Bilecik province, it was observed that the sodium absorption rate increased by 12% from 0.83 to 0.93 and the water quality deteriorated. When the researcher's results are compared with the changes in the RDI values found in our research, it is seen that the deterioration of water quality rises and drought rises are directly proportional. The RDI value in Bozüyük, which was 1.18 in June, decreased to 0.17 (by 594%) in September, and the RDI value in Bilecik, which was 0.8 in June, decreased to 0.37 (by 116%) in September. The 594% decrease in the RDI value and the 350% increase in the SAR value in Bozüyük reveal a significant decrease in the availability of irrigation water. In Bilecik, the RDI value decreased by 116% and the SAR value increased by only 12%. The results indicate that Bilecik has a better water resource than Bozüyük and the quality of this water resource is less affected by drought. In Bilecik, the deterioration in water quality is also less because the drought effect is less.

As a result, factors such as floods, drought and water pollution can lead to yield losses in agricultural production and can lead to degradation of agricultural lands. Therefore, regional disaster risk maps should be created and irrigation planning should be made according to these maps.

As a result of this study, the sensitivity of the main agricultural products in Bilecik against the drought was determined. Besides, the amount of flood water likely to occur in Bilecik was determined. This study will contribute to the literature by examining major disasters such as drought and flood in Bilecik all together. This study has made a difference especially in terms of examining the relationship between drought index result and crop yield with the coefficient of determination.

It is recommended that the results obtained using different drought indices and hydrological models for the region in the future should be compared with the results of this study.

ABSTRACT

Due to the developing environmental awareness, economic production demands and the necessity of saving in energy use, radical changes in soil cultivation have started to be made in the world and in Turkey in recent years. Accordingly, conservation tillage, which is an alternative to conventional tillage, especially direct sowing method is rapidly becoming widespread. Within the framework of this idea, it is important to protect natural resources, which cannot be renewed or take a long time to be renewed in the production process, and to reduce environmental pollution.

Although it is possible to make the soil suitable for the growth of cultivated plants by tillage, the destruction of nature caused by unconscious and excessive tillage is extremely important. Intensive tillage and clearing the upper surface of the soil from plant residues cause soil compaction and erosion. The increase in field traffic, especially in the period when the soil is moist, will rapidly compact the soil.

For sustainable and economical plant cultivation in the agricultural areas of our country, it is necessary to implement the most accurate cultivation techniques that have been put forward by experts in the period from soil preparation to harvest. In order for the soil treatments to be applied in field agriculture to be successful, optimum seed bed preparation that accumulates moisture in the soil profile is required. Suitable seed bed preparation is possible by taking into consideration the climate of the region, soil type, land slope, crop rotation, available agricultural tools and recommended technical information.

Reduced tillage techniques are an increasingly widespread agricultural practice that aims to ensure environmental sustainability by preserving soil structure. These methods aim to treat the soil surface with minimum intervention and thus help to prevent soil erosion, increase water holding capacity and protect biodiversity. Conservation tillage is recognised as a strategy to increase productivity without disturbing the natural functions of the soil. In this context, reduced tillage plays an important role in reducing environmental impacts by contributing to

the preservation of soil physical and chemical properties. However, the success of these practices may vary depending on local climatic conditions, soil types and agricultural production methods. In this study, how reduced tillage methods can be evaluated in line with the conservation tillage concept was analysed and the environmental impacts of the practices, their long-term consequences on soil health and their relationship with productivity were discussed. In addition, the findings of recent research on the potential benefits and limitations of these methods are also included.

Keywords: Tillage, Reduced Tillage, Conservation Tillage, Direct Seeding

AZALTILMIŞ TOPRAK İŞLEME UYGULAMALARININ KORUYUCU TOPRAK İŞLEME TEKNİĞİ AÇISINDAN DEĞERLENDİRİLMESİ

ÖZET

Gelişen çevre bilinci, ekonomik üretim talepleri ve enerji kullanımında tasarrufa gitme zorunluluğu nedeniyle son yıllarda, dünyada ve Türkiye'de toprak işlemede köklü değişiklikler yapılmaya başlanmıştır. Buna bağlı olarak geleneksel toprak işlemeye alternatif olan koruyucu toprak işleme, özellikle doğrudan ekim yöntemi hızlı bir şekilde yaygınlaşmaktadır. Bu düşünce çerçevesinde, üretim sürecinde özellikle yenilenemeyen veya yenilenmesi uzun zaman alan doğal kaynakları korumak ve çevre kirliliğini azaltmak önem kazanmaktadır.

Toprak işleme ile toprağın kültür bitkilerinin yetişmesi için uygun hale getirilmesi mümkün olmakla beraber, özellikle bilinçsiz ve aşırı toprak işleme ile meydana gelen doğadaki tahribat son derece önemlidir. Yoğun toprak işleme ve toprak üst yüzeyinin bitki artıklarından arındırılması toprağın sıkışmasına ve erozyona neden olur. Toprağın özellikle nemli olduğu dönemde tarla trafiğindeki artış toprağı hızla sıkıştıracaktır.

Ülkemizdeki tarım alanlarında sürdürülebilir, ekonomik bitki yetiştiriciliği için uzmanlarca, toprak hazırlığından hasada kadar olan dönemde araştırmalarla ortaya konulmuş en doğru yetiştirme tekniklerinin uygulamaya geçirilmesi gerekmektedir. Tarla tarımında uygulanacak toprak işlemlerinin başarılı olabilmesi için toprak profilinde nem biriktiren optimum tohum yatağı hazırlığına ihtiyaç vardır. Uygun tohum yatağı hazırlığı bölgenin iklimi, toprak tipi, arazi eğimi, ekim nöbeti, eldeki tarım aletleri ve tavsiye edilen teknik bilgilerin mutlaka göz önünde bulundurulması ile mümkündür.

Azaltılmış toprak işleme teknikleri, toprağın yapısını koruyarak çevresel sürdürülebilirliği sağlamayı amaçlayan, giderek yaygınlaşan tarım uygulamalarındandır. Bu yöntemler, toprak yüzeyinin minimum müdahale ile işlenmesini hedefler ve bu sayede toprak erozyonunu engellemeye, su tutma kapasitesini artırmaya ve biyolojik çeşitliliği korumaya yardımcı olur. Koruyucu toprak işleme, toprağın doğal işlevlerini bozmadan, verimliliği artırmaya yönelik bir strateji olarak kabul edilmektedir. Azaltılmış toprak işleme, bu bağlamda, toprağın fiziksel ve kimyasal özelliklerinin korunmasına katkı sağlayarak çevresel etkilerin azaltılmasında önemli bir rol oynamaktadır. Ancak, bu uygulamaların başarısı, yerel iklim koşulları, toprak tipleri ve tarımsal üretim yöntemlerine bağlı olarak değişiklik gösterebilmektedir. Bu çalışmada, azaltılmış toprak işleme yöntemlerinin koruyucu toprak işleme anlayışı doğrultusunda nasıl değerlendirilebileceği incelenmiş olup, uygulamaların çevresel etkileri, toprak sağlığı üzerindeki uzun dönemli sonuçları ve verimlilikle ilişkileri ele alınmıştır. Bununla beraber, söz konusu yöntemlerin potansiyel faydaları ve sınırlamaları üzerine yapılan güncel araştırmaların bulgularına da yer verilmiştir.

Anahtar Kelimeler: Toprak İşleme, Azaltılmış Toprak İşleme, Koruyucu Toprak İşleme, Doğrudan Ekim

1. GİRİŞ

Gelişen çevre bilinci, ekonomik üretim talepleri ve enerji kullanımında tasarrufa gitme zorunluluğu nedeniyle son yıllarda, dünyada ve Türkiye'de toprak işlemede köklü değişiklikler yapılmaya başlanmıştır. Bu değişikliklere bağlı olarak geleneksel toprak işlemeye alternatif olan koruyucu toprak işleme, özellikle doğrudan ekim yöntemi hızlı bir şekilde yaygınlaşmaktadır. Bu düşünce çerçevesinde, üretim sürecinde özellikle yenilenemeyen veya yenilenmesi uzun zaman alan doğal kaynakları korumak ve çevre kirliliğini azaltmak önem kazanmaktadır.

Toprak işleme ile toprağın kültür bitkilerinin yetişmesi için uygun hale getirilmesi mümkün olmakla beraber, özellikle bilinçsiz ve aşırı toprak işleme ile meydana gelen doğadaki tahribat son derece önemlidir. Yoğun toprak işleme ve toprak üst yüzeyinin bitki artıklarından arındırılması toprağın sıkışmasına ve erozyona neden olur. Toprağın özellikle nemli olduğu dönemde tarla trafiğindeki artış toprağı hızla sıkıştıracaktır.

2. TOPRAK İŞLEME

Tarla tarımında başarılı olabilmek için, tohumun ekimine uygun, iyi bir tohum yatağı hazırlamak gerekmektedir. İyi tohum yatağı hazırlığı da toprak bünyesine uygun tarım alet ve makineleri kullanarak zamanında, tekniğine uygun bilinçli bir toprak işleme ile mümkündür.
Toprak işlemeyi, tohumların ekilebilmesi, bitkilerin yetişebilmesi için, toprağın uygun duruma getirilmesi ve bu durumun korunması için herhangi bir araçla gevşetilmesi, ufalanması ve karıştırılması olarak tanımlayabiliriz.
Toprak işleme yöntemleri, toprak tipine, toprak işleme zamanına, ekim nöbetine, ekilen bitkinin cinsine, iklim şartlarına ve eldeki mekanizasyon seviyesine göre değişmektedir.
Toprak işlemenin amaçları:

- Tohum yatağını hazırlamak,
- Yabancı ot kontrolünü yapmak,
- Toprak yüzeyindeki bitki artıkları, anız ve ahır gübresinin gömülmesini sağlamak,
- Su ve rüzgâr erozyonunu kontrol etmektir.

3. TOPRAK İŞLEME SİSTEMLERİ

Toprak işlemenin amacı toprak verimliliğini korumak, erozyonu azaltmak, toprak sıkışıklığını önlemek, topraktaki flora ve faunanın korunmasını ve çeşitliliğin muhafazasını sağlamaktır(Önal,1995; Aykas ve Önal, 1999).
Çeşitli etkiye sahip toprak işleme aletlerinin kullanımına dayalı olarak farklı toprak işleme sistemleri ortaya çıkmıştır. Bu sistemleri iki ana grupta toplamak mümkündür.

- Geleneksel toprak işleme
- Koruyucu toprak işleme

Şekil 1. Toprak işleme sistemleri

3.1.GELENEKSEL TOPRAK İŞLEME

Geleneksel toprak işleme de toprağın üst yüzeyi isleme derinliğinde kabartılır. Bu toprak isleme yönteminde toprağın pullukla devrilmesi esastır. Geleneksel toprak işleme, özellikle ülkemizde yoğun ve aşırı toprak işlemeyi beraberinde getirmekte, toprak sıkışmasını ve erozyonu teşvik etmektedir. Türkiye topraklarının % 34,4'ünün erozyonu körükleyen yüksek eğimli alanlardan (%15-40) oluşması bu tehlikeyi daha da artırmaktadır(Korucu ve ark., 1998).

Şekil 2. Pullukla Toprak İşleme

3.2.KORUYUCU TOPRAK İŞLEME

Koruyucu toprak işleme sisteminde toprağı devirerek işleyen pulluk ve benzeri aletler kullanılmaz. Toprak sıkışıklığının sorun olduğu yerlerde toprağı belli bir derinlikte yırtarak işleyen çizel vb. aletler kullanılır. Bu sistemde ön bitki veya ürün artıkları tarla yüzeyinde bırakılır. Erozyon kontrolünde koruyucu toprak işleme ve doğrudan ekimin olumlu etkileri ortaya konulmuştur.

Genel kural olarak koruyucu toprak işleme sisteminde tarla yüzeyinin en az %30 oranında bitki artığı ile kaplı halde bulunması amaçlanır (Köller, 2003). Yüzeyde çok az miktarda bitki örtüsü bulunmasının bile erozyonu büyük ölçüde önlediği yapılan araştırmalar ile saptanmıştır.

Koruyucu toprak işleme; yabancı ot kontrolü ve tohum yatağı hazırlığı için yapılan ve geleneksel toprak işlemeye göre tarlada geçiş sayısını önemli ölçüde azaltan bir sistemdir. Bu sistem, prensip olarak toprağı devirmeden işlemeye yönelik uygulamaları içerir. Koruyucu toprak işlemede geleneksel toprak işlemede olduğu gibi temel toprak işleme, tohum yatağı hazırlama ve ekim işlemleri ayrı ayrı veya birleştirilerek yapılabilir. Koruyucu toprak işleme sisteminde iki temel düşüncenin gerçekleşmesi hedeflenir.

- Ön bitki veya ikinci ürün artıklarının tarla yüzeyine veya yüzeye yakın katmanlara yerleştirilmesi,
- Toprak işleme yoğunluğunun azaltılması (Önal, 1995).

Korumalı toprak işleme sistemi olarak uygulamada değişik alt sistemlere rastlamak mümkündür. Bunlardan bazıları aşağıda belirtilmektedir.

- Şerit Halinde Toprak İşleme
- Ekim Sırasında Toprak İşleme
- Malçlı Toprak İşleme
- Sırta Ekime Yönelik Toprak İşleme
- Doğrudan Ekim

3.2.1. ŞERİT HALİNDE TOPRAK İŞLEME

Tohum yatağı hazırlığı için ekim öncesi tarla yüzeyinin 1/3 ünün islenmesine izin veren koruyucu toprak işleme uygulamasıdır. Bu uygulamada toprak işleme genellikle ekimle beraber yapılır ve ekim sıralarının geleceği bölgelerde 5 ila 30 cm genişliğinde toprak işleme yapılarak bunun dışında kalan bölgeler anızla kaplı bırakılır (Godwin, 1990). Bu uygulamanın yanında sırta ekim için toprak işleme de yalnız sırtların yapılacağı şeritlerde toprak diskli ve benzeri aletlerle işlenir.

Şekil 3. Şerit halinde toprak işleme

3.2.2. EKİM SIRASINDA TOPRAK İŞLEME

Toprak frezesi, rotatiller veya PTO tahrikli tırmık ile ekim makinası birleştirilerek yapılan uygulamadır. Bu uygulamada, tarlanın tamamında toprak işlemesi yapılabileceği gibi, şerit halinde toprak işlemeye benzer şekilde sadece ekimin yapılacağı sıralarda toprak işlemesi yapılabilir.

Şekil 4. Ekim sırasında toprak işleme

3.2.3. MALÇLI TOPRAK İŞLEME

Malçlı toprak işlemenin temel felsefesi tüm yıl boyunca toprak yüzeyini bitki artıkları veya bitkiyle kaplı tutarak kaymak tabakası oluşumunu önlemek, filiz çıkış sorunlarını ve erozyonu azaltmaktır. Bu amaçla çizel, kültivatör, diskaro gibi aletler kullanılır.

Tohumun malçlı tohum yatağına ekiminde başarıya, ekim makinesinin performansının yanında, ekimden sonra tohum yatağı bölgesinde oluşan fiziksel ve kimyasal değişmelerde etki etmektedir.

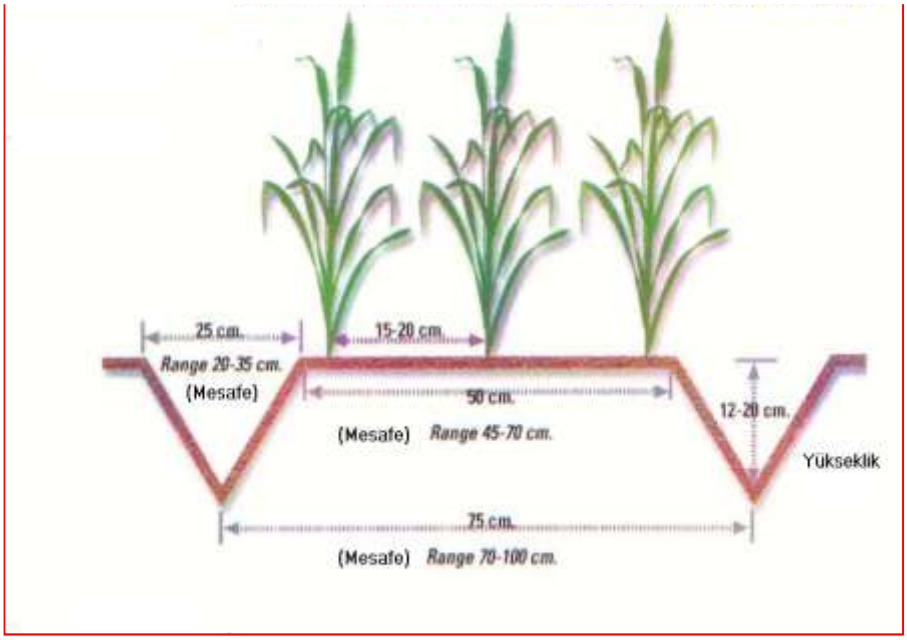
Şekil 5. Malçlı toprak işleme(Anonim)

3.2.4. SIRTA EKİME YÖNELİK TOPRAK İŞLEME

Bitki üzerine ekileceği ve bakım işlemleri sırasında veya hasat sonrasında sırt oluşturulması ve bunların her yıl aynı yerde korunmasını sağlayan sistemdir.

Sırta ekime yönelik toprak işlemede; toprak genellikle gübre uygulamaları dışında ekime kadar işlenmeden bırakılır. Bitkiler önceki yetiştirme döneminde yapılmış sırtlara ekilir veya dikilir Genellikle kazayağı, diskli sıra temizleyicileri, gömücü üniteler veya yatay diskleri bulunan ekim makineleri kullanılmaktadır.

Şekil 6. Sırta ekime yönelik toprak işleme



Şekil 7. Sırta ekime yönelik toprak işleme

3.2.5. DOĞRUDAN EKİM

Doğrudan ekim, koruyucu toprak işleme gibi toprağın yapısını iyileştirmekte, toprak neminin korunmasını sağlamaktadır. Doğrudan ekim yapılan alanlarda sonbahar toprak işlemesine belirli ölçüde izin verilebilir.

Tarlada anız artıklarının parçalanmasından sonra sonbaharda toprağı devirmeden işleyen aletlerle toprak işlenir. Bu durumda toprak yüzeyinde anız artıklarının en az % 50 sinin kalması gerekmektedir. Toprak yüzeyinde bulunan bitki artıkları toprağın korunması yönünden büyük önem taşımaktadır.

Doğrudan ekimin başarısı, iklim ve toprak koşullarına, ekim makinasının performansına ve yabancı ot mücadelesine bağlıdır. Ot mücadelesi genel olarak herbisitle yapılır. Doğrudan ekim yapılan tarlalarda ciddi yabancı ot sorunu varsa 4-5 yılda bir ekim öncesi azaltılmış toprak işleme uygulanabilir.

Şekil 8. Hasat edilmiş buğday tarlasına ekilmiş soya fasulyesi

4. TOPRAK İŞLEMESİZ- DOĞRUDAN EKİM YÖNTEMİNİN DEZAVANTAJLARI

- Üst üste tahıl ekilişlerinde kök çürüklüğü hastalıklarında artış olabilir.
- Üst üste tahıl ekilişlerinde nematodlarda yoğunlaşma meydana gelebilir.
- Mevcut mibzerler dönüş yapmak zorunluluğu vardır.
- Toprak yüzeyinde bitki atıkları varlığını sürdürdüğü ve ortam yaşamaları için daha iyi bir ortam sağlandığından, fazla böcek ve hastalık problemleri ortaya çıkabilir.
- Ürün artıkları ile ertesi döneme hastalık veya zararlılar taşınabilir.

- İyi bir tohum-toprak teması sağlayarak tohumu nemli toprağa yerleştirebilen ve bunu yüzeydeki artıklarla tıkanmadan gerçekleştirebilen özel makinelere veya mevcut ekim makinelerin da değişikliklere ihtiyaç duyulur.

5. TOPRAK İŞLEMESİZ -DOĞRUDAN EKİM YÖNTEMİNİN AVANTAJLARI

- Toprak işleme doğrudan ekim riskini azaltır.
- Yağmurun toprağa İnfiltrasyonunu artırır ve buharlaşmayı azaltarak rutubetin toprakta tutulmasını sağlar.
- Zaman tasarrufu sağlar.
- Atmosfere sera gazı (CO_2) salınımını azaltır.
- Bitki çıkışını güçleştiren ve yüzey akışın neden olan kaymak tabakası oluşumunu engeller.

Çizelge 2. Toprak İşleme ve Ekim sistemlerinin Karşılaştırılması

Sistem	Tarla Uygulaması	Üstünlükleri	Eksiklikleri
Kulaklı Pulluk	Son bahar ve ilkbaharda sürüm	Drenajı zayıf topraklar için uygunluğu	Erozyon kontrolündeki düşüklüğü
Çizel Pulluğu	Sonbaharda çizel ile sürüm	Yüzeyi tamamıyla temiz bırakan toprak işleme sistemine göre daha az erozyon oluşumu	Toprak nem kaybının yüksek oluşu
Disk	İlkbahar veya sonbaharda diskli aletlerle işleme	Toprak karıştırabilme kabiliyetinin yüksekliği	Erozyon kontrolünün düşüklüğü
Sırta Ekime Yönelik Toprak İşleme	Sapların parçalanması, sırta ekim, yabancı ot kontrolü için bakım ve tekrar sırt oluşturma	Değişik toprak tipleri için uygunluk	Makinelerde değişikliğe gereksinim duyulması
Toprak İşlemesiz	İlaçlama ve bozulmamış yüzeye ekim	Minimum yakıt ve iş gücü gideri	Aşırı herbisit bağımlılığı

6. KORUYUCU TOPRAK İŞLEMENİN YARARLARI VE SAKINCALARI

Korumalı toprak işleme de, toprağın en az işlenmesi söz konusudur. Toprağı işleme düzeyi ve sıklığı azaltıldığında, anız veya bitki atıkları toprağa tamamen karıştırılmaz ve toprağın üzerinde bırakılır. Tohum; bu anız veya işlenmiş topraktaki küçük şeritlere ekilmektedir. Burada bu işlemler yapılırken bazı avantajlar ve dezavantajlar söz konusu olmaktadır.

Avantajları

- Yerleştirilen ürünler , suyu daha etkin bir şekilde kullanır.
- Toprağın su tutabilme kapasitesi artar.
- Yağışlardan dolayı su kayıpları ve buharlaşma azalır.
- Ekim tahininde hava koşullarına bağımlılık azalır.
- Ekim öncesi toprak işleme çalışmaları azalır, böylece iş gücü ve yakıttan tasarruf sağlanır.
- Ekim için daha az işlem yapılması, gerek traktör gerekse toprak işleme ve ekim makinelerinin daha az aşınması. Bu ise tamir ve bakım masrafları azaltır.
- Toprak yüzeyine bırakılan bitki atıkları su ve toprak erozyonunu azaltır.
- Bitki çıkışını güçleştiren ve yüzey akışa neden olan kaymak tabakası oluşumunu engeller.

Dezavantajları

Pahalı ve değişik özellikleri olan üretim ekipmanları başlangıçta yüksek yatırım maliyeti gerektirir.

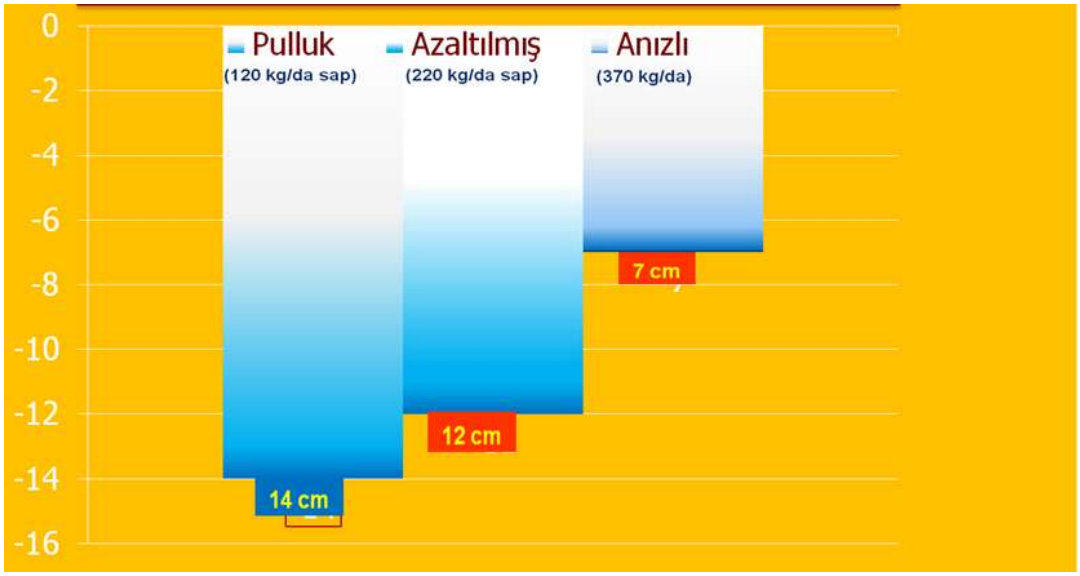
- Anız artıklarının tohumla teması toksik etki oluşturabileceğinden özel ekim makinelerinin kullanılması zorunlu olmaktadır.
- Toprak az veya hiç işlenmeyeceğinden ortaya çıkacak olan yabancı otlarla mücadele şarttır.
- Üreticilerin eğitimini gerektirir, çünkü tamamıyla yeni bir dinamiğe sahip koruyucu tarım sistemleri yüksek derecede yönetim kabiliyetine ihtiyaç duymaktadır.

7. KORUYUCU TOPRAK İŞLEMENİN ÇEVREYE SAĞLADIĞI YARARLAR

Geleneksel tarım; ürün artıklarının yakılması, yabancı ot kontrolü için derin toprak işleme gibi uygulamaları içerdiğinden, genel olarak çevre için zararlıdır. Bu teknikler toprakta sıkışıklığı arttırarak deformasyona ve erozyona neden olurken, aşırı gübre ve ilaç kullanımı sonucunda oluşan kalıntılar ile yeraltı sularının kirletilmesine de yol açarlar. Geleneksel yöntemde yer alan pulluk kullanımı ile toprağa yağmur damlalarının bombardımanı olmakta, sulama suyunun agregatlaşmamış toprak zerreciklerini sürüklemesi ile düşey erozyonla beraber taban taşı oluşumu da hızlanmaktadır.

Çizelge 3. Tarla Yüzeyinde Bulunan Bitki Artığı – Toprak Kaybı ilişkisi(Korucu ve ark.2001)

Bitki Artığı (Ton/ ha)	Yüzey Alanı (%)	İnfiltrasyon (%)	Toprak Kaybı (Ton/ ha)
0.00	45.0	54	13.00
0.63	40.0	60	7.50
1.25	25.0	74	2.50
2.50	0.5	99	0.75
5.00	0.1	99	0.00
10.00	0.0	100	0.00

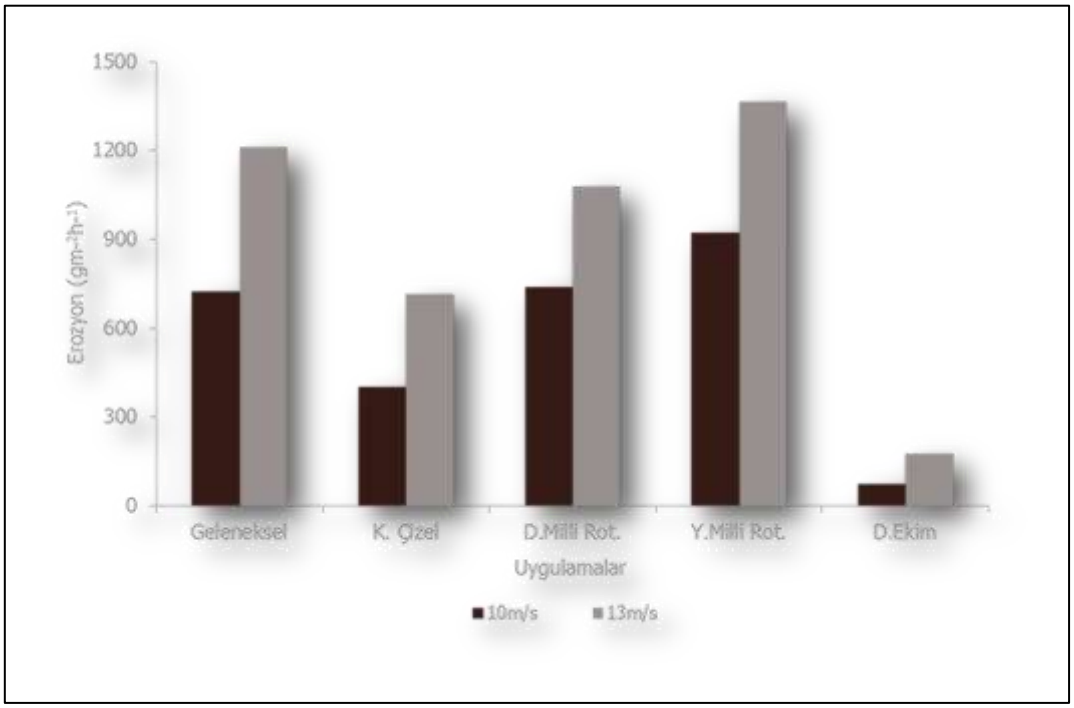


Şekil 10. Farklı toprak işleme sistemlerinde, ekim döneminde buğday tohumlarının çimlenmesi için yeterli nem seviyesinin bulunduğu toprak derinliği (Marakoğlu,T.,2010)

Her yıl erozyon nedeniyle Dünyada 75 milyar ton toprak kaybolmaktadır. Buda 9 milyon hektarlık bir tarımsal alanın kaybolması demektir. Türkiye topraklarının yaklaşık % 48 'nin ciddi erozyon tehdidi altında olduğu söylenebilir. Yanlış ve bilinçsiz toprak işlemeden kaynaklanan erozyon nedeniyle yılda 150 ton/ha' lık bir toprak kaybının meydana geldiği ortaya konmuştur. Doğrudan ekim, toprak erozyonunda %60-90 oranında azalmaya neden olmaktadır

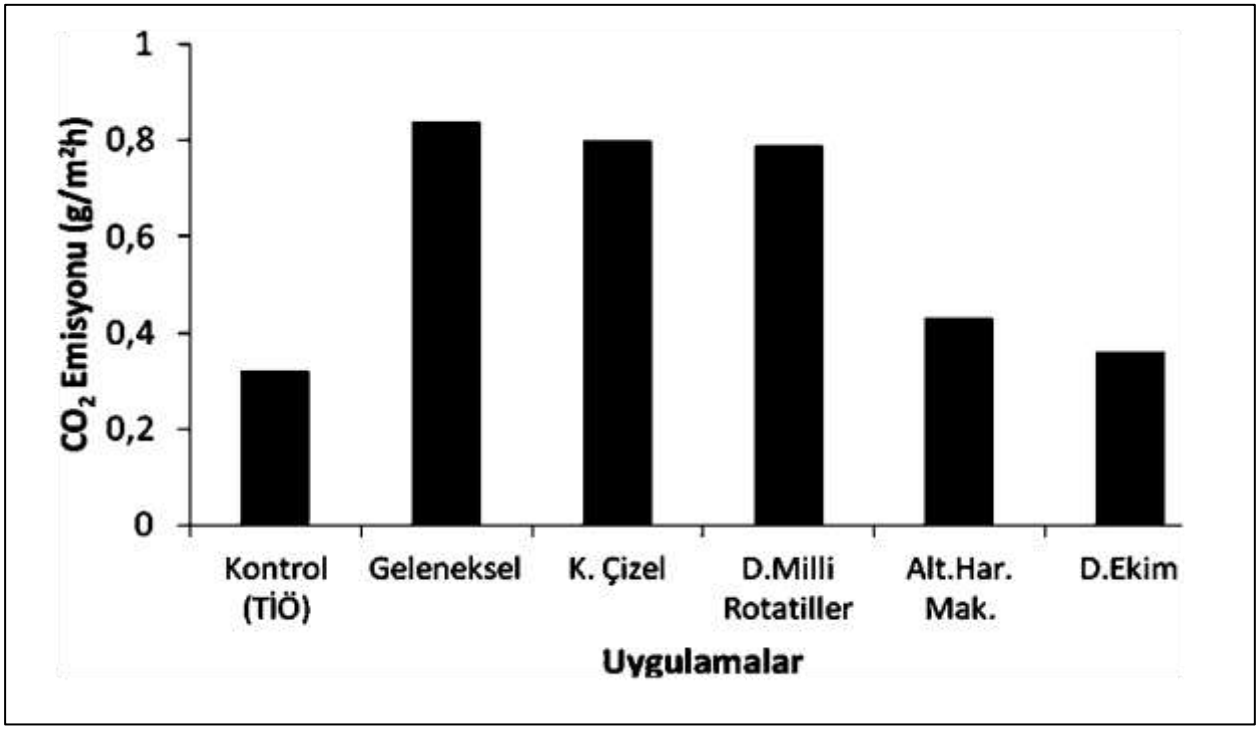
Yapılan denemeler yüzeyde çok az miktarda bitki artığının bulunmasının bile erozyonu büyük ölçüde önlediğini göstermiştir. Yüzeyde bulunan yaklaşık 500 kg/ha'lık bitki örtüsü yüzey akısını % 0.1 düzeyine indirirken, İnfiltrasyonu % 99 düzeyine çıkarmıştır. Yaklaşık 4 da

alanda 25.4 mm yağmur düşmesi ile bu alana uygulanan kinetik enerji 275,600 kpm dir. Yüzeyde bitki artığı bulunmayan tarlalarda bu enerji toprak zerrelerinin kopmasına, parçalanmasına dolayısıyla su ve rüzgar erozyonuna hassas hale gelmesine neden olur. Yüzeyde bulunan bitki artıkları bu enerjiyi absorbe ederek toprağın zarar görmesini engeller (Önal, 1995).

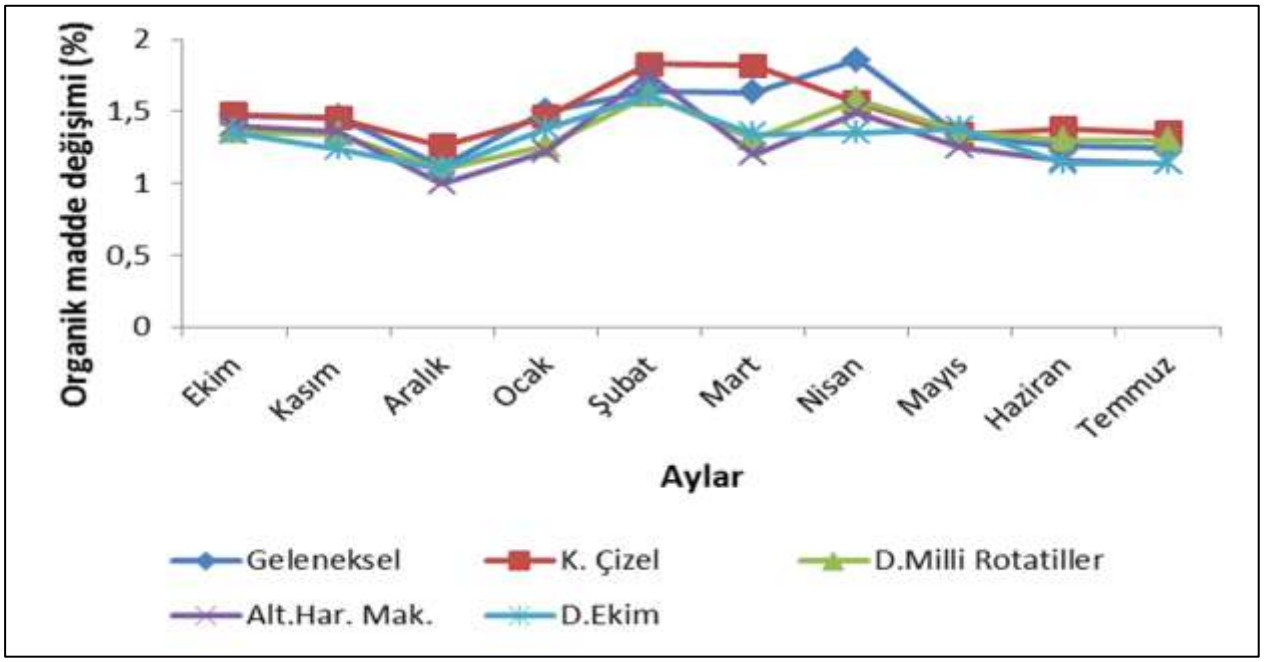


Şekil 11. Uygulamaların erozyon üzerindeki etkileri(Marakoğlu,T.,2012)

Geleneksel toprak işleme teknikleri, CO_2'in atmosfere emisyonunu arttırarak global ısınmaya neden olur. Tarımın sürdürülebilirliğini çevreye verdiği olumsuz etkiler nedeniyle azaltır.



Şekil 12. Toprak işleme tekniklerinin CO_2 emisyonu üzerinde etkisi (Talantimur,V.,2014)



Şekil 13. Toprak işleme tekniklerinin – organik madde değişimi eğrileri (Talantimur,V.,2014)

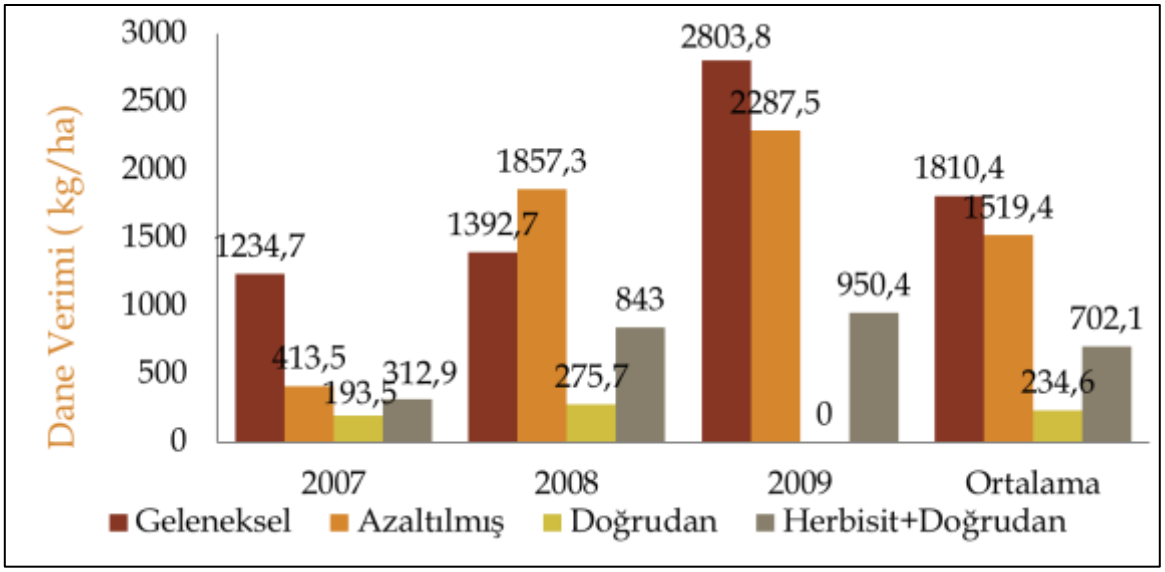
8. KORUYUCU TOPRAK İŞLEMENİN EKONOMİK AVANTAJLARI

Geleneksel toprak işleme, koruyucu toprak işlemeye özellikle sıfır toprak işlemeye göre makine yatırımı, bakım-onarımı, iş gücü bakımından daha yüksek girdilere ihtiyaç duymaktadır.

Doğrudan ekim yönteminde, tarlada sadece ekim için bir kez geçiş yapılırken, geleneksel yöntemde bu sayı en az iki veya daha fazladır. Daha az sayıda geçiş, daha az makine yıpranması ve bakım maliyeti demektir.

Özellikle çapa bitkileri ve tahıl üretimindeki koruyucu toprak işlemenin sağlamış olduğu aşağıdaki ekonomik faydalarını göz önünde bulundurmak gerekir.

- Yakıt, zaman, makine yıpranması ve işçilik tasarruf
- Üretimde düzenlilik,
- Topraktaki besin maddelerinin korunması
- Kurak iklim bölgelerinde ürün yetiştirme kolaylığı
- Çiftçilik ve yer altı sularındaki kalitenin korunması
- Devlet kredisi desteği(özellikle yurtdışında uygulanmaktadır.)



Şekil 14. Farklı Uygulamalara Ait Dane Verimi (kg/ha) (Marakoğlu,T., 2010.)

Şekil 16. Nohut Üretiminde Azaltılmış Toprak İşleme ve Doğrudan Ekim Uygulamalarının Enerji Bilançosu (Mj/ha)

9. SONUÇ

Ülkemizdeki tarım alanlarında sürdürülebilir, ekonomik bitki yetiştiriciliği için uzmanlarca, toprak hazırlığından hasada kadar olan dönemde araştırmalarla ortaya konulmuş en doğru yetiştirme tekniklerinin uygulamaya geçirilmesi gerekmektedir. Tarla tarımında uygulanacak toprak işlemlerinin başarılı olabilmesi için toprak profilinde nem biriktiren optimum tohum yatağı hazırlığına ihtiyaç vardır. Uygun tohum yatağı hazırlığı bölgenin iklimi, toprak tipi, arazi eğimi, ekim nöbeti, eldeki tarım aletleri ve tavsiye edilen teknik bilgilerin mutlaka göz önünde bulundurulması ile mümkündür.

TECHNICAL AND ECONOMIC COMPARISON OF SPRAYING WITH UNMANNED AERIAL VEHICLES (UAVs) AND FIELD SPRAYERS

Ali BOLAT
Doç. Dr., Adıyaman Üniversitesi Ziraat Fakültesi, Tarla Bitkileri Bölümü, Adıyaman, Türkiye

ABSTRACT

Pesticides are extensively used in agricultural pest control to manage harmful organisms and prevent crop losses, making these chemicals a fundamental component of modern agriculture. However, the selection of pesticide application methods is critically important for ensuring both economic efficiency and environmental sustainability. The implementation of proper spraying techniques prevents pesticide drift to non-target areas, thereby mitigating adverse effects on ecosystems and enhancing agricultural productivity. In this context, the evaluation of spraying methods used in the agricultural sector in terms of their technical and economic dimensions is of great necessity for the development of environmentally sustainable agricultural practices. This study aims to provide comprehensive insights into the selection of effective spraying methods in agriculture, contributing to the development of sustainable practices and guiding the formulation of future agricultural strategies. The aim of this study was to compare the technical and economic aspects of spraying methods between field sprayers and unmanned aerial vehicles (UAVs), which are widely used in chemical control. Technical aspects such as technological innovation, time efficiency, operational standards, and application precision are examined. Economic factors including cost-effectiveness, return on investment periods, operating expenses, and maintenance costs are also evaluated. Furthermore, the study analyzes the pesticide drift potential of both methods, along with their impacts on ecosystems and potential threats to biodiversity. The findings reveal that, despite the high initial investment costs of UAVs, they offer lower operating costs and faster return periods in the long term. Additionally, UAVs demonstrate significant advantages over field sprayers in terms of automation, data collection capabilities, application precision, and coverage speed. Their environmentally friendly characteristics further highlight their potential to enhance agricultural productivity and minimize costs, establishing UAVs as a superior alternative to conventional field sprayers for sustainable agricultural practices.

Keywords: Field sprayers, Unmanned aerial vehicles (UAVs), Pesticide drift, Sustainable agriculture

İNSANSIZ HAVA ARAÇLARI (İHA) VE TARLA PÜLVERİZATÖRLERİ İLE YAPILAN İLAÇLAMALARIN TEKNİK ve EKONOMİK YÖNDEN KARŞILAŞTIRMASI

ÖZET

Tarımsal mücadelede, zararlı organizmaların kontrol altına alınması ve ürün kayıplarının önlenmesi amacıyla pestisitler yoğun bir şekilde kullanılmakta olup, bu kimyasallar modern tarımın temel unsurlarından biri haline gelmiştir.Ancak, pestisit uygulamalarında ilaçlama yöntemlerinin seçimi, hem ekonomik verimlilik hem de çevresel sürdürülebilirlik açısından kritik bir öneme sahiptir. Doğru ilaçlama tekniklerinin uygulanması, pestisitlerin hedef dışı alanlara taşınmasını engelleyerek ekosistem üzerindeki olumsuz etkileri azaltmakta ve tarımsal üretkenliği artırmaktadır. Bu bağlamda, tarım sektöründe kullanılan ilaçlama yöntemlerinin teknik ve ekonomik boyutlarıyla değerlendirilmesi, çevresel sürdürülebilir tarım uygulamalarının geliştirilmesi açısından büyük bir gereklilik taşımaktadır. Bu çalışmada, tarım sektöründe etkin ilaçlama yönteminin seçilmesine dair kapsamlı bilgiler sunarak, sürdürülebilir tarım uygulamalarının geliştirilmesine katkıda bulunmayı amaçlamakta ve gelecekteki tarımsal stratejilerin belirlenmesine yön vermektedir. Bu araştırmada, kimyasal mücadelede yaygın olarak kullanılan tarla pülverizatörleri ile insansız hava araçları (İHA) arasındaki ilaçlama yöntemlerini teknik ve ekonomik boyutlarını karşılaştırmalı bir şekilde incelemiştir. Çalışmada, her iki ilaçlama yöntemi çevre koruma kriterleri çerçevesinde de değerlendirilmiştir. Teknik özellikler açısından, teknolojik yenilik, zaman tasarrufu, kullanım normları, ilaçlama hassasiyeti gibi kriterler ele alınırken; ekonomik özellikler bakımından, maliyet etkinliği, yatırım geri dönüş süreleri, işletme giderleri ve bakım masrafları gibi unsurlar inceleniştir. Ayrıca her iki yöntemin ilaç sürükleme potansiyelleri ve bunların ekosistem üzerindeki etkileri ve biyoçeşitlilik üzerindeki potansiyel tehditler gibi kriterler de analiz edilmiştir. Elde edilen bulgular, İHA'ların başlangıçta yüksek yatırım gereksinimlerine rağmen, uzun vadede daha düşük işletme maliyetleri ve daha hızlı geri dönüş süreleri sağladığını ortaya koymaktadır. Ayrıca, İHA'ların otomasyon ve veri toplama yetenekleri, uygulama hassasiyeti, kaplama hızı gibi avantajları ile çevre dostu olma durumu, tarımsal üretkenliği artırma ve maliyetleri minimize etme konularında tarla pülverizatörlerine kıyasla belirgin üstünlükler sağladığı tespit edilmiştir.

Anahtar Kelimeler: Tarla pülverizatörleri, İnsansız hava araçları (İHA), İlaç sürüklenmesi, Sürdürülebilir tarım

1.GİRİŞ

Artan dünya nüfusu ile birlikte ortaya çıkan gıda maddesi ihtiyacı mevcut tarım alanlarından maksimum verim alabilmek için zirai ilaçların (pestisit) kullanımını kaçınılmaz kılmıştır. Birleşmiş Milletler Gıda ve Tarım Örgütü verilerine göre 2019 yılı dünya pestisit kullanımı 4,16 milyon ton olarak gerçekleşmiştir. Pestisit grupları itibarıyla değerlendirildiğinde %53,3'ünü herbisitler, %23,2'sini fungisit ve bakterisitler ve %16,7'sini de insektisitler oluşturmaktadır. Pestisitlerin aşırı kullanımı, tarımda verimliliği artırmak amacıyla yaygın olarak başvurulan bir yöntem olmasına rağmen, çeşitli çevresel ve sağlık sorunlarına yol açabilir. Aşırı pestisit tüketimi, çevre kirliliği, biyoçeşitlilik kaybı, toprak kalitesinin bozulması, su kirliliği, insan sağlığı üzerindeki olumsuz etkiler ve zararlı organizmaların pestisitlere karşı direnç geliştirmesi gibi sorunlara neden olabilir (Aktar ve ark., 2009). Aşırı pestisit kullanımı, ile oluşan ilaç sürüklenmesi çevresel kirlilik, biyoçeşitlilik kaybı ve insan sağlığı üzerinde olumsuz etkiler yaratabilir (Pimentel & Levitan, 1986). Tarımda kullanılan geleneksel tarla pulverizatörleri, geniş alanları kapsayarak ilaçlama işlemlerini gerçekleştirmekte, ancak bu süreçte bazı olumsuzluklar ortaya çıkmaktadır. Pulverizatörlerin hassasiyet eksikliği, ilaç sürüklenmesi riskini artırarak çevresel kirliliğe yol açabilir. Ayrıca, gereğinden fazla pestisit kullanımı ekonomik kayıplara ve çevresel zararlara neden olurken, ağır makinelerin tarlada sık kullanılması toprak sıkışmasına sebep olarak bitki köklerinin gelişimini engelleyebilmektedir. Bu yöntemler ayrıca daha fazla zaman ve iş gücü gerektirmektedir, bu da verimliliği olumsuz etkileyebilir. Bu durum, pestisitlerin doğru miktarda ve uygun koşullarda uygulanması ve alternatif tarım yöntemlerinin araştırılmasını gerektirmektedir. Bu kapsamda tarımda pestisit uygulamalarında, verimliliği artırmak ve maliyetleri düşürmek amacıyla çeşitli teknolojik yenilikler benimsemektedir. İnsansız Hava Araçları (İHA) bu yeni nesil sistemler arasında önemli bir yer tutmaktadır. İHA (UAV/UAS (Unmanned Aerial Vehicle/Systems)), uluslararası mevzuatta pilotun (operatör) içinde insan ve silah olmayan uçağa uzaktan kumanda ile kontrol etmesine (Manual uçuş) veya pilot müdahalesi söz konusu olmayıp, tamamen uydu kontrollü (Otomatik uçuş) kullanıma sahip olan cihazlara denilmektedir (Kahveci ve Can, 2017). Bu ilaçlama sisteminin ilaçlama süreçlerinde avantajları ve dezavantajları bulunmaktadır. Bu bağlamda, ilaç kullanım normları, sürüklenme potansiyelleri, operatör becerisi ve dekar başına düşen ekonomik değerlendirmeler gibi faktörler kritik öneme sahiptir.

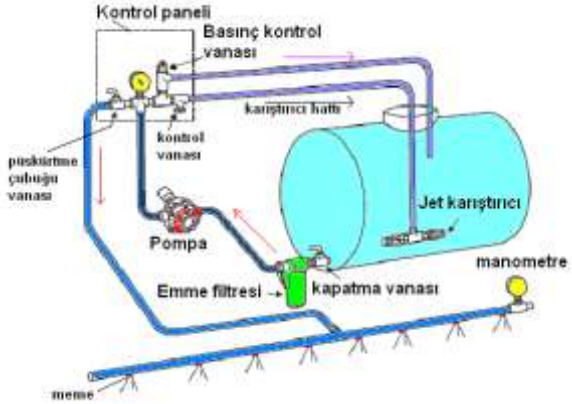
Bu araştırmada amaçlanan, kimyasal mücadelede yaygın olarak kullanılan tarla pülverizatörleri ile insansız hava araçları (İHA) arasındaki ilaçlama yöntemlerini teknik ve ekonomik olarak karşılaştırmaktır. Çalışmada, her iki ilaçlama yöntemi çevre koruma kriterleri çerçevesinde de değerlendirilmiştir.

2. MATERYAL VE YÖNTEM

Çalışmada tarla pülverizatörü ve İnsansız Hava Aracı yöntemleri değerlendirmeye alınmıştır. her iki yöntemin teknik özellikleri incelenmiş; uygulama hassasiyeti, alan kaplama hızı ve kullanıcı dostu olma gibi faktörler değerlendirilmiştir.

TARLA PÜLVERİZATÖRÜ İLE İLAÇLAMA TEKNİĞİ

Depodaki sıvı, bir pompanın sıvıya kazandırdığı basınç enerjisi ile memelere aktarılmakta ve damlalar halinde parçalanarak hedefe iletilmektedir (Şekil 1). Stardart tip mekanik bir tarla pülverizatörü depo,pompa, regülatör, manometre, dağıtım Vanaları, karıştırıcı ve memelerden oluşmaktadır.



Şekil 1. Tarla Pülverizatörü şematik görünümü

İNSANSIZ HAVA ARAÇLARI (İHA) İLE İLAÇLAMA TEKNİĞİ

Tarımda giderek popülerleşen bir yöntemdir. İHA'lar, hassas tarım uygulamaları için idealdir. Küçük ve orta ölçekli arazilerde, özellikle erişimi zor veya hassas bitkilerin olduğu alanlarda kullanılır. İHA (UAV/UAS uluslararası mevzuatta pilotun (operatörün) içinde olmadığı ve uydu kontrollü (otomatik uçuş) cihazlardır. İHA 'lar kontrol kartına bağlı sürücü ve pompa yardımıyla tankdaki sıvıyı basınçlı olarak memelere ulaştırarak püskürtme işlemi gerçekleştirmektedir (Şekil 2).

1-
2-
3- Şekil 2. İHA İlaçlama mekanizması diyagramı

İHA ilaçlama deposu, genellikle hafif ve dayanıklı malzemelerden üretilir ve taşıma kapasitesine uygun boyutlarda tasarlanır. Pompa sistemi, ilacın sabit bir basınçla püskürtülmesini sağlar ve pompanın akış hızı ve basıncı, ilaçlama verimliliğini doğrudan etkiler

ve bitki yüzeyine optimal miktarda ilacın ulaşmasını sağlar. İHA üzerinde 2 farklı tip püskürtme memeleri bulunmaktadır, bunlar Hidrolik memeli sistem ve Santrifüj (döner diskli) sistemlerdir.

Hidrolik Memeli Püskürtme Sistemi: Sıvı, pompa yardımıyla basınç altında memelere iletilir ve püskürtülür. Bu sistem daha düşük maliyetli ve düşük enerji tüketimine sahiptir ancak düşük akış hızı oluşur ve damlacık boyutunun ayarlanması zordur.

Santrifüj (Döner diskli) Püskürtme Sistemi: Sıvı, dönen bir disk veya çark üzerine dağıtılır ve santrifüj kuvveti ile püskürtülür. Yüksek Akış Hızı (12L/min), homojen damlacıklar üretir, ayrıca damlacık boyutu ayarlanabilir (50 – 500 mikron) ve düşük basınç ve enerji gereksinimi ile hassas uygulamalar için uygundur.

Her iki ilaçlama sistemi Teknik özellikler bakımından incelenerek bu özellikler bakımından karşılaştırmalar yapılmıştır (Tablo 1).

Tablo 1. Tarla pülverizatörü ve İHA İlaçlamanın Teknik Bakımından Karşılaştırması

Özellik	**Tarla Pülverizatörü**	**İnsansız Hava Aracı**
İlaç Kullanım Normları	200-400 litre/hektar	20-40 litre/hektar
Zaman Tasarrufu	5-10 hektar/saat	10-15 hektar/saat
Hassasiyet	Düşük	Yüksek
Sürüklenme Potansiyeli	%25	%15
Çevresel Etkiler	Yüksek ilaç israfı	Düşük ilaç israfı
Operatör Bilgi Gereksinimi	Orta	Yüksek
Biyolojik etkinlik	Orta	Yüksek

İlaç Kullanım Normları: İHA'lar, hektar başına 10-20 litre ilaç kullanarak daha az ilaç kaybı sağlar (Zhang ve ark., 2021). Tarla pülverizatörleri ise hektar başına 200-400 litre ilaç kullanmakta olup, bu durum daha fazla ilaç tüketimine ve dolayısıyla maliyet artışına yol açmaktadır (Lee ve Kim, 2021).

Zaman Tasarrufu : İHA'lar ile ilaçlamanın daha hızlı gerçekleştirilmesine olanak tanır (Zhang ve ark., 2021). Ortalama depo kapasitesinde bir İHA, saatte 10-15 hektar arazi ilaçlayabilir (Alkan ve Ertuğrul, 2022). Tarla pülverizatörleri ise saatte 5-10 hektar ilaçlama yapılabilmektedir (Garcia ve Chen, 2021).

Hassasiyet: İHA'lar, yüksek hassasiyetle ilaçlama yapabilmeleri sayesinde, hedef bitkilere daha az zarar verirken, ilaç kayıplarını da minimum seviyeye indirir (Chen ve ark., 2020). Tarla pülverizatörleri ise genellikle daha düşük hassasiyete sahiptir; bu da ilaçların hedef dışına taşınma riskini artırmaktadır (Hernandez ve ark., 2022).

Sürüklenme Potansiyeli: İHA'ların sürüklenme potansiyeli, rüzgar koşullarına bağlı olarak %15 olarak belirlenmiştir (Zhang ve ark., 2021). Rüzgar hızı arttıkça, ilaçların hedef dışına taşınma

oranı da artmaktadır. Tarla pülverizatörlerinde ise sürüklenme oranı %25 olarak belirlenmiştir (Hernandez ve ark., 2022). Bu durum, çevresel kirliliği arttırmakta ve hedef bitkilere zarar verebilmektedir.

Çevresel Etkiler: İHA'ların hassas uygulama yetenekleri, çevresel etkileri azaltma kapasitesine sahipken (Zhang ve ark., 2021), tarla pülverizatörleri daha yüksek ilaç israfı nedeniyle çevresel kirliliğe yol açmaktadır (Hernandez ve ark, 2022).

Operatör Beceri Gereksinimi: İHA kullanımı, teknik bilgi ve deneyim gerektirdiği için operatör becerisi yüksek olmalıdır (Martinez ve ark., 2022). Bu durum, bazı çiftçiler için engel teşkil edebilir. Tarla pülverizatörlerinde ise operatör becerisi orta seviyededir; deneyimli operatörler daha etkili bir şekilde ilaçlama yapabilir (Lee ve Kim, 2021).

Biyolojik Etkinlik Durumu: Yapılan bazı araştırmalarda , insansız hava araçlarının tarımda biyolojik etkinlik açısından geleneksel tarla pülverizatörlerine göre belirgin avantajlar sunduğunu göstermektedir. Örneğin Patil ve ark. (2024) pamuk bitkisinde İHA kullanımının, geleneksel pülverizatörlere göre %20 daha yüksek verimlilik gösterdiğini ve İHA'ların, pestisit uygulamalarında daha az ilaç kullanarak %30 daha az çevresel etki yarattığını belirtmiştir.

Her iki ilaçlama sistemi ekonomik özellikler bakımından incelenerek bu özellikler bakımından karşılaştırmalar yapılmıştır (Tablo 2).

Tablo 2. Tarla Pülverizatörü ve İHA İlaçlamanın Ekonomik Bakımından Karşılaştırması

Özellik	**Tarla Pülverizatörü**	**İnsansız Hava Aracı**
Başlangıç Maliyeti	Orta (1000-3000 USD)	Yüksek (5000-20.000 USD)
İşgücü Maliyetleri	Yüksek	Düşük
Bakım Maliyetleri	Düşük (50-600 USD)	Yüksek (500-1500 USD/Yıl)

Başlangıç Maliyeti: İHA'ların başlangıç maliyetleri standart tip tarla pülverizatörlerine göre daha yüksektir. Ancak sunduğu teknolojik avantajlar, uzun vadede daha yüksek verimlilik sağlayabilir (Garcia ve Chen, 2021).

İşgücü Maliyetleri: İHA kullanımı, genellikle daha az iş gücü gerektirmektedir. İHA'lar daha az iş gücü gerektirmesi nedeniyle çiftçilere önemli bir maliyet avantajı sunmaktadır. Bu avantaj, çiftçilerin toplam girdi maliyetlerini düşürmektedir (Kumar ve Singh, 2021).

Bakım Maliyeti: Bakım maliyetleri açısından, İHA'lar genellikle daha düşük maliyetler sunmaktadır. İHA'ların bakım maliyetleri, yıllık 500 ile 1.500 USD arasında değişirken, tarla pülverizatörlerin bakım maliyetleri yıllık satış fiyatlarının yaklaşık % 10 kadar olabilmektedir (Aiswarya ve ark., 2024).

3. SONUÇ VE ÖNERİLER

İHA'lar, tarla pülverizatörlerine göre daha az ilaç kullanımı, zaman tasarrufu ve yüksek hassasiyet sunarak çevresel ilaç sürüklenme riskini azaltma potansiyeline sahiptir. Bu durum, hem ekonomik hem de ekolojik açıdan önemli avantajlar sunmaktadır.

İHA uygulamaları için ise, şu önerilerin dikkate alınması faydalı olacaktır.

- Eğitim ve Bilinçlendirme: Çiftçilere İHA teknolojileri hakkında eğitim verilmesi, teknik bilgi ve deneyim kazanmaları için seminerler düzenlenmesi.
- Destekleyici Politikalar: Tarım Bakanlığı ve ilgili kurumlar, İHA kullanımını teşvik edici destek programları geliştirmesi ile İHA'ların yaygınlaşmasını sağlayabilir.
- Araştırma ve Geliştirme: İHA teknolojisi ile pülverizasyon teknikleri ve ilaç doz çalışmaları üzerine araştırma yapılmalıdır.
- Çevresel Etki Değerlendirmesi: İHA kullanımının çevresel etkileri ve ilaç sürüklenme potansiyelleri araştırılmalıdır.

ÖZET

Tarımda sürdürülebilirliğin sağlanması, artan küresel nüfusun beslenebilmesi ve çevresel etkilerin azaltılması açısından büyük önem taşımaktadır. Bitki koruma uygulamaları, bu hedeflerin gerçekleştirilmesinde önemli bir rol oynamaktadır. Geleneksel yöntemlerin yetersiz kaldığı günümüzde, yapay zeka (YZ) ve modern tarım makineleri, bitki koruma süreçlerinde devrim yaratmaktadır. Görüntü işleme, sensör teknolojileri, otonom sistemler ve karar destek yazılımları sayesinde hastalık, zararlı ve yabancı otların erken tespiti mümkün olmakta; hedefe yönelik, çevre dostu ve verimli mücadele yöntemleri geliştirilebilmektedir. Özellikle görüntüleme sistemleri, bitki dokularında oluşan anormallikleri yüksek doğruluk oranı ile analiz edebilmekte ve bu sayede müdahale sürecinin zamanında başlatılmasına olanak tanımaktadır. Bu teknolojilerin sağladığı en büyük avantajlardan biri, kaynak kullanımında önemli ölçüde tasarruf sağlamasıdır. Su, gübre ve pestisit gibi girdiler daha az miktarda kullanılmakta ve çevresel etkiler minimuma indirilmektedir.

Anahtar Kelimeler: Bitki Koruma, Yapay Zeka, Tarım Makineleri, Otonom Sistemler, Hassas Tarım

GİRİŞ,

Tarımda dijitalleşme, 21. yüzyılın en büyük dönüşüm süreçlerinden biri olarak değerlendirilmektedir. Nüfus artışı, iklim değişikliği, tarım arazilerinin azalması ve iş gücü yetersizliği gibi etkenler, geleneksel tarım yöntemlerinin artık yetersiz kaldığını göstermektedir. Bu bağlamda, özellikle bitki koruma alanında dijital teknolojilerin entegrasyonu, hem üretim verimliliğini hem de sürdürülebilirliği artırmak amacıyla büyük önem taşımaktadır.

Bitki koruma, tarımsal üretimin vazgeçilmez bir unsurudur. Bitkiler, üretim süreci boyunca birçok biyotik (hastalıklar, zararlılar, yabancı otlar) ve abiyotik (kuraklık, don, tuzluluk) stres faktörüne maruz kalmaktadır. Bu faktörlerle mücadele edebilmek için geliştirilen modern teknolojiler, artık yalnızca pestisit kullanımını değil, veriye dayalı, hedefe yönelik, zamana duyarlı müdahaleleri de kapsamaktadır.

Yapay zekâ (YZ), bu alandaki dönüşümün merkezinde yer almaktadır. Görüntü işleme, makine öğrenimi ve derin öğrenme algoritmaları sayesinde bitkilerin yaprak, sap, meyve gibi kısımlarında oluşan hastalık belirtileri çok erken safhalarda tespit edilebilmektedir. Örneğin; yaprakta meydana gelen renk değişimi, leke, deformasyon gibi belirtiler dronlar ya da sabit kameralar ile taranmakta, bu görüntüler analiz edilerek olası hastalık türleri belirlenmektedir. Geleneksel yöntemlerde gözle muayene ve manuel müdahale gerekirken, YZ destekli sistemlerde bu süreçler hem daha hızlı hem de daha hassas şekilde yönetilmektedir.

Makine öğrenimi algoritmaları, geçmişten gelen verilerle sürekli kendini güncelleyerek daha doğru tahminler yapabilmektedir. Bitki sağlığına dair veri kümeleri, hava durumu bilgileri, toprak özellikleri ve geçmiş hastalık kayıtları birleştirilerek, gelecekte oluşabilecek riskler önceden öngörülebilir. Bu da çiftçinin karar alma sürecini büyük ölçüde kolaylaştırmakta ve doğru zamanda doğru müdahalenin yapılmasını sağlamaktadır.

Nesnelerin interneti (IoT), bitki koruma teknolojilerinin bir diğer önemli bileşenidir. Tarım alanlarına yerleştirilen nem, sıcaklık, pH, yaprak ıslaklığı, toprak sıcaklığı gibi çeşitli sensörler, çevresel koşulları anlık olarak izleyebilir. Bu sensörlerden elde edilen veriler, bir merkezde toplanarak yapay zekâ sistemlerine aktarılır. Böylece, örneğin mantar hastalıklarının nemli ortamlarda daha hızlı yayıldığı bilgisiyle entegre şekilde çalışan sistem, kritik nem seviyelerine ulaşıldığında otomatik olarak ilaçlama yapılmasını önerebilir veya gerçekleştirebilir.

Otonom tarım makineleri, bu teknolojilerin sahaya yansıyan fiziksel araçlarıdır. GPS destekli traktörler, insansız hava araçları (dronlar), yer robotları ve otomatik ilaçlama makineleri, bitki koruma uygulamalarında devrim niteliğinde yenilikler sunmaktadır. Dronlar, geniş arazilerin hızlıca taranmasını ve haritalanmasını sağlar. Bu haritalar üzerinden riskli bölgeler belirlenerek yalnızca o alanlara müdahale edilir. Böylece hem pestisit kullanım miktarı azaltılır, hem de çevresel zararlar en aza indirilir.

Yapay zekâ ile donatılmış makineler, aynı zamanda hasat zamanını belirlemede, toprak analizlerinde ve ürün kalitesinin izlenmesinde de aktif rol oynamaktadır. Örneğin; meyve renginin olgunluk düzeyine göre analiz edilmesiyle en verimli hasat zamanı tespit edilebilir. Bu, hem kalite hem de raf ömrü açısından avantaj sağlar.

Tüm bu teknolojilerin entegre şekilde çalıştığı sistemlere "akıllı tarım" ya da "Tarım 4.0" adı verilmektedir. Tarım 4.0, tarımsal faaliyetlerde insan müdahalesinin en aza indirildiği, yapay zekâ ve otomasyonun temel rol oynadığı bir üretim modelini temsil etmektedir. Bitki koruma teknolojileri de bu modelin kilit noktalarından biridir. Günümüzde birçok ülkede, kamu destekli projelerle bu sistemlerin geliştirilmesi ve çiftçilere yaygınlaştırılması hedeflenmektedir.

Ancak bu süreç bazı zorlukları da beraberinde getirmektedir. Öncelikle, yapay zekâ destekli sistemlerin maliyeti hâlâ birçok küçük ölçekli üretici için yüksek seviyelerdedir. Ayrıca, bu teknolojilerin etkin şekilde kullanılabilmesi için tarım alanında çalışanların teknik bilgiye sahip olması gerekmektedir. Kırsal alanlarda internet altyapısının yetersizliği, sensör sistemlerinin düzgün çalışmasını engelleyebilmektedir. Tüm bu zorlukların aşılması için kapsamlı eğitim programlarına, altyapı yatırımlarına ve devlet destekli finansal teşviklere ihtiyaç duyulmaktadır.

Buna rağmen, uzun vadede bu teknolojilere yapılan yatırımın karşılığı oldukça büyüktür. Yapay zekâ ve dijital teknolojiler sayesinde tarımda verimlilik %20-40 oranında artabilmekte, pestisit kullanımı %30-50 oranında azaltılabilmektedir. Ayrıca bu teknolojiler sayesinde ürün kayıpları minimize edilmekte ve gıda güvenliği artırılmaktadır.

Bir diğer önemli konu da veri güvenliği ve etik kullanımdır. Tarımsal verilerin toplanması, işlenmesi ve paylaşılması sırasında çiftçilerin kişisel haklarının korunması önem arz etmektedir. Yapay zekâ sistemlerinin şeffaflığı, karar alma süreçlerinde kullanıcıya bilgi verme zorunluluğu, veri gizliliği gibi konulara dikkat edilmesi gerekmektedir.

Sonuç olarak, yapay zekâ, IoT ve otonom sistemlerin bitki koruma uygulamalarına entegrasyonu, sadece üretim miktarını artırmakla kalmamakta; aynı zamanda çevresel sürdürülebilirliği sağlamakta, kaynakları daha verimli kullanmakta ve tarımın geleceğini şekillendirmektedir. Bu dönüşüm süreci, bilgi teknolojileri ile tarımsal bilgi birikiminin birleştiği bir yapıyı zorunlu kılmaktadır. Bu sebeple, çiftçilere teknolojik okuryazarlık kazandırılması, üniversite-sanayi iş birliğinin artırılması ve tarım politikalarının bu yönde şekillendirilmesi büyük önem taşımaktadır.

GELİŞME

Tarım sektörü, dünya genelinde giderek artan nüfusun beslenme ihtiyaçlarını karşılamak, gıda güvenliğini sağlamak ve çevresel sürdürülebilirliği desteklemek gibi çok yönlü hedeflerle dönüşmektedir. Bu dönüşümde, teknolojik gelişmeler ve dijitalleşme süreci, üretimin her aşamasında büyük rol oynamaktadır. Özellikle bitki koruma alanında yapay zekâ destekli uygulamaların kullanımı, geleneksel yöntemlere göre çok daha verimli, ekonomik ve çevre dostu çözümler sunmaktadır.

Yapay zekâ (YZ), büyük veri analizinden görüntü işleme tekniklerine, otonom makinelerden karar destek sistemlerine kadar birçok bileşeni bir araya getirerek tarımda devrim yaratmaktadır. Bu sistemler sayesinde, tarım alanlarından toplanan büyük veriler (iklim bilgileri, toprak nemi, bitki sağlığı parametreleri, geçmiş zararlı ve hastalık verileri vb.) işlenerek hastalıkların ve zararlıların yayılma modelleri çıkartılabilmekte, olası tehditler öngörülebilmekte ve gerekli müdahaleler zamanında yapılabilmektedir.

Görüntü işleme teknolojileri, özellikle yapay sinir ağları ve derin öğrenme algoritmaları ile birleştiğinde, bitkilerde meydana gelen anormallikleri erken aşamada tespit edebilmekte ve yüksek doğrulukla sınıflandırabilmektedir. Örneğin, domates bitkisinde meydana gelen sararma, beneklenme, solma gibi hastalık belirtileri bu sistemler sayesinde insan gözünden çok daha hızlı ve doğru şekilde analiz edilebilmektedir. Bu teşhis verileri, otonom makinelerle entegre edilerek ilaçlamanın sadece gerekli alanlara yapılmasını sağlamakta, böylece pestisit kullanımını azaltarak çevre ve insan sağlığına olumlu katkı sağlamaktadır.

GPS ve drone teknolojileri ile desteklenen bu sistemler, tarım arazilerinde konum bazlı müdahale imkânı sunmaktadır. Bu sayede tarlanın sadece hastalık riski taşıyan alanları ilaçlanmakta, diğer alanlara gereksiz müdahale edilmemektedir. Aynı şekilde, su ve gübre kullanımı da optimize edilerek hem maliyet düşürülmekte hem de doğal kaynakların sürdürülebilir kullanımı sağlanmaktadır. Araştırmalar, bu teknolojilerin doğru entegrasyonu ile ilaç kullanımında %40'a varan azalma, ürün verimliliğinde ise %20'ye kadar artış sağlanabildiğini göstermektedir.

Yapay zekâ destekli karar destek sistemleri (DSS), geçmiş yıllara ait verileri analiz ederek çiftçilere proaktif stratejiler önermektedir. Bu sistemler, hava durumu verileriyle birlikte bitki gelişim takvimlerini analiz ederek hastalık riskinin yüksek olduğu dönemlerde uyarı verebilir. Bu sayede çiftçiler, müdahalelerini plansız şekilde değil, bilimsel temellere dayalı biçimde gerçekleştirebilir.

Sensör teknolojileri, tarımsal dijitalleşmenin temel taşlarından biridir. Toprak pH'ı, nem düzeyi, sıcaklık, yaprak ıslaklığı gibi birçok parametreyi gerçek zamanlı olarak ölçen sensörler sayesinde, tarım alanlarında anlık durum takibi yapılabilmekte ve bu bilgiler YZ sistemlerine beslenerek daha isabetli kararlar alınabilmektedir. Örneğin, bir bölgedeki nem oranı ideal seviyenin altına düştüğünde, otomatik sulama sistemleri devreye girebilmekte ya da düşük nem koşullarının bazı mantar hastalıkları için risk oluşturabileceği değerlendirilerek önleyici müdahale planları geliştirilebilmektedir.

Ancak bu gelişmelere rağmen, dijital tarım teknolojilerinin yaygınlaştırılmasında bazı yapısal sorunlar da bulunmaktadır. Öncelikle, bu teknolojilerin kurulumu ve bakımı ciddi bir maliyet gerektirmektedir. Özellikle küçük ölçekli üreticiler için bu tür yatırımlar çoğu zaman erişilebilir değildir. Ayrıca, sistemlerin etkin bir şekilde kullanılabilmesi için kullanıcıların belirli bir teknik bilgi seviyesine sahip olmaları gerekmektedir. Bu da çiftçiler için sürekli eğitim, teknik destek ve danışmanlık hizmetlerinin önemini artırmaktadır.

Devlet destekli programlar, üniversite-sanayi işbirlikleri ve AR-GE projeleri, dijital tarımın yaygınlaştırılmasında kritik rol oynamaktadır. Çiftçilerin bu teknolojilere erişimini kolaylaştırmak, altyapıyı güçlendirmek ve eğitim programlarını yaygınlaştırmak bu sürecin başarılı olması için gereklidir. Avrupa Birliği ve Amerika gibi bölgelerde dijital tarım uygulamaları kamu politikalarıyla desteklenmekte, çiftçilere hibe ve kredi kolaylıkları sağlanmaktadır. Türkiye'de de benzer şekilde Tarım ve Orman Bakanlığı tarafından yürütülen projelerle çiftçilere yönelik teknoloji destekleri artırılmaktadır.

Sonuç olarak, yapay zekâ, IoT, otonom sistemler ve sensör teknolojilerinin bitki koruma alanına entegrasyonu, yalnızca tarımsal verimliliği artırmakla kalmayıp aynı zamanda çevresel sürdürülebilirlik ve ekonomik kalkınma açısından da büyük fırsatlar sunmaktadır. Bu dönüşüm süreci, yalnızca teknoloji transferi değil, aynı zamanda kültürel ve yapısal değişimi de beraberinde getirmektedir. Tarımda dijitalleşmenin başarısı, bu teknolojilerin yerel koşullara uyarlanması, çiftçilere uygun hale getirilmesi ve uzun vadeli politikalarla desteklenmesi ile mümkün olacaktır.

SONUÇ

Tarımda dijitalleşme, son yıllarda dünya genelinde tarımsal üretimi dönüştüren önemli bir süreç haline gelmiştir. Artan nüfus, iklim değişikliği, doğal kaynakların tükenmesi ve gıda güvenliği gibi faktörler, tarım sektöründe daha verimli, sürdürülebilir ve teknolojik çözümlere olan ihtiyacı artırmıştır. Bu bağlamda, yapay zeka (YZ), nesnelerin interneti (IoT), büyük veri, sensör teknolojileri ve otonom tarım makineleri gibi dijital araçlar, bitki koruma uygulamalarının doğasını temelden değiştirme po...

Bitki koruma, tarımsal üretimin sürdürülebilirliği açısından stratejik bir alan olarak öne çıkmaktadır. Geleneksel bitki koruma yöntemleri, genellikle geniş alanlara homojen bir şekilde kimyasal ilaç uygulamasını içermekteydi. Bu yaklaşım, hem çevresel hem de ekonomik açıdan önemli sorunlara neden olmaktaydı. Gereksiz ilaç kullanımı, toprak ve su kaynaklarının kirlenmesine, yararlı organizmaların zarar görmesine ve pestlerin direnç geliştirmesine yol açmaktaydı. Dijital teknolojiler, bu problemlerle baş edebişlmek için önemli bir silah niteliğindedir

Yapay zeka destekli bitki koruma sistemleri, tarla verilerini analiz ederek hastalık ve zararlıların yayılma olasılığını tahmin edebilmektedir. Bu amaçla kullanılan algoritmalar, geçmiş yıllara ait iklim verileri, toprak nem düzeyleri, sıcaklık, rüzgar yönü ve güneşlenme gibi parametreleri değerlendirmektedir. Böylece, yalnızca mevcut durum değil, gelecekteki olası risk senaryoları da modellenebilir hale gelmektedir. Bu durum, bitki koruma önlemlerinin önceden planlanmasını ve zamanında uygulanmasını sağlar

Görüntü işleme teknolojileri de YZ sistemlerinin tarımda kullanımında büyük rol oynamaktadır. Özellikle yaprak, gövde ve meyve yüzeylerinde oluşan renk değişimleri, lekeler, deformasyonlar ve gelişim bozuklukları, YZ tabanlı görüntü analiz sistemleri tarafından yüksek doğrulukla tespit edilebilmektedir. Bu sistemler genellikle makine öğrenmesi ve derin öğrenme algoritmaları ile desteklenmekte, zaman içinde yeni verilerle kendini güncelleyebilmektedir. Bu teknolojiler sayesinde hastalık ve zararlı teşhisi kolaylıkla yapılabilmektedir

Ayrıca, bu tespitlerin ardından otonom ilaçlama sistemleri devreye girmektedir. Bu sistemler, tarla üzerinde konum bazlı çalışmakta ve sadece gerekli alanlara müdahale etmektedir. Örneğin, yapay zekâ destekli bir drone veya traktör, tarla üzerinde analiz edilen bölgeleri haritalandırmakta, zararlı bulunan alanlara hassas ilaçlama yaparken sağlıklı bölgelere hiçbir müdahalede bulunmamaktadır. Bu durum, hem ilaç kullanımında ciddi bir tasarruf sağlamakta hem de çevresel zararı minimuma indirmektedir.

Bu otonom sistemlerin etkinliği, yalnızca ilaçlama değil, aynı zamanda toprak işleme, gübreleme ve hasat gibi diğer tarımsal işlemlerde de giderek artmaktadır. YZ destekli robotlar, ekim sırasında optimum tohum yerleşimini sağlayabilmekte, gübre uygulamasında dozajı dinamik olarak ayarlayabilmekte ve hasat zamanının doğru tespitiyle ürün kalitesini artırabilmektedir. Bu tür uygulamalar, sadece üretim verimliliğini artırmakla kalmamakta, aynı zamanda çiftçilerin iş yükünü azaltarak kırsalda yaşam kalitesini artırır

Sensör teknolojileri, bu sistemlerin temelini oluşturmaktadır. Toprak sensörleri nem, sıcaklık, pH ve besin seviyeleri gibi kritik verileri anlık olarak ölçerken, bitki sensörleri ise yaprak sıcaklığı, yaprak nemi ve bitki büyüme hızı gibi parametreleri izlemektedir. Bu veriler, YZ sistemlerine gerçek zamanlı olarak aktarılmakta ve tüm bu parametreler üzerinden analizler yapılmaktadır. Örneğin, düşük toprak nemi ve yüksek sıcaklık tespit edildiğinde, bu koşulların bazı fungal hastalıklar için risk oluştur...

Drone teknolojisi ile birleşen bu sistemler, büyük arazilerde hızlı ve etkili bir veri toplama imkânı sunmaktadır. Yüksek çözünürlüklü kameralar ve termal sensörler ile donatılmış insansız hava araçları, tarlaların üzerinde uçuş yaparak, hem görüntü verilerini toplamakta hem de bitki sağlığı haritaları oluşturabilmektedir. Bu haritalar üzerinden analiz yapan YZ algoritmaları, riskli bölgeleri tespit ederek çiftçiye dijital rapor sunmakta ve önerilerde bulunmaktadır.

Karar destek sistemleri (Decision Support Systems – DSS), çiftçilere yalnızca mevcut durumu göstermekle kalmamakta, aynı zamanda olası riskleri öngörerek alınması gereken önlemleri önermektedir. Bu sistemler, geçmiş yılların verileriyle birlikte çalışarak, mevsimsel eğilimleri tespit edebilmekte ve ilaçlama-sulama programlarını optimize edebilmektedir. Yapay zekâ, bu noktada sistemin özelleştirilmesini ve kişisel tarla koşullarına göre ayarlanmasını mümkün kılmaktadır.

Bu teknolojilerin sahada kullanımına dair birçok başarılı örnek bulunmaktadır. Örneğin, Amerika Birleşik Devletleri'nde geliştirilen "See & Spray" adlı sistem, bitkiler üzerindeki zararlıları yapay görme ile tespit ederek, sadece o bölgelere pestisit püskürtülmesini sağlamaktadır. Bu uygulama, ilaç kullanımını ortalama %90 oranında azaltmakta ve aynı zamanda işçilik maliyetlerinde ciddi bir tasarruf sağlamaktadır.

Benzer şekilde, Avrupa'da yaygınlaşmaya başlayan robotik sistemler, bağcılık ve sebze üretimi gibi özel üretim alanlarında kullanılarak, hassas ilaçlama ve bitki bakımı işlemlerini gerçekleştirmektedir. Bu sistemler, gece gündüz çalışabilmekte ve insan gücüne duyulan ihtiyacı azaltarak kırsal bölgelerde tarımsal işgücü açığını kapatmaktadır.

Türkiye'de de son yıllarda dijital tarım uygulamalarına yönelik önemli adımlar atılmaktadır. Tarım ve Orman Bakanlığı'nın "Dijital Tarım Pazarı" (DİTAP) gibi projeleri, çiftçilerin dijital tarım teknolojilerine erişimini artırmayı hedeflemektedir. Bunun yanı sıra TÜBİTAK destekli Ar-Ge projeleri ve üniversite iş birlikleri ile yerli üretim tarım teknolojileri geliştirilmektedir. Ancak, bu gelişmelerin kırsal kesimde yaygınlaşabilmesi için altyapı yatırımları, teknik eğitim programları ve finansal desteklerin artması gerekmektedir

Bu dönüşüm süreci aynı zamanda bazı yapısal sorunları da beraberinde getirmektedir. Özellikle küçük ölçekli çiftçiler için teknolojiye erişim, yeterli bilgi ve beceri eksikliği önemli bir engel oluşturmaktadır. Yüksek maliyetli ekipmanların edinimi, bakım ve onarım ihtiyaçları, dijital

altyapı eksiklikleri gibi faktörler, bu sürecin önünde ciddi birer bariyer niteliğindedir. Bu nedenle devlet politikalarının ve destek mekanizmalarının, yalnızca büyük işletmeleri değil, küçük üreticileri de kapsayacaktır

Ayrıca, dijital tarımda veri güvenliği ve özel hayatın gizliliği gibi konular da göz ardı edilmemelidir. Çiftçilerin üretim süreçlerinden elde edilen verilerin kim tarafından, nasıl kullanılacağına dair yasal düzenlemeler yapılmalı ve etik kurallar belirlenmelidir. Teknoloji tedarikçileri ile çiftçiler arasındaki güven ilişkisinin sağlanabilmesi için şeffaflık, veri yönetimi ve kullanıcı dostu tasarım ön planda tutulmalıdır.

Uzun vadede YZ ve dijital tarım sistemlerinin daha yaygın hale gelmesiyle birlikte, bitki koruma yöntemlerinin de evrim geçirmesi beklenmektedir. Gelecekte, tohumdan hasada kadar tüm üretim sürecinin YZ tabanlı otomasyonla yürütüldüğü entegre sistemlerin daha fazla kullanılacağı öngörülmektedir. Bu sistemler sayesinde yalnızca ekonomik verimlilik değil, çevresel sürdürülebilirlik ve sosyal kalkınma da sağlanacaktır.

Sonuç olarak, yapay zeka ve tarım makinelerinin entegrasyonu, bitki koruma uygulamalarında çevreci, ekonomik ve etkili çözümler sunmaktadır. Bu teknolojiler sayesinde hastalık ve zararlılarla mücadele daha akılcı ve hedefe yönelik hale gelmiştir. Tarımda dijitalleşme süreci devam ettikçe, veri analitiği ve otomasyonun sağladığı avantajlar daha geniş alanlara yayılacak, üretim kalitesi artacaktır. Ancak bu dönüşüm sürecinin başarılı olabilmesi için çiftçilerin bu teknolojilere erişimi, eğitimi ve desteklenmeleri gerekmektedir

ABSTRACT

Monitoring early-stage crop development holds a significant role within precision agriculture practices. In particular, assessing crop emergence success and identifying irregular emergence patterns are critically important for timely and accurate planning of agronomic interventions such as reseeding or fertilization. In this context, unmanned aerial vehicles (UAVs) equipped with multispectral imaging technologies enable high-resolution data acquisition across agricultural fields. This study aims to evaluate the effectiveness of vegetation indices derived from multispectral unmanned aerial vehicle (UAV) images in determining early crop emergence in oats on a farm in Kırşehir.

Field observations were made 15 days after the oat sowing date using a DJI Phantom 4 Multispectral UAV flight at a flight altitude of 30 meters. As a result of the flight, multispectral images of 0.599 hectares of oat cultivation area were obtained. NDVI (Normalized Difference Vegetation Index) and GNDVI (Green Normalized Difference Vegetation Index) maps were produced to detect plant emergence from the images obtained. The average NDVI value of these maps was determined as 0.062, and the GNDVI value as 0.224. These index values indicate an early growth stage in which the vegetation cover is still sparse but spectrally distinguishable from bare soil. The spatial distribution of both indices proved effective in detecting emergence problems, particularly in low-lying areas and regions affected by soil compaction. GNDVI provided more precise differentiation of early emergence variations due to its higher spectral sensitivity to chlorophyll content than NDVI.

The research showed that, with multispectral UAV imaging technology, uniform emergence rates can be determined with high accuracy, even in the early stages of oat development Timely detection of irregular emergence or unsuccessful germination zones allows earlier and pinpoint

planning of interventions such as resowing, regional fertilization, or soil analysis in problem areas. The use of vegetation indices, such as NDVI and GNDVI, for these purposes increases the effectiveness of agricultural management decisions at the beginning of the production season and contributes to the improvement of agricultural productivity. Integrating early detection systems for crop emergence into agricultural management practices offers substantial advantages in minimizing economic losses and enhancing the effectiveness of precision agriculture applications.

MULTİSPEKTRAL İHA TABANLI BİTKİ İNDEKSLERİ İLE YULAF TARLALARINDA ERKEN DÖNEM BİTKİ ÇIKIŞLARIN İZLENMESİ

ÖZET

Erken dönem bitki gelişiminin izlenmesi, hassas tarım uygulamaları içerisinde önemli bir yer tutmaktadır. Özellikle bitki çıkış başarısının değerlendirilmesi ve düzensiz çıkışların tespit edilmesi, yeniden ekim veya gübreleme gibi tarımsal müdahalelerin zamanında ve doğru şekilde planlanabilmesi açısından kritik öneme sahiptir. Bu doğrultuda multispektral görüntüleme teknolojileriyle donatılmış insansız hava araçları, tarım alanlarında yüksek çözünürlüklü veri elde edilmesini sağlamaktadır. Bu çalışma, Kırşehir'de yer alan bir tarım işletmesinde, multispektral insansız hava aracı (İHA) görüntülerinden türetilen bitki indekslerinin, yulafta erken dönem bitki çıkışlarının belirlenmesindeki etkinliğini değerlendirmeyi amaçlamaktadır.

Arazi gözlemleri, yulaf ekim tarihinden 15 gün sonra, 30 metre uçuş irtifasında gerçekleştirilen DJI Phantom 4 Multispectral İHA uçuşu ile yapılmıştır. Uçuş sonucunda, yulaf ekim alanına ait 0.599 hektar büyüklüğünde multispektral görüntüler elde edilmiştir. Elde edilen görüntülerden bitki çıkışlarını tespit etmek için NDVI (Normalized Difference Vegetation Index) ve GNDVI (Green Normalized Difference Vegetation Index) haritaları üretilmiştir. Bu haritalara ait ortalama NDVI değeri 0.062, GNDVI değeri ise 0.224 olarak belirlenmiştir. Elde edilen indeks değerleri, bitki örtüsünün henüz yoğunlaşmadığı, ancak bitki çıkışlarının spektral olarak algılanabildiği bir döneme işaret etmektedir. Her iki indeksin mekânsal dağılımı, özellikle düşük kotlu alanlar ve toprak sıkışmasının gözlendiği bölgelerdeki çıkış problemlerinin tespiti açısından etkili olmuştur. GNDVI, klorofile olan daha yüksek spektral duyarlılığı sayesinde, NDVI'ya kıyasla erken çıkış farklılıklarını daha net biçimde ortaya koymuştur.

Araştırma sonuçları multispektral İHA görüntüleme teknolojisiyle, yulaf gelişiminin erken dönemlerinde bile üniform çıkış oranlarının yüksek doğrulukla belirlenmesinin mümkün olduğunu göstermiştir. Düzensiz çıkış veya başarısız çimlenme bölgelerinin zamanında tespiti, sorunlu alanlarda yeniden ekim, bölgesel gübreleme veya toprak analizi gibi müdahalelerin daha erken ve kesin olarak planlanmasına olanak tanır. Bu amaçlar için NDVI ve GNDVI gibi bitki örtüsü endekslerinin kullanılması, üretim sezonunun başlangıcında tarımsal yönetim kararlarının etkinliğini artırır ve tarımsal üretkenliğin iyileştirilmesine katkıda bulunur. Bitki çıkışlarına yönelik erken algılama sistemlerinin tarımsal uygulamalara entegre edilmesi, hem ekonomik kayıpların en aza indirilmesine hem de hassas tarım uygulamalarının daha etkin biçimde uygulanmasına olanak tanımaktadır.

Anahtar Kelimeler: Yulaf, Bitki çıkışı, Multispektral İHA, NDVI, GNDVI, Hassas Tarım

1. GİRİŞ

Günümüzde tarımsal üretimde yalnızca verimliliğin artırılması değil aynı zamanda doğal kaynakların etkin kullanımı, girdi maliyetlerinin azaltılması ve karar destek sistemlerinin bilimsel verilere dayalı olarak yürütülmesi oldukça önemlidir (Gebbers & Adamchuk, 2010). Bu doğrultuda geliştirilen hassas tarım teknolojileri tarımsal alanlardaki çevresel ve yapısal değişkenliğin dikkate alındığı, arazi içi farklılıkların veriye dayalı olarak yönetildiği yeni bir uygulama mekanizmasını devreye sokmuştur (Mulla, 2013). Uzaktan algılama sistemleri hassas tarımın teknolojik altyapısında kritik bir rol üstlenir. Özellikle bu sistemin içerisinde bulunan ve gelişmiş kamera sensörlerle donatılmış insansız hava araçlarıyla (İHA), tarla düzeyinde yüksek mekânsal çözünürlükte ve zamansal hassasiyette veri elde edilmesini mümkün kılmaktadır (Tsouros et al., 2019; Zhang & Kovacs, 2012). Bu sayede tarımsal kararlar daha erken ve yerinde alınabilmektedir. Bu teknolojik altyapının temel bileşenlerinden biri uzaktan algılama sistemleridir. Özellikle multispektral sensörlerle donatılmış insansız hava araçları (İHA), tarla düzeyinde çok yüksek çözünürlükte ve zamansal hassasiyette veri toplamaya imkân tanımakta; bu da tarımsal kararların daha yerinde ve erken dönemde alınmasını sağlamaktadır (Hunt et al., 2010; Tripicchio et al., 2015).

Yulaf (*Avena sativa* L.) hem insan hem de hayvan beslenmesinde kullanılan önemli bir serin tahılıdır. Hayvan yemi ve insan gıdası olmasının yanında; ilaç ve kozmetik sanayisinde kullanım alanlarının artması sebebiyle özellikle son yıllarda oldukça önem kazanmıştır (Çeri & Acar, 2019; Karaman et al., 2020). Ülkemizde 142.740 hektarda tane ve 362.438 hektarda hasıl olmak üzere toplamda 505.178 hektarda yulaf tarımı yapılmaktadır (TÜİK, 2024).

Bu çalışmanın amacı yulaf tarımında multispektral İHA görüntülerinden elde edilen NDVI ve GNDVI indeksleri aracılığıyla, yulaf tarlalarında erken çıkış başarısının değerlendirilmesini sağlamak ve bu teknolojilerin uygulama potansiyelini ortaya koymaktır.

2. MATERYAL ve YÖNTEM

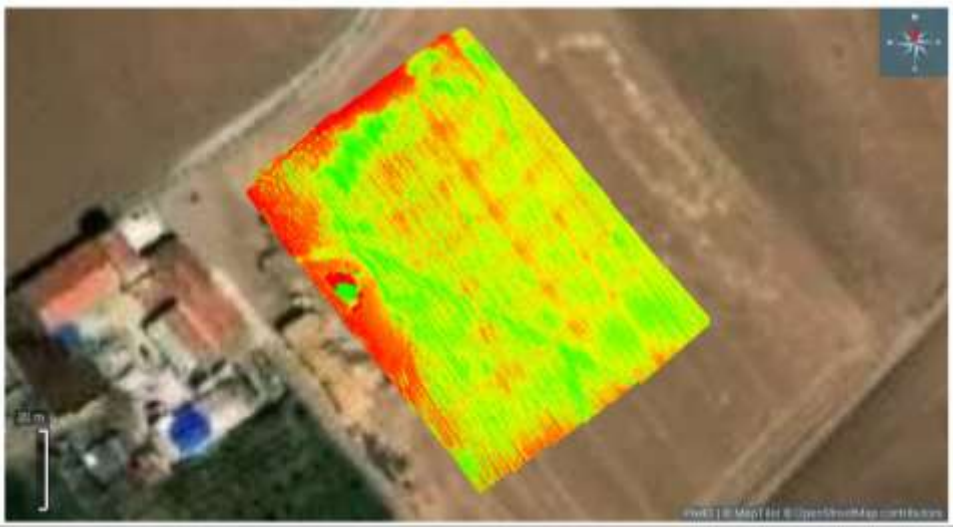
Bu çalışma, Türkiye'nin İç Anadolu Bölgesi'nde yer alan Kırşehir ilinde, 0.599 hektarlık yulaf (Avena sativa L.) ekili bir tarla üzerinde gerçekleştirilmiştir. Görüntüleme işlemi, ekimden 15 gün sonra, doğrudan güneş ışığı etkisini en aza indirmek amacıyla sabah saat 10:00 ile 11:00 arasında gerçekleştirilmiştir. Veriler, DJI Phantom 4 Multispectral insansız hava aracı (İHA) kullanılarak 30 metre irtifadan tek bir uçuşla toplanmıştır. Uçuş planlamasında, yanal örtüşme oranı %80 olarak ayarlanmış ve bu sayede görüntü mozaikleme doğruluğu artırılmıştır. Multispektral kamera sistemiyle elde edilen görüntüler, 1.545 cm/piksel Ground Sampling Distance (GSD) değerine sahiptir.

Elde edilen ham görüntüler, Pix4Dfields yazılımı kullanılarak işlenmiş ve bu süreçte görüntüler tek bir ortomozaik harita halinde birleştirilmiştir (Sekil 2.1). Daha sonra bu ortomozaik veri üzerinden bitki sağlığına ilişkin NDVI (Normalized Difference Vegetation Index) ve GNDVI (Green Normalized Difference Vegetation Index) değerleri hesaplanmıştır. NDVI ve GNDVI bitki indeksleri piksel bazlı olarak raster formatında analiz edilmiş, ve harita çıktıları üzerinden düşük yoğunluklu bitki örtüsüne sahip alanlar mekânsal olarak tanımlanmıştır.

Sekil 2.1. Araştırma sahasına ait ortomozaik harita

3. BULGULAR ve TARTIŞMA

Araştırma sonucunda ortalama NDVI bitki indeksi değeri 0.062, GNDVI değeri ise 0.224 olarak belirlenmiştir. Harita çıktıları üzerinden düşük yoğunluklu bitki örtüsüne sahip alanlar mekânsal olarak tanımlanmıştır. Elde edilen NDVI ve GNDVI haritaları, yulaf bitkisinin ekim sonrası erken çıkış dönemine ait gelişim durumunu yansıtmaktadır (Şekil 3.1 ve Şekil 3.2). Bu dönemde bitkiler henüz sık bir örtü oluşturmamış olup, spektral indeksler bitkisel örtü yoğunluğunun ve çıkış homojenliğinin değerlendirilmesine imkân tanımıştır.



Şekil 3.1. Araştırma alanına ait NDVI bitki indeksi haritası

Şekil 3.2. Araştırma alanına ait GNDVI bitki indeksi haritası

NDVI ve GNDVI değerleri incelendiğinde, GNDVI'nın klorofil ve azot duyarlılığı daha yüksek olduğundan, erken dönem çıkış farklılıklarını NDVI'ya kıyasla daha net biçimde ortaya koyduğu gözlemlenmiştir (Gitelson et al., 1996; Gnyp et al., 2014). Özellikle arazi üzerindeki düşük kotlu alanlar ile toprak sıkışmasının belirgin olduğu bölgelerde, her iki indeks üzerinden de çıkışın düzensiz olduğu alanlar mekânsal olarak belirlenmiştir. Bu farklılıkların, tarla içi değişkenliklerin erken dönemde haritalanmasına olanak tanıdığı daha önceki çalışmalarda da vurgulanmıştır (Bendig et al., 2014; Madec et al., 2017). Böylece, NDVI ve GNDVI'nin birlikte kullanımı, üreticilerin çıkış problemlerinin yoğunlaştığı bölgelere yönelik ve hedefe odaklı müdahaleler geliştirmesine ya da uygulamasına olanak sağlamaktadır.

Ayrıca bu indeksler aracılığıyla elde edilen mekânsal veri, geleneksel gözleme dayalı yöntemlere kıyasla daha hızlı, tekrarlanabilir ve nesnel analizler yapılmasına imkân tanımaktadır. GNDVI'nin yeşil bant üzerinden hesaplanması, erken dönemde klorofil miktarındaki küçük farklılıkları algılayabilme kapasitesini artırmış ve bu durum bitkiler henüz homojen bir yaprak alanı oluşturmadan çıkış sorunlarının tanımlanmasını mümkün kılmıştır. Çeşitli çalışmalar, yeşil bant temelli indekslerin özellikle azot yönetimi ve erken bitki gelişim dönemlerinde NDVI'ya kıyasla daha yüksek duyarlılık ve doğruluk sunduğunu ortaya koymuştur (Gitelson et al., 1996; Gnyp et al., 2014). Elde edilen bulgular, İHA tabanlı multispektral görüntülemenin yalnızca genel bitki sağlığının izlenmesinde değil, aynı zamanda erken dönem çıkış başarısının değerlendirilmesinde de etkili bir yöntem olarak kullanılabileceğini ortaya koymaktadır.

4. SONUÇ

NDVI ve GNDVI haritalarının birlikte kullanımıyla elde edilen erken fenolojik döneme ait uzamsal indeks çıktıları, sezon boyunca uygulanacak tarımsal yönetim stratejileri için önemli bir temel oluşturabilir. Özellikle İHA tabanlı multispektral görüntüleme teknolojisi, bitkilerin

çıkış dönemine ait mekânsal farklılıkları belirleyerek, üreticiye alan bazlı müdahale imkânı sunmaktadır. Bu sayede, tarla içi heterojenlik erken evrede tespit edilerek, verim kaybının engellenmesi ve kaynakların daha etkin kullanılması mümkün hale gelmektedir.

Araştırma sonuçları hassas tarım uygulamaları içinde önemli bir yeri olan İHA tabanlı multispektral görüntülemenin, erken bitki çıkışlarının izlenmesinde etkin bir araç olduğunu ortaya koymuştur. Spektral indekslerin mekânsal dağılımının çözümü, çıkış düzensizliklerini ve zeminle ilişkili çevresel faktörleri açığa çıkararak, müdahale stratejilerinin hem zamanlamasını hem de mekânsal hassasiyetini geliştirme potansiyeline sahiptir. Bu yöntemin tarımda yaygınlaşması, yalnızca ekonomik kayıpların azaltılmasına değil, aynı zamanda çevresel sürdürülebilirliğin güçlendirilmesine de önemli katkılar sunacaktır.

AN INVESTIGATION OF NUTRITION STATUS IN OLIVE (*Olea europaea* L.) GARDENS IN ONIKİŞUBAT (KAHRAMANMARAŞ) COUNTY BASED ON SOIL AND LEAF ANALYSIS

Ahu Alev ABACI BAYAR
Dr. Öğr. Üyesi, Kırşehir Ahi Evran Üniversitesi, Ziraat Fakültesi Toprak Bilimi ve Bitki Besleme Bölümü, ahu.abaci@ahievran.edu.tr, orcid no: 0000-0002-4467-7676

ABSTRACT

This study was conducted to determine the physical and chemical properties as well as the macro and micro nutrient element contents of soils from olive (Olea europaea) orchards. In the analyzed soil samples, sand, silt, and clay contents ranged between 30.51–73.40%, 12.00–40.42%, and 11.11–39.01%, respectively, and the soils were generally classified as sandy clay loam and sandy loam in terms of texture. Soil pH values ranged from 7.15 to 8.18, indicating that most of the soils were mildly alkaline. Organic matter contents varied between 0.98% and 3.52%, with approximately 60% of the soils found to be deficient. The EC (soluble salt) values of all samples fell within the non-saline class, while $CaCO_3$ contents ranged from 2.53% to 24.31%, indicating that the soils were rich in lime. Among the macro nutrients, phosphorus and potassium were mostly found at sufficient levels, calcium was high, whereas magnesium was generally below the threshold. Of the micro nutrients, iron (Fe), manganese (Mn), copper (Cu), and zinc (Zn) were generally present in adequate amounts; however, zinc deficiency was observed in some samples. Leaf analysis supported these findings and revealed nutritional deficiencies in some orchards, particularly in phosphorus, magnesium, and zinc. It was also evaluated that the high lime content could reduce the availability of phosphorus and certain microelements, negatively affecting plant nutrition. In conclusion, although the soils in these olive orchards generally possess favorable properties, deficiencies in organic matter and some essential nutrients pose potential constraints for sustainable productivity. Therefore, strategies aimed at increasing soil organic matter and implementing conscious fertilization practices based on regular soil and leaf analyses are recommended.

Keywords: olive, *Olea europaea*, soil properties, leaf analysis

ONİKİŞUBAT (KAHRAMANMARAŞ) İLÇESİNDEKİ ZEYTİN (*Olea europaea* L.) BAHÇELERİNDE TOPRAK VE YAPRAK ANALİZLERİNE DAYALI BESLENME DURUMUNUN İNCELENMESİ

ÖZET

Bu çalışma, zeytin (*Olea europaea*) yetiştirilen bahçelerdeki toprakların fiziksel ve kimyasal özelliklerinin yanı sıra makro ve mikro besin element içeriklerini belirlemek amacıyla yürütülmüştür. İncelenen toprak örneklerinde kum, silt ve kil oranları sırasıyla %30.51-73.40, %12.00-40.42 ve %11.11-39.01 arasında değişmiş; genel olarak kumlu killi tın ve kumlu tın tekstür sınıflarında yer almıştır. Toprakların pH değerleri 7.15–8.18 aralığında olup, çoğunluğu hafif alkali karakter göstermektedir. Organik madde içerikleri %0.98-3.52 arasında değişmiş ve toprakların yaklaşık %60'ının yetersiz düzeyde olduğu belirlenmiştir. EC (çözünebilir tuz) değerleri tüm örneklerde tuzsuz sınıfa girmekte; $CaCO_3$ içerikleri ise %2.53-24.31 aralığında seyrederek toprakların kireççe zengin olduğunu göstermektedir. Makro besin elementlerinden fosfor ve potasyum çoğunlukla yeterli düzeyde tespit edilmiş; kalsiyum içeriği yüksek, magnezyum ise sınır değerin altında bulunmuştur. Mikro besin elementlerinden demir (Fe), mangan (Mn), bakır (Cu) ve çinko (Zn) genellikle yeterli seviyelerde olmakla birlikte, Zn eksikliği bazı örneklerde gözlemlenmiştir. Yaprak analizleri de bu bulguları desteklemiş; özellikle fosfor, magnezyum ve çinko yönünden bazı bahçelerde beslenme yetersizlikleri tespit edilmiştir. Yüksek kireç içeriklerinin fosfor ve mikro elementlerin yarayışlılığını azaltabileceği ve bu durumun bitki beslenmesi üzerinde olumsuz etkiler oluşturabileceği değerlendirilmiştir. Sonuç olarak, zeytin yetiştirilen bu topraklar genel olarak uygun özellikler taşısa da, organik madde yetersizliği ve bazı besin element eksiklikleri, sürdürülebilir verim açısından potansiyel sorun oluşturmaktadır. Bu nedenle, düzenli toprak ve yaprak analizlerine dayalı bilinçli gübreleme uygulamaları ile toprak organik madde düzeyinin artırılmasına yönelik stratejiler geliştirilmelidir.

Anahtar kelimeler: zeytin, *Olea europaea*, toprak özellikleri, yaprak analizleri

1. GİRİŞ

Zeytin (*Olea europaea* L.), özellikle Akdeniz iklimi başta olmak üzere, dünya genelinde farklı iklim bölgelerinde yetiştirilebilen önemli bir tarım ürünüdür. Zeytin yetiştiriciliği, hem ekonomik hem de çevresel açıdan büyük bir öneme sahiptir, çünkü bu bitki, su kaynaklarının sınırlı olduğu bölgelerde bile verimli bir şekilde yetişebilme kapasitesine sahiptir (Makhlouf ve M'Hamdi, 2020). Zeytinyağı, içerdiği antioksidanlar ve tekli doymamış yağ asitleri sayesinde kardiyovasküler hastalıklar başta olmak üzere çeşitli kronik hastalıklara karşı koruyucu etkiler göstermektedir (Cicerale ve Keast, 2012). Ayrıca, zeytin ağacı çevresel açıdan büyük bir öneme sahiptir; zeytinlikler, toprak erozyonunun engellenmesine ve biyolojik çeşitliliğin korunmasına katkı sağlamaktadır (Gómez ve García, 2012).

Türkiye, zeytin üretiminde dünya sıralamasında üst sıralarda yer almakta olup, hem sofralık zeytin hem de zeytinyağı üretimi açısından önemli bir potansiyele sahiptir. Bu üretim potansiyeli içinde Kahramanmaraş, son yıllarda zeytin tarımının yaygınlaştığı önemli illerden biri olarak öne çıkmaktadır (Çolak ve Özkan, 2017). Akdeniz, Doğu Anadolu ve Güneydoğu Anadolu iklim kuşaklarının kesişim noktasında yer alan Kahramanmaraş, bu yönüyle farklı agroekolojik özellikler göstermekte ve bu durum zeytin tarımı açısından hem fırsatlar hem de bazı sınırlılıklar yaratmaktadır. Kahramanmaraş, zeytin yetiştiriciliği için uygun iklim ve toprak koşullarına sahip bir bölgedir. Akdeniz iklimi özellikleri gösteren bu bölgede, zeytin yetiştiriciliği, özellikle kış mevsimlerinin ılıman geçmesi ve yaz mevsimlerinde sıcaklıkların yüksek olmasının etkisiyle yaygındır.

Zeytin yetiştiriciliğinde optimum verim ve kaliteye ulaşmak, uygun toprak koşullarının sağlanmasına doğrudan bağlıdır. Zeytin bitkisi, iyi drene olmuş, hafif asidik veya nötr pH seviyesine sahip, organik maddece zengin ve mineral içeriği yüksek topraklarda sağlıklı gelişim göstermektedir (Yılmaz, 2015). Kahramanmaraş'ta zeytin yetiştirilen topraklar; iklimsel farklılıklar, topografik yapı ve jeolojik özelliklere bağlı olarak çeşitlilik göstermekte, bu da toprak özelliklerinin yerel düzeyde analiz edilmesini gerekli kılmaktadır. Özellikle toprak pH'ı, tuzluluk seviyesi, kireç içeriği, organik madde miktarı ve su tutma kapasitesi gibi faktörler, zeytin ağaçlarının gelişimi üzerinde belirleyici rol oynamaktadır (Tosun, 2014; Pekcan ve ark., 2021).

Kahramanmaraş, Türkiye'nin zeytin yetiştiriciliği yapılan illerinden biri olup, bu ilde zeytin yetiştiriciliği her geçen yıl artan bir ivme göstermektedir. Kahramanmaraş, Doğu Akdeniz Bölgesi'nde yer almasına rağmen, iklim özellikleri açısından Akdeniz, Doğu Anadolu ve Güneydoğu Anadolu bölgelerinin geçiş noktasında yer alır. Bu durum, zeytin yetiştiriciliği açısından hem avantajlar hem de zorluklar yaratmaktadır. Zeytin bitkisi, iyi havalanan, kum, silt ve kil oranlarının uygun olduğu topraklarda iyi gelişim gösterirken, toprak özellikleri, verim ve kalite üzerinde doğrudan etkili olmaktadır (Pekcan ve ark., 2021). Kahramanmaraş'ta zeytin yetiştirilen toprakların özellikleri, bölgenin iklim koşullarına ve topografyasına bağlı olarak farklılık gösterebilmektedir. Bu toprakların pH değeri, tuzluluk oranı, kireç içeriği ve organik madde miktarı, zeytin ağaçlarının gelişimi üzerinde doğrudan etkili olmaktadır. Bölgedeki toprakların genellikle kireçli ve kalkerli yapıda olması, zeytinin yetişmesine uygun bir ortam sağlasa da, bazı yerlerde toprağın asidik veya bazik özellikler taşıması, zeytin üretiminin

verimini etkileyebilmektedir (Tosun, 2014). Ayrıca, toprak derinliği ve su tutma kapasitesi gibi faktörler de, zeytin yetiştiriciliği açısından önemli parametrelerdir.

Zeytin üretiminde gübreleme stratejilerinin belirlenmesi, toprakta bulunan besin elementlerinin miktarı ve bunların bitki tarafından alım düzeyine göre planlanmalıdır. Zeytin bitkisinde görülen bazı fizyolojik bozukluklar, çoğunlukla besin elementi eksiklikleri veya bu elementler arasındaki dengesizliklerden kaynaklanmaktadır. Bu nedenle, sürdürülebilir ve kaliteli üretim için toprakların fiziksel ve kimyasal özelliklerinin detaylı biçimde incelenmesi büyük önem taşımaktadır (Keleş-Uzel ve Çimrin, 2020).

Bu çalışmanın amacı, Kahramanmaraş ilinde zeytin yetiştirilen alanlara ait toprakların fiziko-kimyasal özelliklerini belirleyerek beslenme durumlarını incelemektir. Çalışma, bölgedeki farklı zeytinlik alanlardan alınan toprak örnekleri üzerinde yapılan analizler ışığında, toprak özelliklerinin zeytin yetiştiriciliği ile ilişkisini ortaya koymayı hedeflemektedir.

2. MATERYAL ve YÖNTEM

Çalışma alanı olan Onikişubat İlçesi, Türkiye'nin Akdeniz Bölgesi'nde yer alan Kahramanmaraş ilinin merkez ilçelerinden biridir. Coğrafi açıdan Akdeniz, Doğu Anadolu ve Güneydoğu Anadolu bölgelerinin kesişim noktasında yer alması nedeniyle geçiş iklimi özellikleri gösterir. İlçenin arazisi dağlık ve engebeli olup, kuzey ve doğu kesimlerinde yüksek rakımlı alanlar bulunur. Onikişubat ilçesinin matematiksel (enlem ve boylam) konumu yaklaşık olarak 37°30' - 38°00' kuzey enlemleri ile 36°30' - 37°00' doğu boylamları arasında yer almaktadır. Bu konumu ile Onikişubat, Türkiye'nin güney kuşağında yer almakta olup, karasal ve yarı kurak iklim özelliklerinin görüldüğü bir yerleşim birimidir.

2.1.Toprak Örnekleme ve Analiz Yöntemleri

Bu çalışmada verimlilik analizlerinin sağlıklı bir şekilde yapılabilmesi amacıyla, hastalık ve zararlılarla bulaşık olmayan, kaliteli ve yüksek verim potansiyeline sahip, verim çağındaki tesadüfen belirlenen 11 adet bahçeden toprak örnekleri alınmıştır. Örnekleme, her bahçede iki farklı derinlikten (0–30 cm ve 30–60 cm) gerçekleştirilmiştir. Toprak örnekleri, her iki ağaç taç izdüşümünün ortasından zigzaglar çizilerek alınmış ve bahçeyi temsil edecek şekilde örnekleme yapılmıştır. Elde edilen topraklar, sahada plastik bir kovada homojen şekilde karıştırılmış; ardından her örnekten yaklaşık 1–1.5 kg alınarak etiketlenmiş naylon torbalara konulmuş ve laboratuvara taşınmıştır. Laboratuvara ulaştırılan örnekler, bekletilmeden gölgede hava ile kurutulmuştur.

Kuruyan toprak örnekleri tahta tokmaklarla dövülerek, 2 mm çapındaki elekten geçirilerek analizlere hazırlanmıştır. Analize hazır topraklarda; Toprak tekstürü, Bouyoucos hidrometre yöntemi ile belirlenmiştir (Bouyoucos, 1951). Toprak reaksiyonu (pH), 1:2.5 toprak-su süspansiyonunda pH metre ile ölçülmüştür (McLean, 1982). Organik madde içeriği Walkley-Black yöntemiyle (Ülgen ve Ateşalp, 1972), kireç içeriği ise Scheibler kalsimetresi ile tekrarlamalı olarak saptanmıştır (Hızalan ve Ünal, 1966). Toplam tuz miktarı Richards (1954) yöntemine göre analiz edilmiştir. Değişebilir potasyum (K), kalsiyum (Ca) ve magnezyum

(Mg) miktarları amonyum asetat ekstraksiyonu ile (Richards, 1954), alınabilir demir (Fe), çinko (Zn), bakır (Cu) ve mangan (Mn) ise DTPA ile ekstrakte edildikten sonra atomik absorpsiyon spektrofotometresi (AAS) cihazında ölçülmüştür (Lindsay ve Norvell, 1978). Topraklarda yarayışlı fosfor (P) içeriği ise 0.5 N sodyum bikarbonat ekstraksiyonu ve mavi renk oluşumuna dayanan kolorimetrik yöntemle belirlenmiştir (Olsen ve ark., 1954).

2.2.Yaprak Örnekleme ve Analiz Yöntemleri

Seçilen bahçelerde yaprak örnekleri, kış dinlenme döneminde (Kasım-Aralık) zeytin ağaçlarının her ağacın 4 yönünden ve yıllık sürgünlerin ortasından karşılıklı yaprak çifti alınmıştır (Canözer, 1978; Eryüce, 1979). Örnekleme sırasında, ağaçların bir yıllık sürgünlerinin ortasında yer alan, güneş ışığı alan dallardaki gelişimini yeni tamamlamış yaprak çiftleri tercih edilmiştir. Örnekler, her ağacın dört yönünden dengeli bir şekilde alınarak, bireyleri temsil edecek şekilde hazırlanmıştır.

Toplanan yaprak örnekleri aynı gün laboratuvara getirilmiş, önce çeşme suyu ardından saf su ile yıkanarak yüzey kirleticilerden arındırılmıştır. Daha sonra, kurutma kağıdı ile kurutulmuş ve etüvde 70 ºC'de 48 saat sabit ağırlığa gelinceye kadar kurutulmuş ve daha sonra porselen havanda öğütülerek analiz için hazırlanmıştır (Kacar, 2014). Öğütülen yaprak örnekleri, yaş yakma yöntemi (nitrik asit + perklorik asit karışımı) ile yakılmıştır. Analizlerde, yapraklardaki fosfor (P) içeriği Vanadomolibdofosforik sarı renk yöntemi ile belirlenmiştir (Kacar, 1984). Potasyum (K), kalsiyum (Ca), magnezyum (Mg), sodyum (Na), demir (Fe), çinko (Zn), bakır (Cu) ve mangan (Mn) elementlerinin konsantrasyonları ise Atomik Absorpsiyon Spektrofotometresi (AAS) ile tespit edilmiştir (Kacar ve İnal, 2008).

3.BULGULAR ve TARTIŞMA

Bu çalışmada analiz edilen zeytinlik topraklarının fiziksel yapıları, kimyasal özellikleri ve besin elementi içerikleri değerlendirilmiştir. Tekstür analizine göre toprakların kum, silt ve kil oranları sırasıyla %30.51–73.40, %12.00–40.42 ve %11.11–39.01 arasında değişmiştir. Bu oranlar doğrultusunda topraklar genel olarak "kumlu killi tın" ve "kumlu tın" sınıfına girmektedir. Benzer şekilde, Özsayar ve Çimrin (2022) tarafından yapılan bir araştırmada da zeytinlik topraklarının büyük kısmının kumlu killi tın, killi tın, killi ve kumlu tın bünyeye sahip olduğu bildirilmiştir. Zeytin bitkisi toprak bünyesi açısından yüksek seçicilik göstermemekle birlikte, killi ve tınlı topraklarda daha iyi gelişim sergilemektedir (Llamas, 1984).

Toprakların pH değerleri 7.15 ile 8.18 arasında olup, hafif alkali karakter göstermektedir. Ülgen ve Yurtsever (1995) tarafından yapılan sınıflamaya göre toprakların %45'i nötr, %55'i hafif alkali özelliktedir. Zeytin bitkisi geniş bir pH aralığına tolerans gösterebilen bir türdür (Hartmann ve Lilleland, 1966; Özbek, 1981; Llamas, 1984).

Organik madde içeriği %0.98 ile %3.52 arasında değişmekte, ortalama %2.25 seviyesindedir. Zeytinliklerin %60'ında organik madde içeriği yetersiz olarak değerlendirilmiştir. Bu bulgu, Özsayar ve Çimrin (2022) tarafından yapılan çalışmada da desteklenmiş ve bölgedeki toprakların büyük çoğunluğunun organik madde bakımından yetersiz olduğu ortaya konmuştur.

Toprakların tuz içeriği %0.011 ile %0.13 arasında değişmektedir. Tüzüner (1990) tarafından belirtilen sınıflandırmaya göre bu değerler tuzsuz sınıfa girmektedir. Zeytin bitkisi tuza karşı orta derecede tolerans gösteren bir tür olup (Özbek, 1981; Llamas, 1984), incelenen zeytinliklerde tuzluluktan kaynaklanan herhangi bir olumsuzluk gözlenmemiştir.

Toprakların kireç ($CaCO_3$) içerikleri %2.53 ile %24.31 arasında değişmekte olup, bu da toprakların kireççe zengin olduğunu göstermektedir. Zeytin bitkisi yüksek kireç içeriğine dayanıklı olmakla birlikte, optimal gelişimini %9–19 arasında kireç içeren topraklarda göstermektedir (Hartmann ve Lilleland, 1966; Mengel ve Kirkby, 1987). Özsayar ve Çimrin (2022), benzer şekilde zeytinlik topraklarının kireç içeriklerini %1.12 ile %18.40 arasında, ortalama %2.60 olarak rapor etmiştir.

Makro ve mikro besin elementlerine ilişkin analizlerde; fosfor (P) içeriği 2.51–33.21 mg kg^{-1} arasında değişmiş, ortalama 17.68 mg kg^{-1} olarak tespit edilmiştir. Sillanpää (1990) sınıflamasına göre örneklerin %33'ü yüksek, %40'ı yeterli, %27'si düşük düzeyde P içermektedir. Potasyum (K) içeriği 112–678 mg kg^{-1} arasında değişmiş, ortalama 268 mg kg^{-1} olarak bulunmuş ve örneklerin %45'i yüksek, %55'i yeterli düzeydedir. Kalsiyum (Ca) içeriği ise %63 oranında yüksek, %37 oranında yeterli seviyededir. Magnezyum (Mg) içeriği 102–328 mg kg^{-1} arasında değişmiş ve %48.2'si yetersiz, %51.8'i yeterli bulunmuştur.

Yarayışlı mikro elementlerden demir (Fe) içeriği 0.19–12.03 mg kg^{-1} aralığında olup, ortalama 6.11 mg kg^{-1} olarak belirlenmiş; örneklerin %50'sinde yüksek, %47'sinde orta ve %3'ünde düşük düzeyde bulunmuştur. Bakır (Cu) içeriği 0.55–6.34 mg kg^{-1} arasında değişmiş ve tamamı yeterli düzeydedir. Mangan (Mn) içerikleri 3.83–12.23 mg kg^{-1} arasında değişmiş ve tüm örneklerde yeterli düzeydedir. Çinko (Zn) içerikleri %87 oranında yeterli, %13 oranında düşük düzeydedir.

Yapılan bitki analizleri sonucunda zeytin yapraklarında P oranı %0.053–0.17 arasında belirlenmiş, örneklerin %18.18'i yetersiz, %81.82'si yeterli düzeydedir. Diğer makro elementlerden kalsiyum %0.65–1.51, potasyum %0.28–0.92, magnezyum %0.11–0.41 arasında değişmiştir. Yapraklardaki Fe, Mn, Cu ve Zn içerikleri sırasıyla 39.2–182.6, 18–134, 4.05–28.32 ve 6.24–32.15 mg kg^{-1} aralığında belirlenmiştir. Söylemez ve ark. (2017), Şanlıurfa yöresinde yürüttükleri çalışmada yapraklardaki P içeriğinin %82.5 oranında yetersiz olduğunu bildirmiş, bu durumu yüksek toprak kireci ile ilişkilendirmiştir. Özsayar ve Çimrin (2022) ise P (%13.33), K (%40), Ca (%73.33), Mg (%93.33), Cu (%53.33), Mn (%26.67) ve Zn (%13.33) bakımından yapraklarda eksiklikler saptamıştır. Doran ve ark. (2008) tarafından yapılan benzer bir çalışmada, yaprakların P, K, Ca, Mg, Fe ve Mn düzeylerinin yeterli, ancak N, Zn, Cu ve B düzeylerinin yetersiz olduğu belirtilmiş ve bu durumun zeytinliklerde önemli bir beslenme sorunu oluşturduğu vurgulanmıştır.

Bu veriler, zeytinlik topraklarının kimyasal yapısında bazı besin maddeleri açısından dengesizlikler bulunduğunu ve özellikle bilinçsiz gübreleme uygulamalarının bu dengesizlikleri artırabileceğini göstermektedir.

Zeytin (*Olea europaea*) türüne ait toprağın bazı fiziksel ve kimyasal özellikleri Çizelge 1 ve 2'de verilmiştir.

Çizelge 1. *Olea europaea* türüne ait toprağın bazı fiziksel ve kimyasal özellikleri.

Bitki Türü	Kum (%)	Silt (%)	Kil (%)	Bünye sınıfı	pH	Tuz (EC) ($dS.m^{-1}$)	Kireç ($CaCO_3$) (%)	Organik madde (OM) (%)
Olea europaea	52,05	26,21	25,18	SCL	7,77	0,07	13,42	2,25

Çizelge 2. *Olea europaea* türüne ait toprağın bazı makro ve mikro besin elementleri özellikleri.

4. SONUÇ

Bu çalışma kapsamında incelenen zeytin bahçesi topraklarının fiziksel ve kimyasal özellikleri ile besin element içerikleri değerlendirilmiştir. Toprak bünyesi bakımından örneklerin büyük çoğunluğunun kumlu killi tın ve kumlu tın sınıfında yer aldığı belirlenmiş, bu durum zeytin tarımı açısından elverişli bir yapı sunmakla birlikte, bazı örneklerde yüksek kil içeriği gözlenmiştir. Toprakların pH değerleri genellikle hafif alkali karakter göstermekte olup (%55), bu durum zeytin bitkisinin adaptasyon aralığı içinde yer almakta ve gelişimini olumsuz yönde etkilememektedir. Ancak, organik madde içeriklerinin ortalama %2.25 gibi düşük seviyelerde bulunması, uzun vadede toprak verimliliği ve besin elementi döngüsü açısından olumsuz sonuçlar doğurabilir.

Topraklarda tuz içeriği %0.011 - %0.13 arasında değişmekte olup, tüm örnekler tuzsuz sınıfında yer almakta ve bu açıdan zeytin yetiştiriciliği için herhangi bir tuzluluk sorunu bulunmamaktadır. Kireç içeriği ise oldukça geniş bir aralıkta (%2.53 - %24.31) dağılım göstermekte ve genel olarak kireççe zengin topraklar olarak sınıflandırılmaktadır. Yüksek kireç içerikleri, özellikle fosfor ve mikro elementlerin yarayışlılığı üzerinde olumsuz etki yapabileceğinden, bu durum dikkatle izlenmelidir. Makro besin elementlerinden fosfor (P) ve potasyum (K) düzeyleri genel olarak yeterli ya da yüksek bulunmuş, ancak bazı örneklerde P eksikliği gözlemlenmiştir. Kalsiyum (Ca) içeriği toprakların %63'ünde fazla, magnezyum (Mg) ise %48.2 oranında yetersiz seviyede bulunmuştur. Mikro elementler açısından Fe, Mn, Cu ve Zn içerikleri büyük oranda yeterli düzeyde saptanmakla birlikte, Zn eksikliği %13 oranında belirlenmiştir.

Yaprak analizlerine göre, zeytin bitkisinin makro ve mikro besin element içerikleri büyük ölçüde yeterli düzeyde olmakla birlikte, %18.18 oranında fosfor eksikliği, ayrıca bazı örneklerde potasyum, magnezyum ve çinko gibi elementlerde düşük seviyeler tespit edilmiştir. Bu eksikliklerin büyük ölçüde yüksek kireç içeriği ve düzensiz gübreleme uygulamalarından kaynaklandığı düşünülmektedir.

Sonuç olarak, çalışma alanındaki zeytin bahçesi toprakları genel olarak zeytin yetiştiriciliği için uygun özellikler göstermekte, ancak organik madde ve bazı mikro besin elementleri yönünden iyileştirmelere ihtiyaç duymaktadır. Bu bağlamda, dengeli gübreleme programlarının uygulanması, organik madde düzeyinin artırılmasına yönelik tedbirlerin alınması ve düzenli toprak-yaprak analizleriyle izleme çalışmalarının sürdürülmesi önerilmektedir.

ABSTRACT

This study presents the evaluation of the preliminary data from a comprehensive project. The umbrella project, titled "TR.AQUA: Innovative and Sustainable Practices in Aquaculture within the Framework of Food Supply Security", is supported by the TÜBİTAK-1004 program. Comprising 16 sub-projects, the initiative aims to generate high-level technology. Our research group contributes with the project titled "From Organic Waste to Fish Feed", which brings together various disciplines and is expected to yield valuable outcomes for sustainable food production while positively impacting fish and plant producers socioeconomically and technologically.

The project aims to integrate earthworm-based vermicompost production with fish and plant cultivation. The key topics include: utilization of organic waste, vermicompost production, biochemical composition (fatty acids, lipids, antioxidant defense system etc.). of composting worms, the use of obtained vermicompost in plant cultivation, and the incorporation of composting worms into fish feed rations. This particular study focuses on evaluating the vermicomposting process of organic wastes. The selected organic wastes were solid digestate from a biogas plant (BD) and liquid olive mill wastewater (OMWW). Cattle manure (CM), the natural habitat of composting worms, was used as the primary substrate. *Eisenia fetida* was selected as the vermicomposting species.

Biogas digestate and OMWW were studied as two separate waste types. To determine optimal mixing ratios for the vermicomposting process, cattle manure was mixed with these wastes at 0%, 25%, 50%, 75%, and 100% ratios. Due to its solid form, BD was mixed with manure following principles of solid blending, whereas OMWW was applied by replacing the water used for moistening the vermicomposting piles (consisting of 100% cow manure) with the liquid waste.

This study evaluated the reproductive performance of the worms to determine ideal mixing ratios, using parameters such as cocoon count, number of hatchlings, and worm biomass. The experiment lasted for 90 days, considering the reproductive cycle of the worms. All experimental bins were maintained at 70% field capacity moisture throughout the trial. At the end of the experiment, worm counts were conducted in each bin, and chemical analyses were performed on initial materials and mixtures.

Results indicated that 25% and 50% biogas digestate mixtures were optimal. However, OMWW, even at the lowest tested concentration (25%), had a toxic effect; although worms survived in this mixture, no reproduction occurred, and higher concentrations caused rapid mortality. These findings suggest that OMWW requires further investigation at significantly lower concentrations to be viable for vermicomposting.

ORGANİK ATIKTAN BALIK YEMİNE: TARIM VE SU ÜRÜNLERI ENTEGRASYONU İÇİN BİYOGAZ ATIĞI VE ZEYTİN KARA SUYUNUN VERMİKOMPOSTLAMASINDA *Eisenia fetida* BİYOMASI

ÖZET

Çalışma geniş kapsamlı bir projenin bir bölümüne ait ilk verilerin değerlendirilmesini içermektedir. Bir çatı proje olan "TR.AQUA Gıda Arzı Güvenliği Çerçevesinde Su Ürünlerinde Yenilikçi ve Sürdürülebilir Uygulamaları" projesi TUBITAK-1004 programı tarafından desteklenmiştir. Çalışma, 16 adet projeden oluşmakta olup yüksek teknoloji üretmek hedeflenmiştir. Çalışma grubumuza ait proje, "Organik Atıktan Balık Yemine" başlıklı, farklı disiplinleri bir araya getiren, balık ve bitki üreticilerini sosyo-ekonomik ve teknolojik yönden olumlu şeklide etkileyecek, sürdürülebilir gıda üretimi açısından değerli sonuçlar ortaya koyabilecek bir çalışmadır.

Projenin hedefi, toprak solucanı ve nitelikli vermikompost üretimi ile balık ve bitki yetiştiriciliği entegrasyonunu sağlayabilmektir. Çalışma konuları; organik atıkların değerlendirilmesi, vermikompost üretimi, vermikompost solucanlarının biyokimyasal içeriği (yağlar, yağ asitleri, antioksidan içeriği gibi), elde edilen vermikompostun bitki yetiştiriciliğinde kullanımı ve son olarak elde edilen vermikompost solucanlarının balık yemi rasyonlarına katılabilmeleri şeklinde özetlenebilir. Bu çalışmada organik atıkların vermikopostlama sürecine ait veriler değerlendirilmektedir. Organik atık olarak, biyogaz tesisi katı atığı ve sıvı zeytin karasuyu belirlenmiştir. Ayrıca solucanların doğal yataklığı olan ahır gübresi ana materyal olarak kullanılmıştır. Vermikompostlama için *Eisenia fetida* türü solucanlar tercih edilmiştir.

Biyogaz atığı ve karasu iki ayrı konu olarak çalışılmıştır. Her iki organik atığın vermikompostlanma süreci için ahır gübresi ile ideal karışım oranlarının belirlenmesi amacıyla karışım dozları belirlenmiştir. Biyogaz atığı katı olduğundan ahır gübresi ile katıların homojen karışabilme ilkelerine bağlı kalarak karışımlar hazırlanmıştır. Karasuyun karıştırılmasında ise %100 ahır gübresinden oluşan, vermikopostlanacak yığınların nemlendirilmesinde kullanılacak saf su ile karasuyun karıştırılması şeklinde bir yol izlenmiştir. Her iki atık için de karışım oranları; %0, 25, 50, 75 ve 100 olarak belirlenmiştir. Bu çalışmada solucanlara ait üreme özelliklerine ait veriler ve buna bağlı olan ideal karışım oranlara ait veriler değerlendirilmektedir. İdeal karışım oranları belirlenirken kullanılan solucan biyolojisine ait parametrelerden ise kokon sayısı, yavru sayısı ve solucan biyoması seçilmiştir. Deneme süresi solucanların üreme kabiliyetleri de göz önüne alınarak 90 gün olarak belirlenmiştir. Denemedeki kovalar, karışımlar hazırlandıktan ve solucan ilaveleri yapıldıktan sonra her gün tarla kapasitesinin %70 seviyesinde nemlendirilmiştir. Deneme sonunda tüm kovalardan solucanlara ait sayımlar yapılmıştır. Bunu yanı sıra, denemede kullanılan başlangıç organik materyallere ve karışımlara ait kimyasal analizler yapılmıştır. Veriler değerlendirildiğinde, biyogaz atığı karışımları içerisinde ideal oranların %25 ve %50 olduğu, karasuyun ise vermikompostlamada bu konsantrasyonlarda kullanılamayacağı belirlenmiştir. Belirlenen konsantrasyonlarda karasu uygulamalarında %25'lik uygulamada solucanlar yaşamakta olsalar da hiç üremeyişler diğer konsantrasyonlarda ise hızlıca ölmüşlerdir. En düşük konsantrasyonun

bile solucanlara toksik etki yaptığı belirlenmiş olup çok daha düşük dozlarda çalışmanın yenilenmesi gerektiği ortaya çıkmıştır.

Anahtar Kelimeler: Vermikompostlama, Eisenia fetida, Biogas residue, Olive mill wastewater, Agri-aquaculture integration

1. GİRİŞ

The increasing global population and concomitant rise in food demand necessitate the development of sustainable solutions across both terrestrial and aquatic production systems. While traditional disposal of organic wastes exacerbates environmental burdens, valorizing these wastes within the value chain both enhances waste management and reduces production costs. In this context, mesophilic vermicomposting yields two principal products: a compost rich in microbial activity and beneficial-microorganism diversity (vermicompost/vermicast) and, secondly, earthworm biomass (Hepşen Türkay, 2023).

Vermicompost (vermicompost/vermicast) is a soil-like material with high levels of plant-available nutrients and enzymatic activity, produced through the combined action of earthworms (e.g., Eisenia fetida) and microorganisms on organic residues. Earthworm biomass, by contrast, is rich in protein, fatty acids, and antioxidants, offering a sustainable alternative to conventional fishmeal sources. These two products are integrated to increase crop yields and soil health in plant production, while simultaneously reducing feed costs and environmental impacts in aquaculture.

The world population is projected to reach approximately 10 billion by 2050, requiring a 60 % increase in food production over current levels. In addition to terrestrial agriculture, there is now an imperative to utilize aquatic resources more intensively to meet human nutritional needs (FAO). Indeed, aquaculture has long been the fastest-growing food-production sector globally and in Türkiye, underscoring its promise for meeting animal-protein requirements and supporting healthy diets. The share of farmed fish—including crustaceans and molluscs—in total fisheries production rose from 3.9 % in 1970 to 33 % in 2005 and reached 46 % in 2018 (FAO, 2020). Currently, aquaculture supplies 50 % of the fish consumed worldwide, a figure expected to climb to 62 % by 2030. In Türkiye, cage-culture production has mirrored this growth, reaching 420 000 t yr^{-1}: 144 000 t of rainbow trout (Oncorhynchus mykiss) and 149 000 t of European sea bass (Dicentrarchus labrax), together accounting for 70 % of national output (TÜİK, 2021).

This expansion in fish production brings a corresponding increase in feed demand. Reliance on fishmeal and fish oil (limited by natural stocks and high cost) has driven the search for alternative protein and lipid sources that maintain ecological balance (Gatlin et al., 2007). Potential plant- and animal-based alternatives must be evaluated for their effects on fish health, and by extension, on human health (Engin et al., 2024). Protein remains the principal determinant of both growth performance and feed cost in aquafeeds (Lovell, 1989). Numerous studies have demonstrated successful use of plant ingredients as alternative protein sources (Gomes et al., 1995; Gomez-Requeni et al., 2004; Kaushik et al., 2004), yet antinutritional factors and essential-amino-acid deficiencies remain challenges.

Recently, earthworm meal has emerged as a promising aquafeed ingredient. Its nutrient profile closely approximates that of fishmeal (Hasanuzzaman et al., 2010), and studies have shown superior growth in common carp (Cyprinus carpio) compared with fishmeal and soybean meal (Rawling et al., 2012). In African catfish (Clarias gariepinus), earthworm meal significantly enhanced growth, indicating its potential as a major protein source (Zakaria et al., 2012). A

study in Vietnam likewise highlighted earthworms as an important feed ingredient for local carp farming systems (Pucher et al., 2014).

Although Turkish vermicompost producers utilize earthworm biomass, its application as a protein source has not yet been explored. Therefore, integrating fish farms with vermiculture operations holds particular promise. The properties of vermicompost are determined by the composition of the worm feed, which also influences the worms' biochemical makeup. To maximize yields for both crops and live feed, it is essential to investigate different worm-feed substrates and identify formulations that optimize performance in both systems.

This paper presents preliminary results from a comprehensive project and introduces its overall framework. Under the 2021 TÜBİTAK 1004 Program, twelve high-technology platforms were supported; one of these—the "TR.AQUA Innovative and Sustainable Practices in Aquatic Products for Food Security" platform—comprises sixteen distinct projects. Our group's contribution, entitled "From Organic Waste to Fish Feed," brings together multiple disciplines to deliver socio-economic and technological benefits for plant and fish production, thereby advancing sustainable food systems.

The present study aims to determine the optimal mixture ratios of two common organic residues (BD and OMWW) in vermicomposting by E. fetida, maximizing both vermicompost yield and the nutritional quality of earthworm biomass. Substrate selection considered availability, valorization potential, environmental risks when unmanaged, contributions to vermicompost properties, and effects on worm composition. The findings will provide a novel, practicable model for sustainable soil-health management and diversification of live-feed resources.

2. MATERIAL METHOD

In this study, two types of organic residues were selected to evaluate the different compositional profiles that develop within earthworms. Biogas plant digestate and olive mill wastewater were chosen as the test substrates. Selection criteria included the volumes generated, potential for valorization, environmental hazards posed by open discharge, contributions to the quality of the vermicompost product, and effects on the biochemical composition of the earthworms.

In this study, 2 types of organic waste were preferred in order to evaluate the different compositions that will occur in the worm body. For this purpose, biogas plant waste and olive processing waste, olive mill waste, were determined as organic waste. While determining the organic wastes, the amounts released, the amounts to be evaluated, the environmental disadvantages created by the wastes remaining open, their contributions to the vermicompost product and their effects on the composition in the worm body were taken into consideration.

Since biogas digestate is a solid material, mixtures were prepared according to principles of homogeneous blending with CM. For the olive mill wastewater, the wastewater was mixed with deionized water—used to moisten the piles of %100 CM for vermicomposting—to achieve the desired moisture content. The earthworm species Eisenia fetida was used throughout.

Table 1. Life cycle and optimum ecological requirements of Eisenia fetida

Eisenia fetida	Biological cycle
Optimum temperature	25 °C
Optimum moisture content	70–90 %
Average adult weight	0.55 g (± 0.01 g)
Adult size	4–8 mm (diameter) × 50–100 mm (length)
Time to reach juvenile stage	21–28 days

Biogas digestate (BD) and olive mill wastewater (OMW) were treated as separate trials. To determine the optimal mixing ratios with CM for each residue, the proportions given in the table were established. CM and BD (both solid materials) were air-dried, passed through a 2 mm sieve, and then blended.

Table 2. Mixture Ratios of Organic Residues Used in the Experiment

Biogas digestate mixture ratios	**Olive mill wastewater mixture ratios**
100 % CM + 0 % BD	100 % CM + 0 % OMW (100 % DW + 0 % OMW)
75 % CM + 25 % BD	100 % CM + 25 % OMW (75 % DW + 25 % OMW)
50 % CM + 50 % BD	100 % CM + 50 % OMW (50 % DW + 50 % OMW)
25 % CM + 75 % BD	100 % CM + 75 % OMW (25 % DW + 75 % OMW)
0 % CM + 100 % BD	100 % CM + 100 % OMW (0 % DW + 100 % OMW)

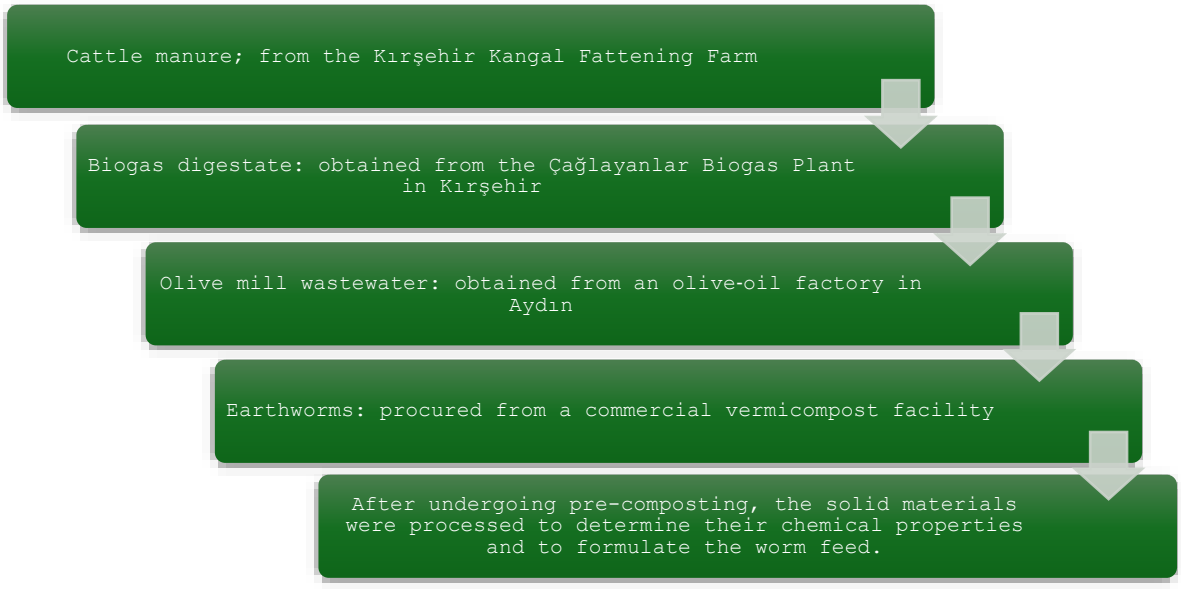

Table 3. Analyses and Methods Used to Determine the Chemical Composition of the Organic Wastes

Analysis	Method
pH	Potentiometric (1:10 organic material : deionized water), pH meter
Electrical conductivity (EC)	Potentiometric (1:10 organic material : deionized water), EC meter
Organic matter (%)	Dry combustion in a muffle furnace
Total nitrogen (N_total)	Distillation; Kjeldahl method
Analizler	Metot
pH	Potansiyometrik (1:10 organik materyal:saf su), Ph metre
EC	Potansiyometrik (1:10 organik materyal:saf su), EC metre

N total	Distilasyon ile, Kjeldahl metot

Figre1. Procurement of materials and preparation for testing

The experimental design was created in a randomized plot experimental design with 30 experimental buckets, including 2 organic wastes, 5 mixing ratios and 3 replications.

Table 4. Experimental design

Lab No.	Sample No.	Mixture	Lab No.	Sample No.	Mixture
1	1_1	100 % CM + 0 % BD	16	6_1	100 % CM + 0 % OMWW
2	1_2	100 % CM + 0 % BD	17	6_2	100 % CM + 0 % OMWW
3	1_3	100 % CM + 0 % BD	18	6_3	100 % CM + 0 % OMWW
4	2_1	75 % CM + 25 % BD	19	7_1	100 % CM + 25 % OMWW
5	2_2	75 % CM + 25 % BD	20	7_2	100 % CM + 25 % OMWW
6	2_3	75 % CM + 25 % BD	21	7_3	100 % CM + 25 % OMWW
7	3_1	50 % CM + 50 % BD	22	8_1	100 % CM + 50 % OMWW
8	3_2	50 % CM + 50 % BD	23	8_2	100 % CM + 50 % OMWW

9	3_3	50 % CM + 50 % BD	24	8_3	100 % CM + 50 % OMWW
10	4_1	25 % CM + 75 % BD	25	9_1	100 % CM + 75 % OMWW
11	4_2	25 % CM + 75 % BD	26	9_2	100 % CM + 75 % OMWW
12	4_3	25 % CM + 75 % BD	27	9_3	100 % CM + 75 % OMWW
13	5_1	0 % CM + 100 % BD	28	10_1	100 % CM + 100 % OMWW
14	5_2	0 % CM + 100 % BD	29	10_2	100 % CM + 100 % OMWW
15	5_3	0 % CM + 100 % BD	30	10_3	100 % CM + 100 % OMWW

Each mixture (20 kg per treatment) was placed into plastic buckets in accordance with homogeneous mixing protocols. Prior to adding worms, all buckets were moistened daily with deionized water for seven days to raise the moisture content to 70%. Moisture additions for each blend were calculated based on maximum water-holding-capacity analyses.

Figure 2. Preparation and Initiation of the Experiment

Subsequently, 1,000 individuals of E. fetida were introduced into each bucket. During the trial, any moisture lost from the surface was replenished daily to maintain constant humidity. The experiment was conducted in the Soil Science and Plant Nutrition Laboratory of the Faculty of Agriculture at KAEÜ for 30 days. Although originally planned for 90 days, the trial was terminated on day 30.

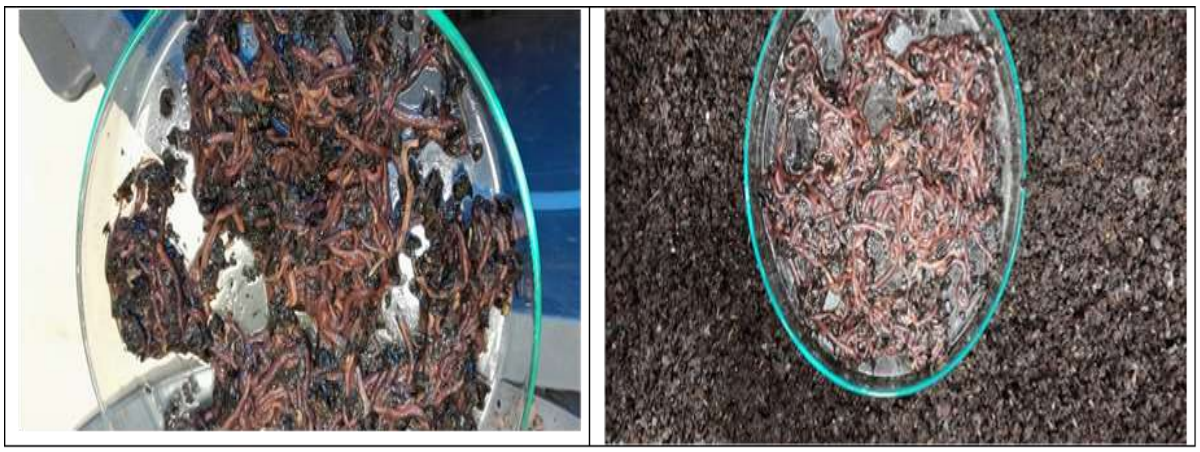

Figure 3. Initial worm enumeration and addition to the buckets

3. RESULTS

Chemical analyses of the organic residues were performed using the methods described above.

Table 5. Chemical Composition of the Organic Wastes Used in the Experiment

Analysis	**Cattle manure**	**Biogas digestate**	**Olive mill wastewater**
pH (1:10 w/v)	8.17	7.30	5.80
EC (dS m^{-1}, 1:10 w/v)	5.04	2.50	5.67
Organic matter (%)	32.29	78.00	36.50
Total nitrogen (%)	1.30	2.60	1.19
C/N ratio	18.03	21.72	22.20

Trial termination and worm harvest, although planned for 90 days, the trial was halted on day 30 because worm survival was negligible in most treatments. All worms, cocoons, and juveniles were carefully counted.

Figure 4. Worm images from olive mill wastewater and biogas waste applications

Table 6. Earthworm biomass and reproduction data. Mixtures (CM: cattle manure; BD: biogas digestate)

Mixture	Worm biomass increase (%)	Number of cocoons	Number of juveniles
100 % CM + 0 % BD	1.01	162	235
75 % CM + 25 % BD	0.68	63	97
50 % CM + 50 % BD	0.41	11	0
25 % CM + 75 % BD	0	0	0
0 % CM + 100 % BD	0	0	0

Table 7. Earthworm biomass and reproduction data. Mixtures (CM: cattle manure; OMWW: olive mill wastewater)

Mixture	Worm biomass increase (%)	Number of cocoons	Number of juveniles
100 % CM + 0 % OMW	1.94	157	274
100 % CM + 10 % OMW	0.12	3	0
100 % CM + 25 % OMW	0	0	0
100 % CM + 50 % OMW	0	0	0
100 % CM + 75 % OMW	0	0	0
100 % CM + 100 % OMW	0	0	0

At high application rates of both residues, worm biomass and reproductive output declined, and survival ceased altogether. In the OMW treatments, worms did not survive at any of the planned concentrations. At 75 % and 100 % OMW, all worms died on day 1; at 50 %, they died by day 3; and at 25 %, they perished one week later. Unexpectedly, a 10 % OMW treatment was added on day 3; although worms appeared lethargic and nearly immobile, some were still alive at harvest. The few cocoons observed likely resulted from gravid individuals introduced at the start.

In the BD trials, worms in the 75 % and 100 % treatments became immobile and died within the first week. In contrast, the 25 % and 50 % BD treatments supported worm survival and biomass increases. However, the highest biomass and reproductive counts were observed in the control (100 % CM) treatment, which received no additional residue.

4. DISCUSSION

Because the primary goal of vermicomposting is waste management, it is essential to identify the highest residue-application rates that still allow active worm metabolism. Although worms thrive naturally in pure CM, effective waste valorization requires determining how much alternative residue can be blended without compromising worm health. In this project, BD was retained at three application rates, whereas OMW was eliminated and replaced with olive pomace (the solid olive cake); the trial has since been reestablished and is ongoing.

Notably, the surviving worms in the 10 % OMW treatment indicate that even lower concentrations warrant investigation. The acute mortality observed in the OMW treatments may stem from the high phenolic content, as well as pH and salinity levels outside the worms' tolerance range. Nonetheless, earthworms generally tolerate slight deviations, and previous studies have shown that even toxic–rich sludges (e.g., certain sewage sludges) can support limited colonization at low blend ratios (Kızılkaya & Hepşen, 2014).

Losses at high BD rates likely reflect the physicochemical transformations undergone during anaerobic digestion. Overall, earthworms were negatively affected as the proportion of their natural bedding (CM) decreased across all alternative-residue treatments.

Acknowledgement:
This study was supported by the TUBITAK-1004 program under the umbrella project "TR.AQUA Food Supply Security Framework for Innovative and Sustainable Applications in Aquaculture". The project consists of 16 sub-projects with the aim of producing high technology, and our study is included in the project titled "From Organic Waste to Fish Feed" in this group. We would like to thank TUBITAK for the support it gave to our study. We would also like to thank Demirler Yağhane Çine, Aydın/Türkiye, for their contributions, who provided the olive millwastewater used as the experiment material for our study.

ABSTRACT

Apple, which is in the pome fruit group, is one of the most produced and consumed species in the world. Although Turkey is at the top in terms of production amount, due to the lack of standardization in terms of yield and quality, the rate in production amount is not reflected in apple exports. One of the factors that directly affects yield and quality is; pre-harvest fruit drop, which is the fruit falling from the tree before reaching ideal size and quality. It has been determined that pre-harvest fruit drop causes serious economic losses in many apple varieties, especially in commercial terms, in some years. It has been determined that the main factor causing fruit drop is the increase in the amount of ethylene in the plant, and pre-harvest drop can be reduced by using substances that inhibit ethylene biosynthesis. In order to reduce pre-harvest drop, many researchers use plant growth regulators such as SADH daminozide (Alar), 2.4 DP (dicloropene) 2.4.5-trichloropenoxypropionic acid (2.4.5-TP), especially AVG and NAA. In literature studies, the most commonly used one is AVG (aminoethoxyvinylycine). AVG is used commercially in apple orchards in many countries around the world to delay fruit ripening and improve harvest and storage quality by inhibiting ethylene biosynthesis in various plant tissues.

Keywords: Apple, pre-harvest drop, fruit drop

ELMA YETİŞTİRİCİLİĞİNDE ÖNEMLİ BİR SORUN: HASATÖNÜ MEYVE DÖKÜMLERİ

ÖZET

Yumuşak çekirdekli meyveler grubunda yer alan elma, dünya üzerinde en fazla üretimi ve tüketimi yapılan türlerden biridir. Türkiye üretim miktarı yönünden üst sıralarda yer almasına rağmen, verim ve kalite yönünden bir standardizasyon sağlanamaması nedeniyle, üretim miktarındaki oran, elma ihracatına yansımamaktadır. Verim ve kaliteyi doğrudan etkileyen faktörlerden biriside; meyvenin ideal büyüklük ve kaliteye ulaşmadan ağaç üzerinden düşmesi yani hasat önü meyve dökümüdür. Hasat önü meyve dökümlerinin bazı yıllarda özellikle ticari açıdan önemli olan birçok elma çeşidinde ciddi ekonomik kayıplara neden olduğu belirlenmiştir. Meyve dökümüne neden olan başlıca faktörün bitki bünyesindeki etilen miktarındaki artış olduğu, etilen biyosentezini engelleyen maddelerin kullanımı ile hasat önü dökümün azaltılabileceği belirlenmiştir. Birçok araştırıcı tarafından hasat önü dökümü azaltmak amacıyla; AVG ve NAA başta olmak üzere, SADH daminozide (Alar), 2,4 DP (dicloropen) 2,4,5-trikoropenoksipropionik asit (2,4,5-TP) gibi bitki büyüme düzenleyiciler kullanılmaktadır. Yapılan literatür çalışmalarında en çok AVG (aminoethoxyvinylycine)'nin kullanımına rastlanmıştır. AVG çeşitli bitki dokularında etilen biyosentezini inhibe ederek, meyve olgunlaşmasını geciktirmek, hasat ve depolama kalitesini iyileştirmek için dünyanın birçok ülkesinde elma bahçelerinde ticari olarak kullanılmaktadır.

Anahtar Kelimeler: Elma, hasatönü döküm, meyve dökümü

GİRİŞ

Yumuşak çekirdekli meyveler grubunda yer alan elma, dünya üzerinde en fazla üretimi yapılan türlerden biridir. Dünya gıda örgütüne göre, 2023 yılında dünyada yaklaşık 97.3 milyon ton elma üretilmiştir. Üretim sıralamasında Çin, 49.601.700 ton ile ilk sırada yer alırken, ABD 5.151.680 ton üretimi ile 2. sırada, Türkiye ise 4.602.517 ton ile 3. sırada yer almaktadır. (Anonymous, 2025). Ancak verim ve kalite yönünden bir standardizasyon sağlanamaması nedeniyle (Oğuz ve Karaçayır, 2009), üretim miktarındaki oran, elma ihracatına yansımamaktadır (Bashimov, 2016). Verim ve kaliteyi doğrudan etkileyen faktörlerden biriside; meyvenin ideal büyüklük ve kaliteye ulaşmadan ağaç üzerinden düşmesi yani hasat önü meyve dökümüdür (Wargo ve ark., 2004; Greene, 2006).

Elma yetiştiriciliğinde meyvenin renk ve irilik açısından istenen kaliteye ulaşmadan dökülmesi olayı hasat önü döküm olarak ifade edilmekte ve bu durum bazı yıllarda ve özellikle bazı çeşitlerde yüksek seviyelere ulaşarak ciddi ekonomik kayıplara neden olmaktadır (Greene ve ark., 1987). Yere düşen meyvelerin raf veya depo ömrü azalmaktadır. Hasat önü dökümü önlemek için bazı üreticiler meyveleri yeterli olgunluğa gelmeden toplamakta bu ise yine depolanma yeteneğini azaltmakta ve kalite kayıplarına neden olmaktadır. Elmada meyvenin ağaç üzerinde durduğu her hafta için ağırlığı % 5 ile 7 arasında artmaktadır (Byers ve Eno, 2002). Bu durumda elma yetiştiriciliğinde, kalite kayıplarını en aza indirerek, meyveyi ağaç üzerinde tutulabildiği kadar tutmak yetiştiricilere ciddi kazanç sağlayacaktır. Bu nedenle bahçede sulama, gübreleme, tarımsal mücadele, seyreltme gibi kültürel uygulamaları yerine getirmek bir zorunluluktur.

Sulama, gübreleme, seyreltme gibi kültürel önlemler yanında, ekoloji, kullanılan anaç ve çeşit, ağacın yaşı ve ürün yükü hasat önü dökümde etkili olan başlıca faktörlerdir (Wargo ve ark., 2004). Hasat önü dökümü azaltmak için öncelikle kültürel işlemlerin uygun şekilde ve zamanında yerine getirilmesi gereklidir. Ancak, ideal şartlarda yetiştirilse bile, her zaman hasat önü dökümün önüne geçilememektedir.

Hasat önü meyve dökümlerinin bazı yıllarda özellikle ticari açıdan önemli olan birçok elma çeşidinde ciddi ekonomik kayıplara neden olduğu belirlenmiştir (Yuan ve Carbaugh, 2007; Yuan and Li 2008). Meyve dökümüne neden olan başlıca faktörün bitki bünyesindeki etilen miktarındaki artış olduğu, etilen biyosentezini engelleyen maddelerin kullanımı ile hasat önü dökümün azaltılabileceği belirlenmiştir (Rath et al 2006). Birçok fizyolojik olayda olduğu gibi hasat önü dökümde de gelişme düzenleyicilerin belirleyici rolü olduğundan, ticari olarak farklı gelişme düzenleyiciler eskiden beri kullanılmaktadır. Bu amaçla, sentetik oksinlerden naftalin asetik asit (NAA) ve 2.4.5-TP, ile daminozid (Alar) meyveciliğin ileri olduğu ülkelerde, elma üreticileri tarafından kullanılmaktadır. Daminozidin kırmızı renk oluşumunu hızlandırdığı, meyve olgunlaşmasını yavaşlattığı ve dökümü geciktirdiği bildirilmiştir (Polland, 1974). Ancak, çevreye verdikleri bazı olumsuz etkilerden dolayı bugün daminozid ve 2,4,5-TP'nin hasat önü dökümde kullanımı birçok ülkede yasaklanmıştır. Bu ürünlerin yasaklanmasından sonra hasat önü dökümde kullanılacak gelişme düzenleyici olarak, NAA tek ürün olarak kalmıştır. NAA, genel olarak elmada meyve seyreltmesi ve hasat önü dökümü engellemek amacıyla kullanılmaktadır (Greene and Schupp, 2004). Bazı çalışmalarda NAA'nın bazı çeşitlerde hasat önü dökümü engellemede etkili olduğu ifade edilmiştir (Marini ve ark., 1993).

Ancak diğer taraftan NAA'nın meyve etinde yumuşamaya neden olduğu ve meyvenin hasattan sonra raf veya depo ömrünü azalttığı tespit edilmiştir (Yuan ve Carbaugh, 2007). Ayrıca gün geçtikçe yapılan çalışmalarda NAA'nın dökümü kontrol etmede yetersiz kaldığı, olgunluğu ilerlettiği ve meyve etinde yumuşaya neden olduğu belirlenmiştir (Greene, 2003; Yuan ve Carbaugh, 2007). Greene ve ark. (1987) ise dökümü kontrol etmede NAA kullanmanın her zaman iyi sonuç vermediğini ve bu kimyasaldan tutarlı sonuçlar alınmadığını vurgulamıştır.

1970'li yılların başında AVG, [{S}–trans–2-amino–4–(2–aminoetoksi)–3–butenoik asit hidroklorid], Hoffman LaRoche'daki bilim adamları tarafından keşfedilmiş rizobitoksin'nin etoksi anoloğudur (Boller ve ark., 1979). ilk olarak AVG'nin ticari üretimine, Maag Kimya şirketi tarafından başlanmıştır. Fakat yüksek maliyetinden dolayı üretimi devam etmemiştir. Daha sonraki aşamada Abbott Laboratuvarı tarafından araştırmalara yeniden hız verilmiştir (Clarke ve ark., 1996).

AVG, çeşitli bitki dokularında etilen biyosentezini inhibe ederek (Byers, 1997), meyve olgunlaşmasını geciktirmek, hasat ve depolama kalitesini iyileştirmek için dünyanın birçok ülkesinde elma bahçelerinde ticari olarak kullanılmaktadır (Phan-Thien et al 2004). AVG'nin hasat önü dökümün engellemesi ve olgunlaşmanın geciktirilmesindeki etkinliği yapılan çalışmalarla belgelenmiştir (Greene and Schupp, 2004; Schupp and Greene, 2004).

Son yıllarda yapılan pek çok çalışma sonucunda, doğal bir etilen engelleyici olarak görülen aminoethoksivinilglisin hidroklorid (AVG) hasat önü dökümü engelleme de NAA'ya alternatif olarak değerlendirilmiştir. Birçok araştırma sonucuna göre, AVG elmada etilen üretimini baskı altına alarak meyve olgunlaşmasını yavaşlatmakta ve dökümü geciktirmektedir (Schupp ve Greene, 2004; Greene, 2005; Yuan ve Carbaugh, 2007). Diğer taraftan AVG'nin bu etkisi kullanılan çeşide, uygulama zamanı ve dozuna bağlı olarak değişmektedir (Autio ve Bramlage, 1982). Schupp ve Greene (2004)'e göre uygulanan AVG konsantrasyonu arttıkça, döküm oranı azaldığını bildirmişlerdir. Ayrıca AVG'nin uygulama zamanının da önemli olduğu bildirilmekte, çeşit ve ekolojik koşullara bağlı olarak tahmini hasattan 4 veya 8 hafta önce uygulamanın iyi sonuç verdiği bildirilmektedir (Greene, 2002). AVG'nin döküm oranını kontrol etme yanında, NAA'nın aksine, meyve olgunlaşmasını da geciktirerek, et sertliğini muhafaza ettiği ve hasattan sonra raf ve depolama ömrünü artırdığı bildirilmektedir (Greene ve Schupp, 2004).

AVG ve amino oksi asetik asit (AOA) kofaktör olarak pridoksal fosfatı (PLP) kullanarak enzimleri engellemektedir (Taiz ve Zeiger, 2008). Autio ve Bramlage (1982) ise, bu mekanizma neticesinde meyvede olgunlaşmanın ve hasadın geciktirildiği, meyve eti sertliğinin arttırıldığı ve depo ömrünün uzatıldığını tespit etmiştir. Son yıllarda yapılan çalışmalarda, AVG'nin armut, vişne, kayısı, erik, nektarin ve şeftali gibi birçok meyve türünde, meyve eti sertliğinin muhafaza edilmesinde etkili olduğu; elmada ise bu etkisinin yanında, hasat önü dökümün azaltılmasında da başarılı sonuçlar verdiği bildirilmiştir (Williams, 1980; Amarante ve ark., 2002; Bregoli ve ark., 2002; Greene ve Schupp, 2004). Ayrıca AVG meyvelerde, meyve kopma direncini artırmakta, nişasta parçalanmasını ve çözünebilir şeker birikimini geciktirmekte, asitlik ve meyvelerin tatlanmasını sağlayan aromatik esterlerin oluşumunu azaltmaktadır (Autio ve Bramlage, 1982; Bregoli ve ark., 2002; Jobling ve ark., 2003; Silverman ve ark., 2004; Torrigiani ve ark., 2004).

AVG'nin etkisi meyve tür ve çeşidine, ağacın yaşına, anaca, uygulama zamanına, uygulama dozuna ve ekolojik koşullara bağlı olarak önemli değişiklikler göstermektedir (Greene ve Schupp, 2004). Bangerth (1978), AVG'nin elmada hasat önü döküm üzerine tam bir etki göstermesi için uygulamaların tek bir uygulama zamanında değil farklı uygulama rejimleri şeklinde yapılması gerektiğini bildirmektedir. Matoo ve ark. (1977)'ı AVG uygulamasını müteakiben meydana gelen yüksek sıcaklıkların, etilen salınımının engellenmesinde daha etkin rol oynadığını bildirmişlerdir.

AVG'nin etkisi çeşitlere göre değişmektedir. Chu (1998) AVG'nin nişasta parçalanmasını ve meyve eti sertliğinde meydana gelen kaybı geciktirdiğini, Greene (2000) yaptığı çalışmada meyve eti sertliğinin AVG uygulamasına ve çeşide bağlı olarak farklılık gösterdiğini tespit etmiştir. Lurie (2000) ise AVG uygulamaları ile meyve kabuğunda meydana gelen renk gelişiminin geciktirildiğini belirtmektedir.

Greene (2006), AVG'nin etkinliğinin artan uygulama dozlarına bağlı olarak doğrusal bir şekilde arttığını, AVG uygulamalarının ağacın her tarafını iyice kaplayacak şekilde yapılması gerektiğini, bunun için yayıcı yapıştırıcılar ile birlikte yapılan uygulamaların daha başarılı sonuçlar verdiğini bildirmiştir. Ayrıca uygulamaların rüzgarsız ve yağışsız bir zaman diliminde yapılması gerektiğini vurgulamıştır.

SONUÇ

Sonuç olarak meyve ağaçlarında üreticiler açısından önemli bir problem olan hasat önü dökümün azaltılmasına yönelik olarak yapılan birçok çalışmada, AVG'nin etkili bir madde olduğu ve hasat önü dökümden kaynaklanan kayıpları azaltmada önemli bir rol oynadığı, dozlarının, uygulama zamanının iyi belirlenerek kültürel önlemler ile birlikte kullanılabileceği görülmüştür. Ayrıca, AVG'nin diğer büyümeyi düzenleyici maddeler ile kombinasyonlar yapılması ile AVG'nin etkinliğinin ortaya çıkarılması sağlanacaktır.

ABSTRACT

Tree plantations offer a significant advantage in carbon fixation within ecosystems due to their perennial structure, especially when compared to herbaceous plants. Although fruit orchards have a shorter lifespan than forest ecosystems, they possess a higher carbon sequestration potential than annual crops. This potential can be further enhanced through sustainable agricultural strategies. Carbon sequestration is defined as the process of absorbing and storing carbon dioxide from the atmosphere, and fruit trees play a crucial role in this process. Through photosynthesis, they absorb atmospheric CO_2 and convert it into structural components such as cellulose, thereby reducing the accumulation of carbon dioxide in the atmosphere. However, the destruction and removal of fruit trees can lead to the release of the carbon they have accumulated over time back into the atmosphere, thereby increasing greenhouse gas emissions. In recent years, climate change has become increasingly evident, exposing many regions to challenges such as floods, droughts, and unpredictable weather events, which in turn have posed serious threats to food security. Fruit trees are of great importance in mitigating the effects of climate change and ensuring food security. To accurately assess the carbon balance in agricultural production, various practices such as cultivation techniques, soil tillage, and fertilizer use must also be taken into account. Agriculture not only supports human and animal nutrition, but also provides essential ecosystem services such as improving soil quality, preventing erosion, and producing high levels of biomass, making it a vital component in the fight against climate change.

Walnut orchards, olive groves, cherry orchards, vineyards, and other perennial fruit species can contribute to the development of renewable energy strategies due to their carbon retention capacity. Moreover, pruning residues generate a substantial amount of biomass, and incorporating these materials into the soil enhances carbon accumulation, thereby contributing positively to the ecosystem's carbon cycle.This process not only enhances the productivity of agricultural land but also requires the evaluation of environmental impacts such as water use, pesticide application, and energy consumption.

This study evaluates the impacts of fruit orchards on carbon emissions in light of existing literature.

MEYVE BAHÇELERİNİN KARBON SEKESTRASYONU VE SÜRDÜRÜLEBİLİR TARIMDAKİ ROLÜ

ÖZET

Ağaç plantasyonları, çok yıllık yapıları sayesinde otsu bitkilere kıyasla ekosistem içerisinde karbon fiksasyonu açısından önemli bir avantaj sunar. Meyve bahçeleri, orman ekosistemlerine kıyasla daha kısa bir ömre sahip olmalarına rağmen, otsu bitkilere oranla daha yüksek karbon fiksasyon potansiyeline sahiptir. Bu potansiyel, sürdürülebilir tarım stratejileriyle daha da artırılabilir. Karbon sekestrasyonu, atmosferdeki karbondioksitin emilerek biyokütlede veya toprakta depolaması süreci olarak tanımlanır. Meyve ağaçları, bu süreçte önemli bir oynar. Fotosentez yoluyla atmosferden CO_2'yi emerek bunu selüloz gibi yapısal bileşenlerine dönüştürürler. Bu durum atmosferdeki karbondioksit birikimini azaltır. Ancak meyve ağaçlarının tahribi ve kesilmesi, zamanla biriktirdikleri karbonun atmosfere geri salınmasına ve dolayısıyla sera gazı emisyonlarının artmasına neden olabilir. Son yıllarda giderek daha belirgin hale gelen iklim değişiklikleri; sel, kuraklık ve öngörülmeyen hava olayları gibi çevresel zorluklarla pek çok bölgeyi karşı karşıya bırakmış bu durum ise gıda güvenliğini ciddi şekilde tehdit etmiştir. Meyve ağaçları, iklim değişikliğinin etkilerinin azaltılmasında hem de gıda güvenliğinin sağlanmasında önemli bir rol üstlenmektedir. Tarımsal üretimde karbon dengesini doğru değerlendirilebilmesi için; yetiştirme teknikleri, toprak işleme ve gübre kullanımı gibi uygulamalar dikkate alınmalıdır. Tarım, yalnızca insan ve hayvan beslenmesini sağlamakla kalmaz; aynı zamanda toprak kalitesini iyileştirme, erozyonu önleme ve yüksek düzeyde biyokütle üretme gibi temel ekosistem hizmetlerini sunarak, iklim değişikliğiyle mücadelede hayati bir rol üstlenir. Ceviz bahçeleri, zeytinlikler, kiraz bahçeleri ve üzüm bağları gibi çok yıllık meyve türleri, karbonu tutma kapasitesi sayesinde yenilenebilir enerji stratejilerinin geliştirilmesine de katkı sunabilir. Ayrıca budama kalıntıları, önemli miktarda biyokütle üretir ve bu artıkların toprağa kazandırılması, toprakta karbon birikimini artırarak ekosistemin karbon döngüsüne olumlu katkı sağlar. Bu süreç, yalnızca tarımsal arazi verimliliğini yükseltmekle kalmaz; aynı zamanda su kaynaklarının kullanımı, pestisit uygulamaları ve enerji tüketimi gibi çevresel etkilerin de değerlendirilmesini gerektirir.

Bu çalışmada meyve bahçelerinin karbon emisyonları üzerine etkileri mevcut literatürler çerçevesinde değerlendirilmiştir.

Anahtar Kelimeler: Karbon Sekestrasyonu, Tarımsal Sürdürülebilirlik, Meyve Bahçeleri, Yenilenebilir Enerji

1. GİRİŞ

Karbon sekestrasyonu, atmosferdeki CO_2'nin bitkiler, bitki artıkları ve diğer organik bileşikler yoluyla toprağa aktarılması süreci olarak tanımlanır. Bu karbon, toprak organik maddesinin (humus) bir parçası olarak depolanır ve uzun süreli olarak tutulur. Toprakta karbon (C) sekestrasyonu, atmosferik CO_2'nin toprak örtüsü (pedosfer) tarafından tutularak depolanması ve uzun vadeli olarak güvenli biçimde muhafaza edilmesini ifade eder. Bu süreç, karbonun toprakta kalış süresini artırmayı ve yeniden atmosfere salınımını en aza indirmeyi hedeflemektedir. (Lal ve ark., 2015). Yaşam döngüsü değerlendirmesi (LCA), bir ürünün, süreç veya faaliyetin yaşam döngüsü boyunca enerji ve malzeme kullanımıyla ortaya çıkan atıklar ve emisyonların çevresel etkilerini nicel olarak analiz eden bir yöntemdir (ISO, 2006). Tarım sistemlerinde LCA uygulamaları, üretim süreçlerinin çevresel etkilerine yönelik artan farkındalıkla birlikte giderek yaygınlaşmaktadır. Bu etkiler arasında su tüketimi, biyolojik çeşitlilik kaybına yol açan arazi dönüşümleri, pestisit, herbisit ve fungisit kullanımı ile enerji tüketimi yer almaktadır. Karbon ayak izi, bir ürün ya da faaliyetin yaşam döngüsü boyunca neden olduğu sera gazı emisyonlarının hesaplanmasıdır ve çevresel sürdürülebilirliğin geliştirilmesinde önemli bir araçtır (EPLCA, 2007). Karbon ayak izi, LCA metodolojisi içerisinde önemli bir değerlendirme aracı olup, ürünlerin çevresel etkilerinin analizinde temel bileşenlerden biri olarak yer almaktadır. Birçok çalışma, bir ürünle doğrudan veya dolaylı ilişkili girdiler ve emisyonları analiz etmek amacıyla sistematik bir yaşam döngüsü değerlendirmesi (LCA) yaklaşımını benimsemiştir. Tarım ürünlerinin çevresel etkilerinin değerlendirilmesinde yaşam döngüsü değerlendirmesi (LCA) yönteminin uygulanması, çiftlik ölçeğinden yerel ve bölgesel düzeylere kadar uzanan önemli varyasyonlar nedeniyle karmaşık bir süreç olarak karşımıza çıkmaktadır. Bu bağlamda, özellikle doğal koşullar ve pazar dinamikleri açısından büyük çeşitlilik gösteren bölgelerde, farklı meyve üretim sistemlerinin çevresel performanslarının karşılaştırmalı olarak analiz edilmesi büyük önem taşımaktadır (Liu ve ark., 2010). Karbon ayak izi (CF) analizi bir ürünün yaşam döngüsü boyunca gerçekleşen doğrudan ve dolaylı sera gazı (GHG) emisyonlarını ölçmeye yönelik bir yöntemdir. Bu yöntem, ürünün tedarik süresince karşılaşılan çevresel açıdan kritik noktaların, sınırlamaların ve sorunların belirlenmesini sağlarken, karbon ayak izinin azaltılmasına yönelik stratejilerin geliştirilmesine imkân tanır (Wiedmann & Minx, 2007). Organik ürünlerin, geleneksel ürünlere kıyasla daha düşük fosil enerji kullanımı ve sera gazı (GHG) emisyonuna sahip olduğu, dolayısıyla ile küresel ısınmaya daha az katkı sağladığı kabul edilmektedir (Kaltsas ve ark., 2007). Organik ürünlerin daha düşük sera gazı emisyonu sağladığına dair bu görüş, farklı ürün türleri ve üretim koşullarında yapılan organik-konvansiyonel sistem karşılaştırmalarına dayanmaktadır. Ancak organik üretim standartlarının öngördüğü yöntemsel farklılıkların yanı sıra, topografya, çiftlik yönetimi, girdi temini, ürün verimliliği ve pazara erişim gibi etkenler de tarımsal üretim sistemlerinin çevresel performansını önemli ölçüde etkileyebilmektedir (Edwards-Jones ve ark., 2008). Bu çalışmanın amacı, meyve bahçelerinin karbon sekestrasyonuna olan katkılarını ortaya koymak ve bu sistemlerin iklim değişikliğiyle mücadele ile toprak kalitesinin artırılmasındaki potansiyelini mevcut literatür doğrultusunda değerlendirmektir.

2. MEYVE BAHÇELERİNİN KARBON SEKESTRASYONUNDAKİ ROLÜ

Meyve ağaçları, fotosentez yoluyla atmosferden CO_2'yi absorbe ederek hücresel yapılarında özellikle selülozda biriktirir. Bu şekilde atmosferdeki karbon birikiminin azaltılmasına önemli katkı sağlarlar. Ancak bu ağaçların kesilmesi veya yok edilmesi durumunda depolanan karbon yeniden atmosfere salınır ve bu durum sera gazı emisyonlarını artırabilir. Dünya genelinde sera gazı emisyonlarının yaklaşık %19–20'sinin, azot oksit kullanımı, yoğun toprak işleme ve arazi hazırlığı gibi tarımsal faaliyetlerden kaynaklanmaktadır. Bu nedenle, tarımsal uygulamaların çevresel etkileri büyük önem taşımaktadır (Rahman ve ark., 2021). Karbon sekestrasyonu, atmosferden CO_2 emilimini ile bu karbonun ağaçların gövde, dal, yaprak, kök ve topraktaki biyokütle bileşenlerinde depolanma sürecidir (Hurd ve ark., 2022). Bu süreç, ağacın yaşı, yaprak alanı ve fotosentez verimliliği gibi biyolojik özeliklerinin yanı sıra (Wang ve ark., 2023), ağaç türü, toprak tipi, iklim koşulları, arazi yapısı ve uygulanan tarımsal yönetim stratejilerine bağlı olarak değişkenlik gösterir (Vacek ve ark., 2023). Yapılan tahminlere göre, meyve ağaçları da dahil olmak üzere odunsu bitkiler yılda 0,42 ila 0,65 petagram karbonu atmosferden çekebilmektedir. Meyve ağaçlarının bu yönüyle atmosferik karbondioksit seviyelerinin düşürülmesine önemli ölçüde katkıda sağladığı bildirilmektedir (DiMatteo ve ark., 2023). Karbon depolama oranının, genellikle ağaçların gençlik dönemlerinde yüksek seviyededir ve ağaçlar maksimum büyüklüğe ulaştıkça bu oran azalma eğilimi gösterir (Harris & Betts, 2023). Bu nedenle tarımsal ormancılık uygulamaları, biyokütlede karbon tutulumunu destekleyici tüm meyve türlerini kapsamalıdır. Karbon sekestrasyonu ve iklim değişikliğiyle mücadele çabalarının yalnızca çevresel değil, politik ve ekonomik açılardan da sürdürülebilir olması; gıda ve beslenme güvenliğini sağlaması açısından ülkeleri çok yönlü meyve ağaçlarının kullanımına yönlendirmelidir (Gelaye & Getahun, 2024).

İran'da ceviz bahçelerinde yapılan bir çalışmada, enerji kullanım desenleri, enerji girdileri ve verim arasındaki ilişki analiz edilmiştir. Doğrudan ve yenilenebilir enerji girdilerinin üretim çıktıları üzerinde olumlu etkileri olduğu; özellikle ahır gübresi, insan iş gücü ve sulama suyunun verime katkı sağladığı belirlenmiştir. Bu bulgular, ceviz yetiştiriciliğinde organik girdilerin ve sürdürülebilir enerji kullanımının yaygınlaştırılmasıyla karbon ayak izinin azaltılabileceğini göstermektedir (Banaeian ve Zangeneh, 2011).

Zeytin yetiştiriciliğinde önerilen sürdürülebilir yönetim modeli, karbon sekestrasyonu açısından çevresel faydalar sağlamaktadır. Bu modelde kentsel atık suyun geri dönüştürülerek damla sulamada kullanılması, örtü bitkileri ile budama artıklarının geri dönüşümüne dayalı toprak yönetim uygulamaları benimsenmiştir. Güney İtalya'da sekiz yıl boyunca uygulanan bu yöntem hem toprakta hem de bitki biyokütlesinde karbon stoklarını arttırmış; geleneksel sistemlere kıyasla antropojenik sera gazı emisyonlarının azaltmıştır. Bu uygulamalar çevresel sürdürülebilirliğin yanında üreticilerin ekonomik gelirlerini artırarak tarımsal faaliyetlerin sürekliliğini desteklemiş ve arazi terkini azaltmıştır (Palese ve ark., 2013).

İspanya'da yapılan bir çalışmada, organik ve geleneksel tarım sistemlerinin sera gazı emisyon performansı yaşam döngüsü değerlendirmesi (LCA) ile karşılaştırmıştır. Alan bazında %56, ürün bazında %39 oranında sera gazı emisyonu azalması tespit edilmiştir. Bu azalmanın örtü bitkilerinin kullanımı ve budama artıklarının toprağa dâhil edilmesiyle sağlanan karbon

girdileri sayesinde toprakta gerçekleşen sekestrasyondan kaynaklandığını belirlenmiştir. (Aguilera ve ark., 2015).

İtalya'da yürütülen çalışmada zeytin yetiştiriciliği ve yağ üretim süreçlerinde karbon ayak izi yöntemi kullanılarak yaşam döngüsü analizi yapılmış, sera gazı emisyonları ayrıntılı şekilde değerlendirilmiştir. Emisyonlarının büyük ölçüde gübre ve pestisit uygulamalarından kaynaklandığını (3,34–7,74 kg CO_2-eq) ve ikinci en büyük katkının ise cam şişe kaynaklı ambalajlama sürecinden geldiğini (1,13–3,20 kg CO_2-eq) bildirmişlerdir (Pattara ve ark., 2016).

Russo ve ark. (2016), zeytin yetiştiriciliği için LCA ve Ürün Çevresel Ayak İzi (PEF) metodolojilerini kullanılarak yaptıkları çalışmada ülkeler arası önemli farklılıklar tespit etmişlerdir. Yunanistan'da, düşük dizel, elektrik ve su kullanımı çevresel etkiyi azaltırken düşük verim dezavantaj yaratmıştır. İtalya'da yüksek zeytin verimi birim ürün başına düşen sera gazı emisyonlarını azaltarak küresel ısınma etkisini hafifletmiş, ancak bu verim genellikle yüksek gübre kullanımıyla sağlandığı için çevresel etkileri artırmıştır. İspanya'da ise organo-fosforlu pestisitlerin yoğun kullanımı, özellikle ekotoksisite kategorisinde çevresel yükün artmasına neden olmuştur.

Yan ve ark. (2016), yaptıkları çalışmada, Çin'de beş farklı meyve türü (portakal, armut, elma, muz, şeftali) üzerinden meyve üretiminin karbon ayak izini değerlendirmiştir. Yaşam döngüsü analizine dayalı verililerle, hektar başına karbon ayak izi 2,9–12,8 t CO_2-eş/ha, ürün başına ise 0,07–0,7 kg CO_2-eş/kg olarak hesaplamıştır. Portakal ve armut ürün ve besin bazında en düşük karbon ayak izine sahipken, sentetik azot gübresinin tüm meyve türlerinde toplam sera gazı emisyonlarının %50'sinden fazlasına neden olduğunu bildirmişlerdir.

İtalya'da yürütülen bir araştırmada, altı farklı zeytinyağı üretim sisteminin çevresel etkileri LCA yöntemiyle incelenmiş ve 1 litre zeytinyağı üretiminin 0,22–3,39 kg CO_2 eşdeğeri emisyona neden olduğu belirlenmiştir. En düşük çevresel etki pestisit kullanılmayan organik üretim sistemlerinde gözlemlenmiş; toplam etkinin %60'ının ambalajdan kaynaklandığı saptanmıştır (Maffia ve ark., 2020).

İran'da, ceviz bahçelerinde yapılan başka bir analizde, enerji akışı ve emisyonlar değerlendirilmiş; enerjinin en büyük tüketicisinin %40 oranında benzin olduğu, gübre, sulama ve makine kullanımının da karbon ayak izini arttırdığı tespit edilmiştir. Toprak işleme ve pestisit uygulamalarının sera gazı emisyonlarına kayda değer katkı sağladığını belirtmişlerdir (Khanali ve ark., 2021).

İtalya'da konvansiyonel ve organik zeytin fidanlıklarının çevresel etkileri LCA yöntemi ile karşılaştırılmıştır. En büyük emisyon kaynaklarının plastik saksılar (%45-63) ve torf bazlı yetiştirme ortamı (%22-32) olduğu belirlenmiştir. Organik yönetim sistemi, toplam sera gazı emisyonlarını konvansiyonel sistemlere kıyasla %13 oranında azaltmış; karbon sekestrasyonu da dikkate alındığında bu azalma %15,7'ye ulaşmıştır. Ancak, organik sistemle yetiştirilen fidanların odunsu dokularında biriken karbon miktarının %6,7 oranında daha düşük olduğu gözlemlemişlerdir. Zeytin fidanlığı sektöründe organik üretime geçişin karbon ayak izini azaltma potansiyeline sahip olduğunu bildirmişlerdir (Lazzerini ve ark., 2022).

Certini ve ark. (2023), ceviz ağaçlarının düşük verimli alanlarda dahi yüksek karbon sekestrasyonu potansiyeline sahip olduğu ve bu potansiyelin, azot bağlayıcı türlerle birlikte

yetiştirildiğinde (*Alnus cordata*) daha da arttığını belirlenmiştir. Bu tür birlikteliklerin, cevizde erken büyümeyi teşvik ederek hem odun kalitesini hem de karbon depolama kapasitesini artırdığı ifade edilmiştir.

3. TOPRAK YÖNETİM UYGULAMALARI VE KARBON SEKESTRASYONU

Toprak organik maddesi (SOM), biyosferdeki en büyük karbon havuzlarından birini oluşturmaktadır. Küresel ölçekte yaklaşık 1400 petagram (Pg) olarak tahmin edilen bu miktar, atmosferdeki CO_2'nin yaklaşık iki katına karşılık gelmektedir. Toprak hem karbon hem de besin elementleri açısından önemli bir kaynak ve yutak olarak işlev görebilir. Tarımsal arazi kullanımında ve iklimde meydana gelen değişiklikler, toprakta depolanan karbon miktarında dalgalanmalara yol açarak, atmosfer ile toprak arasındaki CO_2 akışlarını etkileyebilir. Bununla birlikte, bazı tarımsal yönetim uygulamaları, toprakta net karbon sekestrasyonunu teşvik edebilir. (Falloone ve ark., 1998). Toprak organik karbon konsantrasyonu, toprak kalitesi, işlevselliği ve ekosistem hizmetlerinin belirlenmesinde kritik bir unsur olup, on yıllık ölçeklerde yenilenebilir bir kaynak niteliğindedir (Lal, 2021). Karbondioksit (CO2), küresel ısınmadan birincil olarak sorumludur ve atmosferik CO2 konsantrasyonundaki artış, nüfus artışı, endüstriyel genişleme ve ormansızlaşmanın birleşik etkisinden kaynaklanmaktadır (Ma ve ark., 2000). Maryo ve ark. (2023), son 250 yılda atmosferdeki CO_2 düzeyinin yaklaşık 280 ppm'den 412 ppm'nin üzerine çıktığını ve bunun küresel ısınmanın temel nedenlerinden biri olduğunu belirtmiştir. Bu bağlamda, iklim değişikliğiyle mücadele ve atmosferik karbonun azaltılması için toprak yönetimi stratejileri büyük önem taşımaktadır. Toprakta karbon tutulmasını artırmak amacıyla organik artıklar veya gübre yoluyla sağlanan karbon girdileri, toprağın dokusal özelliklerinden daha belirleyici bir rol oynamaktadır (Blanco-Canqui, 2013). Bu kapsamda öne çıkan yöntemlerden biri olan Koruyucu Tarım (CA), iklim değişikliğini hafifletmede önemli bir araç olarak öne çıkmaktadır ve iki temel mekanizma ile bu etkiyi sağlar. Topraktaki karbon dinamiklerini değiştirerek toprak karbon stoklarını artırmak ve toprağın mekanik olarak işlenmesini azaltarak karbon oksidasyon süreçlerini sınırlamak. Özellikle, İspanya'da, doğrudan ekim ve örtü bitkisi kombinasyonlarına dayalı koruyucu tarım sistemlerinin, önemli bir karbon yutağı potansiyeli taşıdığı bildirilmektedir. Ancak bu sistemlerin, iklim koşulları ve bitki desenine göre optimize edilmesi gereklidir. Nitekim karbon sekestrasyon oranlarının, monokültür yerine ürün rotasyonunun uygulandığı ve minimum toprak işleme uygulanan sistemlerde daha yüksek olduğu saptanmıştır (González-Sánchez ve ark., 2012). Toprak organik karbonunun 30–100 cm derinlikteki alt toprak katmanlarında birikimini sağlamak için kullanılan başlıca yöntemler, derin köklü bitki türlerinin yetiştirilmesi ve derinlere tünel açan toprak solucanlarının etkinliğinden yararlanılmasıdır. Toprak organik karbonu ile toprak agregasyon yeteneği, bitkilerin kullanabileceği su kapasitesi, besin maddelerinin tutulması, hacim ağırlığı ve porozite arasında pozitif bir ilişki bulunmaktadır. Bu nedenle, bozulmuş topraklardaki organik karbon stoklarının yeniden kazandırılması, küresel gıda güvenliğinin artırılması ve iklim değişikliğiyle mücadele açısından önemli bir stratejidir. Böylece çevresel sorunlara tarımsal temelli çözümler sunulması mümkün hale gelmektedir (Lal, 2021). Özellikle çok yıllık bitkilerin yer aldığı agroekosistemlerde, toprak ve bitki kaynaklı karbon tutulumuna özel önem verilmesi gerekmektedir. Akdeniz iklim koşullarında yapılan araştırmalar, organik tarım uygulamalarında kullanılan organik gübre kullanımının

daha düşük N_2O emisyonları ve daha yüksek toprak organik karbon (SOC) stokları ile ilişkili olduğunu göstermektedir (Aguilera ve ark., 2015). Diğer yandan, atmosferik karbonun azaltılması noktasında yalnızca toprak değil, bitki örtüsünün yapısı da önem arz etmektedir. Shiferaw ve ark. (2022), odunsu bitki türlerinin karbon stoğu ve biyokütle potansiyelinin, CO_2 emisyonları üzerindeki etkisine dikkat çekerek bu türlerin iklim değişikliği sürecindeki rollerinin kritik olduğunu vurgulamışlardır. Bu değerlendirme, odunsu bitkilerin atmosferik karbonu depolama kapasiteleri sayesinde sera gazı emisyonlarının azaltılmasına kayda değer katkılar sunduğunu göstermektedir.

4. SONUÇ

Dünya genelinde sera gazı emisyonlarının yaklaşık %19–20'si, azot oksit salınımı, yoğun toprak işleme ve arazi hazırlığı gibi tarımsal faaliyetlerden kaynaklanmaktadır. Bu çerçevede, konvansiyonel tarımdan organik tarıma geçiş, sera gazı (GHG) emisyonlarının ve enerji tüketiminin azaltılmasında etkili bir strateji olarak öne çıkmaktadır. Ayrıca, mekanik toprak işlemenin sınırlandırılması ile sulama suyu, pestisit ve gübre gibi tarımsal girdilerin daha verimli kullanımı, üretimin çevresel etkilerini azaltmada önemli katkılar sunmaktadır. Düşük karbonlu üretim ve tüketim politikalarının benimsenmesi ve uygun pazarlama mekanizmalarının geliştirilmesi; ürün besin değeri, üretici geliri ve iklim değişikliğiyle mücadele arasında denge kurulmasını sağlayarak meyve üretiminden kaynaklanan karbon emisyonlarının azaltılmasına katkıda bulunabilir. Meyve bahçelerinin, özellikle ceviz ve zeytin gibi çok yıllık türlerin hem biyokütlelerinde hem de toprakta önemli miktarda karbon depolama kapasitesine sahip olduğu gösterilmiştir. Organik üretim sistemleri ve sürdürülebilir bahçe yönetim modelleri (örneğin örtü bitkileri kullanımı, atıkların geri dönüşümü, damla sulama) bu kapasiteyi artırmakta ve net karbon sekestrasyonunu teşvik etmektedir. Nitekim İtalya, İspanya, İran ve Çin'de yapılan çeşitli yaşam döngüsü değerlendirmeleri; üretim sistemlerinin enerji girdisi, ambalajlama biçimi, pestisit ve gübre kullanımı gibi faktörlerle doğrudan ilişkili olarak karbon ayak izi üzerinde önemli etkilere sahip olduğunu ortaya koymuştur. Özellikle sentetik gübre kullanımı, meyve üretiminin birincil aşamasında oluşan toplam sera gazı emisyonlarının büyük bir kısmından sorumlu olduğundan, bu girdinin azaltılması sektördeki emisyonların düşürülmesi açısından kritik öneme sahiptir. Bitkisel üretime yönelik yaşam döngüsü değerlendirmesi (LCA), karbon ayak izi ve sera gazı emisyonlarının belirlenmesinde etkili bir analiz aracı olup, meyve üretiminin çevresel etkilerinin kapsamlı biçimde ortaya konulmasına olanak tanır. Bu yöntem aracılığıyla, bahçe yönetimi süreçlerinde alınacak kararlarla emisyon azaltımına yönelik sürdürülebilir iyileştirme stratejileri geliştirilebilir. Ayrıca ceviz gibi azot bağlayıcı türlerle birlikte yetiştirildiğinde karbon sekestrasyon kapasitesi daha da artırılabilmekte, böylece düşük verimli alanlarda bile iklim değişikliğiyle mücadeleye katkı sağlanabilmektedir. Tüm bu bulgular, meyve ağaçlarının sadece tarımsal üretim unsurları değil, aynı zamanda etkili birer karbon yutağı olarak da değerlendirilmesi gerektiğini ortaya koymaktadır.

ABSTRACT

Walnut (*Juglans regia.L*) thrives best in deep, well-aerated and fertile soils. In walnut cultivation, factors such as soil pH, texture (sand,silt and clay ratios), organic matter content, and permeability significant affect growth and yield. Walnuts can grow within a wide pH range; while a Ph between 5,5 and 8,5 is considered suitable, the optimal range is between 6,2 and 7,5 When the humus content falls bellow 2%, it negatively impacts growth and fruit production. Walnut trees cannot develop in waterlogged soils, and even short-term flooding can cause severe damage to their roots. In general, deep, well-drained soils with high productivitiy are considered essential for walnut plantations.

Geographic Information Systems (GIS) have long been a key tool for identifying alternative uses of agricultural land, applying precision agriculture techniques, evaluating crop productivity, and creating land suitability maps. Lands suitability analysis stands out as one of the most beneficial applications of GIS in spatial planning and management processes. These analyses utilize various datasets, including climate, soil an vegetation information.

This study utilized soil data obtained from the SoilGrids platform to create a suitability map for walnut cultivation in Kırşehir province. The SoilGrids data for Kırşehir were integrated into the ArcGıs Pro software. These data include soil properties at depths of 15-30 cm, 30-60 cm and 60-100 cm, covering factors such as pH, soil texture,and organic matter content. Using these data,maps of soil pH, organic matter content, and soil texture parameters were generated to assess the suitability of soils for walnut cultivation. The Analytic Hierarchy Process (AHP), a weighted overlay analysis method, was used to determine the suitabilitiy of different soil properties for walnut cultivation. This approach enabled a comprehensive evaluation of potential walnut cultivation areas in Kırşehir based on fundamental soil characteristics and provided insights for sustainable agricultural practices.

KIRŞEHİR'DE CEVİZ YETİŞTİRİCİLİĞİ İÇİN TOPRAK UYGUNLUK HARİTASI: SOİLGRİDS VERİLERİNE DAYALI AHP YÖNTEMİYLE DEĞERLENDİRME

ÖZET

Ceviz (*Juglans regia* L.) derin, iyi havalanmış ve verimli topraklarda en iyi şekilde gelişir. Ceviz yetiştiriciliğinde, toprağın pH değeri, tekstür (kum, silt, kil oranları), organik madde içeriği ve geçirgenliği gibi faktörler, büyüme ve verim üzerinde önemli bir etkiye sahiptir. Ceviz, geniş bir pH aralığında yetişebilir; pH değeri 5,5 ile 8,5 arasında uygun olup, optimum aralık 6,2 ile 7,5 arasında yer almaktadır. Humus içeriği %2'nin altına düştüğünde, büyüme ve meyve verme üzerinde olumsuz etkiler meydana gelir. Ceviz ağaçları, uzun süreli suya doygun topraklarda gelişemez ve kısa süreli su baskınları bile köklerine ciddi zarar verebilir. Genellikle yüksek verimliliğe sahip derin, iyi drenajlı topraklar ceviz plantasyonları için bir gereklilik olarak kabul edilir. Coğrafi Bilgi Sistemleri (CBS), uzun süredir tarım arazilerinin alternatif kullanım alanlarını belirleme, hassas tarım uygulamaları, ürün verimliliğini değerlendirilmesi ve arazi uygunluk haritalarını oluşturulmasında önemli bir araç olarak kullanılmaktadır. Arazi uygunluk analizi, CBS'nin mekânsal planlama ve yönetim süreçlerinde en faydalı uygulamalardan biri olarak öne çıkmaktadır. Bu analizlerde, iklim, toprak ve vejetasyon gibi çeşitli veri setlerinden yararlanılmaktadır.

Bu çalışma, Kırşehir ilindeki ceviz yetiştiriciliği için uygun toprak haritası oluşturmak amacıyla SoilGrids platformundan elde edilen toprak verilerini kullanmıştır. Çalışmada, Kırşehir iline ait SoilGrids verileri ArcGIS Pro programına entegre edilmiştir. SoilGrids verileri, 15-30 cm, 30-60 cm ve 60-100 cm derinliklerindeki toprak özelliklerine dair verileri içermektedir. Bu veriler arasında pH değeri, toprak tekstürü, organik madde içeriği faktörleri yer almaktadır. Bu veriler üzerinden, toprak pH'sı, organik madde içeriği ve toprak tekstürü parametreleri haritalanarak ceviz yetiştiriciliği için uygunluk haritası oluşturulmuştur. Ağırlıklı çakışma analizi yöntemi olan Analitik Hiyerarşi Süreci (AHP), farklı toprak özelliklerinin ceviz yetiştiriciliği için uygunluk derecesini belirlemek amacıyla kullanılmıştır. Bu yaklaşım, Kırşehir ilinde ceviz yetiştiriciliği için potansiyel alanlarının temel toprak özellikleri açısından kapsamlı bir şekilde değerlendirilmesini ve sürdürülebilir tarım uygulamaları için öngörüler sağlamıştır.

Anahtar Kelimeler: Kırşehir, Ceviz yetiştiriciliği, Toprak özellikleri, SoilGrids, Uygunluk haritası, AHP

1. GİRİŞ

Artan nüfusun gıda talebini karşılamak için tarımsal üretime duyulan ihtiyaç artarken, toprakların üretim potansiyeli giderek azalmaktadır. Araştırmalar, toprak erozyonu, aşırı toprak işleme ve kontrolsüz otlatma gibi etkenlerle dünya genelinde bitki örtüsüyle kaplı alanların %10'undan fazlasında ciddi verim kayıpları yaşandığını ortaya koymaktadır. Bu durum, sürdürülebilir toprak yönetimi uygulamalarının gerekliliğini ve toprak bozulmasının küresel gıda güvenliği üzerindeki olumsuz etkilerini açıkça göstermektedir (Lal, 1994; Teka ve Haftu, 2012). Arazinin en uygun şekilde kullanımı, bitki gereksinimleri ile toprak ve arazi özelliklerinin birlikte değerlendirilmesine bağlıdır. Bu nedenle, etkili arazi yönetimi uygulamalarının planlanmasında ayrıntılı mekânsal toprak verilerine ihtiyaç duyulmaktadır (Burrough, 1996; Teka ve Haftu, 2012).

Ceviz ağacı, yüksek verimli ve kaliteli toprak koşullarında ideal gelişimini gösterir. Bu nedenle, sağlıklı bir büyüme ve verimli üretim için ceviz bitkisinin besince zengin topraklara ihtiyacı vardır. Büyüme dönemi boyunca hem yeterli nem sağlayabilen hem de köklerin hava almasına olanak tanıyan toprak yapıları tercih edilmelidir. Köklerin etkili bir şekilde yayılabilmesi için toprak derinliğinin 90 ila 150 cm ya da daha fazla olması gerekir. Alt tabakada kum, çakıl, sıkışmış kil veya ana kaya gibi geçirimsiz katmanların bulunması kök gelişimini sınırlandırabilir. Fazla su tutan ve hava geçirmez topraklar, köklerin oksijen alımını engelleyerek hem kök büyümesini yavaşlatır hem de ağacın genel gelişimini olumsuz etkiler (Ponder, 2004). Ceviz, gelişmiş kök sistemi sayesinde toprak koruma projelerinde, erozyonla mücadelede ve tarımsal ormancılık faaliyetlerinde önemli bir rol oynar (Craioveanu, 2006). Toprak, sınıflandırma ve saha değerlendirmesinin ötesinde, oluşumu ve çevresel işlevleri açısından da kapsamlı bir şekilde ele alınmalı ve yorumlanmalıdır.

Topraklar, endüstriyel, kentsel ve tarımsal insan faaliyetleri sonucunda genellikle bozulmaya uğrar ve işlevlerinde azalma meydana gelir. Toprak bozulmasını önlemek ve bozulan toprakları rehabilite etmek için güvenilir toprak verileri, uygun arazi kullanım sistemleri ve etkili toprak yönetim uygulamaları kritik öneme sahiptir. Ayrıca, çevrenin daha iyi anlaşılması bu süreçlerin başarısı için temel bir gerekliliktir. Toprak tekstür sınıfları, birleşik parçacık boyutu dağılımlarını tanımlayan kategoriler olarak belirlenmiştir. Tekstür sınıflarına ek olarak, kil yüzdesine yönelik saha tahmini de sağlanmış olup, bu tahminler kil içeriğindeki değişimleri belirlemek ve analitik verilerle karşılaştırmak için kullanılmaktadır. Kil, silt ve kum yüzdeleri arasındaki temel ilişki dikkate alınarak, kum fraksiyonu; kumlar, tınlı kumlar ve kumlu tınlar olarak alt bölümlere ayrılmıştır. Bu sınıflandırma, çok iri, iri, orta, ince ve çok ince kum oranlarına göre yapılmaktadır (FAO, 2006).

Toprak tekstürü, toprak su tutma kapasitesini, suyun toprak içinde ve üzerinden hareket etme hızını ve köklerin topraktaki ilerleme kolaylığını etkiler. Toprak tekstürü, içerdiği kum, silt ve kil parçacıklarının oranına bağlıdır. Kumlu topraklar genellikle besin maddelerinden fakirdir ve aşırı drenajlıdır; ağır tekstürlü topraklar ise su hareketini ve kök gelişimini engelleyebilir. Tınlı topraklar, toprak parçacıkları arasındaki çeşitliliği sayesinde en iyi yapıya sahiptir; bu yapılar, suyun ve havanın geçişini kolaylaştıran büyük boşluklara sahip olur. Silt tınısına sahip ve alt tabakasında kil bulunan kireçli topraklar iyi dikim alanları olarak kabul edilebilir. Ancak, taşlı topraklar, tarım için uygun olmadığı için bu tür alanlardan kaçınılmalıdır. Siyah ceviz, besin

açısından talepkâr bir bitkidir ve toprak parçacıklarının boyutu, besin maddelerinin bulunabilirliğini etkiler. İnce dokulu topraklar, daha kaba topraklara kıyasla daha fazla besin sunar. Toprağın pH'ı, besin maddelerinin bulunabilirliğini düzenler. Toprağın üst 6 inçlik (yaklaşık 15 cm) katmanının pH'ı 6,5 ile 7,2 arasında olmalıdır.

Yüzey toprağının (A horizonu) yaklaşık %2,0- %3,5 organik madde içermesi ve yeterli besin maddesine sahip olması tavsiye edilir (Parker et al.,1992; USDA Forest Service, 2008). Toprak profili, kök sistemi gelişimini engelleyebilecek engellerden arınmış, en az 3 feet (yaklaşık 1 metre) derinlikte olmalıdır. Daha sığ topraklar, yeterli su tutma kapasitesine sahip olmayabilir ve bu durum tatmin edici ağaç büyümesini engeller. Aşırı drenajlı ya da kötü drenajlı topraklar, siyah ceviz yetiştiriciliği için uygun değildir. Bu tür topraklar, hava hareketini kısıtlar, kök büyümesini engeller ve ağaçların boyunu ve çapını sınırlar. Yüksek alanlardaki daha iyi ceviz yetiştirme alanları, genellikle kuzey ve doğuya bakan düşük eğimli yamaçlarda, vadilerde ve dar akarsular boyunca yer almaktadır. Güney yönüne bakan yamaçlar ve dar sırt tepeleri ise, toprakların genellikle kuru, sığ ve erozyona oldukça duyarlı olması nedeniyle ceviz yetiştirmek için uygun olmayan alanlardır. Potansiyel ceviz yetiştiricisi için, ceviz yetiştirmek amacıyla "iyi" ve "kötü" toprakların belirlenip harita üzerinde gösterilmesi büyük bir kolaylık sağlayacaktır. Illinois, güneydoğu Minnesota, Iowa ve Indiana gibi bölgelerde, topraklar siyah ceviz yetiştirmek için "uygun", "sınırlı" ve "uygunsuz" olarak sınıflandırılmıştır (Ponder et al., 1989; USDA Forest Service, 2008). İyi drene olabilen, derin ve üretken topraklar ceviz plantasyonları için temel gerekliliklerdendir. Toprak dokusu bakımından tınlı yapıda olması (kil <%35, silt %30-50, kum %30-50) uygundur. Ancak yağış miktarı arttıkça toprağın kil içeriğine olan tolerans azalır (Mohni ve ark., 2009). Toprak pH'ı konusunda geniş bir aralıkta gelişim gösterebilen ceviz, 5,5 ile 8,5 arası pH değerlerine uyum sağlayabilirken, ideal aralık 6,2 ile 7,5'tir. Toprak pH'ı alkali düzeylere çıktığında kalsiyum ve sodyum birikimi, asidik düzeylerde ise manganez artışı görülebilir. Topraktaki humus oranı %2'nin altına düştüğünde, ceviz ağaçlarında hem büyüme hem de verim üzerinde olumsuz etkiler ortaya çıkar (Strugstad ve Despotovski, 2012; Popa ve ark., 2023). Ayrıca, ceviz ağaçları çinko ve bor eksikliklerine duyarlıdır; bu nedenle dikim öncesi toprak analizleri yapılarak özellikle çinko düzeyleri kontrol edilmelidir. En uygun gelişim için, kireç bakımından zengin, humus içeriği yüksek, derin, gevşek yapılı tınlı veya killi-tınlı topraklar tercih edilmelidir. Köklerin 3 ila 4 metreye kadar ulaşabilmesi için, alt toprak tabakalarının geçirgen olması, yoğun kil, taşlı yapı veya su tutan katmanlar içermemesi önemlidir. Çünkü ceviz ağaçları uzun süreli toprak su doygunluğuna karşı duyarlıdır ve kısa süreli su baskınları bile kök sistemine zarar vererek ağacın gelişimini durdurabilir (Ahmad ve ark., 2018).

Coğrafi Bilgi Sistemleri (CBS) destekli Çok Kriterli Karar Analizi (ÇKKA), son dönemlerde özellikle arazi uygunluğunun değerlendirilmesi ve toprakların bozulmasının önüne geçilmesine yönelik tarımsal planlamalarda önemli bir araç olarak öne çıkmaktadır (Akpoti ve ark., 2019; Tashayo ve ark., 2020a). Bu yöntem, birden çok kriter ve amaca dayalı olarak karar olasılıklarını analiz eder. ÇKKA kapsamında kriterlere verilecek ağırlıkların belirlenmesinde çeşitli yöntemler kullanılabilmektedir. Bu yöntemler arasında Analitik Hiyerarşi Süreci (AHS), farklı ve çok sayıda faktörü aynı anda değerlendirebilme kapasitesi sayesinde oldukça etkili bir teknik olarak kabul görmektedir. AHS, karar verme sürecinde kriterlerin önem düzeylerini hiyerarşik bir yapı aracılığıyla belirler (Zhang ve ark., 2015; Mardani ve ark., 2016; Bilgilioğlu

ve ark., 2021). Bu yöntem, kriterler arasında ikili karşılaştırmalar yapılmasını sağlayarak süreci sadeleştirir ve değerlendirmelerin tutarlılığı, tutarlılık oranı (index) kullanılarak doğrulanır (Akıncı ve ark., 2013; Mondal ve ark., 2019).

SoilGrids, 250 metrelik mekânsal çözünürlüğe sahip hücre boyutlarıyla, makine öğrenme yöntemleri kullanarak dünya çapında toprak özelliklerine ait haritalar üretmektedir. Dünya genelinde yaklaşık 240.000 lokasyondan elde edilen toprak gözlemlerini; bitki örtüsü, arazi morfolojisi, iklim, jeoloji ve hidroloji gibi özellikleri tanımlayan 400'den fazla küresel çevresel yardımcı değişkenle birlikte analiz ederek toprak özelliklerini modellemektedir (Poggio ve ark.,2021). Çalışmamızda SoilGrids, verileri ve ArcGIS Pro 3.2 yazılımı ile Kırşehir ilinde ceviz yetiştiriciliği için toprak uygunluk haritalarının oluşturulması amaçlanmıştır.

2. MATERYAL ve YÖNTEM

Bu çalışmada, toprak özelliklerinin ceviz yetiştiriciliği açısından uygunluğunu belirlemek amacıyla Analitik Hiyerarşi Süreci (AHS/AHP) yöntemi kullanılmıştır. Değerlendirme kriterleri olarak organik madde, kum, silt, kil ve pH parametreleri seçilmiştir. Bu kriterler, toprakların fiziksel ve kimyasal özelliklerini temsil etmekte olup, her biri ceviz yetiştiriciliği üzerinde önemli etkiye sahiptir. AHP yöntemiyle kriterlerin göreceli önem derecelerini belirlemek amacıyla 1–9 ölçeğinde ikili karşılaştırma matrisi oluşturulmuştur. Oluşturulan 5×5 boyutundaki karşılaştırma matrisi, kriterlerin birbirlerine göre ne derece önemli olduğunu yansıtmaktadır.

Bu ağırlıklar, ArcGIS Pro 3.2 yazılımında toprak uygunluk haritalarının oluşturulmasında kullanılmıştır. Her toprak verisi katmanı (kil, silt, kum, pH ve organik madde), SoilGrids platformundan 15–30 cm, 30–60 cm ve 60–100 cm derinliklerden elde edilmiştir (ISRIC – World Soil Information, 2023). Katmanlar sınıflandırılmış ve uygunluk skorları belirlenmiştir. Ardından, bu katmanlar Weighted Overlay (Ağırlıklı Bindirme) analizine dahil edilerek birleşik toprak uygunluk haritası oluşturulmuştur.

Tablo 1. İkili Karşılaştırma Yönteminden Kullanılan 1-9 Skalası (Saaty, 2008)

1	Her iki faktör eşit öneme sahip
3	Biraz daha fazla önemli
5	Kuvvetli derecede önemli
7	Çok kuvvetli derecede önemli
9	Aşırı önemli
2,4,6,8,	Ara ortalama değer

Analitik Hiyerarşi Süreci (AHS) Yöntemi ve Uygulama Aşamaları

Analitik Hiyerarşi Süreci (AHS/AHP), belirsizlik ortamında karar verme süreçlerini sistematik hale getiren hem nitel hem de nicel verilerin birlikte değerlendirilebildiği çok kriterli karar

verme (ÇKDV) yöntemlerinden biridir. Saaty (1980), tarafından geliştirilen bu yöntem, karar vericilerin bilgi, deneyim ve sezgilerini karar sürecine entegre etmelerine olanak tanıması açısından önemlidir. AHS, karmaşık karar problemlerini daha sade ve anlaşılır bir yapıya kavuştururken, karar vericinin problem üzerindeki kontrolünü ve farkındalığını artırır. Yöntem, özellikle birden fazla kriterin ve alternatifin değerlendirilmesini gerektiren durumlarda hem bireysel hem de grup kararları için uygulanabilir ve güvenilir sonuçlar sunar. Analitik Hiyerarşi yöntemi temel olarak üç ana aşamadan oluşmaktadır (Wind & Saaty, 1980), İlk adımda, karar problemini oluşturan hedef, kriterler, alt kriterler ve alternatifler hiyerarşik bir yapıya dönüştürülür. Bu yapı, problemin temel unsurlarının sistematik bir şekilde modellenmesini sağlar. İkili Karşılaştırma Matrisi ve Ağırlıkların Belirlenmesi: İkinci aşamada, hiyerarşide yer alan kriterler ve alt kriterler kendi aralarında ikili olarak karşılaştırılır. Bu karşılaştırmalar, karar vericinin her bir unsurun göreli önemine ilişkin algısını yansıtır. Saaty'nin önerdiği ölçek kullanılarak oluşturulan karşılaştırma matrisi yardımıyla kriterlerin ağırlıkları hesaplanır. Son aşamada, ikili karşılaştırma matrisinden elde edilen verilerin tutarlılığı, tutarlılık oranı (Consistency Ratio- CR) hesaplanarak değerlendirilir.

CR değeri %10'un altındaysa tutarlılık kabul edilebilir düzeydedir. Bu koşul sağlandığında, alternatifler belirlenen kriter ağırlıklarına göre değerlendirilir ve en uygun alternatif, en yüksek öncelik değerine sahip olan olarak belirlenir. AHS'nin sunduğu sistematik yapı sayesinde, karmaşık karar verme süreçleri daha şeffaf ve rasyonel bir şekilde yönetilebilmekte, böylece karar vericilerin daha güvenilir sonuçlara ulaşmaları mümkün hale gelmektedir (Ömürbek ve Şimşek ,2014).

Çalışmamızda oluşturulan karşılaştırma matrisinin tutarlılığı değerlendirilmiştir. CR değerinin 0.10'dan küçük olması, karşılaştırma matrisinin tutarlı olduğunu göstermektedir. Bu amaçla tutarlılık oranı (CR) hesaplanmış ve 0 olarak bulunmuştur, matris tam tutarlıdır. Bu matris aşağıda sunulmuştur;

Tablo 1. AHP İkili Karşılaştırma Matrisi

Kriter	OM	PH	Kil	Kum	Silt
OM	1	9/8	9/4	9/3	9/2
PH	8/9	1	8/4	8/3	8/2
Kil	4/9	4/8	1	4/3	4/2
Kum	3/9	3/8	3/4	1	3/2
Silt	2/9	2/8	2/4	2/3	1

Matris normalleştirilerek her kriter için ağırlık vektörü hesaplanmıştır. Elde edilen ağırlıklar şu şekildedir;

Tablo 2. Toprak Değerlendirme Kriterleri ve AHP Karşılaştırma Matrisi

Toprak Değerlendirme Kriterleri	Kriter Ağırlıkları
Organik Madde (OM)	%34,6
PH	%30,8
Kil	%15,4
Silt	%11,5
Kum	%7,7

Tablo 3. Toprak Parametreleri Optimum aralık ve Riskli aralık

Parametre	Optimum Aralık	Riskli aralık
OM	%2-3,5	<1,5
PH	6,2-7,5	<5,0- >8,2
KUM	30-50 (%)	>50 (%) Aşırı geçirgen
KİL	<35 (%)	>35 (%) Kompakt
SİLT	30-50 (%)	>50 (%) Erozyon Riski

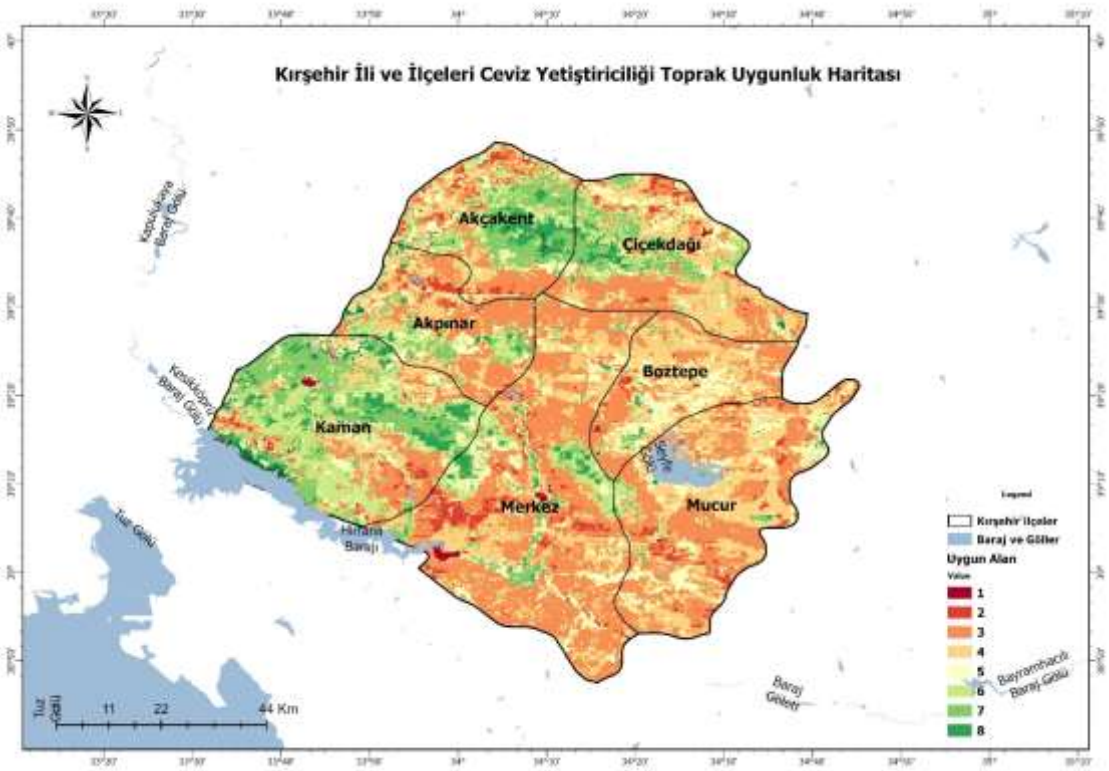
Şekil 10. pH Oranına Göre Toprak Uygunluk Sınıflandırması



Şekil 11. Kırşehir İli Ceviz Yetiştiriciliği İçin Toprak Uygunluk Haritası

Bu harita, SoilGrids verilerine dayalı toprak parametrelerinin AHP yöntemiyle değerlendirilmesi sonucu oluşturulmuş toprak uygunluk haritasıdır. Renk skalası üzerinden ceviz yetiştiriciliği açısından toprakların uygunluk düzeyleri 1 (en düşük) ile 8 (en yüksek) arasında derecelendirilmiştir. Ceviz yetiştiriciliği açısından farklı toprak katmanlarında değerlendirilen fiziksel ve kimyasal özelliklerin bütüncül bir yaklaşımla mekânsal olarak yorumlanmasını sağlamıştır. Elde edilen sonuçlara göre, belirli bölgelerdeki toprakların ceviz yetiştiriciliği açısından yüksek düzeyde uygun olduğu görülmüştür. Bu alanlar, optimum pH aralığına, yeterli organik madde içeriğine ve uygun doku yapısına sahip toprakları içermektedir. Kaman ilçesi, en yüksek uygunluk değerlerine sahip alanların büyük bölümünü barındırmaktadır. Bu, bölgenin ceviz yetiştiriciliği açısından en elverişli yerlerden biri olduğunu ortaya koymaktadır. Seyfe Gölü çevresi hem su varlığı hem de toprak yapısı açısından bazı avantajlara sahip olmasına rağmen, uygunluk düzeyinin düşük olduğu (turuncu-kırmızı alanlar) görülmektedir. Bu da muhtemelen tuzluluk veya yüksek pH gibi sorunlara işaret etmektedir.

3. BULGULAR ve TARTIŞMA

Bu çalışmada, SoilGrids veri tabanından elde edilen toprak özellikleri değerlendirilerek, ceviz yetiştiriciliği açısından uygunluk aralıkları belirlenmiştir. SoilGrids, 250 metrelik mekânsal çözünürlüğe sahip hücre boyutlarıyla, makine öğrenme yöntemleri kullanarak dünya çapında toprak özelliklerine ait haritalar üretmektedir Belirlenen toprak parametreleri, Analitik Hiyerarşi Süreci (AHS/AHP) yöntemi kullanılarak ikili karşılaştırmalarla ağırlıklandırılmıştır. Her bir kriterin göreli önemi, uzman görüşleri ve literatür verileri doğrultusunda sayısal olarak ifade edilmiştir. Ağırlıklandırılmış kriterler, ArcGIS Pro 3.2 yazılımı aracılığıyla CBS (Coğrafi Bilgi Sistemleri) tabanlı "Weighted Overlay" analizi ile mekânsal olarak bütünleştirilmiş ve ceviz yetiştiriciliği açısından uygunluk düzeylerini gösteren tematik haritalar oluşturulmuştur. Bu analiz, farklı çevresel faktörlerin bir arada değerlendirilmesini sağlayarak potansiyel üretim alanlarının mekânsal dağılımını ortaya konulmuştur. Yön ve Sönmez'in (2021), Burdur bölgesinde gerçekleştirdikleri çalışmada, ceviz yetiştirilen toprakların pH değerlerinin 0–30 cm derinlikte 6,58–7,59; 30–60 cm derinlikte ise 6,84–7,64 arasında değiştiği belirlenmiştir. Araştırmada, toprak örneklerinin organik madde bakımından düşük humuslu, fosfor açısından yetersiz ve alınabilir demir (Fe) ile çinko (Zn) içerikleri yönünden de eksik olduğu ifade edilmiştir. Toprakların büyük çoğunluğunun (%80'den fazlası) yüksek oranda kireç içerdiği, bu nedenle özellikle demir, çinko ve kısmen de fosfor gibi besin maddelerinin yeterli düzeyde bulunmadığı vurgulanmıştır. Bruning ve ark. (2021), gerçekleştirdiği saha gözlemlerinde, bazı ceviz bahçelerinde ağaçların kuraklık belirtileri gösterdiği, bu durumun olası bir tuzluluk problemiyle ilişkili olup olmadığının araştırıldığı bildirilmiştir. Ölçümlerde, üst toprakta pH değeri 8,3; alt toprakta ise 8,5 olarak saptanmış, bu yüksek pH seviyelerinin bazı mikro besin elementlerinin alımını zorlaştırarak besin eksikliklerine neden olabileceği ifade edilmiştir. Çalışmamızda en uygun pH aralığı olan 6,2-7,5 parametresi belirlenmiş analizler bu parametreye göre yapılmıştır. Son olarak, Yan ve arkadaşları (2024), Tibet'in Gyaca bölgesinde gerçekleştirdikleri araştırmada farklı toprak ana materyalleri ve toprak tiplerinin ceviz verimi üzerindeki etkilerini incelemişlerdir. Özellikle 0–20 cm derinliğindeki üst toprak katmanında, organik madde içeriği, toplam azot miktarı, mikrobiyal biyokütle (MBC), fosfor ve diğer besin

elementlerinin seviyelerinin yüksek olduğu ve bu unsurların ceviz verimini doğrudan etkileyen önemli faktörler olduğu sonucuna varılmıştır. Ayrıca, bu besin elementlerinin ve mikrobiyal aktivitenin yüksekliğinin toprak yönetimi ve gübreleme stratejilerinin verimlilik üzerindeki önemini ortaya koyduğu belirtilmiştir. Çalışmada, ceviz bahçesi topraklarının pH seviyesinin 7,0'ın üzerinde olduğu ve bu durumun plato tipi ceviz çeşitleri için uygun olan hafif alkali bir ortam sağladığı sonucuna ulaşılmıştır. Çalışmamızda, SoilGrids veri tabanından elde edilen toprak özellikleri kullanılarak 15–30 cm, 30–60 cm ve 60–100 cm derinlik aralıklarında analizler gerçekleştirilmiştir. Bu derinlik katmanlarında toprak pH'ı, kil oranı, organik madde gibi önemli toprak parametreleri değerlendirilmiştir. Her bir parametre için ceviz yetiştiriciliğine uygunluk aralıkları tanımlanmış ve bu uygunluk düzeylerine göre mekânsal analizler yapılmıştır. Parametre bazlı uygunluk analizlerinin ardından, toprak verilerine dayalı genel bir toprak uygunluk haritası oluşturulmuştur.

4. SONUÇ

Ceviz yetiştiriciliği açısından farklı toprak katmanlarında değerlendirilen fiziksel ve kimyasal özelliklerin bütüncül bir yaklaşımla mekânsal olarak yorumlanmasını sağlamıştır. Elde edilen sonuçlara göre, belirli bölgelerdeki toprakların ceviz yetiştiriciliği açısından yüksek düzeyde uygun olduğu görülmüştür. Bu alanlar, optimum pH aralığına, yeterli organik madde içeriğine ve uygun doku yapısına sahip toprakları içermektedir. Kaman ilçesi, en yüksek uygunluk değerlerine sahip alanların büyük bölümünü barındırmaktadır. Bu, bölgenin ceviz yetiştiriciliği açısından en elverişli yerlerden biri olduğunu ortaya koymaktadır. Seyfe Gölü çevresi hem su varlığı hem de toprak yapısı açısından bazı avantajlara sahip olmasına rağmen, uygunluk düzeyinin düşük olduğu (turuncu-kırmızı alanlar) görülmektedir. Bu da muhtemelen tuzluluk veya yüksek pH gibi sorunlara işaret etmektedir. Elde edilen bu toprak uygunluk haritası, ceviz yetiştiriciliği için yatırım planlamasında, arazi kullanım kararlarında ve sürdürülebilir üretim alanlarının seçilmesinde rehber niteliği taşımaktadır. Sonuç olarak, çalışmada kullanılan CBS tabanlı analiz yöntemleri, bölgesel düzeyde ceviz yetiştiriciliği için uygun alanların belirlenmesine katkı sağlamış ve tarımsal planlamaya yönelik önemli bir zemin oluşturmuştur. Bu yöntem, sadece ceviz değil, diğer tarım ürünleri için de benzer şekilde uygulanabilirliği olan sürdürülebilir bir analiz yaklaşımı sunmaktadır.

ABSTRACT

Walnut (*Junglans* sp.), which is valued for both its fruits and timber, is one of the most important hard-shelled fruit species that grows in many regions around the world and has also become widespread in Anatolia. It is widely produced in North and South America, Asia and to a limited extent in North Africa, Australia and New Zealand. Its fruits being rich in oil and protein are important features that are increasing its consumption in the world. Following the USA, China and Iran, Turkey is the country that produces more than half of the walnuts in the world.

Walnut, which is an allogamous plant, is a species that is very difficult or impossible to propagate by cutting or dipping. It is propagated by grafting classically. In terms of obtaining production material in walnut cultivation, this method creates obstacles both because it is time consuming and because of serious labor costs. In addition, the fact that plants grafted onto rootstocks propagated by seeds form large trees causes difficulties in terms of cultural practices. Also, micropropagation is the most important starting point in terms of the widespread use of clonal rootstock production. In order to overcome these problems, micropropagation in *in vitro* conditions is becoming increasingly important in walnut cultivation. Micropropagation in walnut was initially done to overcome the difficulties encountered in rooting methods in traditional production of these species. With this production method, it is possible to obtain many identical seedlings from a single bud. Grafting labor can be eliminated and time and labor can be saved. In addition, the use of clonal rootstocks, which should be widespread in nursery farming as soon as possible, will also increase. Micropropagation is quite valuable in terms of providing easy reproduction of rootstocks, providing pest-free plant material, and providing mass production opportunities and providing phenotypic and genotypic similarities in the produced plants. Although the success of micropropagation depends on many internal and external factors, adventitious root formation is the most important stage. Phytohormones and plant growth regulators have significant effects on adventitious root formation of plant species. The main problems in *in vitro studies*; problems such as microbial contamination, phenolic release and adaptation of explants to tissue culture conditions. These factors cause the loss of explants and thus prevent successful *in vitro* formation.

This evaluation study aimed to summarize the studies conducted in micropropagation of both varieties and rootstocks of walnut *in vitro* conditions and the current situation.

CEVİZİN *in vitro*'DA MİKRO ÇOĞALTILMASI İLE İLGİLİ DEĞERLENDİRMELER

ÖZET

Hem meyveleri hem de kerestesi için değerlendirilen ceviz (*Junglans* sp.) dünya üzerinde birçok bölgede yetişen, Anadolu coğrafyasında da yaygınlaşmış olan en önemli sert kabuklu meyve türlerinden birisidir. Dünyada yaygın bir şekilde Kuzey ve Güney Amerika, Asya'da sınırlı olarak ta Kuzey Afrika, Avustralya ve Yeni Zellanda'da üretimi yapılmaktadır. Meyvelerinin zengin yağ ve protein kaynağı olması dünyada tüketimini giderek artıran önemli özelliklerindendir. ABD, Çin ve İran'ın ardından Türkiye dünya üzerinde ceviz üretiminin yarıdan fazlasını gerçekleştiren ülkelerdir.

Allogam bir bitki olan ceviz, çelik veya daldırma ile çoğaltılması çok güç ya da imkânsız olan bir türdür. Klasik olarak aşı ile çoğaltılmaktadır. Ceviz yetiştiriciliğinde üretim materyalinin elde edilmesi açısından bu metot, hem zaman alması hem de ciddi işçilik maliyetleri nedeniyle engeller oluşturmaktadır. Ayrıca tohumla çoğaltılan anaçlar üzerine aşılanan bitkilerin büyük ağaçlar oluşturması, kültürel uygulamalar açısından zorluklara neden olmaktadır. Bunun yanında klonal anaç üretiminin de yaygınlaşması açısından mikroçoğaltım en önemli çıkış noktasıdır. Bu problemleri aşabilmek için ceviz yetiştiriciliğinde *in vitro* koşullarda mikro çoğaltım giderek daha fazla önem kazanmaktadır. Cevizde mikro üretim başlangıçta bu türlerde geleneksel üretimde köklendirme metotlarında karşı karşıya kalınan güçlükleri yenmek için yapılmıştır. Bu üretim şekli ile bir tomurcuktan çok sayıda birbirinin aynı, adına doğru fidan elde etmek mümkün olmaktadır. Aşı işçiliği ortadan kalkarak zamandan ve işçilikten tasarruf sağlanabilir. Ayrıca, bir an önce fidancılıkta yaygınlaşması gereken klonal anaçların bu sayede fidancılıkta kullanımı da artacaktır. Mikroçoğaltım, anaçların kolayca çoğaltılmasını sağlayan, zararlılardan ari bitkisel materyal sağlamakla birlikte kitlesel üretim imkânı sunması ve üretilen bitkilerde fenotipik ve genotipik benzerlikler sağlaması açısından oldukça değerlidir. Mikroçoğaltımın başarısı çok sayıda içsel ve dışsal faktörlere bağlı olsa da adventif kök oluşumu en önemli aşamadır. Fitohormonlar ve bitki büyüme düzenleyicileri, bitki türlerinin adventif kök oluşumu üzerinde önemli etkilere sahiptir. *In vitro* çalışmalarındaki başlıca sorunlar; mikrobiyal kontaminasyonlar, fenolik salınımı ve eksplantların doku kültürü koşullarına adaptasyonu gibi problemlerdir. Bu faktörler, eksplantların kaybedilmesine dolayısıyla başarılı bir *in vitro* oluşumunun engellenmesine neden olmaktadır.

Bu değerlendirme çalışması; *in vitro* koşullarda cevizin hem çeşit hem de anaçlarının mikroçoğaltımında yapılan çalışmaları ve mevcut durumu özetlemeyi amaçlamıştır.

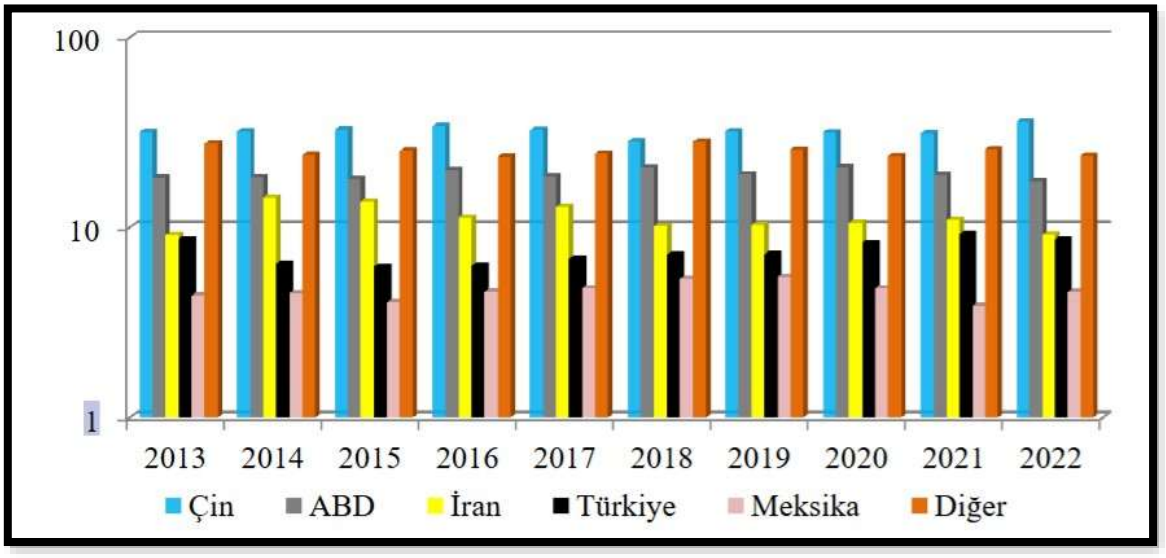
Anahtar Kelimeler: *Juglans regia* L., Mikroçoğaltım, Eksplant, Ortam

1.GİRİŞ

Ceviz Juglandales takımının, Juglandaceae familyasında *Juglans* cinsi içerisinde sert kabuklu meyvelerindendir (Şen, 2011). *Juglans* cinsine ait 22 tür olup, diploid yapılı *Juglans* türlerinin kromozom sayısı 2n=32' dir. Ceviz türleri arasında en çok yetiştirilen *Juglans regia* L.'dir (Akça,2014). Ceviz sert kabuklu meyve yapısına sahip olup, yeşil kabuk ve iç cevizden oluşmaktadır. İç ceviz ise embriyodan meydana gelir. Tohumda endosperm bulunmadığından yedek besin kotiledon içerisinde birikmektedir (Esen, 2013). Genç dal yapısı pürüzsüz, ilerleyen yıllarda gövdede çatlaklar meydana gelir ve kabuk rengi gri ya da siyahımsı renk alır. Ceviz ağacı için gerekli koşullar sağlandığında boyları 25m'ye kadar ulaşabilir. Büyük yuvarlak taç yapısının olmasının yanında taç özelliği çeşitlerine göre farklılık göstermektedir (Şen, 1986).

Ceviz, meyve ve çerezlik şeklinde yaygın olarak tüketilen ve besin içeriği bakımından zengin bir beslenme içeriği sunar. Vücudun günlük ihtiyacı olduğu birçok besin elementini barındırır. Yüksek oranda yağ (%65 civarında) ve protein (%15 civarında) içeriğine sahip oldukları bilinmektedir (Yiğit ve ark. 2005). Türkiye'de ve dünyada ceviz ihtiyacının artmasıyla yetiştiricilik, üretim miktarı ve niteliği de artmaktadır.

Tablo 1. Dünya ceviz üretim miktarında ülkelerin payı (%) (Tarım ve Orman Bakanlığı 2024)



Tablo 1 de Çin birinci sırada yer alırken hemen arkasından ABD gelmektedir.

Tablo 2. Türkiye'de ceviz üretim alanı ve üretim miktarı (TÜİK, 2024)

Yıllar	Üretim alanı (da)	Üretim (t)
2013	639.000	212.000
2014	694.000	181.000
2015	718.000	190.000
2016	869.000	195.000
2017	920.000	210.000
2018	1.118.000	215.000
2019	1.246.000	225.000
2020	1.418.000	287.000
2021	1.535.000	325.000
2022	1.665.000	335.000
2023	1.741.000	360.000

2013-2023 yılları göz önünde tutulduğunda; üretim alanındaki artış %172.45 iken, üretim miktarında ise %69.8'lik bir artış olduğu görünmektedir. Türkiye'de 2023 yılında bir önceki yıla göre ceviz üretimi %7.46'lık bir artışla 360 bin tona ulaşmıştır. Bu artışın zamanla yeni tesis edilen bahçelerin meyveye yatmasıyla daha da artacağı düşünülse de, üretim alanına bağlı olarak üretim miktarındaki artışın yetersiz olduğu söylenebilir.

Ceviz ağaçlarının çiçek yapısı monoiktir. Erkek ve dişi çiçeklerin olgunlaşma zamanının farklı olması nedeniyle, allogam bir yapı gösterir dolayısıyla heterozigoti belirgindir. Ülkemizde ceviz yetiştiriciliğinde aşı ile çoğaltılan fidanlar kullanılmakta, anaç olarak hemen tamamı tohumdan elde edilmiş çöğürler tercih edilmektedir. Ekonomik değeri yüksek olan ceviz fidanlarının yetiştirilmesi zaman alır. Bilindiği gibi birçok çalışma, anacın üzerine aşılanan çeşidin verimliliğine ve kalitesine etki ettiğini bildirmiştir. Özellikle diğer türlerde de tercih edilen klonal anaçların bu etkide stabil oldukları, adına doğru fidan üretimini büyük oranda sağlayabildikleri bilinmektedir. Ceviz ile ilgili araştırmaların büyük bir çoğunluğu çeşit geliştirme üzerindedir. Bunun yanında klonal anaçların çoğaltılmasına dönük bir ilgi de söz konusudur. Kaliforniya'da eskiden beri en yaygın kullanılan Paradox çöğürleri (*J. hinsii* tohumları ve *J. regia* melezi) anaç olarak kullanılmaktadır. Bu anaçların üretimi tohum anaçlarına göre daha maliyetli olmasının yanında da bulunabilirlik sorunları olduğundan fidan üreticileri hala tohum anaçlarıyla üretim gerçekleştirmektedirler (Özelçi, 2024). Ülkemizde ise *J.regia* tohumlarından elde edilen çöğürler anaç olarak kullanılmaktadır (Erdoğan 2006). Ceviz yetiştiriciliğinde kullanılan anaçların bazı problemlerinin olduğu, cevizde modern üretimi sağlayabilecek özelliklerde olmadığı bilinmektedir. (Sütyemez, 2011). Dolayısıyla standart ceviz anaç/lar eldesine yönelik ıslah çalışmalarına ve mevcut klon anaçlarının hızlı bir şekilde üretilerek devreye sokulmalarına ihtiyaç vardır.

2. BAZI CEVİZ ANAÇLARI

2.1. *Juglans hindisii:* Kaliforniya bölgesinde en yaygın kullanılır. Derin ve verimli topraklarda tercih edilir. Ağır ve yüksek kireçli topraklara karşı toleransı yoktur. *Phytophthora*, nematod ve siyah çizgi hastalığı olmayan topraklarda kullanımı önerilir.

2.2. *Juglans regia*: Tüm dünyada en yaygın olarak kullanılan Anadolu cevizi (*Juglans regia*) anacıdır. Bu anaç siyah çizgi hastalığına karşı dayanıklıdır. Ancak aşırı tuzlu topraklara, kök urlarına, nemotadlara, kök çürüklüğüne neden olan *Armillaria*, kök kanserine ve taç çürüklüğüne duyarlıdır. Bu nedenle, toprak koşulları ve hastalık risklerinin dikkate alınması önemlidir

2.3. Paradox (*J. hindsii* X *J. regia*): Bu anacın en önemli özelliği *Phytophthora* türlerine ve nematodlara karşı ebeveynlerine göre daha dayanıklı olmasıdır. Hızlı gelişim göstermesine rağmen, siyah çizgi hastalığına ve kök kanserine karşı duyarlıdır Paradox anacından son yıllarda geliştirilen klonal üç farklı anaç mevcuttur. Bunlar; Vlach, RX1 ve VX211'dir.

2.3.1. VX211: Bu anaç nemotodlara karşı diğer paradox klon anaçlarına kıyasla daha dayanıklı olduğu bilinmektedir.

2.3.2. RX1*:* *Phytophthora citricola* türüne karşı oldukça dayanıklı bir anaçtır.

2.3.3. Vlach: Güçlü yapısıyla bilinen ilk klonal paradoks anacıdır. Nematodlara karşı duyarlı olmasının yanında kök enfeksiyon hastalıklarına karşı dirençli olduğu bilinmektedir.

2.4. Royal (*J. nigra* X *J. hindsii*): Oldukça kuvvetli bir ceviz anacıdır ve çok hızlı büyür. Özellikle kereste yönünden değerli bir ağaç yapısına sahiptir. Ancak yaygın bir kullanıma ulaşamamıştır.

2.5. *Juglans major*: Yüksek pH içeren topraklara uygun bir ceviz anacıdır. Ancak diğer anaçlara kıyasla fazla bir üstünlüğe sahip olmaması nedeniyle kullanımı yaygın değildir (Şen 1986).

Cevizin zor çoğaltılan bir tür olması nedeniyle alternatif olarak son yıllarda mikroçoğaltma tekniği giderek önem kazanmaktadır. Özellikle ceviz yetiştiriciliğinde, *J. regia x J. hindsii* melezi olan Paradox tohum anacının klonları (Vlach, RX1 ve VX211) ve bazı ceviz çeşitleri (Chandler, Fernor, Fernette, Franquette, Hartley, Vina, Howard, Tulare, Lara ve Serr), ABD, İspanya, Fransa ve Yunanistan'da ekonomik olarak *in vitro* da çoğaltılmaktadır (Anonim

2025a). Ülkemizde ise Vlach anacı ve Chandler çeşidi, doku kültürü yoluyla üretilmeye başlanmıştır (Anonim 2025b).

Mikroçoğaltım, bir bitkiden alınan embriyo, sürgün, kök, kallus gibi dokuların yapay besin ortamlarında ve aseptik olarak yeni bitkiler elde edilmesini içerir (Babaoğlu ve ark. 2002). Bu yöntem, anaçların üremesini sağlayan, zararlılardan arındırılmış bitkisel materyal sağlamakla birlikte kitlesel üretim imkânı sunar. Aynı zamanda, üretilen bitkilerde fenotipik ve genotipik benzerlikler sağlar. Mikroçoğaltım diğer metotlarla karşılaştırıldığında daha kısa sürede sonuç verir ve zor üretilen türlerin üretimi gerçekleştirilebilir.

Ceviz mikroçoğaltımına ilişkin ilk başarılı raporlar 1980'li yıllara dayanmaktadır (Driver, McGranahan, Gruselle – Rodriguez). Genetik, eksplantların fizyolojik ve biyokimyasal durumu, çevre koşulları ve kültür ortamının kimyasal ve besinsel bileşimi en önemli faktörler arasındadır. Fitohormonlar ve bitki büyüme düzenleyicileri bitki türlerinin adventif kök oluşumu üzerinde önemli etkilere sahiptir.

3. *İn Vitro* OLUŞUMU VE ÇOĞALTMAYI ETKİLEYEN FAKTÖRLER

Ceviz mikroçoğaltımı, türün ticari ölçekte üretimi için önemli bir araç olmasına rağmen bu sürecin en öngörülemeyen aşaması olan *in vitro* oluşum, hala aşılması gereken çeşitli zorluklar ile karşı karşıyadır. *In vitro* oluşumunun karşılaştığı başlıca sorunlar; mikrobiyal kontaminasyonlar, fenolik salınımı ve eksplantların doku kültürü koşullarına adaptasyon gibi problemlerdir. Bu faktörler, eksplantların kaybedilmesine dolayısıyla başarılı bir *in vitro* oluşumun engellenmesine neden olmaktadır. Ayrıca, her bitkide karşılaştığımız gibi cevizde de genotipleri arasında da önemli farklılıklar gözlemlenmiştir. Bazı genotipler kültüre alınmaya daha yatkınken, diğerleri oldukça direnç göstermektedir. Genotip değiştirilemeyen bir faktör olarak bilinse de, gençlik derecesi ve kültür koşulları optimize edilerek bu faktörün olumsuz etkileri azaltılabilir. Örneğin, saha koşullarında yetişen ağaçlardan alınan eksplantların, *ex vitro* kontrollü koşullar altında tomurcukları filizlenmeye zorlanarak *in vitro* başlatmanın başarısı artırılabilir. Bu yaklaşım, Licea-Moreno ve ark. (2015) (ceviz melezleri için) ve Yegizbayeva ve ark. (2021) (*J. regia* için) tarafından başarıyla uygulanmıştır

Çoğalma oranı, ticari mikroçoğaltımın uygulanabilirliğini doğrudan etkiler. Yüksek çoğalma oranları, potansiyel üretim maliyetlerini düşürür. Ancak, genel mikroçoğaltım iyileştirmelerine dair çalışmalar bulunsa da, özellikle çoğalma oranlarının artırılmasına yönelik araştırmalar sınırlıdır. Bazı araştırmalar, DKW-C formülasyonunda yapılan değişikliklerin, örneğin floroglusinol takviyesi ve FeEDTA'nın FeEDDHA ile değiştirilmesi, ceviz hibritleri ve İran cevizi için büyümeyi ve *in vitro* materyallerin çoğalma oranlarını teşvik ettiğini göstermiştir. Paradox cevizleri, Amerikan siyah ceviz genotipleri ve bazı İran ceviz klonlarında da B5, Cheng, MS ve WPM yerine DKW ortamı kullanılarak önemli çoğalma oranı farklılıkları kaydedilmiştir (Yegizbayeva ve ark. 2021).

Sıvı ortamların kullanılması, ticari mikroçoğaltım da potansiyel bir atılım olarak görülmektedir. Ancak, bu konuda bugüne kadar çok az ve sınırlı sayıda çalışma yapılmıştır. Heile-Sudholt ve arkadaşları, Amerikan siyah cevizinden elde edilen sürgünleri sabit sıvı ortamlarda kültüre alsalar da, bu durum *in vitro* materyallerin kalitesi veya çoğalma oranları için katkı

yapmamıştır. Diğer yandan, Stevens ve Pijut (2018), çalkalamalı sıvı ortam kullanarak iki Amerikan siyah ceviz klonunun çoğalmasını sağlamışlardır. Fakat, kontrol olarak jelleşmiş ortam kullanılmadığından dolayı iklimlendirme sırasında köklü mikro sürgünlerin tamamen ölümünün, bu ortamdan mı kaynaklandığını belirlemek mümkün olmamıştır. Licea-Moreno ve ark., (2015), geçici daldırma biyoreaktörlerinde (TIB'ler) çeşitli ceviz hibrid klonlarının çoğalma oranlarının arttığını bildirmiştir. Daha sonra, Licea-Moreno ve ark., (2020) bu sistemlerde karşılaşılan bazı sorunları çözerek jelleşmiş ortamda kültüre edilenlere benzer yüksek kaliteli mikro sürgünler üretmeyi başarmışlardır. Bununla birlikte, cevizlerin ticari mikroçoğaltımında geçici daldırma sistemlerinin (TIS) kullanımı için daha fazla araştırmaya ihtiyaç duyulmaktadır.

Saeedi ve Vahdati (2023*) in vitro* daki ceviz eksplantlarını farklı ışık spektrumlarına sahip aydınlatma sistemlerine maruz bırakarak morfo-fizyolojik özellikler ve biyokütle birikimi üzerindeki etkilerini incelemiştir. Birleştirilmiş spektrumların, özellikle mavi-kırmızı ve kırmızı-uzak kırmızı kombinasyonlarının, diğer tek renkli ışık spektrumlarına kıyasla daha iyi biyokütle birikimine (toplam taze ve kuru ağırlık) yol açtığını göstermişlerdir. Işık-yayan diyot (LED) uygulamalarının, ceviz *in vitro* eksplantlarının morfo-fizyolojik özelliklerini önemli ölçüde etkilediği de gözlemlenmiştir. Beyaz ışık spektrumları spesifik yaprak alanını (SLA) artırırken, yeşil ışık spektrumları yaprak su içeriğini (LWC) yükseltmiştir. Uzak kırmızı ışığın uygulanması ise yaprak kütle alanını (LMA) ve birim yaprak alanı başına su içeriğini (LWCA) artırmıştır. Sonuç olarak belirli ışık spektrumları kullanılarak ceviz *in vitro* eksplantlarının morfolojik ve büyüme özelliklerinin iyileştirilebileceği belirlenmiştir. Dolayısıyla, ceviz *in vitro* yayılımında daha etkili protokoller geliştirmek için yeni stratejilerin optimizasyonu önemli bir potansiyele sahiptir.

Sonuç olarak, ceviz mikroçoğaltımında *in vitro* oluşum aşaması, üstesinden gelinmesi gereken önemli zorluklar içermektedir. Ancak, gençlik derecesinin yönetilmesi, uygun kültür ortamının seçilmesi ve sıvı ortamlar, farklı ışık spektrumları, özellikle de geçici daldırma sistemleri gibi yenilikçi yaklaşımların kullanılması, bu zorlukların aşılması ve ticari ölçekte ceviz mikroçoğaltımının uygulanabilirliğinin artırılması için büyük bir potansiyel sunmaktadır. Gelecekte yapılacak araştırmaların, bu alandaki bilgi birikimini artırmaya ve ceviz mikroçoğaltımını daha verimli ve sürdürülebilir hale getirmeye odaklanması gerekmektedir.

4. MİKROÇOĞALTIMDA YER ALAN AŞAMALAR

Başarılı bir mikroçoğaltım protokolü, her bir bitki için kendine özgü gereksinimlere sahip, dikkatle planlanmış ve optimize edilmiş dört temel aşamadan oluşur.

4.1. Aseptik Kültürün Başlatılması

Bitki materyalini kontamine eden mikroorganizmalardan arındırarak steril bir ortamda kültür başlatılması en önemli aşamalardan biridir. Yüzey sterilizasyonu ve uygun kültür ortamlarının kullanılması, kontaminasyonu önlemek ve sağlıklı gelişim sağlamanın anahtarıdır. *Juglans* türlerinin *in vitro* çoğaltılmasında başarı, genellikle uygun eksplant seçimine bağlıdır. Eksplant seçimi, uygulanacak *in vitro* çoğaltım tekniği ile doğrudan ilişkilidir. Genellikle,

somatik embriyogenez, kallus oluşumu, köklenme, çimlenme ve sürgün organogenezi gibi süreçlerin başlatılması için genç dokular tercih edilir. Dolayısıyla, istenilen *in vitro* çoğaltım yöntemi dikkate alınarak yapılan eksplant seçimi, *Juglans* türlerinde başarılı bir çoğaltım sürecinin temelini oluşturmaktadır. Nitekim; Şirin (2014), uygun fizyolojik dönemin ve eksplantın seçiminin, kültürlerdeki tanen ve diğer toksik bileşiklerin zararlı etkilerinin üstesinden gelinmesi, kabul edilebilir bir sürgün çoğalma oranının sağlanması ve seçilmiş sert kabuklu meyve klonlarının mikroçoğaltımında köklenmiş sürgünlerin son derece önemli olduğunu vurgulamıştır. Olgun ceviz ağaçlarından alınan eksplantlarla yapılan mikroçoğaltım çalışmasında iç kontaminasyonun önemli bir sorun olduğu bilinmektedir. Ayrıca, yüzey sterilizasyonu aşamasında dokularda oksidasyon sonucu oluşan koyulaşmanın sürgün oluşumunda büyük bir azalmaya neden olduğunu ve bu sorunun dezenfeksiyona daha dayanıklı ancak yarı odunsu olan genç sürgün eksplantları kullanılarak bu problemin aşılabileceğini belirtilmektedir (Leal ve ark.2007).

Besleyici formülasyonun da *in vitro* başlatma üzerinde önemli bir etkisi olduğu kanıtlanmıştır. Fakat, literatürde çelişkili sonuçlar rapor edilmiştir. DKW formülasyonu, *in vitro* kültür sonuçlarını iyileştirmek amacıyla geliştirilmiş ve birçok araştırmacı (Heile -Sudholt ve ark. 1989, Revilla ve ark.1989, Yegizbayeva ve ark., 2021) tarafından doğrulanmıştır. Buna karşılık, bazı araştırıcılar (Gruselle, R, Lone, I.A)(Gruselle, Lone) MS (1962) formülasyonunu kullanarak daha iyi sonuçlar elde etmişlerdir. Bu durum, *in vitro* oluşumun başarısını artırmak için uygun kültür ortamı seçiminin önemli bir faktör olduğunu göstermektedir. Örneğin, *J. regia* fidelerinin nodal gövde segmentlerinden koltuk altı tomurcuk uzaması, 0,4 µM BA ve 0,8 µM NAA içeren Murashige ve Skoog (MS) ortamında başarılı bir şekilde sağlanmıştır (Chalupa, 1981). Benzer şekilde, Gruselle ve diğerleri (1987), bir MS ortamında 4,4 ve 8,9 µM BA'nın *J. regia* nodal eksplantları için uygun olduğunu belirtmişlerdir.

4.2. Sürgün Oluşturma

Bu aşamada, başlatılan kültürler, büyüme regülatörleri ve uygun kültür ortamı kullanılarak çok sayıda mikro sürgün elde etmek için çoğaltılır. Bu aşamanın amacı, yeterli sayıda genetik olarak özdeş sürgün üretmektir. Çeşitli araştırmalar, *Juglans* türlerinin mikro çoğaltım potansiyeline sahip olduğunu göstermektedir (Sommers vd, 1982; Driver ve Kuniyuki, 1984; ve diğerleri). Şirin (2014) Kaman 1 çeşidinin MS ortamına eklenen 0.5 mg L-1 BAP ve 0.5 mg L-1 İBA konsantrasyonları ile en çok sürgün oluşumu sağlayan ortam olduğu; eksplant başı yaprak sayısının 3.00 ile 5.33 adet arasında değiştiğini saptamıştır. Sekmen ve ark. (2017), ceviz'in *in vitro* koşullarda çoğaltım protokolü oluşturabilmek için, Chandler çeşidinin sürgünlerinde bir göz bulunan nodal segmentleri eksplant olarak kullanmıştır. DKW, DKW–C ve MS besin ortamları içerisinde ise üçer farklı hormon konsantrasyonları ile 9 farklı kültür oluşturmuştur. Yapılan çalışmada en iyi mikroçoğaltım sonucunun, DKW–C besin ortamı içerisinde 1 mg/L BAP + 0,5 mg/L IBA + 1 mg/L GA3 hormonları ile aktif kömür ilavesi yapılan ortamda %45 oranında sürgün gelişiminin olduğunu belirtmiştir. Yegizbayeva ve ark. (2021) Özbek çeşidi Ideal ve Çin çeşidi Liaohe çeşidinin sürgün büyüme hızını 1 ve 1,5 mg/L'lik 6-benzilaminopurin (BAP) konsantrasyonlarında MS ve DKW ortamlarında karşılaştırmıştır. DKW ortamında sürgün büyümesi yavaşlamış, yapraklar sararmış ve bazı sürgünler kararmıştır. DKW ortamına

FeEDDHA ve floroglusinol eklenmesi, sürgün büyüme hızını artırmış ve yüksek kaliteli materyal elde edilmesini sağlamıştır. Sonuç olarak, zenginleştirilmiş DKW ortamı, ceviz Ideal ve Liaohe-1'in mikroklonal çoğaltılması için en uygun besin ortamı olarak belirlenmiştir Dirlik ve ark. (2022), paradox ceviz anacına ait nodları kullanarak birim eksplant başına düşen en yüksek sürgün sayısını 1.05 sürgün/eksplant olarak 4 mg L-1 BAP içeren DKW ortamında olduğunu belirlemiştir. Özelçi (2024), Kozdere ve Chandler çeşitlerinde DKW ortamında sürgün uzaması, sürgün sayısı ve yaprak sayısı ölçümlerinde MS ortamına göre en iyi sonuçları vermiş ve istatiksel olarak fark bulunduğunu bildirmiştir. Dolayısıyla, cevizlerde *in vitro* sürgün çoğalmasını etkileyen çeşitli faktörler bulunmaktadır ve optimizasyon, tür ve genotipe özeldir.

4.3. Mikro Sürgünlerin Köklendirilmesi

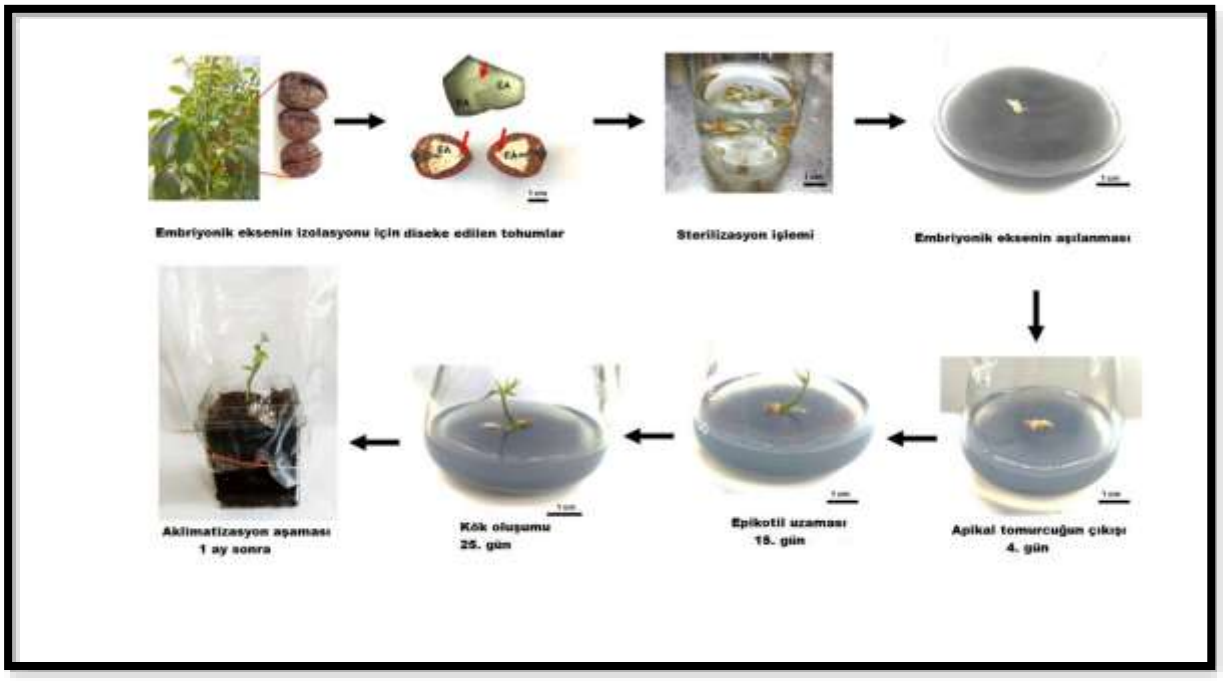
Ceviz türlerinin mikroçoğaltımında karşılaşılan temel zorluklardan biri, düşük köklenme oranlarıdır. Bu sorunu aşmak için çeşitli yaklaşımlar denenmiştir. Bunların özeti aşağıda belirtilmiştir. Jay-Allemand ve ark. (1992), ¼ DKW besin ortamı ve vermikülit kombinasyonunun kök uzamasını ve ikincil kök gelişimini desteklediğini, köklenme oranını önemli ölçüde (%15-50) artırdığını ve birincil kök sayısını katladığını göstermiştir. Vermikülitin, kök penetrasyonu ve havalanma açısından jelrite üstün olduğu, fakat sadece su ile kullanıldığında yetersiz köklenmeye neden olduğu belirtilmiştir. Caboni ve Damiano (2006), ½ DKW ortamında 10 µM IBA kullanımı ve 10-12 günlük karanlık uygulamasının (indüksiyon aşaması) başarılı bir köklenme için önemli olduğunu vurgulamışlardır. İndüksiyon aşamasından sonra mikro sürgünlerin hormonsuz bir ortama aktarılması da önemli değere sahiptir. Zarghami ve Salari (2015) yaptıkları çalışmada, Chandler, Hartely ve Z60 ceviz çeşitleriyle sürgün çoğaltımı için 1,5 mg/L BAP ve 0,01 mg/L IBA içeren bitki büyümeyi düzenleyici kullanarak en iyi sonucu elde etmiştir. Tuan ve ark. (2017) ise, farklı besin ortamları ve bitki büyüme düzenleyicileri ile yaptıkları çalışmada, Rugini ortamının taze ağırlığı artırdığını, katı ortamın sürgün yayılımı için daha uygun olduğunu ve 2,2 µM BA'nın en iyi sonuçları verdiğini belirlemişlerdir. Ayrıca, 12 µM IBA içeren yarı katı ortamlarda 5 günlük karanlığın köklenme için gerekli olduğu ve ¼ DKW + Vermikülit ile ¼ MS + Vermikülit ortamları arasında önemli bir fark bulunmadığı sonucuna varmışlardır. Kök ekspresyonu alt fazında kullanılan karbon kaynağına daha fazla dikkat edilmiştir. Sükroz açık ara en çok kullanılan karbon kaynağıdır ve çoğalma aşamasında olduğu gibi aynı konsantrasyonu korur. İndüksiyon sırasında olduğu gibi, bir karbon kaynağının varlığı köklerin *in vitro* gelişimi için öneme sahiptir. *J. nigra* No.23x *J. regia* hibrit klonu için sükrozun köklenme üzerinde sürgün büyümesinden daha büyük bir etkisi olduğu bildirilmiştir (Chenevard, D ve ark. 1995). Dolayısıyla, genellikle, nispeten yüksek sükroz konsantrasyonu (117 mM ile 153 mM arasinda) en iyi köklenme başarısını vermektedir (Vahdati K, ve ark. 2022). Bu çalışmalar, ceviz mikro çoğaltımında köklenme oranını optimize etmek için besin ortamı kompozisyonunun, karbon kaynağının, bitki büyüme düzenleyicilerinin karbon kaynağının ve karanlık uygulaması gibi faktörlerin köklenmeyi etkilediğini göstermektedir.

4.4. Doku Kültürü ile Yetişen Bitkilerin Pişkinleştirilmesi ve Sahaya Aktarılması

Köklenen mikro sürgünler, kontrollü koşullarda pişkinleştirildikten sonra dış ortama uyum sağlamaları gerçekleştirilir. Bu süreç, başta nem ve sıcaklık gibi çevresel faktörlere kademeli olarak alıştırılmayı hedefler. Pişkinleştirme tamamlandıktan sonra, bitkiler dış ortama aktarılmaya hazır hale gelir. Cevizin dış koşullara aktarma üzerine çok az çalışma yapılmasına rağmen *in vitro* ceviz bitkilerinin mikro sürgünlerinin kalitesinin, stoma özelliklerinin ve su tutma kapasitesinin cevizin pişkinleşmesi sırasında önemli rol oynadığı kanıtlanmıştır (Vahdati, ve ark. 2004, Maleki Asayesh ve ark., 2017, Asayesh ve ark. 2017). Bununla birlikte, cevizin köklenme kapasitesinin düşük olması nedeniyle, yalnızca köklü mikro sürgünlerin hayatta kalma olasılığı vardır. Ancak bu durum hayatta kalmayı sağlamak için her zaman yeterli değildir. Mikro sürgünlerin köklenmesine ek olarak, bu aşamanın üstesinden gelmek için sağlıklı ve bol miktarda yaprağın olması gereklidir (McGranahan ve ark., Yegizbayeva ve ark., Licea-Moreno ve ark., 2016).

İn vitro'da üretilen stomaların işlevsel olmadığı ve iklimlendirme sırasında ölümlerin ana nedeni olduğu varsayılmaktadır. Nitekim, Mj209x Ra melez klonların çoğaltılması için gerçekleştirilen mikroçoğaltım protokolü ile, yetişkin ağaçlarınkine benzer anormal olmayan stomalar elde etmek mümkün olmuştur (Licea-Moreno ve ark., 2016). Tam işlevselliklerine ulaşmak için stomaların oluşumu gereklidir. Genel olarak, ilk iki hafta boyunca yüksek bağıl nem (>%80) gereklidir. Daha sonra, bağıl nemin azaltılması hayatta kalan mikro sürgünlerin güçlenmesine katkıda bulunur. Aklimatizasyonun bağlaması sırasında doğrudan güneş ışığından ve düşük sıcaklıklardan (<16° C) kaçınılması da tavsiye edilir.

Sonuç olarak, başarılı bir mikroçoğaltım protokolü, bu dört aşamanın her birinin dikkatli bir şekilde yönetilmesini ve optimize edilmesini gerektirir. Her aşamadaki başarı, nihai olarak, sağlıklı ve genetik olarak özdeş bitkilerin üretilmesiyle sonuçlanır. Bu da, bitki yetiştiriciliğinde verimliliği artırmaya ve bitki türlerinin korunmasına önemli katkılar sağlar.



Şekil 1. Embriyonik eksenin eksplant olarak kullanıldığı ceviz kültürünün in vitro kurulması ve iklime alıştırılması (kırmızı ok; embriyo ve EA; embriyonik eksen). (Sharma ve Kumar 2024)

5. CEVİZ MİKROÇOĞALTIMININ ENGELLERİ

Eksplantlardaki fenolik bileşenin oksidasyonuna duyarlılık, eksplantların içindeki kirlilik, kültür ortamına uyum sağlama, köklenme ve toprağa aktarımla ilgili zorluklar, ceviz mikroçoğaltımının en önemli sorunlarıdır (Kepenek ve Kolağası 2016).

5.1. Sterilizasyon

İn vitro ortamda yapılacak olan mikroçoğaltım yöntemlerinde ilk aşama sterilizasyon olup, her bitki için uygun protokolün bulunması çalışmanın başarıya ulaşması için oldukça önemlidir. Dışardan alınan eksplantların *in vitro* koşullarında kontaminasyona yol açmaması için en etkili sterilizasyon yönteminin tespit edilmesi gerekmektedir. Bu konu ile ilgili birçok genotipte farklı araştırıcılar çeşitli sterilizasyon maddelerini farklı dozlarda kullanmışlar ve farklı sonuçlar elde etmişlerdir (tablo 3). Kültür ortamında kullanılan eksplantların iç kısımlarında bulunan mikroorganizmalar uzaklaştırılamadığından, yüzey sterilizasyonu bazen yetersiz kalabilmektedir. Sterilizasyonun yeterince başarılı olmaması durumunda, bu mikroorganizmalar eksplantla rekabete girerek ortamda çoğalmaya başlar. Bunun sonucunda eksplantların büyümesi yavaşlar, ardından nekroz gelişir ve eksplantlar kaybedilir (Kane, 2003).

Cevizlerde yüzey sterilizasyon işlemi yaygın ve kabul görmüş bir işlemdir. Ceviz için, yaygın olarak benimsenen prosedür; eksplantlar 20-30 saniye boyunca %50- 70 (v/v) etanol (EtOH) ile muamele edilir ve ardından daldırılır %0,1 – %15 (h/h) sodyum hipoklorit (NaOCl) ile %0,01 Tween 20 ilavesiyle eksplantlar ile 10- 20 dakika muamele edilir daha sonra bunu steril ortamda üç durulama (5 dk.) takip etmektedir. *J. regia*'nın nodal segmentlerinin bulaşık olmayan kültürünün, eksplantlar 10-20 dakika boyunca %1 NaOCl ve 2-3 damla Tween-20 ile işlendiğinde başarılı bir şekilde oluşturulduğu gözlemlenmiştir (McGranahan ve ark., 1988). Pijut (1997), *J. cinerea*'nın nodal segmentleri için en iyi sterilizatörlerin 15-20 dakika boyunca işlendiğinde %0,8 (v/v) NaOCl ve 15% Clorox ağartıcısı olduğunu bildirmiştir. Roschke ve Pijut (2006), *J. regia* sürgünlerini musluk suyunda 30 dakika ve ardından %70 etanolde 30 saniye yıkadıkları bir çalışma yürütmüşlerdir. Bhat ve ark., (2022), eksplantları 5 dakika boyunca %0,1 $HgCl_2$ ile mazru bırakıp ardından 10 saniye boyunca %70 etanol ile uygulanmış *Juglans regia*'nın kontaminasyonsuz nodal kültürlerini başarıyla oluşturabilmişlerdir. Juyal ve ark. (2024) de yapmış olduğu G1 ve G2 ceviz çeşitlerinde nodal eksplantta farklı sürelerde sterilizasyon aşamasında tabi tuttuktan sonra Bhat ve ark., (2022) ile aynı sonuçların uyumlu olduğunu bildirmiştir.

Özelçi (2024) ise sterilizasyon aşamasında farklı olarak $CuSO_4$ (Civa klorür) dahil edilmesi sonucunda enfeksiyon oranında sayısal olarak azalma gözlemlediğini belirtmiştir. Yüzey sterilizasyonu için %30 NaClO uygulaması ile $CuSO_4$'ün birlikte kullanılması sayısal olarak en başarılı sonucu vermesine rağmen ceviz çeşitleri arasında kontaminasyon oranı, kararan ve süren sürgün sayılarında farklılıklar gözlemlenmemiştir. Civa klorürün yüzey sterilizasyonunda olumsuz sonuçlar verdiğini bildirmiştir. Tablo 3'te çeşitli türler için benimsenen sterilizasyon protokolleri gösterilmektedir.

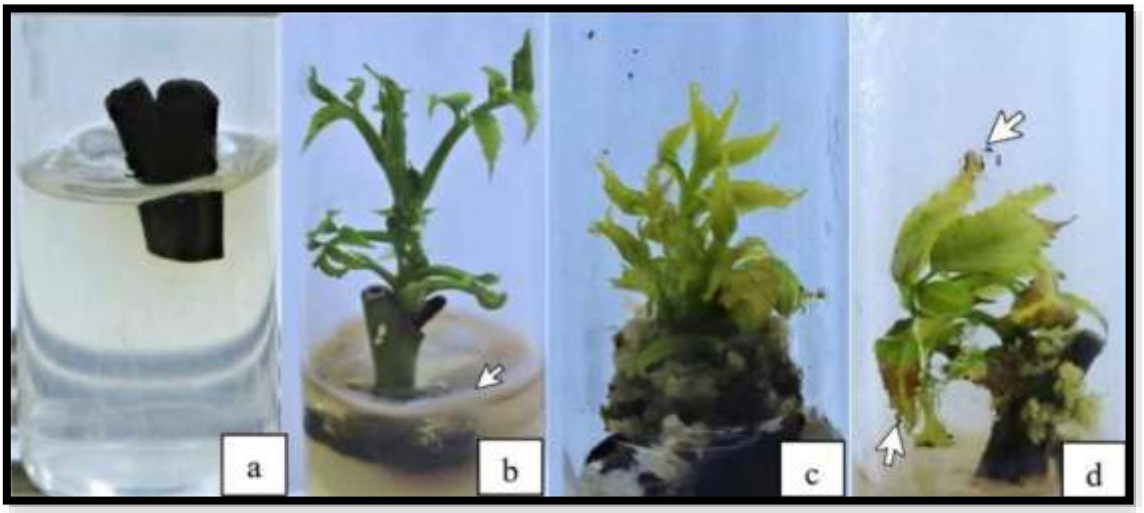
5.1.Kontaminasyon

Kontaminasyonlar, ekzojen ve endojen mikroorganizmalardan kaynaklanabilir. Bitki kültürleri, çok çeşitli bakteri, mantar ve viral organizmalar tarafından kontamine olabilir ve bunların çoğu türe özgüdür (Varghese & Joy, 2016). Bu kontaminantlar, etkilerini hemen gösterebileceği gibi, uzun süre herhangi bir belirti vermeyebilir (Ray & Ali, 2016). *İn vitro* bitki kültürlerinde kontaminasyondan kaynaklanan kayıpların yaklaşık %20-55'i bakterilerden kaynaklanmaktadır (Tekielska vd, 2019).

Araziden toplanan veya mikrobiyal kontaminasyon olasılığı olan bitki dokularıyla yapılan çalışmalarda etil alkol ve/veya çamaşır suyuna ek olarak ilave sürfaktan ile yüzey sterilizasyonu gerekmektedir. Konsantrasyon ve maruz kalma süresi kullanılan eksplant türüne bağlı olarak deneysel olarak belirlenir (Leelavathy ve Sankar, 2016). Fu ve ark., (2003), *Carya illinoensis* (Pikan cevizi) bitkisi üzerinde yaptıkları çalışmada, en uygun sterilizasyon yönteminin önce bitkinin %70'lik EtOH'de bekletilmesi ve ardından %0,2'lik $HgCl_2$'de (birkaç damla Tween 20 eklenerek) 15 dakika karıştırılması ve ardından steril distile su ile 10 kez durulanması olduğunu belirtmişlerdir. Ayrıca besin ortamına penisilin ve streptomisin eklenmesinin kontaminasyonu önlediğini bulmuşlardır (Fu ve ark, 2003). Leal ve ark., (2007), tam verim çağındaki ceviz ağaçlarından aldıkları eksplantlarla yapılan mikroçoğaltım deneylerinde iç kontaminasyonun önemli bir sorun olduğunu belirtmişlerdir. Ayrıca, yüzey sterilizasyonu aşamasında dokularda

oksidasyon sonucu oluşan koyulaşmanın sürgün oluşumunda büyük bir azalmaya neden olduğunu ve bu sorunun dezenfeksiyona daha dayanıklı ancak yarı odunsu olan genç sürgün eksplantları kullanılarak aşılabileceğini belirtmişlerdir (Leal ve ark., 2007)

Kontaminasyon kayıpları genotip, kültür ortamı gibi faktörler arasındaki olası etkileşime göre belirlenmiştir (Yegizbayeva ve ark.,2021). Gruselle ve Boxus (1990) ayrıca üç saf ceviz türü ve melez Paradox arasında farklı enfeksiyon yüzdeleri kaydetti, kontaminasyon eksplantların yüzdesi 0 ile %67,8 arasında değişkenlik gösterdiğini bildirmiştir. Mikroorganizmalar, bitkiler de dahil olmak üzere ökaryotlarda her yerde bulunur, endo ve ektosimbiyont olarak hareket eder, çoğu yaşamları için gereklidir (Berg ve ark., 2014), bu nedenle her genotip kendi mikrobiyomunu getirebilir. Aynı zamanda, bu mikrobiyom, mevsim, konum ve yaş gibi birçok faktörden etkilenerek değişebilir, hatta bitkilerin farklı organları arasında bile değişebilir (Thomas ve ark., 2008).



Şekil 2. Ceviz kültüründe karşılaşılan sorunlara örnekler şunlardır: a) kararma b) kontaminasyon c) vitrifikasyon d) nekroz (Dirlik ve ark., 2022)

Tür/çeşit	Eksplantlar	Çalışma	Dezenfektanlar ve dozaj	Yöntem	Kaynak

			Nodal eksplant için:	Akan musluk suyu ile durulanır 2 dakika boyunca %70 Etil alkol (v/) ile muamele edilir, musluk suyu ile durulanır 2 dakika boyunca hafif deterjan (Teepol) ile muamele edilir, deterjan izlerini yeniden azaltacak şekilde iyice kurulanır 1Kashl Yüzey aktif madde (Tween 20) işlemi 20 dakika boyunca verildi, damıtılmış su ile yıkanır. 30 dakika boyunca mantar ilacı (Bavistin) 196 (a/h) ile tedavi edilir. Damıtılmış su ile iyice durulanmış Nadir süreler için HgCl (%0,1) ve NaOCl (%0,5) ile sterilize edilmiştir.	

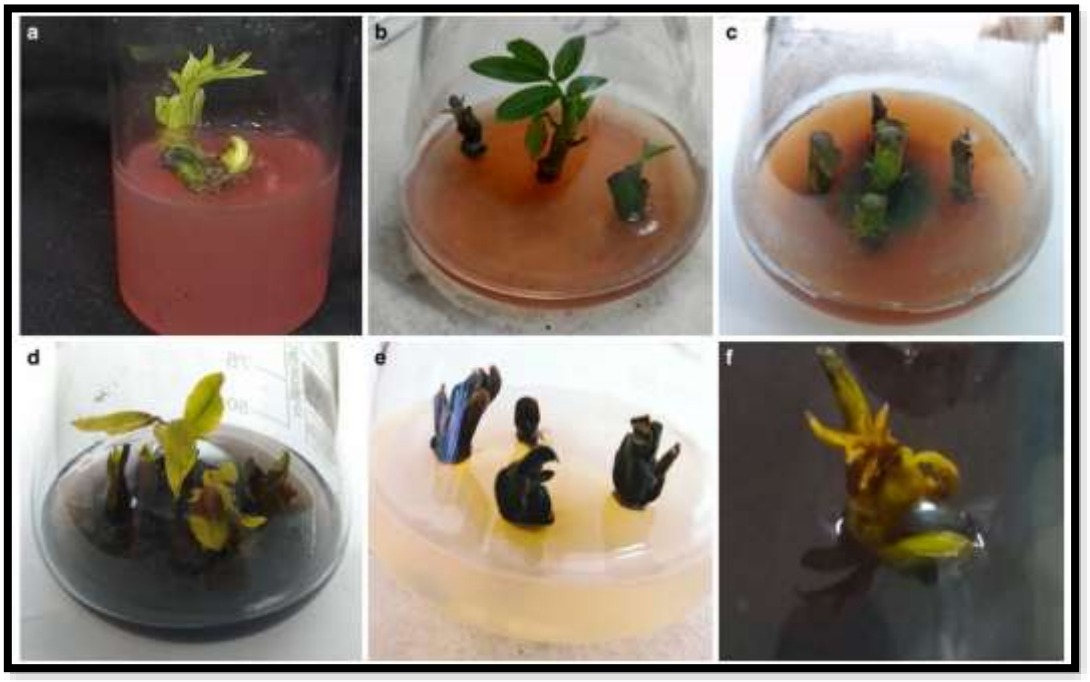
Tablo 3. Eksplantların sterilizasyonu için kullanılan yöntemler

5.2.Kararma

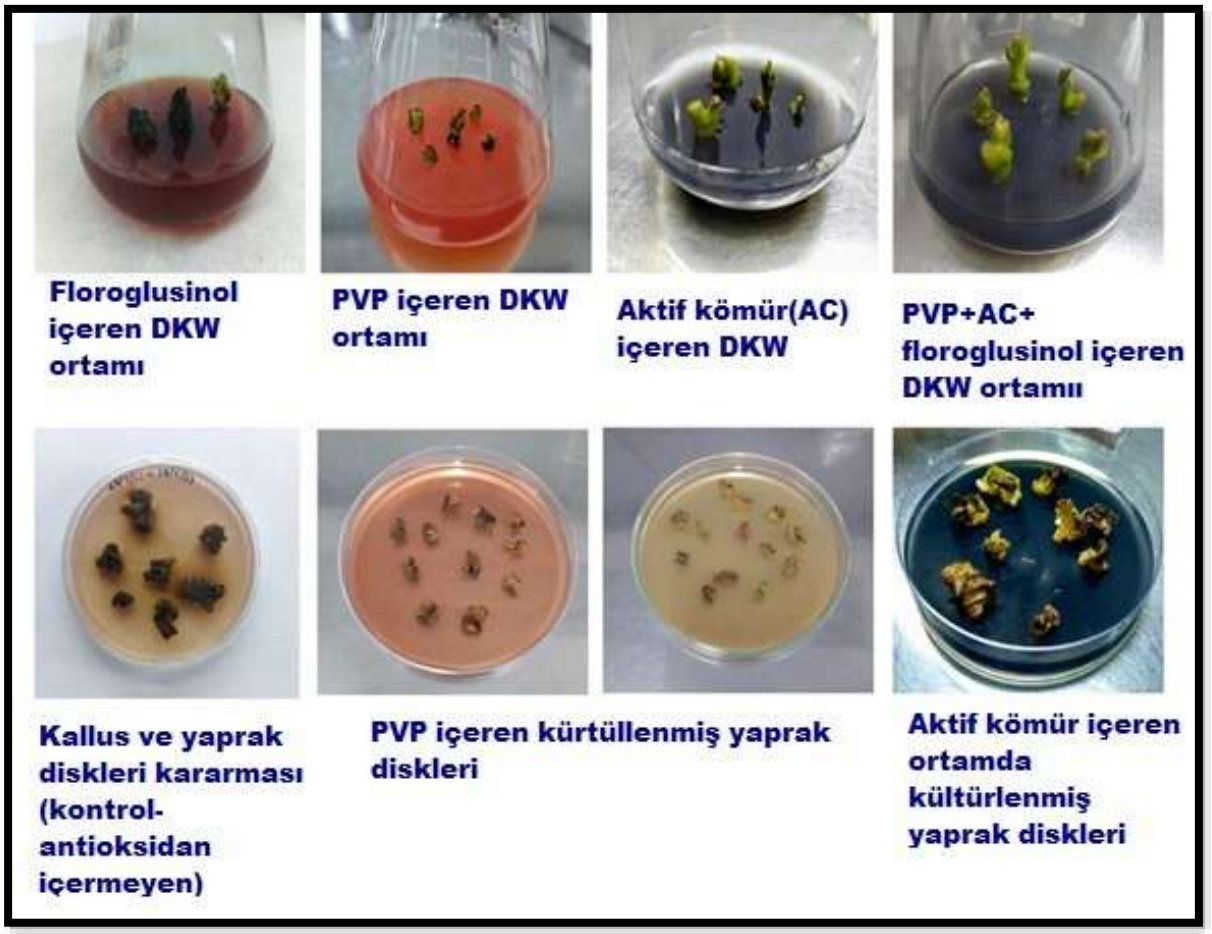
Ceviz bitkilerinin *in vitro* rejenerasyonunda karşılaşılan en önemli zorluklardan biri, fungal ve bakteriyel kontaminasyonun yanı sıra, eksplantların ve ortamların oksidatif veya fenolik gerekçelerle kararmasıdır (şekil 3). Cevizdeki en önemli fenolik madde juglone'dur (5-hidroksil-1, 4-naftokinon); serbest radikal oluşumundaki kimyasal reaktivitesi ve hasarı nedeniyle, aşılama bölgelerinde nekroz, apoptoz ve hücre ölümü yoluyla dokular üzerinde yıkıcı bir etkiye sahiptir (Jones, 2001 Solar ve ark., 2006). Ortamın esmerleşmesi, polivinil pirolidon (PVP), sitrik asit, askorbik asit, aktif kömür, tiyoüre, L-sistein, glutamin, aspargin, arginin gibi maddeler eklenerek veya sık sık alt kültürleme (Pierik., 1987; Rout ve ark., 1999) (şekil 4) veya aşılamadan sonra kültürleri bir ya da iki gün tamamen karanlıkta inkübe ederek üstesinden gelinebilen eksplantların kesilmiş yüzeyinden sızan polifenollerin oksidasyonunun sonucudur; çünkü polifenol oksidaz aktivitesinin ışık tarafından indüklendiği bulunmuştur (Pittet ve Moncousin, 1981). Bu durum, doku kültürlerinin başarısını önemli ölçüde etkilemektedir. Kararmayı azaltmak amacıyla, farklı araştırmacıların farklı konsantrasyonlarda kullandıkları bu maddelerle elde edilen sonuçlar değişkenlik göstermiştir. Bu durum, etkili bir kontrol stratejisi geliştirmek için daha fazla araştırma yapılması gerektiğini açıkça ortaya koymaktadır. Bu araştırmalar, ceviz bitkilerinin *in vitro* çoğaltılmasında verimliliği artırmak için hayati önem taşımaktadır (Pierik, 1987). Ehteshamnia ve Gulami (2014) üç farklı strateji geliştirerek uyguladığı çalışmada Chandler ve Jamal olmak üzere iki ceviz çeşidi için DKW,

aktif kömürle (AC) zenginleştirilmiş DKW ve askorbik asit (AA) ile desteklenmiş MS kültür ortamlarının mikro kesimlerin yerleşimi üzerindeki etkileri incelenmiştir. Sonuçları ise AC ile zenginleştirilmiş DKW ortamının, diğer ortamlara göre daha uygun olduğunu göstermiştir. İkinci çalışmada, aynı ceviz çeşitlerinin mikro kesimlerinin, DKW bazal ortamında ve AC/AA içeren DKW ortamında 48 saat arayla üç kez alt kültüre alınması değerlendirilmiştir. AC içeren DKW ortamında alt kültüre alınan mikro kesimler, AA içeren DKW ortamındakilere göre daha iyi sonuçlar vermesine rağmen, aradaki fark istatistiksel olarak anlamlı bulunmamıştır. Üçüncü deneyde ise, mikro kesimler kültüre alınmadan önce damıtılmış su, polivinil pirolidon (PVP) ve AA çözeltilerinde 2 saat bekletilmiştir. PVP'ye batırılan mikro kesimler, diğer gruplara göre daha başarılı bir yerleşim göstermiştir. Sonuçlar, İran cevizi mikro kesimlerindeki kararma gibi problemin, belirtilen yöntemlerin farklı kombinasyonları kullanılarak başarıyla kontrol altına alınabileceğini ortaya koymaktadır. Melatonin, askorbik asit veya sitrik asit gibi antioksidanlar oksidatif stresi azaltabilir ve fenolik bileşik oksidasyonunu engelleyebilir. Aktif kömür veya PVP gibi adsorbanlar fenolik bileşiklere bağlanabilir ve onları daha az toksik hale getirebilir.

Karanlıkta yetiştirilen dokularda kararma, ışıkta yetiştirilen *in vitro* kültürlere göre daha düşüktür (Escobar ve ark., 2008). Kararmanın kapsamı, ortamın temel bileşimini ve bitki büyüme hormonlarının türünü veya içeriğini değiştirerek azaltılabilir (Jones ve Saxena, 2013).



Şekil 3. a) DKWf'de sürgün tomurcuğu başlangıcı; b) DKWm'de sürgün tomurcuğu başlangıcı; c) DKW besiyerinde kahverengileşme; d) WPM'de yaprakların solması; e) MS besiyerinde eksplantların kahverengileşmesi; f) WPM'de engellenen büyüme (Sharma vd. 2025).



Şekil 4. Ceviz çeşidi 'Chandler'da eksplant kahverengileşmesini ve in vitro oluşumunu önlemek için farklı antioksidanların etkisi (Sharma vd. 2025).

5.3. Aklimatizasyon

Mikro çoğaltılan bitkilerin başarılı bir şekilde aklimatize edilmesi ve daha sonra araziye aktarılması, *in vitro* teknolojisinin ticari olarak değerlendirilmesi açısından önemli bir adımdır. Doku kültürü yayılımındaki en büyük zorluklardan biri, bitkilerin laboratuvardan seraya veya tarlaya taşındığında yüksek ölüm oranıdır (Kumar ve Rao, 2012). Bu, bahçecilikte yaygın bir sorundur ve *in vitro* çoğaltımdan sonra bitkiciklerin hayatta kalmasını sağlamak için etkili protokoller geliştirmeye yönelik devam eden araştırmalar vardır (Aliniaeifard ve ark., 2020). *In vitro* bitkiler, doğal ortamlara, seraya ve tarlaya kıyasla farklı CO_2 konsantrasyonlarında yetiştirilir. Doku kültürü bitkileri, adapte edilmiş sera bitkilerine kıyasla daha yüksek stoma yoğunluğu ve indeksine sahip yuvarlak ve açık stomalara sahiptir. Öte yandan, su kaybı oranları adapte edilmiş ve sera bitkilerinden önemli ölçüde daha yüksektir (Joshi ve ark., 2006; Bertolino ve ark., 2019). Yüksek ve düzensiz stoma yoğunluğu ve stoma boyutundaki çeşitlilik, yüksek stres altında yaprakların hızla solmasıyla ilişkili olabilir. Ancak, mikroçoğaltılan cevizin iklime alıştırılmasının, ilk iki haftada yüksek nem isteği ve zor köklenme nedeniyle bitkilerin

hızla kuruması veya hastalıklara karşı duyarlılığı nedeniyle zor bir prosedür olduğu bildirilmiştir. Preece ve Sutter (1991) ve Sutter ve ark. (1992), toprağa transfer sırasında kökleri desteklemek ve korumak için sorbarodlar (soğukta kıvrılmış selülozdan yapılmış bir silindirden oluşan ve selüloz kağıdına sarılmış yapı) ve bitkilerin kurumaya karşı direncini artırmak için havalandırılmış kültür kabından oluşan serada ve açık alanda mikroçoğaltılmış bitkilerin iklime alıştırılmasını incelemiştir. Bu şekilde yetiştirilen bitkilerin, *ex vitro* koşullara transfer edildiğinde daha iyi hayatta kalma gösterdiği görülmüştür. Sorbarodlar, bitkilerin uygun şekilde işlenmesi için gerekli korumayı ve kolaylığı sağlamıştır. Leal ve ark. (2007) sera koşullarında (bağıl nem %100 ve sıcaklık 18 ila 20°C aralığında) mikro bitkilerin iklimlendirme süresine başlanarak hem in vitro hem de *ex vitro* işlemler kullanılarak başarılı köklenme oranına ulaşabileceğini bildirmiştir.

Kumar ve Shama (2025) *İn vitro* rejenere edilmiş bitkiler, bir aylık sağlam kök ve sürgün oluşumu süresi sonrasında başarılı bir şekilde iklime alıştırmada bitkiler öncelikle 10 dakika boyunca %1,0 (w/v) CAPTAN fungisit ile muamele edilip ardından 30 dakika boyunca akan musluk su altında tutulmuştur. Daha sonra bitkiler, 24^{+}–2 °C ve %90 bağıl nemde tutulan, önceden steril 1:1:1 kum, toprak ve hindistan cevizi torfu karışımını içeren iklimlendirme ortamına aktarılmıştır. 25-30 gün sonra yeni yaprakların oluşumu gözlemlenmiş ve ardından %60,0'lık bir hayatta kalma oranı gösteren saha koşullarına aktarılmıştır.

Aklimatizasyon sırasında köklenme başarısı ve hayatta kalma, kök başlatma aşamasına getirilen mikro sürgünlerin kalitesine büyük ölçüde bağlıdır. McGranahan ve Driver (1987) 'Paradox' için çoğaltmadan elde edilen 3 ila 10 cm boyundaki güçlü mikro sürgünlerin kullanılmasını tavsiye etmiştir. McGranahan ve Driver (1987) İran cevizinin iklimlendirilmesi için bu tanımı genişletmiş ve rafine etmiş, sadece apikal uçlarında nekroz ve/veya yaprak dökümü olmayan mikro sürgünlerin iklimlendirme aşamasında hayatta kalmasının muhtemel olduğunu belirtmiştir. Licea-Moreno (2016) da Mj209x Ra melez fidan klonları için, yeşil ve bol yapraklı sağlıklı ve güçlü mikro sürgünlerin köklenmeye ve pişkinleşme sırasında *ex vitro* koşulların üstesinden gelmeye daha hazır olduğunu belirtbildirmiştir.

6. DİĞER FAKTÖRLER

Sıcaklık, su alımını ve besin metabolizmasını etkileyerek ve enzimatik faaliyetleri teşvik ederek veya engelleyerek adventif köklenmeyi etkileyebilir (Geiss ve ark., 2018) Sıcaklığın *in vitro* ceviz köklenmesi üzerindeki etkisi hakkında çok az araştırma vardır Payghamzadeh ve Kazemitabar 2011). *J. nigrax J. regia* 'A35' köklenmesi 22ºC'de (%60) 27°C'ye (%45) göre daha fazla olmuştur (Dolcet-Sanjuan ve ark. 2004) Benzer şekilde, Vahdati ve ark. (2004) 22ºC'deki indüksiyonun 'Sunland' (%94'e kars1 %50), 'Chandler' (%42'ye karsi %13) ve 'Vina'da (%25'e karsi %3) 30° C'ye göre daha fazla köklenme sonuçlandığını bulmuştur. Genel olarak, 20-28°C aralığındaki sıcaklıklar ceviz kök indüksiyonu için faydalı olmuştur (Leslie ve McGranahan, G.H. 2009).

Hangi tür ve genotiplerin köklenmesinin en zor olduğu konusunda farklılıklar vardır. Nitekim Gruselle ve Boxus (1990) aynı kültür koşullarını kullanarak *J. regia* için hibrit 'Paradox' klonlarından (sırasıyla %46,4 ve 2,9) daha iyi köklenme başarısı (%64,8) ve mikro sürgün başına daha fazla kök (4,22) elde etmiştir. Bunun yanında Dolcet-Sanjuan ve ark. (2004) ceviz

melezlerinin (*J. nigrax J. regia*) klonlarnin *J. regia* klonlarından daha kolay köklendiğini gözlemlemiştir. Bununla birlikte, Jay-Allemand ve ark. (1992) *J. major* klonlarının ve *J. regia* hibritlerinin *J. sieboldianax J. regia, J. nigra*'dan daha yüksek köklenme yüzdelerine sahip olmasına rağmen *J. nigra* klonları arasında da çarpıcı farklılıklar gözlemlenmiştir. *In vitro* protokollerin düşük tekrarlanabilirliği, aynı genotiplerin ve değişkenlerin değerlendirildiği ve aynı protokollerin izlendiği durumlarda bile farklı laboratuvarlardan elde sonuçların karşılaştırılmasını oldukça karmaşık hale getirmektedir (Yegizbayeva ve ark. 2021)

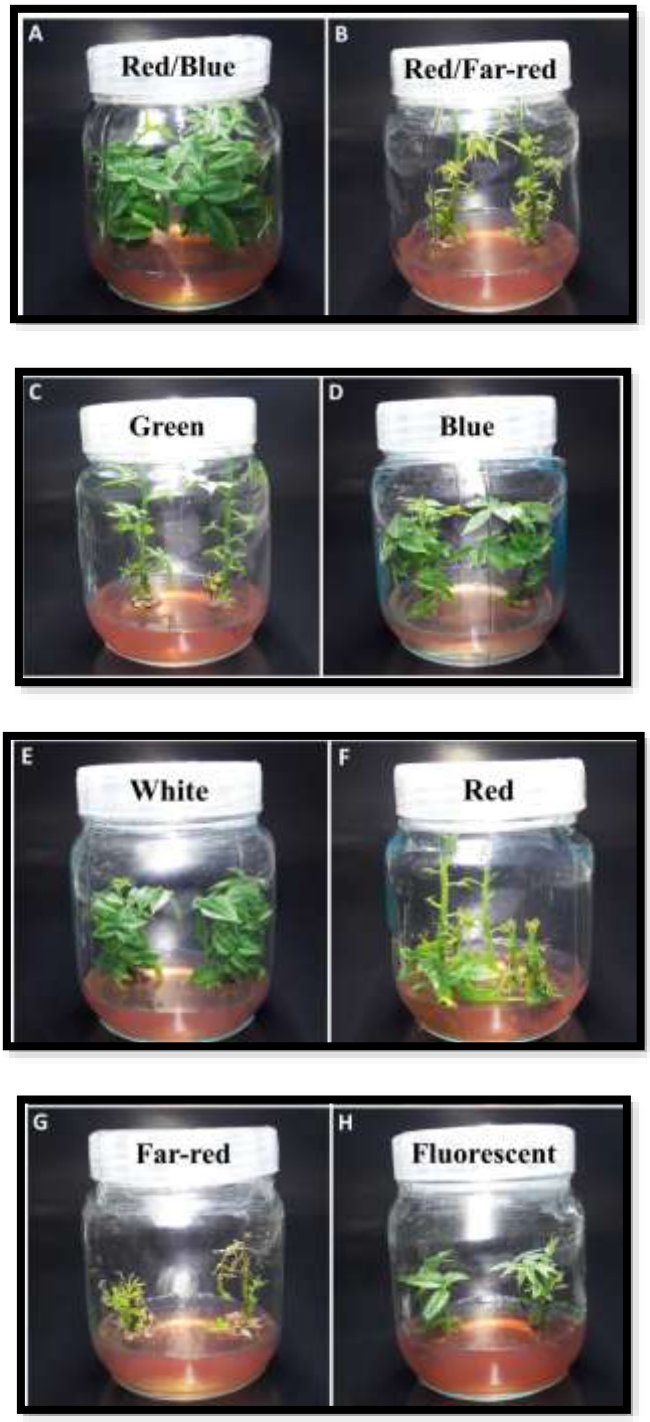
Kültür ortamının fiziksel desteği de köklenme başarısını etkiler. Leslie ve ark. (2005) jelleşmiş kültür ortamının sıvıdan daha iyi olduğunu bulmuştur. Jelrite ve Kobe Agar arasında da farklılıklar gözlemlenmiştir. Jay-Allemand ve ark. (1992) kök uzamasını ve ikincil köklerin gelişimini teşvik etmek için *in vitro* ekspresyon ortamında vermikülit kullanılmasını önermiştir. Ortamdaki nispeten düşük tuz konsantrasyonlarının mikro sürgünlerin köklenmesini arttırdığı bilinmektedir (Murashige, 1979). Pijut (1997), mikro çeliklerin köklendirilmesinde ½ MS ortamını kullanmıştır. Scaltsoyiannes ve ark. (1997) sürgünlerde kök indüksiyonu için ¼ konsantrasyonda makro element içeren DKW bazal ortamını kullanmıştır. Ayrıca, NO_3/NH_4 oranı 0,1'den 3,0'a yükseldiğinde, eksplant başına kök sayısında bir artış olduğunu bildirmiştir. Hyndman ve ark. (1982) KNO_3 ve NH_4NO_3 konsantrasyonunda bir azalmanın köklenme yüzdesini artırmada belirleyici faktör olduğunu ifade etmişlerdir.

İn vitro çoğaltmada ışık önemli bir faktördür. Son yıllarda farklı ışık kaynaklarının etkileri ile ilgili birçok çalışma yürütümüştür. Işık, *in vitro* doku kültürü uygulamaları ve *ex vitro* iklimlendirme sırasında üretilen bitkicikler için önemli bir süreç olan fotosentezde önemli bir rol oynar. Doku kültürü uygulamalarında, floresan ışıklar, yüksek basınçlı sodyum ışıklar, metal halojenür ışıklar ve akkor ışıklar dahil olmak üzere yapay ışık kaynakları kullanılmıştır (Dutta Gupta ve Jatothu, 2013; Cavallaro ve ark, 2022). Floresan ışıklar doku kültürü odalarında en yaygın kullanılan ışıklardır (Economou ve Read, 1987). Işık spektrumlarının yoğunluğunu ve bileşimini kontrol etme ve ayarlama olanakları sınırlıdır ve bu parametreler sabit olmayıp doku kültürü bitkilerinin büyümesi sırasında değişir (Bantis ve ark, 2016). Kırmızı ve uzak kırmızı ışıkların düşük yoğunluğu nedeniyle, çok az fotosentetik olarak aktif radyasyon yayarlar (PAR= %20-30). Bu ışıkların dalga boyu genellikle yeşil ve mavi bölgededir (Miler ve ark, 2019). Doku kültürü bitkilerinin üretiminde floresan ışıkların kullanımı ayrıca elektrik tüketimiyle ilişkili önemli maliyetlere neden olur. Bu nedenle, bitki doku kültürü laboratuvarlarında başarılı ticari mikro çoğaltma için, üretim verimliliğini artırmak, maliyetleri düşürmek ve doku kültürü bitkilerinin kalitesini iyileştirmek için etkili bir ışık kaynağına ihtiyaç vardır.

Fotosentetik sistemin uygunsuz gelişimi ve *in vitro* kültür sırasında stomaların bozulması, bitki dokusunun bir dizi morfolojik ve fizyolojik bozukluğuna yol açabilir (Urban ve ark., 2017). Doku kültürü yapılan bitkiler *in vitro* da normal görünse de, aktif olarak fotosentez yapma olasılıkları düşüktür (Askari ve ark., 2022). Doku kültürü bitki üretiminin büyük ölçekteki eksikliklerinin üstesinden gelmek için, *in vitro* koşullarda yeni çevre kontrol sistemlerinin geliştirilmesi gereklidir.

Ceviz çoğaltma sürecinde önemli bir adım, ceviz doku kültürü bitkilerinin *in vitro* pişkinleştirilmesidir (Vahdati ve ark., 2021). *In vitro* pişkinleştirme, doku kültüründe yetiştirilen bitkilerin *ex vitro* saha koşullarına adapte edildiği bir işlemdir. Bu işlem anormalliklerin

kademeli olarak üstesinden gelinmesini ve *ex vitro* koşullarına adaptasyonu içerir (McCartan ve ark., 2004). *In vitro* kuruma, bitkilerin nakilden hemen sonra ölmesine yol açabilen hızlı su kaybının sonucudur. Bu nedenle, doku kültürü ceviz bitkilerinde verimli stomaların gelişimi hayati önem taşır. Morfogenez ve ilgili konular, esas olarak mavi, kırmızı ve uzak kırmızı ışık spektrumları aralığındaki fotonlar tarafından aktive edilen çeşitli fotoreseptörler tarafından düzenlenir (Griffin ve Toledo-Ortiz, 2022). Son yıllarda, ışık yayan diyotlar (LED'ler), doku kültürü bitkilerinin büyümesi ve gelişmesi için potansiyel bir alternatif ışık kaynağı olarak kullanılmıştır. LED'ler, bitkilerin ihtiyaçlarına uygun ışık kalitesinin manipüle edilmesine olanak tanır (Trivellini ve ark., 2023). Geleneksel sistemlerle karşılaştırıldığında, LED aydınlatma sistemleri dayanıklılık, küçük boyut, uzun çalışma ömrü, nispeten soğuk yayma yüzeyi, elektrik giriş akımıyla doğrusal bir foton çıkışı ve spektral bileşimi kontrol etme yeteneği gibi benzersiz avantajlara sahiptir (Brown ve ark., 1995). Fotosentez ışık spektrumundan doğrudan etkilenir ve fotosentez bitki büyümesi için gereken karbonhidratları sağladığından, farklı ışık spektrumlarının doku kültürü eksplantlarının fotosentetik performansını etkileyebileceği varsayılmıştır (şekil 5).



Şekil 5. Farklı ışık kaliteleri altında yetiştirilen 'Chandler'ın *in vitro* eksplantlarının morfolojisi: (A) Kırmızı ve mavi ışığın kombinasyonu (70:30), (B) kırmızı ve uzak kırmızı ışığın kombinasyonu (70:30), (C) yeşil (530 nm'de dalga boyu tepe noktası), (D) mavi (460 nm'de dalga boyu tepe noktası), (E) beyaz ışık (400-700 nm), (F) kırmızı (660 nm'de dalga boyu tepe noktası), (G) Uzak kırmızı ışık (730 nm'de dalga boyu tepe noktası), (H) floresan ışık (380-750 nm) (Saeedi ve ark., 2023).

Farklı karbon kaynakları, farklı odunsu türlerin rizogenezini etkileme kabiliyetlerini göstermiştir. Cevizin kök ekspresyonu aşamasında çoğunlukla sükroz kullanılmış olsa da, diğer karbon kaynaklarının da uygun olduğu kanıtlanmıştır. Licea-Moreno ve ark. (2012), Mj209x Ra melezinin köklenmesi için kök ekspresyon kültür ortamına fruktoz eklemiş ve genotipe bağlı olarak en iyi uygulama için %57,4 ila %90,9 köklenme oranı elde etmiştir. Genel olarak, fruktozun kök oluşumu için glukoz veya sükrozdan daha iyi bir destekleyici olduğu bildirilmiştir (Licea-Moreno ve ark., 2015).

7. SONUÇ

Bitki ıslah yöntemleri, bitkilerin vejetatif olarak çoğaltılabilme yeteneğine sahip olması durumunda başarılı ve etkilidir. Bu nedenle, cevizin vejetatif çoğaltımının zorluğu göz önüne alındığında, cevizin farklı vejetatif çoğaltım yöntemlerini araştırmak ve bunlarla ilgili farklı veriler toplamak çok önemlidir. Günümüzde, ceviz geleneksel olarak aşılama ile güvenilir bir şekilde çoğaltılsa da, bu uygulamanın başarısı çevresel ve içsel faktörlerden etkilenir. Bunun yanında, hipokotil, epikotil ve mikro/mini aşılama teknikleri oldukça etkili yöntemler olarak tanıtılsa da bu yöntemlerin optimizasyonu için daha fazla araştırmaya ihtiyaç duymaktadır.

Mikro çoğaltma, kısa bir süre içinde (yaklaşık bir yıl) minimum eksplant miktarlarıyla sayısız bitki üretmeyi sağlayan en değerli çoğaltma yöntemi olarak kabul edilir. Şu anda, dünya çapında yalnızca birkaç önemli şirket ve araştırmacı, cevizleri doku kültürüyle çoğaltma protokollerine ve yeteneğine sahiptir. Doku kültürü üretiminin başarısında çeşitli faktörler rol oynar ve ceviz kültürünün doku kültürü üretiminden sonra bile en kritik sorun, bunların arazi koşullarına adaptasyonudur. Bütün bu süreçlerle ilgili yapılan çalışmalarda başarılı sonuçlar elde edilse de birçok durumda bu sonuçların geçerliliği olmamaktadır. Özellikle klonal ceviz anaçlarının mikro çoğaltımında bu problemlerin çözümüne dönük daha fazla araştırmaya ihtiyaç vardır.

ABSTRACT

Peanut belongs to the Leguminosae family and is an economically important oil, feed and food crop. It is widely grown in tropical and subtropical regions of the world. Although peanut kernels are the most important product of the peanut plant, all parts of the plant are useful and can be used in various ways. Peanut seeds are a rich source of nutrients and have various health benefits. The seeds contain 40-55% oil, 20-35% protein and 10-20% carbohydrates. They also provide 567 kcal of energy from 100 g of seeds. Being a legume, peanut increases the nitrogen content of the soil by fixing the free nitrogen of the air through special Rhizobium bacteria in the roots. Thus, it allows the use of less nitrogenous mineral fertilizers in the areas where it is grown and provides economical and ecological contribution. According to 2022 figures, 54,238,560 tons of product was obtained from 305,362,630 decares of land in the world, while the average yield was 177.62 kg/da. In the same year, while 186,340 tons of product was obtained from 457,000 decares in Turkey, the average yield was 407.74 kg/da, well above the world average. According to TUIK data, 70% of the peanut production in Turkey is realized in Adana and Osmaniye provinces. These provinces are followed by Şırnak, Antalya, Gaziantep and Kahramanmaraş. In 2017, 165,330 tons were produced on 419,495 decares of area, while this figure was realized as 185,137 tons on 460,098 decares of area in 2023. When peanut is analyzed according to their usage areas, they are an important raw material for the oil industry in the world. However, its use in the oil industry is not preferred in our country. In recent years, it is seen that peanuts are generally consumed as a food in our country, although peanut butter and peanut flour for use in bakery products have become widespread in our country. The main problems in peanut production are high input costs, drying problems, price instability, climate change and water scarcity. As a solution to these problems; drought resistant varieties, mobile drying systems, cooperatives and cooperative support can be offered. This presentation aimed to discuss the production status of peanuts in the world and in Turkey and the problems encountered in peanut production and their solutions.

Keywords: Peanut, Leguminosae, Oil, Production, Production problems

YER FISTIĞI (*Arachis hypogaea* L.) YETİŞTİRİCİLİĞİ VE TÜRKİYE'DEKİ ÖNEMİ

ÖZET

Yer fıstığı Leguminosae (Baklagiller) familyasından olup, ekonomik açıdan önemli bir yağ, yem ve gıda ürünüdür. Dünyanın tropikal ve subtropikal bölgelerinde yaygın olarak yetiştirilir. Yer fıstığı tohumları yer fıstığı bitkisinin en önemli ürünü olmasına rağmen, bitkinin tüm kısımları faydalıdır ve çeşitli şekillerde kullanılabilir. Yer fıstığı tohumları, zengin bir besin kaynağıdır ve sağlığa çeşitli faydaları vardır. Tohumları %40-55 yağ, %20-35 protein ve %10-20 karbonhidrat içerir. Ayrıca 100 gr tohumdan 567 kcal enerji sağlarlar. Baklagillerden olduğu için yer fıstığı, köklerindeki özel *Rhizobium* bakterileri vasıtasıyla, havanın serbest azotunu bağlayarak, toprağın azot içeriğini artırır. Böylece, yetiştirildiği alanlarda daha az azotlu mineral gübre kullanımına imkân verip, ekonomik ve ekolojik katkı sağlar. 2022 yılı rakamlarına göre dünyada 305 362 630 dekarlık alandan 54 238 560 ton ürün elde edilirken, ortalama verim 177.62 kg/da olarak gerçekleşmiştir. Aynı yıl ülkemizde 457 000 dekardan 186 340 ton ürün elde edilirken, ortalama verim dünya ortalamasının hayli üzerinde olarak 407.74 kg/da olarak gerçekleşmiştir. TÜİK verilerine göre, Türkiye'de yapılan yer fıstığı üretimin % 70'i Adana ve Osmaniye illerinde gerçekleşmektedir. Bu illeri Şırnak, Antalya, Gaziantep ve Kahramanmaraş illeri takip etmektedir. 2017 yılında 419 495 dekar alanda 165 330 ton üretim yapılırken 2023 yılında bu rakam 460 098 dekar alanda 185 137 ton olarak gerçekleşmiştir. Yer fıstığı kullanım alanlarına göre değerlendirildiğinde, dünyada yağ sanayisi için önemli bir ham maddedir. Fakat ülkemizde yağ sanayisinde kullanımı tercih edilmemektedir. Son yıllarda ülkemizde yer fıstığının, yer fıstığı ezmesi ve özellikle unlu mamullerde kullanılmak üzere yer fıstığı unu olarak kullanımı yaygınlaşsa da genellikle çerez olarak tüketildiği görülmektedir. Son yıllarda yer fıstığı üretiminde başlıca; yüksek girdi maliyetleri, kurutma sorunu, fiyat istikrarsızlığı, iklim değişikliği ve su kıtlığı gibi sorunlar vardır. Bu sorunlara çözüm olarak ise; kuraklığa dayanıklı çeşitler, mobil kurutma sistemleri, kooperatifleşme ve kooperatif desteği gibi uygulamalar sunulabilir.

Bu bildiride, yer fıstığının dünyadaki ve Türkiye'deki üretim durumu, yer fıstığı üretiminde karşılaşılan sorunlar ve çözüm önerileri tartışılmıştır.

Anahtar Kelimeler: Baklagil, Yer fıstığı, Üretim, Üretim sorunları

1. GİRİŞ

Yer fıstığı, Leguminosae (Baklagiller) familyasından olup tohumları için yetiştirilen yağ ve protein kaynağı olarak önemli bir endüstri bitkisidir. Yer fıstığı ekonomik açıdan önemli bir yağ tohumu, yem ve gıda ürünüdür ve dünyanın tropikal ve subtropikal bölgelerinde yaygın olarak yetiştirilir. Yer fıstığının botanik adı olan *Arachis hypogaea* Linn., yabani ot anlamına gelen Yunanca 'arachos' ve toprak altı/yer altı odası anlamına gelen hypogaea kelimelerinden türetilmiştir ve toprakta meyve/bakla üreten bir yabani ot/bitkiyi ifade eder. 30-50 cm boyunda büyüyen ve 2/5 fillotakside (iki zıt çift; terminal yaprakçık yok) tetra foliat yapraklar taşıyan tek yıllık, otsu bir bitkidir (Prasad vd 2011). Yer fıstığı tohumları yer fıstığı bitkisinin en önemli ürünü olmasına rağmen, bitkinin tüm kısımları faydalıdır ve çeşitli şekillerde kullanılabilir.

Yer fıstığının en önemli ürünü olan yer fıstığı tohumları zengin bir besin kaynağıdır ve çeşitli sağlık yararları sağlar. Tohumları %40-55 yağ, %20-35 protein ve %10-20 karbonhidrat içerir. 100 gr tohumdan 567 kcal enerji sağlarlar (Arıoğlu, 2007). Yer fıstığı yağı, palmitik (%7-12), oleik (%40-50) ve linoleik (%25-35) olmak üzere yedi yağ asidi içerir ve toplam yağ asitlerinin yaklaşık %90'ını oluştururlar. %80'den fazla oleik asit içeren yüksek oleik hatlar da mevcuttur. Ayrıca, tohumları kalsiyum, fosfor, demir ve çinko gibi mineraller; E gibi vitaminler ve tiamin, pantotenik asit, riboflavin, foliatlar ve niasin gibi B-kompleks grupları; p-kumarik asit ve resveratrol gibi antioksidanlar açısından iyi bir kaynaktır ve biyolojik olarak aktif polifenoller, flavonoidler ve izoflavonlar içerir. Yağ çıkarıldıktan sonra elde edilen fıstık unu, hayvancılık ve kümes hayvanları için yüksek proteinli zengin bir yemdir. Birincil bileşenler ham protein (%45,6), şeker (%32,50), yağ (%2,5), lif (%8,3) ve küldür (%5,0). Ayrıca lizin, metiyonin, sistein, treonin ve arginin gibi amino asitlerin ve kalsiyum, fosfor, sodyum ve potasyum gibi minerallerin zengin bir kaynağıdır.

Baklagillerden olduğu için yer fıstığı köklerindeki özel *Rhizobium* bakterileri vasıtasıyla havanın serbest azotunu bağlayarak toprağın azot içeriğini artırır. Böylece, yetiştirildiği alanlarda daha az azotlu mineral gübre kullanımına imkân verir.

Dünyada yer fıstığı üretim bakımından yağlı tohumlu bitkiler arasında dördüncü sırada yer almaktadır. 2022 yılı rakamlarına göre dünyada 305.362.630 dekarlık alandan 54.238.560 ton ürün elde edilirken ortalama verim 177,62 kg/da olarak gerçekleşmiştir (FAO, 2022). Aynı yıl ülkemizde 457.000 dekardan 186.340 ton ürün elde edilirken, ortalama verim dünya ortalamasının hayli üzerinde olarak 407,74 kg/da olarak gerçekleşmiştir. Yer fıstığı kullanım alanlarına göre değerlendirildiğinde dünyada yağ sanayisi için önemli bir ham maddedir. Fakat ülkemizde yağ sanayisinde kullanımı tercih edilmemektedir. Ayrıca ülkemizde son yıllarda yer fıstığının, yer fıstığı ezmesi ve unlu mamullerde yer fıstığı unu olarak kullanımı yaygınlaşsa da genellikle çerez olarak tüketildiği görülmektedir (Şahin, 2014).

Yer fıstığı tohumunda yüksek miktarda riboflavin, tiamin, nikotinik asit ve E vitamini bulunmakla birlikte A, C ve D vitaminlerinin miktarı yok denecek kadar azdır. Yer fıstığının kavrulması işlemi sırasında tiamindeki azalmaya karşılık niasin ve riboflavin vitaminleri miktarlarında önemli bir değişme olmadığı rapor edilmiştir (Anonim, 2006). Yapılan araştırmalar sonucunda yer fıstığının, resveratrol (3, 4', 5-trihidroksi-stilben), fenolik asitler, flavonoidler ve fitosteroller gibi biyoaktif bileşikler bakımından zengin olduğu, ayrıca koenzim Q10 ve arjininin içeriğinin de yüksek olduğu saptanmıştır (Özalp ve Kürklü, 2020).

Resveratrol; kanser, kardiyovasküler hastalıklar, nörolojik hastalıklar gibi birçok kronik hastalığın temelinde bulunan inflamasyona karşı koruyucudur (Arya vd., 2016). Yer fıstığının içerdiği çoklu doymamış yağ asitleri (ÇDYA) miktarının fazla, doymuş yağ asitleri (DYA) miktarının ise düşük olduğu, ayrıca birçok vitamin, mineral ve fenolik bileşiklerden zengin olması nedeniyle kardiyovasküler hastalıklardan, Alzheimer, Parkinson gibi sinir hücresi kaybına neden olan nörodejeneratif hastalıklara ve çeşitli kanser türlerine kadar birçok hastalığın önlenmesinde ve tedavisinde etkili bir gıda olduğu belirtilmektedir (Chen vd., 2005; Delmas vd., 2006).

Yer fıstığı kolesterol içermemesi ve kompleks karbonhidrat olan posa içeriği bakımından zengin olması nedeniyle iyi bir besin kaynağıdır. Bunlara ek olarak yer fıstığı tohumlarının ham protein içeriğinin %22-30 civarında olması, vejetaryenler ve veganlar için sağlıklı bir diyetsel protein kaynağı olarak değerlendirilmektedir (Mutegi vd., 2013).

Yer fıstığı, 20 amino asidin tümünü farklı oranlarda içermekle birlikte önemli bir aminoasit olan arjininin en önemli kaynağı olma özelliğini taşımaktadır. Protein sindirilebilirliğine göre düzeltilmiş amino asit skoruna (Protein digestibility corrected amino acid score [PDCAAS]) göre yer fıstığı ve soya gibi diğer baklagillerin büyüme, gelişme ve sağlıklı bir yaşam sürdürülmesi için et ve yumurtadan sonra gelen protein kalitesi yüksek bir gıda olduğu belirtilmektedir (FAO, 2002). Bitkisel kaynaklı protein bakımından zengin olan yer fıstığının, içerdiği posa ve çeşitli biyoaktif bileşenlerden dolayı da sağlık üzerine olumlu etkileri bulunmaktadır (Wu vd., 2009).

Yer fıstığı, dünya çapında 100'den fazla ülkede farklı tarımsal ekolojik ortamlarda yetiştirilmektedir. Ancak, ana yetiştirme, toplam yer fıstığı alanının ve üretiminin büyük bir kısmını oluşturan Asya ve Afrika'nın gelişmekte olan ülkeleriyle sınırlıdır.

Hem gelişmiş hem de gelişmekte olan ülkelerde fıstık tüketim modelinde gözle görülür bir farklılık vardır. Gelişmekte olan ülkelerde üretilen fıstığın çoğu, iç tüketim ihtiyaçlarını karşılamak için yağ çıkarmak üzere işlenirken, ABD gibi gelişmiş ülkelerde çoğunlukla bir gıda kaynağı olarak tüketilir. Yıllar geçtikçe, gelişmekte olan ülkelerde bile, şekerleme sınıfı fıstıklara yönelik artan uluslararası pazar talepleri ve diğer daha ucuz alternatif yağların bulunabilirliği ile eğilim daha çok gıda kaynağına doğru kaymıştır. Afrika'da fıstık kavrulmuş, haşlanmış veya çiğ olarak ve fıstık ezmesi olarak tüketilir. Arjantin ve Brezilya'da büyük miktarda şekerleme fıstığı kavrulmuş kuruyemiş olarak veya fıstık şekerlemesi gibi atıştırmalık yiyecekler olarak paketlenmiş halde tüketilir. ABD'de fıstık tüketimi çoğunlukla fıstık ezmesi, paketlenmiş atıştırmalık kuruyemişler (tuzlu, tuzsuz, aromalı ve balla kavrulmuş) ve fıstık şekerlemeleri şeklindedir.

Fıstık, dünyanın en büyük bitkisel yağ kaynaklarından biridir. Amerika Birleşik Devletleri Tarım Bakanlığı (USDA) veri tabanlarına göre, fıstık dokuz büyük yağlı tohum bitkisi arasında bitkisel yağ üretiminde dünya çapında beşinci sıradadır (http://www.fas.usda.gov/psdonline/psdHome.aspx, 2025). Fıstık yaygın olarak bir yağlı tohum mahsulü olarak görülse de fıstıkların kullanımı ülkeden ülkeye büyük ölçüde değişmektedir. Bazı ülkelerde üretimin büyük kısmı yağ için işlenirken, Amerika Birleşik Devletleri gibi ülkelerde fıstıklar öncelikle gıda olarak kullanılır. Ayrıca yetiştirildiği ülkelerde çiftçilerin nakit gelirinin de önemli bir kaynağıdır.

2. DÜNYA'DA YER FISTIĞI ÜRETİMİ

Dünya'da en fazla yer fıstığı üretimi yapan ülkelerin üretim alanları, üretim miktarları ve verim değerleri Tablo 1'de verilmiştir.

Tablo 1. Dünyada en fazla yer fıstığı üretimi yapan ülkeler

Ülkeler	Üretim Alanı (da)	Üretim Miktarı (ton)	Verim (kg/da)
Dünya	305.362.630	54.238.560,13	177,62
Türkiye	457.010	186.340	407,74
Malavi	4.000.000	350.000	87,50
Arjantin	4.064.770	1.346.166	331,18
Kamerun	4.500.000	500.000	111,11
Mali	4.789.670	442.679	92,42
Kongo	5.100.000	486.389	95,37
ABD	5.606.600	2.525.670	450,48
Burkina Faso	6.237.690	559.064,4	89,63
Çad	7.626.420	829.431	108,76
Gine	8.542.870	1.025.144,1	120
Nijer	10.037.620	670.613,5	66,81
Tanzanya	10.200.000	710.000	69,61
Myanmar	11.941.610	1.741.377,8	145,82
Senegal	12.251.720	150.1498	122,55
Sudan	30.000.000	2.500.000	83,33
Nijerya	34.000.000	4.284.000	126
Çin	44.400.000	18.329.500	412,83
Hindistan	57.047.400	10.134.990	177,66

(FAO, 2022)

2022 yılında dünyada 305.362.630 dekar alandan 54.238.560,13 ton yer fıstığı elde edilmiş olup dünya verim ortalaması 177,62 kg olarak gerçekleşmiştir (FAO, 2022). Dünya yer fıstığı üretimine baktığımızda en fazla üretimin, Afrika ve Asya ülkelerinde gerçekleştiği görülmektedir. Ancak Afrika ülkelerindeki üretim alanları fazla olmasına rağmen, dekardan

elde edilen verimin çok düşük düzeylerde kalmasından dolayı üretim miktarı istenilen düzeye ulaşamamıştır. Özellikle Nijer ve Tanzanya 10 milyon dekar üretim alanına sahipken, dekara elde edilen verimin 66 kg civarında olması nedeniyle üretim miktarı 700 bin ton civarında kalmıştır. Dünya'da en fazla yer fıstığı üreten ülkelere baktığımızda Hindistan ve Çin'in ilk sıraları aldığı görülmektedir. Özellikle Çin'de yetiştirilen yer fıstığının verim değeri (412,83 kg/da) ABD'den (450,48 kg/da) sonra ikinci sıradadır. Türkiye'de yer fıstığı üretim alanı 457 bin dekar iken verim, dünya ortalamasının çok üzerindedir (407,74 kg/da). Bu durum ülkemiz iklimi ve toprak yapısı yer fıstığı tarımı için çok uygun olduğunun önemli bir göstergesidir.

3. YER FISTIĞININ TÜRKİYE'DEKİ ÜRETİM DEĞERLERİ

Tablo 2. Türkiye'de en fazla yer fıstığı üretimi yapılan illerin ekim alanı, üretim miktarı ve verim değerleri

İller		2017	2018	2019	2020	2021	2022	2023

(TÜİK, 2024)

TÜİK verilerine göre, Türkiye'de yapılan yer fıstığı üretimin %70'i Adana ve Osmaniye illerinde gerçekleşmektedir. Bu illeri Şırnak, Antalya, Gaziantep ve Kahramanmaraş illeri takip etmektedir. Ancak, son yıllarda Şırnak ilinde gerçekleşen yer fıstığı üretiminde önemli bir artış görülmektedir. 2017 yılında 419.495 dekar alanda 165.330 ton üretim yapılırken 2023 yılında bu rakam 460.098 dekar alanda 185.137 ton olarak gerçekleşmiştir. 2017 ve 2023 yıllarında gerçekleştirilen üretim alanları ve miktarlarına baktığımızda önemli bir değişikliğin olmadığı görülmektedir. Ancak, 2019 yılında Türkiye'de yer fıstığı üretim alanı 424.211 dekar ve üretim 169.328 ton iken bu rakam, 2020 yılında 547.747 dekar ve 215.927 tona çıkmıştır. Yer fıstığı tarımının en fazla yapıldığı Adana'da, yer fıstığı üretim alanları 2020 yılında bir önceki yıla

kıyasla yaklaşık %30'luk bir artış göstermiştir. Bunun yanı sıra Şırnak'taki üretim alanı 2017 yılında 5000 dekardan, 2020 yılında yaklaşık %1300'lük bir artış göstermiş ve 63.750 dekarlara çıkmıştır. 2021 yılında ülkemizde 579.192 dekar alanda 234.167 ton yer fıstığı üretimi yapılmış ve bu artışa en fazla katkı sağlayan yine Adana ve Osmaniye illeri olmuştur. Adana'da yer fıstığı üretimi yapılan alanda çok fazla bir değişiklik olmazken, Şırnak'ta 2021 yılındaki üretim miktarı 2020 yılına göre daha da artarak 63.750 dekar 24946 ton üretimden ve 75.575 dekar ve 29.696 tona ulaşmıştır.

4. YER FISTIĞI ÜRETİMİNDE SORUNLAR

4.1.İKLİM DEĞİŞİKLİĞİ VE SU SIKINTISI

İklim değişikliği sonucu temiz su kaynaklarının azalması nedeniyle her geçen gün temiz su kaynaklarına ulaşım zorlaşmaktadır. Yer fıstığı gibi yaz döneminde yetiştirilen ürünler su kıtlığı sorunundan daha fazla etkilenmektedir. Çünkü yer fıstığı tarımının yapıldığı dönemde vejetasyon süresinin önemli bir kısmında yağmur yağmamakta ve bitkilerin su ihtiyacı sulama yapılarak sağlanmaktadır. Bu bağlamda yer fıstığı tarımının salma su yöntemi yerine, damla sulama yöntemiyle sulanması teşvik edilmelidir. Ayrıca, bu sorunun üstesinden gelebilmek için kuraga dayanıklı yeni çeşitlerin geliştirilmesi ve üretime aktarılması da teşvik kapsamına alınması sağlanmalıdır.

4.2. GİRDİ MAALİYETİNDEKİ SÜREKLİ ARTIŞ

Yer fıstığı tarımındaki girdilerde sürekli bir artış söz konusudur. Bunların başında, tarla kirası gelmektedir. Çiftçi tarlaya ekim yapmadan alacağı ürünün yarısını tarla kirası olarak vermek durumunda kalmaktadır. Bunun yanı sıra mazot, gübre ve sulamada kullanılan elektrik fiyatlarında da her geçen yıl önemli artışlar olmakta ancak, üretici bu artışları fiyata yansıtamamaktadır. Bu nedenlerle, yer fıstığı tarımı yapan üreticilere kooperatifler tarafından vade farksız gübre ve mazot sağlanması üreticiye önemli katkı sağlayacaktır.

4.3. İKİNCİ ÜRÜN TARIMINDA KURUTMA PROBLEMİ

Yer fıstığı üretiminin yaklaşık %30'u ikinci ürün olarak gerçekleşmektedir (İşler ve Gözüyeşil, 2016). Yer fıstığı tarımında ürünlerin kurutulması doğal yollarla güneşe sermek suretiyle yapılmaktadır. Ancak, bu durum ikinci ürün yetiştiriciliğinin hasadında sorunlara neden olmaktadır. Çünkü ikinci ürün hasadında, hasatlar yağmurlu döneme denk gelebilmekte ve bu durum yer fıstığı meyvelerinin kısa sürede kurumasını engelleyebilmektedir. Nemli kalan yer fıstığı meyvelerinde kayıplar ve daha önemlisi aflatoksin oluşumu meydana gelmektedir. Bu sorunun üstesinden gelebilmek için römorklu kurutma sistemlerinin üretime dahil edilmesi önemli faydalar sağlayacaktır.

4.4. YER FISTIĞINDA FİYAT İSTİKTARININ OLMAMASI

Yer fıstığı tarımını etkileyen en önemli faktör, üretim yılları arasında bir fiyat istikrarının olmaması diye söylemek mümkündür. Çünkü tüketim oranında yıllar arasında çok fazla farklılıklar olmamasına rağmen üretim miktarlarında değişiklikler olmaktadır. Bu durum yer fıstığının fiyatını doğrudan etkilemektedir. Bazı yıllar üreticinin birim alandan elde ettiği gelir üretim maliyetinden bile az olabilmektedir. Bunun önüne geçebilmek için yer fıstığı üreticilerinin ürün planlamasını yapmasına yardımcı olacak, tüccar ile fiyat dengesini ayarlayacak ve üretilen yer fıstığının farklı şekillerde işlenip tüketiciye sunulmasını sağlayacak bir kooperatifin kurulması gerekmektedir.

ABSTRACT

Kırşehir is a city located in the Central Anatolia Region and stands out due to the distinct effects of its continental climate. In Kırşehir, winters are cold and rainy, while summers are hot and dry. The city's annual average temperature is 11.5°C, and the average relative humidity is 63 %. Annual rainfall varies between 350 and 500 mm, with an average of 385.4 mm. The rainfall distribution in the province is irregular; the least amount of rainfall occurs during the summer months, when irrigation is most needed. With the end of the rainfall at the beginning of the summer months in Kırşehir, the vegetation that comes to life in the spring quickly turns yellow and dries; this causes the land to have a steppe texture in the summer season. Although Kırşehir has a surface area of 657.012 hectares and is rich in terms of irrigable land, only 9.3% of the total agricultural land can be irrigated; only 42.176 hectares out of 454.720 hectares of agricultural land are effectively irrigated. In Kırşehir, barley ranks first in terms of cereal production, with barley fields covering approximately 40 % of the province. The main reason for this is that barley is largely used as animal feed, making it the most preferred cereal by local farmers. Barley is followed by wheat and oats. Chickpeas, beans, and red and green lentils are produced in Kırşehir among the legumes. Kırşehir ranks 3rd in Turkey for chickpea and green lentil production. Sugar beets, sunflowers for oil and snacks, and potatoes are the main industrial crops grown in the province. The production of forage crops is of great importance in supporting animal husbandry and addressing the deficit in quality roughage. The main forage crops in Kırşehir include silage maize, alfalfa, vetch, and sainfoin. Additionally, the cultivation of medicinal and aromatic plants is also gradually developing in the province.

Keywords: Kırşehir province, cereals, industrial crops, cultivation area

KIRŞEHİR İLİNDE BİTKİSEL ÜRETİM VE TARIMSAL YAPI

ÖZET

Kırşehir, İç Anadolu Bölgesi'nde yer alan ve karasal ikliminin belirgin etkileriyle öne çıkan bir şehirdir. Kırşehir'de kışlar soğuk ve yağışlı, yazlar ise sıcak ve kurak geçer. Şehirde yıllık ortalama sıcaklık 11.5 °C, ortalama nispi nem oranı %63'tür. Yıllık yağış miktarı 350 ile 500 mm arasında değişmekte olup, ortalama yağış 385.4 mm'dir. İlde yağış dağılımı düzensizdir; en az yağış, sulamaya en çok ihtiyaç duyulan yaz aylarında gerçekleşmektedir. Kırşehir'de yaz aylarının başlangıcından itibaren yağışların sona ermesiyle, ilkbaharda canlanan bitki örtüsü kısa sürede sararıp kurur; bu durum arazinin yaz mevsiminde bozkır dokusuna sahip olmasına yol açar. Kırşehir, 657.012 hektarlık yüzölçümüne sahip olup, sulanabilir arazi bakımından zengin olmasına rağmen, toplam tarım arazisinin yalnızca % 9.3'ü sulanabilmekte; 454.720 hektarlık tarım alanından yalnızca 42.176 hektarı etkin bir şekilde sulanmaktadır. Kırşehir'de tahıl üretimi açısından birinci sırayı arpa alır; arpa ekili alan, ilin yaklaşık % 40'ını oluşturur. Bunun başlıca nedeni, arpaların büyük oranda hayvan yemi olarak kullanılmasıdır, bu yüzden bölge çiftçileri tarafından en çok tercih edilen tahıl türüdür. Arpayı, buğday ve yulaf izlemektedir. Kırşehir'de yemeklik tane baklagiller arasında nohut, fasulye, kırmızı ve yeşil mercimek üretilmektedir. Nohut ve yeşil mercimek üretiminde Kırşehir, Türkiye genelinde 3. sırada yer almaktadır. Şeker pancarı, yağlık ve çerezlik ayçiçeği ile patates ise ilde yetiştirilen başlıca endüstri bitkilerindendir. Hayvancılığın desteklenmesi ve kaliteli kaba yem açığının giderilmesi amacıyla yem bitkileri üretimi büyük önem taşımaktadır. Kırşehir'de başlıca yem bitkileri arasında silajlık mısır, yonca, fiğ ve korunga yer almaktadır. Ayrıca, ilde tıbbi ve aromatik bitki yetiştiriciliği de giderek gelişmektedir.

Anahtar Kelimeler: Kırşehir ili, tahıllar, endüstri bitkileri, ekim alanı

GİRİŞ

Kırşehir ili, Türkiye'nin İç Anadolu Bölgesi içinde yer alan Orta Kızılırmak Havzası'nda konumlanmaktadır. İl, Coğrafi koordinatları ise, 34 derece 10 dakika doğu boylamı ve 39 derece 08 dakika kuzey enlemidir. Bu konum, bölgenin hem iklimsel hem de coğrafi özelliklerini belirleyen önemli bir faktördür. Kırşehir'in en yüksek rakımlı bölgelerinden biri olan Göllü Dağı (1.745 metre) gibi dağlık alanlar bulunurken, ilin en düşük rakımlı yerleri ise 850 metreye kadar inen Kızılırmak Vadisi ve çevresidir (Anonim, 2024a).

Kırşehir yöresi, Orta Anadolu'nun jeolojik yapısında önemli bir yere sahip olan Orta Anadolu Masifi'nin bir parçasıdır. Bu bölge, Türkiye'nin en büyük masiflerinden biri olan "Kırşehir Masifi" içerisinde yer alır. Kırşehir Masifi, Türkiye'deki dokuz büyük masiften biri olmasının yanı sıra, yüzölçümü bakımından en geniş olanıdır. Kırşehir ili, Kızılırmak nehrinin oluşturduğu büyük yay şeklindeki alanın içinde konumlanmıştır. Coğrafi sınırları incelendiğinde; kuzeyde Delice Irmağı Vadisi, batıda Kaman-Kılıçözü Vadisi ve doğuda Seyfe Gölü'nün çöküntü alanı ile çevrili olduğu görülür. Bu çöküntü ve vadiler, bölgenin hem doğal sınırlarını belirlemekte hem de rakım açısından daha alçak kesimleri oluşturmaktadır. Söz konusu jeolojik yapı, bölgenin yer şekilleri, tarım alanları ve su kaynakları üzerinde belirleyici bir rol oynamaktadır (Anonim, 2024a).

Kırşehir tarımı, İç Anadolu Bölgesi'nin karasal iklimi ve bozkır ekosisteminin etkisiyle şekillenmiş; zamanla hem geleneksel hem de modern tarım yöntemlerini bir araya getiren bir yapı kazanmıştır. İlde bitkisel üretimin büyük bölümünü tarla bitkileri oluşturur. Buğday, arpa ve nohut başta olmak üzere tahıllar ve baklagiller ön plandadır. Ayrıca şeker pancarı ve ayçiçeği gibi endüstriyel ürünlerin üretimi de önemlidir. Kırşehir merkez ile Kaman çevresindeki alanlarda, kuru tarıma uygun ürünler olan buğday, arpa, mercimek ve nohut yaygın şekilde yetiştirilir. Öte yandan, Hirfanlı Barajı gibi su kaynaklarının sağladığı imkânlarla sulanabilir arazilerde ayçiçeği, şeker pancarı, domates ve çeşitli yem bitkilerinin üretiminde artış gözlemlenmiştir (Anonim, 2024b). Son yıllarda sera faaliyetlerine verilen destekle birlikte elma ve ceviz gibi meyve yetiştiriciliği ile bağcılık alanlarında da önemli gelişmeler yaşanmıştır. Bu çalışmanın amacı; Kırşehir ilinde bitkisel üretim ve tarımsal yapısını ortaya koymaktır.

Şekil 1. Kırşehir İlinin Türkiye'deki yeri ve konumu

Kırşehir İli ve İlçeleri Hakkında Genel Bilgiler

Kırşehir, merkez ilçe dâhil olmak üzere toplam yedi ilçeden oluşan bir ildir ve Türkiye İstatistik Kurumu'nun (TÜİK) 2024 verilerine göre toplam nüfusu 244.546'dır. İl genelinde tarım ve hayvancılık en önemli geçim kaynaklarıdır. Akçakent ilçesinin nüfusu 3.438 olup, 2024 yılında 1.280 kişi tarımla uğraşmaktadır; ilçede tahıl, yağlık ayçiçeği ve yem bitkileri üretilmekte, ayrıca büyükbaş ve küçükbaş hayvancılık yapılmaktadır. Nüfusu 6.918 olan Akpınar ilçesinde 2.168 kişi tarım sektöründe çalışmakta; 208.253 dekar ekilebilir arazi, 100.837 dekar çayır-mera ve 27.534 dekar ormanlık alan bulunmakta, toplamda 46.710 adet büyük ve küçükbaş hayvan varlığı mevcuttur. Boztepe ilçesi 5.229 nüfuslu olup, 2.167 kişi tarımla uğraşmaktadır; 25.500 dekar sulanabilir araziye rağmen sulama yetersizliği verimi düşürmektedir. İlçede kültür ırkı sığırların artışı ve modern mandıraların kurulması hayvancılığa ilgiyi artırmıştır. Çiçekdağı'nın nüfusu 13.908, tarımla uğraşan kişi sayısı ise 3.157'dir; yüksek rakımlı coğrafyasında tahıl, bakliyat ve ayçiçeği gibi ürünlerin üretimi yaygındır. 33.469 nüfusa sahip Kaman ilçesinde 4.940 kişi tarımla uğraşmakta; 807.776 dekar kültür arazisinin 49.510 dekarında sulu tarım yapılmakta ve polikültür tarım uygulanmaktadır. Mucur ilçesi 18.235 nüfusa sahip olup, 3.390 kişi tarımla uğraşmaktadır; toplam 788.100 dekar tarım arazisinin 27.904 dekarında modern yöntemlerle buğday, arpa, ayçiçeği, mercimek ve pancar yetiştirilmektedir. Kırşehir'in en büyük nüfusa sahip ilçesi olan Merkez ilçede 163.349 kişi yaşamaktadır ve 2024'te 4.289 kişi tarımla uğraşmaktadır; toplam 1.156.120 dekar tarım arazisinin %52,8'inde tarla bitkileri, %0,7'sinde sebze, %0,5'inde ise meyve yetiştirilmekte, kalan %46'sı ise sulama olanaklarının kısıtlılığı nedeniyle nadasa bırakılmaktadır. Başlıca ürünler arpa, buğday, patates, şeker pancarı ve ayçiçeğidir.

Kırşehir'in Tarımsal Arazileri: Kullanım Durumu ve Sulama Kapasitesi

Kırşehir ilinin toplam 657 bin hektarlık arazi varlığının 455 bin hektarı tarıma elverişli olup, bu alanın büyük bir bölümü kuru tarım arazisidir (Tablo 1). İşlemeli tarım yapılabilen I., II., III. ve IV. sınıf toprakların toplamı 302.792 hektardır ve bu da tarım arazilerinin yaklaşık %69'unu oluşturmaktadır. Kullanılan tarım alanlarının %66,2'sinde tarla bitkileri, %0,6'sında sebze ve %0,9'unda meyve yetiştiriciliği yapılmaktadır. Kırşehir'in uzun yıllar yıllık ortalama yağış miktarı yaklaşık 380 mm'dir ve bu yağışların büyük kısmı ilkbahar aylarında düşmektedir (Kıymaz, 2011). Bu durum, tarımsal üretimi önemli ölçüde sınırlamaktadır. Tarım arazilerinin yalnızca %9,2'sinde sulama yapılabildiğinden, bölgede yoğun olarak kuru tarım uygulanmakta ve 159 bin hektar (%32,4) alan nadasa bırakılmaktadır. Ayrıca, 45 bin hektarlık tarıma elverişli alan kavaklık, söğütlük gibi tarım dışı amaçlarla kullanılmaktadır (Çizelge 1). Ormanlık, fundalık ve tarıma elverişsiz alanlar ise ilin arazi varlığının 75.406 hektarını (%11,6) kapsamaktadır (Yavuz vd, 2020).

Tablo 1. Kırşehir ilinin kullanım durumuna göre arazi dağılımı (Yavuz vd, 2020)

KULLANIM DURUMU	KIRŞEHİR	
	ALANI (ha.)	%
1.Kültür arazisi varlığı	454.720	69.2
a-Tarla ürünleri ekim alanı	240.323	58.4
b-Nadas alanı	158.947	28.9
c-Bağ alanı	1.850	0.4
d-Meyve bahçesi alanı	3.500	1.0
e-Sebze ekim alanı	5.000	1.3
f-Tarıma elverişli olup kullanılmayan alan	45.100	10
2.Çayır-mer'a alanı	129.027	19.2
3.Orman fundalık alanı	24.706	3.8
4.Tarıma elverişsiz alan	50.700	7.8
TOPLAM	657.012	100

Kırşehir, sulanabilir arazi potansiyeli açısından zengin olmakla birlikte, fiilen sulanan alanlar bakımından oldukça yetersiz bir durumdadır. Toplam 454.720 hektarlık tarım arazisinin yalnızca 42.176 hektarında aktif sulama yapılmaktadır. İl genelinde yıllık 3.221 hm^3 yüzey suyu ve 75 hm^3 yeraltı suyu olmak üzere toplam 3.296 hm^3 su potansiyeli bulunmasına rağmen, tarım arazilerinin sadece %9,3'ü sulanabilmektedir (Anonim, 2025c). Sulanan alanların 31.642 dekarlık kısmı devlet eliyle, 10.534 dekarlık kısmı ise halk sulaması yoluyla gerçekleştirilmektedir. Toprak yapısı ve topoğrafik koşullar göz önüne alındığında, mevcut tarım arazilerinin %80'ine denk gelen 366.222 hektarlık kısmı sulanabilir nitelikte olmasına rağmen, bu alanların yalnızca küçük bir bölümü sulanabilmektedir (Anonim, 2025c).

Kırşehir İlinin İklimsel Özellikleri ve Doğal Bitki Örtüsü

Kırşehir ili, karasal iklimin belirgin özelliklerini taşımaktadır. Kış mevsimi soğuk ve kar yağışlı geçerken, yazlar sıcak ve kurak olmaktadır. Yağışlar genellikle sonbahar ve ilkbahar aylarında düşmektedir. İç Anadolu'yu çevreleyen Toroslar ve Kuzey Anadolu Dağları, Karadeniz ve Akdeniz'in ılıman iklim etkilerinin iç bölgelere ulaşmasını engellediğinden, Kırşehir'de sert karasal iklim koşulları hakimdir.

İlin yıllık ortalama sıcaklığı 11,5 °C, ortalama nispi nem oranı ise %63'tür. Yıllık yağış miktarı 350–500 mm arasında değişmekte olup, ortalama 385,4 mm olarak gerçekleşmektedir (Anonim, 2020). Yağışların büyük bölümü ilkbahar aylarında görülürken, tarımsal faaliyetlerin yoğunlaştığı yaz aylarında yağış miktarı oldukça düşüktür. Bu durum, tarımsal üretim açısından

önemli bir dezavantaj oluşturmaktadır. Ayrıca ilde yağış dağılımı düzensizdir. Kırşehir'de ortalama rüzgar hızı 2,8 m/sn olup, egemen rüzgar yönleri kuzeybatı, kuzey ve kuzeydoğudur. En hızlı rüzgarlar ise güneydoğudan esmektedir.

Yaz aylarının kurak geçmesi nedeniyle, ilkbaharda yeşeren otlar yaz sonunda kurur ve il genelindeki araziler bozkır görünümüne bürünür. Kırşehir, İç Anadolu Bölgesi'nin bozkır kuşağı içinde yer almakta olup, orman örtüsünden büyük ölçüde yoksundur. İlin doğal bitki örtüsünü genellikle step (bozkır) bitkileri oluşturmaktadır. Ormanlık alanlar ilin yüzölçümünün sadece %3,7'sini kaplamaktadır (Anonim, 2024b).

Doğal koşullar nedeniyle kendiliğinden orman oluşumu sınırlı olan ilde, orman alanlarının artırılması ancak bilinçli ağaçlandırma çalışmalarıyla mümkün olabilmektedir. Çiçekdağı'nın kuzey kesimleri ile Akçakent ilçesi çevresinde meşe, karaçam, ardıç ve sedir türlerinden oluşan ormanlık alanlar bulunmaktadır. Bu ormanlar; karaçam, sedir ve kavaktan oluşan verimli korular, karaçam ve sedirden meydana gelen bozuk korular ile meşe ağaçlarından oluşan baltalık formundadır. İlçelere göre orman varlığı incelendiğinde; en geniş ormanlık alana Akçakent sahipken, bunu Çiçekdağı, Merkez İlçe, Kaman ve Mucur ilçeleri takip etmektedir (Anonim, 2024b).

Kırşehir'de Tarımsal Üretim ve Bitkisel Ürünler Analizi

Kırşehir ilinde en fazla ekim alanına sahip olan tahıl türü 1.231 bin ha ile arpadır. Kırşehir ilinde besi hayvancılığında arpa, rasyonlarda önemli bir yer tutmakta ve bu durum, arpanın ilde temel bir kesif yem olarak öne çıktığını göstermektedir. Arpanın bu önemi, TÜİK verilerine de yansımıştır. 2000-2011 yılları arasında Türkiye genelinde arpa üretimi %18 oranında azalırken, Kırşehir'de bu oran %21 artış göstermiştir. Türkiye genelinde ortalama arpa verimi dekara 265 kg iken, TR71 bölgesinde bu rakam 295 kg'a ulaşmıştır. Özellikle Kırşehir ve Nevşehir illerinde arpa tane verimi 300 kg/da 'nın üzerinde gerçekleştiği yıllar olmuştur Tüik verilerine göre 2024 yılında arpanın ortalama verimi 205 kg/da olarak gerçekleşmiştir. Dekara verimlerde 2024 yılındaki bu değişiklik arpa tarımının yapıldığı yıldaki toprak, iklim ve tarımsal uygulamalar gibi birçok faktör etki ettiğinden yıllara göre ortalama verimdeki değişiklik normaldir. İl genelinde 252 bin ton arpa üretilmiştir. Kırşehir'de yürütülen entansif hayvancılıkta arpa tanesi yoğun şekilde değerlendirilmektedir. Arpa tarımını öne çıkarmaktadır (Kır, 2024)

Tablo 3: Kırşehir İli Tahıl Üretim Verileri (Anonim, 2024b)

	Ekilen Alan(da)	Ortalama Verim(kg)	Üretim Miktarı(ton)
Buğday (Durum)	55.358	252	13.925
Buğday	725.796	228	165.144
Mısır	3.724	678	2.526
Arpa	1.231.493	205	252.412
Çavdar	2.460	312	767
Yulaf	44.326	315	13.978
Tritikale	3.037	337	1.022

Kırşehir genelinde 1.231 bin ha alandan 252.412 ton arpa, 781.154 da alandan 179.069 ton buğday, 44.326 da alandan 13.978 ton yulaf, 3.724 da alandan 2.526 ton mısır, 2.460 da alandan 767 ton çavdar ve 3.037 da alandan 1.022 ton ile tritikale danesi elde edilmiştir (Anonim, 2024b). Kırşehir ili tahıl üretimi olarak ilk sırayı arpa alır (Tablo3). Arpa ekilen alan olarak ilin neredeyse %60'lık kısmışını oluşturur. Bunun sebebinin ağırlıklı olarak hayvan yemi olarak kullanılmasından dolayı bölge çiftçisinin en çok tercih ettiği tahıldır. Son yıllarda yaz sıcaklarının ve rüzgarların buğday üzerindeki olumsuz etkileri buğday üretimini düşürmektedir. Üçüncü sırada ise yulaf gelir. Yulaf çiftçiler tarafından büyük oranla hayvan yemi olarak üretilir. Son yıllar üretim verilerine bakıldığı zaman yulaf tarımının artışı gözlenmektedir.

Kırşehir'de baklagil tarımı son yıllarda Tarım ve Orman Bakanlığı'nın sağladığı tohum ve ürün desteklemelerindeki artışlar sayesinde önemli ölçüde gelişme göstermektedir. 2024 yılı TÜİK verilerine göre, Kırşehir nohut üretiminde Türkiye genelinde ilk sırada yer almaktadır. İl genelindeki üretim verilerine göre, 2024 yılında toplam 38.569 ton nohut üretilmiştir ve bu miktar, ilde en fazla üretilen baklagil olmasını sağlamıştır (Anonim, 2024b) (Tablo 3). Çiftçilerin nohuda yönelmesinde en önemli etkenlerden biri, nohudun toprağa azot kazandırma özelliğidir. Ayrıca, münavebe (ürün rotasyonu) sisteminde önemli bir yere sahip olması da nohut ekimini teşvik eden unsurlar arasındadır. Bu nedenlerle, son yıllarda nohut tarımı Kırşehir'de ön plana çıkmıştır. Kırşehir il genelinde baklagil tarımı kapsamında kırmızı mercimek 1.247 dekarlık, yeşil mercimek ise 130.823 dekarlık alanda yetiştirilmektedir. Yeşil mercimek, ekim alanı bakımından önemli bir yer tutmakta ve ildeki baklagil üretimi içinde geniş bir paya sahiptir (Tablo 3). Fasulye tarımı ise 2.390 dekarlık alanda yapılmakta olup, il genelinde sınırlı düzeydedir (Anonim, 2024b). Fasulye üretiminin düşük olmasının başlıca nedeni, bölgede sulama olanaklarının yetersizliğidir. Su ihtiyacı yüksek olan bu ürün, yeterli sulama desteği sağlanmadığında istenilen verim düzeyine ulaşamamakta ve bu durum toplam üretimi olumsuz etkilemektedir (Tablo 3).

Tablo 4: Kırşehir İli Baklagil Üretim Verileri (Anonim, 2024b)

	Ekilen Alan(da)	Ortalama Verim(kg)	Üretim Miktarı(ton)
Fasulye	2.390	181	432
Nohut	354.836	109	38.569
Mercimek(Kırmızı)	1.247	83	103
Mercimek(Yeşil)	130.823	66	8693

Kırşehir'de sanayi kuruluşlarının azlığı, endüstri bitkilerinin üretimini de olumsuz yönde etkilemektedir. İlde en fazla ekim alanına sahip endüstri bitkisi, 92.340 dekarlık alanda yetiştirilen yağlık ayçiçeğidir (Tablo 5). Kırşehir'de endüstri bitkileri arasında işlenme imkânı bulunan tek ürün ise şeker pancarıdır. Bu nedenle, şeker pancarı ekim ve üretim miktarı bakımından diğer endüstri bitkilerine göre öne çıkmaktadır. Ekilen alan bakımından; Şeker pancarı ikinci sırada (34.432 da), patates üçüncü sırada (33.967 da), ayçiçeği (çerezlik)

dördüncü sırada (12.714 da) ve aspir son sırada (11.112 da) alanda tarımı yapılmaktadır (Anonim, 2024b) (Tablo 5).

Tablo 5: Kırşehir İli Endüstri Bitkileri Üretim Verileri (Anonim, 2024b)

	Ekilen Alan(da)	Ortalama Verim(kg)	Üretim Miktarı(ton)
Ayçiçeği(Yağlık)	92.340	127	11.702
Ayçiçeği(Çerezlik)	12.714	122	1.548
Aspir	11.112	99	1.098
Patates	33.967	3.047	103.510
Şeker Pancarı	34.432	7.427	255.713

Kırşehir'de üretilen yem bitkileri arasında, mısır silajı 17.775 dekarlık alanda 97.885 ton ile en büyük üretim alanına sahipken, yonca 17.424 dekarda 35.268 ton ile ikinci sıradadır. Korunga 17.134 dekarda 6.769 ton üretimle üçüncü sıradadır. Fiğ (yeşil ot) 14.166 dekarda 12.370 ton üretimle dördüncü sıradadır. Diğer fiğler 12.780 dekarda 2.812 ton üretimle beşinci sırada yer almaktadır. Yulaf 9.930 dekarda 7.046 ton üretimle altıncı sırada gelirken, tritikale 3.367 dekarda 2.694 ton üretimle yedinci sıradadır. Macar fiğ 2.731 dekarda 2.485 ton üretimle sekizinci sıradadır. Adi fiğ 1.349 dekarda 1.146 ton üretimle dokuzuncu sıradadır. Yemlik bezelye 430 dekarda 955 ton üretimle onuncu sırada yer almaktadır. Son olarak, çayır otu 185 dekarda 204 ton üretimle en küçük alana sahip yem bitkisi olarak on birinci sıradadır. (Anonim, 2024b). Kırşehir ilinde yem bitkileri yetiştiriciliği, toplam 9.3 bin hektar alanda yapılmaktadır ve bu alanlarda 169.934 ton kaliteli kaba yem üretilmiştir (Anonim, 2024b). Kır (2024) göre Kırşehir ilinin toplam hayvan birim sayısı 247.000 olup, bu hayvanların ihtiyaç duyduğu kaliteli kaba yem miktarı 1.127.000 tondur. Kırşehir ili Aksaray, Kırıkkale, Nevşehir ve Niğde illerinden arasında kaliteli kaba yem açığına sahip il konumundadır. İl genelinde kaba yem açığı olmasına rağmen, arpa ekim alanının fazla olması ve entansif hayvancılıkla bağlantılı olarak arpa tanesi, hayvan beslenmesinde yoğun bir şekilde kullanılmaktadır (Kır, 2024).

Tablo 6: Kırşehir İli Yem Bitkileri Yeşil Ot Üretim Verileri (Anonim, 2024b)

	Ekilen Alan(da)	Ortalama Verim (kg)	Üretim Miktarı (ton)
Adi Fiğ	1.349	850	1.146
Macar Fiğ	2.731	910	2.485
Diğer Fiğ	12.780	220	2.812
Fiğ (Yeşil Ot)	14.166	686	12.370
Yonca (Yeşil Ot)	17.424	2.024	35.268
Korunga (Yeşil Ot)	17.134	395	6.769

Kırşehir ilinde bahçe bitkileri üretimi, tarımsal ürün deseninde az bir yer kaplamaktadır. Bahçe bitkileri üretiminde, meyve oranı %1.5, sebze oranı ise %0.5'lik bir alanı kaplamaktadır. Meyve üretiminde başlıca yetiştirilen ürünler arasında ceviz, üzüm, badem, elma, kayısı yer almaktadır. Ceviz üretimi 26.809 dekar alanda yapılırken, üzüm 5.276 dekar, badem 1.653 dekar, elma 1.062 dekar ve kayısı ise 109 dekar alanda yetiştirilmektedir. Ayrıca, sebze üretiminde kavun 1.734 dekar, domates ise 872 dekar alanda tarımı yapılan başlıca ürünlerdendir (Anonim, 2024b). Son yıllarda ise, seracılık faaliyetlerinde de önemli bir artışlar gözlemlenmektedir.

SONUÇ

Kırşehir ilinin tarımsal üretimi, genel olarak tahıl, baklagil ve endüstri bitkileri yetiştiriciliği üzerine yoğunlaşmaktadır. Kırşehir'de en fazla ekim alanına sahip tahıl türü arpa olup, bu ürün bölgedeki tarımsal yapının temel taşlarından biridir. Arpa üretimi, hayvancılıkla doğrudan bağlantılı olarak, besi hayvancılığında önemli bir kesif yem kaynağı olarak kullanılmaktadır. Kırşehir, Türkiye genelinde arpa üretiminde artış gösteren iller arasında yer almakta ve verim açısından öne çıkmaktadır. Baklagil üretimi de önemli bir yer tutar, özellikle nohut, Türkiye'deki en büyük üretim alanına sahip ürünlerden biridir. Son yıllarda mercimek ve fasulye üretimi de yapılmakla birlikte, fasulye üretiminin sınırlı olmasının başlıca nedeni sulama eksiklikleridir. Endüstri bitkileri arasında ise şeker pancarı ve ayçiçeği öne çıkmaktadır; ancak sanayi kuruluşlarının azlığı, bu ürünlerin işlenmesinde kısıtlamalara yol açmaktadır. Bahçe bitkileri üretimi ise meyve ve sebzelerle sınırlı olup, özellikle ceviz, üzüm ve badem gibi ürünlerle çeşitlenmiştir. Kırşehir'de son yıllarda seracılığın artış göstermesi, tarımsal üretimin çeşitlenmesine katkı sağlamaktadır. Yine de, Kırşehir'in tarımsal üretimi, sulama altyapısının iyileştirilmesi ve sanayi bitkileri üretiminin artırılması ile daha verimli hale getirilebilir.

Baklagil üretimi (özellikle nohut) ve seracılıkta yaşanan artışlar, Kırşehir'in tarımsal üretimini çeşitlendiren ve sürdürülebilirliğini artıran gelişmeler olarak öne çıkmaktadır

ABSTRACT

This research was conducted to determine the factors affecting students in choosing the Faculty of Agriculture. In this context, the main material of the study is the data obtained from Kırşehir Ahi Evran University Agricultural Faculty students. Online survey forms were used as data collection tools in the research. The survey was applied to a total of 346 agricultural faculty students. While examining the socio-demographic structure, percentage rates and frequency tables were used. In order to determine the perspective of the students towards the profession, 5 Likert type scales were used. Questions using Likert scale in the survey form were subjected to reliability analysis. In the analysis of data, percentage ratios, mean scores and standard deviations were calculated and were summarized in the tables. It was also assessed by a chi - square fit test to see if there was a meaningful fit between the answers to the questions on the Likert scale. As a result of the evaluation of the surveys, significant differences in the students' preference for the Faculty of Agriculture according to gender were only preferred by male students at a higher level in terms of field of interest and job opportunities. In the Faculty of Agriculture, the lowest voluntary preference was from Science High School graduates, while the highest level came from students who graduated from normal high schools. It was determined that preferences with family advice were significantly low. It was determined that students who preferred the Horticulture department were significantly high in terms of job opportunities and areas of interest. Due to insufficient exam scores, the mandatory preference was observed in the Agricultural Biotechnology department.

Keywords: Faculty of Agriculture, preference, job opportunities

ZİRAAT FAKÜLTESİ TERCİHİNDE ETKİLİ FAKTÖRLERİN BELİRLENMESİ: KIRŞEHİR AHİ EVRAN ÜNİVERSİTESİ ÖRNEĞİ

ÖZET

Bu araştırma, Ziraat Fakültesine devan eden öğrencilerinin tercihlerinde etkili faktörleri belirlemek amacıyla yapılmıştır. Bu kapsamda Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi öğrencilerinden elde edilen veriler araştırmanın ana materyalini oluşturmaktadır. Araştırmada veri toplama aracı olarak online anket formları kullanılmıştır. Anket toplam 346 Ziraat Fakültesi öğrencisine uygulanmıştır. Sosyo-demografik yapı incelenirken yüzde oranlar ve frekans tablolarından faydalanılmıştır. Öğrencilerin mesleği tercih nedenini belirlemek amacıyla 5'li likert tipi ölçek kullanılmıştır. Anket formunda likert ölçeği kullanılan sorular, güvenilirlik an analizine tabii tutulmuştur. Verilerin analizinde yüzde oranlar, ortalama puanlar ve standart sapmalar hesaplanarak tablolarda özetlenmiştir. Ayrıca likert ölçeğindeki sorulara verilen cevaplar arasında anlamlı bir uyum olup olmadığı ki -kare uygunluk testine tabi tutularak değerlendirilmiştir. Anketlerin değerlendirilmesi sonucunda, Öğrencilerin cinsiyete göre Ziraat Fakültesi tercihinde önemli farklılıklar sadece ilgi alanı ve iş imkanları yönünden erkek öğrenciler tarafından daha yüksek düzeyde tercih edilmiştir. Ziraat Fakültesi tercihinde kendi isteğiyle tercihte en düşük Fen Lisesi mezunları iken en yüksek düzey ise normal liselerden mezun olan öğrencilerden gelmiştir. Aile tavsiyesiyle tercihler önemli düzeyde düşük olduğu belirlenmiştir. Bahçe Bitkileri bölümü tercih eden öğrencilerin iş imkânı ve ilgi alnı yönünden önemli düzeyde yüksek olduğu belirlenmiştir. Sınav puanı yetersizliği nedeniyle mecburen tercih durumu ise Biyosistem Mühendisliği bölümünden gözlenmiştir.

Anahtar Kelimeler: Ziraat Fakültesi, tercih, iş olanakları

GİRİŞ

Ziraat mühendisleri; bitkisel ve hayvansal üretim ile bu üretim süreçlerine ilişkin hasat, sınıflandırma, ambalajlama, muhafaza, depolama, değerlendirme ve pazarlama gibi faaliyetlerin etüt, planlama, projelendirme, uygulama ve denetiminden sorumlu meslek grubudur (Tüzük, 1991). Tarım faaliyetlerinin kökeni, M.Ö. 8000'li yıllarda Mezopotamya'da ortaya çıkan yerleşik tarım topluluklarına kadar uzanmakta olup, bu topluluklar temel tarımsal uygulamaları başlatarak günümüz ziraat mühendisliğinin tarihsel altyapısını oluşturmuştur. Osmanlı İmparatorluğu döneminde modern tarımsal eğitim faaliyetleri başlamış, Türkiye Cumhuriyeti döneminde ise kurumsal yapı kazanarak gelişimini sürdürmüştür (Çiftçi, C. Y. 2016). Tarım sektörü, yalnızca ekonomik kalkınmanın temel dinamiklerinden biri olmakla kalmayıp, aynı zamanda gıda güvenliğinin sağlanması, kırsal kalkınmanın desteklenmesi ve sürdürülebilir çevre yönetimi açısından da stratejik bir öneme sahiptir. Bu bağlamda, ziraat fakülteleri; bilimsel bilgi üretimi, teknolojik gelişmelerin tarıma entegrasyonu ve nitelikli insan kaynağı yetiştirilmesi noktasında kritik bir rol üstlenmektedir.

MATERYAL VE YÖNTEM

Araştırmanın ana materyalini, Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi'nde 2024-2025 eğitim-öğretim yılında öğrenim gören öğrencilerden online anket yoluyla elde edilen veriler oluşturmaktadır. Bu kapsamda fakültede öğrenim gören 346 öğrenci ile gönüllülük esaslı anket yapılmıştır. Çalışma, iki bölümden oluşmaktadır. İlk bölümde ankete katılan öğrencilerin demografik özelliklerini belirlemek amacıyla çoktan seçmeli sorulara yer verilmiştir. Bu bölümdeki sorulara verilen cevaplar frekans tabloları ve yüzde hesaplamalarla özetlenerek yorumlanmıştır. İkinci bölümde ise ankete katılan öğrencilerin ziraat fakültesini tercih nedenlerini belirlemek amacıyla 5'li Likert tipi sorulara yer verilmiştir. Bu bölümdeki sorulara verilen cevaplar yüzde oranlar, ortalama puanlar ve standart sapmalar hesaplanarak tablolarda özetlenmiştir. Ayrıca bu ölçekteki sorulara verilen cevaplar arasında anlamlı bir uyum olup olmadığı ki-kare uygunluk testine tabi tutularak değerlendirilmiştir. Veri toplama aracı olarak kullanılan anket formunda Likert ölçeği kullanılan sorular, güvenilirlik analizine tabii tutulmuştur. Yapılan güvenilirlik analizi sonucunda bulunan Cronbach's Alpha (α) değerleri 0,70 den büyük olduğu için oldukça güvenilirdir (Akgül ve Çevik, 2003).

BULGULAR VE TARTIŞMA

Sosyo-demografik yapı

Araştırmada ankete katılan öğrencilerin sosyo-demografik özellikleri incelenerek aşağıda özetlenmiştir. Ankete 346 öğrenci katılmış olup katılım sağlayan öğrencilerimizin 196 kişisi erkek ve 150 kişisi ise kadınlardan oluşmaktadır. Ankete katılan öğrencileri oransal olarak ifade edildiğinde ise yaklaşık %56.6'sı erkeklerden %43.4'ü ise kadınlardan oluşmaktadır (Tablo 1).

Tablo 1. Kırşehir Ahi Evran Ziraat Fakültesi öğrenci sayısı ve ankete katılım oranları

	Öğrenim gören		Ankete Katılan		Ankete Katılım oranı (%)
	Kişi	Yüzde (%)	Kişi	Yüzde (%)	
Erkek	714	67,2	196	56,6	
Kadın	347	32,7	150	43,4	
Toplam	1061	100,0	346	100,0	

Öğrencilerimize mezun oldukları lise çeşidi için sorulara verilen cevaplara ilişkin veriler Tablo 2'de verilmiştir. Türkiye'de lise ve dengi okullarda okuyan öğrenci sayısı Millî Eğitim Bakanlığı verilerine göre resmi liselerde öğrenci sayısı 4 milyon 159 bin 331, açık öğretim liselerinde 1 milyon 75 bin 550 ve özel liselerde ise 562 bine öğrenci eğitim görmektedir. Millî Eğitim Bakanlığı verilerine göre 8432 adet lise ve dengi okulda eğitim verilmektedir. Türkiye genelinde 2898 adet Anadolu Lisesi, 1698 adet İmam Hatip Lisesi, 365 adet Fen Lisesi, 293 Mesleki ve Teknik Lise, 105 adet Güzel Sanatlar Lisesi, 92 adet Sosyal Bilimler Lisesi ve 99 adet Spor Liseleri bulunmaktadır (TUİK, 2025; MEB,2025). Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi'ne devam eden öğrencilerin %66,47'si Anadolu Lisesi, %14.16'sı Diğer Liseler, %6.07'si Fen Lisesi ve %13.01'i Meslek liselerinden mezun olmuşlardır, ayrıca bir kişi ise lise mezuniyet için cevaplama yapmamıştır.

Tablo 2. Ankete katılan öğrencilerin mezun oldukları lise çeşidi dağılımı

Lise türleri	Kişi	Yüzde (%)
Anadolu Lisesi	230	66,47
Diğer Liseler	49	14,16
Fen Lisesi	21	6,07
Meslek Lisesi	45	13,01
Boş	1	0,29
Toplam	346	100

Ankete katılım sağlayan öğrencilerin hangi bölümde okuyorsunuz sorusuna verdikleri cevapların dağılımına ilişkili olarak 86 öğrenci Tarla Bitkileri, 55 kişi Tarım Ekonomisi, 49 Kişi Bitki koruma, 44 kişi Bahçe Bitkileri, 43 Kişi Tarımsal Biyoteknoloji, 36 kişi Biyosistem Mühendisliği, 33 Kişi Zootekni Bölümünden katılım sağlamıştır (Tablo 3).

Tablo 3. Ankete katılan öğrencilerin okuduğu bölüme ilişkin cevap dağılımları

Okuduğu Bölüm	Kişi	Yüzde (%)
Bahçe Bitkileri	44	12,7
Bitki Koruma	49	14,2
Biyosistem Mühendisliği	36	10,4
Tarım Ekonomisi	55	15,9
Tarımsal Biyoteknoloji	43	12,4
Tarla Bitkileri	86	24,9
Zootekni	33	9,5
Total	346	100

Ankete katılım sağlayan öğrencilerin hangi sınıfa devam ediyorsunuz sorusuna belirttikleri cevaplarla ilişkili olarak; en fazla katılımın 1. sınıf öğrencileri olduğunu ve en düşük katılımın ise 4. Sınıf öğrencilerine ait olduğu görülmektedir (Tablo 4). Ayrıca Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi'nde 2024-2025 eğitim döneminde son sınıfa devam eden öğrenci sayısı diğer sınıf sayılarına göre oldukça düşüktür. Tercihler konusunda özellikle 1. Sınıf öğrencilerinin katılımlarının yüksek olması tercih nedenlerinin daha doğru yansımasında da önemli etkisi olacaktır.

Tablo 4. Ankete katılan öğrencilerin devam ettiği sınıfa ilişkin cevap dağılımları

Sınıf	Kişi	Yüzde (%)
1	136	39,3
2	102	29,5
3	69	19,9
4	39	11,3
Total	346	100

Ziraat fakültesini tercih etme nedenleri

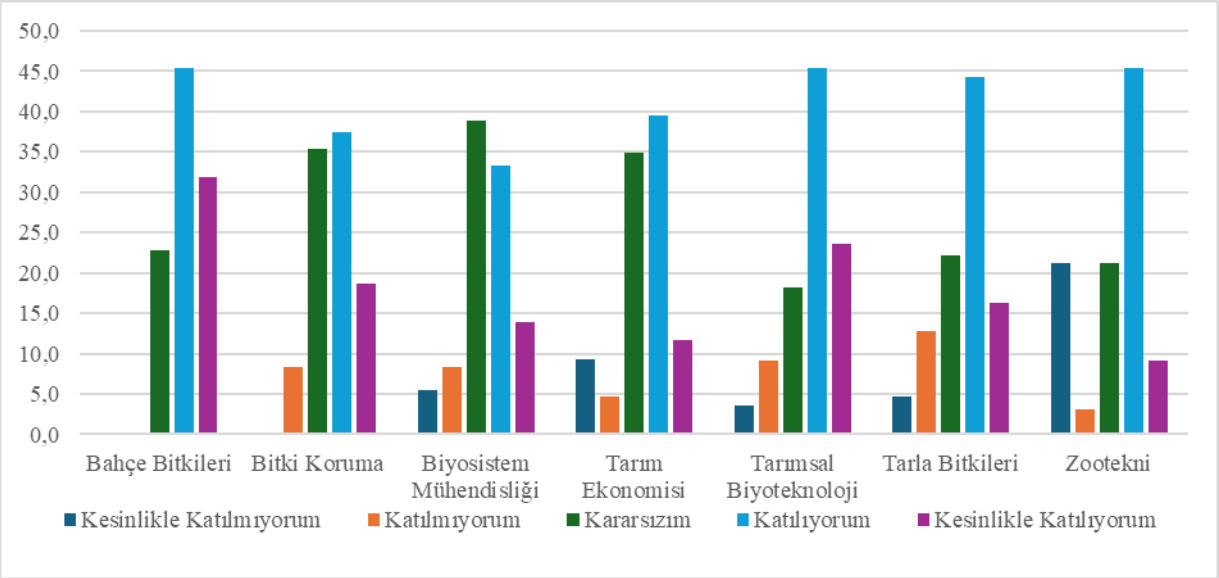
Ankete katılan öğrenciler anketin ikinci kısmında ziraat fakültesini neden tercih ettiklerine dair soruları cevaplamışlardır. Öğrencilerin verdiği cevaplar doğrultusunda Ziraat Mühendisliğinin saygınlığı ve Dünya'da gıda temininde öneminin tercihlerdeki etkisi istatistiksel anlamda önemli olmadığı saptanmıştır.

Tablo 5. Ankete katılan öğrencilerin Ziraat Fakültesini tercihine ait görüş oranları (%) ve önem seviyeleri

Sebepler	1	2	3	4	5	Top.	X^2	p
Saygın bir meslek olması	5,8	15,9	26,4	34,5	17,4	100	31,717	0,134
Geleceğinin parlak olması	3,2	4,1	20,3	43,0	29,4	100	42,906	0,010
Gıda temininde önemli olması	2,3	2,9	7,0	40,3	47,5	100	32,57	0,113
Gelirinin yüksek olması	5,5	7,5	26,7	42,0	18,3	100	46,612	0,004
Kolay iş bulabilmesi	9,3	8,4	31,4	35,5	15,4	100	43,386	0,009
Ailemin yönlendirmesi	23,5	33,0	7,8	25,8	9,9	100	38,072	0,034
İlgi alanıma girmesi	7,9	11,1	11,1	37,0	32,9	100	51,504	0,001
İş imkanlarının çok olması	8,7	15,9	21,4	38,0	15,9	100	56,18	0,000
Puanımdan dolayı	24,5	29,7	9,6	24,8	11,4	100	45,599	0,005

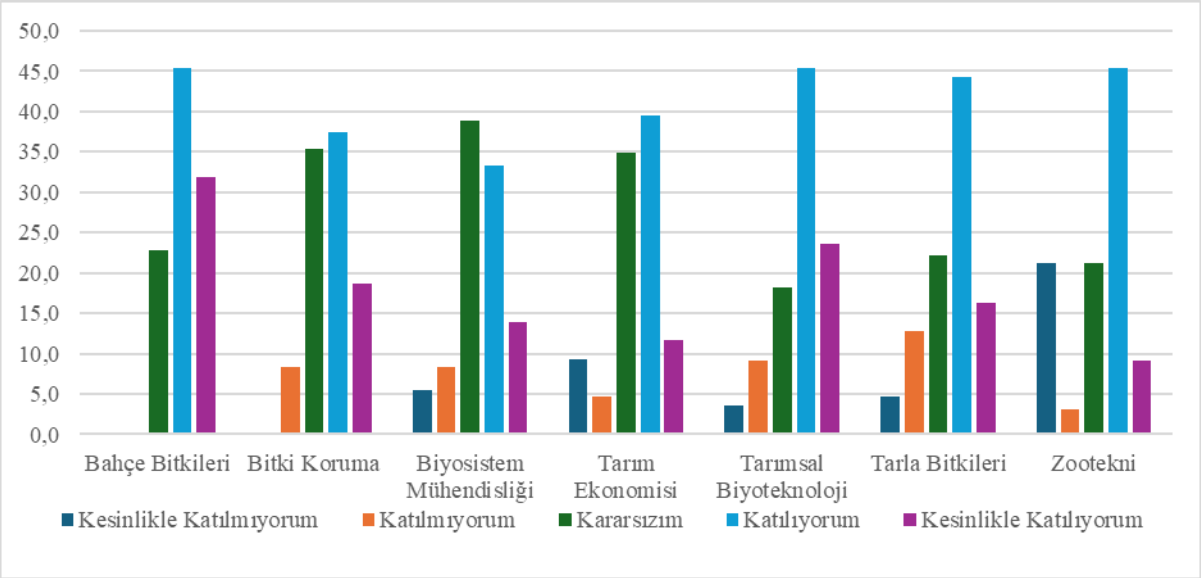
1. Kesinlikle karşıyım, 2. Karşıyım, 3. Fikrim yok, 4. Destekliyorum, 5. Kesinlikle destekliyorum

Ziraat Mühendisliğinin geleceğinin parlak olduğu fikri tercih nedenin önemli etkisi olduğu ve istatistiksel anlamda 0,01 önem seviyesinde anlamlı olduğu saptanmış bölümler arasında farklılıklarda P<0,05 seviyesinde gruplandırma yapılmıştır. Bu fikir en güçlü olduğu bölüm Bahçe Bitkileri, Biyoteknoloji ve Tarla Bitkileri bölümü olurken en düşük olduğu bölüm ise Zootekni bölümü olmuştur.



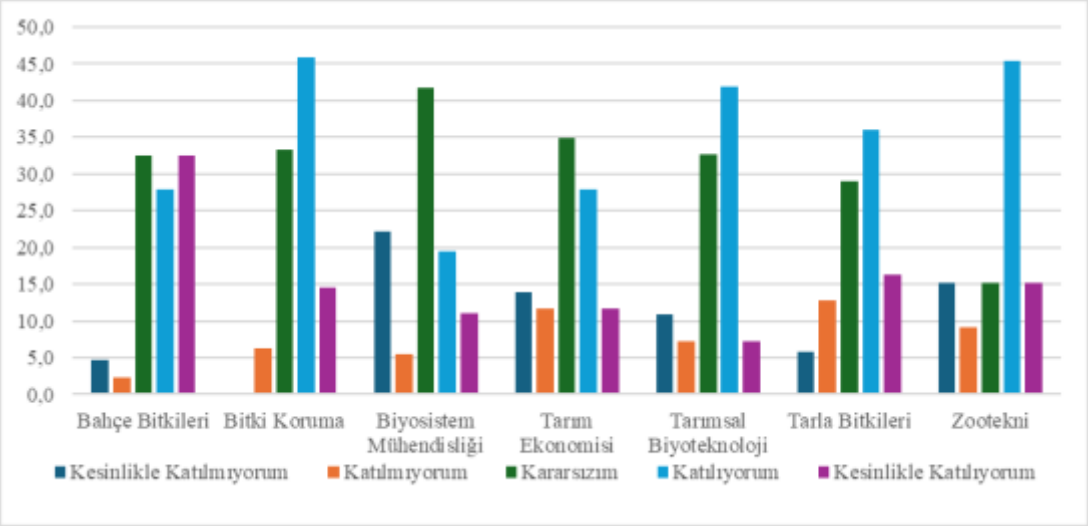
Şekil 1. Ziraat Mühendisliğinin geleceğinin parlaktır fikrinin bölümlere göre dağılım grafiği

Ziraat Mühendisliğinin gelirinin yüksek olduğu fikri ile Ziraat Fakültesini tercih etme nedeni istatistiksel anlamda 0,01 önem seviyesinde anlamlı olduğu saptanmış ve bölümler arasında farklılıklarda P<0.05 seviyesinde gruplandırma yapılmıştır. Bahçe Bitkileri bölümü ziraat mühendisliği mesleği tercinde gelirinin yüksek olduğu düşüncesinden diğer bölümlerin oldukça üzerinde orana sahip olmuş ve en yüksek grupta yer alırken sırasıyla Tarımsal Biyoteknoloji, Bitki Koruma, Tarla Bitkileri, Tarım Ekonomisi ve Biyosistem Mühendisliği ikinci grupta yer almıştır. Zootekni Bölümü öğrencileri ise en düşük bu fikre sahip olan bölüm olmuştur.



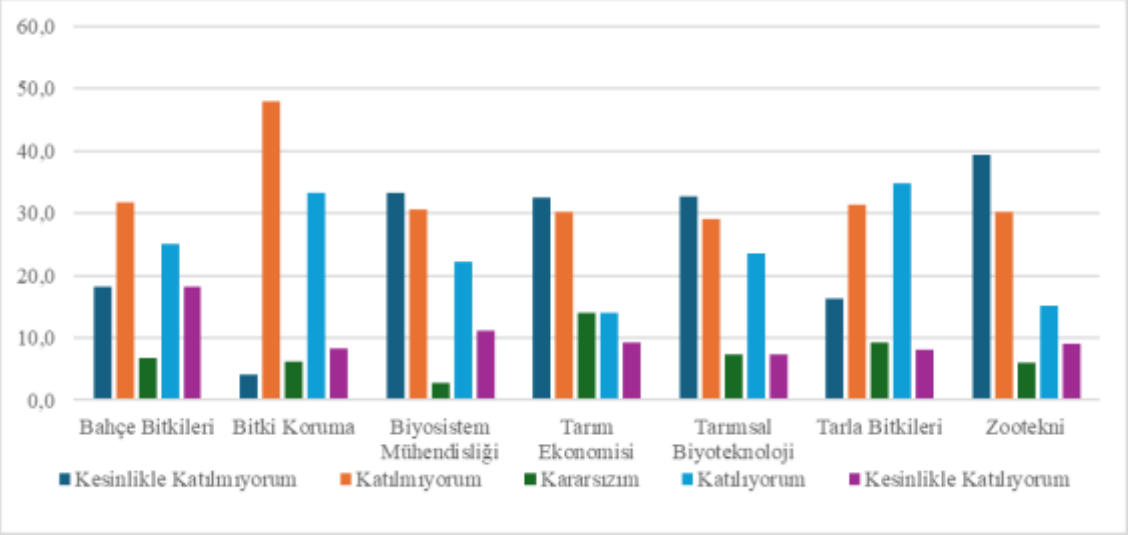
Şekil 2. Ziraat Mühendisliğinin gelirinin yüksek olduğu fikrinin bölümlere göre dağılım grafiği

Ziraat Mühendisliğinde kolay iş bulabilmesi fikri ile Ziraat Fakültesini tercih etme nedeni istatistiksel anlamda 0,01 önem seviyesinde anlamlı olduğu saptanmış ve bölümler arasında farklılıklarda P<0,05 seviyesinde gruplandırma yapılmıştır. Bahçe Bitkileri, Bitki Koruma, Tarla Bitkileri ve Zootekni Bölümü öğrencileri ziraat mühendisliği mesleği tercinde kolay iş bulma fikrinin yüksek olduğu düşüncesinden diğer bölümlerin oldukça üzerinde bir oranla aynı grupta yer almıştır. En düşük grupta ise sırasıyla Tarım Ekonomisi, Tarımsal Biyoteknoloji ve Biyosistem Mühendisliği yer almıştır.



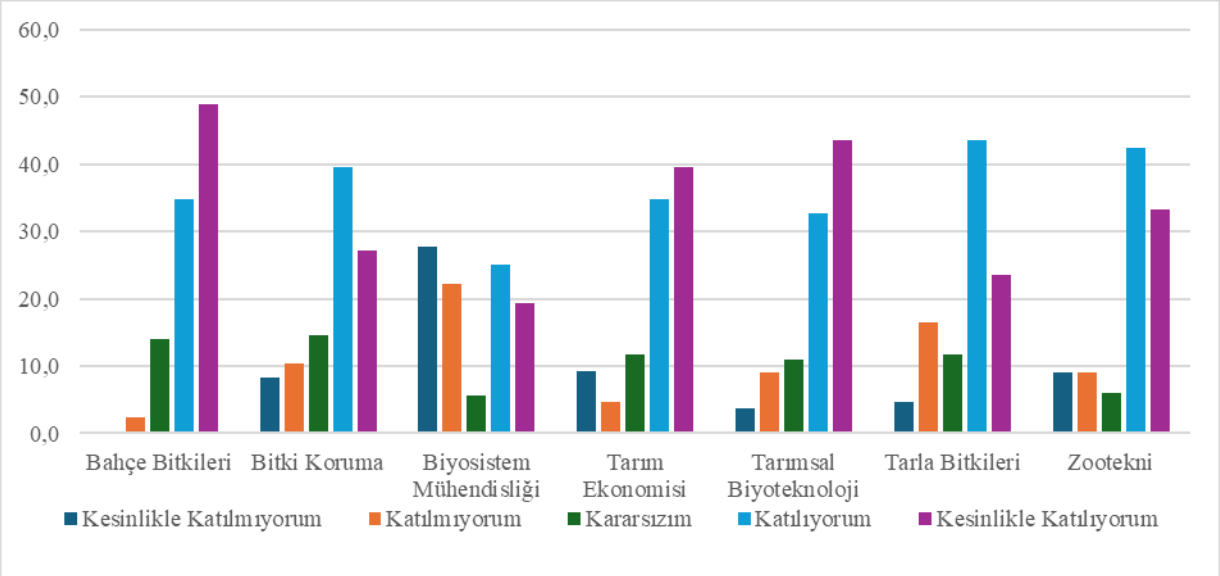
Şekil 3. Ziraat Mühendisliğinin kolay iş bulabilmesi fikrinin bölümlere göre dağılım grafiği

Ziraat Mühendisliğini tercih etmemde ailemin yönlendirmesi etkili olduğu fikri istatistiksel anlamda 0,05 önem seviyesinde anlamlı olduğu saptanmış ve bölümler arasında farklılıklarda $P<0,05$ seviyesinde gruplandırma yapılmıştır. Genel olarak ankete katılan öğrencilerin aile yönlendirmesine katılmadıkları tespit edilmiştir. Ailesinin etkisine en düşük olduğu bölüm ise Zootekni bölümü olduğu görülmektedir. Aile etkisinin diğer bölümlere göre daha yüksek olan bölümler ise Tarla Bitkileri, Bahçe Bitkileri ve Bitki Koruma Bölümleri olmuştur. Ayrıca kolayca iş bulma imkânı ziraat fakültesini tercih eden öğrencilerin cinsiyetine göre farklılık önemli ($P<0.01$) çıkmış ve erkek öğrencilerin tercihinde kolay iş bulma yönünden Kadın öğrencilere göre daha fazla önem verdiğini göstermektedir.



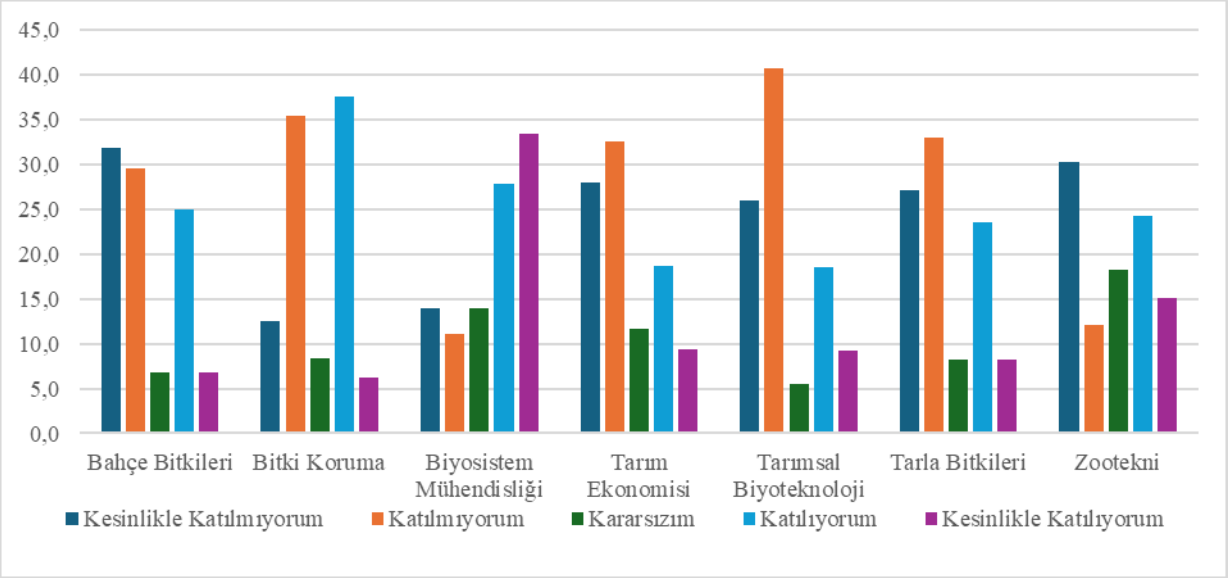
Şekil 4. Ziraat Mühendisliğini seçmemde ailemin yönlendirmesi etkili olduğu fikrinin bölümlere göre dağılım grafiği

Ziraat Mühendisliğini tercih etmemde ilgi alanıma girmesi etkili olduğu fikri istatistiksel anlamda 0,01 önem seviyesinde anlamlı olduğu saptanmış ve bölümler arasında farklılıklarda P<0,05 seviyesinde gruplandırma yapılmıştır. Biyosistem Mühendisliği öğrencileri diğer bölümlerden önemli düzeyde farklılık göstererek ayrı grupta yer almıştır. En yüksek ilgi alanı ile tercih ise sırasıyla Bahçe Bitkileri, Tarımsal Biyoteknoloji ve Tarım Ekonomisi bölümleri olmuştur. Ayrıca ilgi alanına girmesi nedeniyle ziraat fakültesini tercih eden öğrencilerin cinsiyetine göre farklılık önemli (P<0.01) çıkmış ve erkek öğrencilerin tercihinde ilgi alnı yönünden kadın öğrencilere göre daha fazla tercih ettiğini göstermektedir.



Şekil 5. Ziraat Mühendisliğini seçmemde ilgi alanım fikrinin bölümlere göre dağılım grafiği

Ziraat Mühendisliğini tercih etmemde puanımın etkili olduğu fikri istatistiksel anlamda 0,01 önem seviyesinde anlamlı olduğu saptanmış ve bölümler arasında farklılıklarda P<0,05 seviyesinde gruplandırma yapılmıştır. Tarımsal Biyoteknoloji, Bahçe Bitkileri, Tarım Ekonomisi ve Tarla Bitkileri bölümleri kesinlikle etkili olmadığını bildirirken Biyosistem Mühendisliği öğrencileri ise puanı nedeniyle Ziraat fakültesini tercih ettiğini bildirmişlerdir.



Şekil 6. Ziraat Mühendisliğini seçmemde puanımdan dolayı fikrinin bölümlere göre dağılım grafiği

SONUÇ

Bu araştırma, Ziraat Fakültesine devan eden öğrencilerinin tercihlerinde etkili faktörleri belirlemek amacıyla yapılmıştır. Bu kapsamda Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi öğrencilerinden elde edilen veriler araştırmanın ana materyalini oluşturmuştur. Araştırmada veri toplama aracı olarak online anket formları kullanılmış ve ankete toplam 346 ziraat fakültesi öğrencisi katılım sağlamıştır. Anketin değerlendirilmesi sonucunda, ankete katılan öğrencilerin yaklaşık %56,6'sı erkeklerden %43,4'ü ise kadınlardan oluşmaktadır. Ankete katılan öğrencilerin %66,47'si Anadolu Lisesi, %14.16'sı Diğer Liseler, %6.07'si Fen Lisesi ve %13.01'i Meslek liselerinden mezun olduğunu bildirmişlerdir. Ankete katılan 346 öğrencinin 86'sı Tarla Bitkileri, 55'i Tarım Ekonomisi, 49'u Bitki Koruma, 44'ü Bahçe Bitkiler, 43'ü Tarımsal Biyoteknoloji, 36'sı Biyosistem Mühendisliği ve 33'ü Zootekni Bölümünden katılım ile sağlamıştır. Ayrıca en yüksek katılımın 1.sınıf öğrencilerine ait olduğu görülmektedir.

Öğrencilerin cinsiyete göre Ziraat Fakültesi tercihinde önemli farklılıklar sadece ilgi alanı ve iş imkanları yönünden erkek öğrenciler tarafından daha yüksek düzeyde tercih edilmiştir. Ziraat Fakültesi tercihinde kendi isteğiyle tercihte en düşük Fen Lisesi mezunları iken en yüksek düzey ise normal liselerden mezun olan öğrencilerden gelmiştir. Aile tavsiyesiyle tercihler önemli düzeyde düşük olduğu belirlenmiştir. Bahçe Bitkileri bölümü tercih eden öğrencilerin iş imkânı ve ilgi alnı yönünden önemli düzeyde yüksek olduğu belirlenmiştir. Sınav puanı yetersizliği nedeniyle mecburen tercih durumu ise Biyosistem Mühendisliği bölümünden gözlenmiştir. İş imkânı, kolay iş bulma ve gelir seviyesinin yüksek olması tercih nedenini önemli düzeyde artırmıştır.

ABSTRACT

This research was conducted to determine the perspective of the students of agriculture faculty towards the profession of agricultural engineering. In this context, the main material of the study is the data obtained from Kırşehir Ahi Evran University Agricultural Faculty students. Online survey forms were used as data collection tools in the research. The survey was applied to a total of 346 agricultural faculty students. While examining the socio-demographic structure, percentage rates and frequency tables were used. In order to determine the perspective of the students towards the profession, 5 Likert type scales were used. Questions using Likert scale in the survey form were subjected to reliability analysis. In the analysis of data, percentage ratios, mean scores and standard deviations were calculated and were summarized in the tables. It was also assessed by a chi -square fit test to see if there was a meaningful fit between the answers to the questions on the Likert scale. As a result of the evaluation of the surveys, it was determined that there were no differences in the perspectives of the students towards the profession according to gender, while there were significant ($P<0.05$) differences between departments and classes. While the students of the Department of Horticulture and Agricultural Biotechnology had a significantly more positive perspective on the agricultural engineering profession, the least positivity was observed from the students of the Department of Animal Science.

GİRİŞ

Ziraat fakülteleri, tarım ve hayvancılık gibi kritik sektörlerde uzmanlaşmış profesyoneller yetiştiren önemli akademik kurumlardır. Ziraat mühendisleri; lisans veya uzmanlık alanlarına göre, bitki, tohumluk, gübre, toprak, sulama suyu, tarım ilacı, yem, gıda, tarım alet ve makinaları, su ürünleri, bitki hastalık ve zararlıları, tarım ürünleriyle ilgili sıvı ve katı atıklar, tarım ürünleri üzerindeki ilaç kalıntıları konularında araştırma, kalite kontrolu, standart ve yönetmeliklere uygunluk gibi amaçlarla fiziksel, kimyasal ve mikrobiyolojik kontrol ve analizler yapmak üzere laboratuvar kurmaya ve işletmeye yetkilidirler (Tüzük, madde 11). Ziraat mühendisliği, yalnızca ülke ekonomisi için değil, aynı zamanda küresel gıda güvenliği, çevre sürdürülebilirliği ve doğal kaynakların yönetimi gibi temel alanlar için de büyük bir öneme sahiptir. Ancak, bu alanda eğitim gören öğrencilerin mesleklerine bakış açıları, meslek seçimleri ve geleceğe yönelik beklentileri, zaman içinde değişebilen dinamiklerdir. Bu değişimler, ekonomik, toplumsal ve sektörel faktörlerle doğrudan ilişkilidir. Ziraat mühendisliği gibi dinamik bir alanda, tarım politikalarındaki değişiklikler, iş gücü piyasasında yaşanan dönüşümler ve teknolojik gelişmeler öğrencilerin mesleklerine yönelik tutumlarını etkileyebilmektedir. Ayrıca, tarım sektöründeki istihdam fırsatları ve mezunların kariyer beklentileri de bu bakış açılarını şekillendiren önemli faktörler arasında yer almaktadır.

MATERYAL VE YÖNTEM

Araştırmanın ana materyalini, Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi'nde 2024-2025 eğitim-öğretim yılında öğrenim gören öğrencilerden online anket yoluyla elde edilen veriler oluşturmaktadır. Bu kapsamda fakültede öğrenim gören öğrencilerden 346 kişi ile gönüllülük esaslı anket yapılmıştır. Çalışma, iki bölümden oluşmaktadır. İlk bölümde ankete katılan öğrencilerin demografik özelliklerini belirlemek amacıyla çoktan seçmeli sorulara yer verilmiştir. Bu bölümdeki sorulara verilen cevaplar frekans tabloları ve yüzde hesaplamalarla özetlenerek yorumlanmıştır. İkinci bölümde ise ankete katılan öğrencilerin ziraat mühendisliği mesleğine bakış açısını belirlemek amacıyla 5'li Likert tipi sorulara yer verilmiştir. Bu bölümdeki sorulara verilen cevaplar yüzde oranlar, ortalama puanlar ve standart sapmalar hesaplanarak tablolarda özetlenmiştir. Ayrıca bu ölçekteki sorulara verilen cevaplar arasında anlamlı bir uyum olup olmadığı ki-kare uygunluk testine tabi tutularak değerlendirilmiştir. Veri toplama aracı olarak kullanılan anket formunda Likert ölçeği kullanılan sorular, güvenilirlik analizine tabii tutulmuştur. Yapılan güvenilirlik analizi sonucunda bulunan Cronbach's Alpha (α) değerleri 0.70'den büyük olduğu için oldukça güvenilirdir (Akgül ve Çevik, 2003).

BULGULAR VE TARTIŞMA

Sosyo-demografik yapı

Araştırmada ankete 346 öğrenci katılmış olup katılım sağlayan öğrencilerimizin cinsiyetine ilişkin soruya verdikleri cevaplar doğrultusunda 196 kişisi erkek ve 150 kişisi ise kadınlardan oluşmaktadır. Ankete katılan öğrencileri oransal olarak ifade edildiğinde ise yaklaşık %56.6'sı erkeklerden %43.4'ü ise kadınlardan oluşmaktadır (Tablo 1). Anketin online hazırlanması nedeniyle gönüllülük esaslı olması nedeniyle herhangi bir oran hedefimiz bulunmamaktadır.

Tablo 1. Kırşehir Ahi Evran Ziraat Fakültesi öğrenci sayısı ve ankete katılım oranları

	Öğrenim gören		Ankete Katılan		Ankete Katılım oranı (%)
	Kişi	Yüzde (%)	Kişi	Yüzde (%)	
Erkek	714	67,3	196	56,6	
Kadın	347	32,7	150	43,4	
Toplam	1061	100,0	346	100,0	

Öğrencilerimize mezun oldukları lise çeşidini belirlemek için sorulan sorulara verilen cevaplara ilişkin veriler Tablo 2'de verilmiştir. Anketimize katılım sağlayan Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi öğrencilerinin %66.47'si Anadolu Lisesi, %14.16'sı Diğer Liseler, %6.07'si Fen Lisesi ve %13.01'i Meslek liselerinden mezun olduklarını bildirmişlerdir.

Tablo 2. Ankete katılan öğrencilerin mezun oldukları lise çeşidi dağılımı

Lise türleri	**Kişi**	**Yüzde (%)**
Anadolu Lisesi	230	66,47
Diğer Liseler	49	14,16
Fen Lisesi	21	6,07
Meslek Lisesi	45	13,01
Boş	1	0,29
Toplam	346	100

Ankete katılım sağlayan öğrencilerin hangi bölümde okuyorsunuz sorusuna verdikleri cevapların dağılımında 86 öğrenci Tarla Bitkileri, 55 kişi Tarım Ekonomisi, 49 Kişi Bitki koruma, 44 kişi Bahçe Bitkileri, 43 Kişi Tarımsal Biyoteknoloji, 36 kişi Biyosistem Mühendisliği, 33 Kişi Zootekni Bölümünden katılım sağlamıştır (Tablo 3). En düşük katılım Zootekni ve Biyosistem Mühendisliği bölümünden gözlenirken bu sonuçların fakültede bölümlere göre öğrenci dağılımı ile de uyumlu olduğu görülmektedir.

Tablo 3. Ankete katılan öğrencilerin okuduğu bölüme ilişkin cevap dağılımları

Okuduğu Bölüm	Kişi	Yüzde (%)
Bahçe Bitkileri	44	12,7
Bitki Koruma	49	14,2
Biyosistem Mühendisliği	36	10,4
Tarım Ekonomisi	55	15,9
Tarımsal Biyoteknoloji	43	12,4
Tarla Bitkileri	86	24,9
Zootekni	33	9,5
Total	346	100

Ankete katılım sağlayan öğrencilerin hangi sınıfa devam ediyorsunuz sorusuna belirttikleri cevaplarla ilişkili olarak; en fazla katılımın 1. sınıf öğrencileri olduğunu ve en düşük katılımın ise 4. Sınıf öğrencilerine ait olduğu görülmektedir (Tablo 4). Ayrıca Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi'nde 2024-2025 eğitim döneminde son sınıfa devam eden öğrenci sayısı diğer sınıf sayılarına göre oldukça düşüktür. Fakültede bölümlerin sınıf mevcudiyeti dikkate alındığında en fazla öğrencinin 1. ve 2. sınıflarda olduğu görülmektedir.

Tablo 4. Ankete katılan öğrencilerin devam ettiği sınıfa ilişkin cevap dağılımları

Sınıf	Kişi	Yüzde (%)
1	136	39,3
2	102	29,5
3	69	19,9
4	39	11,3
Total	346	100

Ziraat mühendisliği mesleğine bakış açıları;

Ankete katılan öğrenciler anketin ikinci kısmında ziraat mühendisliğine bakış açılarının belirlenmesi hedefleyen soruları cevaplamışlardır. Öğrencilerin verdiği cevaplar doğrultusunda

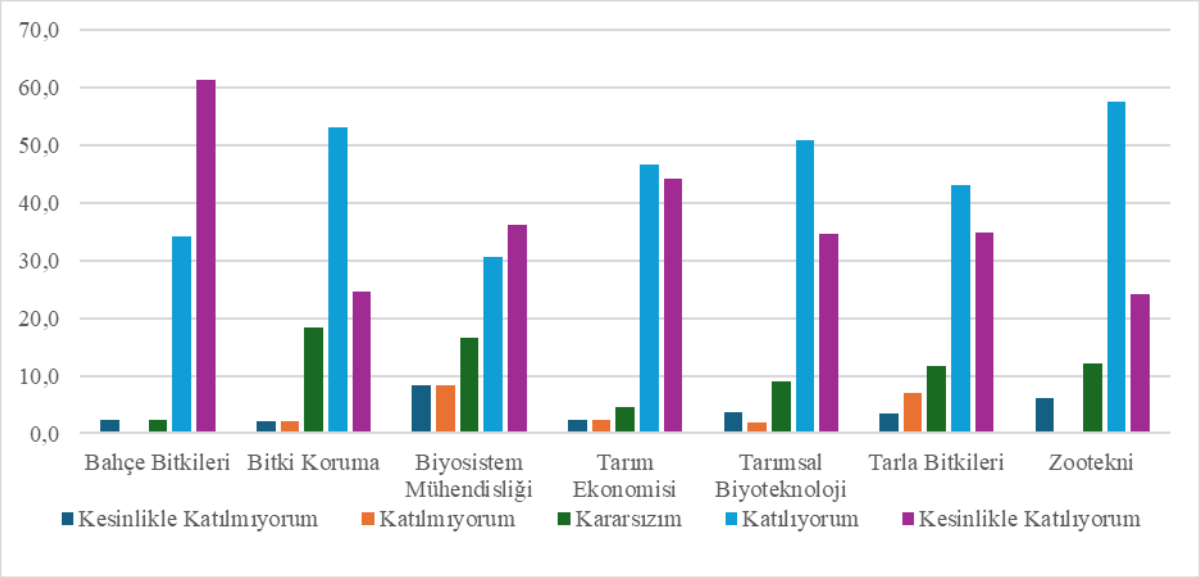
özel sektörde çalışma istekleri ile tarımsal üretimi geliştirme hedeflerim var sorularına verdikleri cevapların istatistiksel anlamda önemli olmadığı saptanmıştır (Tablo 5).

Tablo 5. Ankete katılan öğrencilerin ziraat mühendisliğine bakış açılarına ilişkin sorulara verilen cevapların oranları (%) ve önem seviyeleri

Sorular	1	2	3	4	5	Top.	X^2	p
Ziraat fakültesini okumaktan memnunum	3,8	3,5	10,7	45,1	37,0	100	37,579	0,038
Okuduğum bölümden memnunum	2,9	3,5	14,7	40,5	38,4	100	43,105	0,010
Ziraat Mühendisi olmak beni heyecanlandırıyor	4,3	4,6	15,0	48,3	27,7	100	33,007	0,104
Tarım Bakanlığında çalışmak istiyorum	11,6	12,2	30,5	27,0	18,6	100	41,976	0,013
Özel Sektörde çalışmak istiyorum	11,0	6,1	33,6	34,2	15,1	100	28,791	0,228
Akademik çalışma istiyorum	13,3	15,0	30,6	24,3	16,8	100	45,617	0,005
Ziraat Mühendisliği yapmak istemiyorum	24,0	29,5	27,5	13,6	5,5	100	57,347	0,001
Aldığım teorik dersler mesleğim için yeterlidir	7,5	10,4	23,7	42,8	15,6	100	42,519	0,011
Aldığım uygulamalı dersler mesleğim için yeterlidir	9,9	10,1	22,0	38,8	19,1	100	53,812	0,001
Eğitim aldığım süreçte mesleğime ilgim arttı	3,2	3,5	14,5	49,3	29,6	100	50,869	0,001
Tarımsal üretimi geliştirme hedeflerim var	9,3	8,4	31,4	35,5	15,4	100	30,556	0,167
Çevreme mesleğimi tavsiye ederim	1,5	0,6	2,3	46,5	49,1	100	40,659	0,018

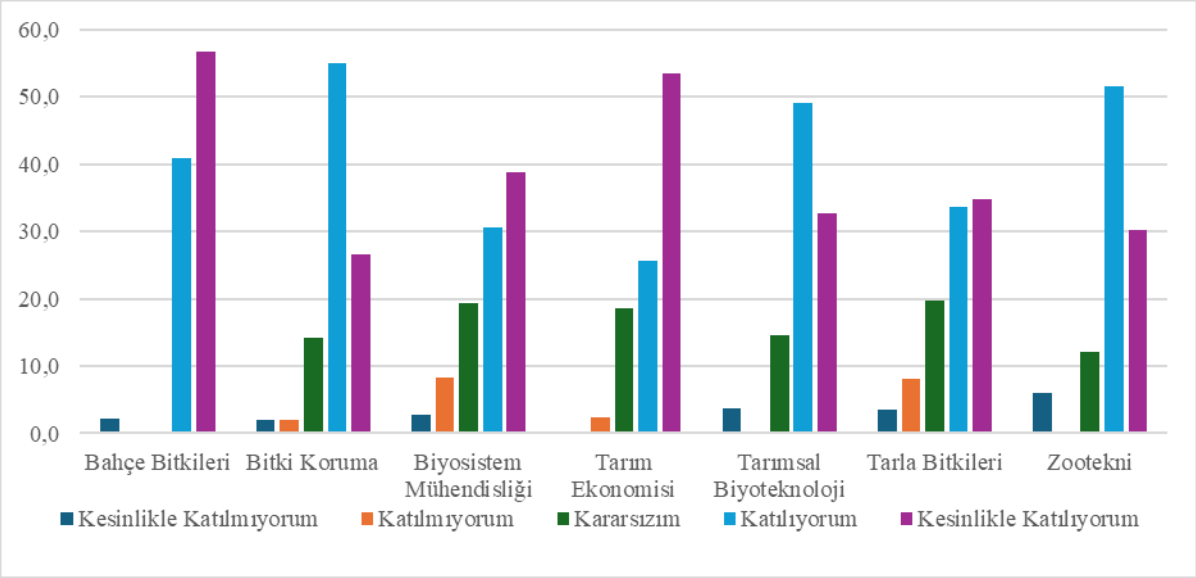
1: Kesinlikle karşıyım, 2: Karşıyım, 3: Fikrim yok, 4: Destekliyorum, 5: Kesinlikle destekliyorum

Ziraat fakültesinde okumaktan memnunum sorusuna verilen cevapların bölümlere göre $P<0.05$ önem seviyesinde anlamlı olduğu saptanmıştır. Bahçe bitkileri ve Tarım Ekonomisi bölümü öğrencileri önemli düzeyde diğer bölümlerden farklıdır ve en yüksek düzeyde memnuniyet grubunda yer almıştır. En düşük memnuniyet grubunda ise Biyosistem Mühendisliği bölümü öğrencileri yer almıştır. Tüm bölümlerde kararsızım seçeneğinin az olduğu ve genel olarak %65'in üzerinde memnuniyet olduğu gözlenmiştir. (Şekil 1). Ziraat fakültesinde memnuniyet oranı sınıf ilerledikçe artarken sadece 3.sınıfta düştüğü gözlenmiştir.



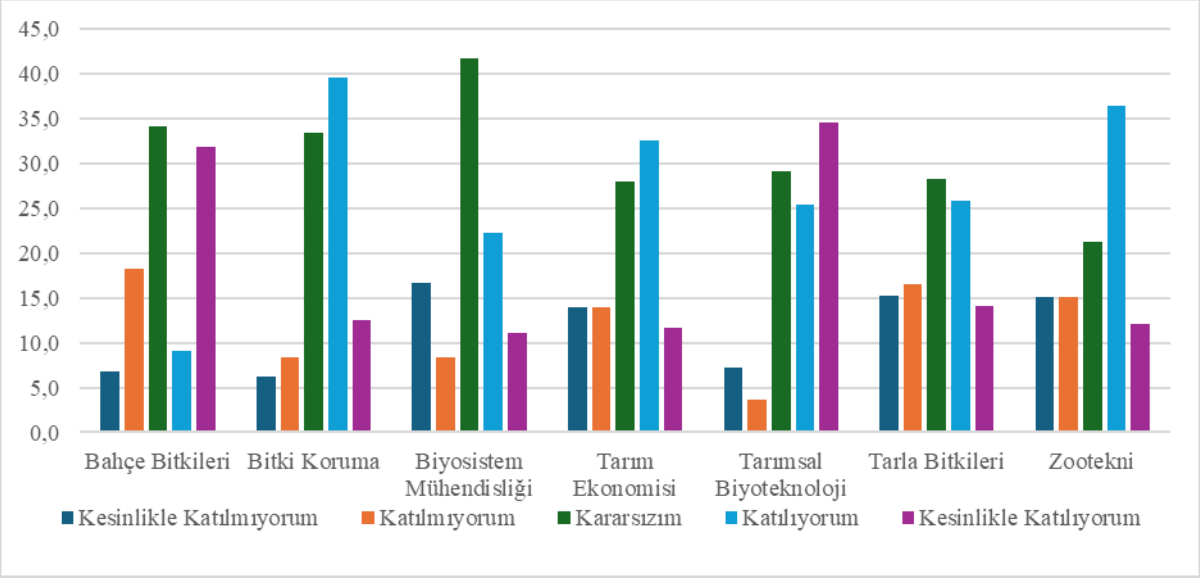
Şekil 1. Ziraat fakültesini okumaktan memnunum fikrinin bölümlere göre dağılım grafiği

Okuduğu bölüm için memnuniyete verilen cevaplar neticesinde cevapların önemli düzeyde farklılıklar gösterdiği ve bu farklılıklarında $P<0.01$ önem seviyesinde anlamlı olduğu saptanmıştır. Bölümler bazında yapılan ortalamaların karşılaştırılmasında Bahçe bitkileri bölümü %95'in üzerinde memnuniyet oranıyla en memnun grupta yer almıştır. Bitki koruma, Tarımsal Biyoteknoloji ve Zootekni bölümü ikinci memnuniyete sahip bölümler olmuştur. Karasızlık oranı en düşük orana ulaşırken memnuniyetsizlik de önemli düzeyde düşüktür. En yüksek memnuniyetsizlik ise Biyosistem mühendisliği ve Tarla bitkileri bölümünden saptanmış olsa da her iki bölümde de memnuniyet oranı %68'in üzerindedir (Şekil 2). Öğrencilerin bölümlerinden memnuniyeti oranı sınıf ilerledikçe artarken sadece 3.sınıfta düştüğü gözlenmiştir.



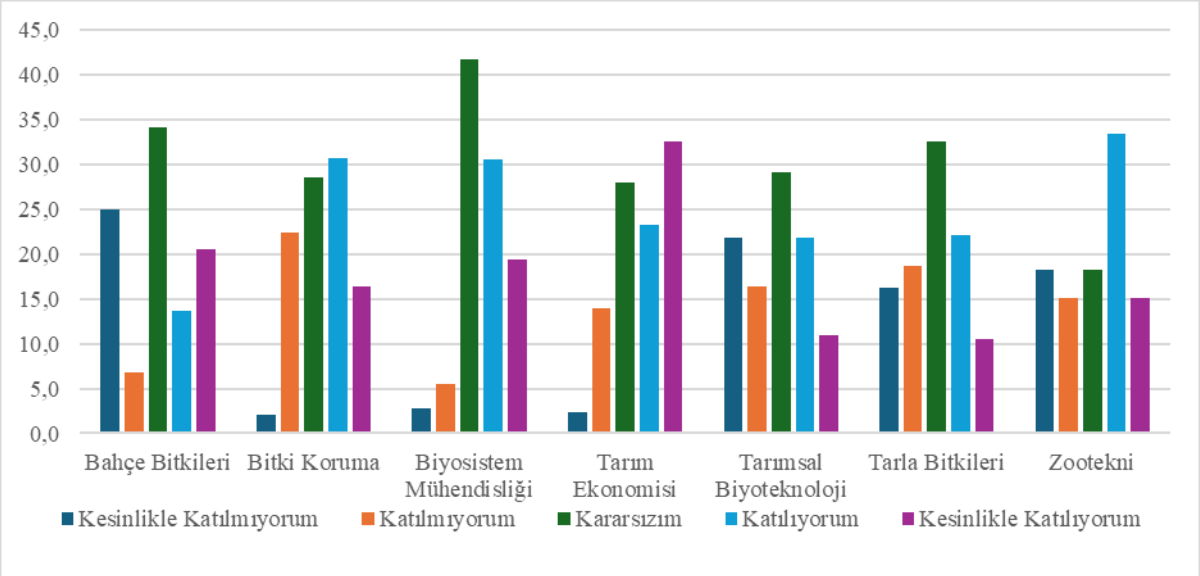
Şekil 2. Okuduğum bölümden memnunum fikrinin bölümlere göre dağılım grafiği

Öğrencilerin mezuniyet sonrası çalışmak istedikleri kurum sorulduğunda Tarım Bakanlığı önemli düzeyde talep görmüş ve bölümler arasında farklılıklar istatistiksel anlamda önem ($P<0,05$) göstermiştir. Tarımsal biyoteknoloji ve bitki koruma bölümü Tarım bakanlığında çalışma hedefi daha yüksek olmuştur. Tarla bitkileri ve Zootekni Bölümü öğrencileri diğer bölümlere göre en yüksek katılmama oranı gösterirken Biyosistem mühendisliği ise en kararsız düşünceye sahip olduğu gözlenmiştir (Şekil 3). Öğrencilerin tarım bakanlığında çalışma talebi oranı sınıf ilerledikçe artarken sadece son sınıfta en yüksek düzeye ulaşmaktadır. Ayrıca özel sektörde çalışma istekleri ise en yüksek 1.sınıf iken en düşük ise 4.sınıf olarak ortaya çıkmıştır.



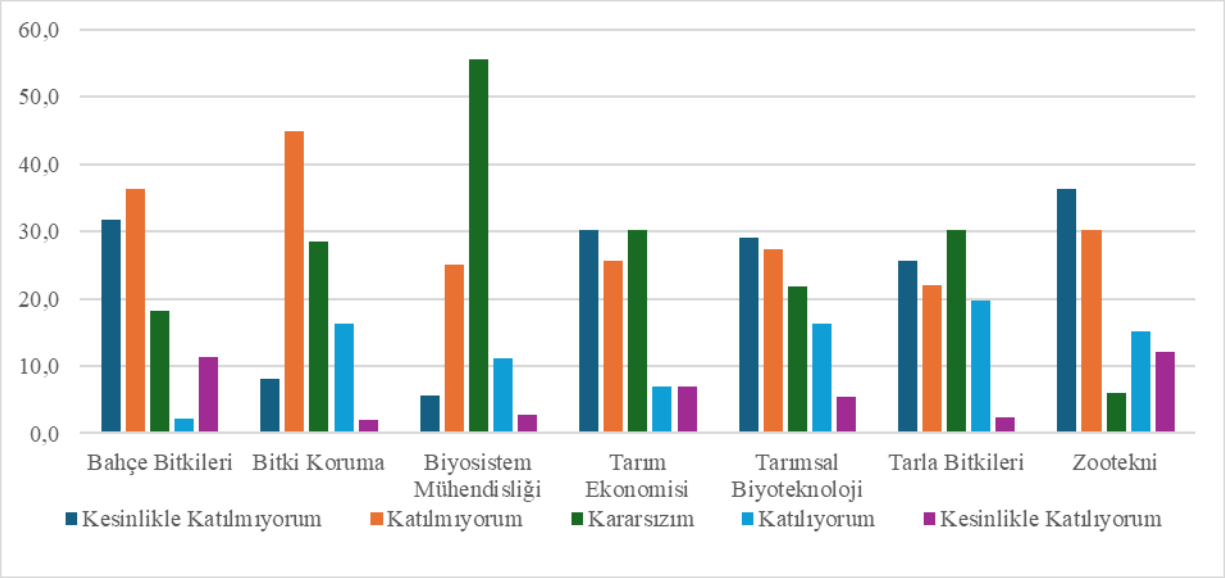
Şekil 3. Tarım Bakanlığında çalışmak istiyorum fikrinin bölümlere göre dağılım grafiği

Akademisyen olma isteklerine verdikleri cevaplara göre bölümler arası farklılıklar istatistiksel anlamda önemli olduğu saptanmıştır. Tarım ekonomisi ve Biyosistem mühendisliği bölümü öğrencilerinde akademisyenlik isteği ağırlık gösterirken Tarımsal biyoteknoloji ve tarla bitkileri bölümü öğrencileri en düşük seviye taleplerini dile getirmişlerdir. En yüksek karasızlık ise Biyosistem mühendisliği ve Bahçe bitkileri öğrencilerinden gözlenmiştir (Şekil 4). Akademisyen olma isteği en yüksek oranlarının 1.sınıf öğrencilerinden elde edilirken en düşük oranlar ise 4. sınıflardan elde edilmiştir.



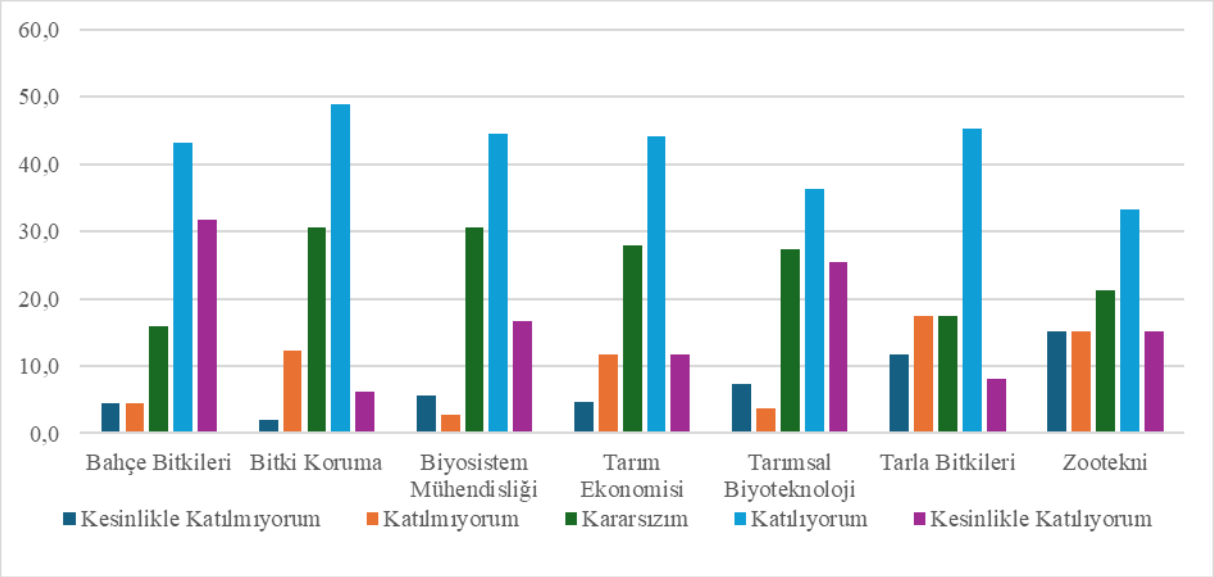
Şekil 4. Akademik çalışmak istiyorum fikrinin bölümlere göre dağılım grafiği

Öğrencilere yöneltilen ziraat mühendisliğini yapmak istemiyorum seçeneğine verilen cevaplar bölümler arasında önemli ($P<0.01$) farklılık göstermiştir. Önemli düzeyde bölüm öğrencileri buna karşı olmalarına karşın Biyosistem öğrencilerinde kararsızlık oranı %55.6 ile oldukça yüksektir. Bahçe bitkileri ve Bootekni bölümü öğrencileri bu düşüncenin önemli düzeyde karşı olduğu görülmektedir. Bu sonuç bize öğrencilerin eğitim boyunca mesleklerini yapma isteğini artırdığını da göstermektedir. Ayrıca sınıf ilerledikçe mesleği icra etme isteği de artmaktadır. Genel olarak ziraat mühendisliği mesleğini yürütmeme isteği aldığı hem teorik hem de uygulamalı derslerle, ziraat fakültesi ve bölümünü okuduğuna memnuniyet durumu bakımından önemli ve negatif ilişki gösterirken sadece özel sektörde çalışma isteği ile pozitif ve önemli ilişki göstermiştir.



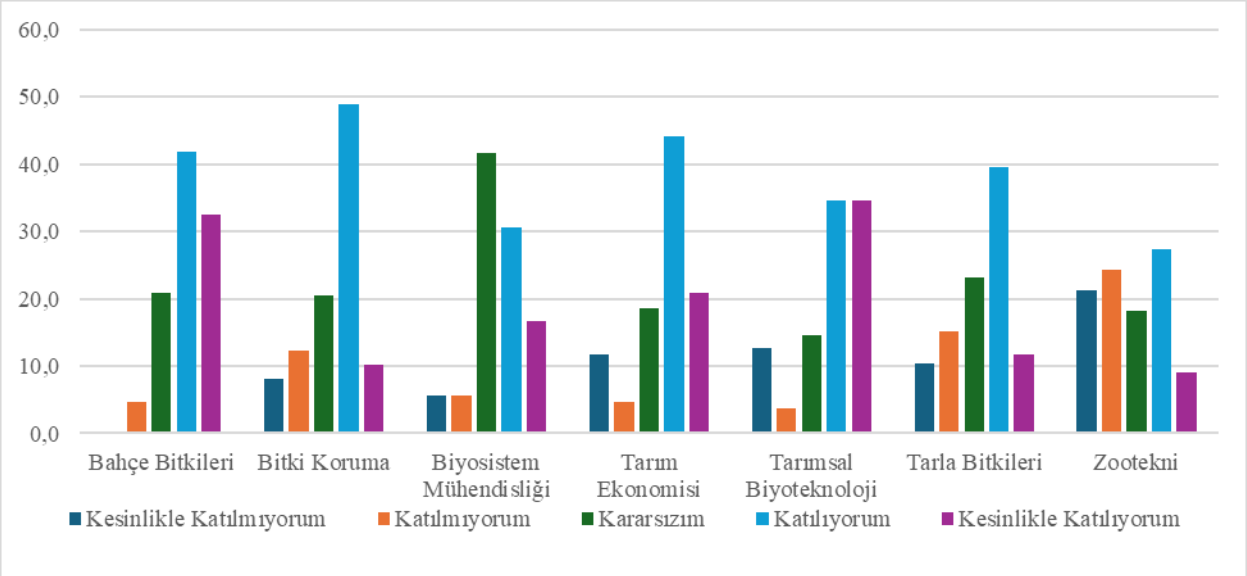
Şekil 5. Ziraat Mühendisliği yapmak istemiyorum fikrinin bölümlere göre dağılım grafiği

Öğrencilerin teorik derslerde aldıkları eğitimin meslekleri için yeterli midir sorusuna verdikleri cevap bölümler arasında farklılık göstermiş ve bu farklılıkta $P<0.01$ önem seviyesinde anlamlı çıkmıştır. Bahçe bitkileri bölümü teorik derslerinin yeterliliği konusunda en yüksek grupta yer almıştır. Tarımsal biyoteknoloji ve Biyosistem Mühendisliği ikinci memnun grupta yer alırken en düşük grupta ise Zootekni ve Tarla Bitkileri bölümü yer almıştır. Teorik derslerin yeterliliği konusunda en yüksek oranlar 4. sınıf öğrencilerinden gözlenmiştir.



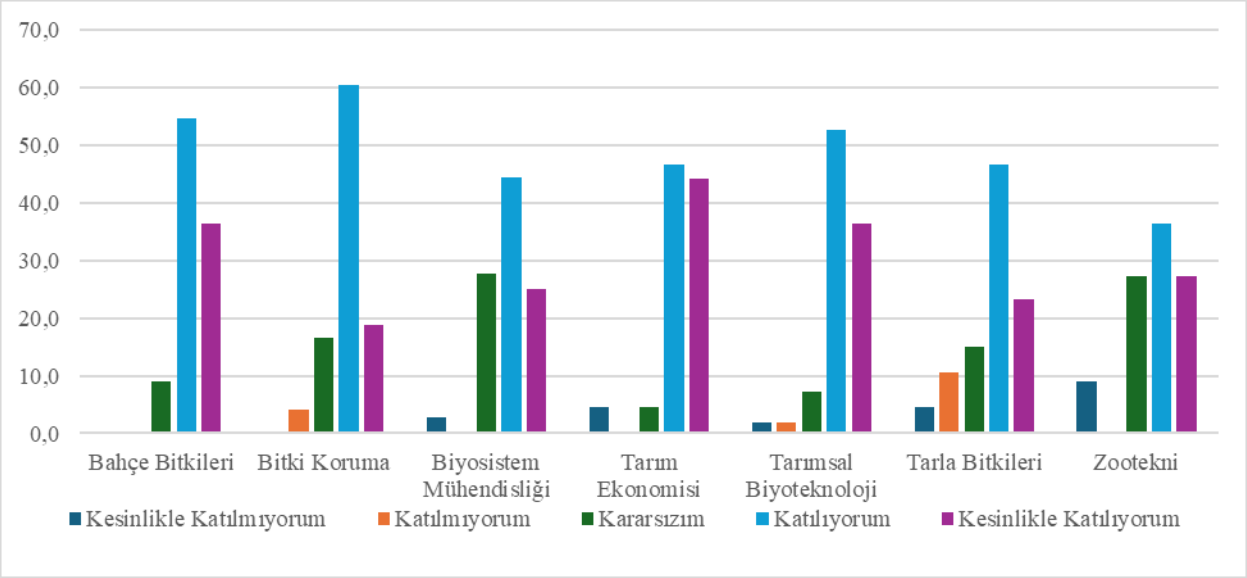
Şekil 6. Aldığım teorik dersler mesleğim için yeterlidir fikrinin bölümlere göre dağılım grafiği

Öğrencilerin uygulama derslerinin meslekleri için yeterli midir sorusuna verdikleri cevap bölümler arasında farklılık göstermiş ve bu farklılıkta P<0.01 önem seviyesinde anlamlı çıkmıştır. Bahçe bitkileri, Tarımsal biyoteknoloji ve Tarım Ekonomisi bölümü yeterliliğinde en üst grupta yer almıştır. En düşük grupta ise Zootekni bölümü yer almış ve ankete katılan zootekni öğrencilerinin yarıya yakını bu konuda yetersizliği tercih etmiştir (Şekil 7). Ayrıca özellikle 3. sınıf öğrencilerinin uygulamaların yetersizliği konusunda daha yüksek düzeyde fikir beyan etmişlerdir.



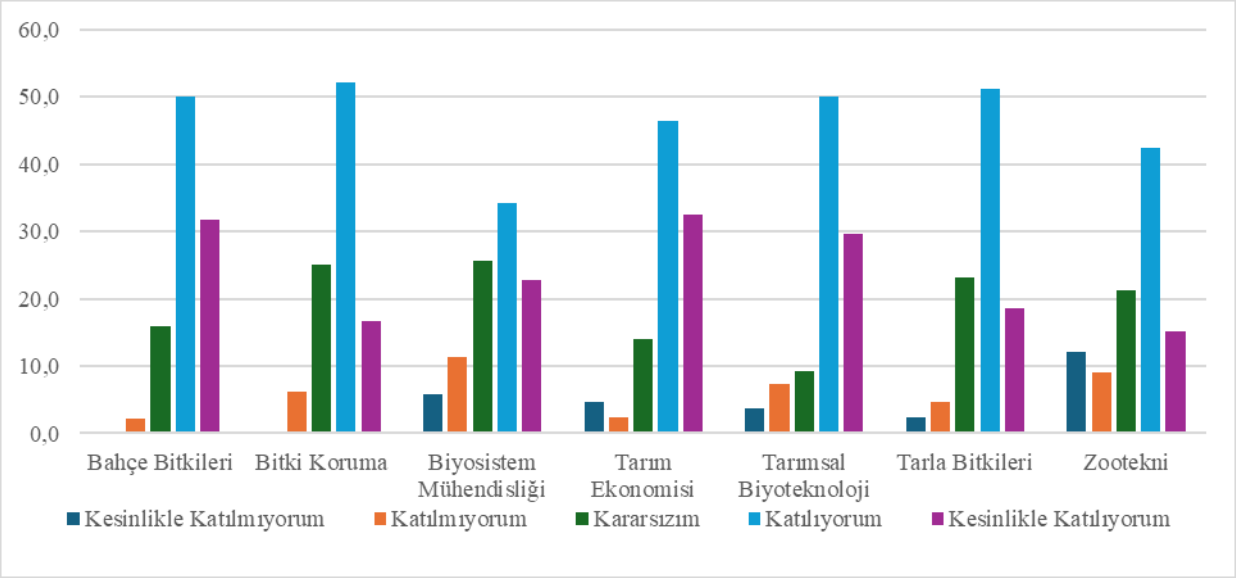
Şekil 7. Aldığım uygulamalı dersler mesleğim için yeterlidir fikrinin bölümlere göre dağılım grafiği

Eğitim aldığım süreçte mesleğime ilgim arttı sorusuna verilen cevap ile bölümler arasında önemli farklılık olduğu ve bu farklılığında P<0.01 önem seviyesinde anlamlı olduğu saptanmıştır. Bahçe Bitkileri, Tarım Ekonomisi ve Tarımsal Biyoteknoloji bölümü öğrencileri neredeyse %90 civarında olumlu düşünceleri ile en yüksek grupta yer almıştır. En yüksek olumsuz düşünce ise Tarla Bitkileri bölümü öğrencileri tarafından verilmiştir. Karasızlık oranı ise Biyosistem Mühendisliği ve Zootekni bölümünde %25'in üzerinde olmuştur (Şekil 8). Mesleğe ilgi artışı 1.sınıfta %70 civarında iken son sınıfta bu oran %90 seviyelerine yaklaşmıştır.



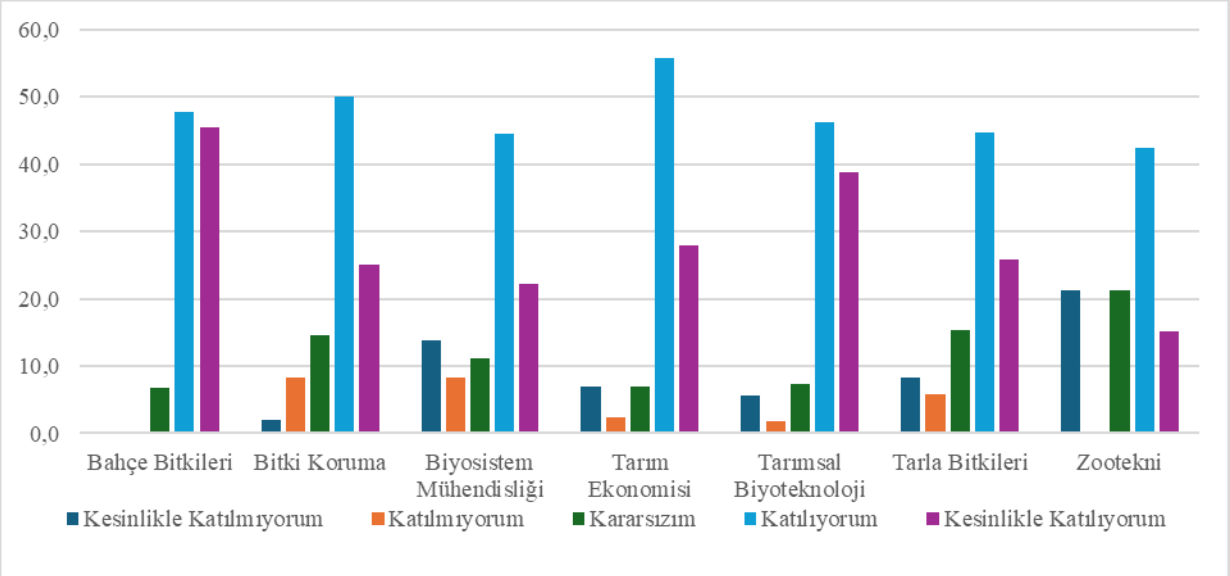
Şekil 8. Eğitim aldığım süreçte mesleğime ilgim arttı fikrinin bölümlere göre dağılım grafiği

Tarımsal üretimi geliştirme hedeflerim var sorusuna verilen cevap ile bölümler arasında önemli farklılık olduğu ve bu farklılığında P<0.01 önem seviyesinde anlamlı olduğu saptanmıştır. Bahçe Bitkileri, Tarımsal Biyoteknoloji ve Tarım Ekonomisi bölümü öğrencileri olumlu düşünceleri ile en yüksek grupta yer almıştır. Zootekni ve Biyosistem Mühendisliği bölümü ise bu düşünceye en düşük düzeyde katılan grupta yer almıştır. Ayrıca tarımsal üretimi geliştirme isteği ve gücü 3.sınıfta en düşük düzeylerde tespit edilirken son sınıflarda bu oran %80'lere yaklaşmıştır.



Şekil 9. Tarımsal üretimi geliştirme hedeflerim var fikrinin bölümlere göre dağılım grafiği

Çevreme mesleğimi tavsiye ederim fikri bölümler arasında önemli farklılık olduğu ve bu farklılığında P<0.01 önem seviyesinde anlamlı olduğu saptanmıştır. Bahçe Bitkileri bölümü öğrencileri diğer bölümlerin öğrencilerine göre oldukça yüksek düzeyde tavsiye edeceklerini belirtmişlerdir. Tarımsal Biyoteknoloji ve Tarım Ekonomisi bölümü öğrencileri ise çevrelerine mesleklerini tavsiye etme konusunda ikinci grupta yer almıştır. Öğrenciler 1.sınıfta %80 düzeyde çevresine mesleğini tavsiye edeceğini belirtirken bu oran 2. ve3. sınıflarda gerilemiş ve 4. sınıfta %85'lere ulaşmıştır.



Şekil 10. Çevreme mesleğimi tavsiye ederim fikrinin bölümlere göre dağılım grafiği

Sonuç ve Öneriler

Bu araştırma, Ziraat Fakültesi öğrencilerinin ziraat mühendisliği mesleğine bakış açısını belirlemek amacıyla Kırşehir Ahi Evran Üniversitesi Ziraat Fakültesi öğrencilerinden elde edilen veriler kullanılmıştır. Araştırmada veri toplama aracı olarak online anket formları kullanılmıştır. Anket toplam 346 Ziraat Fakültesi öğrencisine uygulanmıştır. Sosyo-demografik yapı incelenirken yüzde oranlar ve frekans tablolarından faydalanılmıştır. Öğrencilerin mesleğe bakış açısını belirlemek amacıyla 5'li likert tipi ölçek kullanılmıştır. Anketlerin değerlendirilmesi sonucunda, Öğrencilerin cinsiyete göre mesleğe bakış açılarında farlılıklar olmadığı saptanırken bölümler ve sınıflar arasında önemli (P<0.05) farklılıklar olduğu tespit edilmiştir. Bahçe Bitkileri ve Tarımsal Biyoteknoloji bölümü öğrencileri ziraat mühendisliği mesleğine bakış açılarının önemli düzeyde daha olumlu iken en düşük olumluluk ise Zootekni bölümü öğrencilerinden gözlenmiştir. Genel olarak Ziraat Fakültesinde okuyan öğrencilerin yaklaşık %95 düzeyinde çevresine mesleği tavsiye edeceğini bildirmiştir. Ayrıca bu sonuçla ilgili olarak Ziraat Fakültesi'nde okumaktan memnun olanların oranı %82 düzeyinde gerçekleşmiştir. Karasızlık oranının yüksek olduğu (%33-%30 aralığında) sorular ise özel sektörde çalışma, tarımsal üretimi geliştirme, akademisyen olma ve Tarım Bakanlığı'nda çalışmadır. Ziraat mühendisliği mesleğini yapmak isteyenler %55 seviyesinde kalırken

yapmayı düşünmeyenler ise %20'ye yaklaşmıştır. Öğrencilerin bölüm ders düzenlemesi özellikle uygulamalı derslerdeki memnuniyetler fakülteden, bölümden, çevresine mesleği tavsiye etme, mesleğini sevme ile anlamlı ve pozitif güçlü ilişkili olduğu gözlenmiştir.

FACTORS AFFECTING MEAT QUALITY IN RUMINANT ANIMALS: RED MEAT QUALITY FROM FARM TO TABLE

ABSTRACT

Meat is one of the basic protein sources rich in essential amino acids used in human nutrition. In addition to essential amino acids, it also contains minerals, vitamins and fatty acids in its structure. A large portion of the meat needed worldwide is obtained from ruminant animals such as cattle, sheep and goats. Today, in addition to increasing the production amounts of meat obtained from such animals, intensive scientific studies are also being carried out to improve the quality characteristics that affect consumer preferences. Meat quality characteristics can be examined in two categories as internal and external quality factors. Internal factors refer to physiological characteristics such as the appearance quality characteristics of meat (colour, texture, amount of intramuscular fat, fat colour, drip and clearance loss, etc.) and eating quality characteristics (softness, flavour, juiciness) that vary according to factors such as the type, breed and gender of the animal. External factors refer to the safety quality characteristics of meat products (microorganism load, physical and chemical residues, food additives). Many features used as quality criteria in meats, including chemical composition, pH, colour, water holding capacity, softness, texture, flavour, spoilage and contamination, can be defined instrumentally. All these features are evaluated as criteria in meeting consumers' expectations of quality meat. Consumers evaluate meats with high marbling rate, bright red colour, hard tissue structure, moderate visible fat content and fresh meat odour as quality meat. On the other hand, meats that have lost their original meat colour specific to the species they belong to, have soft tissue structure, relatively low marbling rate, excessive visual fat content and abnormal meat odour are evaluated as low quality meats. In this review, genetic factors affecting the quality of red meat obtained from ruminant animals, management factors such as slaughter age, slaughter weight, castration, environmental stress factors, animal feeding and feeding strategies, slaughtering of animals and the effects of post-slaughter processes on meat quality are examined.

Keywords: Meat Quality, Ruminants, Quality Parameters, Consumer Preference

RUMİNANT HAYVANLARDA ET KALİTESİNİ ETKİLEYEN FAKTÖRLER: ÇİFTLİKTEN SOFRAYA KIRMIZI ET

ÖZET

Et, insanların beslenmesinde kullanılan esansiyel amino asitler bakımından zengin temel protein kaynaklarından birisidir. Yapısında esansiyel amino asitlerden başka mineral, vitamin ve yağ asitlerini de içerir. Dünya genelinde ihtiyaç duyulan et miktarının büyük bir bölümü sığır, koyun ve keçi türü ruminant hayvanlardan elde edilmektedir. Günümüzde bu tür hayvanlardan elde edilen etlerin üretim miktarlarının arttırılmasının yanında, tüketici tercihlerini etkileyen kalite özelliklerinin iyileştirilmesi için de yoğun bilimsel çalışmalar yapılmaktadır. Et kalite özellikleri içsel ve dışsal kalite faktörleri olarak iki kategoride incelenebilir. İçsel faktörler, hayvanın türü, ırkı ve cinsiyeti gibi faktörlere göre değişen etin görünüm kalite özellikleri (renk, tekstür, kas içi yağ miktarı, yağ rengi, damlama ve tasfiye kaybı, vs.) ve yeme kalite özellikleri (yumuşaklık, lezzet, sululuk) gibi fizyolojik özellikleri ifade etmektedir. Dışsal faktörler ise et ürünlerinin güven kalite özelliklerini (mikroorganizma yükü, fiziksel ve kimyasal kalıntılar, gıda katkı maddeleri) ifade etmektedir. Etlerde kalite kriteri olarak kullanılan kimyasal bileşimi, pH, renk, su tutma kapasitesi, yumuşaklık, tekstür, lezzet, bozulma ve kontaminasyon dahil olmak üzere birçok özellik enstrümantal olarak tanımlanabilmektedir. Tüm bu özellikler, tüketicilerin kaliteli et beklentilerinin karşılanmasında birer kriter olarak değerlendirilmektedir. Tüketiciler, mermerleşme oranı yüksek, parlak kırmızı renkli, sert doku yapısına sahip, orta düzeyde görünür yağ içeren ve taze et kokusuna sahip etleri kaliteli et olarak değerlendirmektedirler. Buna karşın ait olduğu türe özgü orijinal et rengini kaybetmiş, yumuşak doku yapısına sahip, mermerleşme oranı nispeten daha az, aşırı görsel yağ içeren, anormal et kokusuna sahip etler ise düşük kaliteli etler olarak değerlendirilir. Bu makalede ruminant hayvanlardan elde edilen kırmızı etlerin kalitesini etkileyen genetik faktörler, kesim yaşı, kesim ağırlığı, kastrasyon, çevresel stres faktörleri gibi yönetimsel faktörler, hayvan besleme ve yemleme stratejileri, hayvanların kesimi ve kesim sonrası ete uygulanan işlemlerin et kalitesi üzerindeki etkileri incelenmiştir.

Anahtar Kelimeler: Et Kalitesi, Ruminantlar, Kalite Parametreleri, Tüketici Tercihi

1. GİRİŞ

Dünya nüfusunun sürekli artış göstermesi, gıda ihtiyacını da beraberinde getirmektedir. Dünya genelinde doğal kaynakların eşit kullanılamaması, coğrafya ve iklimin elverişsizliği gibi birçok etken dolayısıyla insanların sağlıklı beslenme ve kaliteli gıdaya erişimi konusunda eşitsizlik bulunmaktadır. Fakat insan vücudunda fonksiyonların sağlıklı bir şekilde yerine getirilmesi için ihtiyaç duyulan besin maddelerinin yeterli ve dengeli bir şekilde tüketilmesi gerekmektedir (Wu, 2016). Et; protein, mineral, vitamin ve yağ asitleri açısından zengin olan temel bir gıda maddesidir (Gündüz ve Çayıroğlu, 2024). Bununla birlikte etlerin tercih edilebilirliği ve genel kabul edilebilirliği sahip olduğu kalite parametreleri ile doğrudan ilişkilidir. Etin kimyasal bileşimi ve fiziksel özellikleri etin kalitesini belirlemektedir. Bu özellikler hayvan türü, ırk, bireysel özellikler, cinsiyet, yaş, yetiştirme teknolojileri ile et üretim prosedürü (besleme, taşıma ve kesim koşulları) ve işleme (depolama süresi veya sıcaklık koşulları) gibi diğer faktörlerden etkilenir. Kasın bileşimi, dokusu ve karkasın kesimi, üretimi ve depolanması sırasında gerçekleşen bazı biyokimyasal işlemler esas olarak etin yumuşaklığını etkilerken, yağ içeriğinden etkilenen lezzet, genetik yöntemlerle, büyüme performansı kontrolüyle ve diyet takviyeleriyle manipüle edilebilmektedir (Geletu ve ark. 2021). Söz konusu özellikler gıda işleme endüstrisi ve tüketici tercihlerini etkileyen önemli kalite parametreleridir. Özellikle renk, sululuk, mermerleşme seviyesi ve tat, tüketici memnuniyeti üzerinde oldukça büyük etkilere sahiptir (Önenç ve Ozdogan, 2022; Gündüz ve Çayıroğlu, 2024). Yüksek kaliteye sahip et üretmek için, et kalite özellikleri ve bunları kontrol eden faktörlerin özelliklerini iyi bilmek ve anlamak gerekmektedir (Joo ve ark., 2013; Geletu ve ark., 2021).

Et kalitesi değerlendirme süreci çiğ etin kalite kontrolüyle başlar. Çiğ etin görsel değerlendirmesinde, renk, görünüm, koku ve tat gibi organoleptik niteliklerden yararlanılır. Bu tip duyusal değerlendirmelerinin birçoğu hala insanlar tarafından panel testleri şeklinde yapılmaktadır. Bununla birlikte taze et kalitesi, kompozisyonu, besin maddeleri içeriği, rengi, su tutma kapasitesi, yumuşaklığı, lezzeti, bozulma ve bulaşma dahil olmak üzere bazı özellikler enstrümantal olarak tanımlanabilmektedir (Geletu ve ark., 2021). Et rengi, paketlenmiş et rengi, yağ miktarı ve dağılımı, yağ rengi, etin yüzeyindeki damla miktarı, tepsideki atık sıvı miktarı ve etin dokusu etin görünüm kalite özelliklerini belirler. Bu özellikler, tüketicinin satın alma noktasında kaliteli et seçme kararını büyük ölçüde etkilemektedir (Joo ve ark. 2013).

Bu makalede, çiftlikten sofraya kadar ruminant hayvanlardan elde edilen kırmızı etlerin kalitesini etkileyen faktörler incelenmiştir.

2. ETLERDE KALİTE PARAMETRELERİ

Et kalitesini belirlemede kullanılan göstergeler etin kimyasal, fiziksel ve duyusal özelliklerinin ortaya konulmasında kullanılan parametrelerdir. Bunlar Tablo 1'de özetlenmiştir. Etin protein ve amino asit içeriği, yağ ve yağ asidi içeriği, vitamin ve mineral içeriği kimyasal özellikleri ifade ederken; mermerleşme, pH, pişirme kaybı, kesme kuvveti, rengi, tekstür ve olgunluğu etin fiziksel özelliklerini ifade etmektedir. Yumuşaklık, lezzet, sululuk, tat, koku, görünüm, genel kabul gibi değerler ise etin duyusal özelliklerini ifade etmektedir.

Tüm bu parametreler hayvanın türü, ırkı, bireysel özellikleri, cinsiyeti, yaşı, yetiştirme ve besicilik uygulamaları ile et üretim prosedürü (besleme, taşıma ve kesim koşulları) ve işleme (depolama süresi veya sıcaklık koşulları) gibi faktörlerden etkilenmektedir. Buna göre ruminant hayvanlardan elde edilen etlerin kalitesini etkileyen faktörleri içsel ve dışsal faktörler olarak iki sınıfa ayırmak mümkündür. İçsel faktörler, etin görünüm kalitesi özellikleri (renk, damlama ve tasfiye kaybı, tekstür, kas içi yağ miktarı) ve yeme kalitesi özelliklerini (yumuşaklık, lezzet, sululuk) ifade ederken, dışsal faktörler et ürünlerinin güven kalitesi özelliklerini (mikroorganizma yükü, fiziksel ve kimyasal kalıntılar, gıda katkı maddeleri) ifade etmektedir. Etlerin kalitesini belirleyen faktörleri Tablo 2'de şematize edilmiştir. Tüm bu özellikler, tüketicinin yüksek kaliteli et beklentisine katkıda bulunmaktadır (Joo ve ark. 2013). Tüketiciler kaliteli eti, arzu edilen renge, sert dokulu, daha az damlamaya, yüksek mermerleşmeye, orta düzeyde görünür yağa ve taze et kokusuna sahip et olarak kabul ederler. Buna karşın renk bozulması, yumuşak doku, çok miktarda damlama, daha az mermerleşme, aşırı görünür yağ ve anormal et kokusu düşük kaliteli olarak kabul ederler (Joo ve ark. 2013).

Tablo 1. Et kalitesini değerlendirmede kullanılan parametreler

Kalite özellikleri	Göstergeler
Kimyasal özellikler	Protein ve amino asit içeriği, yağ ve yağ asidi içeriği, vitamin ve mineral içerikleri
Fizikokimyasal özellikler	pH, pişirme kaybı, kesme kuvveti, et rengi, yağ rengi, tekstür, olgunluk
Duyusal özellikler	Yumuşaklık, lezzet, sululuk, tat, koku, görünüm, genel kabul

Tablo 2. Et kalitesini etkileyen faktörler

Faktörler	Başlıca kalite özellikleri
Genetik faktörler	
Tür	Mermerleşme, duyusal özellikler, verim
Irk	Mermerleşme, duyusal özellikler, verim
Cinsiyet	Mermerleşme, duyusal özellikler, verim
Yönetimsel faktörler	
Kesim yaşı/ağırlığı	Mermerleşme, duyusal özellikler, verim
Eneme/kastrasyon	Mermerleşme, duyusal özellikler, verim
Sosyal topluluk	
Çevresel stres faktörleri	
(Sıcaklık ve mevsim etkisi)	Mermerleşme, duyusal özellikler, verim
Diğer yönetimsel faktörleri	Mermerleşme, duyusal özellikler, verim
Besleme ile ilgili faktörler	
Kaba-kesif yem oranı	Mermerleşme, yağ asidi bileşimi, duyusal özellikler
Yem katkı maddesi ilavesi	Mermerleşme, yağ asidi bileşimi, duyusal özellikler
Beslenme planı	Mermerleşme, duyusal özellikler, verim
Üretim sistemleri	Mermerleşme, duyusal özellikler, verim
Kesim öncesi koşullar ve kesim sonrası uygulamalar	
Kesim öncesi koşullar	Renk, görünüm, duyusal özellikler
Kesim sonrası uygulamalar	Renk, görünüm, duyusal özellikler
Et kasının bulunduğu yer	Mermerleşme, yağ asidi bileşimi, duyusal özellikler
Güven kalitesi özelliklerini	Mikroorganizma yükü, fiziksel ve kimyasal kalıntılar, gıda katkı maddeleri vs.

Baik ve ark., (2023)'den uyarlanmıştır.

3. KIRMIZI ETİN BESİNSEL BİLEŞİMİ

Kırmızı etin besinsel kalitesini, içerdiği protein, esansiyel amino asit, mineral ve vitamin miktarları belirler. Etin amino asit profili kaslar veya türler arasında nispeten sabittir. Ancak, kolajen açısından zengin kaslar, yüksek glisin içeriği ve esansiyel olmayan bazı amino asitleri içermesi nedeniyle daha düşük bir besin değerine sahiptir. Kas içi yağ, kas kütlesinin küçük bir kısmını oluşturmasına rağmen, et yağ asidi içeriği ve profili türe, belirli bir kasın anatomik kökenine ve hayvan diyetine göre değiştiğinden insan yağ asidi alımında rol oynar (Listrat ve ark., 2016). Türlere göre kırmızı etlerin kimyasal bileşimi Tablo 4, dana ve kuzu etinin esansiyel amino asitleri içeriği Tablo 5'de verilmiştir. Tablolar incelendiğinde etlerin protein, çinko,

demir, selenyum ve fosforun iyi bir kaynağı olduğu ve A vitamini ve B kompleks vitaminleri açısından da zengin bir kaynak olduğu görülecektir (Geletu ve ark., 2021).

Tablo 3. Et kalitesini etkileyen faktörün etki düzeyleri

	Yağlılık	Sululuk	Renk	Gevreklik	Lezzet	Genel kabul
Irk	***	*	*	*	Ø	*

Ayrıca et önemli miktarda su içerir. Etin yaklaşık %70-76'ini su oluşturur (Sakowski ve ark., 2022). Bu su etin rengi, dokusu ve yüzey görünümü üzerinde önemli bir etkiye sahiptir. Etin su içeriği yağ içeriği ile ters orantılı olarak değişir. Yağ dokusundaki su konsantrasyonunu farklılığı, kas içi yağ içeriğinin farklılığından kaynaklanır. Hayvanların yaşı da et su konsantrasyonun üzerinde etkin rol oynar. Nitekim et su içeriği hayvanların yaşıyla birlikte azalma eğilimi gösterir (Sakowski ve ark., 2022). Etin yapısında bulunan doku suyunun tutulma yeteneği "etin su tutma kapasitesi" olarak ifade edilir ve bu değer çiğ etin görünümü ve çiğneme sırasındaki sululuk üzerinde etkin rol oynar (Geletu ve ark., 2021).

Tablo 4. Türlere göre kırmızı etlerin kimyasal bileşimi

100 g yağsız et	Sığır	Dana	Kuzu	Koyun	Keçi

4. RUMİNANTLARDA ET KALİTESİNİ ETKİLEYEN FAKTÖRLER

4.1. Genetik faktörler

Ruminant hayvan etlerinde kalite hayvanın türü, ırkı ve cinsiyet et kalitesini etkilemektedir (Guerrero ve ark., 2013). Büyüme ve yağlanma sırasında, sırasıyla kas dokusunda bir büyüme (kas-kemik oranında artış) ve ardından yağ dokusunda bir büyüme (yağ-kas oranında artış) meydana gelir (Clinquart ve ark., 2022). Bununla birlikte, bu evrim olgunluklarına bağlı olarak et kalitesi ırklar arasında bile değişkenlik gösterir. Örneğin, Charolais, Limousine ve Belçika Mavisi gibi geç olgunlaşan ırklar, az yağlı ağır karkaslar üretmektedir. Buna ilaveten sütçü sığır ırkları daha yüksek iç yağ depolarına sahipken, et verim yönlü ırkları daha yüksek deri altı yağ depolarına sahiptir (Clinquart ve ark., 2022).

Et kalitesi ve özellikleri bakımından hayvan türleri arasındaki farklılıklar daha homojen olduğu düşünülen küçükbaş hayvan türleri arasında bile belirgin olarak kendini göstermektedir. Nitekim yapılan çalışmalar, koyun etinin keçi etine göre kas içi yağ içeriğinin daha yüksek, daha yumuşak ve daha baskın bir aromaya sahipken, daha düşük kuru madde ve protein içeriğine sahip olduğunu göstermiştir. Ayrıca koyun eti keçi etine göre daha açık renkli, daha

yumuşak, daha zayıf su tutma kapasitesi gösterirken pişirme kaybının daha fazla olduğu ifade edilmektedir. Koyun ve keçi etine ait bazı kalite özelliklerinin karşılaştırması Tablo 6'da verilmiştir. Tablo 6 incelendiğinde koyun etinin keçi etine göre kuru madde ve protein içeriği düşük, kas içi yağ miktarı daha yüksektir. Et rengi bakımından koyun eti keçi etine göre daha açık renklidir. Ayrıca koyun etinin pişirme kaybı keçi etine göre daha fazla olduğu görülmektedir.

Hayvan ile ilgili et kalitesini etkileyen faktörlerden biriside ırktır. Irkların et kalitesi üzerine etkisi karkas morfolojisindeki kas ve yağ dokusunun çeşitliliğinden kaynaklanmaktadır. Ancak et kalitenin etkileyen faktörler ile ilgili sonuçları ırk üzerinden değerlendirilebilmek için hayvanların yaş, kilo ve olgunluk derecelerinin aynı olması gerektiğine vurgu yapılmaktadır. Kural olarak, hayvanlarda ırkın pH, renk, doku ve duyusal özellikler gibi enstrümantal ve duyusal et kalitesi üzerindeki etkisinin az olduğu söylenebilir. Çoğu farklılık muhtemelen kaslılık seviyelerindeki farklılıklardan kaynaklanmaktadır (Guerrero ve ark., 2014). Hayvan ırkları arasında et kalitesi bakımından farklılığa sebep olan etkenlerden birisi de kas içi yağ asidi profili farklılığıdır. Özellikle melez sığırların yağ asidi bileşimindeki farklılıklar, kas içi yağ içeriğindeki farklılıklardan ziyade genetik farklılıklar ileri geldiği değerlendirilmektedir (Guerrero ve ark., 2014).

Tablo 6. Koyun ve keçi etine ait bazı kalite özelliklerinin karşılaştırması

Özellikler	Koyun	Keçi
Kuru madde	Daha düşük	Daha yüksek
Protein	Daha düşük	Daha yüksek
Kas içi yağ miktarı	Daha yüksek	Daha az
Et rengi	Daha açık renkli	Daha koyu
Pişirme kaybı	Daha fazla	Daha az

Babiker ve ark. (1990).

Türkiye'de mevcut koyun ırkları arasında Kıvırcık kuzularının et kalitesi ilk sırada yer alırken, bunu Karayaka, Dağlıç gibi koyun ırkları takip etmektedir. Sığırlarda ise Angus, Hereford, Limuzin, Şarole gibi kültür ırkların et kalitesi açısından değerli ırklar olarak kabul edilmektedir (Boztepe ve Aytekin, 2025).

Ivanović ve ark. (2014), aynı yaş grubundaki Balkan Keçisi ve Sırp Beyaz Keçilerinde et kalitesi özelliklerini karşılaştırdıkları çalışmalarında, ırkın etin kimyasal birleşimi, sertliği, yağ asidi kompozisyonu, bazı amino asitler, çinko ve bakır içeriği bakımından farklılık gösterdiğini bildirilmişlerdir. Migdał ve ark. (2021), aynı yaş aynı rasyon ile beslenen Karpat ve Saanen keçisi etlerinin kimyasal bileşim, amino asit, yağ oranı, renk ve duyusal özellikler bakımından farklılıklar olduğunu bildirmişlerdir. Benzer şekilde Xie ve ark. (2012) da aynı yaş grubunda ve aynı rasyonla yetiştirilen sığır ırklarının bazı et kalitesi parametreleri bakımından farklılık gösterdiğini bildirmişlerdir.

Hayvanların cinsiyetleri arasındaki et kalitesi farklılıkları tam olarak anlaşılamamış olmakla birlikte bunun kanda dolaşan cinsiyet hormonlarının farklı düzeylerinden kaynaklandığına inanılmaktadır (Boztepe ve Aytekin, 2025).

Beside erkek hayvanlarla çalışmanın daha hızlı büyüme ve daha yağsız karkaslar elde etmek başta olmak üzere bazı avantajları vardır (Hopkins ve Mortimer, 2014). Erkeklerde testislerden salgılanan testosteron hormonu, kaslardaki protein sentezini, insülin duyarlılığını ve lipit profilini iyileştirmektedir. Öte yandan, dişilik hormonu olan östrojenin kas yapımını olumsuz etkilediği ve daha fazla yağ kazanımını uyardığı belirtilmektedir (Kutay ve ark., 2024). Hormonların etkisi nedeniyle, daha kaslı bir yapıya sahip olan erkek hayvanların eti, dişi hayvanlarınkine göre dokusal olarak daha kabul edilebilir olarak değerlendirilmektedir. Ayrıca, et kalitesinin ve yağ asidi bileşiminin de cinsiyete bağlı olarak değiştiği vurgulanmaktadır (Kutay ve ark., 2024).

Et kalitesi üzerinde cinsiyetin etkisi (erkek, dişi ve enenmiş) esas olarak depolanan yağ miktarı, depolanma yeri, büyüme hızı ve karkas verimi ile ilişkilidir. Karkas özellikleri ırka nazaran cinsiyetten daha fazla etkilenir. Benzer şekilde, dişiler daha erken gelişim gösterdiklerinden erkeklerden daha fazla etkilenirken, düveler ara bir konumda kalır (Geletu ve ark., 2021). Cinsiyetin etkisinden kaynaklı olarak karkasın konformasyonu ve yağ içeriğinde oluşan farklılıklar, et kalitesi özelliklerinden pH, renk, yumuşaklık ve diğer parametreleri de etkileyebilmektedir. Cinsiyetin özellikle de etin yağlılığı ve yumuşaklığı üzerinde olumlu etkileri olduğu değerlendirilmektedir (Pogorzelska-Przybyłek ve ark., 2020).

4.2. Yönetimsel faktörler

Hayvanın kesim anındaki yaşı ve ağırlığı et kalitesini etkileyen faktörlerden birisidir. Bir hayvanda ırk, cinsiyet, diyet, hastalık vb. durumlar aynı olması durumunda yaş arttıkça canlı ağırlıkta artacağı için bu iki faktör bir arada değerlendirilmesi daha uygun olacaktır (Geletu ve ark., 2021). Yaşlı hayvanların etinde miyoglobin ve demir seviyeleri daha yüksektir. Bu da daha koyu renkli kas oluşumuna neden olmaktadır (Poveda-Arteaga ve ark., 2023). Belhaj ve ark. (2021) hayvanların kesim yaşının nihai pH ve et rengi üzerinde etkili olduğu, kesim yaşı ilerledikçe parlaklığın azaldığını, kırmızılığın ise arttığını bildirmişlerdir. Araştırıcılar renkte yaşanan bu farklılıkların yaş ilerledikçe demir ve miyoglobinin artmasıyla ilgili olabileceğini bildirmişlerdir. Przegalińska-Gorączkowska (2012) yaptıkları çalışmalarında, düşük canlı ağırlığa (20-30 kg) sahip kuzuların, yüksek canlı ağırlığa (30-40 kg) sahip kuzulara göre daha iyi bir yağ asidi profili meydana getirdiğini bildirmişlerdir. Benzer bir çalışmada iki aylık yaşta ve 8.7 kg ve 13.6 kg ağırlığındaki kuzularda bazı et kalite kriterlerini inceleyen Palidori ve ark. (2017), 5 aylık olan hayvanların etlerindeki yağ ve protein oranının 2 aylı yaştakilere göre daha yüksek olduğunu, et renginin ise daha koyu olduğunu bildirmişlerdir.

Hayvanlarda kesim yaşının et kalitesi üzerine etkisini olumlu yönde kullanmak için ırklara göre uygun kesim ağırlığının belirlenmesi önerilmektedir (Boztepe ve Aytekin, 2025). Bunu yaparken hem erken kesim hem de geç kesimle ilgili olumsuzlukların önlenmesi de göz önünde bulundurulmalıdır. Nitekim erken kesimlerde besi sonu canlı ağırlığa ulaşılamadığından ekonomik bir kayıp söz konusu olabilir. Aksine geç kesimde ise yemden yararlanma oranının

azalması ile birlikte karkas yağ oranının artması, et kalitesi ve maliyetini olumsuz yönde etkileyebilir (Geletu ve ark., 2021).

Hayvanları hadım etme ve çevre, sığır etinin kalitesini ve miktarını etkiler. Hadım etme, kalite sınıfını iyileştirdiği için sığır etinin kalitesini önemli ölçüde etkiler. Hadım etme yöntemi (yarı hadım etme veya tam hadım etme) sığır etinin kalitesini ve miktarını etkiler. Danaları yarı hadım etme, tam hadım etmeye kıyasla daha yüksek et verimi üretir. Ayrıca, yarı hadım edilmiş sığırlar, hadım edilmemiş sığırlara kıyasla daha yüksek kas içi yağ içeriğine ve daha düşük kesme kuvvetine (daha yüksek yumuşaklık) sahip et üretirler (Baik ve ark., 2023).

Hayvanların gruplar halinde, birbirleriyle etkileşime girmeleri ve ilişki içerisinde bulunmaları kendi içlerinde baskın olan veya pasif olan hayvan gruplarının ortaya çıkmalarına neden olur. Sığırlarda, baskınlıkla ilgili etkileşimler stres, morluklar ve fiziksel yaralanmalara neden olur. Sığır besi yeri sistemleri; yemlik, suluk, gölgelik, dinlenme ve yatma yerleri gibi temel kaynaklara erişim açısından rekabet olan alanlar hayvanlar için rahatsızlıklara ve buna bağlı biyolojik maliyetlere neden olabilir. Bu da bu hayvanlardan elde edilecek etlerin kalitesinde problemlere sebep olabilir (Guerrero ve ark., 2013). Partida ve ark. (2007) ve Miranda de La Lama ve ark. (2009) sosyal baskınlık endeksine göre sınıflandırdıkları sığırlarda, hayvanların sosyal statüsünün karkas veya et kalitesi parametreleri üzerinde hiçbir etkisi olmadığını, ancak duyusal et kalite sonuçları bakımından biraz farklılık olabileceğini bildirmişlerdir. Baskınlıkla ilgili yapılan çalışmalardan elde edilen sonuçlar, işletmelerde hayvanları yaş, ırk, cinsiyet, ağırlık ve vücut boyutu gibi özellikler bakımından homojen gruplar oluşturulması gerektiğini göstermektedir.

Stresin nihai et kalitesi üzerindeki etkilerini anlamak için, kesimden sonra ette glikojen ve laktik asit ile pH düşüşü arasındaki ilişkiyi anlamak önemlidir. Et kalitesinin önemli belirleyicisi pH'dır. Kaliteli etlerde kesim sonrası 24 saat dinlendirildikten sonraki nihai pH değeri, genellikle 5.4–5.7 arasındadır. Bu değer canlı hayvanlarda 7.1'dir (Boztepe ve Aytekin, 2025). Sıcaklık veya soğuk stresi, özellikle kesimden hemen önce hayvanların fiziksel ve psikolojik durumları üzerinde farklı etkilere sahip olabilir ve bu da yüksek pH ve daha koyu, sert ve kuru bir et elde edilmesine sebep olabilir. Sıcak ortamlar vücudun ısı dağılımını bozabilir ve hayvan stresini artırabilirken, soğuk ortamlar ise kas titremesini artırabilir ve bu da kesim öncesi glikojen rezervlerini hızla tüketebilir. Hayvanların kışın kesilmesi, sert ortalama sıcaklıklar (-3.3 °C) ve düşük bağıl nem (%57.73) nedeniyle daha açık renkli ve daha yüksek pH'ya sahip et üretilmesine neden olabilir (Poveda-Arteaga ve ark., 2023).

Sığırlarda, yüksek ortam sıcaklıkları, deri altı depo yerine, iç depolarda daha fazla kas mermerleşmesi ve yağ birikimini destekleyebilir. Ancak, yüksek ortam sıcaklıkları aynı zamanda daha koyu renkli et üretilmesine de yol açabilir. Yapılan çalışmalarda ortalama günlük sıcaklığın 35 °C olduğu ülkelerde etlerin yaklaşık %60'ının koyu renkli olduğu belirlenmiştir (Gregory, 2010). Bu gibi yerlerde bölgeye adapte olmuş, sıcaklığa toleranslı olan hayvan ırkları yetiştirilmesinin yanında hayvanlar için gölgelikler oluşturulması koyu renkli et üretim sıklığını azaltabilir.

Metabolizmayı etkileyen çevresel faktörler hayvanlarda yağ birikimini etkileyebilir. Kronik ısı stresi durumunda hayvanlarda beta oksidasyon azalır ve lipit birikimini artar. Soğuk stresinde ise tam tersi bir etki söz konusudur. Yani hayvanlar vücut sıcaklığını korumak için daha fazla

enerji sağlamak amacıyla lipit oksidasyonunu arttırırlar (Schumacher ve ark., 2022). Dolayısıyla soğuk havalarda hayvanların enerji gereksinimleri artar. Hayvanlar bu enerjiyi hem metabolizmayı dinamik tutarak ısı üretmek hem de deri altında yağ biriktirerek fazla enerjiyi yalıtmak için kullanırlar. Bu nedenle kış aylarında beslenen hayvanların eti daha yağlı olur. Bitki örtüsünün bol olduğu ilkbahar ve yaz aylarında taze otlarla beslenen hayvanların etlerinin yağ asidi bileşimi ve rengi de farklılık gösterir. Hayvanların enerji metabolizması kış aylarında daha aktiftir ve bunun sonucunda salınan laktik asit etin pH'ını düşürerek rengini ve dokusunu etkiler. Ayrıca yaz aylarında aşırı sıcaklıklardan dolayı strese giren hayvanların eti de bu durumdan olumsuz etkilenmektedir (Kutay ve ark., 2024). Kuzu etinin yaz ve kış mevsimlerindeki özellikleri değerlendiren Miranda ve ark (2009) incelenen özellikler üzerinde mevsimin önemli etkileri olduğunu bildirmişlerdir. Kışın kesilen kuzuların eti, daha koyu renk, daha yüksek nihai pH, daha sert et ve daha düşük su tutma kapasitesine sahip olduğu belirlenmiştir.

Hayvanlar genel olarak soğuktan ziyade sıcaktan daha fazla strese girdiği görülmektedir. Sığırları 18 °C'den yüksek sıcaklıklarda kesime tabi tutmak, hayvanın ısı stresini arttırmada problemlere neden olabilir. Bu da etin daha koyu, daha sert ve daha kuru olma olasılığını artırabilir. Sığır eti renk değerlerini korumak için soğuk günlerde gereksiz stres faktörlerinden kesinlikle kaçınılmalıdır. Kesim öncesi koşullar, sıcaklık kaynaklı stresi azaltmak ve et rengini iyileştirmek için hayvanlara konforlu bir ortam sağlamalıdır (Poveda-Arteaga ve ark., 2023).

4.3. Besleme ile ilgili faktörler

Birçok durumda etin kimyasal bileşimi ve besleme değeri, hayvanların beslenme stratejileri ve besleme planları ile manipüle edilebilmektedir. Hatta rasyon değişiklikleri veya rasyona katkı maddesi ilavesi, etin bileşimi ve kalitesi üzerinde en derin etkilere sahip anahtar faktördür. Bu nedenle hayvan besleme bilim insanları karkas verimini ve randımanını iyileştirme gayretlerine ek olarak, et kalitesini de ön plana çıkaran, etkili hayvan besleme stratejileri geliştirebilir. Bu stratejiler insanların kaliteli ve güvenilir kırmızı ete ulaşmasına katkıda bulunabilir.

Hayvanlarda büyüme esas olarak kas hücrelerinin çoğalması ve büyümesi yoluyla gerçekleşmektedir. Bu hücrelerin oluşumu için proteine ihtiyaç vardır. Rasyonda kullanılan hammaddenin türüne ve miktarına bağlı olarak hem hayvanın performansı hem de etin kalitesi etkilenebilmektedir (Önenç ve Özdoğan, 2022).

Hayvanların beslenmesinde kullanılan yemler, etin renk, koku ve lezzet kalitesi üzerinde önemli etkilere sahiptir ancak etkileri et yağında daha belirgindir (Geletu ve ark., 2021). Besicilikte canlı ağırlık kazancı artırmak için rasyondaki kesif yem miktarının arttırılması, karkasta daha fazla yağ birikimine neden olmaktadır (Önenç ve Özdoğan, 2022; Schumacher ve ark., 2022). Vestergaard ve ark. (2000), kesif yem esaslı bir rasyonla beslenen danalarda merada beslenen hayvanlara kıyasla daha fazla yağlanma olduğunu bildirmiştir. Benzer şekilde Dıáz ve ark. (2002), kesif yem esaslı rasyonla beslenen kuzularda merada beslenen kuzulara göre daha fazla yağlılık sergilediğini belirlemişlerdir.

Et kalitesi üzerinde rasyonun kaba ve kesif yem içeriği de etkin rol oynamaktadır. Nitekim French ve ark. (2001), otla beslenen hayvanlardan elde edilen sığır etinin kesif yemle beslenen

hayvanlardan elde edilen etlere göre yumuşaklık, sululuk ve lezzet açısından daha düşük değere sahip olduğunu bildirmişlerdir. Diğer bir ifade ile araştırıcılar, kesif yemlerle beslenen hayvanların kaba yemlerle beslenen hayvanlara göre daha yumuşak ve daha iyi aromaya sahip et üretildiğini bildirmişlerdir.

Kutay ve ark. (2024) rasyonun enerji içerinin artması ile kaslar arasındaki yağ miktarının arttığını, bunun bir sonucu olarak etin sululuğu ve yumuşaklığının iyileşebileceğini ifade etmişlerdir. Buna ilaveten, danaların ot silajı ile beslenmeleri halinde karkasta yağlılığın arttığı, buna karşın silaj ve kesif yemle beslenen hayvanlarda yağlılığın azaldığı da ifade edilmektedir (Kutay ve ark., 2024). Rasyondaki temel besin bileşenlerinin dışında aromatik maddeler de etin duyusal özelliklerini değiştirir. Kekik ve biberiye gibi kuvvetli aromaya sahip bitkilerin etin tadını ve kokusunu iyileştirdiği bilinmektedir (Kutay ve ark., 2024).

Rasyonlara ilave edilen yem katkı maddeleri, kullanım amaçlarından bağımsız olarak, etin fizikokimyasal yapısında değişikliklere neden olabilmektedir. Bu konuda yapılan bir çalışmada (Ornaghi ve ark (2020) doğal katkı maddelerinin, et rengi ve su tutma kapasitesini etkilemediğini, ancak etin nihai pH değeri, tekstürü, yumuşaklığı, lipid oksidasyonunu ve genel kabul edilebilirliği önemli ölçüde etkilediğini bildirmişlerdir.

Hayvanları besleme planları et kalitesi üzerinde önemli etkilere sahiptir. Özellikle sütten kesim yaşı ve bakım-besleme uygulamaları et kalitesi üzerinde önemli etkilere sahiptir. Sakız ırkı kuzuları yapay süt ve doğal süt besleyen Simitzis ve ark. (2024), iki grup arasında pH, renk, su tutma kapasitesi ve kesme kuvveti değerleri gibi et kalite özelliklerinde önemli bir fark olmadığını ancak etin raf ömründe iyileşme olduğunu bildirmişlerdir. Benzer çalışmada Ripoll ve ark. (2019), oğlaklarda yapay süt ile beslemenin etin pH değerini artırdığı bu durumunda dokusal parametreleri değiştirerek kesme kuvvetini azalttığı ve yapışkanlığı artırdığı bildirmişlerdir. Pateiro ve ark. (2013) farklı yaşlarda sütten kesilerek 9-9.5 yaşa kadar standart besleme uyguladığı danalarda, sütten kesim yaşının etin kuru madde, protein ve kül değerleri bakımından farklılık olmadığı, ancak, erken yaşta sütten kesilen hayvanlarda kas içi yağ miktarının daha yüksek olduğunu bildirmişlerdir. Araştırıcılar, yedi aylık sütten kesilen hayvanların etlerinin diğer gruplara göre daha kırmızı ve daha yumuşak olduğunu bildirmişlerdir.

Ruminantların karkas ve et kalitesini etkileyen faktörlerden biriside üretim sistemleridir. Hayvancılıkta üç tip üretim sisteminden bahsedebiliriz. (1) Ekstansif üretim sistemi, (2) entansif üretim sistemi ve (3) yarı entansif üretim sistemi.

Ekstansif üretim sistemi meralarda otlatmayı ve hayvanların genellikle yeşil alanlarda büyümelerini ve bu geniş arazi alanındaki mevcut meralarda beslenmelerini içerir. Bu tip üretim sisteminde üretilen etlerin kalitesi bir bakıma meranın kalitesi ile ilişkilidir. Bu üretim sisteminde daha koyu renkli, daha yağsız ve daha iyi bir yağ asidi profiline sahip karkas elde edildiği değerlendirilmektedir (Santos ve ark., 2021). Bu da lezzet ve sağlık arasında denge arayan sağlık bilincine sahip tüketiciler için sığır etindeki en önemli özelliklerden biridir.

Entansif üretim sisteminde sığırların otlatılmadığı ve tamamıyla yoğun beslenmeye tabi tutulduğu bir sistemdir. Üretimin yoğunlaşmasıyla birlikte hayvan başına kullanılabilir alan azalmaktadır. Bu üretim sisteminde daha parlak et üretilmektedir. Bununla birlikte, ırk ve

genetik yapı da sığır eti renginde önemli bir rol oynar (Santos ve ark., 2021). Yoğun üretim sisteminin sağladığı daha yüksek enerjili bir rasyon, daha yüksek miktarda deri altı yağ ve kas içi yağ üretilmesini sağlar. Yağlanma süresi arttıkça, kas içi yağ birikimi de artar (Santos ve ark., 2021). Ayrıca yoğun olarak yetiştirilen sığır etinin yağ asidi profili de daha iyidir ve bu profil yem hammaddeleri tercihi ile iyileştirilebilir (Santos ve ark., 2021).

Yarı entansif üretim sistemi, hem ekstansif hem de entansif sistemleri birleştiren bir üretim sistemidir. Örneğin, hayvan büyümesinin ilk aşamasında mera beslemesine tabi tutulur, ardından hayvanların kesif yem ile beslendiği bir besi dönemi takip eder. Aynısı, hayvanın besi boyunca hem otlatılması hem de kesif yem ile beslenmesinin birlikte yapıldığı üretim için de geçerlidir. Bu besicilikte uygulanan en yaygın üretim sistemidir. Bunun birkaç nedeni vardır, özellikle meranın mevsimselliği, beslenme ihtiyaçlarını karşılamak için kesif yem kullanımını gerektirir. Bu sistemde üretilen etler daha açık kırmızı renkte, daha düşük lezzet yoğunluğunda, daha yağlı, daha yumuşak ve daha sulu etlerdir (Santos ve ark., 2021).

4.4. Kesim öncesi koşullar ve kesim sonrası uygulamalar

Hayvanlarda kesim öncesi stresin kaslardaki glikojen miktarını azalttığı, bunun sonucunda daha yüksek pH ve dolayısıyla daha koyu etin yanı sıra yumuşaklık, sululuk, lezzet, beğeni ve raf ömrü açısından daha düşük kaliteli etin oluşmasına yol açtığı iyi bilinmektedir (Santos ve ark., 2021). Kesim gönderilen hayvanlar yükleme, taşıma, ani ortam değişikliği, mevsim koşulları, açlık, susuzluk, yorgunluk gibi birçok faktörün etkisiyle stres yaşamaktadır. Hayvanlarda özellikle rutin taşıma, kesimhane ağıl ortamı koşulları ve kesim operasyonları sırasında işçilerin veya diğer hayvanların yaptığı sesler ve hareketlere karşı duyarlılık artabilir. Hayvanlarda stresin oluşturduğu olumsuzlukları önlemek açısından, kesim öncesi aynı grupta barındırılan hayvanları aynı partide nakletmek önerilmektedir (Poveda-Arteaga ve ark., 2023).

Hayvanın kesim öncesi strese girmesi glikojen rezervlerinin azalmasına laktik asit oluşumunun kısıtlanmasına, etin pH değerinin yükselmesine koyu kesiklere yol açabilecek olan enzimlerin, kortizollerin ve katekolaminlerin hızlı bir şekilde salınmasını neden olmaktadır. Stres sonucu etin duyusal kalitesi ve kimyasal birleşiminde meydan gelebilecek olan olumsuzluklar tüketici tarafından memnuniyetsizlikle sonuçlanır. Özellikle hayvanların kesim yerine nakilleri esnasında oluşan stres, kesim padoklarında kalış süresi ve padokta maruz kaldıkları istenmeyen davranışlar bu hayvanlardan elde edilen etlerin özellikle renklerinde olumsuzluklara neden olmaktadır (Poveda-Arteaga ve ark., 2023).

Kesim sırasında sığırlara, elektrikle veya darbeli sersemletme uygulandığında, etin glikojen konsantrasyonları arasında farklılık olsa bile, et rengi, 24 saat sonraki pH değeri, su tutma kapasitesi ve pişirme kaybı bakımından sersemletilmeyen hayvanlara göre daha iyi sonuçlar verdiğini bildirmişlerdir Önenç ve Kaya (2004).

Taşıma ve bekletme sırasında hayvanların rastgele karıştırılması, koyu, sert ve kuru karkas elde etme olasılığını artırabilir. Aksine hayvanları yetiştirildikleri sosyal gruplarda tutmak etlerin rengini iyileştirebilir. Uzun taşıma ve uzatılmış bekletme süreleri, sığırların glikojen rezervlerini önemli ölçüde azaltabilir ve bu hayvanların etinde daha düşük L^*, a^* ve b^* değerleri oluşturabilir. Ancak, hayvanların uzun mesafeler boyunca taşınması gerekiyorsa,

glikojen rezervlerinin kesimden önce yenilenebilmesi ve et kalitesi sorunlarının en aza indirilebilmesi için yeterli ölçüde yem ile uzun ve sessiz bir bekletme önerilmektedir. Kesimhane operasyonlarını, hayvan refahını ve et rengini optimize etmek için sığırlarla doğrudan temas halinde olan çalışanlara hayvan işleme hakkında basit ve sürekli bir eğitim programı da sağlanmalıdır. Ek olarak, koyu, sert ve kuru karkas riskini azaltmak için sersemletme işleminin hassas bir şeklide ve yalnızca eğitimli personel tarafından yapılması gerekir (Poveda-Arteaga ve ark., 2023).

Kesimden sonra ette meydana gelen kimyasal olaylar sıcaklıkla birlikte daha hızlı gerçekleşir. Etin kimyasal yapısını etkileyen enzimler sıcaklığa duyarlıdır ve karkasın hızla soğutulması bu enzimlerin aktivitesini yavaşlatacaktır. Ayrıca bu işlem mikroorganizmaların aktivitelerini sınırlayacağı için besin madde kaybını ve renk değişimini de azaltacaktır (Kutay ve ark., 2024). Karkasların uzun süre bozulmadan saklanması insan sağlığı açısından önemlidir. Etler genellikle 4 °C'de saklanır. Ancak kesimden sonra karkas sıcaklığını hızla bu dereceye düşürmek etin yapısına zarar verebilir. Bu tip zarar gören etler daha serttir, tadı kötüdür ve yüksek su kaybına sahiptir (Kutay ve ark., 2024). Etleri dondurarak saklama etin yumuşaklığını artırabilir ancak bu durum su tutma kapasitesi, renk ve lezzet gibi et kalite parametreleri üzerine olumsuz etkiler meydana getirebilmektedir. Dondurarak saklama yönteminin et kalitesi üzerinde etkisi, dondurma oranı, depolama sıcaklığı ve süresine bağlı olarak değişen kristalleşme boyutu ve dağılımına göre değişmektedir (Kutay ve ark., 2024). Derin dondurma ve depolama sıcaklığının (–50 °C, –60 °C ve –80 °C) kuzu etinin kalitesi ve tazeliği üzerine etkisini araştıran Choi ve ark. (2018), derin dondurmada, normal dondurmaya göre daha az sızdırma olduğunu bildirmişlerdir. Muela ve ark. (2015), kuzu etlerinde depolama süresi ve teşhir süresi arttıkça et kalitesinde genel bir düşüş olduğunu bildirmişlerdir.

Tüketiciye sunulmak üzere hazırlanan ete uygulanan işlemler etin özelliklerini etkileyebilir. Fiziksel elektriksel uyarım, kuru dinlendirme, kuru kürleme, yüksek basınçla işleme işlemleri uygulanırken; kimyasal fermantasyon, tütsüleme, kürleme ve marine etme gibi teknikler kullanılır. Ete uygulanan elektriksel uyarım gevrekliği, etin rengini, tadını ve kokusunu iyileştirir; mermerleşmeyi daha belirgin hale getirir, olgunlaşma süresini kısaltır ve raf ömrünü uzatır (Kutay ve ark., 2024). Etleri kuru kürleme domuz etinin sindirilebilirliğini kötüleştirirken; sert, buruşuk, koyu kahverengi ete neden olur. Yüksek basınçla işleme besin değerlerini kaybetmeden etin sindirilebilirliğini ve dokusunu iyileştirirken kuzu etinde kararmaya neden olur. Etin fermente edilmesiyle oluşan alkol, ketonlar ve aldehitler belirli bir aroma sağlar (Kutay ve ark., 2024).

Kesim sonrası işlemlerden birisi olan paketleme sistemleri üzerine Kowalczyk ve ark. (2024) yürüttüğü çalışmada dana etlerini vakumlu paketlemenin modifiye atmosfer paketlemeye göre önemli ölçüde daha düşük lipid oksidasyon değeri gösterdiği ve daha yüksek yumuşaklığa sahip olduğu bildirmişlerdir. Benzer şekilde Berruga ve ark. (2005) vakumla paketlenen kuzu etinin, modifiye atmosfer altında paketlenen ete göre istenilen duyusal özellikleri daha iyi koruduğu ifade etmişlerdir.

Hayvan vücudunda aşırı çalışan kaslar daha fazla kasıldıkları için daha sert hale gelir. Ruminant hayvanların ön kolları ve arka bacakları daha fazla çalıştıkları için diğer kısımlara nazaran daha sert bir yapıya sahiptir. Ancak, memelilerde sırttaki en az aktif kas olan M. longissimus dorsi,

en yumuşak yapıya sahip kaslardır (Kutay ve ark., 2024). Bu kasta biriken kas içi yağ miktarı mermerleşme olarak bilinir. Mermerleşme karkas kalitesinin önemli bir belirleyicisi ve lezzetin öngörücüsü olup kas sıkılığı, lezzet ve sululuk ile yakından ilişkilidir. Et kalitesinin değerlendirilmesinde çok önemli bir faktördür. Pişirme sırasında eti suyla dolduran yağlı katmanlar nedeniyle sululuk ve yumuşaklık gibi lezzet özelliklerini etkiler (Geletu ve ark., 2021).

4.5. Güven kalite özellikleri

Ette mikroorganizma varlığı ve seviyesi taze et için en önemli güven kalite özelliğidir. Etlerde güven ayrıca fiziksel ve kimyasal kalıntılar, gıda katkı maddeleri ve et ürünlerinin hayvansal olarak tanımlanmasını da içerir. Genel olarak tüketiciler et güvenliğini, etin bozulmasının en hızlı göstergeleri olan görsel ve koku değerlendirmeleriyle değerlendirirler. Ancak bunlar güvenilir göstergeler değildir. Etin bakteriyel patojenlerin taşıyıcısı olarak önemi halk sağlığı açısından önemlidir. Bu nedenle, birçok ülkede etin işlenmesinde çok sıkı güvenlik uygulamaları geliştirilmiştir. Tehlike Analizi Kritik Kontrol Noktası (HACCP) sistemi, et zinciri içindeki et güvenliği yönetim sisteminin temelini oluşturur (Geletu ve ark., 2021).

Geçmişte, kaliteli et denildiğinde, et ürünlerinin duyusal algıları, tazeliği ve güvenilirlik yönleriyle daha yakından ilişkiliyken, son zamanlarda insan sağlığıyla ilgili beslenme, refah ve işlevsellikle ilişkilendirilmektedir. Sonuç olarak, tüketiciler ette bulunan yüksek yağ ve kolesterol içeriğini istenmeyen ve sağlıksız olarak görebilirler. Ancak et zengin bir protein, esansiyel amino asit, mineral ve vitamin kaynağı olduğu için besleyicidir (Geletu ve ark., 2021).

Son yıllarda tüketicilerin etin nasıl üretildiğine ilişkin endişelerinde önemli bir artış olmuştur. Hayvan refahı konusundaki endişeler dünya çapında büyük ölçüde artmıştır ve hayvanların 'organik' yetiştirilmesinde önemli bir gelişme olmuştur. Tüketiciler, hayvanların insani koşullar altında yetiştirilmesini, taşınmasını ve kesilmesini talep etmektedir. Ayrıca, tüketiciler satın aldıkları etin etik açıdan sağlam üretim sistemlerinden elde edildiğinden emin olmak istemektedir. Sonuç olarak, çiftçilerin, veteriner hekimlerin, paketleyicilerin ve bilim insanlarının çiftlikte ve kesim tesisinde hayvan refahının nasıl değerlendirileceği ve denetleneceği konusunda daha fazla bilgi sahibi olmaları gerekmektedir.

5. SONUÇ

Et, insanların sağlıklı ve dengeli beslenmesi için gerekli olan temel besin maddelerinin önemli bir kaynağıdır. Et kalitesini etkileyen faktörlerin bilinmesi etin kaliteye göre değerlendirildiği ülkelerde hem üreticiler hem de tüketiciler açısından önemli hale gelmiştir. Tüketicilerin kırmızı et alırken dikkat ettikleri duyusal kalite parametreleri, et rengi, görünüm, görsel yağ miktarı, fiyatı, hangi hayvandan elde edildiği, varsa markası ve görsel sunumudur. Tüketim sırasında ise yumuşaklık, lezzet ve sululuk gibi kalite parametreleri ön plana çıkmaktadırlar. Dolayısıyla kaliteyi etkileyebilecek tüm değişkenler hakkında bilgi sahibi olan bir tüketici kırmızı et alım tercihlerini kolaylıkla değiştirebilmektedir. Et kalitesini etkileyen faktörler bir bütün olarak değerlendirildiğinde, kaliteli ürün elde edebilmek için ahırdan sofraya kadar üretim zincirinin her aşamasında üretim ve işleme prosedürlerine titizlikle uyulması gerekmektedir.

ABSTRACT

Savcılı Büyükoba Village, located in Kaman district of Kırşehir province, is a village with significant potential in tourism and agriculture. It is one of the villages bordering the Hirfanlı Dam Reservoir among the villages of Kaman district. It is one of the border places of Hirfanlı Dam Reservoir among the villages of Kaman district. It also stands out with its active agricultural activities throughout the province and district.In addition, it has been observed through previous studies that there is a high demand for the village to eliminate the picnic and recreation needs in the summer throughout the province and district.The local people's perspective on tourism is positive. When we look at the village in general: The presence of water due to its border with the Hirfanlı Dam, the microclimatic climate feature due to its south-facing position, the presence and diversity of its agricultural potential, the fact that its population structure is young and crowded compared to other villages and towns, highlight the existence of the village's rural tourism potential. Within the scope of rural tourism activities and potential, the current situation in the village is investigated, promoted and developed. It is aimed to reveal and promote the rural landscape potential of Savcılı Büyükoba village with correct, sustainable tourism and recreation plans. It is aimed to bring cultural landscape values to the village through rural tourism activities from non-agricultural economic activities and to reduce the migration effect. It is aimed to reveal the rural landscape features of Savcılı Büyükoba village depending on rural tourism activities, to provide economic investments with new job opportunities and to increase the contribution of the village to the provincial and district economy. The main material of the study is the borders of Savcılı Büyükoba Village and its rural tourism potential. As a method, it includes literature review, study area visits, photo shooting, field synthesis, data collection and evaluation stages.

As a result; Savcılı Büyükoba Village has an important place in our Kaman district and the province in terms of both rural tourism and agricultural potential. With this study, the rural landscape potential of the village was transformed into rural tourism activities and its gains were revealed.

Keywords: Kaman, Savcılı Büyükoba, rural tourism, landscape

KIRSAL TURİZM FAALİYETLERİ KAPSAMINDA SAVCILI BÜYÜKOBA (KIRŞEHİR/KAMAN) KÖYÜNÜN PEYZAJ POTANSİYELİNİN İNCELENMESİ

ÖZET

Kırşehir ili Kaman ilçesinde bulunan Savcılı Büyükoba Köyü, turizm ve tarımda önemli bir potansiyele sahip köyüdür. Kaman ilçe köyleri arasında Hirfanlı Baraj Göletine sınır köylerden biridir. İl ve ilçe genelinde aktif olarak zirai faaliyetleri ile de ön plana çıkmaktadır. Ayrıca il ve ilçe genelinde yazın piknik ve rekreasyon ihtiyaçlarının giderilmesi için köye yoğun bir talebin olduğu daha önce yapılan çalışmalar ile gözlemlenmiştir. Yerel halkın turizme olan bakış açısı olumludur. Genel olarak köye baktığımızda: Hirfanlı Barajına sınır oluşu ile su varlığı, tarımsal potansiyelinin varlığı ve çeşitliliği, güney bakarlı olmasıyla mikroklimatik iklim özelliği, nufüs yapısının diğer köy ve kasabalara göre kalabalık ve genç oluşu köyün kırsal turizm potansiyeli varlığını ön plana çıkarmaktadır. Kırsal turizm faaliyetleri ve potansiyeli kapsamında köydeki mevcut durum araştırılarak, tanıtılması ve geliştirilmesi hedeflenmektedir. Savcılı Büyükoba köyünün kırsal peyzaj potansiyelinin doğru, sürdürülebilir turizm ve rekreasyon planlamaları ile ortaya çıkarılması ve tanıtılması amaçlanmıştır. Kültürel peyzaj değerlerinin tarımdışı ekonomik faaliyetlerden kırsal turizm faaliyetleriyle köye kazandırılması ve göç etkisinin azalması hedeflenmiştir. Kırsal turizm faaliyetlerine bağlı olarak Savcılı Büyükoba köyünün kırsal peyzaj özelliklerinin ortaya çıkarılması ile yeni iş olanaklarıyla ekonomik yatırımların sunulması ve köyün, il ve ilçe ekonomisine katkısının arttırılması amaçlanmıştır. Çalısmanın ana materyalini Savcılı Büyükoba Köyü sınırları ve kırsal turizm potansiyeli oluşturmaktadır. Yöntem olarak; literatür taraması, çalışma alanı ziyaretleri, fotoğraf çekimleri, alan sentezi, ve verilerin toparlanması, değerlendirme aşamalarını kapsamaktadır.

Sonuç olarak; Savcılı Büyükoba Köyü, Kaman ilçemizde ve ilde gerek kırsal turizm gerekse tarım potansiyeli olarak önemli bir yere sahiptir. Yapılan bu çalışma ile köyün kırsal peyzaj potansiyelinin kırsal turizm faaliyetlerine dönüştürülerek kazanımları ortaya konmuştur.

Anahtar Kelimeler: Kaman, Savcılı Büyükoba, kırsal turizm, peyzaj

1. GİRİŞ

Kırsal alanlar, kent yaşamının stresinden bunalan insanların en çok tercih ettiği doğaya dönük alanların başında gelmektedir. Kırsal alanlarda gerçekleştirilecek rekreasyon ve turizm etkinlikleri doğayla uyumlu, bütünleşik ve sürdürülebilir olmalıdır. Diğer türlü kırsal alanlarda bazı olumsuz etkilerin oluşması söz konusudur. Bu etki sadece o alanda değil aynı zamanda yerli ve yabancı faydalanıcıların kırsal turizm deneyim kalitelerini etkileyecektir. Bu nedenle kırsal alanlarda gerçekleştirilen turizm ve rekreasyon etkinliklerin alanın kırsal ekolojisine uyum sağlaması gerekir.

Kırsal alanları koruma ve kullanma dengesinin kurulabilmesi ancak sürdürülebilir turizm ve rekreasyonel planlama ile mümkündür. Kentsel veya kırsal alanların birbirinden farklı doğal, ekolojik ve sosyo-kültürel yapıları, planlama aşamalarında iyi analiz edilerek ortaya konulmalıdır. Her alanın kendine özgü değerleri korunarak ve geliştirilerek ortaya çıkarılmadır. Bu nedenle uygulanacak turizm ve rekreasyon planlama çalışmalarında alanın ekolojik, kırsal özellikleri, turizm ve rekreasyon talep ve gereksinimleri ile kaynak potansiyelleri ortaya çkarılmalıdır. Bu araştırmada; Kırşehir ili içinde gerek tarımsal faaliyetleri gerekse Hirfanlı Barajı varlığı ile turizm, rekreasyon kapasitesi olan Savcılı Büyükoba Köyünün kırsal peyzaj potansiyeli araştırılmıştır.

Literatür özeti

Bu yayın; Duran Gökalp (2016) tarafından yayınlanan “Savcılı Büyükoba Örneğinde (Kaman/Kırşehir) Kırsal Peyzaj Özelliklerinin Kırsal Kalkınma Açısından Araştırılması” doktora tezinden üretilmiştir.

Peyzaj “doğa, insan, kültür gibi çevreye ilişkin tüm canlı ve cansız materyalleri ekolojik amaçlar doğrultusunda değerlendiren, çevreyi korumayı, doğayı insan yaşamına ve yaşam ortamlarına adapte etmeyi amaçlamıştır” (Yazgan, 2014: 30)

Kırsal peyzaj; İnsanın doğa içinde, kentsel amaçları dışındaki çeşitli uğraşlarını sürdürdüğü çevrenin genel görünümüdür. Bu uğraşılar daha çok tarımsal olabileceği gibi, sanayi ile ilgili yada rekreasyonel olabilir. Uğraşı amaçlarına göre, doğa ile ilişkileri dengeli yada dengesiz sonuçlar ortaya koymaktadır (Koç ve Şahin 1999).

Kırsal turizm kavramı genel olarak tüm turizm türlerini içerisinde barındırmaktadır. Doğal alanlarda, az nüfus yoğunluğu olan yerleşimlerde ve ormancılık, tarım ve geleneksel uğraşlarla turizm aktivitelerinin ilişkili olduğu alanlarda yapılmaktadır.

Kırsal turizm "yerel halkın geleneklerini ve yaşam biçimlerini tanımak, kırsal karakterdeki aktivitelere katılmak, kültürel ve tarihi çevreyi tanımak amacıyla kırsal alanlara yapılan seyahat" olarak tanımlanabilir (Blangy ve Vautier 2001).

Kırsal turizm, doğal kaynaklar, kültürel miras, kırsal yaşam tarzı ve yerel ekonomik etkinliklerle bütünleştirilmiş bir turizm türüdür. Öyle ki kırsal turizmin gerçekleştirildiği kırsal alanlar sahip oldukları kültürel peyzaj özelliklerinin yanı sıra doğal peyzaj elemanların sayısı ve çeşitliliği (su, vista, topografya, bitki örtüsü, temiz hava vb.) ile de her türlü rekreasyonel faaliyetler için uygun ortamlardır. Bu nedenle doğal varlıklar kırsal turizme hammadde oluşturmakta olup, aynı zamanda

da insanların seyahatlerini yönlendiren çekici bir güçtürler (Kiper, Özyavuz ve Korkut,2011, 22).

2. MATERYAL VE YÖNTEM

Bu çalışmanın ana materyalini; Kırşehir İli Kaman İlçesi Savcılı Büyükoba Köyü sınırları içinde kalan alanın kırsal turizm ve peyzaj potansiyeli oluşturmaktadır. Yöntemi; veri toplama ve toplanan verilerin analiz edilerek değerlendirilmesidir. İller Bankası'ndan (2011) elde edilen araştırma alanı sayısal haritası ArcGIS 10.1 ortamına aktarılarak turizm haritası elde edilmiştir.

3. GELİŞME

Köyün coğrafi konumu ve yerleşimi

Kırşehir ili Kaman ilçesinde bulunan Savcılı Büyükoba köyü Kaman ilçesine 16 kilometre, il merkezine ise 58 kilometre uzaklıkta yer almaktadır. Köy 1946-1971 yılı arasında Bucak Merkezi, 1971-2004 yılları arasında Belediye olarak hizmet vermiştir. Fakat nüfusu 2000 altında olduğu için 30 Mart 2014 yerel seçiminden sonra 6360 sayılı yasanın geçici 2. maddesi gereği yeniden köy olmuştur. Köyün toplam sınır alanı:

- Mücavir Alanı: 52,137 da
- Yüzölçümü: 36.999 km²
- İmar Alanı: 15,000 da'dır.

Şekil 1. Köyün uydu görüntüsü yeri ve Türkiye'deki konumu

Köy sınırları içinde kalan kırsal peyzaj özellikleri rekreasyon ve turizm açısından potansiyeli incelendiğinde, Savcılı Büyükoba köyü araştırma alanı olarak belirlenmiştir. Bu potansiyeller;

- Hirfanlı Baraj Gölü ile su varlığı
- Ulaşım-erişilebilirlik
- Tarımsal peyzaj özellikleri

- Sosyo-kültürel değerleri
- Topoğrafik özellikleri
- Jeolojik (Granit taş) oluşumlardır.

Şekil 2. Savcılı Büyükoba köyünün genel görüntüsü

Köyün arazi varlığı

Köyün arazi varlığı alanları ve kullanımı çizelge 1'de yer almaktadır.
Çizelge 1. Arazi varlığı (Anonim 2014)

KÖY ADI	TARLA	MER'A	BAĞ BAHÇE MEYVE	YERLEŞİM ALANI	MEZARLIK OKUL CAMİ	YOL	TOPLAM
S.Büyükoba (da)	32.396,74	2.517,00	3.164,96	169,22	38,52	70,00	38.356,44

Çizelge 1'de köyün 32.396,74 da tarım alanıdır. Bağ bahçe alanı 3,164 da, mera alanı 2517 da olup, toplam arazi valığı 38.356,44 da'dır.

Köyün arazi kullanım biçimi

Ekonomik yaşamda temel ekonomik aktivite % 82,27'lik istihdam payıyla tarım ve hayvancılıktır. Köy hanesinin % 75'inin işleyeceği toprağı vardır. Hanelerin arazi büyüklüğü en fazla 1100 dekar, en az arazi büyüklüğü ise 3 dekar olmuştur. Köyde hane başına ortalama arazi büyüklüğü 50 dekardır.

Köyde uygulanan münavebe şekli ilk yıl arpa-buğday, ikinci yıl nadas (ayçiçeği-nohut) olmaktadır. Sulu tarım alanlarında ise sebzecilik, bağcılık ve meyvecilik ön plandadır. Köyün arazi kullanım biçimi çizelge 2'de verilmiştir.

Şekil 3. Köyün tarımsal faaliyetler görüntüsü (Orijinal 2015)

Çizelge 2. Arazi kullanım biçimi (Anonim 2014)

Köyün yöresel tatları

Köyün yöresel yemek kültüründe bölgesel tatlar bulunmaktadır. Çizelge 3'te yöresel tatları ayrıntılı olarak verilmiştir. Ayrıca yetiştirilen yaş meyve ve sebze mahsullerinin kurutulması hemen hemen her hanede yapılmaktadır. Evde yapılan salça, üzüm pekmezi, bulgur, kurutulmuş sebze ve meyve türleri bu ürünler arasındadır.

Çizelge 3. Yöresel lezzetler (2014)

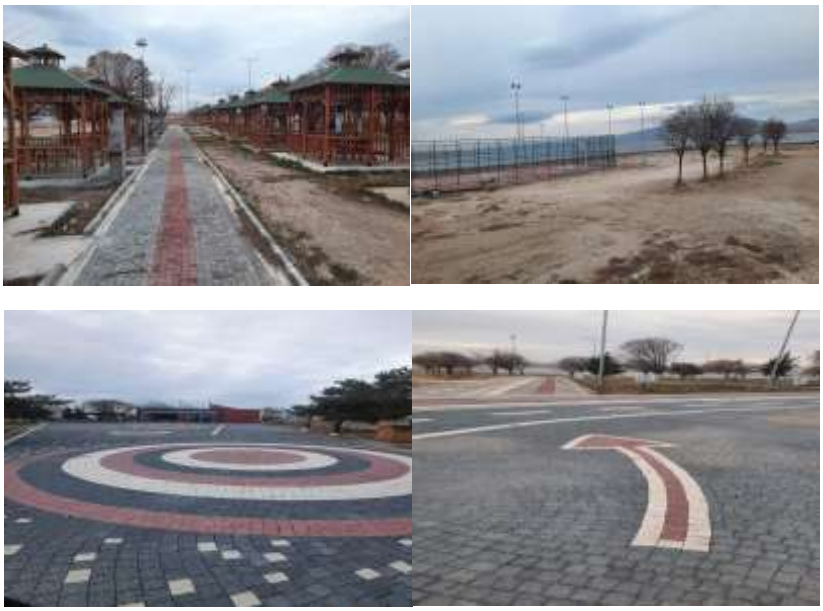
Köyde yapılan çalışmalar (Duran Gökalp, 2016)

Köyün rekreasyon ve turizm alanları

Kavram olarak turizm köy için bilinen bir kavramdır. Köyün konum olarak Hirfanlı Barajı gölüne kıyısının olması nedeniyle rekreasyon faaliyetleri yapılmakadır (Şekil 4).

Şekil 4. Köy baraj kıyısının eski hali (Orjinal 2015)

Köydeki turizm faaliyetleri il içinde bilinmekte ve yetkili kurumlarında gündeminde olmaktadır. Bu nedenle 2024 yılında İl Valilik bütçesi ile köyün su kenarında çevre düzenleme, piknik alanları, spor tesisi, restoran-kafe yapılarak kullanıcıların hizmetine yeniden açılmıştır (Şekil 5).



Şekil 5. Köy baraj kıyısının yenilenmiş hali (Orjinal 2024)

Çizelge 4. Köyün kırsal peyzaj değerleri

Doğal peyzaj özellikleri				Tarihi değer		Spor olanakları			Yemek kültürü		
Su varlığı	Yaban hayatı	Tarımsal doku	Kükürtlü su kaynağı	Sualtı tarihi varlığı	Öküztaşı (taşınmış)	Su sporları	Doğa yürüyüşü	Amatör balıkçılık	Gastronomik lezzetler	Hamur işleri	Geleneksel tarımsal ürünler

Yerinde yapılan çalışmalar (Duran Gökalp, 2016)

- **Turizme yönelik konaklama**

Turizm faaliyetleri genellikle günübirlik rekreasyon aktiviteleri için kullanıldığından konaklama ihtiyacı olmamaktadır. Ayrıca il ve ilçe merkezine köyün yakın olması nedeniyle konaklama ihtiyacı geri planda kalmaktadır. Köyde pansiyon yoktur. Ancak baraj kıyısında kamp alanları planlanabilir.

- **Hamam**

Köyün içinde hamam olarak kullanılan doğal kükürtlü su kaynağı bulunmaktadır. Su kaynağı kükürtlü olup belli bir noktadan çıkmaktadır. Jeotermal suyun sıcaklığı MTA tarafından yapılan ölçümlerle 19–34,5 ºC ve 5.5 lt/sn debi akışkanlık ile el yakmayan derecededir (mta.gov.tr.

Erişim tarihi: 08.09.2024). Köy halkı hamamı: çamaşır, halı-kilim yıkama yeri ve yıkanma ihtiyaçlarını gidermek için kullanmaktadır. Yapılan incelemelerde hamamın bakımsız olduğu yerinde görülmüştür.

Şekil 6. Hamam (Orjinal 2024)

- **Delikli taş**

Kayalık alanda iklim şartları nedeniyle kendiliğinden oluşmuş üst üste iki delikli parçadır. Köyde yaşayan halk tarafından dilek dileyerek taş içinden geçilince dileğin gerçek olacağına inanılır. Ancak köy dışında çok fazla bilinmemektedir (Şekil 7).

Şekil 7. Delikli taş (Orjinal 2015)

- **Hirfanlı Baraj Gölü (Kırşehir) Turizm Merkezi Sınırı**

25687 sayılı ve 31.12.2004 tarihinde Kültür ve Turizm Bakanlığı'nın Resmi Gazetedeki 2004/ 8321 sayılı Bakanlar Kurulu Karar ile, Hirfanlı Barajı'nın kıyı kenarının büyük bir bölümü turizm merkezi olarak ilan edilmiştir. Savcılı Büyükoba köyünün Hirfanlı Baraj Gölü Turizm Merkezi sınırları içinde kalan kısmı, doğal ve kültürel peyzaj varlığı olarak kırsal turizm için büyük bir potansiyel oluşturmaktadır.

Tuz gölünün kuzey doğusundan geçen ve Kızılırmak nehri üzerinde bulunan büyük bir baraj gölüdür. Hirfanlı Barajı Turizm alanın eni 13 km, uzunluğu 75 km'dir (Anonim 2007).

Şekil 8. Hirfanlı barajı sınır çizgisi (Anonim 2011)

Gölette farklı balık türleri yetiştirilmektedir. Bu balıklar; sazan, kefal, kaya, gümüşbalığı ile kepenek türleridir. Balık lokantası kültürü de vardır. Göl suyu tatlı olduğu için tatlı su balıkları yaşamaktadır. Kaman'a 19 kilometre uzaklıktaki tesislere günübirlik ulaşım mümkündür. Su, kumsal, balık varlığı ile bölge insanının deniz ve plaj özlemini azda olsa karşılama durumundadır.

Şekil 9. Savcılı Büyükoba köyü Hirfanlı Barajı kırsal turizm aktiviteleri

Köyden Hirfanlı Barajı kıyısı rekreasyon alanlarına uzaklık 5 km'dir. Bu alana ulaşım yolu asfalt ve kolaydır. Su varlığından köy halkı yüzme, piknik, dinlenme, tarım ve balıkçılık, sulama faaliyetleri ile fayda sağladıklarını yapılan toplantılarda söylemişlerdir (Şekil 9). Su varlığı Hirfanlı Baraj kıyısında sınırı olan tüm köyler ile ortak kullanım alanları bulunmaktadır.

3. SONUÇ

Savcılı Büyükoba Köyü, Kaman ilçemizde ve ilde gerek kırsal turizm gerekse tarım potansiyeli olarak önemli bir yere sahiptir. Yapılan bu araştırma ile köyün kırsal peyzaj potansiyelinin varlığı sürdürülebilir kırsal turizm faaliyetlerine dönüştürülerek kazanımları ortaya konmuştur.

Değerlendirme analizlerine göre; Savcılı Büyükoba köyünün tarımsal ve turizm açısından zengin bir çerçeveye sahip olduğu görülmüştür. Mevcut kırsal turizm potansiyel unsurları

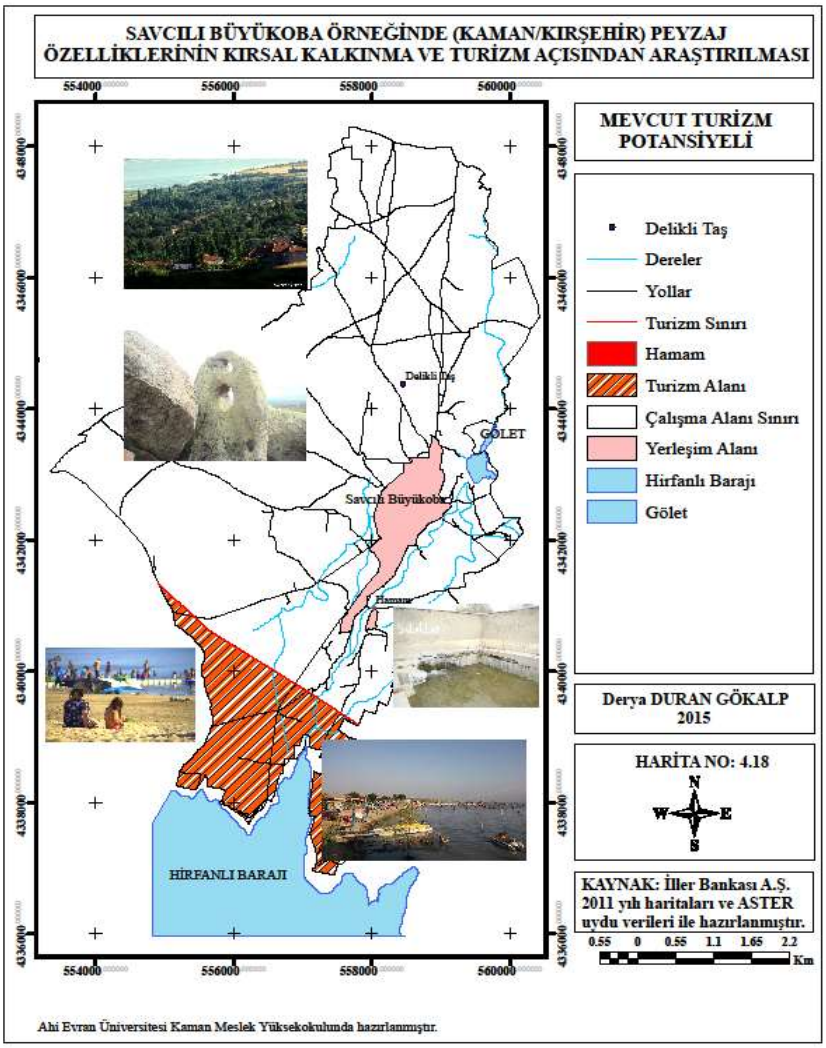
Harita 4.18 de ortaya konulmuştur. ArcGIS ortamında oluşturulan haritanın araştırma alanını tanımak, bilgi edinmek isteyen yerel halk ve turistlere öncülük etmesi planlanmıştır.

Savcılı Büyükoba Köyü'nde

- Tarımsal ürün deseni ve üretim potansiyeli,
- Yeşil alan varlığı,
- Su varlığı (Hirfanlı Barajı, Gölet, Hamam)
- Rekrasyon alan varlığı,
- Jeolojik yapısı ve granit taş varlığı,
- Turizm alanı olması,
- Köy halkının kırsal turizm faaliyetlerini benimsemesi kırsal turizm potansiyelinin ve uygulanabilirliğini ortaya koymaktadır.

Savcılı Büyükoba köyünde gerçekleştirilecek olan planlı kırsal turizm faaliyetlerine köyde özellikle su kenarında yapılması ile olumlu ve sıcak bakmaktadır. Köyde yaşayan yerel halka göre turizm; tatil yapmak, gezmek, bir yerden başka yere gitmek, denize girmek, piknik yapmak, eş-dost ziyareti gibi faaliyetleri tanımlamaktadır.

Kumsal olması nedeniyle yerel halk ve kullanıcılar tarafından kıyı kenarı plaj olarak adlandırılmaktadır. Plajda, piknik alanları restoran, spor sahaları ile günlük ihtiyaçların karşılanabileceği alanlar yer almaktadır. "Bozkırın plajı" olarak bilinen Savcılı Büyükoba`ya yetkililer ile yapılan görümeler neticesinde yılda yaklaşık olarak 30 bin araç giriş yapmaktadır.



Şekil 10. Mevcut turizm potansiyeli haritası (Duran Gökalp, 2016)

Harita 4.18'e göre Savcılı Büyükoba Köyü araştırma alanının mevcut turizm potansiyeli incelendiğinde; Delikli taş, Hamam gibi turizm potansiyeli olan noktaların coğrafi yerleri işaretlenmiştir. Köyün yerleşim alanı sınırları taranarak alan içindeki konumu belirlenmiştir. Ayrıca Hirfanlı Baraj Gölü Turizm Alanının, Savcılı Büyükoba Köyü sınırı içine giren alanı taralı olarak, turizm faaliyetleri de görsel olarak gösterilmiştir. Göletin konumuda sınır içinde konumlandırılmıştır. Araştırma alanı içinde bulunan yollar, dereler ve sınırlar çizgi olarak gösterilmiştir.Kırsal alanların planlanmasında; yerel halkın, turizm potansiyeli ve ekonomik kazançlarını arttırmak için kalkınma projelerine katılımı sağlanmalı ve kırsal ölçekte planlama geliştirilmesi, sürdürülebilirliği desteklenmelidir.

Sonuç olarak; bu araştırmada doğal ve kültürel peyzaj potansiyeli kapsamında geliştirilebilecek tüm önerilere bakıldığında, Savcılı Büyükoba köyü için sürdürülebilir kırsal peyzaj planlama unsurlarının seçimiyle kırsal turizm aktivitelerinin uygulanabilirliği görülmüştür.

GLANDULAR TRICHOMES AS MODEL STRUCTURES IN PHYTOCHEMICAL BIOSYNTHESIS RESEARCH

Dr. Öğr. Üyesi İlker TÜRKAY[1], Prof. Dr. Lokman ÖZTÜRK[2]

[1] Kırşehir Ahi Evran Üniversitesi, Teknik Bilimler MYO, Bitkisel ve Hayvansal Üretim Bölümü, ilker.turkay@ahievran.edu.tr, 05332270401, ORCID NO: 0000-0002-6373-4357
[2] Tokat Gaziosmanpaşa Üniversitesi, Fen Fakültesi, Biyoloji Bölümü, lokman.ozturk@gop.edu.tr, 05334773365, ORCID NO: 0000-0003-0789-9584

ABSTRACT

This review provides a comprehensive synthesis of the value of plant glandular trichomes—microscopic chemical factories on the plant surface—as model structures for phytochemical biosynthesis research. Based on an extensive survey of recent literature, the article first catalogues the extraordinary morphological and anatomical diversity of trichomes across taxa, linking species-, organ- and developmental stage-specific patterns to adaptive ecological strategies. It then dissects the high-flux biosynthetic routes for terpenoids, phenylpropanoids, alkaloids and unusual fatty-acid derivatives that operate within trichome cells, summarising current insights into subcellular compartmentation and metabolite trafficking. Focusing on developmental genetics, the paper clarifies how HD-ZIP IV (Wo), bHLH (SlMYC1) and MYB-like transcription factors, together with jasmonate signalling, coordinate trichome biogenesis with metabolic output. The methodological strengths of microscopy, laser-capture micro-dissection, multi-omics platforms and CRISPR-based gene editing are highlighted, underscoring their capacity to interrogate and re-engineer single-cell factories. Application-oriented sections discuss how enhanced trichome density or rewired metabolite profiles can increase innate pest resistance, optimise the yield of high-value natural products and lay the groundwork for ‘designer trichomes’ that enable sustainable in planta bioproduction. By identifying knowledge gaps—such as the need to characterise trichome-specific promoters, transporters and understudied species—the review proposes a forward-looking research agenda. Overall, it positions glandular trichomes as a unifying model for single-cell systems biology and as a versatile platform for next-generation metabolic engineering, with far-reaching implications for sustainable agriculture, pharmaceuticals and the flavour-fragrance industries. In doing so, it offers researchers not only an updated conceptual framework but also practical guidelines for translating trichome biology into tangible technological innovations.

Keywords: Glandular trichomes, Secondary metabolites, Terpenoids, Metabolic engineering, Plant defence

FİTOKİMYASAL BİYOSENTEZ ARAŞTIRMALARINDA MODEL YAPILAR OLARAK SALGI TÜYLERİ

ÖZET

Bu çalışma, bitki yüzeyinde mikroskobik kimyasal fabrikalar olarak görev yapan salgı tüylerinin (glandular trikomlar) fitokimyasal biyosentez araştırmalarındaki model değerini kapsamlı biçimde incelemektedir. Literatür taramasına dayalı olarak hazırlanan makalede, öncelikle farklı taksonomik gruplarda görülen salgı tüylerinin morfolojik ve anatomik çeşitliliği ele alınmış; tür-, organ- ve gelişim evresi-spesifik varyasyonların ekolojik uyum stratejileriyle ilişkisi tartışılmıştır. Ardından trikom hücrelerinde yüksek düzeyde işleyen terpenoid, fenilpropanoid, alkaloid ve yağ asidi türevli yolaklar ayrıntılı olarak analiz edilmiş; hücre altı bölgeleme ve metabolik trafik mekanizmaları üzerindeki son bulgular sentezlenmiştir. Gelişimsel ve hormonal kontrolün genetik temeline odaklanan makale, Wo/HD-ZIP IV, SlMYC1 ve MYB benzeri transkripsiyon faktörleri ile jasmonat sinyalinin trikom biyogenezi ve metabolit akışını nasıl eşzamanlı yönettiğini açıklığa kavuşturmuştur. Mikroskopi, laser-yakalama mikrodiseksiyon, çoklu omik (transkriptomik-proteomik-metabolomik) ve CRISPR yaklaşımlarının salgı tüyü biyolojisinde sunduğu metodolojik avantajlar vurgulanmış; bu araçların tek hücre düzeyinde metabolik mühendislik tasarımları için potansiyeli değerlendirilmiştir. Son bölümde, yükseltilmiş trikom yoğunluğu veya yeniden programlanmış metabolit profilleri sayesinde haşere direncinin artırılması, yüksek değerli doğal ürün üretiminin optimize edilmesi ve "tasarım trikomları" aracılığıyla sürdürülebilir biyoprodüksiyon senaryoları tartışılmıştır. Ayrıca, az çalışılmış türlerde trikom işlevselliğinin aydınlatılması, trikom-özgül promotörlerin keşfi ve ürün taşınımını düzenleyen taşıyıcı proteinlerin karakterizasyonu gibi gelecek araştırma gündemleri önerilmiştir. Bu yönüyle makale, sürdürülebilir tarım, eczacılık ve koku-lezzet endüstrileri için stratejik yenilik fırsatlarını ortaya koymaktadır.

1. INTRODUCTION

Plant glandular trichomes are specialized epidermal appendages that serve as microscopic chemical factories on the plant surface. Approximately one-third of all vascular plant species develop glandular trichomes (Chang et al., 2024), and these structures contribute a significant portion of a plant's secondary metabolite profile. Glandular trichomes typically consist of a stalk and a secretory head of one or more cells, and they actively synthesize, secrete, and sometimes store a diverse array of phytochemicals. These compounds include essential oils, resins, and other specialized metabolites valued as fragrances, flavors, or pharmaceuticals. Evolutionarily, many trichome-derived substances function in plant defense – deterring herbivores, inhibiting pathogens, or mitigating abiotic stresses – even though humans also exploit them for industrial uses (Glas et al., 2012). Because of their prolific biosynthetic activity and accessible location on plant surfaces, glandular trichomes have become model structures to investigate the cellular biology of phytochemical production. In this review, we survey the structural and functional diversity of glandular trichomes across plant taxa, their roles in producing various classes of natural products, the major biosynthetic pathways housed in these "mini-factories" and the genetic regulation of their development and metabolic output. We also discuss modern techniques used to study glandular trichomes and highlight applications in biotechnology and medicinal plant improvement.

2. STRUCTURAL AND FUNCTIONAL DIVERSITY OF GLANDULAR TRICHOMES

Glandular trichomes are multicellular secretory structures that arise from protodermal (epidermal) cells and exhibit remarkable diversity in form, size, and distribution on plant organs (Muravnik, 2020). They vary from tiny capitate trichomes with a single-celled glandular head to larger peltate trichomes with a multicellular head, often on a short stalk. Capitate trichomes typically consist of a basal cell, a stalk cell, and a single secretory head cell, whereas peltate trichomes have a broader head of many secretory cells sitting on one or two stalk cells (Jing et al., 2014; Muravnik, 2020).

Individual plants often bear multiple trichome types – for example, tomato (*Solanum lycopersicum*) has eight distinct trichome forms (four glandular and four non-glandular) on its stems and leaves (Flood, 2019). The density and placement of glandular trichomes can vary by species and organ, reflecting adaptive strategies.

Functionally, glandular trichomes serve as combined structural and chemical defense units for plants. They act as physical barriers (hairs that impede insect movement or create a boundary layer on the leaf) and as sites of concentrated chemical release, often deterring pests upon contact (Bergau et al., 2015). Many trichomes secrete sticky or noxious substances that can trap, repel, or poison herbivorous insects. At the extreme, carnivorous plants like sundews (genus *Drosera*) have evolved glandular trichomes that exude mucilaginous enzymes to capture and digest insects (Bergau et al., 2015; Flood, 2019). More commonly, however, the secretions are defensive or protective: for instance, glandular hairs on *Urtica dioica* (stinging nettle) inject irritants as a deterrent (though these are technically cystolithic trichomes), and those on *Tithonia* and *Solanum* species exude insecticidal resins. Trichome secretions also protect against

microbial pathogens – many contain antifungal or antibacterial compounds that suppress infection on the plant surface. In addition to biotic defense, glandular trichomes help plants cope with abiotic stresses. They can secrete UV-absorbing flavonoids or other phenolics that form a chemical sunscreen, and their presence on the surface may reflect excess light and reduce leaf temperature or water loss. Indeed, the formation of glandular trichomes in different lineages is thought to be driven by the need to protect plants from herbivores, pathogens, intense light (UV-B), and heat (Muravnik, 2020).

Despite this functional diversity, a unifying feature of glandular trichomes is their extraordinary capacity to synthesize and accumulate specialized metabolites. These secretory cells are metabolically hyperactive, often producing and storing compounds at concentrations that would be cytotoxic elsewhere in the plant. To manage this, many glandular trichomes have evolved internal or external storage compartments. In some types, the secreted product is compartmentalized in a subcuticular storage cavity (a space between the cell wall and cuticle) – as seen in the large peltate glands of mint and cannabis, where a dome-like cuticle retains the essential oil or resin that the head cells produce. Storing the metabolites in an extracellular cavity prevents autotoxicity to the producing cells and allows accumulation of high concentrations (Tanney et al., 2021). Other trichomes continuously exude their products to the plant surface (forming a coating of exudate such as the sticky sugar esters on wild tobacco leaves) or sequester them in vacuoles within the trichome cells. From a structural standpoint, the secretion mechanism can thus differ: some glandular hairs release their contents only when the cuticle ruptures or when the trichome is mechanically damaged, whereas others slowly seep out products through microscopic pores or along the sides of the trichome. Additionally, glandular trichomes are often short-lived "expendable" organs – certain types secrete a burst of metabolites and then senesce or reload, corresponding to what Werker (1993) classified as "short-term" vs "long-term" glandular hairs based on secretion timing (short-term glands quickly unload a one-time secretion, whereas long-term glands can repeatedly secrete over time) (Ascensão et al., 1999; Muravnik, 2020). This dynamic aspect highlights that glandular trichomes are not static storage structures but actively metabolizing and sometimes transient organs. Overall, the structural variability (unicellular vs. multicellular, capitate vs. peltate, presence or absence of a storage cavity, etc.) underpins a wide range of functional roles across plant species.

3. ROLE IN PHYTOCHEMICAL BIOSYNTHESIS ACROSS DIFFERENT TAXA

Glandular trichomes are truly natural cell factories, responsible for much of the chemical diversity that plants produce for defense, signaling, and interaction with their environment. Across the plant kingdom, these glands have independently evolved in many lineages and often converged on similar functions. They are especially prominent in certain families – for example, the mint family (*Lamiaceae*) is characterized by abundant peltate glandular trichomes that produce essential oils, while the sunflower family (*Asteraceae*) often has capitate trichomes that secrete bitter terpenoids and other deterrents. In fact, some of the most famous plant natural products come from glandular trichomes: the antimalarial sesquiterpene lactone artemisinin is produced in the capitate trichomes of *Artemisia annua* (wormwood), and the psychoactive

cannabinoids (THC, CBD) of Cannabis sativa are synthesized in stalked glandular trichomes on the female flowers (Chang et al., 2024). These examples underscore how trichomes act as biofactories for important pharmaceuticals and bioactive compounds.

Notably, multiple classes of phytochemicals are made in trichomes, and a single plant may deploy trichomes to produce different compounds in different organs. For instance, *Solanum* species (nightshades) have glandular trichomes that exude acylsugars (sugar esters) as a sticky insect trap on leaves, while other trichomes on the same plant emit volatile terpenes that repel pests. In wild tomatoes (*Solanum habrochaites*, *S. pennellii*), high densities of type IV and VI glandular trichomes correlate with increased insect resistance due to the cocktail of acylsugars and terpenoids they secrete. By contrast, the cultivated tomato has fewer glandular trichomes and correspondingly lower levels of these defensive chemicals, illustrating how domestication can reduce natural chemical defenses (Huchelman et al., 2017).

Across different taxa, glandular trichomes often fulfill ecological roles such as: (i) Herbivore Defense – deterring feeding or oviposition by insects via toxic or antifeedant metabolites (e.g. nicotine and related alkaloids in tobacco can exude onto leaf surfaces, and numerous terpenes produced by trichomes deter herbivory) (Glas et al., 2012); (ii) Pathogen Defense – secreting antimicrobial agents (e.g. thymol and carvacrol in thyme trichomes are strongly antifungal); (iii) Attraction of Pollinators or Mutualists – in some plants, glandular trichomes produce floral oils or scents that attract pollinators or predators of herbivores. For example, species of *Dalechampia* and *Calceolaria* have glandular hairs on flowers that secrete oils collected by specialized bees, and some carnivorous plants use sweet exudates from trichomes to lure prey. Thus, while defense is a primary role, trichome metabolites can also mediate beneficial interactions.

Importantly, glandular trichomes are often metabolically specialized for certain compound classes within a given species. This means a particular trichome type usually produces a limited set of related compounds in very high amounts (Huchelman et al., 2017). This specialization is evident in the chemical profiles across taxa: Lamiaceae trichomes predominantly make monoterpenes and other volatile terpenoids (which give culinary herbs like basil, oregano, and mint their aroma), Asteraceae trichomes often produce sesquiterpene lactones and other bitter compounds (contributing to the medicinal bitterness of chamomile, feverfew, etc.), and *Solanaceae* trichomes may generate phenylpropanoid derivatives, acylsugars, or methylketones as defense chemicals (Huchelman et al., 2017). Even alkaloids – a class more commonly associated with internal secretory cells – can be found in glandular trichomes of some taxa. For instance, a histochemical study of thyme (Thymus) detected alkaloids localized specifically in both capitate and peltate trichome cells (staining positive with Dragendorff's reagent) while the rest of the leaf tissue was free of alkaloids (Jing et al., 2014). This indicates that alkaloid biosynthesis or accumulation in those species is compartmentalized in the trichomes. In tobacco (*Nicotiana*), certain nicotine-related alkaloids and diterpenes (like cembranoids) are present in trichome exudates, contributing to the plant's sticky defensive coating.

In summary, throughout the plant kingdom glandular trichomes are repeatedly used as sites of high-yield production of specialized metabolites crucial for survival. Some genera (e.g. Mentha, Lavandula, Cannabis) have been effectively "domesticated" for their trichome products –

peppermint oil, lavender oil, or cannabis resins – emphasizing the value of these structures. Glandular trichomes, though varied in morphology across taxa, universally function as micro-chemical reactors that enhance plant fitness by deploying chemical defenses and other ecologically relevant compounds on the plant's exterior.

4. MAJOR BIOSYNTHETIC PATHWAYS IN GLANDULAR TRICHOMES

Glandular trichomes are biochemically versatile, capable of synthesizing compounds from all major classes of plant secondary metabolites. Key pathways for terpenoids, phenolics, and alkaloids (among others) are often highly active in trichome cells, sometimes in a unique or modified form compared to the same pathways in other tissues. A remarkable feature is that trichomes tend to channel metabolic flux into a narrow set of end-products (the compounds that define that plant's chemical profile) in extraordinary quantities (Huchelman et al., 2017). Below we provide an overview of the major phytochemical classes produced in glandular trichomes and the biosynthetic routes involved, noting that these pathways frequently intersect with primary metabolism and are tightly regulated within the trichome.

4.1. TERPENOIDS

Terpenes and terpenoids (isoprenoids) are arguably the most common class of compounds in glandular trichomes. These include monoterpenes (C_10), sesquiterpenes (C_15), and diterpenes (C_20), which often constitute essential oils, resins, and gums. In trichomes of many aromatic plants (mint, basil, sage, etc.), monoterpenes like menthol, limonene, and pinene are synthesized via the plastid-localized MEP (methylerythritol phosphate) pathway, whereas sesquiterpenes like patchoulol or artemisinin derive from the cytosolic mevalonate (MVA) pathway – though cross-talk between the two pathways can occur. For example, studies in snapdragon flowers showed that the plastidial MEP pathway was supplying precursors for both monoterpene and sesquiterpene biosynthesis in glandular cells (Huchelman et al., 2017), highlighting the metabolic flexibility of trichomes. The typical terpenoid biosynthetic machinery in trichomes includes terpene synthase enzymes (e.g., menthone synthase in peppermint trichomes; amorpha-4,11-diene synthase in Artemisia gland cells) that convert universal C_5 building blocks (IPP/DMAPP) into cyclic or acyclic terpene skeletons, often followed by cytochrome P450 monooxygenases and specialized transferases to produce oxidized, polyoxygenated terpenoids. Trichome cells are often enriched in organelles needed for terpene biosynthesis: they harbor abundant leucoplasts (plastids without pigments) for monoterpene synthesis and well-developed smooth endoplasmic reticulum for sesquiterpenes and diterpenes that require P450s (Muravnik et al., 2020). Notable examples of terpenoids from trichomes include the essential oils of herbs (rich in mono- and sesquiterpenes), the glandular resins of conifers and Cannabis (rich in diterpenoid and terpenophenolic resins), and defensive terpenes in tomato (e.g. zingiberene and α-tomatine in wild tomato type VI trichomes). The yields are impressive – some peppermint cultivars exude >1% of leaf dry weight as monoterpene oil from trichomes. Because terpenoids are volatile or semi-volatile, they often

evaporate or diffuse from trichomes, forming a chemical plume that deters insects or attracts pollinators, depending on context.

4.2. PHENOLICS AND PHENYLPROPANOIDS

Glandular trichomes of many species produce compounds derived from the phenylpropanoid pathway, which transforms phenylalanine into a variety of aromatic metabolites. These include simple phenylpropanoids (such as eugenol, chavicol, etc.), flavonoids, and related polyphenols. In basil (*Ocimum basilicum*), for instance, peltate trichomes accumulate phenylpropanoid aroma compounds like chavicol and methyl eugenol in addition to terpenes (Huchelman et al., 2017; Türkay et al., 2023; Türkay et al., 2024). Some trichomes secrete flavonoid aglycones or flavonoid glycosides onto the surface; these can act as UV protectants or antimicrobial agents. Glandular trichomes of Teucrium species secrete sticky flavonoids that form a crust on the leaf. The enzymes of phenolic biosynthesis (e.g., phenylalanine ammonia-lyase (PAL), cinnamate 4-hydroxylase, and various reductases and transferases) have been found to be highly expressed in trichome cells of phenolic-rich plants (Huchelman et al., 2017). In some cases, the phenolics from trichomes contribute to plant taste and pigmentation – e.g., *Cannabis* trichomes produce not only cannabinoids but also flavonoids that can color the resin; *Pelargonium* glandular hairs secrete quercetin derivatives that end up on the leaf surface. An important subset of phenolics in trichomes are the phenylpropanoid volatiles (like vanillin, isoeugenol) that add to floral or leaf scents. These often arise from the shikimate/phenylpropanoid pathway and might be formed in concert with terpenes. In basil, coordinated regulation of phenylpropanoid and terpenoid synthesis in trichomes has been observed, indicating these pathways can be co-activated to produce a particular blend of metabolites (Huchelman et al., 2017).

4.3. ALKALOIDS

While many plant alkaloids are made in internal tissues (e.g. roots or phloem) and stored in vacuoles, there are cases where glandular trichomes participate in alkaloid biosynthesis or secretion. The pyridine alkaloid nicotine, for instance, is synthesized in tobacco roots but it can be transported to leaf trichomes and concentrated in trichome exudate along with sugary compounds – forming a toxic mix on the leaf surface of *Nicotiana*. Certain tropane alkaloids (like scopolamine) in genus *Datura* have been suggested to effuse from young stem trichomes. Direct evidence comes from histochemical studies: in Thymus species, glandular trichomes tested positive for alkaloids, indicating these cells either produce or accumulate alkaloidal compounds (Jing et al., 2014). Another example is the ergot alkaloids found on some grasses: an intriguing recent discovery showed endophytic fungi living in grass glandular trichomes produce ergot alkaloids on the surface (Steiner et al., 2015), effectively using the trichome as a delivery structure. In general, alkaloid presence in trichomes is less common than terpenes or phenolics, but when it occurs, it adds a potent layer of chemical defense (since many alkaloids are neurotoxic or feeding deterrents). As analytical techniques improve, new alkaloids localized to trichomes continue to be identified. The biosynthetic pathways for alkaloids in trichomes follow the same core enzymatic steps as elsewhere (e.g., decarboxylation of amino acids, BIA

pathway for benzylisoquinoline alkaloids, etc.), but often the final steps or regulation might be tailored to trichome expression. For instance, a atropa species might express a final O-methyltransferase for scopolamine predominantly in its trichomes if that's where the plant deploys the compound.

4.4. SPECIALIZED LIPIDS AND OTHERS

In addition to the classic categories above, glandular trichomes produce various unusual metabolites. Acyl sugars (sugar esters of fatty acids) are produced in high quantities by trichomes of wild tomatoes and some petunias as a sticky defense; these are synthesized by acyltransferases that are expressed almost exclusively in the glandular head cells. Methylketones (e.g., 2-tridecanone and 2-undecanone) are secreted by type VI trichomes of certain *Solanum* species; they derive from fatty acid pathways and have strong insecticidal activity (e.g., against whiteflies) (Huchelman et al., 2017). Cardenolides and other defensive steroids can also accumulate in trichome exudates in some *Apocynaceae* and *Solanaceae*. Essentially, if a plant benefits from having a defensive or communicative chemical at its surface, evolution often routes that compound's production into a glandular trichome. This partitioning is advantageous because the toxic or deterrent compound is confined to an expendable external cell, protecting the rest of the plant from harm while maximizing impact on the target (herbivore, microbe, etc.).

It is noteworthy that glandular trichomes often exhibit a degree of metabolic compartmentalization. Within a single trichome cell, different organelles handle different steps: plastids, cytosol, ER, vacuoles, and the apoplast may all be involved in a single compound's biosynthesis. For example, in *Cannabis* trichomes, cannabinoid biosynthesis starts in the cytosol (with phenolic precursors), continues in plastids (where the terpenoid moiety is made), and finishes in the apoplastic space of the secretory cavity where the two parts condense to form THCA, which then accumulates under the cuticle (Tanney et al., 2021). Such multi-step routing requires transporters or facilitators to shuttle intermediates between compartments. This level of metabolic orchestration is part of what makes glandular trichomes excellent model systems for studying the integration of biosynthetic pathways within a single cell type.

In summary, glandular trichomes are hotspots of secondary metabolism, adept at producing terpenoids, phenylpropanoids, alkaloids, and other specialized compounds. The major biosynthetic pathways operating in trichomes are the same core pathways found in plants at large, but in trichomes they are often upregulated and optimized to funnel precursors into a narrow set of outputs. This results in the accumulation of particular chemicals in amounts rarely seen in normal cells. Understanding these pathways in the trichome context has practical implications (as discussed later) for metabolic engineering and enhancing the production of high-value plant metabolites.

5. GENETIC AND MOLECULAR REGULATION OF PHYTOCHEMICAL PRODUCTION IN GLANDULAR TRICHOMES

The development of glandular trichomes and the regulation of their metabolic activity are tightly controlled by genetic networks. Research in recent years has begun to unravel the molecular players that specify where and how glandular trichomes form, as well as those that activate the biosynthetic pathways within trichome cells. This section discusses (a) the genetic control of glandular trichome development (how plants decide to make a glandular trichome and ensure it becomes a secretory cell type), and (b) the regulatory mechanisms that govern phytochemical biosynthesis in trichomes (transcription factors, signaling pathways, etc. that turn on the production of secondary metabolites).

5.1. DEVELOPMENTAL REGULATION OF GLANDULAR TRICHOMES

Plants use a combination of general and specialized regulators to initiate glandular trichomes. In the model plant Arabidopsis thaliana, trichome development (though non-glandular in this species) is controlled by a well-known network of transcription factors: an R2R3 MYB (GLABRA1), bHLH proteins (GL3/EGL3), and a WD40 repeat protein (TTG1) form a complex that activates trichome formation, while single-repeat MYBs (TRY/ CPC) act as inhibitors to create spacing patterns. In plants with multicellular glandular trichomes like tomato, tobacco, and Artemisia, homologous networks exist but with additional layers of regulation for the multicellular and glandular character. A key regulator in tomato is the *Woolly (Wo)* gene, which encodes an HD-ZIP IV transcription factor. Wo is essential for the formation of both glandular and non-glandular trichomes in tomato (and likely in many other species with multicellular trichomes). Mutations in Wo (such as the classical woolly mutant of tomato) result in a near hairless phenotype, whereas overexpression leads to excess trichome formation – indicating Wo has a dose-dependent, positive role in trichome initiation and development. Another crucial regulator in tomato is a basic helix–loop–helix (bHLH) transcription factor called SlMYC1. Recent studies showed that SlMYC1 is necessary for the development of the most abundant glandular trichomes (type VI) in tomato: CRISPR knockout lines completely lacked type VI trichomes (Xu et al., 2018). Interestingly, when SlMYC1 was knocked out, a novel aberrant trichome type appeared (termed type “VII-like”), suggesting that other factors initiate a prototrichome that fails to fully differentiate without SlMYC1 (Flood et al., 2019). This bHLH likely works in concert with MYB partners and hormonal signals (similar to how Arabidopsis GL3 works with GL1). Indeed, SlMYC1 is part of the jasmonate signaling pathway – as a JA-responsive bHLH, it connects herbivore stress signals to both trichome development and compound production.

Only a few trichome-specific regulators have been characterized so far, and the field is rapidly evolving. A breakthrough in 2024 identified two tomato genes, *Gland Cell Repressor 1* and *2* (*GCR1*, *GCR2*), which encode MYB-like transcription factors that act as negative regulators of glandular fate. These *GCR* genes are expressed in early developing trichomes and prevent excessive gland cell formation; when both are knocked out, tomato develops enlarged glandular trichomes (implying more secretory cells per trichome). Notably, homologs of *GCR* in tobacco and petunia appear to have a similar repressive role, suggesting a conserved mechanism across

species. The *GCR* repressors are part of a two-step regulatory process: they themselves are kept in check by an upstream repressor (in tomato, a *TOE1* homolog, part of the *AP2* miR172 pathway) that relieves inhibition at the right time. On the flip side, positive regulators like Leafless (LFS) in tomato have been proposed to promote gland formation, being the targets that *GCR* represses In tobacco, a MIXTA-like MYB transcription factor has been implicated in trichome formation on leaves (MIXTA is known in petunia for epidermal cell patterning and likely has parallels in trichome cell patterning) (Chang et al., 2024).

Hormonal regulation is another key aspect: jasmonic acid (JA) strongly induces glandular trichome development in many species. JA-deficient tomatoes have fewer trichomes and lower terpene production, while application of JA or its mimic can increase trichome numbers and chemical output. This effect is partly mediated by JA-responsive transcription factors such as SlMYC1 (which, as noted, is JA-inducible and necessary for trichome development). Conversely, gibberellins (GA) and other hormones can modulate trichome initiation in species-specific ways – e.g., applying GA to peppermint was found to increase trichome density and essential oil yield by upregulating biosynthetic genes (Huchelman et al., 2017). Cytokinin and auxin signaling have also been linked to trichome initiation in some studies, although JA is the dominant positive signal for glandular trichomes associated with defense. In summary, the developmental fate of a glandular trichome is determined by a network of transcription factors (MYB, bHLH, HD-Zip, etc.) operating under the influence of plant hormone signals and possibly small RNAs. Many of these regulators have dual roles, affecting both the physical development of the trichome and the activation of metabolic pathways within.

5.2. REGULATION OF PHYTOCHEMICAL PRODUCTION

Once a glandular trichome cell is formed, it must activate the suite of enzymes required to produce its specialized metabolites. This is achieved through trichome-specific or trichome-enhanced expression of biosynthetic genes, controlled by developmental and environmental cues. Often the same transcription factors that drive trichome development continue to upregulate secondary metabolism genes in those trichomes. A striking example is again *SlMYC1* in tomato: knockdown of *SlMYC1* (which allowed a few trichomes to still form) led to a drastic reduction in the expression of terpene synthase genes and a corresponding drop in monoterpene levels, even in plants that still had glandular trichomes present (Flood et al., 2019). This demonstrates that *SlMYC1* is required not only for making the trichome itself but also for turning on the terpenoid biosynthetic pathway within that trichome. Similarly, in Artemisia annua, a bHLH transcription factor (AaMYC2) and an AP2/ERF factor (AaERF1, also called ARTF1) have been identified that bind to promoters of artemisinin pathway genes (like *ADS*, *CYP71AV1*) and enhance their expression specifically in trichome cells, especially under JA stimulation. Other transcriptional activators such as WRKYs and MYBs (e.g., AaWRKY9 in *Artemisia*, or TcMYB2 in *Camellia* trichomes for tea catechins) have been found to orchestrate the production of particular compounds.

Frequently, these regulatory genes are part of inducible defense pathways. When a plant is attacked or stressed, signals like JA, salicylic acid, or abiotic stress signals can elevate the production of trichome chemicals. For instance, wounding or herbivory triggers a JA burst that

in tomato not only prompts more trichomes but also increases the output of terpenes and acylsugars from existing trichomes. Trichomes can even serve as "sensor" cells; tomato type VI trichomes store jasmonic acid (in its active form JA-Ile) and upon being touched or damaged by insects, they release it, thereby alerting the plant and systemically enhancing defense responses (Flood et al., 2019). This implies a feedback loop where trichome-produced JA can amplify its own biosynthetic pathways in a positive reinforcement cycle.

On the genomic level, plants often cluster genes for particular trichome-produced metabolites. For example, in some wild tomatoes, the genes encoding enzymes for acylsugar biosynthesis are physically grouped in the genome, allowing coordinated regulation. A notable case is a cluster of several methylketone synthesis genes in *Solanum habrochaites* (discovered to underlie insect resistance); by introgressing this cluster into cultivated tomato, researchers enhanced glandular methylketone output and pest resistance (Huchelman et al., 2017). Such gene clusters likely share regulatory sequences that trichome-specific transcription factors recognize. Comparative genomics has revealed that related species often have conserved blocks of trichome metabolism genes – for example, *Nicotiana* and *Solanum* (both Solanaceae) have some syntenic regions for trichome diterpene biosynthesis, hinting at an evolutionary conservation of regulatory modules.

Apart from transcription factors, post-transcriptional and enzymatic regulation also fine-tune phytochemical production. Glandular trichomes express specific microRNAs and RNA-binding proteins that can modulate the stability of mRNAs for pathway enzymes (this area is still being explored). At the enzyme level, the compartmentalization we discussed means that transporters and enzyme allostery play roles. Trichomes express unique transport proteins to move metabolites or precursors: for instance, an ABC transporter in petunia (PhABCG1) exports volatile phenylpropanoids from cells, and in tobacco a glandular-specific lipid transfer protein (NtLTP1) is required for secretion of hydrophobic diterpenes to the outside (Huchelman et al., 2017). Disrupting these transport processes can cause accumulation of products in the wrong place or feedback inhibition of the pathway. Thus, the molecular regulation of trichome biosynthesis includes not just turning genes on, but also ensuring their products are efficiently moved and stored.

In summary, the genetic and molecular regulation of glandular trichomes operates on two synergistic fronts: morphogenesis (driven by a network of developmental genes influenced by hormones) and metabolic pathway activation (driven by both the developmental network and by specialized metabolic regulators). Only a handful of master regulators (like Wo, SlMYC1, AaMYC2, etc.) have been characterized to date, and current research continues to identify new ones (e.g., the *GCR* repressors) (Chang et al., 2024). A deeper understanding of these regulatory circuits is not only of fundamental interest (elucidating how a plant cell differentiates into a high-output producer of secondary metabolites), but also of practical value for engineering plants with enhanced natural product output.

6. METHODS AND TECHNIQUES FOR STUDYING GLANDULAR TRICHOMES

Investigating glandular trichomes requires an integrated approach, as one must examine both their structural traits and their complex chemistry. Fortunately, because trichomes are external and often abundant, they are amenable to a variety of microscopy, molecular, and analytical techniques. Here we outline key methods used in glandular trichome research, ranging from visualization of trichome anatomy to omics technologies for profiling their genes and metabolites.

6.1. MICROSCOPY AND IMAGING

Microscopy is fundamental for characterizing trichome morphology and development. Light microscopy (bright-field or differential interference contrast) is used to observe trichome form on plant surfaces and in section. For example, simple visual examination under light microscopy distinguishes capitate vs peltate trichomes and can reveal contents (e.g., refractive droplets of oil in a gland head). Histochemical staining techniques can localize classes of chemicals in situ – as demonstrated by Dragendorff's reagent staining of alkaloids in *Thymus* trichomes, producing an orange color specifically in the secretory cells (Jing et al., 2014). Fluorescence microscopy and confocal laser scanning microscopy are used to probe trichome cellular structure; many glandular metabolites (like chlorogenic acid or flavonoids) are autofluorescent and can indicate distribution within the trichome. Researchers also use fluorescent dyes to test membrane integrity or the presence of cuticular holes in glands. For surface architecture, scanning electron microscopy (SEM) provides high-resolution images of trichome shape, density, and the presence of subcuticular spaces or pores. SEM has been extensively used to survey trichome types on new plant species and to monitor trichome development (e.g., capturing images of a developing multicellular trichome at different stages). Transmission electron microscopy (TEM) goes further to visualize ultrastructure: it can show the dense cytoplasm of secretory head cells, the enlarged plastids filled with lipid vesicles (terpenoid precursors), abundant smooth ER, and the cuticle layer bulging to form a storage cavity (Tanney et al., 2021). TEM also allows observation of the mode of secretion – for instance, vesicles fusing with the plasma membrane to release contents into the cell wall space. Newer imaging methods like 3D electron tomography and atomic force microscopy have also been applied to special cases (e.g., mapping the thickness of the cuticle over a gland or the turgor pressure within a secretory cell).

6.2. TRICHOME ISOLATION AND CELL-SPECIFIC ANALYSIS

A major advantage in trichome research is that trichomes and their exudates can be harvested relatively easily from the plant surface (Glas et al., 2012). This allows scientists to study trichome chemistry and genetics in relative isolation from the rest of the leaf. Methods for isolating trichomes include mechanical brushing or shaving of leaves (to physically remove the trichomes), solvent washing (a quick dip in solvent can strip off surface exudates or even knock off trichome glands), and more refined techniques like laser capture microdissection (LCM). In LCM, microscopic laser cuts can excise individual glandular trichome cells from tissue sections

for downstream RNA or metabolite analysis – this has been used in plants like Medicago to profile trichome-specific gene expression. Another innovative approach is flow cytometry for trichome cells: researchers have exploited natural autofluorescence of glandular trichome cells (due to their rich metabolites) to separate them. For example, Bergau et al. (2015) dissociated tomato leaf cells and used fluorescence-activated cell sorting (FACS) to collect developing trichome cells, enabling transcriptomic analysis of trichomes at different maturation stages (Huchelman et al., 2017). Additionally, density gradient centrifugation can pellet trichomes from a leaf homogenate (since trichomes often have distinct size/density). Once isolated, trichome-rich preparations can be subjected to omics analyses (detailed below) or biochemical assays. It is also possible to isolate the exuded compounds specifically – for instance, by gentle rinsing of the leaf with solvent or by using tiny capillaries to sample the droplets under the trichome cuticle in species like *Cannabis*. The ease of trichome/exudate collection has been a boon: it has "permitted a detailed study of their metabolites, as well as the genes and proteins responsible for them" (Glas et al., 2012), essentially allowing researchers to link chemistry with gene expression in the same cell type.

6.3. OMICS TECHNOLOGIES (TRANSCRIPTOMICS, PROTEOMICS, METABOLOMICS)

Modern high-throughput methods have revolutionized the study of glandular trichomes. Transcriptomic profiling (RNA-seq) of isolated trichomes or trichome cells identifies which genes are highly expressed relative to non-trichome tissue. Such studies have uncovered transcripts for all enzymes of certain pathways, confirming that (for example) mint peltate gland cells contain the full suite of monoterpene biosynthetic genes, or that in Lavandula, genes for both terpene and phenolic synthesis are co-expressed in glands. A comparative trichome transcriptome analysis in different mint species helped explain differential menthol production by correlating gene expression levels of key pathway enzymes. There are now trichome transcriptome datasets for many species, compiled in resources like the TrichOME database (a comparative omics database for plant trichomes). This database allows researchers to query genes of interest across multiple trichome transcriptomes to find common regulators or enzymes. On the protein side, proteomic analyses of trichomes have been attempted, though obtaining sufficient material is challenging. In one case, Champagne and Boutry (2013) performed proteomics on glandular trichomes of a non-model plant, identifying many abundant enzymes and unique proteins in the trichome cells. Proteomics can reveal, for instance, specialized isoforms of enzymes or abundant carrier proteins (like the aforementioned lipid transfer protein in tobacco trichomes). Metabolomics is, of course, central – using GC-MS, LC-MS, NMR, and other analytical chemistry techniques to profile the compounds present in trichomes. Coupling metabolomic data with transcript profiles helps assign functions to genes (e.g., if a certain unknown cytochrome P450 is highly expressed in trichomes at the same time a unique compound appears, it hints that the P450 may be responsible for that compound's synthesis). A comprehensive approach is exemplified by a multi-omics study on tomato glandular trichomes. Balcke et al. (2017) integrated transcriptomics, proteomics, and metabolite analysis and found that tomato glandular trichomes have distinct central metabolism geared towards producing large amounts of sucrose and amino acids to support rapid specialized

metabolite synthesis. This kind of systems biology approach can identify bottlenecks in pathways or unusual metabolic adaptations in trichomes (for example, an upregulation of glycolysis to provide extra acetyl-CoA for terpenoid biosynthesis) (Huchelman et al., 2017).

6.4. GENETIC AND GENOMIC APPROACHES

To understand gene function in trichome development and metabolism, researchers employ genetic approaches such as mutants, transgenics, and gene editing. Classical mutant screening has identified numerous "hairless" or "excess hair" mutants in plants like *Arabidopsis*, tomato, cucumber, and others – these often correspond to key regulators (e.g., hairless in tomato is an allele of *Woolly*). Modern CRISPR-Cas9 gene editing has allowed targeted knockout of suspected trichome genes (for instance, knocking out candidate transcription factors like SlMYC1 (Flood et al., 2019) or metabolic genes to test their role in trichomes). Coupled with trichome-specific phenotypic assays (like measuring metabolite changes or trichome counts in the edited lines), this yields functional validation. Virus-induced gene silencing (VIGS) is another tool used particularly in species that are not easy to transform; VIGS in *Nicotiana* has been used to transiently silence genes in trichomes (for example, silencing a terpene synthase to see if a particular compound disappears from the exudate). On the flip side, overexpression of genes (often using trichome-specific promoters to target expression to trichomes) can be used to enhance certain pathways or trichome development. For instance, overexpressing a positive regulator like Wo or SlMYC1 in tomato results in a higher density of glandular trichomes and elevated levels of their metabolites (Chang et al., 2024). The availability of reference genomes for plants with glandular trichomes (e.g., the tomato genome, the tobacco genome, the cannabis genome, etc.) has accelerated discovery of gene candidates by enabling QTL mapping and genome-wide association studies for trichome traits. If a particular wild species has an exceptionally high metabolite from trichomes, crossing it with a low-producing line and doing QTL analysis can pinpoint genetic loci underlying the difference. This strategy was used with wild tomato species, leading to the identification of loci controlling acylsugar production and trichome density, which turned out to be clusters of metabolic genes (Huchelman et al., 2017).

6.5. ANALYTICAL CHEMISTRY AND FUNCTIONAL ASSAYS

Finally, specialized analytical techniques are employed to link structure with function. Gas chromatography-mass spectrometry (GC-MS) is the workhorse for volatile compounds: by enclosing a single leaf or even an intact plant in a chamber, one can sample the headspace to analyze trichome-emitted volatiles. Alternatively, individual trichomes or isolated exudate can be directly analyzed – for example, a single cannabis trichome's contents can be laser-desorbed and sent into a mass spectrometer (techniques like LDI-MS imaging). Liquid chromatography (HPLC/UPLC) helps quantify non-volatile, often more polar trichome compounds (like cannabinoids, glycosides, alkaloids). In the alkaloid-storing thyme trichomes mentioned, GC-MS of leaf extracts confirmed the presence of specific alkaloids in young leaves, correlating with the histochemical stain (Jing et al., 2014). To complement chemical analysis, bioassays are used to test the function of trichome metabolites. For instance, insect feeding trials on plant

lines with different trichome profiles can demonstrate that higher terpene or acylsugar levels (due to a genetic modification) confer greater pest resistance (Huchelman et al., 2017). Microbial growth assays with trichome exudates can show antimicrobial efficacy. Even simple assays like observing whether an insect avoids walking on a leaf with sticky trichomes provide functional insight.

In combination, these methodologies enable researchers to dissect glandular trichomes from the macro scale (distribution on the plant, ecological effects) down to the molecular scale (gene expression networks and enzyme functions). Glandular trichomes have thus become a model for single-cell type analysis in plants – akin to a "plant cell in a test tube" that can be studied in isolation. As new techniques emerge (such as single-cell RNA sequencing, or improved in vivo imaging), our ability to probe the inner workings of glandular trichomes will continue to grow, providing even deeper understanding of how these tiny biochemical factories operate.

7. APPLICATIONS IN PLANT BIOTECHNOLOGY, METABOLIC ENGINEERING, AND PHARMACEUTICAL RESEARCH

The unique properties of glandular trichomes – their capacity for high-level biosynthesis and secretion of valuable natural products – make them attractive targets for biotechnological applications. Harnessing trichomes can lead to crops with improved pest resistance, higher yields of commercially important phytochemicals, and even novel biofactories for drug production. Here we discuss how insights from trichome biology are being applied in agriculture and industry, and the future prospects for engineering these natural factories.

Enhancing Crop Protection: One major application is breeding or engineering crops with higher glandular trichome density or potency to naturally resist pests. Since glandular trichomes are often the first line of chemical defense, increasing their number or the amount of toxin they produce can reduce reliance on pesticides. For example, wild tomato species with dense, sticky trichomes are resistant to whiteflies and aphids, and breeders have introgressed these traits into cultivated tomato. A specific success story involved transferring a sesquiterpene biosynthetic pathway from a wild tomato (*Solanum habrochaites*) into cultivated tomato, which conferred strong resistance to insect herbivores (Huchelman et al., 2017). This was achieved by crossing (and, in modern approaches, by transgenic insertion) of the gene cluster responsible for producing the insect-repellent terpene zingiberene; the resulting plants accumulate the sesquiterpene in their glandular trichomes and are less damaged by pests. Similarly, breeding programs in crops like *Brassica* (mustard greens) and Solanum tuberosum (potato) are exploring wild relatives with more effective trichomes to introduce into elite varieties. In ornamental plants such as chrysanthemums, increasing trichome-borne pyrethrins (natural insecticides) is of interest.

Transgenic approaches have also been demonstrated: overexpressing trichome development regulators can amplify defense. In tomato, simultaneous overexpression of the *HD-Zip* gene Wo and the bHLH SlMYC1 (the "woolly/SlMYC1 module") led to a plant with a carpet of glandular trichomes that produced heightened levels of defensive compounds, significantly improving resistance to insects (Chang et al., 2024). This kind of genetic engineering essentially

turns up the dial on the plant's innate defense factory. Another approach is to engineer the biochemistry of trichomes: for instance, making the trichomes produce a new deterrent compound. A proof-of-concept was shown in tobacco, where researchers engineered trichomes to produce oxime-based volatiles that repel insects, by inserting a *CYP79* gene from maize under a trichome-specific promoter. The transformed tobacco emitted the volatile and showed reduced herbivory. Because trichomes localize toxic compounds away from vital tissues, plants can potentially tolerate higher levels of these bio-pesticides when they are trichome-targeted.

7.1. METABOLIC ENGINEERING FOR HIGH-VALUE COMPOUNDS

Glandular trichomes are often the sites of biosynthesis for plant-derived medicinal compounds. Thus, they present an opportunity for metabolic engineering to boost the supply of these pharmaceuticals. A prominent example is artemisinin from A. annua trichomes – efforts have been made to increase artemisinin yield by genetic means, such as overexpressing key enzymes (ADS, DBR2) or regulatory genes (the *AP2* factor *AaORA*) in the trichomes. Some success has been seen in doubling artemisinin content by transgenic approaches, although industrial production has also turned to synthetic biology in yeast. In *Cannabis*, where cannabinoids (THCA, CBDA) are made exclusively in glandular trichomes, there is intense interest in both classical breeding and biotech to increase cannabinoid yield or tailor the cannabinoid profile for medical applications. Understanding the gene network in cannabis trichomes (which genes control cannabinoid synthase expression, etc.) is guiding breeding for higher THC or CBD strains (Tanney et al., 2021). On the metabolic engineering front, one could foresee inserting the cannabinoid pathway into trichomes of a more easily grown plant or even engineering microbial systems with key elements from trichomes.

Transgenic metabolic engineering in trichomes has been demonstrated in model systems like tobacco – often referred to as a "trichome biofactory" for proof-of-concept. For instance, the production of taxadiene (a precursor of the anti-cancer drug Taxol normally from yew tree bark) was achieved in cultured tobacco cells by introducing a taxadiene synthase (Huchelman et al., 2017). While that was in cell culture, a similar idea is to engineer tobacco plants so that taxadiene accumulates in their glandular trichomes (tobacco trichomes can accumulate diterpenes, so they are a plausible surrogate host). As another example, transgenic mint plants were created to overexpress a cytochrome P450 and reductase, resulting in diversion of the monoterpene pathway to produce a novel compound in the peltate glands (demonstrating that one can reprogram the product profile of trichomes). The choice of promoter is crucial in such efforts; typically trichome-specific promoters (like the promoter of a trichome resin protein or a terpene synthase gene that is only active in gland cells) are used so that the transgene is expressed predominantly in the trichomes. This avoids burdening the rest of the plant with the metabolic perturbation and concentrates the effects in the trichome "factory." Additionally, engineering strategies often try to boost precursor supply for the target pathway: for terpenoids, this might mean upregulating the MEP pathway genes or diverting metabolic flux from primary isoprenoids into specialized terpenes. One study highlighted the importance of drawing from the existing metabolic pools – e.g. sinking more geranyl diphosphate into monoterpenes by

overexpressing a sink enzyme – and understanding the cross-talk between pathways to avoid bottlenecks (Huchelman et al., 2017).

7.2. COMMERCIAL CULTIVATION AND BIOPRODUCT HARVESTING

Beyond genetic engineering, knowledge of trichomes influences agricultural practices. For crops like mint, basil, lavender, and cannabis, growers aim to maximize glandular trichome formation because that directly translates to product yield (essential oil content or cannabinoid content). Horticultural research has shown that certain light spectra or mild stress can induce more trichomes. For instance, UV-B exposure can trigger higher flavonoid accumulation in trichomes as a protective response, so some growers use UV supplementation to enhance output. Similarly, moderate drought or nutrient stress at the right growth stage sometimes increases essential oil concentration by stimulating trichome development. However, these need to be applied carefully to avoid overall crop loss. In cannabis, where a multi-billion dollar industry relies on trichome-produced resin, there is interest in trichome-focused cultivation techniques and even mechanical or chemical elicitors that encourage trichome proliferation (Tanney et al., 2021). One could imagine foliar sprays of jasmonate or other elicitors to temporarily boost trichome density and metabolite production shortly before harvest – indeed, methyl jasmonate treatments have been used in artemisinin production fields to increase yield.

From a pharmaceutical research perspective, glandular trichomes are a treasure trove of natural compounds. Many new lead compounds (antimicrobials, anti-cancer agents, etc.) are discovered by screening trichome exudates from diverse plant species. Because trichomes often produce unique chemistries (sometimes not found elsewhere in the plant), they broaden the chemical diversity available for drug screening. Researchers are exploring under-investigated plants that have interesting traditional uses – often these have prominent aromatic or sticky trichomes – to isolate novel bioactive constituents. Once a valuable compound is identified, trichome-targeted metabolic engineering can be employed to upscale its production. There is also interest in synthetic biology to mimic trichome systems: for example, reconstructing a plant pathway in yeast or *E. coli*. However, certain steps (especially those requiring compartmentalization or membrane-bound enzymes) are challenging to replicate in microbes. In such cases, enhancing the native plant's production via trichomes might be more practical.

7.3. ENVIRONMENTAL AND INDUSTRIAL IMPLICATIONS

By leveraging glandular trichomes, we can develop plants that are more self-reliant in defense (reducing pesticide use) and that yield higher quantities of natural products (reducing the need for chemical synthesis of those products). The essential oils industry, which was valued at over $18 billion in 2020 (Tanney et al., 2021), depends largely on plants with glandular trichomes (like mint, lavender, lemongrass, etc.). Improving trichome productivity in those crops has direct economic benefits. In some cases, breeding has unintentionally reduced trichome counts for aesthetic reasons (e.g., smoother leaves); biotechnology offers a way to reintroduce or amplify those traits without altering the plant's primary characteristics. Glandular trichomes have also been proposed as sites to produce non-native valuable compounds – for example,

engineering a fodder crop to produce an insect pheromone in its trichomes, turning the crop into a pest-confusing agent in the field.

In conclusion, glandular trichomes stand at the intersection of plant defense, natural product chemistry, and biotechnology. They exemplify how a single cell type can be programmed to perform extreme biochemical feats, and they offer a convenient target for scientific manipulation. Ongoing research is making it possible to dial the trichome's output up or down or even change its product mix. As our understanding deepens, we may see the development of "designer trichomes" – plants whose glandular hairs are custom-tailored to produce new compounds on demand. From more pest-resistant crops to sustainable production of medicines and fragrances, the potential applications of glandular trichome research are vast and impactful. Glandular trichomes, once merely an interesting microscopic feature, have now truly achieved "model status" as living laboratories for studying and engineering phytochemical biosynthesis (Chang et al., 2024).

ABSTRACT

Potato cyst nematodes (PCNs) are soil-borne pests that damage potato plants in many countries of the world. Especially *Globodera rostochiensis* (Wollenweber, 1923) Skarbilovich, 1959 and *G. pallida* Stone, 1973 (Tylenchida: Heteroderidae) are species that cause serious yield losses in potato plants. Since they are on the quarantine list in Turkey and many parts of the world, they need to be diagnosed correctly and quickly. Since the cysts of the pest survive in the soil for many years, it is very difficult to control. Using varieties resistant to the damage caused by PCN is one of the effective and environmentally safe methods in control. Correct identification of the species and race of the nematode is of great importance in developing potato varieties resistant to PCN. In this study, morphological species identification was made from PCN populations taken from 16 locations in Niğde province. As a result of the identification, all samples were identified as *G. rostochiensis*. In the measurements made, it was determined that the morphological measurement values of all samples were compatible with the reference literature value of *G. rostochiensis*. The study result will contribute to the development of varieties resistant to the detected species and to sustainable agriculture.

Keywords: Cyst Nematode, taxonomy, potato, diagnosis.

NİĞDE İLİ ALTIN KİST NEMATODU (*Globodera rostochiensis*) POPÜLASYONLARININ MORFOLOJİK TEŞHİSİ

ÖZET

Patates kist nematodları (PKN'ler) dünyanın pek çok ülkesinde patates bitkisine zarar veren toprak kökenli zararlılardır. Özellikle *Globodera rostochiensis* (Wollenweber, 1923) Skarbilovich, 1959 ve *G. pallida* Stone, 1973 (Tylenchida: Heteroderidae), patates bitkisinde ciddi verim kayıplarına neden olan türlerdir. Türkiye ve dünyanın pek çok yerinde karantina listesinde olmaları nedeniyle doğru ve hızlı teşhis edilmeleri gerekmektedir. Zararlının kistleri uzun yıllar toprakta canlılığını sürdürmesi nedeniyle mücadelesi oldukça zordur. PKN verdiği zarara karşı dayanıklı çeşitler kullanılması, mücadelede etkili ve çevre için güvenli yöntemlerden birisidir. PKN karşı dayanıklı patates çeşidi geliştirmede nematodun türünün ve ırkının doğru teşhis edilmesi çok büyük önem arz eder. Bu çalışmada Niğde ilinde 16 lokasyondan alınan kist nematodu popülasyonlarının morfolojik tür teşhisi yapılmıştır. Teşhis sonucunda örneklerin tamamı Patates Altın Kist Nematodu (*G. rostochiensis*) olarak tanımlanmıştır. Yapılan ölçümlerde tüm örneklerin morfolojik ölçüm değerleri *G. rostochiensis*'in referans literatür değeri ile uyumlu olduğu tespit edilmiştir. Çalışmanın sonucu, tespit edilen türe karşı dayanıklı çeşit geliştirme çalışmalarına ve sürdürülebilir patates tarımına katkı sunacaktır.

Anahtar Kelimeler: Kist Nematodu, taksonomi, patates, teşhis.

1. GİRİŞ

Patates bitkisi, (*Solanum tuberosum* L.), yıllık 374.7 milyon ton üretimiyle dünyadaki diğer tarımsal ürünler arasında üretim miktarı bakımından buğday, pirinç ve mısırdan sonra dördüncü sıradadır (FAO, 2023). Patates içeriğindeki yüksek besin değeri nedeniyle, yıllık üretimin 5.7 milyon ton olduğu Türkiye'de insanoğlunun yeterli ve dengeli beslenebilmesi için en değerli besinler arasında yer almaktadır (Anonim, Şubat 2025). En fazla patates üretimi 264.830 da alanda 915.734 ton üretimle Niğde ilinde gerçekleşmekte olup, ortalama patates verimi 3.458,00 kg/da' dır (TÜİK, 2024). Niğde patates üretiminde ve ülke ekonomisine katkıda önemli bir yere sahip olmasına rağmen Patates kist nematodu (PKN)'nun tespit edilmesi gelecekteki patates tarımının sürdürülebilirliği için endişe vericidir.

Patates üretimini sınırlayan pek çok hastalık ve zararlı mevcuttur. Bitki paraziti nematodlar, dünya genelinde %10-15 verim kaybına neden olarak patates üretiminde sınırlayıcı faktörlerin başında gelmektedir. Patates bitkisinde bitki paraziti nematod kaynaklı %12 verim kaybı söz konusudur (Lima ve ark., 2018). PKN bulaşık patates alanlarında tespit edilen verim kayıpları %70'e kadar artabilmesine rağmen patojenin durumu hakkında çok az şey bilinmektedir (Sparkes, 2013; Vallejo ve ark., 2020). Nematod kaynaklı zarar ve kayıp oranı popülasyon yoğunluğu, yıllık döl sayısı, patates yetiştirilen sezonun uzunluğu, toprak sıcaklığı ve konukçu bitki türü gibi pek çok faktöre göre değişebilmektedir (Greco, 1993; Sparkes, 2013). *Globodera* spp. patates bitkisinin dünya çapında ekonomik sonuçlar doğuran en önemli karantina zararlıları olarak kabul edildiğinden, birçok biyotik kısıtlama patates üretimini önemli oranda azaltır (Park ve ark., 2019). PKN dünya genelinde patates yetiştiriciliğinde önemli tehdit olup, verim kaybı yanında regülasyon (düzenleme) işlemleriyle ilgili masraflar nedeniyle de önemli ekonomik etkiye sahiptirler (Mimee ve ark., 2019).

PKN içerisinde *G. rostochiensis, G. pallida, G. ellingtonae* ve *G. tabacum* başta olmak üzere dünya çapında tarımı önemli oranda sınırlayan türler saptanmıştır (Subbotin ve ark., 2020).

G. rostochiensis ve *G. pallida* Güney Amerika orjinli olup *G. rostochiensis* 106 ülkede karantina listesinde en çok yer alan bitki paraziti nematod türüdür (Hockland ve ark., 2006). Tüm dünyada *G. rostochiensis, G. pallida*'dan daha fazla yaygınlık göstermektedir (EPPO, 2014). Türkiye'de PKN ilk kez Bolu ili Dörtdivan ilçesinde tespit edilmiştir (Enneli ve Öztürk, 1996). Daha sonraki yıllarda Niğde, Nevşehir, Bolu, Afyonkarahisar, İzmir illerinde de patates yetiştiriciliği yapılan yerlerde varlığı tespit edilmiştir (Evlice ve ark., 2021).

G. rostochiensis ve *G. pallida* kistleri kalıcıdır, yumurtaları yirmi yılı aşkın toprakta canlı kalabilir ve bu nedenle tespit edilen yetiştirme alanlarında yok edilmesi çok zordur (Gartner ve ark., 2021). PKN doğal olarak taşınamaz, farklı lokasyonlara yayılması genellikle fide, fidan, tohumluk materyalin topraklarından ve işlenmiş patateslerde kistler vasıtasıyla olabilir (Jatala ve Bridge, 1990; Lima ve ark., 2018). *G. rostochiensis*'in tarladaki patates bitkisi üst aksamdaki belirtileri; bodur büyüme, yapraklarda sararma, besin elementi eksikliğine benzer semptomlara benzer. Nematodun kendine has semptomlarının olmayışı, yetiştiriciler arasında zararlının farkındalığını azaltır (Price ve ark., 2021).

Dünya genelinde zararlıyla mücadelede dayanıklı çeşit kullanımı ön plana çıkmaktadır ve dayanıklılık çalışmalarında nematodun türü hatta ırkının doğru tespit edilmesi son derece

önemlidir (Gavrilenko ve ark., 2021). Bu sebeple klasik tür teşhisi yanında moleküler teşhiste türleri tespit etmede önerilen tamamlayıcıdır (EPPO, 2017). *G. rostochiensis* ve *G. pallida'*yı ayırt etmede morfolojik teşhis moleküler çalışmalarla teyit edilerek başarılı şekilde uygulanmaktadır (Camacho ve ark., 2017).

Bu çalışmada Niğde ili ve beldelerinde patates yetiştiriciliğinin yoğun olarak yapıldığı tarlalardan elde edilen kist nematodu popülasyonlarının kist ve larvaları morfolojik karekterlerine göre teşhis edilmiştir.

2. MATERYAL VE METOD

Sürvey Çalışması

Arazi çalışmasında Niğde ili ve beldelerinden patates hasadı dönemi ve hemen sonrasında 0-30 cm derinlikten toprak sondası yardımıyla toprak örnekleri alınmıştır (Şekil 1). Alınan örnekler etiketlenerek laboratuvara taşınmıştır. Toprak örneği alınan Patates kist nematodu popülasyonlarının elde edildiği lokasyonlar verilmiştir (Tablo. 1).

Tablo 1. Niğde ilinde toprak örneğinden kist elde edilen lokasyonlar

Kistlerin Elde Edilmesi (Kist Ekstrasyonu)

Araziden alınan toprak örnekleri, laboratuvarda kist ekstrayonu için kurutularak kaba maddeler (taş, dal parçacıkları) temizlenmiştir. Kurutulan örnekten 250 gr alt örnek kist ekstrasyonu için kullanılmıştır. Alt örnek üst kısımda 850 µm çapında, alt kısımda 250 µm çapında olan eleklerden iyice toprak partiküllerinden kistler açığa çıkacak şekilde bol su ile yıkanmıştır (Fenwick, 1940). 850 µm çapındaki elek üzerindeki kaba maddeler uzaklaştırılmıştır. 250 µm çapındaki elekte biriken toprak parçacıkları ve açığa çıkan kistler iyice toz partiküllerinden arındırılarak huni ile kurutma tülüne alınmıştır. Kurutulan toprak örneği binoküler mikroskop (Leica S8AP0) altında *Globodera* spp. kistleri kategorize edilerek +4 C'de kullanılmak üzere saklanmıştır.

Şekil.1 Araziden alınan toprak örneği(a), kistli toprak(b), kistlerin çıkarımı(c), kistlerin görünümü(d)

Kist Nematodları Tür Teşhisi

PKN tür teşhisi morfolojik ve moleküler özellikleri dikkate alınarak yapılabilmektedir (EPPO, 2017). *Globodera* spp. türlerinin morfolojik karekterizasyonunda, kistlerin ve ikinci dönem larvaların (L2) özellikleri dikkate alınır. Kistlerin fenestral bölgesindeki vulva ile anüs arasındaki yükselti sayısı ve uzunluğu, granek oranı ile ikinci dönem larva vücut uzunluğu, kuyruk bölgesi uzunluğu, hyalin uzunluğu, stilet tokmağı, ve stilet uzunluğu kriterleri önemli teşhis karekterleridir (EPPO, 2017).

Kist Nematodları Dişi Birey Vulva Preperatı Çalışması

Globodera türlerinin vulva teşhisi kistlerden yapılmaktadır. PKN kistleri içi yumurtalarla dolu, ölen dişinin vücududur. Kistler önceleri açık renkte, ilerleyen dönemde kahverengi renge dönen uzun yıllar toprakta canlılığını koruyabilen nematodun dayanıklı formudur. Teşhiste vulva preperatı, kistlerin vulva-anüs bölgesini içeren perineal bölgeden yapılmaktadır. PKN kistleri preperat hazırlamadan önce sert yapının kolay kesilmesi için 24 saat süreyle suda bekletilir. Kistler stero mikroskop altında büstri yardımıyla ergin dişi bireyin baş bölgesi, yaklaşık üçte biri vulva kısmına yakın yerden kesilerek vücut içerisindeki yumurtaları dışarı boşaltılır. Kesilen kist parçacığı %15'lik H_2O_2 (Merck, Kat.No. 1.08597.1000) içinde bekletilerek kahverengi kist kesitinin renginin açılması sağlanır. Teşhiste vulva etrafı %45'lik laktik asit ortamında kesilir. Balmumu yüzük yöntemine (Hooper, 1986) göre hazırlanan lamda saf gliserin damlatılan ortama 5-10 adet vulva kesiti yerleştirilerek lamel kapatılır. Lamel ve

lam etrafı hava temasını önleyecek şekilde (Merck, Kat. No, 107961) kapatılarak kalıcı vulva preperatı hazırlanır (Hooper, 1986).

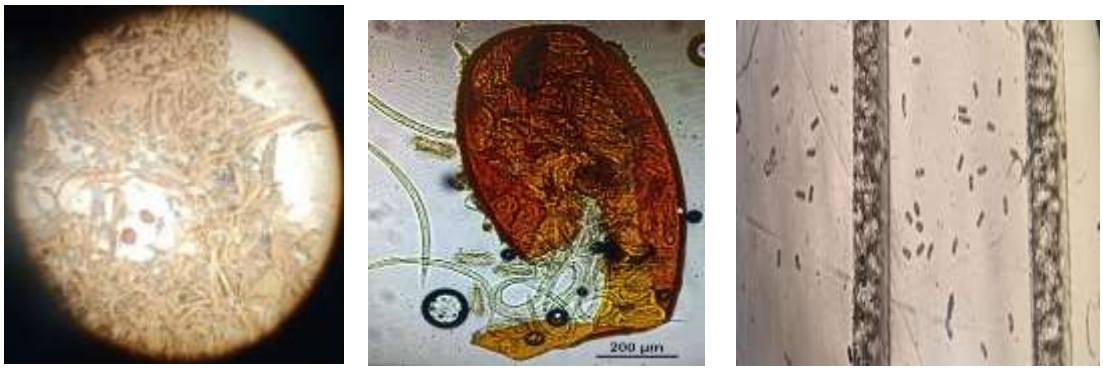
Globodera spp. Dişi Bireylerin Larva Preperatı Çalışması

Globodera spp. ikinci dönem larva preperatı için kistlerden larva fiksasyon işlemi yapılır (Grisse, 1969). Larvalar 65°C'de su banyosunda bekletilerek nematodun dokularına zarar vermeden teşhise hazırlanır. 1 ml TAF (7 ml %40'lık formaldehit, 2 ml trietanolamin ve 91 ml saf su) içerisinde 2 gün bekletilerek fikse edilir. Daha sonra larvalar plastik petriye alınarak kurutulur. Önce 20 kısım 95'lik etanol, 1 kısım gliserin ve 79 kısım saf su içeren çözelti I' den, daha sonra 95 kısım %95'lik etanol ve 5 kısım gliserin içeren çözelti II' den geçirilerek kurutulur. Kalıcı preperat yapımında "Balmumu yüzük" metodu kullanılır (Hooper, 1986). Bu yönteme uygun olarak hazırlanan lamın ortasına saf gliserin damlatılarak içerisine larvalar düzgün şekilde yerleştirilerek üzerine lamel kapatılır. Lam 40°C'lik sıcak plaka aleti üzerinde bekletilerek preperat hazırlanır (Hooper, 1986). Çalışmada PKN ikinci larva dönemi ölçümleri ve dişi nematodların vulva kısımlarına ait ölçümler DM 4000 B LED ışık mikroskobu kullanılarak yapılır. Larva ve vulva ölçüm ve çekimleri LAS IM500 (Leica Application Suite) proğramında gerçekleştirilmiştir. İkinci dönem larva ve kistin vulva alanı kesitlerinin morfolojik teşhiste kullanılan ölçümler *G. rostochiensis'in* sistematikteki teşhis anahtarına göre yapılmıştır (Siddiqi, 2000). Tür düzeyindeki teşhis Golden ve Ellington (1972), Subbotin ve ark.(2010)'a uygun olarak yapılmıştır.

3. BULGULAR VE TARTIŞMA

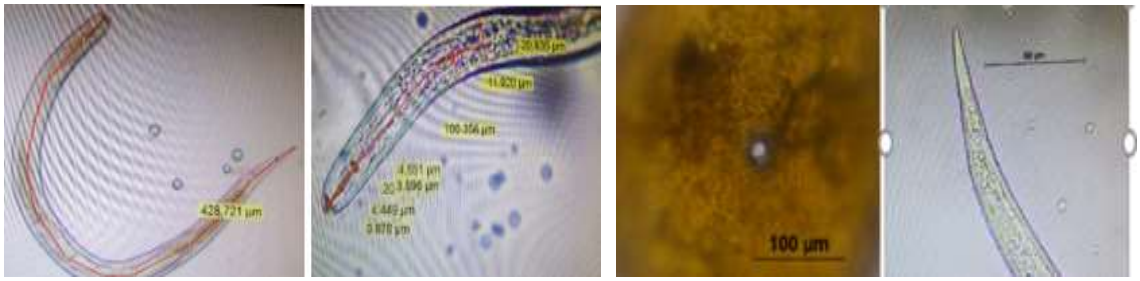
Kist ve Larvalar

Kist nematodu'nun ergin dişileri patates bitkisi dikiminden 6-8 hafta sonra çiçeklenme döneminde köklerde toplu iğne başı büyüklüğünde beyaz, sarı veya kahverengi renkte dikkatlice bakıldığında görülebilmektedir. Bitki köklerinde ölen dişi birey daha koyu renk alarak ilerleyen dönemde dayanıklı formu olan kiste dönüşür. Dişi bireyler önceleri armut şeklinde daha sonraları yuvarlak veya küremsi şekilde görülebilmektedir. Patates bitkisinin vejetasyon dönemini tamamlamasıyla bitki kökleri kuruduktan sonra kökteki kistler toprağa karışır ve uzun yıllar dayanıklı formda toprakta canlılığını korur. Araziden alınan toprak örneklerinden elde edilen kistler, sert yapıda ve açık- koyu kahverengindeydi (Şekil 2). Bitki köklerinde *G. rostochiensis* kistleri kahverengi ve kistlerin ortalama boyu 6.60 mm, eni ise 0.54 mm'dir (Lima ve ark.,2018). Bazen köklerde krem rengi olarak görülen kistler *G. pallida* olarak düşünülebilse de ilerleyen dönemde kahverengine dönüşmektedir. Kistler dişi bireylerin vücududur, kesildiklerinde içerisinde yumurta ve larvalar görülebilir (Şekil 2). Yumurta ve larvalar kist içerinde bulunurlar yumurta paketine sahip değillerdir (EPPO, 2017; Subbotin ve ark., 2010). *G. rostochiensis* ve *G. pallida* kistlerinde larvalar kalıcıdır, yumurtalar yirmi yılı aşkın süre toprakta canlı kalabilir ve bu nedenle nematodun bir kez tespit edildiği alanda yok edilmesi oldukça zordur (Gartner ve ark., 2021).



Şekil 2. Mikroskop altındaki kist (a), L2 dönem larva(b) ve kist içinde yumurtaların(c) görünümü.

Toktay ve ark., (2020) yaptıkları çalışmada ikinci dönem larva ölçümlerinde perineal deseni çevresel fenestrat, kütüküladaki V şeklinde alt yüzey işaretinin yüzeyinde subterminal küçük anüs, kütikül sırtlarını vulva tabanı ile anüs arasında tespit etmişlerdir. Düzensiz yüzey altı noktaları vücudun her yerinde yaygın olarak bulunduğunu ve bazı kistlerin uzun eksenine dik açıyla paralel çizgiler halinde düzenlenmiş olduğunu saptamışlardır (Toktay ve ark., 2020).



Şekil 3. İkinci dönem larva genel görünümü(a), Anterior bölgesi (b), fenestral bölge (c) kuyruk bölgesi (d), görüntüsü

G. rostochiensis'in ikinci dönem larvalarında mikroskop görünümünde, çoğunlukla posteriorde olmak üzere her iki uçta da sivrilen silindirik gövdeye sahipti (Şekil 3a). Baş vücutla boğum oluşturmadan birleşmiş ve labial diski belirgin değildi. İkinci dönem larva teşhisinde en önemli kriterler olan stilet boyu ve şekli açısından larvalar literatürlerde belirtildiği şekilde yuvarlak ve anteriörden basık stilet tokmaklarına sahipti. İkinci dönem larvada stilet belirgin olup, yuvarlak ve anteriordan basık olan stilet tokmakları vardı (Şekil 3b). *Globodera* türlerinin morfolojiye dayalı olarak tür düzeyinde teşhis edilmesi, temel özelliklerinde gözlemlenen değişkenlikler nedeniyle zor olabilmektedir. Median bulb elipsoid şekilde ve valfleri belirgindi. Özefagal bezler vücut uzunluğunun yaklaşık %35'i kadar ventralde bulunmaktaydı. Genital primordiyum hafif posteriörde olmak üzere vücut orta bölgesinde bulunmakta ve lateral alan dört çizgilidir

(Evlice ve ar., 2021). Kuyruk kısmı konik sivri olup uç kısmı yuvarlaktır. Hiyalin bölgesi belirgindir (EPPO,2017; Subbotin ve ark., 2010).

Toktay ve ark., (2020) yılında yaptıkları çalışmada ikinci dönem larva gövdesini ventralde hafif eğik, kuyruk ucu ince bir noktaya doğru sivrilmiş, baş vücudun geri kalanından biraz çıkıntı yapan labial disk ile medial dudaklar boyunca 3-4 halkadan oluştuğunu belirtmiştir. Taramalı elektron mikroskopta labial diskin ve medial dudakların lateral dudaklarla aynı yükseklikte olduğunu, prestoma açıklığını dikdörtgen ve medial dudakların ve labial diskin kalan kısmından marjinal yükseldiğini tespit etmişlerdir. Dudakları dikdörtgen daha büyük boyutlu, bazen düzensiz şekilli ve amfidi taşıdığını, stilet düğmelerini yuvarlak, stilet düğmeleri ile dorsal bez çıkışı arasındaki mesafeyi 3,5-6,5 µm olarak ölçmüşlerdir. Özofageal bezin lobunu vücut uzunluğunun yaklaşık %35'i kadar, genital primordium gövde ortasından biraz sonra, sinir halkasının arkasında boşaltım açığını, median bulb valfini belirgin, anüllerin uzunluğunu gövdenin ortasında, birçok örnekte fazmidi belirsiz, kuyruk ucu pürüzsüz ve halkalı, stilet uzunluğu ve topuz şekli daha önce bildirilenlere benzediğini belirtmişlerdir. (Shahina ve Maqbool 1995; Sirca ve Urek 2004; Subbotin ve Baldwin 2010).

Patates Altın Kist nematodları diğer nematodlarda olduğu gibi teşhiste uzmanlık gerekmekte ölçümler ve gözlemler bir miktar yanıltıcı olabilmektedir. Türlerinin klasik teşhise morfolojiye dayalı olarak tür düzeyinde teşhis edilmesi, larvalarda görülen değişkenlikler nedeniyle zor olabilmektedir. Bu nedenlerden dolayı güvenilir teşhis için kist (vulva) ve ikinci dönem larvalara ait özelliklerin bir arada kullanılması önerilmektedir (EPPO, 2017). Morfolojik ve morfolojik teşhiste türler arası benzerlikler nedeniyle teşhis daha da zordur**.** *Globodera rostochiensis* morfolojik olarak *G. pallida, G. ellingtonae, G. mexicana* ve *G. tabacum*'a büyük benzerlik göstermektedir (Handoo ve Subbotin, 2018). Klasik teşhiste morfolojik ve morfometrik teşhisinde kullanılan birçok karekter olmakla beraber pratikte kistlerde kütikuladaki çizgi sayısı ve granek oranı, ikinci dönem larvalar için stilet uzunluğu ve stilet tokmaklarının şekli büyük önem arz eder (EPPO, 2017; Manduric ve ark., 2004).

Tablo 2. Patates Altın Kist Nematodu larvasının morfolojik ölçüm değerleri (Bkz. Ek)

Yapılan çalışmada ölçümler sonucunda değerlendirmeye alınan 16 popülasyon içerisinde ikinci dönem larva vücut uzunluğu ortalaması 411.70 µm olarak belirlenmiştir. En uzun larva boyu 442.21 µm ile P6 popülasyonunda belirlenirken, en kısa larva boyu ise 359.68 µm ile P40 popülasyonunda tespit edilmiştir. İkinci dönem larvaların teşhisinde stilet boyu ve şekli de teşhiste önemli kriterdir. Stilet boyu açısından bakıldığında ortalama stilet boyu uzunluğu 21,68 µm'dur. En kısa stilet boyu 18,82 µm ile P9 popülasyonunda, en uzun stilet boyu 24,49 µm ile P2 popülasyonunda belirlenmiştir. Teşhiste önemli kriterler olan ortalama kuyruk uzunluğu 46.95 µm olarak tespit edilirken, en uzun kuyruk uzunluğu 54.02 µm ile P18 popülasyonunda, en kısa kuyruk uzunluğu 42.91 µm ile P9 popülasyonunda tespit edilmiştir. Hyalin uzunluğunda en kısa 16.06 µm değeri ile P4 popülasyonunda olurken, en uzun hyalin 26.39 µm ile P2 popülasyonunda tespit edilmiştir. Ortalama hyalin uzunluğu 23.10 µm olarak belirlenmiştir (Tablo 2).

G. rostochiensis'i ve *G. pallida* kıyaslandığında ikinci dönem larvalara ait stilet uzunluğunun daha kısa (21.8 mikron, 19-23 mikron) ve stilet tokmak genişliğinin daha az (3-4 mikron) olduğunu, kistlerdeki sırt deseni sayısının (>14, 16-31), vulva ile anüs arası mesafenin (>55 mikrom, 37-77 mikron) ve Granek oranı (>3, 1.3-9.5) daha yüksek olduğunu, fenestra çapının (<19, 8-20) daha az olduğu bildirilmiştir. *G.rostochiensis* ikinci dönem larvaları stilet tokmakları yuvarlak ve anteriörden basık basık şekilde iken ve *G. pallida* da stilet tokmakları ön yüzeyinde düz ya da anteriordür (EPPO, 2017); Fleming ve Powers, 1998; Subbotin ve ark., 20210; Bačić ve ark., 2013; Altaş ve ark., 2020; Demişbaş Pehlivan ve ark., 2020) Klasik teşhis yapılırken, belirlenen referans aralığının dışına çıkan az sayıda da olsa bireyin olduğu, moleküler olarak teşhis edildiği popülasyonlara da rastlanmaktadır (Oro ve ark., 2010; Inácio ve ark., 2018).Bütün bu morfolojik teşhisler yanında moleküler yöntemle de teşhisin teyit edilmesi önerilmektedir. EPPO'nun 2017 protokolünde de *G. rostochiensis* ve *G. pallida* teşhisinde morfolojik ve moleküler teşhisin bir arada kullanılması önerilmektedir. Bu kriterlerin yanında ikinci dönem larvaların vücut uzunluğu, kuyruk ve hiyalin uzunluğu da sıklıkla kullanılmaktadır. Patates Altın kist nematodu'nun morfolojik teşhisi, çok benzerlik gösteren kist formundaki diğer *Globodera* ve *Heterodera* türleriyle oluşabilecek karmaşayı önlemek için moleküler teşhis yöntemi önem taşır (Inácio ve ark., 2018).

Daha önceki yıllarda yapılan çalışmalarda Niğde, Nevşehir, İzmir, Afyonkarahisar ve Bolu illerinde *G. rostochiensis* varlığını göstermekte olup *G. pallida* varlığına yönelik bir sonuç elde edilmemiştir (Evlice ve ark., 2021). Yapılan bu çalışmada morfolojik olarak 16 adet popülasyonun tamamı *G. rostochiensis* olarak teşhis edilmiş olup *G. pallida* tespit edilmemiştir. Yapılan ölçümler referans literatür ile uyumludur (Fleming ve Powers, 1998; Subbotin ve ark., 2010; Bačić ve ark., 2013; Altaş ve ark., 2020; Pehlivan D. ve ark., 2020; Tokyay ve ark., 2020; Evlice ve ark., 2021). Ulutaş ve ark. (2012) yaptığı çalışmada Türkiyede tespit edilen kist nematodu türü dünyada yaygınlık gösteren *G. rostochiensis* olarak tespit edilmiştir. *G. rostochiensis* 106 ülkeyle karantina listelerinde en çok yer alan bitki paraziti nematod türüdür (Hockland ve ark., 2006).

4. SONUÇ VE ÖNERİLER

PKN karşı mücadelede dayanıklı çeşit kullanımı dünyanın pek çok ülkesinde uygulanmaktadır. Kist nematodları gibi mücadelede dayanıklı çeşitlerin başarıyla uygulandığı zararlılarda tür tespiti daha da önem kazanmaktadır. *G. rostochiensis* ve *G. pallida'* ya karşı geliştirilecek dayanıklı patates çeşitlerinde nematodun türüne özgü dayanıklılık genleri içermelidir. O nedenle türün yanlış tespiti durumunda geliştirilecek çeşit nematoda dayanıklı olmadığı gibi gereksiz maliyet ve emek kaybı yaşanacaktır. Nematodun tür ve ırkının doğru tespit edilerek geliştirilen çeşitler Patates Altın Kist nematoduna karşı mücadelede başarılı sonuçlar vermektedir. *G. rostochiensis* ve *G. pallida*'nın tür teşhisiide morfolojik ve moleküler teşhisin bir arada kullanılması gerekmektedir. Bu durum dayanıklı çeşit geliştirmede önem arz ettiği gibi karantina ve serfitikasyon analizlerinde de önem arz eder. Sonuç olarak Türkiye'de en çok patates üretiminin yapıldığı Niğde ili ve beldelerinden alınan örneklerde 16 adet popülasyondan yapılan morfolojik ölçüm sonuçlarına göre *G. rostochiensis* tespit edilmiştir. *G. pallida*'ya rastlanmamıştır. *G. rostochiensis* popülasyondaki ölçüm değerleri referans literatürle örtüşmektedir. Uzun emek ve maliyet gerektiren kist nematodlarına karşı çeşit geliştirme

çalışmaları içinde tür teşhisi morfolojik, morfometrik ve moleküler çalışmalarla tür teşhisi teyit edilerek yapılması önerilmektedir.

Teşekkür: Bu çalışma "Bazı Patates Çeşitleri Ve Islah Klonlarının Patates Altın Kist Nematodu(*Globodera rostochiensis*, Wollenweber)'na Karşı Reaksiyonunun Belirlenmesi" isimli TAGEM/TBAD/T1/16/A04/P3/P01/2499 nolu proje kapsamında Tarımsal Araştırma ve Politikalar Genel Müdürlüğü tarafından desteklenmiştir.

Çıkar Çatışması Beyanı: Makalede yazaralar aralarında çıkar çatışması olmadığını beyan etmektedirler.

Araştırmacıların Katkı Oranı Beyan Özeti: Yazarlar eşit oranda makaleye katkı sağlamış olduklarını beyan ederler.

ABSTRACT

The powdery mildews (*Erysiphaceae*) are an important group of obligate plant pathogens with an almost worldwide distribution on a wide range of angiosperms. The current study was carried out based on powdery mildew specimens collected from Yedigöller National Park, Bolu Province, Türkiye. Yedigöller National Park, which has seven lakes and numerous streams, has a semi-arid, upper, cold winter Mediterranean climate of daily and seasonal photoperiodism according to Emberger's climate classification.

Plant specimens infected with powdery mildews were collected in the Yedigöller National Park in Bolu Province of Türkiye. Host specimens were prepared according to herbarium techniques. Host plants were identified using the Flora of Turkey and East Aegean Islands. Thin sections prepared from infected host tissue were examined under a Leica DM E light microscope and measured from mounts in tap water. 20 microscopic structures were measured for each sample. Infected host surfaces were photographed using a Leica EZ4D stereo microscope.

As a result of field and laboratory studies, a total of 16 *Erysiphaceae* species were identified: *Erysiphe adunca, E. aquilegiae, E. convolvuli, E. corylacearum, E. heraclei, E. mayorii, E. pisi, E. polygoni, E. tortilis, Golovinomyces valerianae, Neoerysiphe galeopsidis, Phyllactinia fraxini, P. guttata, Po. aucupariae* var. *arcuatispora, Po. helianthemi* and *Po. plantaginis*. Of these, *Podosphaera helianthemi* is a new record for Türkiye mycobiota. The description of the new recorded species is presented and discussed with its macro and micromorphological photographs. All examined specimens were deposited in the Mycological Collection of the Kırşehir Ahi Evran University, Faculty of Agriculture, Department of Landscape Architects, Kırşehir, Türkiye.

INTRODUCTION

The powdery mildews (*Erysiphaceae*) represent a large group of common, obligate plant pathogens of cosmopolitan distribution, usually easily recognizable by their obvious symptoms, i.e. superficial white powdery patches or films of the anamorphic, composed of mycelium, conidiophores and conidia, on leaves, stems and other plant organs. The economic importance of these fungi in phytopathology and plant protection is enormous (Braun and Cook 2012). The host range of powdery mildews consists of almost 10,000 host species worldwide (Amano 1986). With new records added each year, both the number of species and the number of hosts are increasing significantly. In Türkiye, 167 powdery mildews belonging to 18 teleomorphic and anamorphic genera were observed on many different host plants (Kabaktepe et al. 2020; Sesli et al. 2020; Bradshaw et al. 2024).

Studied area Yedigöller National Park is located in the northern part of Bolu Province in the Western Black Sea Region in Türkiye and it includes seven lakes and many streams. According to the Davis's grid square system (1965), the park is situated in the square A3. The climate of the province is a semi-arid, upper, cold winter Mediterranean climate of daily and seasonal photoperiodism according to Emberger's climate classification.

The research area comprises primarily mixed forest vegetation. At lower elevations the forest is dominated by *Carpinus orientalis*, *Fagus orientalis*, *Sambucus nigra*, *Sorbus aucuparia*, *S. torminalis*, *Acer* ssp., *Quercus* spp., *Corylus colurna*, *Cornus mas*, *Alnus glutinosa* and *Populus tremula*. Regions at upper elevations are covered with *Gymnospermae* such as *Abies nordmanniana* subsp. *equi-trojani*, *P. sylvestris*, *Pinus nigra*, and *Taxus baccata*. The understory contains shrubs such as *Rhododendron ponticum*, *Juniperus oxycedrus*, and *Daphne pontica*. The research area is also rich in marshy habitats, and there are aquatic plants in the lake and marsh plants surround the edge of the lake.

The purpose of the current study is to determine the powdery mildews of Yedigöller National Park and make a contribution to mycobiota of Türkiye.

MATERIALS and METHODS

Plant specimens infected with powdery mildews were collected in the Yedigöller National Park in Bolu Province of Türkiye. Host specimens were prepared according to herbarium techniques. Host plants were identified using the Flora of Turkey and East Aegean Islands (Davis 1965–85). Thin sections prepared from infected host tissue were examined under a Leica DM E light microscope and measured from mounts in tap water. 20 microscopic structures were measured for each sample. Infected host surfaces were photographed using a Leica EZ4D stereo microscope. Species were identified using relevant literature (Ellis and Ellis 1987, 1998; Geluta 1989; Braun 1995; Braun and Cook 2012; Bradshaw et al. 2024).

RESULTS

During our study on determining the microfungi on vascular plants in Yedigöller National Park (it is abbreviated as YNP), we collected powdery mildews that infect leaves and stems. As a

result of field and laboratory studies, a total of 16 species belonging to the *Erysiphaceae* family were identified. Of these, *Podosphaera helianthemi* is a new record for Türkiye mycobiota. The list of powdery mildews with their descriptions (for new record only), localities, habitats, host plants, coordinates, altitudes, collection dates, and voucher numbers was arranged below according to the systematics given in Index Fungorum (2025).

Fungi

Ascomycota

Leotiomycetes

Helotiales

Erysiphaceae

Erysiphe adunca (Wallr.) Link

Specimen examined: Bolu Province, YNP, near the İncegöl-Sazlıgöl, on living leaves of *Populus tremula* L. (*Salicaceae*), 40°56′19″N, 31°44′29″E, 901 m, 11.08.2019, GD 1577; Bolu Province, Yedigöller National Park, 40°55′08″N, 31°41′38″E, 1355 m, 08.09.2018, GD 1660.

Erysiphe aquilegiae DC.

Specimen examined: Bolu Province, YNP, roadside, on living stems, petioles and leaves of *Ranunculus* L. sp. (*Ranunculaceae*), 40°53′19″N, 31°41′03″E, 1616 m, 14.07.2019, GD 1964.

Erysiphe convolvuli DC.

Specimen examined: Bolu Province, YNP, near the Atmaca Observation Terrace, under the forest, on living leaves of *Calystegia* R. Br. sp. (*Convolvulaceae*), 40°55′44″N, 31°44′32″E, 1225 m, 22.09.2019, GD 2229.

Erysiphe corylacearum U. Braun & S. Takam.

Specimen examined: Bolu Province, YNP, near the Atmaca Observation Terrace, under the forest, on living leaves of *Corylus* L. sp. (*Betulaceae*), 40°55′44″N, 31°44′32″E, 1225 m, 22.09.2019, GD 2234; Bolu Province, Yedigöller National Park, near the Atmaca Observation Terrace, 40°55′49″N, 31°45′00″E, 1080 m, 22.09.2019, GD 2293.

Erysiphe heraclei DC.

Specimen examined: Bolu Province, YNP, under the forest, on living leaves of *Anthriscus* Pers. sp. (*Apiaceae*), 40°55′76″N, 31°44′04″E, 461 m, 27.06.2018, GD 1314; Bolu Province, Yedigöller National Park, 40°56′49″N, 31°44′51″E, 1166 m, 28.06.2018, GD 1371; Bolu Province, Yedigöller National Park, 40°55′08″N, 31°41′38″E, 1355 m, 08.09.2018, GD 1663.

Erysiphe mayorii S. Blumer

Specimen examined: Bolu Province, YNP, near the İncegöl-Sazlıgöl, under the forest, on living leaves of *Cirsium arvense* (L.) Scop. (*Asteraceae*), 40°56′19″N, 31°44′29″E, 901 m, 11.08.2019, GD 2277.

Erysiphe pisi DC.

Specimen examined: Bolu Province, YNP, on living stems and leaves of *Astragalus* L. sp. (*Fabaceae*), 40°55′76″N, 31°44′04″E, 716 m, 27.06.2018, GD 1975; Bolu Province, YNP, near the İncegöl-Sazlıgöl, under the forest, on living leaves of *Trifolium repens* var. *repens* L. (*Fabaceae*), 40°54′52″N, 31°41′59″E, 1370 m, 11.08.2018, GD 1598.

Erysiphe polygoni DC.

Specimen examined: Bolu Province, YNP, near the Seringöl, on living leaves of *Polygonum* L. sp. (*Polygonaceae*), 40°56′42″N, 31°44′51″E, 785 m, 08.09.2018, GD 1675.

Erysiphe tortilis (Wallr.) Link

Specimen examined: Bolu Province, YNP, roadside, on living leaves of *Cornus mas* L. (*Cornaceae*), 40°56′11″N, 31°44′22″E, 889 m, 03.08.2019, GD 2286.

Golovinomyces valerianae (Jacz.) V.P. Heluta

Specimen examined: Bolu Province, YNP, near the Atmaca Observation Terrace, under the forest, on living leaves of *Valeriana alliariifolia* Adams (*Caprifoliaceae*), 40°55′44″N, 31°44′32″E, 1225 m, 22.09.2019, GD 2231.

Neoerysiphe galeopsidis (DC.) U. Braun

Specimen examined: Bolu Province, YNP, Mengen road, the stream's edge, on living leaves of *Ballota* L. sp. (*Lamiaceae*), 40°57′00″N, 31°44′49″E, 559 m, 03.05.2019, GD 1808.

Phyllactinia fraxini (DC.) Fuss

Specimen examined: Bolu Province, YNP, near the Anıt Karaçam, under the forest, on living leaves of *Fraxinus angustifolia* subsp. *angustifolia* Vahl (*Oleaceae*), roadside, 40°55′40″N, 31°44′59″E, 1143 m, 22.09.2019, GD 2237; Bolu Province, YNP, near the Atmaca Observation Terrace, 40°55′49″N, 31°45′00″E, 1080 m, 22.09.2019, GD 2288; Bolu Province, YNP, near the Atmaca Observation Terrace, 40°55′49″N, 31°45′00″E, 1080 m, 17.09.2021, GD 2515.

Phyllactinia guttata (Wallr.) Lév.

Specimen examined: Bolu Province, YNP, near the Atmaca Observation Terrace, under the forest, on living leaves of *Corylus* sp. L. (*Betulaceae*), 40°55′44″N 31°44′32″E, 1225 m, 22.09.2019, GD 2234; Bolu Province, YNP, near the Atmaca Observation Terrace, under the forest, 40°55′43″N, 31°44′31″E, 1220 m, 18.09.2021, GD 2512.

Podosphaera aucupariae var. ***arcuatispora*** G. Doğan, Erdoğdu & U. Braun

Specimen examined: Bolu Province, YNP, near the Atmaca Observation Terrace, under the forest, on living leaves of *Sorbus aucuparia* L. (*Rosaceae*), 40°55′41″N, 31°44′58″E, 1110 m, 25.09.2022, GD 2563.

Podosphaera helianthemi (L. Junell) U. Braun & S. Takam.

Mycelium on stems and leaves, amphigenous, thin, effuse. Chasmothecia mostly hypophyllous, scattered or in groups, globose, 65–100 µm diam., dark brown. Appendages in the lower half, less then 10, mycelioid, septate, brown up to the upper. Ascus subglobose, ellipsoid, broad ovate, 51–71 × 43–62 µm, sessile, 8-spored. Ascospores ellipsoid-ovoid, 18–22 × 10–14 µm, hyaline, guttulate. Conidia doliiform, 27–30 × 12.8–17.2 µm, hyaline.

Specimen examined: Bolu Province, YNP, on living stems and leaves of *Helianthemum nummularium* subsp. *nummularium* (L.) Mill. (*Cistaceae*), 40°79′80″N, 31°64′55″E, 964 m, 28.06.2018, GD 1354.

Podosphaera plantaginis (Castagne) U. Braun & S. Takam.

Specimen examined: Bolu Province, YNP, near the Kapankaya Observation Terrace, roadside, on living leaves of *Plantago* L. sp. (*Plantaginaceae*), 40°55′40″N, 31°44′12″E, 1290 m, 21.09.2019, GD 2179.

DISCUSSION

In the research area, powdery mildew fungi living as parasites on their hosts are represented by 5 genera and 16 species belonging to these genera. Of these, *Podosphaera helianthemi* is a new record for Türkiye mycobiota. In Türkiye, 167 powdery mildews belonging to 18 anamorphic and teleomorphic genera were observed on many different host plants (Kabaktepe et al. 2020; Sesli et al. 2020; Bradshaw et al. 2024). This study has contributed to the Turkish mycobiota and the number of powdery mildew species in Türkiye has reached 168.

During our research, we observed *Ampelomyces quisqualis* Ces., a hyperparasite on *Erysiphe pisi*. *Ampelomyces quisqualis* is a useful hyperparasite fungus species used as a biological fungicide. This fungus is especially used to control powdery mildew diseases. It attacks and destroys the mycelium and spores of the fungi that cause powdery mildew disease. *Ampelomyces quisqualis* attracts attention as an environmentally friendly biological agent used as an alternative to chemical fungicides in agriculture.

ABSTRACT

Barley (*Hordeum vulgare*) is an important crop worldwide not only in terms of production but also in terms of area under cultivation and is a staple cereal widely grown in arid regions. It has a wide range of uses in agriculture, industry and food production. It is used as malt or beer for humans and also as feed for animals such as cattle, sheep and chickens. Barley can improve soil fertility and reduce erosion, both as a source of income for growers and as a sustainable agricultural component in crop rotation. However, several factors affect its production and productivity; among biotic factors, barley leaf spot blotch/scald is one of the most important fungal diseases. The disease agent was first identified as *Marsonia secalis*, but it was later shown to cause scald disease in Rye. Detailed morphology studies revealed the genus *Rhynchosporium*, which contains beaked and two-celled conidia. The disease was renamed *R. secalis*. However, phylogenetic analysis revealed that *R. secalis* is a complex pathogen group consisting of three host-specific species. *R. secalis* on Rye and Triticale; *R. agropyri* on Common Ryegrass; and *R. commune* on Barley, Great Bromine and other *Hordeum* species were identified as the fungal causal agents of "Leaf Spot Blotch/Scald" disease. Nowadays, researchers have suggested that the barley leaf spot blotch disease caused by *R. commune* should be changed from *R. commune* to *R. graminicola* based on the priority of naming. The causal agent of barley leaf blotch, *R. graminicola*, can cause up to 100% yield losses in countries where barley is grown continuously without crop rotation, such as Morocco, Ethiopia, Peru, Colombia, Ecuador, Turkey, Syria and Iran. *R. graminicola* is an overwintering, spore-producing fungus that can survive in agricultural waste such as stalks and straw for up to one year. It can survive on or below the soil surface and after harvest the pathogen can spread through seeds. Disease severity depends on the amount of plant residue on the soil surface and also coleoptiles are infected when infected seeds germinate under favorable conditions. The

disease can cause epidemics in cool vegetation with frequent rains. Secondary inoculum is dispersed by wind-borne rain splash after the formation of the first lesions. Both leaf and spike are infected. Large watery gray-green spots turn white with brown edges as the leaves dry. This disease produces a completely gray form of the symptom on barley. The spots accumulate frequently, killing the whole leaf. Many methods are proposed to control the disease. Of these, planting resistant barley varieties is used as the best method of control. Also biological agents: *Bacillus subtilis, B. polymyxa* and *Paenibacillus polymyxa* are very effective in controlling this disease. Finally, different fungicides are recommended. The aim of this review is to evaluate various findings on the taxonomy, ecology, epidemiology, symptomatology and epidemiology of *R. graminicola* disease agent of barley.

Keywords: Biology, Etiology, *Rhynchosporium graminicola*, Taxonomy

ARPA YAPRAK LEKESİ/YANIKLIĞI PATOJENİ *RHYNCHOSPORİUM GRAMİNİCOLA*'NIN SİMPTOMATOLOJİSİ, EPİDEMİYOLOJİSİ, EKOLOJİSİ VE MÜCADELE YÖNTEMLERİ

ÖZET

Arpa (*Hordeum vulgare*) dünya genelinde sadece üretim miktarı ile değil ayrıca ekim alan açısından önemli bir ürün olup kurak bölgelerde oldukça yaygın yetiştirilen temel bir tahıldır. Tarım, endüstri ve gıda üretiminde geniş bir kullanım yelpazesine sahiptir. İnsanlar için malt ya da bira ve ayrıca sığır, koyun ve tavuk gibi hayvanlar için yem olarak kullanılır. Arpa yetiştiriciler için hem gelir kaynağı hem de ürün rotasyonu içerisinde yer alarak sürdürülebilir bir tarım bileşeni olmasıyla toprak verimliliğini artırabilir ve erozyonu azaltabilir. Bununla birlikte, çeşitli faktörler üretimini ve verimliliğini etkiler; biyotik faktörler arasında, arpa yaprak lekesi/yanıklığı en önemli fungal hastalıklardan biridir. Hastalık etmeni ilk olarak *Marsonia secalis* olarak tanılanmış ancak daha sonra bu etmenin çavdarda yanıklık hastalığına neden olduğu ortaya konulmuştur. Detaylı morfoloji çalışmaları gagalı ve iki hücreli konidileri içeren *Rhynchosporium* cinsini ortaya çıkarmıştır. Hastalık *R. secalis* olarak yeniden adlandırılmıştır. Ancak, filogenetik analizlere göre, *R. secalis*, konukçulara özel üç türden oluşan kompleks bir patojen grubu olduğu belirlenmiştir. Çavdar ve Tritikale'de *R. secalis*; Ayrık otu'nda *R. agropyri*; Arpa, Büyük Brom ve diğer *Hordeum* türlerinde *R. commune* ''Yaprak lekesi/Yanıklığı'' hastalığının fungal etmenleri olarak tespit edilmiştir. Günümüzde, araştırmacılar, *R. commune* tarafından oluşturulan arpa yaprak lekesi/yanıklık hastalığının adlandırma önceliğine dayanarak *R. commune* etmeni yerine *R. graminicola* olarak değiştirilmesini önermiştir. Arpa yaprak yanıklığına neden olan *R. graminicola* etmeni Fas, Etiyopya, Peru, Kolombiya, Ekvador, Türkiye, Suriye ve İran gibi arpanın ekim nöbeti olmaksızın sürekli olarak yetiştirildiği ülkelerde %100'e yakın verim kayıplarına neden olabilir. *R. graminicola*, sap ve saman gibi tarımsal atıklarda bir yıla kadar hayatta kalabilen, kışlayan ve spor üreten bir fungustur. Toprak yüzeyinde veya altında hayatta kalabilir ve hasattan sonra patojen tohumlar aracılığıyla yayılabilir. Hastalık şiddeti toprak yüzeyindeki bitki artık miktarına bağlıdır ve ayrıca enfekteli tohumlar uygun koşullarda çimlendiğinde koleoptil'ler enfektelenir. Hastalık serin ve sık yağmurlu geçen vejetasyonlarda epidemi oluştura bilir. İkincil inokulum, ilk lezyonların oluşumundan sonra rüzgârla taşınan yağmur sıçramasıyla dağılır. Hem yaprak kını hem de başaklar enfektelenir. Büyük sulu gri-yeşil lekeler, yapraklar kurudukça kahverengi kenarlarla beyazlar. Bu hastalık arpa üzerindeki simptomun tamamen gri renkli bir formunu oluşturur. Lekeler sık sık birikir, tüm yaprağı öldürür. Hastalık mücadelesinde birçok yöntem önerilmektedir. Bunlardan dirençli arpa çeşitlerinin ekimi en iyi mücadele yöntemi olarak kullanılmaktadır. Ayrıca biyolojik ajanlardan: *Bacillus subtilis, B. polymyxa* ve *Paenibacillus polymyxa* bu hastalığın kontrolünde oldukça etki göstermektedirler. Son olarak farklı fungisitler önerilmektedir. Bu derleme kapsamında arpa bitkisine arız olan *R. graminicola* hastalık etmeninin taksonomisi, ekolojisi, epidemiyolojisi, simptomatolojisi üzerine çeşitli bulguları değerlendirmek amaçlanmıştır.

Anahtar Kelimeler: Biyoloji, Etiyoloji, *Rhynchosporium graminicola*, Taksonomi.

1. GİRİŞ

Arpa yaprak lekesi/yanıklığı, dünya çapında ılıman ve nemli bölgelerde arpayı etkileyen, verimde %40'a varan düşüşlere ve tane kalitesinde düşüşe neden olan yıkıcı bir hastalıktır (Wondimu vd 2022). *Rhynchosporium commune* olarak adlandırılan hastalık etmeni en son olarak *R. graminicola* olarak revize edilmiştir (Ababa vd 2023). *R. graminicola* polisiklik bir yaşam döngüsüne sahiptir. Hastalığın birinci inokulumu ürün artıkları, enfekte tohumlar ve askosporlardır. İkincil inokulum, enfekte yapraklar üzerindeki konidilerin sıçrama yoluyla yayılmasıyla gerçekleşir (Srivastava vd 2020). İlk hastalık belirtileri yaprak ayaları ve kınları üzerinde su ile ıslanmış lezyonlar olarak ortaya çıkar. Lezyonlar oval ila düzensiz şekildedir ve gri-yeşil renkten belirgin bir kahverengi kenar ile saman rengine dönüşür (Ababa vd 2023). Kontrol yöntemleri arasında direnç materyalleri ve çeşit karışımları bulunur. Son seçenek olarak çeşitli fungisitler önerilmiştir. Ancak, gelişmemiş ülkelerde patojenite testi, tohum uygulamaları, toprak işleme, çeşit karışımları ve biyolojik kontrol genellikle göz ardı edilmektedir. Sonuç olarak, bu çalışma arpa yanıklığı biyolojisi ve kontrol önlemlerinin kapsamlı bir değerlendirmesinin yanı sıra, toprak işleme, ürün rotasyonu, ekim tarihleri ve çeşitlerin etkilerini belirtmeyi içermektedir. Genel olarak bu derleme, arpa yaprak lekesi/yanıklığı hastalığının simptomatolojisi, epidemiyolojisi, ekolojisi ve mücadele yöntemlerini gözden geçirmek üzere tasarlanmıştır.

2. ARPA YETİŞTİRİCİLİĞİNE GENEL BAKIŞ

Arpa (*Hordeum vulgare*) Poaceae familyasına ait 14 kromozomlu, kendi kendine tozlaşan, diploid bir türdür (Bishnoi vd 2022). Arpa çiçekleri, kendine özgü bir balıksırtı deseninde düzenlenmiş başakçık kümeleridir. Her başakçığın uzun ince bir kılçığı vardır, bu da başakların püsküllü görünmesini sağlar. Başakçıklar üçlü kümeler halindedir. Altı sıralı arpada, her salkımdaki üç başakçık da verimlidir; iki sıralı arpada ise sadece ortadaki başakçık verimlidir (Kikuchi & Handa 2009). Arpa tahıllar içerisinde iyi bir protein kaynağı olarak insanoğlunun sağlıklı beslenmesi, yoksulluğu ve açlığı azaltma ve ekosistem dengesini koruma gibi özellikleri nedeniyle dünya ekonomisinde büyük bir öneme sahiptir (Lukinac & Jukić 2022). 2023 yılı dünya tahıl üretim alanı (738.760.312 ha)'nın yaklaşık %6'sı Arpa ekim alanları (4.6254.750 ha)'ndan oluşmuştur (FAOSTAT 2023). Buna ek olarak, 2023 yılı dünya tahıl üretim miktarı (3.102.697.575 ton)'nın yaklaşık %5'i arpa üretimi (145.759.524 ton)'nden oluşmuştur. Birleşmiş Milletler Gıda ve Tarım Örgütü (FAO)'nün, 2023 verilerine göre Türkiye 9.2 milyon ton arpa üretimi ile sırasıyla Rusya, Avustralya, Fransa ve Almanya'dan sonra en fazla arpa üretimine sahip beşinci ülkedir (FAOSTAT 2023).

Arpa, büyüme mevsiminde 15 ila 20 °C gibi nispeten düşük sıcaklıkları tercih eden bir üründür; dünya çapında ılıman bölgelerde yetiştirilir (Hakala vd 2020). En iyi şekilde iyi drene edilmiş toprakta tam güneş ışığı altında yetişir. Tropik ve subtropik bölgelerde, Güney Asya'da, Kuzey ve Doğu Afrika'da ve Güney Amerika'nın And Dağları'nda yiyecek ve saman için yetiştirilir. Kurak bölgelerde sulama gerektirir. Kısa bir büyüme mevsimine sahiptir ve nispeten kuraklığa dayanıklıdır. Arpa, farklı çeşitlere göre değişmekle birlikte, toprak tuzluluğuna diğer tahıllardan daha toleranslıdır (Slafer vd 2024).

3. ARPA YAPRAK LEKESİ/YANIKLIĞI HASTALIK ETMENİNİN TAKSONOMİSİ

Arpa üretim miktarında oldukça önemli seviyelerde düşüşe neden olan birçok abiyotik ve biyotik stres faktörü bulunmaktadır. *Rhynchosporium graminicola*'nın neden olduğu arpa yaprak lekesi/yanıklık hastalığı en önemli biyotik stres faktörlerinden biridir. *R. graminicola*'nın neden olduğu yaprak lekesi/yanıklığı, uzun süreli serin ve yarı nemli hava koşullarına sahip bölgelerde daha önemlidir (Ababa vd 2023).

R. graminicola, taksonomisi kafa karıştırıcıdır. Bunun en önemli sebeplerinden biri *R. graminicola*'nın yıllar içerisinde birçok kez farklı isimlendirilmesinden kaynaklanır (Caldwell 1937). İlk olarak, 1898'de çavdar ve arpada yaprak lekesi/yanıklık hastalık etmeni olarak *Marsonia secalis* (Oud.) tanımlanmıştır. Daha sonraki araştırmacılar arpada bu hastalığa neden olan mantarın alışılmadık gagalı, iki hücreli konidiosporları bulunan ve *Rhynchosporium* olarak adlandırılan yeni bir fungal cinse ait olduğunu belirlemişlerdir (Zaffarano vd 2011; Crous vd 2021). Bundan dolayı *M. secalis* çavdar yaprak lekesi/yanıklık hastalık *etmeni; R. secalis* arpa yaprak lekesi/yanıklık hastalık etmeni olarak yeniden adlandırılmışlardır (Ababa vd 2023). Ancak filogenetik analizler *R. secalis*'in çeşitli Poaceae türlerine özgü üç türden oluşan bir komplekse parçalandığını ortaya koymuş olup arpa yaprak lekesi/yanıklık hastalığının etmeni tekrardan *R. commune* olarak yeniden adlandırılmıştır. Böylece, *Rhynchosporium* cinsine ait *R. secalis* Çavdarda ve Tritikalede; *R. agropyri* Tarla ayrığı (*Agropyron repens*), Sakallı buğday otu (*Agropyron caninum*); *R. commune* arpa, diğer *Hordeum* türleri ve kılçık otu (*Bromus diandrus*)'nda patojenik etmenler olarak bildirilmiştir (Zaffarano vd 2011; Crous vd 2021; Ababa vd 2023). Son çalışmalarda arpa yaprak lekesi/yanıklık hastalığının etmeni olan *R. commune* yerine *Rhynchosporium graminicola* binomial ismin kullanımı tercih edilmiştir (Crous vd 2021).

4. ARPA YAPRAK LEKESİ/YANIKLIĞININ SİMPTOMATOLOJİSİ, EKOLOJİSİ VE EPİDEMİYOLOJİSİ

Adından da anlaşılacağı üzere, *R. graminicola* ve *Mycosphaerella graminicola* tür (*graminicola*) düzeyinde benzerdir, ancak cins düzeyinde farklıdırlar (Ababa vd 2023). Arpa yaprak lekesi/yanıklığı ile Buğday yaprak lekesi/yanıklığının enfeksiyon şekilleri ve spor üretimleri benzerdir (Navathe vd 2022). Arpa yaprak lekesi/yanıklık hastalığı vejetatif büyüme sırasında tek hücre üretir ve bu büyüme aşamasında "Maya" formundadır (Crous vd 2021). Başka bir deyişle, arpa yaprak lekesi/yanıklık hastalık etmeni miselyum gelişimi sırasında tek hücre üretir ve maya da tek hücreli bir mikroorganizmadır (Ababa vd 2023). Buğday yaprak lekesi üç farklı vejetatif büyüme formuna sahiptir. Bu patojenin vejetatif büyüme formunun ilk şekli 3-5 septalı makropiknidiospor olup en yaygın hücre formudur (Zaffarano vd 2011). Makropiknidiospor formunun "Maya benzeri" evresinden sıklıkla bahsedilmiştir. Ancak mayalar tek hücreli organizmalar iken makropiknidiyosporlar çok hücreli oluşumlardır. Miselyum üçüncü vejetatif gelişim formudur (Ababa vd 2023).

Arpa yaprak lekesi/yanıklık hastalığının etmeni *R. graminicola* toprakta iyi yaşayamaz (Paulitz & Steffenson 2010). Bu mantar, mahsul artıklarında (anız ve saman) bir yıla kadar hayatta kalır. Arpa döküntüleri üzerinde kışı geçirir ve spor üretir. Buna ek olarak, patojen tohumda

bulunabilir ve tohumlarla da yayılabilir (Goodwin 2002). Enfekteli sap ve anızlardan yağmurla sıçrayan sporlar fideleri enfekte edebilir. ilk hastalık belirtileri yaprak ayaları ve kınları üzerinde su ile ıslanmış lezyonlar olarak ortaya çıkar (Abang vd 2006). Lezyonlar oval ila düzensiz şekildedir ve gri-yeşil renkten belirgin bir kahverengi kenar ile saman rengine dönüşür (Abang vd 2006). Yağmur sıçraması, hastalığı alt yapraklardan üst yapraklara doğru yaymaya devam ederek daha sonra ortaya çıkan yaprakları, başakları ve taneleri enfekte eder (Zhan vd 2008). Havadaki sporların rüzgâr yoluyla uzun mesafeli yayılımı da gerçekleşebilir. Bu enfeksiyon yolu, enfekte arpa tarlalarının yakınında bulunan arpa tarlaları içinde önemlidir. Hastalık çok döngülü epidemiye sahiptir; bu da büyüme mevsimi boyunca birkaç enfeksiyon döngüsüne neden olabileceği anlamına gelir (Clare vd 2023). Hastalık döngüsü her 14 günde bir tekrar edebilir. Serin ve nemli koşullar hastalığı destekler; ideal sıcaklık aralığı 18-20 ℃'dir ancak 20 ℃'nin üzerindeki sıcaklıklar hastalık gelişimini yavaşlatır (Abang vd 2006).

5. ARPA YAPRAK LEKESİ/YANIKLIĞI İLE MÜCADE

5.1. Karma Ekim

Genetik homojenlik, bitki hastalıkları salgınlarında önemli bir faktördür. Bununla mücadele etmek için, konukçu popülasyonlara değişkenlik kazandırmak amacıyla çoklu tür, hat veya çeşit kombinasyonları önerilmektedir (Finckh vd 2000). Dayanıklı ve duyarlı izojenik hatların, çeşitlerin veya türlerin birleştirilmesi, ikincil hastalık yayılımını azaltarak salgın şiddetini azaltabilir (Abang vd 2006). Bazı modellemeler, yüzeysel spor dağılım gradyanlarına sahip rüzgârla dağılan hastalıklara karşı çeşit kombinasyonlarının kullanılmasının en başarılı yöntemlerden biridir (Finckh vd 2000). Bununla birlikte, çeşit karışımları, fungisit kullanılmadan *R. graminicola* ve *Stagnospora nodorum* gibi sıçrama yoluyla yayılan patojenlere karşı etkilidir (McDonald 2025). İndüklenmiş direncin, konukçu-patojen etkileşimlerinde yüksek derecede özgüllüğe sahip biyotrofik, hava yoluyla bulaşan enfeksiyonlar tarafından oluşturulan salgınları bastırarak etki mekanizmalarında rol oynadığı düşünülmektedir (Abang vd 2006; Zhan vd 2008; Ababa vd 2023). Ticari çeşitler, yanıklık hastalığına karşı daha az özel direnç kaynağına sahiptir, bu da onları yanıklık hastalığına karşı biyotrofik hastalıklara göre daha az etkili hale getirir. Dahası, spesifik olmayan direnç, enfeksiyonu azaltmak için çeşit karışımlarında kullanılabilir. Arpa ve yulaf kombinasyonlarının ve sadece arpa standlarının, arpanın üst yapraklarındaki lekelerin/yanıklığının bulunma oranını azalttığı bilinmektedir (Finckh vd 2000).

5.2. Dayanıklı Çeşit Kullanımı

Arpanın hastalıklara karşı göstermiş olduğu direnç kalitatif ve kantitatif tipler olarak sınıflandırılabilir. Kalitatif direnç, fide büyüme aşamasında yüksek direnç seviyeleri sunan belirli bir gen tarafından yönetilirken, kantitatif direnç, yetişkin bitki aşamasında kısmi direnç seviyeleri sunan birçok geni ifade eder (Ababa vd 2023). Bu genlerin yeni çeşitlerde birleştirilmesi, daha kalıcı hastalık kontrolü için mümkündür. Çeşitli araştırmacılar, arpa çeşitlerinin yaprak lekesi/yanıklığı hastalığına karşı direnci konusunda hemfikirdir. Mücadele yöntemleri, çevre dostu olması ve kullanım kolaylığı nedeniyle direnç materyalini önemli görmektedir (Looseley vd 2012; Wang vd 2014). Çalışmalar, İskandinav ve kuzey Avrupa arpa

türleri yaprak lekesi/yanıklığı hastalığına dirançli oldukları bildirmiştir. Örneğin; İskoç arpasının "Bere" popülasyonu iyi bir aday olarak kabul edilmektedir (Looseley vd 2012). Arpa materyallerinin *R. graminicola* ırkına karşı fide veya spesifik direncini belirlemeye yönelik yapılan çalışmalar her geçen gün artmaktadır (Ababa vd 2023). Fide büyüme aşamasında, arpada *R. graminicola*'ya karşı en son tanımlanan direnç geni olan Rrs18 de dahil olmak üzere birkaç direnç geni tanımlanmıştır (Ababa vd 2023). Basit Dizi Tekrarı (SSR) markörleri HVM54, Bmac0093 b, HVLTPP8, HVM62 ve Bmag0006'nın *R. graminicola* için kantitatif özellik lokusları (QTL'ler) olduğu bulunmuştur (Ababa vd 2023).

Yabani arpa (*H. spontaneum*), yerel çeşitlere kıyasla yaprak lekesi/yanıklığı hastalığına karşı yüksek bir potansiyel dirence sahiptir. Yerel çeşitlerin sadece %0,5'i altı adet *R. graminicola* izolatına karşı dirençli iken, *H. spontaneum* aksesyonlarının %26'sı test edilen tüm izolatlara karşı dirençlidir (Looseley vd 2012). Saha gözlemleri, büyüme alışkanlığının pleiotropik etkisi olarak yorumlanan bir lekesi/yanıklığı hastalığına direnci QTL'sini ortaya çıkarmıştır. Cüceleşme genine sahip secde bitkileri, yağmur sıçramalarından kaynaklanan hastalık bulaşmasına daha duyarlıdır (Wang vd 2014).

5.3. Kültürel Uygulamalar

Çalışmalar azot gübrelemesi, fungisit uygulama zamanı ve ekim tarihi gibi kontrol uygulamalarının buğday ve arpa yaprak hastalıklarının gelişimini etkileyebileceğini göstermiştir (Ababa vd 2023). Yüksek azotlu gübreleme buğday habitusunun yoğunluğunu artırarak mikro iklimi değiştirebilir ve yaprak ıslaklığını artırarak spor çimlenmesini artırabilir (Finckh vd 2000). Tersine, düşük azotlu gübreleme yaprak lekesi şiddetini artırabilir. Yapraklara iki kez uygulanan propikonazol, yaprak lekesi/yanıklığını kontrol etmek ve tane verimi ile kalite kayıplarını en aza indirmek için en etkili ilaç olarak bulunmuştur (Ababa vd 2023). Fungisit uygulama zamanlaması, fungisit uygulamak için en iyi zamanın belirlenmesinde önemlidir. Yaprak nekrozu lekeleri çiçeklenmeden sonra hızla ortaya çıkar ve tek bir fungisit uygulaması etkilidir (Abang vd 2006). Yaprak lekeleri çiçeklenmeden hemen sonra hızla gelişir ve süt büyüme aşamasına kadar katlanarak büyür. Çiçeklenme aşamasında, haşlanma şiddeti verim düşüşleri ile en büyük ilişkiye sahiptir (Finckh vd 2000). Arpa hastalıklarını kontrol altında tutmak için iki ila üç yıllık ürün rotasyonu, toprak işleme ve başıboş arpanın ortadan kaldırılması uygulanır (McDonald 2025). Yüksek düzeyde anız kaynaklı inokulum bulunan tarlalara arpa ekiminden kaçınmak için ürün rotasyonu şarttır. Ancak bazı çalışmalar, ekim nöbetinin arpa yaprak lekesi üzerinde çok az etkisi olduğunu göstermektedir (Ababa vd 2023).

ABSTRACT

Chickpea is an important legume crop grown in almost every region of Turkey. It is grown in tropical, subtropical and warm climate regions and is the second most important legume crop globally after dry beans. Chickpea is rich in protein, vitamins and minerals and is used in field agriculture as an alternate crop with cereal crops. Although chickpea has an important place among edible grain legumes, its production and yield are not at the desired level. Among the reasons for this, diseases (45%), drought (30%), high temperature (6.25%), frost (6.25%), insect damage (6.25%) and other (6.25%) stress factors can lead to production and yield losses. Fungal diseases are the most important biotic stress factors that can reduce chickpea production and market value. Under favorable conditions, fungal diseases such as root rot/wilt disease, which can cause 50%-70% yield loss, cause difficulties in production and yield. Root rot/wilt disease can be seen at every stage of chickpea cultivation. Plants affected by the disease turn yellow in clusters due to root and root collar rots and plant deaths occur due to drying of these plants in the progressive process. The causal agents of the disease include *Fusarium oxysporum, F. solani, F. moniliforme, Verticillium dahliae, Macrophomina phaseolina, Rhizoctonia solani, Sclerotium rolfsii* and *Sclerotinia sclerotiorum*. Fusarium wilt/root rot is one of the most important diseases affecting chickpeas worldwide. It was first reported in India in 1918, but its etiology has not yet been accurately determined. Fusarium wilt, caused by the soil-borne fungus *Fusarium oxysporum* f. sp. *ciceris*, has become a major factor limiting chickpea production worldwide. The long survival of the pathogen in soil and its high pathogenic variability play a key role in the development and management of the disease, with eight races, 0, 1A, 1B/C, 2, 3, 4, 5 and 6, having been identified so far. These races differ in virulence and aggressiveness on susceptible cultivars, which are affected by the amount of inoculum and environmental conditions required for severe disease. Disease incidence and severity are influenced by pathogen inoculum density, hot soil temperature and susceptibility of the chickpea variety. Effective management of Fusarium wilt requires accurate and rapid identification of the

pathogen and its pathogenic races. Molecular protocols have been developed to aid this process. High-yielding, well-adapted chickpea varieties resistant to the common pathogen race(s) are the most practical and cost-effective individual disease control measure. However, pre-planting diagnosis of the available race(s) of *F. oxysporum* f. sp. *ciceris* using molecular protocols helps to avoid risky soils. This review is not intended as a comprehensive review of the literature on general aspects of Fusarium wilt in chickpea. Rather, it aimed to critically appraise the current knowledge on disease etiology, epidemiology and control strategies.

Keywords: *Cicer arietinum*, Control strategies, Etiology, Epidemiology, *Fusarium oxysporum*

NOHUTTA FUSARİUM SOLGUNLUĞU VE KÖK ÇÜRÜKLÜĞÜ

ÖZET

Nohut, Türkiye'nin hemen hemen her bölgesinde yetişen önemli bir baklagil bitkisidir. Tropikal, subtropikal ve sıcak iklim bölgelerinde yetiştirilmesiyle küresel olarak kuru fasulyeden sonra ikinci en önemli baklagil bitkisidir. Nohut, protein, vitamin ve mineral açısından zengindir ve tahıl ürünleriyle dönüşümlü ürün olarak tarla tarımında kullanılır. Nohut yemeklik dane baklagiller içerisinde önemli bir yere sahip olmasına rağmen üretimi ve verimi istenilen düzeyde değildir. Bunun nedenleri arasında hastalıklar (%45), kuraklık (%30), yüksek sıcaklık (%6.25), don (%6.25), böcek zararı (%6.25) ve diğer (%6.25) stres faktörleri üretim ve verim kayıplarına yol açabilir. Fungal hastalıklar nohut üretim miktarını ve pazar değerini azaltabilen en önemli biyotik stres etmenleridir. Uygun koşullarda %50-%70 oranında ürün kaybına neden olabilen kök çürüklüğü/solgunluk hastalığı gibi fungal hastalıklar nedeniyle üretim ve verimde zorluklarla karşı karşıya kalınmaktadır. Kök çürümesi/solgunluk hastalığı nohut yetiştiriciliğinin her aşamasında görülebilir. Hastalıktan etkilenen bitkiler, kök ve kök boğazı çürüklüklerinden dolayı öbek öbek sararmakta ve ilerleyen süreçte bu bitkilerde kurumalara bağlı olarak bitki ölümleri gerçekleşmektedir. Hastalığın nedensel etmenleri arasında *Fusarium oxysporum, F. solani, F. moniliforme, Verticillium dahliae, Macrophomina phaseolina, Rhizoctonia solani, Sclerotium rolfsii* ve *Sclerotinia sclerotiorum* yer alır. Fusarium solgunluk/kök çürüklüğü, dünya genelinde nohutları etkileyen en önemli hastalıklardan biridir. Bu hastalık ilk olarak 1918 yılında Hindistan'da bildirilmiştir, ancak etiyolojisi henüz doğru bir şekilde belirlenememiştir. Fusarium solgunluğu, toprak kökenli fungus *Fusarium oxysporum* f. sp. *ciceris* tarafından oluşturulan, dünya çapında nohut üretimini sınırlayan önemli bir faktör haline gelmiştir. Patogenin toprakta uzun süre hayatta kalması ve yüksek patojenik varyabilitesi, şimdiye kadar 0, 1A, 1B/C, 2, 3, 4, 5 ve 6 olmak üzere sekiz ırkın tanımlanmış olması, hastalığın gelişimi ve yönetiminde anahtar rol oynar. Bu ırklar, inokulum miktarı ve şiddetli hastalık için gerekli çevresel koşullardan etkilenen duyarlı çeşitler üzerinde virülans ve saldırganlık açısından farklılık gösterir. Hastalık görülme sıklığı ve şiddeti, patojen inokulum yoğunluğu, sıcak toprak sıcaklığı ve nohut çeşidinin duyarlılığından etkilenir. Fusarium solgunluğunun etkili yönetimi, patojenin ve patojenik ırklarının doğru ve hızlı bir şekilde teşhis edilmesini gerektirir. Bu sürece yardımcı olmak için moleküler protokoller geliştirilmiştir. Yaygın patojen ırk(lar)ına dirençli, yüksek verimli, iyi adapte olmuş nohut çeşitleri en pratik ve uygun maliyetli bireysel hastalık kontrol önlemidir. Bununla birlikte, mevcut *F. oxysporum* f. sp. *ciceris* ırk(lar)ının moleküler protokoller kullanılarak ekim öncesi teşhisi, riskli topraklardan kaçınmaya yardımcı olmaktadır. Bu derleme, nohutta Fusarium solgunluğunun genel yönlerine ilişkin literatürün kapsamlı bir incelemesi olarak tasarlanmamıştır. Daha ziyade, hastalık etiyolojisi, epidemiyolojisi ve kontrol stratejileri hakkındaki mevcut bilgilerin eleştirel değerlendirmesini amaçlamıştır.

Anahtar Kelimeler: *Cicer arietinum*, Mücadele stratejileri, Etiyoloji, Epidemiyoloji, *Fusarium oxysporum*

1. GİRİŞ

Nohut gelişmiş ve gelişmekte olan ülkelere yüksek protein sağlayan ve tarla tarımı için hububat rotasyonunda önemli bir role sahiptir. Bu nedenle nohut üretimi dünyada kozmopolit bir dağılıma göstermektedir. Nohut, baklagiller içerisinde kuru fasülye (Phaseolus vulgaris L.)'den sonra dünyada en önemli ikinci baklagil bitkisi (Jiménez-Díaz vd. 2015) olup Güney ve Batı Asya, Doğu ve Kuzey Afrika, Güney Avrupa, Kuzey ve Güney Amerika'nın yanı sıra Avustralya'nın tropik, subtropik ve sıcak iklim kuşaklarında yetiştiriciliği yaygın olarak yapılmaktadır. Nohut üretiminde, çeşitli ülkelerde yapılan çalışmalar, birçok zararlı organizmanın yanı sıra fungal hastalıkları ile ilgili problemleri ortaya çıkarmıştır. Nohutta, kök çürüklüğüne bağlı olarak solgunluk hastalığının nedensel faktörleri arasında abiyotik ve biyotik hastalık etmenlerinin bulunmasından dolayı, bu hastalığın oldukça kompleks bir yapıya sahip olduğu bilinmektedir (Yimer vd. 2018). Bu nedenle solgunluk hastalığı, nohutta, mücadelesi zor ve önemli miktarda verim kaybına neden olan hastalıklardan biridir (Jiménez-Díaz vd. 2015). Dünya genelinde bu hastalık ile ilgili oldukça fazla çalışma bulunmaktadır. Hastalık etmenleri arasında *Fusarium* spp., *Rhizoctonia solani*, *Macrophomina* spp., *Phytophthora* ve nadirde olsa *Sclerotinia* cinsi fungus türleri yer alır. Nohutta, kök çürüklüğüne bağlı olarak solgunluk hastalığının kontrol altına alına bilmesi için öncelikle hastalığa neden olan fitopatojenik fungal etmenlerin biyolojisini ve epidemiyolojisini anlamak çok önemlidir (Agrios 2005). Bu fungal hastalıklardan, toprak kökenli fungusların neden olduğu kök çürüklüğü/solgunluk hastalığı, Türkiye'nin bazı nohut üretim bölgelerinde önemli bir sınırlayıcı faktör haline gelmiştir. Ancak, Türkiye'nin nohut üretim alanlarında önemli verim kayıplarına neden olan toprak kökenli fungal etmenlerin durumunu tam olarak açıklayan kapsamlı bir araştırma bulunmamaktadır. Sonuç olarak, bu çalışma nohut solgunluk/kök çürüklüğü hastalık etmani olan *F. oxysporum* f. sp. *ciceris*'in biyolojisi ve kontrol önlemlerinin kapsamlı bir değerlendirmesinin yanı sıra, toprak işleme, ürün rotasyonu, ekim tarihleri ve çeşitlerin etkilerini belirtmeyi içermektedir. Genel olarak bu derleme, nohut solgunluk/kök çürüklük hastalığının simptomatolojisi, epidemiyolojisi, ekolojisi ve mücadele yöntemlerini gözden geçirmek üzere tasarlanmıştır.

2. NOHUT YETİŞTİRİCİLİĞİNE GENEL BAKIŞ

Nohut (*Cicer arietinum* L.), Fabaceae (Leguminosae) familyasına ait bir bitki türüdür. Nohut bitkisinin Anavatanı Türkiye'nin Güneydoğu Anadolu Bölgesi'dir (Jiménez-Díaz vd. 2015). Nohut, baklagiller içerisinde kuru fasülye (*Phaseolus vulgaris* L.)'den sonra dünyada en önemli ikinci baklagil bitkisi (Jiménez-Díaz vd. 2015) olup Güney ve Batı Asya, Doğu ve Kuzey Afrika, Güney Avrupa, Kuzey ve Güney Amerika'nın yanı sıra Avustralya'nın tropik, subtropik ve sıcak iklim kuşaklarında yetiştiriciliği yaygın olarak yapılmaktadır. Nohut daneleri, lisin aminoasitince zengin protein içeriğinin yanı sıra A, B, C ve D vitaminleri ile birlikte demir (Fe), fosfor (P) ve kalsiyum (Ca) mineralleri açısından da zengin olmasından dolayı insan beslenmesinde oldukça önemli bir besin kaynağıdır (Dubey vd. 2014; Tadesse vd. 2017) Nohut bitkisi bu özelliklerinin yanı sıra buğday, arpa ve yulaf gibi tahıl ürünleri ile birlikte rotasyon bitkisi olarak kullanılması ve havadaki serbest azottan faydalanabilmesi tarla tarımında bu bitkinin önemini daha da arttırmaktadır (Piggin vd. 2015; Mohammed vd. 2017).

Dünyada 2016 yılı verilerine göre 12.650.076 hektar alanda 12.092.948 ton nohut üretimi gerçekleşmiştir (FAOSTAT 2016). Hindistan dünya nohut üretiminin %64.7'sini karşılayarak, dünya nohut üretimi sıralamasında lider konumdadır. Bu ülkeyi sırasıyla Avustralya (%7.2), Myanmar (%4.6), Pakistan (%4.3) ve Türkiye (%3.8) takip etmektedir. Ülkemizde 2017 yılı verilerine göre 3.953.099 dekar alanda, 470.000 ton nohut üretimi yapılmıştır (TUİK 2017). Nohut üretimi, İç Anadolu Bölgesi'nde yoğunlaşmış olup Yozgat'ta 268.186 da alandan 28.418 ton nohut üretimi gerçekleşmiştir (TUİK 2017).

Nohut ekim alanlarında verim kayıplarına yol açan biyotik ve abiyotik stres faktörleri bulunmaktadır (Maruz vd. 2002; Yimer vd. 2018). Nohut verimini etkileyen stres faktörlerini; hastalıklar (%45), kuraklık (%30), yüksek sıcaklık (%6.25), don (%6.25), böcek zararı (%6.25) ve diğer (%6.25) stres faktörleri olarak sıralamak mümkündür (Singh vd. 1994). Dünyada ve ülkemizde nohut verimini etkileyen biyotik stres faktörleri arasında toprak kökenli fungal fitopatojen etmenler önemli bir yer tutmaktadir. Bu güne kadar 55 farklı ülkeden 67 fungus, 3 bakteri, 80 nematod, 22 virüs ve mikoplazma olmak üzere 172 patojenin nohutta hastalığa sebep olduğu rapor edilmiştir (Nene vd., 1996). Dünya genelinde nohut verimini etkileyen en önemli biyotik stres faktörü Aantraknoz hastalığı olup bunu solgunluk ve kök çürüklük hastalığı takip eder. Her iki hastalığın özellikle iklimsel koşulların epidemiler için uygun olduğu durumlarda %100'e varan ürün kayıplarına neden olduğu bilinmektedir (Pande vd., 2005; Jimenez-Díaz et al. 2015).

3. NOHUT SOLGUNLUK/KÖK ÇÜRÜKLÜK HASTALIĞI

Ülkemizde nohut yemeklik dane baklagiller içerisinde önemli bir yere sahip olmasına rağmen üretimi ve verimi istenilen düzeyde değildir. Bunun en önemli nedenlerinden biriside fungal hastalıklardır. Kök çürüklüğü/solgunluk hastalığı, uygun iklim koşullarında, nohutta %50 ile %70 arasında ürün kayıplarına neden olabilmektedir. Nohutta, kök çürüklüğüne bağlı olarak solgunluk hastalığının nedensel faktörleri arasında abiyotik ve biyotik hastalık etmenlerinin bulunmasından dolayı, bu hastalığın oldukça kompleks bir yapıya sahip olduğu bilinmektedir (Yimer vd. 2018). Dünya genelinde bu hastalık ile ilgili oldukça fazla çalışma bulunmaktadır. Ancak ülkemizde, nohutta, solgunluk hastalığının durumu ile ilgili çalışmalar (Bayraktar 2006) kısıtlı sayıda yapılmıştır. Nohutta solgunluk hastalığının ekonomik önemi tam olarak anlaşılamazsa, bu hastalık ile ilgili çalışmalar ve araştırmalar, üretime yönelik değer taşımaktan ve ekonomik bir katkıda bulunmaktan yoksun olabilir.

Taşıdığı öneme karşın nohut, fungal hastalıkları hem üretim miktarını hem de ürünün pazar değerini düşürmektedir. Literatürden, nohuttun tüm gelişim aşamalarında fungal patojenlerin istilası ile karşılaştığı bilinmektedir. Toprak kökenli patojen fungus ya da benzeri etmenlerler arasında, Fusarium *oxysporum*'un sebep olduğu Fusarium solgunluğu, Verticillium solgunluğu (*Verticillium dahliae*), kuru kök çürüklüğü (*Rhizoctonia bataticola* Syn: *Macrophomina phaseolina*), kök çürüklüğü (*Rhizoctonia solani*), kök boğazı çürüklüğü (*Sclerotium rolfsii*), siyah kök çürüklüğü (*F. solani, F. moniliforme*) ve *Sclerotinia sclerotiorum*' un sebep olduğu gövde çürüklüğü hastalıkları yer almaktadır (Nene vd. 2012; Azevedo vd. 2017).

Hastalık etmeni olan Fusarium türleri, Kutuplardan Ekvator'a kadar organik materyal içeren her tip toprakta yaşayabilen oldukça yaygın funguslardır. Bitki türü ve organına göre *Fusarium* simptomları farklılık göstermesine rağmen, genellikle bitkide kök çürüklüğü ve solgunluğa neden olmaktadır (Özer ve Soran, 1991). Nohut'ta solgunluğa ve kök çürüklüğüne neden olan *Fusarium* türleri: *F. oxysporum, F. moniliforme, F. solani, F. avenaceum, F. equiseti, F. eumartii, F. proliferatum, F. semitectum, F. acuminatum, F. sambucinum* ve *F. redolens*'dir. (Trapero-Casas ve Jiménez-Díaz 1985; Maden 1987; Dolar 1996; Demirci 1999; Maruz vd. 2002; Landa vd. 2004; Jiménez-Díaz vd. 2015; Azevedo vd. 2017; Jendoubi vd. 2017; Yimer vd. 2018). Diğer taraftan, toprak kökenli *Rhizoctonia solani* ve *R. bataticola* etmenlerinin neden olduğu kök çürüklüğü İran, Lübnan, Meksika, Suriye, ABD, Brezilya, Avustralya, Etiyopya, Pakistan, Polanya, Hindistan ve ülkemizde gözlenmiştir (Kaiser 1981; Mazur vd. 2002; Güllü 2003; Lande vd. 2004; Aghakhani ve Dubey 2009; Dubey vd. 2014; Azevedo vd. 2017; Yimer vd. 2018). Türkiye'de *R. solani* ve *R. bataticola*'nın nohutlarda kök boğazında koyu kahverengi kök çürüklüğüne ve üst kısımlarında sararma ve solgunluğa neden olduğu Dolar (1996) ve Demirci vd. (1999) tarafından bildirilmiştir. Mevcut literatürde, nohutta, nadiren de olsa kök ve gövde çürümesine neden olan etmenler arasında *Sclerotinia sclerotiorum* ve *S. rolfsii*'nin de bulunabileceği belirtilmektedir (Maruz vd. 2002; Shahjahan vd. 2016; Mandal ve Dubey 2011). *S.rolfsii*'ye karşı, nohut bitkilerinin fide döneminin daha hassas (Sreekar vd. 2003), ancak ileriki dönemlerde *S. sclerotiorum* daha önemli hale geldiği bilinmektedir (Lindbeck vd. 2009).

Fusarium solgunluğu dünya çapında nohutu etkileyen en önemli hastalıklardan biridir. Bu hastalık ilk olarak 1918 yılında Hindistan'da rapor edilmiştir. Şu anda Asya, Afrika, Güney Avrupa ve Amerika'da nohut yetiştirilen bölgelerin çoğunda yaygındır. Fusarium solgunluğu Akdeniz Havzası, Hindistan alt kıtası ve Kaliforniya'da nohut üretimini sınırlayan önemli bir faktör haline gelmiştir.(Haware, 1990; Jalali ve Chand, 1992; Nene ve Reddy, 1987;Trapero-Casas ve Jimenez-Díaz, 1985; Westerlund ve ark., 1974). Patojenlerin doğru tanımlanması ve hızlı karakterizasyonu, etkili bitki hastalıkları yönetimi için çok önemlidir. *Fusarium oxysporum* Schlechtend.:Fr. tarımsal ürünlerde vasküler çürüklük hastalıklarına neden olan anamorfik toprak kökenli bir fungustur. Konukçu spesifikliğine ve konukçu çeşitler arasındaki virülans varyasyonuna dayalı olarak formae speciales olarak sınıflandırılır (Trapero-Casas ve Jiménez-Díaz 1985). Fusarium solgunluğunun bir etmeni olan nohuttaki Fusarium solgunluğu, patojenite testlerinde hastalık sendromu ile ayırt edilen sararma ve solma olmak üzere iki patotip ile büyük çeşitlilik gösterir (Yimer vd. 2018). Sararma, ilerleyici yaprak sararması, damar renk değişikliği ve 40 gün içinde bitki ölümüne neden olurken, solgunluk şiddetli kloroz ve sarkıklığa neden olur (Trapero-Casas ve Jiménez-Díaz 1985). *F. oxysporum* f. sp. *ciceris*'nin sekiz ırkı mevcuttur (0, 1A, 1B/C, 2, 3, 4, 5, ve 6). Irkların tamamı sararma sendromuna neden olurken, 1A, 2, 3, 4, 5 ve 6 ırkları solgunluk sendromuna neden olur. Irk 2, 3 ve 4 sadece Hindistan'da rapor edilirken, ırk 0, 1B/C, 5 ve 6 çoğunlukla Akdeniz bölgesinde ve Amerika Birleşik Devletleri'nde bulunur. Türkiye'de ise 0, 2 ve 3 nolu ırkların yaygın olduğu Bayraktar ve Dolar (2012) tarafından yapılan çalışma ile saptanmıştır. Fusarium solgunluğunun 7 bölgede ve 37 ilde yetiştirlen nohutlarda yaygın olarak görüldüğü ise Kocalar vd. (2020) tarafından yapılan geniş kapsamlı çalışma ile bildirilmiştir.

4. NOHUT SOLGUNLUK/KÖK ÇÜRÜKLÜĞÜNÜN SİMPTOMATOLOJİSİ, EKOLOJİSİ VE EPİDEMİYOLOJİSİ

Kök çürüklüğü/solgunluk hastalığın belirtileri nohut vejetasyonunun her evresinde gözlene bilmektedir. Hastalıktan etkilenen bitkiler, kök ve kök boğazı çürüklüklerinden dolayı öbek öbek sararmakta ve ilerleyen süreçte bu bitkilerde kurumalara bağlı olarak bitki ölümleri gerçekleşmektedir (Haware vd. 1990). Hastalığa hasas çeşitlerde, ekimden sonra 25 gün içerisinde (Erken Solgunluk), solgun, mat yeşil renk ve kuruma gösteren yapraklar, bitkinin tamamen çökmesine neden olmaktadır (Landa vd. 2004). Ancak hastalık belirtileri (Geç Solgunluk), ekimden 6 – 8 hafta sonra, çiçeklenme döneminin başlangıcında, genelde daha çok göze çarpmaktadır (Azevedo vd. 2017; Jendoubi vd. 2017; Yimer vd. 2018). Geç solgunluk görülen bitkilerde, köklerin kabuk ve odun dokusunda ıslak ya da kuru siyahımsı ya da kahverengi renkli lezyonlar, yaprak ve yaprak saplarında sararma veya açık kahverngi renkli nekrotik lezyonlar ve bitki tüm üst aksamında tamen çökme gözlenmektedir (Jiménez-Díaz vd. 2015; Jendoubi vd. 2017).

F. oxysporum f. sp. *ciceris* bitki dokularının iç veya dış yüzeylerinde klamidosporlar yoluyla toprakta inaktif olarak hayatta kalan, eşeysiz üreyen ve kökte yaşayan fakültatif parazit bir fungustur (Yimer vd. 2018). İn vitro misel büyümesi için sıcaklık ve pH koşullar, izolatlara bağlı olarak sırasıyla 7,5 ila 35°C ve 5,1 ila 5,9'dur (Landa vd. 2004). Klamidosporlar eski misellerde ve enfekte nohut dokularında oluşur ve hiflerde düz, kaba duvarlı, terminal veya interkalar olabilir (Jalali ve Chand, 1992). Enfekte toprak, nohutta Fusarium solgunluğu epidemilerinin gelişimi için ana inokulum kaynağıdır. Enfekte tohumlar da hastalığın birincil inokulum kaynağıdır. Enfekte tohumlardan yetiştirilen bitkiler, enfekte toprağa ekilen sağlıklı tohumlardan yetiştirilen bitkilere göre daha hızlı solmaktadır (Jiménez-Díaz vd. 2015). Topraktaki klamidosporlar, nohutta Fusarium solgunluğu için birincil inokulumdur ve çimlenme, konukçuların ve konukçu olmayanların tohum ve kök eksüdatları tarafından uyarılır. Patojen, istila edilmiş toprakta ekimden hemen sonra çimlenen tohumlarda ve büyüyen fidelerde giriş kazanır (Jalali ve Chand 1992; Landa vd. 2004). Patojen istila esas olarak kotiledonlar ve epikotil ile hipokotilin kotiledonlarla birleştiği veya kotiledonlara yakın bölgelerinden ve daha az oranda da kök uzama ve olgunlaşma bölgesinden gerçekleşir (Landa vd. 2004). Patojenin epikotil ve gövde ksilemini kolonize etme hızı ve yoğunluğu, *F. oxysporum* f. sp. *ciceris* ırk/nohut genotip kombinasyonunun uyumluluk derecesiyle doğrudan ilişkilidir. Şiddetli semptomlar geliştikçe ve bitki yaşlandıkça enfekte dokularda bol miktarda klamidospor oluşur (Jiménez-Díaz vd. 2015). Bu klamidosporlar, fungusun organik kalıntılar ve kök eksüdaları tarafından desteklenen sınırlı saprofitik büyümesinin yanı sıra konukçuların ve konukçu olmayanların geçici enfeksiyonları ile yaşam döngülerinden geçebilir (Haware vd. 1990).

Nohutta Fusarium solgunluğu, patojen ırkların saldırganlığı, topraktaki inokulum yoğunluğu, çevre koşulları ve çeşit duyarlılığı gibi çeşitli faktörlerden etkilenmektedir (Haware vd. 1990; Jiménez-Díaz vd. 2015). Hastalığın toprak matriks potansiyelinin azalmasıyla arttığı ve 500 ve 1000 propagül g^{-1} toprak inokulum yoğunluğu ile 25 ve 30°C'de şiddetli bir şekilde geliştiği, ancak 15 ve 20°C'de gelişmediği bildirilmiştir (Jendoubi vd. 2017). İnokulum yoğunluğu 5000 propagül g^{-1} toprak olsa bile 10°C'de hastalık gelişmemiştir (Landa vd. 2004). Toprak sıcaklığı ve *F. oxysporum* f. sp. *ciceris* 0 ve 5 ırklarının inokulum yoğunluğu arasındaki ilişkiyi

belirlemek için kantitatif doğrusal olmayan modeller kullanılmıştır. Modeller, Fusarium solgunluğunda sıcaklık×ırk saldırganlığı etkileşimini göstermiştir. P-2245 ve cv. hatlarının enfeksiyonu için en uygun toprak sıcaklığı PV-61'in 5. ırk tarafından enfeksiyonu için en uygun toprak sıcaklığı sırasıyla 22 ila 26°C olarak tahmin edilmiştir (Haware vd. 1990; Jiménez-Díaz vd. 2015)).

5. NOHUT SOLGUNLUK/KÖK ÇÜRÜKLÜĞÜ İLE MÜCADE

Nohuttaki Fusarium solgunluğu, patojenin birincil inokulumu ile karakterize edilen monosiklik bir hastalıktır. Hastalık ile mücadele etmek için patojeni eradike ve ilk inokulumu azaltmak hedeflenmelidir. Kontrol önlemleri arasında patojen içermeyen tohumların kullanılması, yüksek riskli topraklar için yer seçimi, inokulumun azaltılması veya ortadan kaldırılması, dirençli çeşitlerin kullanılması, sağlıklı tohumların fungisitler veya biyokontrol ajanları ile korunması ve patojen enfeksiyonunu önlemek için ekim nöbeti uygulamalarının seçilmesi yer alır. Bu önlemler entegre bir yönetim stratejisi dahilinde birleştirilmelidir.

5.1. Patojenin Eradikasyonu

Nohutta Fusarium solgunluğunun yönetimi, etkili karantina ve sertifikalı patojen içermeyen tohum kullanımını gerektirir. Patojenin tohum yoluyla yayılmasını önlemek için patojen içermeyen alanlarda sağlıklı tohum üretilmelidir (Pande vd. 2007). *F. oxysporum* f. sp. *ciceris* DNA'sını toprakta ve enfekte asemptomatik nohut bitkilerinin kök ve gövdelerinde 1 pg'ye kadar ölçmek için gerçek zamanlı bir kantitatif polimeraz zincir reaksiyonu (q-PCR) protokolü geliştirilmiştir; bu protokol sertifikasyon programlarında, bitki sağlığı denetimlerinde ve karantina mevzuatında tespit ve tanımlama için kullanılabilir (Jimenez-Fernandez vd. 2011).

Tohum kaynaklı inokulum, 1,5 g kg^{-1} Benlate® T ile tohum sosu yapılarak yok edilebilir (Haware vd. 1978). Sertifikalı veya fungisitle muamele edilmiş tohum, düşük hastalık riskli toprak ve biyokontrol ajanlarıyla tohum işlemleriyle birlikte kullanılmalıdır. Topraktaki *F. oxysporum* f. sp. *ciceris* inokulumu sanitasyon, toprak solarizasyonu ve organik değişikliklerle azaltılabilir. Bu hastalık kontrol önlemleri maliyetli olabilir ve hastalık tahminine ve ürün hasat ekonomisine göre değerlendirilmelidir (Blok vd. 2000; Kirkegaard 2009). Bununla birlikte, toprak solarizasyonu ve organik değişiklikler, toprak kaynaklı fungal patojenlerin ve bitki paraziti nematodların inokulumu üzerinde spesifik olmayan bir etkiye sahip olabilir. Etkilenen mahsullerden döküntüleri çıkarmak ve bunları yakmak veya alevlendirmek gibi sanitasyon, sonraki mahsulde hastalık riskini azaltabilir (Arora vd. 1996). Nisan-Mayıs aylarında yapılan toprak solarizasyonu, Fusarium solgunluğunu başarılı bir şekilde kontrol eder ve Akdeniz iklimine sahip bölgelerde nohut bitkisinin büyümesini ve verimini artırır. *F. oxysporum* f. sp. *ciceris* ile enfekte olmuş toprağın ilaçlanması, yüksek N içeren ürünlerle yapılan toprak işleme ile de sağlanabilir (Bailey ve Lazarovits 2003; Lazarovits 2004).

5.2. Dayanıklılık Mekanizması ve Fizyolojisi

Nohutta Fusarium solgunluğuna karşı direnç, pratik ve uygun maliyetli bir bireysel hastalık kontrol önlemidir. *F. oxysporum* f. sp. *ciceris* ırklarına karşı direnç esas olarak desi germplasmında ve daha az ölçüde kabuli nohutlarında ve yabani *Cicer* spp'de tanımlanmıştır. 0 ve 5 ırklarına karşı kombine direnç *C. bijugum, C. cuneatum, C. judaicum* türlerinde

tanımlanırken, *C. canariense* ve *C. chorassanicum* türleri 0 ırkına dirençli ancak 5 ırkına duyarlıdır. Test edilen tüm *C. pinnatifidum* türü 5. ırka karşı duyarlı iken bazıları 0. ırka karşı dirençlidir (Kaiser vd. 1994). ICRISAT'ta 13.500'den fazla desi germplazm aksesyonunun direnç taraması 165 direnç kaynağı tanımlarken, ICARDA'da Fusarium solgunluğu direnci için taranan 5174 kabuli germplazm aksesyonu arasında 110 dirençli hat tanımlanmıştır. Birkaç kabuli hattı bir veya birkaç *F. oxysporum* f. sp. *ciceris* ırkına karşı direnç taşımaktadır ve desi hattı L-1186'dan aktarılan altı sonraki çeşitteki direnç 0, 1A, 1B/C, 5 ve 6 ırklarına karşı etkilidir (Haware vd. 1990; van Rhenen vd. 1992).

F. oxysporum f. sp. *ciceris*'in belirli ırklarına karşı direnç, ırka veya direnç kaynağına bağlı olarak monojenik veya oligojenik olarak tanımlanmaktadır (Sharma vd. 2005; Sharma ve Muehlbauer 2007). ICRISAT'ta 1A ırkına karşı direnç üzerine yapılan ilk çalışmalarda, geç solma fenotipinin h1, h2 ve H3 olmak üzere üç bağımsız gen tarafından kontrol edildiği varsayılmıştır. İki ya da üç bağımsız gene dayanan benzer bir genetik sistemin, solgunluk hasta parsel taramasında ırk 2'ye direnç kazandırdığı bulunmuştur (Gumber vd. 1995; Kumar 1998); bu da geç solma ya da tam direnç ve homozigot resesif durumu içermiştir. Daha sonra Sharma ve arkadaşları (2005) yapay inokulasyonda ırk 2'ye direncin tek bir resesif gen tarafından yönetildiğini göstermiştir. Nohut genetik haritasının 2. bağlantı grubunda iki kümede yer alan altı tek, resesif direnç geni (foc-01, -02, -2, -3, -4 ve -5) tanımlanmıştır (Halila vd. 2009; 2010).

Irk 0'a karşı direnç, bağımsız olarak ayrılan iki gen tarafından kontrol edilir: JG-62 katılımında bulunan foc-01 ve CA-1938, CA-2139 ve WR-315 hatlarında bulunan foc-02 (Sharma vd. 2005). Her iki gen de ayrı ayrı patojenin 0. ırkına karşı tam direnç sağlamaktadır. Irk 4'e karşı direnç bazı hatlarda monogenik resesif iken, 'Surutato-77'de digenik resesiftir (Tullu vd. 1999).

Nohutta Fusarium solgunluğunda ırka özgü yavaş solma reaksiyonu ilk olarak Sharma ve arkadaşları (2005) tarafından 2. ve 3. ırklarla inoküle edilen bazı nohut hatlarında gözlemlenmiş ve daha sonra solgunluk gösteren bir parselde 0. ırka karşı rapor edilmiştir. Yavaş solma reaksiyonunun genetiği henüz çalışılmamıştır, ancak minör genler tarafından kontrol edildiği öne sürülmüştür.

Tam dirençli fenotip, lokalize hücre ölümü gelişmeden histolojik ifadede değişiklik gösterebilir. Irk 5 ile enfeksiyon, duyarlı 'JG-62' ile karşılaştırıldığında 'WR-315' köklerinde lipid peroksidasyonu, katalaz (CAT) ve süperoksit dismutaz (SOD) aktivitelerinde daha erken bir artış belirlemiştir (García-Limones vd. 2002). Kök ekstraktlarının daha ileri analizleri, araştırmacıları, gövdelerde artmış diamin oksidaz (DAO) aktivitesinin ve köklerde lipid peroksidasyonu ile CAT ve SOD aktivitelerinin daha erken artışlarının, 'WR-315'te ırk 5'e dirençle ilişkilendirilebileceği sonucuna götürmüştür (García-Limones vd. 2002; 2009).

5.3. Fusarium Solgunluğuna Karşı Dayanıklılığı Etkileyen Abiyotik ve Biyotik Faktörler

Nohut çeşitlerinin *F. oxysporum* f. sp. *ciceris* ırkları tarafından enfeksiyona karşı ırka özgü direnç tepkisi, hem sıcaklıktan hem de bitki paraziti nematodlarla birlikte enfeksiyondan önemli ölçüde etkilenebilir (Landa vd. 2006; Castillo vd. 2003). Yapay aşılama deneyleri, inkübasyon sıcaklığındaki 3°C'lik bir artışın kabuli cv. Ayala ve PV-1 aksesyonunun ırk 1A'ya tepkisinin sabit 24°C'de orta veya yüksek derecede dirençli iken 27°C'de yüksek derecede duyarlı hale gelmesi için yeterli olduğunu göstermiştir (Landa vd. 2006). Bu sıcaklık etkisi, İsrail'deki tarla

deneylerinde gösterildiği gibi, nohutta Fusarium solgunluğunu yönetmek için kültürel uygulamaların kullanımı üzerinde bir etkiye sahiptir. Topraktaki *F. oxysporum* f. sp. *ciceris* inokulumu, bitki paraziti nematodlarınki ile çakışmaktadır ve bitkinin iki patojen tarafından enfeksiyonu, fungusa karşı değerli direnci riske atabilir ve duyarlı çeşitlerde hastalık şiddetini artırabilir. Kök-düğüm (*Meloidogyne* spp.) ve kök-lesion (*Pratylenchus* spp.) nematodları nohuda zarar veren en önemli nematodlar arasındadır ve birkaç çalışma *F. oxysporum* f. sp. *ciceris* ile ortak enfeksiyonların bitkinin mantara tepkisi üzerindeki etkisini ele almıştır (Castillo vd. 1998; 2003; Krishna Rao and Krishnappa 1996; Mani and Sethi, 1987; Navas Cortes vd. 2008). Hindistan'da yapılan çalışmalar, solmaya dirençli nohutun *Meloidogyne incognita* veya *Meloidogyne javanica* ile birlikte enfeksiyonlarının, tanımlanamayan bir *F. oxysporum* f. sp. *ciceris* ırkına karşı direncin kırılmasına yol açabileceğini göstermiştir (Krishna Rao ve Krishnappa 1996; Mani ve Sethi 1987; Uma Maheswari vd. 1995; 1997). İspanya'daki çalışmalar, Akdeniz Havzası'nda nohutlara saldırdığı bildirilen tek nematod olan tahıl ve baklagil kök-ur nematodu *Meloidogyne artiellia* ile etkileşimlere odaklanmıştır (Castillo vd. 2008; Di Vito ve Greco, 1988). F. oxysporum f. sp. ciceris ırk 5'e karşı *M. artiellia* kaynaklı direncin kırılmasının altında yatan mekanizmalar, CA-336.14.3.0 ve ICC-14216 hatlarında proteomik bir yaklaşımla daha ayrıntılı olarak araştırılmıştır (Navas-Cortes et al., 2008). Kök proteomlarının karşılaştırmaları, *M. artiellia* ile birlikte enfeksiyonu takiben ırk 5'e verilen farklı tepkilerin, enfekte olmuş bitkilerdeki kurucu protein seviyelerindeki farklılıkları içermediğini göstermiştir. 'CA-336.14.3.0' nohutlarının 'ICC-14216 K' ile karşılaştırıldığında daha yüksek yanıt verebilirliği, nematod tarafından enfeksiyon sırasında eski hatta daha güçlü bir metabolik yeniden programlama ile ilgili olabilir (Castillo vd. 2003; Palomares-Rius vd. 2011).

5.4. Ekim Tarihi ve Biyolojik Mücadele

Ekim tarihi, nohut mahsulünün verimini belirlemede çok önemli bir faktördür ve Akdeniz bölgesinde geleneksel olarak ilkbaharda ekim yapılır. Bununla birlikte, sezon ilerledikçe, ürün artan sıcaklıklar ve artan toprak nemi stresiyle karşılaşır, bu da vejetatif ve üreme dönemlerini kısaltır ve verimi düşürür. Fusarium solgunluğu görülme sıklığı ve şiddeti, ilkbaharda ekilen ürünlerde ortaya çıkan sıcak ve kuru topraklar tarafından artırılır. Buna karşılık, kış ekimi, mahsulün büyüme aşamalarının optimum çevre koşullarıyla eşleşmesini sağlar ve topraktaki mevcut suyun daha iyi kullanılmasıyla verimi artırır. Nohut ekim zamanı, Fusarium solgunluğunun yönetimi için tavsiye edilmiştir ve Hindistan'da yapılan çalışmalar, Ekim ortasına kadar yapılan ekimlerde Fusarium solgunluğu yoğunluğunun azaldığını ve nohut tohum veriminin arttığını göstermiştir. Güney İspanya'da yapılan 3 yıllık bir çalışmada, ekim tarihinin erken ilkbahardan erken kışa alınmasının salgın başlangıcını önemli ölçüde geciktirdiği, salgın gelişimini yavaşlattığı ve nihai hastalık görülme sıklığını, şiddetini ve verim kaybını azalttığı bulunmuştur. Bununla birlikte, nohut ekiminin ilerletilmesinin Fusarium solgunluğunun kontrolü üzerindeki net etkileri, çeşidin duyarlılığına ve *F. oxysporum* f. sp. *ciceris* ırkının virülansına göre değişmiştir. Tohum verimi kaybı öncelikle *F. oxysporum* f. sp. *ciceris* ırkının virülansı ve daha az ölçüde nohut çeşidinin duyarlılığı tarafından belirlenmiştir.

Nohutta Fusarium solgunluğunun yönetimi için ekim tarihi seçimini bir hastalık kontrol stratejisi olarak kullanırken, seçilen ekim tarihlerinde hakim olan sıcaklıklardan kaynaklanan biyolojik kontrol uygulamalarının etkileri üzerinde olumsuz bir etkiden kaçınmak için dikkatli

olunmalıdır. Nohutta Fusarium solgunluğu, farklı bakteriyel veya fungal biyokontrol ajanlarıyla (örneğin, *Bacillus* spp., patojenik olmayan *F. oxysporum, Pseudomonas* spp. ve *Trichoderma harzianum*) tedavi edilerek kontrol edilebilir. Bununla birlikte, bu mikrobiyal ajanlar tarafından hastalığın baskılanmasının aşağıdakilerden etkilendiği gösterilmiştir:

i) patojenin inokulum yoğunluğu,
ii) patojenin ırkı, suşu veya izolatı ve
iii) biyokontrol faaliyetinin çalışması gereken çevresel koşullar.

6. SONUÇ

Fusarium solgunluğu, patojenin henüz rapor edilmediği Avustralya dışında, dünya çapında nohut üretimi için önemli bir sorundur. Hastalık, patojenin toprakta uzun süre hayatta kalması ve popülasyonlarında en az sekiz patojenik ırkın varlığı ile tercih edilmektedir. Bu ırklar, inokulum miktarı ve şiddetli hastalık için gerekli çevresel koşullardan etkilenen duyarlı çeşitler üzerinde virülans ve saldırganlık açısından farklılık gösterir. Hastalık görülme sıklığı ve şiddeti, patojen inokulum yoğunluğu, sıcak toprak sıcaklığı ve nohut çeşidinin duyarlılığından etkilenir. Fusarium solgunluğunun etkili yönetimi, patojenin ve patojenik ırklarının doğru ve hızlı bir şekilde teşhis edilmesini gerektirir. Bu sürece yardımcı olmak için moleküler protokoller geliştirilmiştir. Yaygın patojen ırk(lar)ına dirençli, yüksek verimli, iyi adapte olmuş nohut çeşitleri en pratik ve uygun maliyetli bireysel hastalık kontrol önlemidir. Bununla birlikte, mevcut *F. oxysporum* f. sp. *ciceris* ırk(lar)ının moleküler protokoller kullanılarak ekim öncesi teşhisi, riskli topraklardan kaçınmaya yardımcı olacaktır. Yavaş solma direncinin diğer ekim öncesi hastalık kontrol önlemleriyle birleştirilmesi, entegre hastalık yönetiminde verimliliği artıracaktır.
